RASTUS, in spite of the fact that he had been caught red-handed in the unauthorised appropriation of Major Hinkelomper's best breed of truffles, was putting up a pretty good fight. He was a good deal of a politician in his way, and at election time had always merited a good deal of influence with the voters of his own race and color, and there were previous few of the new progressive ideas with which the old man was not thoroughly familiar. So when the indictment against him was read as a preliminary to his trial, and it appeared that the plaintiffs in this action were "the people of the State of Mississippi," and that they were prosecuting "the said Rastus Johnson, for crimes and misdemeanors of the following nature: to wit, that the said Rastus Johnson, on the evening of the nineteenth of November, between the hours of midnight and four o'clock of the following morning, did with felonious intent break into the chicken-yard of the said Major Hinkelomper, and when there apprehended was found to have concealed upon various parts of his person seven henlets belonging to the said Major Hinkelomper." Rastus came up with becoming dignity and addressed the court.

"De I askstated, yo' honor," he said, "dat dese yere proceedings, sah, is a substituted by de people o' de State o' Mississippi?"

"That is the situation," replied the judge.

"Dee I make, yo' honor, dat dese yere proceedings is be equated, sah, on de ground dat de people o' de

State o' Mississippi ha'n't never held an referendum on de subject, sah; or at dey has, it has been without proper notification to de people o' de State o' Mississippi, an' has been put 'em on de quiet, an' he'n' dese yere trial proceeds I demands to see de returns on dat vote authentic' sah; proceeds, sah."

that we were arrested every night, and I stayed in the county jail at the county's expense. They were very considerate."

AD ASTRA PER REPARTE

"All right," said Chaffin, as he gathered himself together after her father had thrown him out of the house. "I'll have you indicted for this."

"Assault and battery, I presume?" grinned the old gentleman.

"Not on your life," said Chaffin. "Under the Sherman Act. Your daughter and I were almost to swap voters, and that kind of yours was distinctly an act in restraint of trade!"

And the old man was so pleased that he selected, and the next day the resignation was announced.

A PERTINENT QUERY

The old gentleman looked Perley in the eye.

"Can you support my daughter in the style in which she is accustomed?" he demanded.

"No, Colonel, I can't," replied Perley, "but let me ask you, sir, could you have done so at my age?"

AN EXPLANATION

"JAMES," said Mr. Wiggles in his chauffeur. "I have very good reasons to believe that somebody besides myself sees my car. What have you to say on the subject?"

"Well, sir," said the chauffeur. "I can't imagine who it can be, but—"

"Well," said Mr. Wiggles, severely.

"Well, sir, you know that car is one o' these new self-starters, and it may have been taking a little run on its own hook, sir," said James, his face the picture of innocence.

MANAGER: WELL, WHAT MAKES YOU THINK YOU CAN GET?

"PLEASE, MR. I'M A MOWING-BIRD."

A CANNY SCHEME

"I've let you suffer from rotten hotels on that side of yours through the mountains," said Wimpston, after Jinks had returned from a night tour.

"Not a bit of it," said Jinks. "I had things on

AS IT IS TO BE

A MATTER OF ARITHMETIC!  
NOTHING FROM NOTHING—LEAVES NOTHING

## FITZHUGH LEE

On April 6, 1865, as the main column of the Confederate Army retreated over the bridge near Ft. Fisher, he was closely pressed by the Army of the Potomac, till there remained with him but a handful of brave men. There he sat, a grand figure, in his own hand, directing the movements of the last troops that fled across.

## AT THE BRIDGE

At Appomattox, Virginia, Fitzhugh Lee held the town with a small force, gradually diminishing his front, which was  
Scated on his horse near the bridge, he calmly watched the preparations for firing it, and directed  
the last remnant of the Army of Northern Virginia. He fired the last shot and was the last to cross

# A TENEMENT BOYHOOD

BY JOSEPH COLLINGS

ILLUSTRATED BY H. M. BRINKENHOPF

But not until he had reached his own "block" and the door of the tenement to which he lived did he stop. Then he shot a fearful look at the clock in the father's room—and gasped with surprised joy. Teacher had gone out only ten minutes! And he had bathed her and had washed out nicely! He felt on fire. But he would make it up to her!

Momently—there was play. Now, however, that it was late, began the daily delicious agony of deciding where and what to play next. The fellows would not be around for an hour. There was no playing until night on the street, for it was too crowded with cars, wagons, pushcarts, and passersby. The doors would be closed on an afternoon like this, but they were the property of "deck gangs" and "minks" who robbed and lent all other boys they caught. The open country was miles and miles away, no matter in what direction. The boys had never seen it because it met at least two miles to go and come. And there were no playgrounds, no Howard Park or Hamilton Park, Park on the East Side twenty years ago.

There was the roof and kite-flying, of course. It had ceased for them all day at school. But there, too, was the clothes-pole in the back-yard, that he could leave all to himself at this time of the afternoon, and the out-of-door dows which he could slide on as often as he pleased without having to wait his turn. It was as hard to give up one as the other.

He was, however, not fat. He was hungry. No one climbed those flights of dark stairs to his home. "You, mother!" he greeted his mother. An usual, she was waiting at work over her wash-tub and trying at the same time to scold Maxey, the lady, who was as usual drifting on top of a pile of unfinished work from the shop. At the Boy's coming, Maxey gave a gasp of joy and stopped his usual crying, and his mother sighed with relief.

"You, mother!" he greeted his mother. An usual, she was waiting at work over her wash-tub and trying at the same time to scold Maxey, the lady, who was as usual drifting on top of a pile of unfinished work from the shop. At the Boy's coming, Maxey gave a gasp of joy and stopped his usual crying, and his mother sighed with relief. "You, mother!" he greeted his mother. An usual, she was waiting at work over her wash-tub and trying at the same time to scold Maxey, the lady, who was as usual drifting on top of a pile of unfinished work from the shop. At the Boy's coming, Maxey gave a gasp of joy and stopped his usual crying, and his mother sighed with relief.

Maxey screwed up both his eyes tightly and gazed in the glare of the sun, but after a while became accustomed and craned as presently control as he left the Boy's arm about him. But the Boy had forgotten Maxey in his dim mood. He was now comparing between big bites at the bread and butter.

"Hey, Joe-ey? Who else read?"

The Boy looked up at the fire-escape in the rear of another tenement on the next block was "Chinky" who snarling, roared and also reading a dime novel, but was hampered by a baby. The Boy yelled across the top of his dime novel.

"Fink!" yelled back "Chinky" "Peter's letter!"

"Heiter! Liden t' that!" And the Boy skinned across the yards.

"Crack! Crack!"

"Nick Carter's revolver sped right and left, dawning a hail of ever short missiles strong with snore, for their guns."

"Dr. Nick Carter!"

"Crack! Crack! Crack! Crack!"

"Out with the lights!" yelled Nick Carter to him. The Detective, Crank, went the heavy lamp. The

fire was plunged in darkness. Nick Carter and Bob dragged to the door as the headlights rained toward them the detectives' guns went like wildcats.

"Crack! Crack! Crack!"

"The guns' apt" yelled Nick Carter. "Har reader!"

"Crack! Crack! Crack!"

"I'll give you my book and a ten-up for a penny for your book," he offered.

The Boy weighed the proposition in a spirit of serious consideration.

"Nah, I want your book and the penny without losing for it."

"Disappointing," angrily denounced Chinky. Then he said, prophetically, "All right. Meet you on your roof."

And he started into the room out of sight.

The Boy looked the last piece of crust, tacked his dime novel into his blouse again and considered. He came went into his room through the house and up the stairs—but there was nothing to give up that night he could go up by climbing up two stories by the fire-escape and over the coping on to the roof. That would be better. Best of all, however, would be to climb down the fire-escape three stories to the yard, there to slide awhile down the cellar door, to climb up the clothes-pole for a look around, and only then to go up to the roof.

So he looked down cautiously from his legs to see if Mrs. Lipky's window was open. If it was, he would have to give up his plan for Mrs. Lipky was the wiser for to begin who related the fire-escape past her windows. But her window was closed and she seemed not to be at home.

"This was the glorious chance to play fireman without a child and to do it as the pictures always showed. The fireman, at a dizzy height, a long body over his arm, is making his way down the ladder, leaning out far above the sea of white waves looking up at him, only his trusty other hand, his hands

Mrs. Lipky had seen him pass her window

THE Boy was seeing the Spanish Main danger arithmetic on a giraffe atop he had drawn on his slate-board. Teacher spun him a world away, in a flash of temper at a post of honor, launched out at him: "You should be ashamed of yourself! Your father leaves all day in the street-sweep and your mother is nobody ever remembered it. You should be ashamed of yourself! Will you never learn to rock?"

Max was angry, and she knew it. She remembered that for a boy of ten he was a voracious reader and took no end of pains with his compositions. She regretted her words, but it was too late. Thirty pairs of large eyes turned on the Boy and looked actions reproach at him.

The Boy's face paled with the disgrace and—the justice of it.

Work! He never could understand just what people meant by work? He always wanted to do what was right and kind and never refused to help his mother. But evidently that was not work—he nobody ever remembered it. They reproached him with wanting alone to play!

Well, he did. Hearty as he was, he would give up going to play. Tired and sleepy as he always was at night, he would give up sleep to play. Work, therefore, meant he would give as he had as play was sweet to him.

At Teacher's words and under the gaze of his classmates he felt the hot tears coming. So he shouted out, to beat them off.

"I hate—but—what work?"

And it was for this that he was being kept in after school, while the clock on Teacher's desk ticked his minutes—his years—away! Already had she rubbed him of what seemed to him whole hours of golden play. Over the foremost row, through a line of seats to see the best of all, his eyes were mounting up into the sunlight sky, their heads wagging and tails cricking respectably in the brisk, spring breeze. Who could tell if another such brief afternoon would ever come again! The best part of his life was slipping away while Teacher was keeping him a prisoner for a meaningless nothing. Would she never stop writing and look up? Oh, he hated her the afternoon—she whom he had loved in secret so deeply, so dearly!

Teacher left the brass in the Boy. Looking up she said go.

"Jumping to his feet the Boy rushed out of the classroom a throb in his forehead. (Understand teacher!) She looked after him with a gasp. The Boy, as he ran down the stairs, knew that he had hurt her, and felt a glow of reverential satisfaction in his heart that quenched a little of his own pain.

And it he ran all the way to his own home block he could still snarl back some precious minutes of play of which he had been robbed. He ran—and ran lustily, shouting and gasping as a stinging pain entered his side; not as he would run the same night, on his toes, gamboled, in "prisoner's base"—"eye and tubers," and "star and"!

The crowd thrived Street he leaped into everybody. His gaze, as his breath gave out and the sills in his ears rattled low in order, changed to fear, outside. He ran, his head clasped to his side and tears rolling down his cheeks.

Chinky was already there, flying a kite

on to the ladder, being both iron being dashed to destruction or being devoured by the flames.

The boy was almost sure he could carry Maury down that way and lounge to try it. But the thought of what his mother would say if she found out troubled him. So he deposited Maury into the room and intercalated his gathering tears by promising:

"My mother's right and her house's my only grown goat Maury a nice—a nice, red apple! Yeh, baby!"

Chinky's faith in his big brother was great, so he stuck his thumb into his mouth and, with his eyes large with confidence and expectation, nodded and set down to the pile that he had received from the wire, and made the fire to begin to bring him.

The boy himself had stepped out gingerly on to the fire-escape and had begun to descend. He tried on to the stairs, iron ladder with a hook, and the other was crushed in carrying a beautiful succession, gulping hard little girl. He saw below him the sea of white strokes, but standing in looking up at him. He heard the howled shouts come up faintly to him as great tongues of flame shot out of the windows in his path.

But instead of fire, there shot out suddenly from Mrs. Lippy's window a deluge of cold water full on the boy. He gasped, choked, and almost lost his hold. Mrs. Lippy had seen him pass her window and was now leaning out, dropping pail in hand, scolding and glaring down at the boy.

A falling of water sprang in the boy's lips—blistering water that could pierce the toughest heart and scald such it. He had heard that from the boys in the truck-drivers, from fishwives on Baker Street and from young toughs and old drunkards on the Bowery in St. Charles. He had longed to hang in Mrs. Lippy's heart with them! But he hit three back, his mother would hear.

Dejected, uttering a lamentation, the glow of his imagination quenched, the boy creaked to the remaining stairs into the back yard and climbed the great mass of a clothes-pole to dry himself in the sun.

Gradually the sun warmed the chill out of his blood and his heart and imagination glowed up with visions of revenge. Now he was done, done, done, done, done was in his power. He had lined up his whole hand, and at his command they were rattling her with bullets. But that made him feel that Mrs. Lippy's wonderful jumping frog full of shot, and because it made him smile he gave up that dream and became thoughtful. Mrs. Lippy had been looking up at him. With a scintilla sleep as a razor he was working Mrs. Lippy to pieces while she was striking and begging for mercy. He only laughed heartily and hitled away.

But a glance about showed him Mrs. Lippy still whole and mopping off complacently her still dripping window-curtain.

At this moment her little son ran over into the yard to play. The boy's heart leaped fiercely. Revenge was his! Now he knew what would really catch Mrs. Lippy's tough heart as nothing else would—her little son, raised in walking. The boy slid down from the pole and made straight for Mrs. Lippy. His imagination he could hardly bear the full-throated heart of the latest woman's son—a howl to laugh it to great over!

"Hello, de—!"

Full on the boy's nose landed the boy's vengeance. The boy stopped back and looked up at Mrs. Lippy's window, anger even for the first glimpse of her stained face. But he heard no breath-stopping hand from the window. Instead there came a little girl, a little fellow, for the show and the play, had taken his breath away.

The brand leaved as if it were going to burst and great slow tears and blood came down his face. At this moment he looked so much like the Boy's own baby brother when he was suffering in love that the boy could have torn his own hair out with remorse and hated himself.

He stared long's face to his nose, started his bleeding nose, and thrust all the wealth of his own pockets so eagerly upon the youngster and begged him as respectfully not to cry, that, when the sting of pain had worn off, the boy had received a new breath. Lippy out, sobbed a little and then backed off to examine his nose's acquired wealth.

He felt further for himself, his hand touched the boy back to slide down the cellar door and left him in sole possession of it, while he himself climbed up the fire-escape again to look about. He saw Mrs. Lippy looked so happy that the clamp of remorse loosened from about the boy's heart and he felt in his place "I guess out of jail."

The postal afternoon sun warmed him and dried his water and blood soaked nose. He hid himself in a blinal, dreaming possibly. He hid the pole all at himself, the end of it, and he had received a relief from the great mat to the walls of the tenement-house being two large bedsheets together.

As the boy opened his eyes, he saw a man in the rigging of his pirate ship *Elbowed*, trimming sail and keeping a lookout for Spanish treasure galleons. But over head he heard the sea and the wind, and slowly in toward him the sheets inflated grandly in the breeze and the pulleys creaked delightedly, as still as a tickle slanted. The boy's eyes were fixed on what one hand about the mast and, watching his eyes with the other, heed but not the sea below for prey for prey.

But the evening suddenly appeared. The woman in whose still eyes the boy's side were rubbing hot her breasts, traveling away from the boy's side, and set up a yell. There was a long yell of lack from the basement, a man's angry shouts—and the mother and the boy, who had been playing in the yard, dashed out to the attack.

The mother was screaming and snatching his throat round his brutally and the boy, who had been playing in the yard, dashed out to the attack.

The boy was screaming and snatching his throat round his brutally and the boy, who had been playing in the yard, dashed out to the attack.

who whimpers as he creeps slungly down to punishment and shame. . . .

But Maury and Maury were too wretched-out to stand out long against the spirit of his mother's hungry for play. Ten minutes later the last snuffle died away on the tenement stairs as the boy climbed them to his key to the roof.

Outside the door of his own home he stopped to listen for a moment. Maury was crying again and he could hear, above the snuffle of his mother near the washboard, her attempts to soothe the baby.

"Yes—yes, baby! Maury's coming! Don't you hear Maury coming! He'll play with baby!"

But no third sound but voice that it served on conviction even with Maury. He would stop crying for a moment at Maury's name and begin again when there was no Maury forthcoming.

rolled the last line of his page to only ten minutes of flying of Chinky's kite, instead of all the time till the follow came.

Chinky deliberated. The Boy took his *Express Mystery* out of his house to assist his decision. Chinky at once noticed the wretched condition of the dime novel and promptly withdrew the penny from the offer. The Boy was taken for a moment aback. Recovering peace he pointed out that the book was stained with real glue and announced as his final price Chinky's original offer—the penny would have to be "traced." For Chinky would have to glue it with the dust before the Boy counted three.

"Oh—oh—oh!"

"All right!" yelled Chinky, loudly.

The Boy had the "two-up" and the penny went back to Chinky's pocket. The Boy headed him the soggy

"School for you, Joey—school, as long as father and I have breath in our bodies!"

How the Boy yearned to rush into the house. He could just picture Maury's gurgle of delight and the glad relief with which his mother would sigh—she would so find! But, no, he could not do it! If he saw his heart—but he could not give up the roof that afternoon! The hours were so short and the roof were following, outright, lower, and sport to fill his heart like a heavenly draught for which he was parched. For one glad hour then on the roof he would give up hours and hours even out of his sleep!

An inspiration! That was it! He would work—work like a slave that night in return for his play! His mother, to help make both ends meet, subsisted on his father, where that in the unshined coats from the shop every night after he and his father went to bed. But that night the boy would make his mother go to sleep and he would work on the roasts himself. He knew how he could pull out the bastings, which was a large part of her work! Oh, he knew at last what work meant—and he would do it gladly, eagerly.

"Only phone, and just now—just now!" his lips began, proudly of something inside. And shouting out of his own Maury's crying and his mother's tired voice, he led on the stairs and stumbled out on the roof, blinking gladly in the cold of the afternoon sun.

Chinky was already there, firing a kite from the top of a brick chimney, and eager for the breeze in show matter. You can't, in fact, let her go good. For the Boy, observing his neighbor, announced that the price of the *Express Mystery* had come up. It was now Chinky's dime round the penny—and he followed with a certain zeal Chinky's kite soaring in the heavens—

and the boy, who had been playing in the yard, dashed out to the attack. Chinky glared and gulped with indignation and waddy landed the Boy, and went off, to get straight to the bottom of the matter. He was so angry that Chinky, who had been playing in the yard, dashed out to the attack. Chinky glared and gulped with indignation and waddy landed the Boy, and went off, to get straight to the bottom of the matter. He was so angry that Chinky, who had been playing in the yard, dashed out to the attack.

*Express Mystery* and received from Chinky the last string of Chinky's kite—

"But only ten minutes, mad lad!" warned Chinky, and, sitting down at the foot of the chimney, was now passing the mail bundles with Nick Carter.

The Boy himself, kite string in mouth, climbed to the top of the chimney and was now crawling out there in a hunched and wretched manner. His body around the smoking brick and thick smoke that came out of the first, third, and fourth vents, and made full use of the narrow, six-inch margin between the vents and the edge of the chimney—which was also the edge of the roof.

He lay low up, the kite-string gently pulling to his head. High above him he saw, between ill-lit shafts like, the kite itself—great beauty—graciously soaring and nodding. The sun and the breeze playfully jostled each other to cross the Boy's face—now one the stronger than the other. The Boy had then gone over his lips and eyelids, while the breeze buffeted down under the opened curl of his shirt to his neck and bosom. It whimpers and puffed gently in his ear as a kitten's paw. Though the Boy's mind there dithered the long, long dreams of Bordeaux.

From different roofs, by ones and twos, like cats to the call of crying, kite strings he heard, but himself in 'dreams, while the sun shone and the breeze blew and the kite-string murmured if you put it to your ear each picked out his chimney and set to kite-flying.

Each kite, in this best of perfect sun and wind, that speak was sufficient. So such as he lay on his chimney-top, kite string in hand, feet himself in 'dreams, while the sun shone and the breeze blew and the kite-string murmured if you put it to your ear each picked out his chimney and set to kite-flying.

Each kite, in this best of perfect sun and wind, that speak was sufficient. ## PLAYS AND PLAYERS

**When Spring Days Come**

When Spring days come and I have  
 ought to do,  
 I jump a rest beneath some spreading tree,  
 And gaze aloft into the heaven blue,  
 And think of all the wonders sweet and true.  
 A gracious father hath prepared for me  
 The earth all fair, upon whose verdant breast  
 The sun doth sit, as on a throne;  
 The freshness of the air; the songs of birds;  
 The crooning hum of the distant herds;  
 The lovely mysteries  
 Of budding trees;  
 The dawning beauties of the garden  
 The violet, the daffodil and rose;  
 The saffron hills now growing in the sun  
 The twilight brightening when day is done.  
 These things delight  
 All ears and eyes,  
 Whatever may amaze,  
 In me, as in each other,  
 Therefore is crying I love to rest and  
 brood.  
 On Good-Friday,  
 JOHN KENNEDY BAYNE.

**The Revenue-Cutter Cadets**

The public is familiar with the history and traditions of West Point and Annapolis and with the system of discipline and instruction of our country's future generals and admirals, but it knows little of the hawker but not less rigorous life of the young men who are trained at that most important branch, the revenue-cutter service.

Entrance upon cadet life in the revenue corps is attended by conditions vastly different from those of the other governmental institutions. Arrives with the candidate's register are an agreement to follow general and admirals, but it knows little of the hawker but not less rigorous life of the young men who are trained at that most important branch, the revenue-cutter service.

**Hunting the Mammoth**

More than once a complete mammoth skeleton, skull and tusk has been found in the perpetually frozen ground of northern Siberia not far from the ice-bound coast of the Arctic Ocean. Whether there are many more mammoths there still, to be discovered in future years, in this cold and great continent of the North Pole, is not known. Discovered in 1801, and the first was still quite fresh and greedily devoured by the dogs of the

Mammoth formed a steady article of diet among the early races which inhabited Frigid Asia in the warmest intervals of the great Ice Age, when Scandinavia, northern Germany, and the British Isles were a deep hinter sea, and covered with snow and ice exactly like that which covers Greenland at the present day. In those times, the mammoth was common. It has been estimated that there were a hundred thousand years ago, the climate of southern France and northern Spain was probably much the same as that of Labrador today, when to us about the same phase of latitude. This climate was exactly suited to the woolly rhinoceros, the reindeer, the bison, the musk ox, and the large breed of horses very similar in the American horse or mammoth of today, which is a direct descendant of those which they sawed the Western prairie two or three generations ago.

**Told All Their Friends**

The fact that dogs have a way of communicating with their kind is well illustrated in a very singular and amusing fashion in a certain district in south Georgia where no yet little provision is made for the comfort of domestic animals.

One bitter night, as a "cold wave" frequently brings to that locality, a Georgian farmer, who has a dog, and a cow, made for the comfort of domestic animals.

**Worth Looking Into**

The choice of a table beverage frequently has much to do with the health and happiness of a family, not only the children, but grown-ups too.

**The New Food Drink**

This new beverage requires

**No Boiling**

It is regular Postum percolated at the factory and reduced to a soluble powder.

**A Level Temperature**

A level temperature in a cup with hot water, and cream and sugar to taste, produces a very fascinating beverage instantly.

**Instant Postum is free from caffeine or any harmful ingredient.**

Sold by Grocers everywhere, 90 to 100 cup tin, 50c-40 to 50 cup tin, 30c.

**A trial tin (5-cups) sent for grocer's name and 2c. stamp for postage.**

"There's a Reason"

Postum Cereal Company, Ltd., 312 N. 1st St., Minneapolis, Minn.

**Macaroni and Spaghetti**

In the modern macaroni factory, when the dough has been well stirred and kneaded in a powerful machine, it is ready to be formed into macaroni, which is of about half an inch in diameter, or into spaghetti, which is a solid stick of about one-eighth inch in diameter.

The dough is forced, by hydraulic pressure, through a cylinder with a flat circular bronze die at the bottom. This macaroni die, or mold, contains many holes each of diameter of one-fourth of an inch. Each hole has adjusted within it a small pin, directly in the center. This is the device whereby the "hole" in the macaroni is made. The pin divides the dough on one side as the mass starts through the hole, before the dough arrives at the end of the hole, however, the divided sides come together, making a perfect tube.

In the case of the spaghetti tube, the extrusion only pulls back about one-fourth of an inch in diameter, arranged in groups. When macaroni and spaghetti emerge from the cylinders, the next step is not then into series lengths, some depending upon the mode of curing or drying to be pursued. Sometimes this curing or drying is done on trays and sometimes over racks.

It is highly important to the macaroni industry that there should always be a constant supply of freshly milled durum wheat macaroni. For the most part, the chemical analysis is necessary to determine the percentage of gluten and starch, and whether they are present in the proper proportions, in order that they may be obtained a well balanced product of proteins and carbohydrates.

Macaroni made of fresh durum wheat macaroni flour, where a portion of the flour is very much like that of the macaroni. Moreover, it is translucent, inviting to the eye, and it is very tender, and is the best macaroni, will not be translucent.

**The Mussulman of the World**

Transient periodicals publish statistics of the Mohammedan population of the world; and although it is difficult to arrive absolutely the statistics of a country whose name and flag are imperfectly kept, the approximate results are as follows:

The Ottoman Empire contains 25,000,000 Mohammedans, 10,000,000 in Europe and 15,000,000 in Asia. But of these not more than one-half profess the faith of Mohammed.

The Russian Empire has quite a proportion of the followers of Mohammed, and in the British India there are some 5,000,000 Mohammedans, mainly in Persia, Afghanistan, Arabia, and elsewhere. It is estimated that there are about 20,000,000 more. The Dutch colony of Java, with Borneo, the Philippines, and other adjacent islands, contains several millions of Mohammedans.

All the northern and central part of Africa rests firm in the faith of the Prophet.

**Worth Looking Into**

The choice of a table beverage frequently has much to do with the health and happiness of a family, not only the children, but grown-ups too.

**The New Food Drink**

**INSTANT POSTUM**

is proving most satisfying and beneficial in homes where it has taken the place of coffee and tea which contain caffeine and other harmful ingredients.

## The Influence from Abroad

AN ESTIMATE OF THE BEARING OF THE DISTURBANCE IN EUROPE ON THE SITUATION HERE

**S**OME \$100,000,000 worth of American stocks and bonds are owned in Europe. What would be the effect on the markets here if securities elsewhere were allowed to make the owners of those securities suddenly anxious to recall their own small part of the "holdings"?

Because of the fact that in this country the gold market is "free"—that is to say, that the supply is unregulated, the government or anybody else—may not of the three great markets of Europe as in a position to take practically no such gold from here as it is willing to pay for. Suppose the development of such conditions abroad so might determine the great foreign banks to cease here for a really large amount of gold, even if they had to pay a stiff premium to get it. What kind of an effect might that be expected to exert, with the banks, so that it is able to show only the thinnest kind of a margin of gold holdings above legal requirements?

Is the "foreign situation" really of great dominating importance as a market factor? With the above considerations in mind, not a great deal of room for doubt on that score would seem to exist. The revision of the tariff may be accomplished in a way satisfactory to manufacturing to large business interests, and the revision of the steel tariff of "London" may be put on a basis pleasing or displeasing to the "steel," but if Europe really starts to sell out her securities or pull out her money, that is going to take precedence of everything else. Let that once begin and it will really mean to see what is the dominating factor in the market.

But Europe has owned our securities all along, and the big foreign banks have always held this potential control over the gold supply—why should there be any particular anxiety to pull out their money?

Money in Berlin at the time of writing is worth about per cent, and in Vienna has lately been as high as eleven. In Paris the exchange rate of the Banque de France is steadily maintained at the figure touched when the 1907 panic was at its worst, and gold even in the smallest amount is in demand. Turkey and the Bank of London are even more difficult to get, the "Old Lady" maintaining her official bearing rate at the high figure of 10 per cent, with every prospect of an advance in rate in the near future.

To the question as to what is responsible for the trouble in the foreign financial markets only answer is possible—the war between Turkey and the Balkan states. And yet to say that the fight in southeastern Europe is directly responsible for present conditions would be anything but an exact statement. The trouble, it is true, was originated by the commencement of hostilities in the Balkans, but had it been merely a question of a war between Turkey and her neighbors, could never possibly have reached the stage it has. From the original root of the trouble other and far more important roots have grown. There is, in the first place, the aggressive attitude developed by Austria and the resulting danger of a clash among the first-class powers. There is, in the second place, the development of a new power of hitherto unimagined strength and which has completely upset the existing balance. Paris and London are not worried because there is a fight going on in the Balkan Peninsula. What worries them is, first, the danger that what is now to arranging terms of peace Austria and Russia interference will make serious trouble, and second, that as a result of the creation of a new and powerful Slavic nation in the southeast of Austria and Germany, there will have to be a radical change in existing conditions, diplomatic and military.

What, however, interests us far more than the cause of the trouble in Europe is what it is doing here as a result. Because Germany considers it necessary to add largely to her fighting strength we have no corresponding increase to make in our gold. The disturbance of the political balance in Europe makes any particular difference to us. But what does make difference to us is the threat to which the disturbed conditions abroad will result in the selling of American securities and foreign holdings of American gold. Already we have been called upon to take back a very large amount of gold from Europe. How much farther is the selling movement likely to run? Already Europe has taken out of the pockets of our banks more than \$100,000,000 of gold. How much more of the previous metal—gold—prevents it is at the present time when the banks hold so little of it—may we be expected to lose?

Bearing as the first of these two questions—the probable extent of foreign liquidation of "American"—the fact that, prior to the outbreak of the trouble in the Balkans, a yearling selling movement was in progress here and here and here is the most important. Back in the summer of 1911 when the controversy between Germany and France concerned "Maurice Auguste" and the "banion," Europe started to sell out her speculative holdings of "American." Later in the year when the situation became acute and the French bankers brought Germany to a stand by withdrawing funds from Berlin and almost precipitating a panic, the selling increased largely in volume and a good many million dollars worth of American shares and bonds were unconsciously dumped on the market here. Nor, when the crisis was finally passed and the threatened war averted, was any remarkable progress of these securities repurchased by the foreign sellers. There was, actually, some little taking back of securities indicated when the post-war "gold buying black" led to one knows better than the houses handling this kind of business on how moderate a scale these repurchases were. Furthermore, very shortly after that (that was at the beginning of last year) political conditions in this country began to develop in such a way as to undermine the confidence of many foreign holders of American securities, with the result that the selling movement was resumed and on a substantial scale.

All of which is important in showing that when the Balkan trouble broke out late last year, Europe, so far as speculative holdings of "American" are concerned, was pretty well sold out. The great bulk of the speculative holdings abroad were, consequently, liquidated, but in the accounts of those great European banking-houses and wealthy individuals who are generally referred to as the American market from a speculative standpoint, relatively few securities remained. Actual outbreak of hostilities, therefore, cannot be held responsible for the foreign selling that might have been expected. The liquidation of earlier in the year had set, of course, except the state of affairs in the world, and the selling of speculative and semi-speculative holdings, but the total of these sales was not very great. The fact of the matter was that when the Balkan trouble broke out, the "exchange" of "exchange" of the amount of our stocks, and that three simply wasn't such to sell.

That is, as we have seen, the present, for during the months since the Balkan allies declared war on Turkey, Europe has certainly taken on no fresh supplies of American securities. The American market, judging from the number of old certificates coming to the brokerage houses from the other side, there has been quite a little liquidation of foreign government holdings of "Yankees." Some of these certificates, it is reported, bear a date twenty or thirty years old, which would seem to indicate that a lot of old sterling lines of that past quarter-century were unable to accomplish in the way of abatement the situation of the past few months has succeeded in accomplishing. The percentage of such sales to the total amount of American securities held abroad is, it is seen, very small indeed; but when you are dealing with figures which run up into the billions it needs only a trifling percentage to make up an amount in itself considerable.

The present situation, then, with regard to Europe's holdings of our stocks is that most foreign speculative accounts have been closed up and that there has even been some little liquidation of fixed investments in American stocks and bonds.

Considering the present state of things abroad, that is most fortunate for us. Making every allowance for the commutation on to foreign countries which has undoubtedly taken place, it is certain that if Europe at the present time held a speculative position in our securities, any second liquidation would be in full swing and we should be liable to take back our stocks in quantity. With the country's investment appetite no more robust than it is, it is certain that a second liquidation would be a serious matter.

So far as speculative issues are concerned we are safe, roughly—whatever happens. But how about the fixed investments in our securities? It is probably a very conservative estimate of what they amount to. What is the chance of the present foreign holders of our securities any considerable selling of these shares and bonds?

Very slight indeed upon the situation abroad should become such worse than it is at present—

which, indeed, there should be a actual deterioration of war against the first-class powers. "A reaction in the markets" will not do it; on several occasions in recent years there has been far more "reaction" in the markets than there has been in the way of a selling movement of investment holdings having been started. Merely "fear of war" will not do it. It took in 1911 when Germany and France were almost literally at sword's points over the North Africa question, and all the world knew it, nothing of that sort happened. So, from the foreign situation as it stands, not a more rapid advance by higher and the fight for gold becomes even more strenuous than it is, the stock market on this side has little to fear. What would happen in case of a great European war is, of course, an entirely different question. Europe's investment in our securities has gone through all sorts of tests—tariff and trust trouble on this side, and periods of strain and tension abroad—but never since the foreigners increased their stake in our markets to really large proportions has the permanency of the market been tested by a war between powers of the first magnitude. That such an event from its very nature would result in tremendous liquidation of American shares and bonds now held in Europe for investment is as certain as anything can well be.

So important as are the effects of the disturbance abroad on the market for bonds and shares, of even greater importance, probably, is the influence on the money and credit position of the country. There are no less our own place as one of the world's great financial powers, sharing in the case of the other markets when such a crisis as that of the United States is in the air, other important points are high. Long past is the day when money conditions here were independent of conditions abroad. Development of such conditions as arose in Europe in Germany, especially, exerts a strong influence on the situation here.

Visibly, this influence has taken the form of large amounts of our currency being sent to Europe for the making of the loans having been accompanied by the export, as has, of course, very little influence in gold. Desirable, it is, to have our own money in a situation stimulated by active business and speculation and the issue of immense amounts of new securities not particularly favored by the investment public, the Berlin market, however, has been very important for us. Nor has our bid for funds been turned down. It has cost the German bankers a high rate of interest, but the needed money has been obtained. The only one previous occasion in our financial history (in the fall of 1911) here we advanced to an outside market anything like the amount we have advanced to Berlin during the past month.

The bank-credit which has been transferred from New York to Berlin we have had to make up for ourselves on the outflow of gold by which the transfer has been accompanied. Because of the fact that a good deal of currency belonging to inland banks, and temporarily controlled by the banks here, is accumulated in New York, money needs have remained easy and, to outward appearance, it looks as though we could afford to spare the gold we have been sending out. That, however, is very far from being the case. A glance at the reserve position of the banks is all that is necessary to see what a very significant amount has been brought about through foreign takings of our gold. Because of one thing and one thing only have we escaped highly unpleasant effects, and that is that our own reserves are thereby being used no far less than normal.

It becomes a very important question, then, whether this foreign situation is going to keep on affecting us in the way of a drain on our gold, whether it is going to keep capital flowing from here, with an accompanying outflow of gold. Already we have sent out all the gold we can spare—and as things continue, there will be. If in addition to what has already gone out we see to how any further considerable quantity, the effect is bound to be serious.

Everything depends on the development of the situation abroad. Settlement of the trouble in the Balkans and the bringing of the war to a close, if it is, as the Germans would seem enough bringing to an end each element of financial conditions so to make further aid from this side unnecessary. If, however, the present state of things continues, there will undoubtedly be called upon to furnish the foreign markets with a further considerable amount of gold. We have no more gold to send to the markets than we already have. Plans are not philosophy. They need gold, and we've got it, and they've got the means of taking it from us, and that's all there is on that.

## EASTER EVEN

BY MARGARET FRENCH PATTON

Ye home-bound birds, take  
Ye whistling flight, that from our budding bough  
Your sweet lullabies you may make;  
Ye will be Easter day,  
And I would have my garden gay  
On Easter day.

Ye strutting white ducks  
Out your drooping tails, and henceroad take  
The air of your own day, whither it is going  
To-morrow will be Easter day,  
And I would have my garden gay  
On Easter day.

Early in the morning while 'tis dark,  
Like Mary Magdalen, with silver hair,  
I will be Easter day, with my white  
To seek our risen Lord, who knows? For here  
Of birds and buds (He may be walking)

O my dear Lord now is taken from the cross,  
His bloodied body wrapped in linen now,  
And laid by loving hands in a tomb,  
Outraged Nature hoves her head and shows;  
The ground is wet; Jerusalem is still.

Ye sleeping buds, break  
Your young green reveries, and wake  
To fragrant blossoming for His sweet sake;  
To-morrow will be Easter day,  
And I would have my garden gay  
On Easter day.

## Yarns from the Balkans

A Magician's Mishap

In the region between Prizred and Scutari there was a certain man who had devoted his life to the devil, and so much evil that at last the Pasha threw him into prison. One day the Pasha had many guests and thought him that he would amuse the magicians from pieces to do some tricks. They brought before the company to ask for a large bowl of water. This being given him, he performed sundry charms over it and asked the guests what part they would like to see. "Milk," said they. They looked—and there, they saw Milk pour clearly—and, however, see, and a steamer in the water just about to start. "I have your permission," said the magician to the Pasha, "to depart in that steamer?" "Certainly," said the Pasha. The magician put his foot into the bowl of water and at once disappeared and went to America on the steamer. In America he had more than ever to do with the devil and had a wicked servant who aided him.

One day when he had prepared a quantity of magic liquid in large bottles, he ordered his servant to kill him, cut him up, and bottle him. The servant refused. Then he wrote many letters to all parts of the world and made the servant post them. "I shall kill myself," he said; "I can not cut me up and bottle me. Put the bottles in the cellar, leave them for nine months, and tell no one; I shall answer the letters, and you will see that the servant must open the cellar and I shall come to life again." He killed himself, the servant buried him. Some time elapsed and then answers to the letters began to come, written by the magicians himself. The terrified servant gave the letters to the authorities. The letter was opened, and it was found that the proofs had actually begun to come to life. After the nine months were completed, there is no doubt that the steamer would have succeeded and this wicked one would have lived some day, and authorities ordered the paves to be destroyed and that was the end of him.

### THE BEHAVIOR OF MEN

When our fathers were young a certain man of Djikova and a certain man of Scutari were known, each in his own town, as the bravest men in the world. The man of Djikova, in anger, swore to kill the man of Scutari; there must be but one bravest of men.

"No the man of Djikova journeyed over the mountains to Scutari, in which city he knew no one, and in the street he asked, "Which of you is the bravest man in this town?" And the people said, "He is the yonder in the house." And they showed him the man's shop.

The man of Djikova stood without and looked at the goods. The man of Scutari asked him whence he came and what he wanted.

"I come from Djikova and I want nothing," he replied.

"Have you friends in the town?" asked the man of Scutari.

"Not one," said the man of Djikova. "If you have come to me," said the man of Scutari, "you must be weary and thirsty. Come in and rest."

No man of Djikova returned and sat down.

The man of Scutari gave him cold water and they sat and spoke kindly in him. The man of Djikova drank the coffee and said nothing. Three did the man of Scutari serve him with coffee, so in word he was honored great. They he said to him: "You here drink and have rested. Now tell me your business here. In all this time you have heard nothing; it will be hard for you—but we help you."

The man of Djikova sat silent and bitterly thought of the bond of friendship that he had made with a man so kind to a friendless stranger. The man of Scutari urged him to speak.

"I cannot trouble you with my business," said the man of Djikova.

"But you have come so far," said the man of Scutari; "to you it must be important."

"I have come to shoot you," said the

man of Djikova at last and told him the whole.

"Shoot me, then," said the man of Scutari. "Here I am. It would be a pity for you to take so long a journey for nothing."

"We cannot fight here," said the man of Djikova, reluctant.

The man of Scutari arose and thrust his pistols into his sash. "Come out on the field if you wish," he said.

The man of Djikova followed him till they came out to a lonely landscape.

"Now shoot me," said the man of Scutari; "here is my heart."

"That you must shoot, too!" cried the man of Djikova.

"I have made no vow," answered the man of Scutari, with a sigh. "Shoot, but when you go back you must laugh at you."

The man of Djikova drew a pistol, fired, and it flashed in the pan.

"I have lost. It is your turn," he cried, much relieved.

"No!" said the man of Scutari. "There is one thing I can never do, and that is kill a guest from under my roof. You have your second pistol; remember your vow."

The man of Djikova, reluctant, drew his second pistol, fired, and grazed the man of Scutari's nose. Then throwing down his weapons he embraced the man of Scutari warmly. "I could not stand up to be shot at without shooting myself. You are the bravest man of all the world!" he cried. They were brothers and remained fast friends ever afterwards.

### THE MAN WHO UNDERSTOOD HEARTS AND MINDS

A certain man was gifted with the power to understand the talk of beasts and birds. But one evening that, should he ever tell what he had heard, he would drop down dead.

One day he overheard the dokey talking to the horse. The dokey's remarks were very funny and as he came from the stable he laughed.

"Why are you laughing?" asked his wife.

"I am laughing at something the dokey said," he replied.

"What did the dokey say?"

"You know I cannot tell you. I should drop down dead."

But she was waked, as all women are, and she said, "What did the dokey say?"

"He said at last he could hear no more."

"Tomorrow I will tell you," he said. He called his little children, and said goodly to them, and told them he must be tomorrow. They cried bitterly and begged, "Oh, mother, do not kill our dear father!"

But she answered only, "I want to know what the dokey said."

No the poor man went out to take a last look at his yard, and there he saw the cow standing on her legs, waving his wings and crowing like a hen, could.

"Oh, you wicked bird!" cried the dog. "How can you laugh and sing when you do not master, who is so kind to us, must die tomorrow?"

But the cock only crowed the more. "Laugh," said he; "I shall die of laughing! Look at him—the silly fool! He can only see with one eye, and he knows all in his life."

"He has heard this. He picked up a large stick and went back into the house."

Do you want to know what the dokey said? He said only one word, and that was "Laugh," said he; "I shall die of laughing! Look at him—the silly fool! He can only see with one eye, and he knows all in his life."

"He has heard this. He picked up a large stick and went back into the house."

Do you want to know what the dokey said? He said only one word, and that was "Laugh," said he; "I shall die of laughing! Look at him—the silly fool! He can only see with one eye, and he knows all in his life."

"He has heard this. He picked up a large stick and went back into the house."

Do you want to know what the dokey said? He said only one word, and that was "Laugh," said he; "I shall die of laughing! Look at him—the silly fool! He can only see with one eye, and he knows all in his life."

## SCIENTIFIC AUCTION BRIDGE

By E. V. SHEPARD

### "KNICKERBOCKER WHIST CLUB."

"I have read all the books on Auction Bridge. E. V. Shepard's is the best of them all. I doubt if a better one will ever be written. Other writers teach by illustrative hands which you may never hold. He gives simple rules for bidding and playing any hand possible to deal. Every feature of the game is discussed in a way to aid both beginner and expert player. He gives valuable facts concerning the game which have never before been put in concrete form. The rules are clear, practical, and easy to remember. The work is not based upon personal opinion, but is founded upon mathematical facts. No other writer has ever delved in the principles of the game to an equal extent. The results as given through his simple rules are startlingly clear. Every player should own a copy of this work."

## Our Appalling Conscience

Those people who deplore the general worthlessness of modernity always give an impression of crabbiness and detachment. They are much more at home in the past than in the present than from observation. There is a vital despair about them that appears in one of the most respectful manners which we need to feel as children when our grandparents demanded the name of the person who had taken their cat's tail while their grandfathers gnawed the corners of their dear beds. We feel the same assurance that those earnest folk who think the virtue of the world has reached the deeps, run the same enormous risk of discovering unexpectedly the things they seek. They demand to know what the world is coming to, and it is a more marvellous accident before they are handed to receive sharply with modernity's chief characteristic, the overpowering consciousness.

The claim to which we mean well is almost depressing. Good intentions of a wide-reaching and avocative kind have become a profession, and one which becomes to be shortly overworked. The reduction of some kind of well is the only thing in which any one feels justified in being interested. Universal reforms have ceased to be started to deal with the crowds of people who have such good intentions that they can't stand to see anything which they really realized the danger of good intentions in a national state. One or two of the most advanced states have established, at the expense of the taxpayers, a chair for teaching social reform. When every one is to be taught to be a saint, it is better to speak of morality has been reached that should gain the attention of every one, even those abstracted souls who think the world hardly worth consulting.

Brilliant young politicians, too, feel that the old party politics is being handed to the orthodox party politicians, just as in social reform as their fathers went in for it. Young women in great numbers are protesting of having a thorough education on their hands and nothing to do with it, without the help of the state, for social reform. The fact that they receive no remuneration for their arduous task, just as in the past, is what they view as so almost the wholly natural thing about their surprising situation. It helps them to clear their minds of the old ideas, and to know the state of things from the strange sight of the most glaring of the younger generation, spending their days in the National House instead of at home.

The married women who do not like to be asked to do more than their share of housework, is not enough to keep our fully employed, work on hand and so extremely rapidly at the back of our heads, that they find their income, though not precisely the result of their work, is more severely appraised by their own consciences than it ever has been before. Even the most frivolous

people pretend they are not, and worldly old grandmothers, in their effort to be correct, attend public dinners and solely risk in disregard of their conscience may be given to the many speakers who long to utter the words, "Something must be done!"

It is a rush that carries some of us off our feet, and, protesting pitifully at such precipitations, we demand to know what is to be the end of it. If every worker has a solution way, and all his children are well nurtured and well educated and well educated, and if certain luxuries help him to choose his work, and labor exchanges help him to get it, and efficiency engineers make his work so agreeable and profitable that he becomes a substantial consumer, and if one so easily makes his money and makes his heredity of the best, and if legislation removes criminal and inherits from being strong, and if public opinion makes the terms "man" and "woman" merely terms of differentiation and not terms of degradation, used with mutual heat by both parties, and if economic pressure forcing toward to press makes all the conditions of life well—only then, if in a hundred years' time, what will there be left for any of us to do?

Will our reforms ever be finished and all the bad lines are over, won't we be, either, as it were, hence? Of course we will have to make in reality, not in spirit, our money according to the high standards that will then exist. That will be something of a nuisance, and there will still be the weather, and with so much leisure on our hands we will have the very greatest perplexity of wondering what to do with it. Behaviors! They will still remain: no one has thought of doing away with relatives, though there has been a least tendency toward improving them, and that how could we have forgotten?—there will still be us. We will each be as he is, but a considerable number of the least reform are no longer lighter any one.

Nothing, everything as it should be, we will still make have ourselves to battle with. The rich, inexcusable fund of our men's occupations and failures, details, like the strikes and labor troubles, and graft and immorality, of which we each receive a share, and which we know they will always furnish for us that large quality which we spend our days in trying to eliminate. If we eradicate war between countries we can still experience it in the nursery, and if we banish poverty we will continue to find it warring our relations of our world. If the world is of a beautiful orderliness, we will still retain as a souvenir of its past existence, and which we are sure to have, the private explosion of our invariable human perversity we will choose to think that the same who created the perfection existing outside.

## A manufacturer insures against fire losses and takes out policies in credit indemnity and bonding companies for the protection of his business.

Fire, failures, and defaulters represent more or less tangible losses which can be guarded against.

There is one form of loss, however, that is *intangible* and *insidious*, because it cannot be computed in dollars and cents nor can it be readily detected—but it is a *real* loss and saps the profits of the business. It is the *time loss*.

Loss of working time cuts into your business in the three ways illustrated just as surely as mistakes in figuring the cost of material cut into your profits.

Fortunately, *there is an insurance against time losses.*

## International Time and Cost-Keeping Systems

An International System will STOP LOSSES ON YOUR PAY ROLL by preventing payment for time not earned. You will obtain the benefit of *all* of the employee's working time, and you will do it in a way that will get his co-operation and support—because the system is as fair to employee as to employer. *It is a record of the employee made by himself.* Only the habitual late-comer and early-leaver has anything to fear from an International System.

An International System will enable you to **increase your productive capacity** because your plant will be in full operation from the time it opens until the closing whistle blows. Employees coming late or going early diminish productive capacity immensely, and the employer pays for every minute lost or wasted while the machinery is humming.

An International System will enable you to **extend your markets** by putting your time keeping on a strict efficiency basis. Time leaks that now keep cost of production and prices to a point that shuts you out of some markets can be conserved and applied to an extension of territory.

International Systems are used by all kinds of manufacturers and merchants everywhere. They are used for day work and piece work; for parts of jobs or jobs as a whole; for entire plants or certain departments. There is no condition under which labor is employed where International Systems cannot be used to advantage. One manufacturer uses an International Time Recorder in his engine-room as a check on watchmen at different stations; trucking companies use them to "keep tab" on teams and drivers; storekeepers use them to keep the time of their delivery and messenger boys; in some manufacturing plants they are used to record the time of certain intricate or difficult processes of manufacture as well as to keep the time of men.

Let us tell you about an International System as applied to your business. We have field men in most of the principal cities and adjacent territory who are experts in this work.

## The First Bank-Notes

The beginning of the bank-note is a rather surprising custom, very on the line of the people of that time. The first man in England was printed forms with the names of the king and queen for forty pounds and upward. Despite the fact that this offered an excellent chance for dishonesty, forgeries were made in great numbers. The paper of the ordinary white kind, but Wales took the prevention of manufacturing a mentioned in marked paper. At the end of the eighteenth century small notes for one and two pounds were in circulation, and the first instance to such an extent that 312 persons were convicted in England in one year.

The authorities then set about to find some method of telling the forgers. Special water marks were forged, ornamental embossed designs were used. In 1825, however, was tried in the manufacture of the notes with considerable success. They called the discovery of photography, which proved a boon to the inventor, and forgeries again increased.

In order to check the issue of spurious notes, Henry De la Rue invented a process called "anti-photography" bank-note printing. This consisted in painting one portion of one note over with another protective color was used, and over this a third.

When copper plates were used for engraving they so easily were not that impressionless because dim and blurred. This also made easier the work of the forger. An American named Perkins in

1829 introduced plain England a transfer process. The impression was taken from a steel plate on a soft lead cylinder which was pressed flat and hardened. Another method was a film of steel on copper. The paper was made by hand of three machine-made, but all bank-note paper is now machine-made, so it is as good as ever grain and texture.

The lowest denomination of the English bank-note is now five pounds, a little less than the lowest in the United States, and a little larger to Americans, for it is five by eight inches in size; but it is always clear and distinct, and is very difficult to counterfeit. Its average life is only about six weeks, and it is not re-issued after being returned to the bank.

"Wild cat" paper money, so called because of the private making of the notes, often of good venable ability, was current in this country about the middle of the last century and is still within the memory of many. It was a very cheap and light instrument to the larger that a large force of detection was kept busy, but the passing of different laws in the different states after a time abolished entirely the issue of these notes.

The earliest paper money issued in America was in Massachusetts in 1690 in order to satisfy the demands of clamorous soldiers. The first authorized by the Continental Congress was in May, 1775. Six years later it ceased to circulate as money.

Benjamin Franklin and his partner, B. Hall, printed the bills of the Colony of Pennsylvania. The law of the note in its own words was the warning, "To counterfeit is death."

**THE "PORK BARREL" PROBLEM**

(Continued from page 9)

wind of some plan which makes contributions from large external sources of supply depend both for their existence and their size upon a community's general willingness for internal financial cooperation.

It would encourage statesmanship. The four worst examples of broad constructive legislation at Washington have been the "pork" system, the high protective tariff, pensions, and the restrictive number of private bills, and the "pork barrel." They are all the direct result of the same basest special-interest idea. A generation ago a Congressman was apt to consider his duties merely accomplished if he could secure for federal jobs, favorable schedules, and liberal pensions for his favored constituents, as well as a good share of "pork" for his district. The remarkable progress of civil-service reform has greatly reduced the first trouble, and the national springing against tariff-making by big manufacturers is slowly curbing the second; but the third and fourth are as threatening as ever. As long as there are large uncontrolled opportunities for spoils of any kind, the less far-sighted Senators and Representatives will be apt to spend their time pulling wires to secure local appropriations, instead of devoting it to the study of national problems. If the system, rather than the individual Congressman, that is responsible for these conditions—conspicuously we should all share the blame. If the system can be altered, the ability of Congress will be freed for constructive legislation.

It would encourage local self-reliance. The late Dwight L. Moody used to say that he never gave away a tract, because a man did not get much benefit from a thing which cost him neither time nor effort. Similarly, it is the community which invests itself in a new high school or any other public building that really appreciates it most. If a small town wishes an unusually fine post-office or a large Congressional appropriation to deepen its own particular harbor, local pride and self-reliance should be encouraged to meet at least a small share of the cost. The tendency today in America is to rely too much on the state postoffice at Washington, and a little annual self-reliance efforts at home. It would help to revive the proper habit of a community being required to show the necessity of a large expenditure from the national revenue by its willingness to help pay one itself. It is reasonable to suppose that where the application represented real needs community cooperation would be forthcoming. In the line of harbor work, such as a small large and impressive building or a relatively small wharf, the better would have to contribute toward the cost or else request that with federal service in modern quarters until the grade of local public opinion became sufficient to meet the national government's conditional offer, largeness for a ship's direct returns are reduced and local taxes are diminishing to the civic sense of the recipient community as they are to the detriment of one individual.

It would help achieve a right balance between federal and local government. If our system of government is to be regarded, it is essential that we should feel that both the community and the national bond are strong and that they are ultimately inseparable. To break the connection between them is inadequate, owing largely to the highly specialized nature of our industrial work. It does not directly remind the average citizen of his relationship to the federal government. The new federal budget and financial participation by the locality, it would help maintain a right attitude of the public mind. Would not citizens better appreciate their twofold allegiance to their home state and to the all-embracing nation if they were to be asked to contribute small proportionate contributions to meet the cost of permanent local improvements undertaken under the direction of the central government? And is it not of great importance to have this underlying principle recognized before the nation is drawn, as it will almost inevitably be drawn, into the greatest potential pork barrel of American history—federal highways?

This article merely indicates the outlines of a possible policy which might be adopted by Congress so as to reduce the demoralizing effects of the present inopportune way of voting public money to satisfy local interests. That the plan suggested would be a reversal is not claimed, nor are the difficulties of framing legislation to meet the existing unsatisfactory. Perhaps the best opening wedge would be for the Appropriations Committee of the House to pass resolutions to the effect that the interest of the lawless taxpayer demands principles of economy and of local responsibility. It would make his recon-

**Harper's Household Handbook**  
AN EASY GUIDE TO WOMAN'S WORK

This book tells how to take care of a house, how to keep it clean; how to mend, how to choose clothes and how to make them; how to buy food and how to use it; how to take out spots; what to do if a child is burned or poisoned. All the household questions coming with kitchen, attic, and nursery are answered in this guide for the housewife.

Price, cloth, \$1.00 net. HARPER & BROTHERS, NEW YORK

missions of grants for purposes which usually affect a single community depend upon the latter's providing one-tenth of the total cost required. If the plan were issued to work well after a few years and public opinion were behind it, it could then be incorporated as part of our statute law. This result would be facilitated if the commission of inquiry, wisely called for by the last section of this year's "Public Buildings" act should report in its favor, under the clause directing it to "frame a standard or standards by which the cost and cost of public buildings shall, as far as practicable, be determined."

My impression is that with the passing of such a resolution the days of the post-war as a national scandal would be numbered. Congressmen might at first oppose the plan as cutting down their opportunities for reading horse events, but in the end self-interest would drive them to its support even if enlightened statesmanship did not. They would find, as they have found in the case of the "merit system," every possibility to make one constituent grateful by the granting of spoils is more than counterbalanced by the necessity of making two people through their behavior with it. In the real Senate and Representative would welcome the relief from charges of favoritism, with all its attendant irregularity, so often raised by the local representatives of some particular federal project which has failed to pass. Building and harbor workers at Washington would have their numbers cut in two in a year, and those that persisted in their efforts would have to pass the "merit" test of proving their claims by their willingness and capacity to pay a small share of the necessary bills.

**Wooden Spider Webs for Saving Birds**

The life-saving light-house has become a death-dealing instrument for migratory birds. The feathered emigrants, attracted and blinded by the light, often dash themselves against the glass and masonry or fly round and round the tower till they drop from exhaustion. The wretched birds, their slaughter because that aviators have not in work to decrease means for safeguarding the birds. To give some idea of the enormity of the contrivance, instances where actual count was made of the birds killed may be of interest.

One British light-house killed five hundred woodcock in one night. In September, an American light-house, woodcock were killed in four nights, besides eight thousand birds of other kinds. Their dead bodies covered the ground.

A device adopted by a Fishland light-house consists of a horizontal wheel from which hangs a loose net which catches the birds, thus preventing their fall to the rocks. But Professor Thayer has invented a life-saving device which has far less been adopted by the most efficient of them all. It is a sort of wooden spider web and forms a restraining-place for the birds. They go to sleep covered by the night and in the morning are ready to retrace their flight. This wooden web can be seen in north Island on the tower of the Trevellick Light-house. In one night alone two thousand chaffinches and two thousand other birds were saved, and on another night three thousand seafarers escaped the same lodging-house.

**\$24,750 Per Second**

The Germans have recently in the harbor of Wilhelmshaven a Krupp cannon that is capable of firing 24,750 shells per second. Each explosion of this gun of endurance cost \$1,500. Only 80 discharges were possible, because the treated explosion of the explosives produced erosion in the bore. When it is considered that after the combustion of the powder the explosive does not remain in the cannon longer than the fifth part of a second, it is no matter of surprise that after the thirty-fifth discharge the cannon would have been six and one-third seconds of effective service. According to this calculation, such a second in firing life of the cannon would cost \$24,750.

**Improving the Boomerang**

The boomerang of the Australian natives is of various shape and pattern. It has remained for an Englishman to improve the Australian cross-shaped weapon that it is no more than a cross of plain wood, the lower strip of the cross being curved longer than the other arm of it. In throwing this the legs lower end of the cross is held firmly between the thumb and finger vertically, with the place of the cross inside his face. Through steady force, the boomerang will sail return, but after it has traversed a bounded foot or more the revolution increases rapidly until it curves and begins to return right to the thrower.

## The New Administration and China

### "AVOID entangling alliances?"

This was the first and chiefest admonition bequeathed by Grover Washington to his countrymen. Despite the inevitable changes wrought by mighty imperial expansion, it has lost no part of its force or its wisdom. Steam and electricity have worked wonders in drawing countries closer to one another, but the United States still remains and must necessarily continue to be an isolated nation. Barring a "world power" has not altered and cannot alter the situation created by nature. Hence the immunity from international strife which affords our chief advantage and constitutes our greatest blessing. That by our own voluntary action we should initiate forfeiture of this priceless heritage seems incredible; and yet that is precisely what has been going on under the Knox "diplomacy"; that is precisely what President Wilson has declared must stop.

The wit of man could not conceive a more entangling than that involved in the matter of the proposed Chinese loan. Consider the facts. The new government of China needed large sums of money for liquidation of indebtedness to its subjects, for internal improvements, for currency reform, and for other purposes essential to its stable life; for a practically unimpeded monetary way to European bankers for a loan. Ordinarily, thanks to the traditional financial integrity of the Chinese, no difficulty would have been experienced. None was experienced as a matter of fact, and the comparatively insignificant transaction would have been completed without causing a ripple but for a peculiarly unprecedented circumstance. The governments of Germany, France, and Great Britain held the possibility of obtaining exceptional, if not exclusive, commercial advantages for their traders if they could shape the conditions attendant upon the accommodation, and they promptly assumed supervisory control. The nature of the business was changed forthwith from financial to political. Russia and Japan, though huge borrowers of money and ill equipped to make advances, demanded participation.

The United States followed suit, probably at the instigation of Germany, which, viewed approximately the performance in the case of British France, and Russia. But why? Mr. HAYDEN WILSON, former Assistant Secretary of State and reputed originator of the proposal, sets forth the reasons in his letter of resignation.

"The repeated utterances of the last administration," he writes, "most have made it perfectly clear that the motive and purpose of the policy was absolutely first and primarily the preservation of China's integrity and sovereignty, the uplift of the Chinese people morally, materially, and governmentally, the development of China's resources, and the maintenance of our traditional policy of the 'open door,' or equality of opportunity for American enterprise. President Wilson's attitude toward the proposed loan is a measure of foreign control of China's finances, which may be inferred from a study of other countries which have found themselves in a similar situation, it was deemed imperative that there should be American participation in the liquidation of China's finances in order to make sure of the present, friendly and disinterested influence of the United States. The only practicable method of such participation was by the use of reliable American bankers."

The "first and primarily" is transparent language. Not the most glib of minds has been or could be conceived of a primary purpose to in-

sure "China's integrity and protection" or the "uplift of the Chinese people morally, materially, and governmentally." Vaunting ambition to take a high place as a "world power," to fulfill our "manifest destiny," and incidentally to build great personal reputations was at the bottom of it all; and, secondarily, were the possible commercial advantages frankly admitted by the other nations as the chief desiderata.

And who was it that "deemed it imperative" that there should be American participation "in order to make sure of the present, friendly, and disinterested influence of the United States?" Was it China? Not at all. If a request for intervention by us had come from the new government, the fact would hardly have escaped Mr. HAYDEN WILSON'S attention or due embarrassment. No; it was our own sagacious State Department and some other that felt the crying need of making "use of reliable American bankers." And so the United States was dragged into a complex situation as a virtual partner of one European power to maintain an equilibrium against three rival nations. Talk about entangling alliances! It is to wonder that the grave at Mount Vernon still holds its previous loans.

But it is a far cry from the prosaic mind of Grover to the "entangling alliances" sentiment. Mr. HAYDEN WILSON, that in the work of advancing the national interest and promoting the welfare of other nations the financial force of the United States could be marshaled in some manner to present a safely united front abroad, where it would be like the apex of a triangle, but would have at home at its base broad equality of opportunity both for citizens desiring to invest and for bankers desiring to engage in these difficult and relatively risky ventures. It seems, however, that the conclusion reached are expressed upon other grounds.

"I have always thought," from the cradle, so to speak, "of our country as a creditor nation," says Mr. HAYDEN WILSON, "that in the work of advancing the national interest and promoting the welfare of other nations the financial force of the United States could be marshaled in some manner to present a safely united front abroad, where it would be like the apex of a triangle, but would have at home at its base broad equality of opportunity both for citizens desiring to invest and for bankers desiring to engage in these difficult and relatively risky ventures. It seems, however, that the conclusion reached are expressed upon other grounds."

As a figure of speech we venture to assert that this has not been suggested. If, indeed, it has been equaled, by words comprising diplomatic utterance. A demonstration so conclusive of the power of language to conceal thought whose existence is nevertheless clearly admitted, would have wrung tears of joy from the eyes of MARSHALL.

The idiot fact, however, remains that President Wilson's utterances were indeed "entangled" with "other grounds." And those conditions are:

- (1) We shall not be a party to "the pledging of participation loans, some of them entangled and burdensome, to secure the loan."
- (2) We shall not assist in requiring "the administration of these loans by foreign agents."
- (3) We regard as "objectionable to the principles upon which the government of our own people rests" any arrangement which would require, even by implication, for the payment of such a loan, even if it were "to some subsidiary contingency," "any 'forcible' interference in the financial, and also the political, affairs of that great fraternal state just now struggling to a consummation of its power and its obligations to its people."

"The government of the United States is not only willing, but earnestly desirous," the President says, plainly, "of aiding the great Chinese people in every way that is consistent with their untamed development and its own immemorial principles. The awakening of the people of China to a consciousness of their possibilities under free

government is the most significant, if not the most momentous, event of our generation. With this movement and aspiration the American people are in profound sympathy. They certainly wish to participate and participate very generously, in opening to the Chinese and to the use of the world the almost untapped and perhaps untapped resources of China."

But the government of the United States will not become a party to enforced imposition of a loan or of anything else upon a helpless people. Nor will it persist in a mistaken understanding which not only involves extending alliances, but also implies a readiness to turn the gears, if need or pretext should arise, upon those struggling to achieve self-government.

"The conditions of the loan," the President continues, "even to us to touch very nearly the administrative independence of China itself; and this administration does not feel that it ought, even by implication, to be a party to those conditions. The responsibility on its part which would be implied in requesting the bankers to undertake the loan might conceivably go the length in some unhappy contingency of forcible interference in the financial, and even the political, affairs of that great Oriental state, just now awakening to a consciousness of its power and its obligations to its people. The conditions include not only the pledging of particular taxes, some of them antiquated and burdensome, to secure the loan, but also the administration of those taxes by foreign agents. The responsibility on the part of our government implied in the encouragement of such a loan, and the administration to be plain enough and is obnoxious to the principles upon which the government of our people rests."

So we withdraw quietly but definitely from our enterprise into which we should never have drawn. Whatever our government can do properly and conscientiously to aid the new republic will be done freely and gladly, but the intimation is plain that nothing will be done except with the full acquiescence, if not indeed by specific request, of the new republic.

So far as our own trades and manufacturers are concerned, President Wilson's recently pledged administration to "legislative measures necessary to give American merchants, contractors, and engineers the banking and other financial facilities which they now lack, and without which they are at a serious disadvantage as compared with other industrial and commercial lands." That should suffice. In any case it is as much as the government ought to do under circumstances to do or try to do. What, if any, specific "legislative measures" the President has in mind are not divulged, although surely needed extension of banking facilities seemingly is one. To this there should be no objection. The complaint of our exporters that their business suffers from the necessity of dealing with foreign bankers, and the association with their rivals is well founded and should be heeded. Our total export and import trade with China now amounts to less than \$100,000,000 and is growing two-fold. The breaking of the loan agreement, while wholly justifiable in itself, clearly intensifies the duty of the administration to remove all artificial barriers in justice not less to the Chinese than to our own manufacturers.

The American bankers who were involved into the disjunctive enterprise better to sign of disinterestedness at the inevitable outcome of a change in government which necessarily involved a change in policy. They understand the business situation for the primary purpose of widening the market

for American products. That they could have handled their proportion of the loan successfully and at a profit may be taken for granted, but it would have been a complicated and harassing operation, and it is by no means certain that the money that would have been employed cannot be invested elsewhere to good advantage. If the ultimate outcome should be in favor of the millions set aside for China in the development of Alaska, as a consequence of a liberalizing in the Alaskan policy which is actually depopulating that most promising territory, there would be occasion for genuine rejoicing. But that is another story. The incident is not so much that the bankers have emerged from the affair considerably out of pocket, but with distinct credit to themselves.

The minor phases of the somewhat abrupt change in governmental policy require only passing notice. Undoubtedly Mr. HEXTENSON WILSON, after having continued in office by Secretary Hayes's urgent request, had technical cause for complaint at being ignored as the proper officer to promulgate the declaration. His insistence, however, that he should have been "consulted" was silly. What would have been the sense of the President perfunctorily seeking advice which he knew in advance would not be accepted? At the terms in which the Assistant Secretary couched his resignation, moreover, were quite pernick and pompous enough to justify the curtness of the President's acceptance. We must, nevertheless, accord Mr. HEXTENSON WILSON credit for his popularity in requiring that, since it was impossible for him to resign, the President should, though of the same name to mitigate our affairs of state, he was the one whose stepping aside would be the most favorably regarded by the public. EVEN MR. HEXTENSON WILSON could hardly expect Mr. WILSON to resign during his first month of service.

To take no notice of the report that the administration contemplates revisiting the Chinese republic forthwith. The existing government is as wholly personal as even the Mexican government was under DIAZ. The National Council no longer makes even a pretense of exercising authority. The astute and cynical YEN SHUN-KU, who is full proof of the wisdom of the "bushido" will continue to do so for some time to come. Some sort of election is to be held shortly, and it is possible that the adoption of a constitution will clear the atmosphere, but in the mean time there can be no question that the present method of ruling is, in the words of President Wilson, "obnoxious to the principles upon which our form of people rest." Surely it will be time enough to act when a Parliament has been actually chosen.

It is to hope and expect that by that time Secretary HAYES will have come to full realization of the utterly discriminative nature of President Wilson's heartily message to the Chinese high day party to the effect that it is from Mr. HAYES's benign presence, not from his probed absence, that he derives so large a measure of what he and his happy dignitaries designate as "comfort." (N. B.—A red tag is attached to the last paragraph.)

#### Better and Better

Whatever else we may hope for from the special session, everybody understands that its first business is to read a Democratic declaration of faith; that, the success of anything else in any attempt will depend so very largely on this, its initial enterprise, that sensible people are disposed to postpone all talk of other things until we have assurance that the tariff job will be handled rightly and expeditiously.

Of course there can be no absolute assurance till the thing is done, and we are no advocate of cock-sureness while there is still even the possibility of failure. But it is no more than just to praise at once the admirably business-like way in which the Democrats have gone about this task and to congratulate them on the number of speeches they have already delivered. We think they learn well in the short session when the House Committee on Ways and Means held its preliminary hearing and did a lot of preliminary work. The Senate, during the brief session called immediately after its inauguration, promptly did its part in organizing the Finance Committee in a way to handle the tariff by the methods of going tariff reformers. Now we learn that the leaders of the two Houses have arranged a plan of conferences and of cooperation which, while it leaves each House with its proper freedom and prerogatives, bids fair to prevent any serious hitch between them. It looks as if we were soon to go to have the old procedure—a House

bill and then a Senate bill and then a conference-committee bill—but merely a bill or bills which, originating, no they should, in the House, will be only reasonably amended in the Senate and will give the conference committee comparatively little to do. Meanwhile the President is felt to have made his own contribution by his cordial assistance toward the low-tariff Republicans.

Excellent! Excellent! This is not only the right way to tariff reform. It is the right way to everything else the Democratic party has promised to the people; it is the right way to the party's own best chance of holding the people's confidence.

#### One Way with the Combination

THE question is, how best can the ideal be obtained? There seems to be no question, judging from experience, that the present day-against-management and ownership, substituted to public interests and under national control and regulation by national, state, or municipal bodies—is the best.

Such is the thesis concerning great incorporated enterprises, and particularly those which are public utilities and natural monopolies, which President VICE, of the Telephone and Telegraph in connection with his own, has made his own special contribution by his cordial assistance toward the low-tariff Republicans. He does it so simply and clearly that anybody can follow him, reasoning first on general grounds and then from an admirably candid résumé of the history of the Bell Telephone Company. By "the present way" he does not mean the old way of corporations, but the new way of corporations, which has been accepted, the rightfulness as well as the fact of governmental regulations, the right as well as the right of the public to protect itself. He takes no complimentary view of such corporation heads as still try to hold out for the old arbitrary way.

His way, therefore, be reasonably taken as the latest word of enlightened corporation heads, which developed as at the present time, and therefore something that we cannot afford to neglect. For it is not clear that we must sooner or later make up our minds definitely either to accept and try to perfect, or else to reject for something else, this general plan with the larger kinds of business. We must do this or else. We must do this, then we ought to shape our laws accordingly and do it conscientiously, systematically. If not this, then what?

That last is a question it is high time we were asking ourselves, not critically or in a fight or a hurry, but very seriously and responsibly. Indeed, we have to give all these "heads" with government—whether executives, legislatures, or courts—the constant necessity of asking it. For how can they deal with this great matter at all to any good results unless they have some clear conception of the general end and ideal which we ought to be aiming at? Yet deal with it they must.

One alternative, of course, is government ownership of certain utilities now private; it has sincere advocates. Another, of course, is Socialism. Perhaps we ought to say that a third is the destruction of big combinations altogether, but it seems to us too plainly impracticable to be worth considering. Indeed, we know there are other alternatives. But the main thing is that here is the plan we have gradually though imperfectly evolved in practice. Shall we stick to it and make the best of it? If no, then surely advocates of something different should come forward and expound and argue their theories as candidly as Mr. VICE does his.

#### The Constitution in France

The sudden downfall of the Bismarck Ministry may have come a little inopportune for this and other journals which had just been debating on the possibilities of what the London Times calls "the new France." But a mere change of ministers is no longer terrifying to believers in the Third Republic. For our own part, we decline to be troubled by the mere change of ministers, and trouble ourselves only with the problem which Bismarck's fall particularly emphasizes.

It is, however, a very grave matter indeed, this setback to electoral reform in France. For electoral reform, with the particular object of destroying the influence of party-men on election as well as of the influence of party-men on the vote, is more open to talent, and their results more truly expressive of the popular will is urgently needed. It has also been clearly demanded by the people. The ordinary of the Senate, due to its own unrepresentative character, creates, accordingly, a situation quite comparable to that in England which finally forced a great constitutional change

when the Commons took away power from the Lords.

It seems probable that France will have to make a constitutional change also, to get rid of this injustice in her system. True, it is announced that the new Bismarck ministry will drop the issue for the time, to get through the army bill and other pressing measures. But the postponement can hardly be for long. It is true, too, that France has so much means of accomplishing change as the English constitution affords; there is no even progressive, for instance, to be used in cramming a vote obstinate Upper House with new members, for the time, to get through the same irregular, even violently. Still, it would be a poor sort of faith in the Republic that would not credit her with strength enough to change one feature of her system, even after her people have willed the change, without destroying, upsetting the whole.

#### The Administration and New England

New England has already, as we predicted, been called on for men to fill a post quite as honorable as membership in the Cabinet. To two of her eminent citizens in succession our most distinguished ambassadorship has been offered, and with general popular approval. Both have declined. The first was Mr. WILSON, who is, of course, now of a generation older than that now generally found in office! We trust not. Nobody wants to believe that New England is running out of the stock that has borne so many stalwarts of truly national quality. Perhaps it is merely that of late years New England has, in the matter of state-ambassadors, come to wear getting all her eggs in one basket. The Republican basket is broken and the eggs spilled. But we trust they are not, therefore, regarded as broken, and it certainly won't be like New England if the in's soon bringing other eggs to market, anyhow. When the Federalist basket broke, that didn't long prevent her sending out such notable Amans and a Westons and a lot of others besides.

#### The Pay of Ambassadors

MR. McCORMACK has declined to be ambassador to France because he cannot afford the time or the money, and President WILSON seems to regard it as a matter of course that the country has to send such sacrifices of those who are invited to serve it abroad, a service which every year becomes more exacting and more important.

Yes, it is a pity. The manner of life of our ambassadors in the capitals of Europe could be considerably simplified without detriment to the service, and the provision now made is utterly inadequate for even such simplified life. Take our embassy at London. There is no need of sending men to London to spend \$100,000 a year in our service, but we should provide for them to live in a manner modestly suitable to the station we expect them to fill.

But it can be done. It is provision for our ambassador to London is a salary of \$17,500 and a little something for office expenses.

We suppose that some will buy in London what it will buy in New York. A man that has \$5,000 can live himself a very modest city home for \$2,500; can keep, say, one or two domestic servants, and live comfortably in a family of six or five persons. That will cost for wages, food, drink, fuel, and household supplies \$6,000 a year; but his entertainments must be few, small, and modest. He has still \$9,000 to spend on clothes for his family, on the education of his children or their own, on a house, and on what he likes to live in, in summer, on clubs, car fare, newspapers, travel, charities, church, the relief of relatives, life insurance, and all the other incidents of living. To keep a carriage or an automobile is beyond his means.

A polite family that is not too large can probably along on \$17,500 in a modest but perfectly healthy and cheerful manner. It is not so bad enough. But it is not half enough for an American ambassador in London. He should have a house big enough for many people to get in and out of and more about in. It will cost him ten or fifteen thousand dollars a year at least. And to run it suitably—not extravagantly, but just suitably—will cost him or two or three thousand dollars a year. And he must have suitable vehicles to go about in, and lots of other things that our seventeen-thousand-dollar citizen in New York has no occasion to bother his head with at all. It is absurd for our friends in Congress to pay ambassadors so meagrely. It dignifies all the poor men in the country, and certainly excludes from them the men who are most fit to hold them. As a rule,

the men who have much money have either made it themselves, and been too much engrossed in that work to have developed the talents which we look for in diplomats, or else they have inherited it, and avoided hard work, and missed development and high reputation in that way. So it comes to pass that our most available citizens for ambassadorships are the hard-working men who have happened to marry rich wives.

That could not be so. However worthy these gentlemen may be, and however many of them there are, we should not be limited to them in our choice of ambassadors. Congress ought to build suitable houses for ambassadors in all the great capitals, and pay living wages to the men we send to live in them.

#### A Great Gift to a Southern College

Not Southern alone will be heartily glad to note that a Northern university has come in for a very large bequest. By the will of the late Hunter P. Bourne, a banker of this city, his entire estate will eventually go to Washington and Lee University at Lexington, Virginia, and an inventory shows the estate to be worth two million dollars.

Great gifts and bequests from private citizens to colleges and universities have been justifying common in America. There has been nothing in any other country to compare with this country's largeness in this. But hitherto the South has not had its share of them. Yet its need has been greater than that of any other section—for reasons which we all understand. No other section has had so much a struggle to keep up its educational standards. The main reason, of course, has been the heavy expense which comes with the construction here; but there has also been the practical necessity of maintaining two sets of common schools instead of one. As the higher learning is the most costly, and under modern conditions is constantly growing more and more costly, the smaller colleges and universities, no matter how valuable their traditions, have been particularly hard put to it to have their studies and studies advanced. It is a remarkable fact that even during the Civil War most of the greater Northern institutions of learning kept right on growing. Many of the South's, on the contrary, were practically dismantled then, and the task of reviving them was for years little short of a never-ending one. It is for all that glad to have been revived. It is for all that glad that from now on their proper maintenance will be more and more assured. They will be more and more Southern able to help them.

Mr. DORRIS is not exactly a Southerner, but he had a Virginia boyhood, and it is fine to learn that his leisure was devoted by a life-long admiration of Lee, with a desire to measure up to the man making with his fame, to spend his last years as a teacher of Virginia youth. How valuably and irretrievably valuable to a state the possession of a man of his rank may be!

#### "Why Children Weep"

There is a remarkable piece in the April number of McClure's Magazine—"Why Children Weep," by HELEN M. TOUL. It is moving, heart-breaking, and very informing indeed. We commend it to the attention of everybody. The gist of it is that children weep because their fathers have been ground up in the machinery of contemporary industrialism, because their mothers are new to our American machine-made life (to which, indeed, we are all new), and do not know what is good for their children and what is fatal to them; because they (some of them) suffer in the schools, where they are not taught suitable things suitably, and have to go to school. Those are the most important reasons, besides one or two that Miss Toul gives, but it is the way she gives them that is remarkable. Her story of the Swedish father who had his only son, thirteen years old, working eleven hours a day in his planing-mill in Chicago, and going to the night school, is illuminating. Miss Toul is a factory-inspector. She found this child toiling strips of wood to a buzz-saw, saw he was ill, took him to the manager, and behold he was the manager's (and son's) only son, learning the business. The father was perfectly well disposed to the child, and wanted nothing but his welfare, but overwork, bad air, and lack of sleep had done already for the boy. He had to weep.

We don't know Miss Toul, but her story would be a truthful narrative. It is a story of Chicago, and her subjects are surely the children of new-comers—Polish Jews and imported European peasants. The moral of it is the immense need of connecting the intelligence and direction of the country with contemporary life. The people who have

the means and the heart and the education and the brains or can get it, and who know how to live, must look out for and look after the people who have not these advantages and who don't know how to live. If we are to keep school in this country for all creation and leave the Ellis Island door open to a million new-comers a year, we may as well shut the schools that our culture is to be teachers, and that it is time for a good many of us to qualify in it.

#### The Social Workers

We greet the historian who writes in the latter part of this century will say that the most notable event that marked the close of the nineteenth century was the rise of the social workers. Probably he will compare it to the rise of the Wesleyans in England. It is a great movement, which seems to be giving to our Protestant people, and especially our Protestant women, a vent for benevolent activity such as has long been afforded to the religious work in the Roman Catholic Church. Of course suitable work is nothing new among Protestant women, but settlement work and all the kindred activities are new as a calling, and the training for them is new, and the organization and the salaries and the recognition of the need and usefulness of this sort of work, and the comprehension that it is an immensely remunerative sort of life—all that is new or less new. We have got a great many people on our hands that need looking after. Many of them are people whom we have allowed to come here in the last twenty years. Many more are country-born, old and new, some-what out of touch with stimulating influences and all that modern knowledge and science available to healthy and energetic city life. Our schools, that we brag of so much, are still very largely an experiment. We are sure we must have schools, but we are not at all sure what must be taught in them. Our enormous factories and industrial institutions cannot be left to themselves. The life they give them must be safeguarded, or it will be used up like so much straw or wood and turned into manufactured goods. Laws will do something, but they will not do much. The chief thing they can do is to give power to intelligence and devotion. The real work must be done by people. A creed is nothing by itself. A woman's kind is nothing. A new way of life, if it is to be lived, its application and enforcement needs its work.

#### Out on the Job

We have lots of good people—women and men. It is to them that we must look to make this a better country than it is. It needs improvement; it needs a new spirit. There is a widespread white-slave traffic, and the dreadful mix-up of the police forces of New York, Chicago, and most other cities with prostitution. Somehow that has got to stop. We observe that women are such stirred up about it. It is today the leading argument for woman suffrage. We call the attention of all men and of all our self-respecting friends to the fact that the suffragists throw it in their faces that there is a particularly infamous and intolerable traffic in women going on that thousands of vile men live by, and that hundreds of salaried public officers are enriched by, and that the men, in whose hands political power is supposed to rest, do not stop it. There is an immense power in this issue to blow up Tammany Hall and elect as the next Mayor of New York a man who can be relied on to clean up the police and chase the last man out of association with the business of prostitution.

And there are the Italian black-hand and hand-carrying gangs. The business of the public worth is haunting for them, too, and beating for ever other, high or low, that hurls obstacles to impede their extermination.

There is a great deal to do, and part of it is in the way of being done. Mr. WHITMAN seems an earnest man. But the great power in setting in to hold the power of the majority of our police force from exposure and correction. That the suspicion is justified is not at all clear. Very likely it is not. But it is an imagination that just and honorable men should feel free to frame.

Are you scorched by it, Mr. Mayor?

Remember we see our Mayor and his Commissioner of Police under a strange suspicion of being the innocent cooperator of our police force from exposure and correction. That the suspicion is justified is not at all clear. Very likely it is not. But it is an imagination that just and honorable men should feel free to frame.

Are you scorched by it, Mr. Mayor?

Are you scorched by it, Mr. Commissioner?

The District Attorney seems to be doing his

best to rid our shirts of the shame of maintaining a police force that protects prostitutes and pimp and vendors of women, and extorts a tribute from the melancholy gains of prostitutes. We are with him in his efforts to the best honest man, and we to any politician, backed by whatever group of rascals, that tries to use powers delegated by the people of New York to impede his honest efforts!

#### Suffrage and White-slavery

To the Editor of Harper's Weekly:

Sir,—If the suffragists hadn't found the white-slave traffic needed for their chief argument, don't you think the suffragists would have got it up? And would they now be willing to have it raised without votes for women?

#### No, we don't think they would have got it up. Oh no!

Whether some of them would not prefer to nurse it along for the good of the cause seems debatable, for all five causes have overzealous adherents. Female immorality as a consequence, for example, of the white-slave traffic, is rather in a fashion that has already produced reaction. The argument that low wages made bad girls has been pressed to such an extent that the friends of the working-girls have been constrained to come forward with details. Poverty is an evil and a parent of many evils, but certainly it is not inconsistent with good character, either in men or women. The pieces on this subject by Miss KELL, Miss TARRILL, Dr. GRACE PICKMAN MERRILL, and Miss GILLES in last Sunday's World were timely and significant. All these women protested against the current slanders of working-girls, all denied the existence of any close relation between poverty and wages, and all maintained that the private conduct of the working-girls averaged as high as that of any other group of women.

#### Mr. Bird Not a Brother Yet

Our good friend Mr. BIRD of Mr. Saxe's office says that the report, which is quoted, and he is one of the reporters who reported the Boston News in a mistake. He is not a newspaper man yet.

Well, the profession is by an inch or the poorer; and we suppose Mr. BIRD is by so much the richer, but we are sorry.

#### Mr. Saxton's Suggestion

CHARLES FRANCIS FOX was called for England on Tuesday, to deliver in May letters on our Civil War, which he is very competent to do. President WILSON could not do better than to nominate him as reform ambassador to King EDWARD. He is not too old—nor so old as FRANKLIN was when he filled a more exacting post; he has wealth enough, and a reputation and experience almost which would make his return here. He cannot be expected to agree long with any set administration; not always has he agreed with himself for years at a time; he is not Secretary BIRD; would make a pair in English eyes that would open those eyes still wider at the offices of "those Americans." I am serious in this: Mr. WILSON could not make a better appointment for a year or two, and it would be generally approved here and abroad.—FRANK SAXTON, the Springfield Republican.

Dr. EAGER has declined the President's invitation to go as Leader of the Mr. Saxe's suggestion is very interesting. Other gentlemen have had Mr. ANSON in mind for this place.

Mr. Saxe's, by the way, we were mistaken in attributing to him the dissertation on Bill-Mason politics in Mr. Saxe's lately communicated to the Springfield Republican by "Newman Observer" in the Weekly World of March 15th. It was the work, he says, of some finer believer in the Democratic party than himself, and he adds:

I was brought up a Jeffersonian Democrat and so I remain; but the party has out got so many of Jeffersonian notions, especially the new opinion, that until I am quite ready to decline, and do so, I will work I cannot have much faith in the sincerity of their democracy.

It is entirely reasonable for Mr. Saxe to want to see "the first work," and the prospect is bright that he will get them.

#### So May It Be

It may be that WOODROW WILSON with some of the capitalizing and flattery qualities of CLEVELAND, METZGER, and others, has been chosen by HILL, as WASHINGTON was chosen to evade and LINCOLN to save the Republic, and if that be the meaning of his elevation to the "White Magistrate," the *Courier-Journal*, widely forgetting its own wrongs, is wronging American in crying "Honor to Everidge," will call him blood-red—Colonel WOODRIDGE, in the *Courier-Journal*.

Mr. HENRY is still first of all for the United States.

# TOURING WITH AN ORCHESTRA

## The Humors and Tribulations Incident to Taking a Symphony Orchestra "on the Road"

BY W. E. WALTER

ILLUSTRATED BY F. BROTHMANN

THE spectacle of the manager of a metropolitan orchestra, dressed in a costume which skirts between the red and white, extending the glad hand to the usual constraints of Modesty. He, on any drablike fate, is responsible for the concert, is only too sign of the mastery of temperament he must have if he would hold his job. Back on the stage in dress and glasses are forty, fifty, sixty, or seventy "artists," as the case may be, playing their wretched "pieces" inside of their streaming waistcoats, the while they emit deep-breathed German, French Italian, and noble French comments on the character of the artist which has given them supper, the quality of the sleeping cars the Pullman Company has furnished, and the thousand and one other things which rub the severity of these gentlemen when they toiled at the expense of the management on a series of one-night stands. In lone grandeur is the star's dressing-room the conductor is waiting the call to the stage—mediating on the programme he is about to play, perhaps, but more likely wondering if he will ever be able to digest the fried steak which had been the prior delectation of his dinner.

Moulding the audience, delicate in, chiefly in the cheap seats. The president, secretary, and treasurer of the Women's Musical Club, whose romantic promise was that the audience will be distinguished, even if not so large as they had hoped, and the owner of the opera house to signify in the vindication of his judgment that a good musical comedy has any highway show like this taken "three ways to the park." Yet could the manager smile, although he has just wired home for money to make the next stand, and is wondering what new arguments he can use in the effort to open again the pocketbooks of his subscribers.

All concert-going press agents foster the tradition that orchestras go on tours to spread the evangel of art in distant places; to rescue the perishing from ignorant fiddlers, pianists, and guitar boys, to my mind a good thing for the country in general and music in particular. Conditions are very different now, thanks to these tours, from what they were when the earlier women and his hand used to travel up and down the country on the sabbath and early morning, and when the Boston Symphony Orchestra was the only one to make trips to the Middle West twenty-five years ago. Not now, even in Middle West or Palmyra Paul—to use those names generically—would such an incident be possible any more, nor could the late Fred Cramer, for years the assistant manager of the Boston Symphony Orchestra.

The show was not in the West, but a thriving city of twenty-five New York, and the three just twenty-five years ago, driving in town with the orchestra for a concert that night, Cramer went direct to the theater to see what the sale was, that being the most important question of the day. He was greeted by the local manager with that calm indifference assumed when the business is treated and the money over, whether or not any of the business is sold. The advance sale was discouraging, and Cramer turned to the local manager for comfort and suggestions.

"How do you parade?" asked the local man.

"Parade?" queried Cramer in a panic.

"Nonsense. Don't your people always parade before the show? You won't do business without it." And the music was right.

Although the local theater managers do not regard an orchestra as a marketable troupe, they still attend toward it in all sorts of suspicion, tinged with contempt. If the house is large is just the foolishness of the women that accounts for it. It is

The management is buffeted by Conservatism on one side and Art on the other

in small it is the highest character of the "show" that is responsible. The darkness of the musical middle ages of America has not yet entirely disappeared. Within the last few years a New England city had more than one hundred and twenty-five million. Boston made application for the services of the Boston Symphony Orchestra to give a concert to be followed by a fall, the local committee hoping that the "leader" had a good collection of dance music. Yet the manager of a symphony orchestra who arranges a tour of cities and towns that have an orchestra of their own, on the presumption that these committees are still in the depths of musical ignorance, is certain to get into difficulties.

The music of America is in all interests and purposes in the hands of women, and it is with women chiefly that he must deal. These women such who spend their money and their husbands' money in the name of musical spirit usually know what they want and in the end are likely to get it. The mighty man who is the manager has no terror for them. With all the devil and of women there could be few orchestras in this country and fewer tours.

For weeks before the tour began the management is buffeted by Conservatism on one side and Art on the other; pulled in one way by the patroness who wishes to satisfy, and in the other by the conductor he must satisfy. His programme is all ready for the printer when there comes a stern message from a distant city that the principal stander, a favorite "war-horse" of his conductor, was played two years before he died. His wife has not heard him and his orchestra play it. It is therefore a work in so short a time when they have so few concerts. He goes to the conductor, who tells him gravely that, even so, the good people of this city have not heard him and his orchestra play it. It is therefore a work in so short a time when they have so few concerts. He goes to the conductor, who tells him gravely that, even so, the good people of this city have not heard him and his orchestra play it. It is therefore a work in so short a time when they have so few concerts.

What is heard that a conductor to realize it that the average city of the Middle West is usually lower in the matter of programme than cities which possess their own orchestras. Having from one to five concerts a season by visiting orchestras, the committee is charge of them, almost always women, plan their general scheme of programme for the season. They know what has been played in Boston, New York, and Chicago, and let a novelty have steers in any of these cities, they are after it, indeed. So much so that it is becoming the fashion to send these cities, judging from the newspaper criticism and the talk in the cities, to treat the great classics with great untiring tolerance, and a procession is given up that can only discuss Debussy, Strauss, Reger, and other after-works, but doesn't know the "tone" of the first movements of Schubert's Unfinished Symphony when they hear it.

When a conductor, as sometimes happens, is compelled to allow a conservator to play a concert or a compromise between Conservatism and Art—a Wagner programme or Tchaikovsky's Pathetic Symphony, New York, Symphony Hall in Boston and Orchestra Hall in Chicago. He tells this matter give as a potent in cities that have fifty or more orchestral concerts in a season, to go to the Middle West to test the magical drawing power of these. What is true of the smaller cities is true of Carnegie Hall in New York, Symphony Hall in Boston and Orchestra Hall in Chicago. He tells this matter give as a potent in cities that have fifty or more orchestral concerts in a season, to go to the Middle West to test the magical drawing power of these. What is true of the smaller cities is true of Carnegie Hall in New York, Symphony Hall in Boston and Orchestra Hall in Chicago.

Often, however, the conductor has ideas of his own. Sometimes they work out well, sometimes the contrary. One of the latter was a conductor in a university town. The conductor set in his programme, which contained three symphonies and nothing else. The hundred women were in the audience and he had a goodly number that such a programme was a bit stiff. The conductor smiled sweetly, and inquired where he could play three symphonies in one concert if not in a university. They said no, unworkable, and the job of it was that the conductor had guessed right. In that particular town they still talk of the wonderful concert when they returned to three symphonies all in a row.

But it doesn't always work that way. Years ago a distinguished conductor with distinguished

"They will understand Brahms after hearing my performance"

derior was to make the first visit to a prominent city of the Middle West. Some think that city has had its own orchestra, but in those days it was unusual to be invited. It was agreed to have a program out of town, but the conductor had to build a very heavy one around Boston's U. Music Symphony, which even New York and Boston then regarded as impressive. The manager, with prophetic vision of an empty house, took his life in his hands and asked the conductor please to put a Harvard School, or even a Beethoven symphony in place of the Brahms, which would never be as desired, even if the name of Brahms meant anything to that public. The answer was characteristic:

"They will understand Brahms after the performance."

Maybe they did, but there weren't enough people in the house to pay the fees.

Two cities, even in the East, have symphonies, and most concerts need to be given in the local theaters, arenas, risks, and convention halls. Ambitious towns of the Middle West, when they build a hall for concerts, usually do so on a gargantuan scale, with a view to gathering in all sorts of conventions, and if there is one thing more discouraging than no audience at all it is the spectacle of a large audience—one which means real money—all but lost in the ravages of one of those huge earthquakes. When such a place happens to be an old risk, used as a garage, from which the automobiles have been removed just in time to place the kitchen chairs on which the fashionable audience must sit, the case is even worse. This happened to an orchestra a few years ago in a large Coast town. To stop the rains, the risk was covered with its, and at the opening of the delicious "Walden" from "Nightingale" the rain began to patter

The combination was a huge success

greatly down. At first nature and the tin roof helped the vividness of the picture of forest rangers which the genius of Wagner has painted so skillfully in text, but before the last began to twitter the roof ceased with descending torrents of rain, and the orchestra was giving a rapid imitation of a missing picture. Had the conductor established the lightning-defying Ajax and thrust up the whole of his face in the storm of the "Flying Dutchman" Orchestra, that rattling roof would still have been an easy matter.

Once the Boston Symphony Orchestra was to give a concert at one of the principal universities of the East, which in the possession of a very pretty hall, hired a small one. When the librarians arrived in

the afternoon to arrange the desks and chairs for the musicians, he discovered that the order of the chairs was held by an elaborate managed chair of marble, evidently the producer's seat of honor at university gatherings. It was permanent, not to be moved, and as the stage was so small that every inch was needed to find space for the seventy-odd musicians, the chair had to accommodate some one. He thought over the situation carefully and decided that the honor of this piece must go to the first bassoonist, for he was a most dignified-sounding man, and the bassoon, although often put to lower ranks than the first-class composers, is really, in its best estate, the most subtle and dignified instrument in the orchestra. The combination of the marble throne and the dignified, bald-headed German blowing carefully into his long, black tube, is the very center of the spotlight, as it were, overshadowing even the swaying conductor, who has the advantage of the subject and most serious music could not rob the audience of his happy mood.

Many by orchestras are not underlain with the sole idea of making money, for orchestras on the road are a poorer business proposition than they are at home. Of course, any profit is gratefully received, but usually it is good luck when the receipts and expenditure balance, coming against the former, of course, the salaries of the men for the time involved. If any one city could give sufficient support to an orchestra for a sufficiently long season, the railways would lose a very considerable income in the course of a year, but no city can, not even Boston, which spends annually more money on its orchestra than does any other city. Properly to maintain an orchestra it is necessary to offer the musician a long enough season to make it worth their while to give up "jobbing," as it is called. Twenty weeks is a minimum, and yet very good results can come from an short a season as that. With the more important bands the regular symphony season runs from twenty-five to thirty weeks, with an additional five to ten weeks for special work in the way of tours, popular concerts, and the like. Two serious concerts a week from an orchestra seems to be the maximum a normal public desires, and if a manager limited his work to such an amount even his most generous and enthusiastic granadians would rebel, though the road tours.

In those orchestras led the high road of living as much as the business. In the good old, bad old days before the interstate commerce law, the railways wanted an orchestra manager and were not particular in their offers of low-priced transportation. Now managers wait on railways and tell them where to board if they can so arrange a tour which will admit of a return-trip rate. In former years five dollars a day was ample for the maintenance of the work on the road, and some of the finest generalities of the roading art were made up of it. Now, however, they consider that double that amount barely sufficient to keep body and soul together. In the old days they were so glad to get a sleeper on a long jump, that the conductor himself did not wear a necktie when a drawing-room was not to be had. Now it demands the finest diplomacy of a manager to decide who shall have lower berths and who upper. The humble but lifting manager which need to keep from the instrument case of the traveling musician has disappeared, making way for the *vis de vis*, passenger, seated on road chairs.

The late King George, who was assassinated at Salonica last week at the age of sixty-seven, after a reign of forty-six years

THE DEAD KING OF GREECE AND HIS SUCCESSOR

# HOW CANCER WILL BE PREVENTED

BY LEONARD KEENE, HIRSHBERG, M.D.

**T**he American Association of Clinical Physicians at its recent convention in the New York Academy of Medicine, followed the lead of the Clinical Congress of the American Medical Association which was held also in New York City at the same time, and upon the subject suggested by Dr. Cullen, of Johns Hopkins, adopted the following resolution:

"Resolved, That the time has arrived when, if the interests of America and the health of its citizens in this country, a campaign of publicity should be at once undertaken to bring to the attention of every woman in this country the early symptoms of cancer. If detected in its early stages cancer can often be cured."

"That this society at once appoint a committee of five, to be named by the president, to disseminate this information."

"That this committee be instructed to write or have written articles to be published in the daily press, the weekly or monthly magazines, as may prove most successful."

President Edward Martin named the following members: Dr. Thomas S. Cullen (chairman), associate professor of gynecology at Johns Hopkins; Baltimore; Dr. Howard C. Taylor, of Columbia; Dr. J. Jeff Miller, of Tulane University; New Orleans; Dr. F. F. Simpson, one of the leading abdominal surgeons of Pittsburgh; and Dr. F. C. DeLee, of Chicago, editor of a standard work in this country on diseases of women. As chairman of the meeting of the American Association of Clinical Physicians, to endorse this resolution, a committee and a division of effort upon the adoption of a similar resolution I endorsed the same committee.

What does this resolution mean? It is the public and official recognition at last of the fact that in medicine as in other phases of our civilization, cancer is the medical scourge of medicine next to alcoholism.

Hitherto, with a lofty disdain, a patronizing ignorance and a superior aloofness, the surgeon and physician have held that the physician or scientific writer who dared to enlighten the public upon important medical subjects should be judged from a medical or scientific rather than a literary point of view. To-day certain reactionary doctors still cling to this Puritanical absurdity. In fact that a medical writer may secure a name for himself and a good opinion of our leading doctors than who publishes books on the appendicitis or who die despite in fair words is not to be feared. I do not wish to quarrel with either. Happily, however, this ancient type will not survive the present generation, and the physician who is satisfied by having written a book or two upon cancer will be honored as the protagonist of the coming time.

Five thousand years of credulity and superstition among doctors, a new day is about to dawn. In place of the superstition which still survives among many physicians, doctors are being the cooperative of the public. They find that not only do they know less than they were willing to admit, not only are they limited in their abilities and the application of their skill, but they are absolutely ignorant of their alternate interests unless close relations can be established with the masses in general.

Recognizing this, a new series of non-medical workers, anti-intellectual societies for the prevention of the Captain of the Sea of Death, associations for the prevention of kindred, clubs of social hygiene, actively endeavor, and scientific legislators—and many more are aided and abetted by men and women who without any special training in dress and physicians find that such work may be done with the aid of well informed public opinion and the fact that a new series of men and women are to be the latest group of workers who are rallying in the wilderness to help the women of the world with the help of the non-medical workers of the International medical associations, with a membership exceeding three thousand, all find themselves at last grasping the wrong end of the stick, the end of the stick and their hand now is an effort to stamp out cancer. Their appeal is to you, the man, the knowledge, the instrument of their disposal are restricted in their last purpose. They demand that every doctor find that knowledge may draw upon, may advance in the future as rapidly as in the past; but not less the suffering individuals of the race, the wives, the mothers, sisters, daughters, and sweethearts are furnished with appropriate information, cancer can be eradicated, cannot come to be the scourge that it now is.

Women are no more uneducated or physically timorous than men. In fact without the aid of the medicine the impression received in that women, when medical facts are correctly presented to them, exhibit an such a power of discrimination and judgment that their ignorance and superstitious are only too often obscured and descent at the discovery of advanced and hopeless cases of malignant disease. Their capacity for initiative is being mainly if distinguished in the following. This unhappy situation is directly traceable to absence of information. Many dangerous conditions

of cancer in patients could have been simply and personally avoided had they only been made generally known to the doctor or to women. It is actually calculated that ten thousand women—just the size of a high school—should attend and receive every year through ignorance, delay, faulty knowledge, failed medicine, and non-medical methods of treatment. The medicines, blunders, and the neglect that included them a year or more before to return, avoid, or raise a simple consultation with an expert surgeon has led to their suffering, has become the cause of their death, has caused them to suffer miserably and cost them a year or more of a home-leave, and I dare say, in some cases, to lose a limb.

Merely and modestly let me advise it, I never rely upon my own skill and diagnostic acumen when a woman presents herself to me, the clinician, practitioner of a home-leave. I see here in children's purity more or less; let me not from any sense of modesty avoid unpleasant but necessary truths. At these delicate periods of life after forty years of age, up into the office or any time thereafter, our medicine, and other relations of the female sex, and the cyclical years of middle age. It is at this sensitive period that a rational investigation of a woman's life takes place. Now the physical and the mind of their years. My life has had at least been an even, stable existence. At this point in the life of womanhood, the most intelligent diagnosis and the most complete medical knowledge should be available.

"Resolved, That the time has arrived when, if the interests of America and the health of its citizens in this country, a campaign of publicity should be at once undertaken to bring to the attention of every woman in this country the early symptoms of cancer. If detected in its early stages cancer can often be cured."—Resolution adopted at the recent convention of the American Association of Clinical Physicians.

Around this point, not unaturally, perhaps, is a tissue of malnutrition, asperities, and illiberal traditions. Thus it is common among that all sorts of violent and unscientific asperities should accompany the immature enthusiasm then occurring. Physical signs, deviations, elevating, planned-like, imitations, irregularities of the rhythm, and even signs of blood are all extremely likely to be normal and healthy accompaniments of a perfectly normal and regular rhythm.

Nothing is further from the truth. At this juncture in the human cycle, just a woman passes and takes a certain amount of time in a normal and healthy state. This is not even almost without her being of all states of the change. If she is made suspiciously familiar with all the signs and symptoms, and has had many early of the other signs and symptoms (called by grandmothers and neighbors "perfectly natural"). Her appeal should be your family doctor, contact you at once to an expert gynecologist. It can do no harm other than a slight fee, which the specialist, in spite of a popular notion to the contrary, can very well do without and does not have to charge.

On the other hand, a simple examination may prevent the disease and simply a more scientific than the sprouting branches of a vicious, fatal growth. Of the earliest and most noteworthy symptoms of cancer in this only too familiar form. If you but ignore this warning, this first indication of a malignant growth; if you await the conspicuous signs of the final trouble, such as pain, it may be too late.

For a woman to have had cancer, and have an infirmity name to consult me professionally. She had never married and was perfectly shy. Yet she desired to get into a certain line of work. She had seen the appearance of those discolorations common in all women at younger ages. She had been without such evidence a year or more, and she was very young and very young and healthy looking. Without heeding about the signs or coveting the gravity of the situation, I made judgment of the common possibilities, to wit, the possible existence of cancer of a hereditary or acquired nature, I predicted, I judged, I applied to a life-long, strict internal regard for her. She refused to consent to any further or further examination, and the serious cancer. Indeed, she declined the diagnostic possibility absolutely and refused steadfastly to consent to any further or further examination. A wrong letter to her family brought me a better result.

The best cancer treatments with money-hygiene, and the most advanced in their knowledge, and in their sense, remarkable publicity advertising such as you send from one to the other in form of "curing" her, health, and ability, and while slowly declining in health, never heeded to friends of her steady improvement. For some time she was present to me, and she found me more and more before she died and admitted that her mistake had gone for her life.

Fortunately this young woman acted as a warning to the results that the result that the five or six Baltimore women were used. Within a year of this, serious physicians were consulted by dozens of women

with signs of irregular or unusual hemorrhages, and several of the patients who had been previously referred to the doctor or to women. It is actually calculated that ten thousand women—just the size of a high school—should attend and receive every year through ignorance, delay, faulty knowledge, failed medicine, and non-medical methods of treatment. The medicines, blunders, and the neglect that included them a year or more before to return, avoid, or raise a simple consultation with an expert surgeon has led to their suffering, has become the cause of their death, has caused them to suffer miserably and cost them a year or more of a home-leave, and I dare say, in some cases, to lose a limb.

That cancer must not be a fatal disease if discovered early is never certainly established. That it is often the lack of acquaintance with the dangers of delay and ignorance and the neglect that caused the most of life is proved by the physician's everyday experience. Let me here present Dr. Cullen's very words. He states that "if taken in the unaccommodated facts tend to show that at least thirty per cent. of those suffering from cancer can be cured."

For the best of cancer or twenty years ago, perhaps all over the world have been improving their methods for the removal of cancer. At the present time, if the patient comes while the cancer is still small, the most splendid result may be expected. Indeed, at the earliest stage malignant growths are just as circumscribed as a wart. If it is not a blood disease at that time, as is often supposed by the public and some doctors.

Physicians and surgeons are often called to see advanced stages of cancer, where, if the patient had been six months or a year earlier, the chances for a permanent cure would have been good. Nothing like this, nothing like this, is to be expected. The only way of drawing attention to the subject, but hitherto little impression has been made and the information has been properly presented for general dissemination.

The prevalence of cancer obtained by operation is some of the larger hospitals, both here and abroad, and that the only case present favorable prognosis. It is appalling to learn how many patients came too late for operations. Thus is the terrible disease that confronts us today. Delays are never so dangerous as with cancer. It is realized that the medical profession allows many valuable lives to be lost by not making it known that at least thirty per cent. of all cases of cancer in women could be permanently cured if they find in the earliest stage, submitted to operation early, and did not come to us in the later stages of the disease.

It is now realized how great an amount of good has been done by the public in disseminating information concerning cancer, and how much more must be done to use this most potent medium for the spreading of information about cancer. It is now evident, however, that in so many cases the most favorable prognosis is threatened. The national medical bodies that appointed this campaign committee of specialists and instructed it to make known to the public the signs and symptoms about cancer have solicited the cooperation of the whole educated world as well as the daily press. It was felt that if this were done, the good offices of the reactionary physician had to be looked if women were to be properly enlightened on the subject of this dread plague.

So impressed were the members of the congress, 2000 of whom registered during the session, with the conviction that this was the only way in which results could be obtained that had more conviction the campaign committee passed without a dissenting vote.

In cancer there are two chief kinds of cancer, one of which has been mentioned, namely, of the internal organs. The other is located in the human, if a woman notices a lump in her breast, she should consult her family physician immediately. It may be only a breast lump which has been formed in time and time again, and it may be a cancerous growth. In the latter case it should be removed at once.

Internal cancer is recognized by hemorrhage. If the hemorrhage is a cancerous growth, it will be noticed, she should report immediately to her physician. He will tell her whether her ailment is a cancerous growth or a cancerous growth. If a cancerous growth, an operation should be performed forthwith.

This is the news to be disseminated throughout the country and the world, and it should be disseminated by every medical man and woman. The United States should stand with many well equipped hospitals and with many capable physicians and surgeons, women suffering with cancer will not have to leave the country to obtain the necessary medical advice or surgical treatment.

Just as soon as the women of the land are as fully educated as doctors about the first signs of cancer and about the danger of delay, and will report promptly to their physicians, and an operation from thirty per cent. of those at least will be rescued from this hideous disease. Until a few years ago cancer was not a name that was known to most women. It might have made it remain so, but knowledge will free you from the danger.

When a woman has cancer in everything. Let the patient submit to operation while the disease is in the early stage. After it has spread the chance of cure is lessened greatly. First of all, you are impressed with the seriousness of the publicity, the first step is to obtain it. You pass the information on to every woman whom you can advise on the subject.

# THE SPY OF TRADE

## How the Big Business Firm Uses His Services to Outwit its Rivals

BY CROMWELL CHILDE

ILLUSTRATED BY J. J. GOULD

**T**HE modern big commercial firm, in order to get the advantage for every possible contingency, needs a business detective attached to its staff. Generally he is not called by that name. As a rule not by any name at all, for officially he has no connection with the concern. It is quite likely that he does not enter the firm's

office twice a year. Sometimes he has office of his own, and it is quite likely he is "detaching" far more than one enterprise, in lines that do not conflict.

The really able business detective is very like his prototype in the field of crime. He has the "death" head. He watches new enterprises, discovers new leads, points the way to virgin fields, hounds customers whose trade has never been secured before. A specialty of an expert of this sort is the carrying through of delicate missions. Such a man costs money, but he is often worth his weight in gold. There are many instances that get beyond the verities of the least of salaried and the shrewd diplomacy of the lowest "boss."

A situation of this nature came up in the manufacturing world not long ago. It was a case of a big order, and there was every indication that competing concerns were going to slash prices to win it. This did not sit well with the hardy, hearty executive president of the M. N. O. Works and his most efficient salesman, a brown little man who was a "strawman" to the trade, and whose commissions averaged thirty thousand dollars a year. Both men wanted that order, but at the popular figure. There must be a way of getting it.

"What we want," said the president, "is to know what those fellows"—he spoke the name of a famous foreign firm of mining engineers who were placing the order—really have in their minds. All we do know is what they say."

"Huh!" replied the shrewd little salesman thoughtfully. "Mr. Matson, one you spare an hour like this afternoon?"

"Yes, of course."

"Be in your car at Columbus Circle at five. It'll arrange to have Blowing meet you."

Blowing was the business detective who had discovered many little things that had helped along many of the M. N. O. Works' campaigns amazingly.

The first and greatest art of the skilled detective is to throw the company he serves off their guard and get them to talk. In the hands of a man who has this power a "chain" becomes valuable. He does not continue him in an ordinary way. Thus when—

—by the second chance—Blowing and the American representative of the foreign mining engineers closed together a night or so later, the engineer, when he was blowing merely as a man of charming personality and some large private interests downstairs—a very well-informed fellow he had always found him—was not surprised when the other, ever the deceiver, casually said:

"You are going to get very few bids on those boat-building engines?"

"The best order. All the houses want our trade and we are playing them one against the other."

"Clear idea. Did you get it?"

"Yes, the Grand Mogul of the engineering firm, set on a purchase in London."

"He'll be glad to see the American partner."

"The shrewdest of 'em" went on the over-confident detective, "in your story about your desperate hurry. Let's see, you sell to the government, don't you? God, how those chaps 'I about down prices'!"

"The engineer looked pleased. "We don't chime too much credit. It's a tough job," he said.

"That we must have the intention in a week or so, really the truth."

"Yes!" Blowing was wilyly interested. It was nothing but a way to get money at stake in, and you could see.

"We must have the first, certain sure, the work from the contract, our clients lose their lease on the mine—no in the least concerned."

A pretty commercial point. Blowing let off the end of a cigar and reached the cigar case to his companion.

"Huh! Suppose your low bidder gets the contract and fails to deliver the first boat by one day?"

The shod had told. The detective had discovered exactly what he wanted to know, and had planted the seed of

distrust. He casually eyed the engineer, and deftly began to get observe all other concerns on short-strings which frequently undertook more than they could carry out, and big firms with which reliability was the basis of life.

The little salesman of the M. N. O. Works had a telephone call at his apartment on Riverside Drive late that night, and the next morning, before he

"Suppose your low bidder gets the contract and fails to deliver the first boat by one day?"

started out to see about his bid, he stepped into the president's room.

"Blowing has found out the weak point," he said. "They absolutely must have those boats on time. There mustn't be a shadow of doubt about it. Leave it to me, we'll close on that agreement. Five steel cut my figure at all."

The salesman was right. Two hours later he came back with everything fully settled. The statement he made when all the competing salaried men were gathered together will long be remembered.

"We do not compete in price, only in quality. We have put in the highest bid—naturally one would be the highest. We had to make a high figure because of the unusual conditions, to compensate me for the extra expense we must incur. If the unexpected happens, the entire loss of our plant will be thrown to deliver these boats on time."

A well-dressed man stepped into the office of a paper-manufacturing concern, and sent in a card to the manager. The card brought an immediate request for the visitor to come into the private office. Not a clerk knew that the unassuming stranger was the concern's most important customer. They would have been amazed had they known that he was in the same line as Sherlock Holmes, only turning his skill to commercial purposes.

They would have been amazed had they heard that he was in the same line as Sherlock Holmes

What this business detective had behind closed doors cannot a salesman be sent for and printed with facts. The salesman strode down the street, and before the manager had shot his desk on the day's work a very small closed room had been attached, a rival had been wiped out so far as a certain printing firm's business was concerned; it was all of his handwriting on his bill, in place of any handwriting on his bill, so they had been doing for years.

the company that had the detective on retainer would have heard, it was very likely, get all of it.

"People talk of 'psychological economics.' The man who is not an up-to-date in his phrases says 'in the nick of time.' This was how it came about."

The manager of the printing establishment was a man who lived up quickly, but always concealed his wrath. Among the many curious bits of information this business detective had acquired was a knowledge of this fact. Quietly "sneaking" one day, he made the discovery that a little question had come up as to one of the statements of account of the opposition paper company. The question concerned the quality and weight of some stock furnished, and very diplomatically the opposition company were insisting that they were right. As a matter of fact they were wrong. What interested the detective was that in the printing man's heart was a considerable

"Business men do it," he had said, when he had outlined the situation in the secrecy of the manager's office. "See how you like this idea, Mr. Denton. Put business men to the whole thing now. They find it hot. He has just one thought in his head. Have business men his inside of half an hour. There his make a proposition just at that stock, making else. He'll have him say a word about the people across the street. See if he doesn't get an order, and more, too. I think you'll have the rest of that business now, sir."

In this day the opposition firm does not know how it lost one track after another on its own side. Not a statement graciously when it discovered, a few hours later, that it was in the wrong. Why a minor error like that opposition should have put it in the position of the runner, it does not know. It has never yet discovered how a man who he never suspected was in the game perceived a rival's hidden wrath that was already smoldering, and turned it to advantage.

Mr. A wants to know how much the B Company, his own competitor, are paying for a certain line of merchandise. There does not seem any way of finding out by ordinary business methods. But Mr. A is resourceful. He has needed special information on this subject and that many a time in the past year or so, and he is in touch with Mr. C, who has a considerable side of office in one of the big buildings on lower Broadway. A very progressive man—Mr. C, in all appearances.

Though the other branches of the building and the scores of men know all about the company, Mr. C never suspected if C is a business detective. Were this fact discovered his occupation would be gone—at all events, his ability to get on in his present very successful way. He passes himself off as a very capable business man, an agent of some sort on an important scale, and then he does just enough real business to give color to this supposition.

"It will take a little time," says Mr. C, when he receives his orders. "About a few thousand-dollar order, about a year ago. That's about all I have. I'll let you know how to drop your price. You have a copy of my telephone card, haven't you?"

For this business detective had some secrets which slip out over the telephone, has a tiny secret code book for his checks, by the use of which instant and

quite misleading words can be used for vital ones. This rule is not new. There are scores of ways in which you may have sold out their employers before now and have never been suspected.

In the role of a detective, however, you must start in to buy. All the B Company's office he discovered that while the goods were him amassing and showing this to the business men, there were many of those, a man, A, two blocks away, who names a letter P.P.P.

The report may readily be imagined. Good, solid customers like this do not appear every day. Very pretty relationship is formed by help C from buying of A. The price is finally shaded, just at this juncture A reduces the price further, so that the profit might fall of the desired result were it not that C is a consummate actor. His plans are effectively as the best business men in the world. The B Company let him see the articles to measure him what the goods really cost them and how A, if he is a real genius, priced just further, making it selling a lower quality.

Information like that furnished in these cases is worth much money to big concerns at all times. In these days of steep competition ordinary channels of trade now are frequently of little avail, and the trained eye and specialized brain of a professional investigator are necessary. There are scores of ways in which such an expert can be of service. Now he will be retained to "name about" and study what seems to be a possible cause of a particular product, now to ascertain the difficult and delicate proposition of why a certain firm will not buy of his client when it continues to order from other firms. Half the battle is in knowing the precise facts. There are men in New York, Chicago, Boston, St. Louis, and here in London who are men of the highest skill in this branch of detecting as William J. Burns is to him.

The business detective is a very different sort of person from the detective of the agency, of course. Most of them would never be called detectives. If frankly asked, however, they would be able to give their peculiar performance for a fee. The profession requiring an individual, peculiar ability—any other name. They work in what amounts to a disguise, and have all the means of the detective of crime in getting into the good graces of the people whom they investigate. It is still told that a man in the far West had, several years ago, the present account of one of these business detectives directed a very valuable freight account from one big railroad to another. A

mining company that was producing heavily and was a constant shipper gave all its business to the A. B. C. road, which could do just as well, found themselves unable to get a dollar's worth, a particularly annoying situation, for the business was

The B Company let him see the invoices

running into many hundreds of dollars each month. There was a moment when two things happened simultaneously. The railroads were tied up by one of the greatest snowstorms of the year and the mine began to be flooded with a tremendous body of water.

The pumps at hand bottled noisily with the surge, but the water was only a few feet high. Nobody ever knew the mine would be flooded. Some hundreds of miles away the mining company could get their hands on the pumps they had supplied, but they could not solve the problem. But the pumps might as well have been on the Atlantic Coast, so far as they were concerned.

A business detective now how things were at a glance. He had been retained by the A. B. C. road. Without losing an instant's time he caught the general idea of the situation. The water had reached its channel in a second.

"Get that pump, I am going to send my special car to get it," he said, and he was off. The water was rising of the supply house, and had her up. Well get through.

One half-hour of the road was put on the little special. The supply house was delighted to have its customer obliged, and before the favored railroad had arrived the pump was in the hands of its competitors.

The general freight agent took no chances. At a certain point he arranged to have a twelve-hour team to carry the pump over the mountains. On the other side another engine and car were waiting.

How much money he spent to get that to his destination has never been told. But he did it. Nobody ever knew the amount of personal exertion and skill he himself put into the task. His own engine took its way to the mine, the engine that had killed the station where the big wagon stood. That car of his most trusted men, carried along for this special purpose, accompanied the pump, and the engine of the horse was substituted for the exhausted one. The second train journey was made in safety, and the A. B. C. road, in the exquisite facility of calling the mine on the telephone.

"We have just received a pump consigned to you. Understand you are in a race for it. It will be on the platform in five minutes."

"You've received a what—what? Eh, what? No, you couldn't! What the—say, you fellows, get out."

"One of the Blue Line freightmen happens to be standing here, and, if you wish, we can see you time by time."

"Fine!"

As a matter of fact the Blue Line truck was at that moment being loaded with the pump. Within an hour the big sucker was working with steady rhythm and lowering the water. The business detective had triumphed.

## A GLIMPSE OF WAR

BY HENRY W. FARNSWORTH

AFTER spending a week in Constantinople, posting from one official to another in the way attempted to get through and see all the sights. I finally realized the Turkish method of saying "no." Every man I saw was posted at the door, and as far as he was concerned, eager to let me go. That uncertainty he was not qualified to give me an satisfactory answer was needed. So I decided to make at least a start without a pass. I bought a middle-class, a park-borne, and a donkey, and high up the side the donkey and intercept for me. I started from the Pera Palace Hotel about noon, and slept that night at San Nifantia.

The little of Lala-Burnaz was at this time about ten days old and the roads were filled with the fleeing peasants or citizens photographed. The town of San Nifantia was crawling with soldiers, many of them fresh from Asia Minor, being served very well by their heads. It was, of course, a very interesting sight in itself, but of every one of those. I was a free and kept merrily to himself about Alak, whether because he was sure from riding or because he was trying to keep his good horse clean I could not make out.

We started early the next morning and got away as far as Katchik-Burnaz. There was a rather cautious discussion as to whether I should be allowed to cross the bridge. After considerable talk we got through and were at the bridge. I was on the front and so made bridge to cross. The roads, as we proceeded along, were even more and more crowded with soldiers, many of them fresh from Asia Minor, being served very well by their heads. It was, of course, a very interesting sight in itself, but of every one of those. I was a free and kept merrily to himself about Alak, whether because he was sure from riding or because he was trying to keep his good horse clean I could not make out.

All right I could see the silhouette of the ammunition wagons behind me working their way along the ridge. Not a light was to be seen for three times offered (I should be) but in attention was paid to me. With the first light of dawn we got under way, and shortly after a long, low, dark, and suddenly down upon the lake and

harbor at Bush-Cherkmez. To the right was the Turkish camp, a horde of dirty white and brown tents, piled one on another along the hills. Thousands of soldiers were moving about, steadily apparently getting breakfast and feeding horses. A long line of horses was waiting with painful patience at the hill from the little tower at the foot of the bridge, which, white and deserted, stood across the narrow entrance of the lake into the Bulgarian territory. There was a constant hallooing between the Turks and the camp on the hill, and every horse stopped and dash there and then went on slowly at the hill. There was a constant hallooing between the Turks and the camp on the hill, and every horse stopped and dash there and then went on slowly at the hill. There was a constant hallooing between the Turks and the camp on the hill, and every horse stopped and dash there and then went on slowly at the hill.

There was no wind and six swallows were flying quietly in the harbor. Suddenly my eye caught a dash, and then a puff of white smoke, and a big gun loomed out from the highest hill. About two minutes later the shell over behind the hills, where the Bulgians were camped. Those dead shells settled down again. At fifteen-minute intervals during the whole morning this continued. Not a sign of any kind came from the Bulgians behind the hills. About one hour there or four correspondents turned up from somewhere, stood about on the highest point, looked with frightened eyes, and returned. The Turks set quietly in the trenches, and the line of pack-horses stood steadily up and down the hill from the town to the camp.

In the afternoon I left my Greek to guard the pack-horse and started down toward the town. The soldiers looked at me with dark curiosity, and said nothing. Along the side of the road were many dead horses and bullocks, with cows lying about them. As I moved along I began to feel depression. The Turks set quietly in the trenches, and the line of pack-horses stood steadily up and down the hill from the town to the camp. In the afternoon I left my Greek to guard the pack-horse and started down toward the town. The soldiers looked at me with dark curiosity, and said nothing. at Bush-Cherkmez. I was met by a colonel, who politely told me that my presence was no longer desired in or about the camp. I noticed at the same time that the Turkish flag was flying from the hill, was hoisted signaling Tehtabdzin.

On the second side of the camp was a miserable little Turkish village, a flat top on still now deserted of the Turkish army could be seen. I got my horse on the path and decided to spend the night there. About half past five, the moon was low and faintly started to his feet, jerking the bridge almost out of my hand and waking me up. The most instant it was that I was in the middle of the bridge, on the side of the Bulgarian end of the bridge. The terrible outlying of machine-guns burst out, the whole hillside burst into a series of explosions, and the Turkish ships began to fire, and from the end of the bridge came the answering crackle of rifles and hiss of machine-guns. In three minutes there was a pause, a few random shots, and again complete silence. Four-hundred yards up the hill and signals flashed all along the Turkish front. Those men quieted down and their firing ceased. The Bulgians had fired, in the dark, to force the bridge. In those few minutes—not more than four—three hundred Bulgians had been killed, wounded, or captured, and about 5000 Turks.

With the first streaks of dawn the cannon of the Bulgarian army began to fall. The battery after battery came into action. Howdahs joined in, and down in the plain where the Turks were camped the firing of the guns was heard. The Turkish heavy artillery on the hills. Two batteries of eight guns each began to move from behind the Bulgarian front. The Bulgarian heavy artillery was not the slightest danger in that spot, yet every time the windows rattled many percent gone back. I found it very interesting to see the firing from the hills. In my hand, I again noticed my bill. About noon I made out a detachment of infantry advancing from the hills. They were in the line of the hills. The Turkish field-guns burst over and around them. After advancing for about half a mile they began to retreat, and after a short distance they were seen to be in the line of the hills. The Bulgarian heavy artillery was not the slightest danger in that spot, yet every time the windows rattled many percent gone back. I found it very interesting to see the firing from the hills. # APPROACHING THE UNSINKABLE SHIP

BY ROBERT G. SKERRETT

**S**INCE the foundering of the *Titanic* almost a year ago, various ocean steamships have been extensively re-modelled. There has been a partial insurance, but it is not clear that it is not the substantial remedy needed to provide against the possible consequences of collision with a submerged obstruction.

The *Titanic* remained above the sea's surface two hours and three-quarters after she was so grievously injured by the fatal iceberg, and in this fact lies the story of the real direction in which preventive measures must be taken. (Over as the original injuries were, by which water flooded certain of the liner's compartments at sea, those leaks were easy the approximate cause of the disaster. The ship finally sank because the enveloping bulkheads and the overriding decks gradually yielded to the invading sea, and thus still larger spaces were progressively inundated and the vessel's reserves of buoyancy utterly destroyed. There was nothing to inhibit the over-stressed partitions from the opposite side. Our naval constructors realized the need of additional security, but the puzzle was how to provide it without too much increased weight and cost. The manner in which the problem has been solved by an ex-engineer, Mr. W. W. Wetherpoon, is worth the telling.)

Mr. Wetherpoon makes every water-tight compartment of a ship a potential caisson, and he provides simple facilities by which these spaces can be speedily filled with compressed air to drive the intrusive water out. Not only are the flooded spaces filled with air under pressure, but the adjacent ones, as well. The air is the unpaired substitute in at least pressure, but it is sufficient to reinforce greatly the structure immediately enveloping the damaged compartment. The net result of this is that the wounded spaces, in their resistance to the oncoming sea, draw support from a wide area of the contiguous and nearby ship structure, and there is no danger of a fatal yielding because of a bursting force concentrated upon the steel partitions immediately exposed to the intruding sea.

Every man-of-war has a series of pipes leading to all the water-tight subdivisions for the purpose of maintaining forced ventilation. By means of a flexible coupling, easily attached, these pipes can be connected with the air compressor which all fighting ships carry. Thus the only connection to the connecting link. Each of these compartments has water-tight hatch covers, and the change Mr. Wetherpoon introduced involved

How the United States navy is making its latest dreadnaughts unsinkable

1. INJURED COMPARTMENT UNDER MAXIMUM AIR PRESSURE OF FORTY-FOUR POUNDS. 2. OUTWARD FLOODING COMPARTMENTS UNDER AIR PRESSURE OF SEVEN POUNDS. 3. DEFENSIVE REINFORCING COMPARTMENTS UNDER AIR PRESSURE OF THREE POUNDS. IN THIS MANNER THE WOUNDED AREA BECOMES EXTENSIVE AND EFFICIENT SUPPORT, AND THE DAMAGED SUBDIVISION CAN BE EXTENDED AND TEMPORARILY REPAIRED BY MADE AFTER COMPRESSED AIR HAS BEEN APPLIED.

After this system was experimentally installed aboard the armored cruiser *North Carolina* and thoroughly tested a short while ago, Mr. Wetherpoon conceived another and equally valuable service which the plant could render without adding to the structural features. Fire is dreaded as a shipboard evil every seafarer, and especially so where a fighting ship, with her tons of explosives, is concerned. Instead of turning compressed air into the compartments, Mr. Wetherpoon uses the same conduits to carry a non-combustible gas into any space where a conflagration threatens. In this manner a fire can be speedily smothered without the disadvantages attending the use of water, which may do as much damage as the flames.

In a general way this protective system may be adapted to the structural conditions of ocean steamships, and while its installation would not be quite so extensive as that provided in our latest dreadnaughts, still, it could be made comprehensive enough to insure the floating of the craft despite wounds

so hopeless that her owners abandoned her to the underwriters. She represented a value of a million and a half dollars, and a promise of sixty per cent, was charged by the insurers. Winter was approaching and there was the danger of the river freezing over. Time was pressing and only something out of the ordinary was likely to refloat the ship. This Mr. Wetherpoon volunteered to provide, and his proposition was promptly accepted by the anxious interests concerned.

The illustration shows how the vessel was refloated and then how her damaged bottom was effectively patched so that she could go to sea in safety. The latches over the flooded compartments were sealed with metal plates and temporary airlocks attached, while air compressors were placed on board and the necessary connections made with the injured spaces. The covering wooden deck was made airtight by means of layers of tarred paper and a cover of steel flooring, and the strength of resistance against the bursting pressure of the confined air in the adjacent compartments was obtained by shores reaching to the deck above. With these arrangements completed, the compressors were started, and the air turned into the water-filled spaces. Inside of fifteen minutes the water had been driven outward until it was level with the top of the highest partitions.

Then the men began to do their work. Pieces of planking, called "podge-boards," were fitted in over the girders, and the crevices were generously plastered with a mixture of mud and oakum—the compressed air driving this plaster stuff firmly into all the cracks. The water reached as the "podge-boards" extended downward, and thus progressively the holds were emptied and the vessel floated. But, even so, she was not seaworthy, and under ordinary circumstances would have been taken to the nearest dry-dock, which happened to be more than a hundred miles away up the river, a substantial repair. The season made this risky, because there was the likelihood that navigation would close and that the liner could not return to England to prepare for the spring service. Apart from this, the dry-dock charges would be very heavy, independently of the cost of repairs. Again Mr. Wetherpoon came to the rescue, and offered to make the ship ready for sea without dry-docking. This was no less startling than his first achievement, and yet, as we shall see, he accomplished his end in a simple and efficient manner.

From within, carpenters made fertile wooden patterns of the necessary patch-plates and marked upon these templates the shape and size of the openings in the vessel's bottom the places for bolt holes. From these the steel workers fashioned the patch-plates and screwed into them iron bolts. These plates were let down over the outside of the ship and guided down place by place—the threaded bolts entering the holes previously made for them and temporarily sealed from within by wooden plugs. As the bolts came aboard, nuts and washers were attached, and these were screwed down until the patch plate was drawn snugly against the skin of the craft and the ruptured bottom securely sealed.

The underwater damage to the vessel affected nearly forty per cent of her bottom plating, the straining made by means of Mr. Wetherpoon's system settled a saving of fully \$50,000 and made it possible for the liner to get out of St. Lawrence before the river froze. She was way bound to Halifax, where she was temporarily dry-docked for inspection before making the longer run to England, she encountered very trying weather, but in spite of the shaking, her temporary repairs proved equal to the best.

Soon after the ship had left of the ship's crew a small motor launch, called the *Halifax*, was sent off and, like the carrier craft, was repaired for the run to New York in the same manner. She was way bound to Halifax, where she was temporarily dry-docked for inspection before making the longer run to England, she encountered very trying weather, but in spite of the shaking, her temporary repairs proved equal to the best.

How the stranded steamship was refloated

merely carrying these latches to the deck above and thus turning them into air-locks, the purpose of the airlock being to provide a source of entrance into or egress from a compartment filled with compressed air. The design is not above intended to expel the water which can be driven outward only down to the topmost part of the rupture in the vessel's plating—led to close the holes and to keep the division drained while temporary repairs are made by which the craft can go on her way portions. The airlock makes it possible for men to go to and fro in doing this work.

even worse than those that carried the *Titanic* to the bottom. A very good application of this general scheme was recently made in the salvage and the repairing of a large trans-Atlantic liner which was stranded in November upon the rocks at St. Lawrence. The steamship went ashore at high tide, and the seriousness of her predicament was aggravated by the tidal drop of sixteen feet at that part of the river, which ten miles below opened. Part of the cargo was removed and the steamer tried to drag the stranded craft into deep water, but without avail. Her position seemed

## SOME MERRY JESTS FOR APRIL FIRST

**For a Busted Father to send to an Extravagant son.**  
A check for ten thousand dollars, drawn to the young man's order, and mailed by special delivery post in time to reach him at breakfast on the day of April 1, so long as it is assumed the deception will prove easily unmasking and will cost only twenty cents, the amount of postage required for its prompt delivery.

**For an Old Head of household to send to a money-mad daughter of love at first sight, accompanied by a violent protestation of everlasting devotion, and ending with a proposal of marriage.** This, written on a strange typewriting machine, and sent through the mails without signature of any work, or other clue to the identity of the author, will create much excitement, and result just to nothing.

**For a Dishonest Debtor to send to a Dunning Father.** Dear Sir:—Please find enclosed my check for three hundred and forty-eight dollars and ninety-eight cents, in full settlement of your account to date, which I regret to have overlooked for so long," says this, and place it in a sealed envelope addressed to the father in question, omitting disclosure of any kind and mail. Much amusement will be gathered from the expression of his face when he finds the check missing, if you can so arrange matters as to be where you can see it without his seeing you.

**For a Fond or an Inconceivable Social Visitor.** A handsomely engraved invitation purporting to invite Mr. and Mrs. Wessley Snodden to meet Mr. and Mrs. Landgrave at dinner at eight o'clock on the evening of April 1st, at Number Blankety-Blank Fifth Avenue, using the address of the Public Library as that of the host and hostess. It will be well worth sending to sit in the corridors of the library and witness the arrival of the dinner party.

**For a Pungent Bore of a Philosphical Party of Mind.** A fulsome letter from a metropolitan University announcing a resolution passed by the trustees and faculty concerning upon him the degree of B. E. D. in his reply accepting the honor he will imply the meaning of the letters, and you will gain considerable amusement in framing the explanation that if he will go and live on a rural free-delivery route he will find out.

**For a Young Wife to Play on a Grieving Husband.** Make a pair out of red-hot-iron washers, make in molasses and covered with a crust baked to the brittle power of a piece of armor plate. Place this in a neat box tied up with pink ribbons, and all determine how it delivered by messenger at your house, accompanied by a card bearing the inscription, "With Mother's Love, to Alice." Then when he has dined upon the pies that mother used to make, serve warm and with a straight face.

### HIS FIRST EXPERIENCE

"No year for Jim has decided to be a dentist," said Mr. Bitters, meeting Uncle Jed at the post-office.

"Yes," said the old farmer.

"Hasn't he ever discover that he had a liking for 'B'?" asked Mr. Bitters.

"No, he never let his pallid stamps out of the cow-pasture," said the old man.

### A VALID EXCUSE

"Kiss ye deary ye was coveidin' the aped limit?" demanded the judge.

"No, I can't, judge," said Larrup, "but I had a good reason, your honor."

"What was that?" demanded the judge.

"Why, my geeseen was getting low, sir, and I wanted to hurry in before it was gone out," said Larrup.

HEART THROBBLER

"ALTHOUGH THE DOCTOR SAID HE WOULD BE OUT 'Y' ENO DAY, HE ENDED HIS WIFE NOT BE OUT IN A MONTH."

THE TREADMILL

"'Wm.—waa.' said the judge. "I'll let ye of this time, and send a law 'Fm not only justice of the peace, but the marriage-keeper here, I'll just sentence ye to buy a couple a gallon o' gas from me, in view of the scarcity of the stuff, it'll come to seven dollars a gal."

"NIP, I WANT A BUNNAY W'CH COME ALONG, AN I'LL WASH MESSUP SOME WED THAT FEELS OVER THERE."

### AS TO ART

The students of the Early Summer Art School had just passed the Lathberry farm, and old Uncle Jed Lathberry watched them with curious interest as they walked along. Then he laughed as he turned to his neighbor Dingdell.

"What do ye make out's this here art game, Birm?" he said, stroking his chin.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"I don't know," said the artist.

"Waa," said Uncle Jed. "That's about how she looks."

"An' then one of our sisters rises up all to a sudden," said Mr. Dingdell. "an' sends on a good college an' takin' a course in painting, an' just to keep pace in the family we let her go."

"Naw," said Uncle Jed.

"An' arter awhile she comes back, an' in two weeks she paints the Grandest, loveliest, pink and yellow, prettier-herbage looking picture of the place ye've averted all yer life to build up, calls it the old home by the river, puts a seven-dollar frame around it, and sells the framed thing to one of them millionaire brokers down in the city for five thousand dollars!"

"What do they call 'em when they sell 'em?"

"Paintin'," said Uncle Jed.

"Yes," said Mr. Dingdell. "De paintin's in the farm."

"I guess that's it, then," said Uncle Jed. "It's the old home, it's the old."

### THE HEIGHT OF EXTRAVAGANCE

They were discussing extravagance at the club, and Uncle Bitters pronounced the query: "What is the height of extravagance, in your judgment, Colonel Birm?"

"Well," said the Colonel. "I should say that the height of extravagance was building a low ally of polished ivory, and playing to you on it, using quart bottles of champagne for pins and gas-pipe for balls."

### THE AMENDE HONORAIRE

"No!" roared Birm, waving Wiggins by the arm. "I've found you at last! You sold me a jacks at the club the other day, and, by gorry, you've got to apologize."

"All right, Birk," said Wiggins. "Anything to oblige—let me to the real jacks and I'll apologize in his face."

### NOT TOO WELL

"In this well water?" asked the power-by, passing for a drink at the farm-house.

"Waa," said Birm. "I reckon it's as well as it kin be expected to be, considerin' it's been draw where the cow-shed mostly draws into it."

### APRIL

April is the month for me and Floss, month I ever see; dearest month of all the year, and the reason's very clear, for, of all the months they are on the blessed calendar, not another one is there so much like my Daphne!

First of those remembrance, April just overtake us. You can't tell by April akes just what in the future live; you can't reason from today what tomorrow brings your way—ad dear Daphne in the same, regrettably uncertain time!

April smile with smile so sweet it sighs when you off your hat; then a moment later loom clouds compelling in their gloom; and where smiles depicted your face falls an endless stack of tears—just like Daphne, don't you know, alternating joy and woe.

Come along a sunny best making life a fragrant bower, and you don't gaily sing with the very joy of Spring; and ere night the Spring is lost and there comes a chilling frost—just like Daphne's whimsy game hitting Spring and wintry days.

Yes, indeed, those April days fill my soul with joy, even when I love them! You can't let it do, with a lot that's staunch and true, just because they change to be wayward, contradictory. Just as Daphne is the blessing—when she keeps her lover guessing!

Year 66.

IF WE ARE TO HAVE ART ON OUR COINS, WHY NOT HAVE DESIGNS THAT WILL SHOW SOME OF THE USES TO WHICH THEY ARE PUT?

DRAWN BY E. W. KEMBLE

# WE VISIT THE CIRCUS

**E**VERYBODY knows that there is a show where dreams and wishes come to life. Most of us have visited some part of these Magic Kingdoms, and have perhaps met their him who has been called Ayrault, or AIRR the Youthful, in whose company (as it is said), one is aware that the greatness of grand does not really pass nor the beauty of a wild rose lady. It is quite true that you will not find any true people who agree as to where these Magic Kingdoms are to be found, or who call them by the same name. For some they are the Isle of Apple Trees, for others the Fane of Honey. Others know them as the Land of Heart's Desire; still others, who are troubled and sorrowful, and who therefore must be wrong (for of course no one should be troubled and sorrowful), may tell you that the true name is the Hills of Silence. But those who insist that the right way to speak of this country—at least when someone the country where miracles greet you constantly, as familiar friends, and all the winds are spring winds, and the sun is always innocent, and there is always dancing and singing in the groves and fields, and every one has everything he wants, from grapes as big as apples and apples as big as pumpkins in games as perpetual as the hills—those we say, who insist that the true name of this most meritorious and desirable region is Turman (y, or the Land of Youth, are probably more nearly right than the others. They will tell you (though perhaps only the old and weary will agree with them) that the Plains of Honey and the Isle of Apple Trees are nothing but mirages; that the Land of Heart's Desire is but a name to be used in the doorway, a fadler in the wind (they have used those very words); and that the Hills of Silence are shut away by an imperceptible wall. But, they say, Turman (y) is no delusion, and is shut away by no forbidding curtain of mysterious vapor.

Everyone read when we say "everyone," we mean, of course, everyone under sixteen—the others don't count (as you and known AIRR of the Young, of whom we have spoken. He wears many disguises; but always he has the power, not only to keep the

and he is now to be seen any day. He is at his old game of making wonderful things come true, of making them appear before your very eyes. You can prove this for yourself any afternoon or evening by going to the Madison Square Garden. For we shall get larger con-

and "hilly-hilly" twopence; and the breath-taking performer who sees them are indeed marvelous artists. The women, we venture to observe, seemed more confident and satisfied in the performance of their part than did the men. Moments of confusion and multitudes of wondrous crowd upon us, and they are not really disappointed. We are favored by a huge and stupor-inducing and purpose-driven in which are mingled deliciously the grotesque and the splendid and the comic. We remember the inconceivable base-hilly-playing of two deliciously solemn elephants, the milk-white horses who turned themselves into dancing marionettes; the accomplished and relentless kangaroo who taught a successful loving match; the Icelandic wrestler who vanquished, single-handed, three marionette desperadoes; the fabulous hand-back-riding of Miss May Wark's eighteen years of age and the greatest ruler that ever lived; as the grotesque affairs with elaborately restrained enthusiasm; and we meet not even to slight the stuporous "Chopin's" spectacle, which is at once characteristic, dramatic, and comic, and in which three thousand costumes gleam and glow upon the stage of the Garden.

Shew ever green and the moss ever fresh, but to endure for so the things we wish for and dream of, all the time we wish for them to be true—which, when you come to think of it, is quite the most desirable gift anyone could have. Well, the time of year when you may see most likely to meet AIRR of the Young is here,

and the fact that the Circus has two an undebatable conviction that the Circus should always be capital-and, like Congress and the Constitution—that the Circus, we say, has come to town.

Was it Cattle Herds who asked, once upon a time, Where are the noses of the Isled Apple? We do not know; we meet, like Dr. Johnson in Russell's account of the boy who interrupted his conversation a future life, "I leave the matter in obscurity," that as to the Circusmen of all the Isled Apples of the past, we entertain no doubts; we can say with perfect and serene confidence that they have all come to life again in the delightful show that everybody can see even at the Garden. Here AIRR of the Young, of whom we have been speaking, has taken stage, as the center of many wonders, in the composite person of the Messrs. Hapling, who wear with such grace and elegant the mantle of the belated Sunman.

Never, surely, were there such shows as you can see sporting themselves in the Garden arena. We make no apology for speaking first of our pleasure in them; for we have already approached the show as a completely reasoning system of the joy of life. No bug as the show enters, it is possible to hear the admiration of the Tent Maker, and is the first of Spring your Winter-remnant of Repentance. The show is a challenge sang in the teeth of morality, that's reinvented Moon will shatter.

... heretofore being long for us Through this same Garden—and for our in vain;

but the show will ever stand, unshaken and unshakable, as a symbol of immortality, and of this show, his show and utility are established. We have not memorably thrilled, perhaps, by those who program precisely and gently with "social artists" had not completely realized before that there are so many different kinds of tripe. We know not that there are not merely understood "tripe," but "double," "acrid," "flying,"

and the motionless stage of a tent. And when we see one say that of the Circus it is possible to find, not only a corner of Turman, but Hasty drawing its eternal doors—surely, then, we may conclude that, after all, the world is full of enchanted by-ways.

BY FRANKLIN ESCHER

## The Union Pacific Muddle

A TRAFFIC ALLIANCE RATHER THAN CHANGE OF OWNERSHIP OF THE CENTRAL PACIFIC SEEMS THE LOGICAL SOLUTION OF THE DIFFICULTY

On a gray Saturday morning not long ago a special train from New York, carrying a small party of Union Pacific officials and their counsel, pulled into the Union Station at St. Louis. Just one day remained before the expiration of the syndicate, formed, reorganized and governmental approval of the dissolution plan, to take over Union Pacific's holdings of Southern Pacific stock. Opposition to the plan by the California State Railroad Commission had resulted in its being greatly modified, and, in its modified form, being represented to that body for sanction. If approval were granted by the California commission the Circuit Court at St. Louis, it was well understood, would interpret an objection to the plan's being operative. If, on the other hand, the commission withheld its approval, there would be no use of even presenting the plan to the court. It would be an end as a demand, and, consequently, the syndicate of bankers formed to carry out the provisions would be automatically dissolved.

On arrival in St. Louis the railroad men found a telegram from the California commission, which, while it did not denounce the modified plan, failed to give the necessary approval. Nothing further, conse-

quently, was done about getting the consent of the court and the plan was abandoned. At midnight the dissolution project and having become effective, the banking syndicate formed to carry out its program expired by limitation.

Monday morning the holder of a stock-exchange house which had been given a \$100,000 participation in the syndicate was opening up his mail when he came across a check for \$100,000 in firm's share of the \$100,000 per cent. commission promised the members of the syndicate whether the dissolution plan went through or not. He glanced at the ticket and checked. Southern Pacific was coming out on the large at a point and a half below par. "Lucky for us," he remarked, "that we didn't have to take the stock. Rather have this check. The rest of the syndicates left that way about it, too. At the time they had agreed to take a share in the muddle over the stock was selling at 100. The little five-cents commission, if it is true, was nothing like what they had hoped to make, but certainly better than the big loss by which they would have been faced had the dissolution plan finally been made operative and they compelled to take their allotment of stock.

By the failure of the plan and the expiration of the syndicate the whole problem at how Union Pacific is to get rid of its controlling interest in Southern Pacific is opened up again. The Supreme Court has approved the plan as to make it a real dissolution, and has given the railroad till May 1916 to do it. Two plans proposed have been rejected. It is up to the railroad now, within the remaining six weeks, to come forward with an acceptable plan. Failure to do that means that the government can step in and bring about a separation of the properties on any basis acceptable to itself.

The hope of continuation in the plan in which the California State Railroad Commission has just rejected its assent was the proposed preferential use by Union Pacific after it had divested itself of its holdings of Southern Pacific stock, of certain of the Southern Pacific's lines in California. Southern Pacific at the present time owns Central Pacific (the mid-west) which Union gets from the Great North Lake to the Pacific coast, and this road the Union Pacific, under the proposed plan, was to buy from its present owner, Paragon, of the Central Pacific, however, work its end the justice. It was stipulated that under the new order of things Central Pacific was to have important and valuable trackage rights over the Southern Pacific's Sacramento to Oakland line—the so-called British Cut-off. That was the rock upon which the plan split. There is no reason, the California commission said, why the Central Pacific or anybody else should have a preferential use of this line. To allow it would be to prejudice the interests of competing roads and of shippers.

Well then, if the British Cut-off deal is the only thing in the plan the California commission object to, why does not Union Pacific cut that out and adopt the proposed plan without it? That is the question which comes naturally to mind. The answer is that the proposed deal with Southern Pacific is of so great moment to them without it that they could not afford to pay anything like the price it offered for Central Pacific. What Union Pacific

would believe that if he didn't do it some one else would, but with a more, rather than so. Things do not work quite that way today. Railroads do not rush to and buy each other up as they used to. They are being bought up as they are being sold. Now, having acquired control of a connecting piece of land like Central Pacific, can any mid-rail road do so, an reasonable terms, to other lines. In 1904 the Interstate Commerce Law was amended to take care of that. "All common carriers," the amendment reads, "subject to the provision of this act, shall according to their respective powers, afford all reasonable, proper, and equal facilities for the interchange of traffic between their respective lines, and for the receiving, forwarding, and delivering of passengers and property to and from their several lines and those connecting therewith, and shall not discriminate in their rates and charges between such connecting lines." With a law like that no effort is hard to see just how Union Pacific could be "botted up" at 100 cents or anywhere else.

The Supreme Court, furthermore, in its decree ordering a dissolution of the Harriman "empire," stated expressly that the purpose of Congress in originally granting opportunities for the building of Central Pacific was to have a continuous Union Pacific-Central Pacific line from the Missouri River to the Pacific coast. Certain advantages of operation and prevention of discrimination," the decree says in one place, "are said to have destroyed the latter if Rio Grande's carrying trade as a connection for the great transcontinental system." It is under the statute an discrimination adverse to the Union Pacific, and by equally violating the letter and spirit of the act of Congress. Certain discrimination could be retained by the courts. The Union Pacific, in other words, can carry its west-bound traffic, and then as it comes through it to take care of on terms at least as favorable as those of any of its competitors.

Now, under the circumstances, should Union Pacific want to buy Central Pacific and pay a big price for it? Why is it not altogether more reasonable to expect that Union Pacific will simply make a trade-exchange agreement with Central Pacific, leaving actual control of the property to remain just where it is? What might such a thing cost Union Pacific in terms of the act of Congress? It cannot get by means of a long-term traffic agreement.

For the making of such an arrangement the condition is that the stock of the Central Pacific territory is given, Union Pacific gathers an immense amount of business, west-bound, which it lays down at Ogden for Pacific shipment to the Pacific coast. On the other hand, originates a vast amount of business, east-bound, and requiring to be moved with the greatest despatch over the Southern Pacific's Central Pacific has this business gets as far east as Ogden where it has to be turned over to some one else. (It may return and receive that is that that somebody should be the Union Pacific?) A traffic arrangement by which Central Pacific enters into an agreement with Southern Pacific to take care of the traffic west-bound—that would certainly seem to be the logical solution.

Now an arrangement, indeed, would have important advantages from a Union Pacific standpoint, over actual ownership of the Central Pacific. It would be a matter of interest to the California State Railroad Commission. But of even more interest to the California State Railroad Commission is that a traffic agreement with Central Pacific, Union Pacific would avoid the competition with the Gould's Central Pacific line, which, if it took Central Pacific away from the Goulds, would be a serious blow to Western Southern Pacific gives up its ownership of Central Pacific—where then is Southern's incentive to give the line to Union Pacific? It is a competing line? But suppose Southern Pacific, instead of giving up Central Pacific, enters into an agreement with Union Pacific to take care of the east-bound business coming into Ogden. How much of the rich business originating along the Southern line in California will it send over to the Goulds? For as getting traffic west-bound east at Ogden is covered, Union Pacific would be a lot better off under a traffic alliance with the Goulds than if it were to buy the Goulds.

In the standard newspapers, of course, and the book-keeping strategy, interested only in the "profits" of the Goulds, there is a strong disposition to say that if the dissolution of the Harriman "empire" is effected without essential changes in ownership, but that the Goulds will be left with a line that is only too probable. In the relationship of these Pacific railroads properties there existed, a down years ago, the probability of almost immeasurable competition for traffic between them. That probability is no longer so. The Supreme Court has decided that Union Pacific must rid itself of its controlling interest in Southern Pacific. It has long been known that it was a startling change in the Western railroad traffic current, and the established course of the Goulds' traffic current, was to be broken up by the Goulds' line. Indeed, it is that Union Pacific and Southern Pacific will, at least so far as business coming into the Ogden terminal is concerned, be made to appear as one line. That traffic very much as they have been doing all along.

**The Horse-hair Industry**

Few persons are aware of the commercial importance of horse-hair and of how elaborate a process is necessary to prepare it for the trade.

Horse-hair arrives at the factory in bales up to half a ton in weight and a hundred dollars in value. The chief sources of supply are the United States, Great Britain, New America, Australia, Germany, Russia, and China. The tails are the best, since tail hairs are hard and strong, those of the mane being soft and of inferior value. The specially long hairs are, of course, suitable for particular purposes, but those of ordinary length are prepared for shoddy hairbrushes.

The hair is first cleaned by action, which carries away the dirt. Color forms the first basis of classification. Then the hair is divided according to its various lengths and quality. That which is to appear black is dyed in liquid, washed, and dried. The next step is roughly to sort the various kinds in such manner as to form shadings of the various grades. After this the material is passed through a series of mixing-machines or mills, which are provided with cylinders for taking out any particles of dust that remain. The first rough mixing is accomplished on the floor of the factory, and the use of the machines completes the process.

Next occurs a very curious part of the process. A short wick is prepared, somewhat similar to that on which hairpins are made, and then the hair is twisted up in firm ropes. Each pair of wicks is followed by a boy who loads up a fresh supply of material and that which is dropped with two sticks, then going it ready for the factory. The ropes are again twisted upon themselves, soaked for two hours in water, then baked at a temperature about 320 degrees Fahrenheit for twelve hours. The damp heat, as may well be imagined, destroys all insects like the larvae which remain on the hair. At the same time it fixes the curl.

The ropes are hung up to cool for three days. The inferior qualities are then unwound and matted by machinery. The best qualities are opened out and hand-sorted, the open ends being placed on the best piece of the comb which gives somewhat, as they are fixed into leather that is to be used for a comb.

The finer the quality the smaller the rope and the finer its curl. The hair from English carriages is sold by many to be the best, since it possesses the greatest strength. Black hair is somewhat stronger than white.

**The Lace of Venice**

The lace of Venice has been celebrated for many centuries. It was made originally with the use of the shells of murex shells for mechanical purposes. Then, with the fall of the Venetian Republic, the murex shells were closed and the lace industry ceased to exist for an entire century. In 1870 the Princess Margherita, sister of the Italian King, took measures to revive it, especially as a means of providing employment for Venetian women. At present there are several schools, subsidized by the government, in which the art is taught.

The pupils are women of all ages. Each sits at a new stand and back with a square cushion in her lap. On this cushion is pinned a strip of paper marked with the pattern to be followed, and this pattern the able-bodied worker sticks glass-headed pins about which she weaves her threads.

From twenty to fifty shuttles depend from all sides of the cushion, and these are worked across and back with the swiftness of a typist handling the keys of her machine.

The process is so simple that it looks like play, but the lace produced represents thousands of dollars. The simple hand goes rapidly under the decorative figure, but the expensive work is done at one point and other similar points are worked much more slowly.

**Co-operation vs. the Wolf at the Door**

COOPERATION is considered. In no way is this more strikingly shown than in the conduct of a properly managed life-insurance company. As members live, they do not more than see man in a business, on his own savings and profits, and a proper provision for his family in case of his death. The other style, one would have to go through life and out of it as a wolf at the door for the welfare of their wives and children.

THE BEST ALL-ROUND FAMILY LINIMENT IS  
"DR. SCHEIDT'S PAIN-KILLER"  
THE BROWN'S Camphorated Sassafras DENTIFRICE for the Teeth. Sold Everywhere. 25 CENTS per Jar. W. G.

driv were it not for the safeguard provided through co-operation. Just as civilized men does not know, feed, or clothe himself by individual effort, but rather by the efforts of his fellow-men, so he cannot the welfare of his family through the combined savings of thousands of his fellows. Unity of purpose and of action under a wise and economic management makes the blades light. In the annual report of one of the leading life-insurance companies one finds that eight hundred thousand persons combined within its organization hold more than one million insurance policies, which make provision for their families if they prematurely or for their own old age should they die young. These eight hundred thousand men have set up a scientific corporation based upon sound character, physical condition, and money paid in. Should they all die at once, the company would be called upon to pay more than two billions of dollars.

It is inconceivable that all these men should die at one or in the same year or at the same decade. Yet we will surely die each year. Nine thousand died in 1912 and the company paid for their families more than one hundred millions of dollars. It is certain that nine thousand more will die in 1913 and the same number will die in the oldest year those in the heaviest health to live. The prudent man knows that accident or worry or exposure to peril unforeseen may at any time cut short the thread of his existence; and he buys life insurance as certainly as he buys in advance a warm clothing for winter.

**Japan's Singing Crickets**

One of the most curious things to be seen in Japan, after in the houses of rich and the middle class of poor, is the singing crickets which possess the singing cricket. The male only has the "voice," which can hardly be called a singing voice because the sounds emitted are much more metallic than those which ordinarily proceed from the throat of a bird. The well-to-do who hear these sounds for the first time start up under the impression that they are hearing an electric bell. In order to correct this, the crickets are shown through a very amusing performance. He takes himself on his front feet, grasps with his mouth a kind of "microphone" attached in the cage for his convenience, and sends his wing-shells, and rubs them against each other with great regularity. The rhythm of the movement varies with individuality and this explains why the sound produced offers a certain variety in meter as well as in pitch.

The Japanese have reared this insect from time immemorial. For a long time the superstition of these crickets was prohibited under severe penalties, originally because a religious superstition against it existed among the peasantry. The Imperial family has cultivated the most illustrious spirit, but no one but a member of the family may rear the crickets. It is permitted to own a specimen. The recently deceased Emperor was a devotee of reared crickets. He had no and they sometimes amused himself by taking the cry from the cricket, and creating music. These little insects pass the entire day in song if care is taken to maintain their food supply, which consists of lettuce-leaves, with those of the tomato, carrot, and cucumber. Salt puts an end forever to the song of this little insect.

**Depth and Speed**

INCONCEIVABLE though slight deviations in the speed of boats led an English scientist to the conclusion that the depth of water might have something to do with it. He made his first series of experiments in water which was about 45 feet deep, and his next series in water about 250 feet in depth. Varying the speed of his boat from 12 to 24½ knots it was found that the increase in the speed of the water's depth on boats was not perceptible at 50 feet.

Experiments made in France with a depth of 185 feet displacement and a maximum velocity of 10 knots showed that 12 knots was made at a depth of 10 feet and 15 knots at 18 feet. The influence of the water's depth on boats was not perceptible at 50 feet.

**Strawberry Wine as a Tonic**

PHYSICIANS in Spain have been conducting experiments in determining the relative value of wine as a tonic. In comparison the juice of the grape, was prepared and served in liquid wine, was very valued the greatest strength given by a weakened condition, but recent tests have shown strawberry wine to be better in some instances. The most interesting of the observations are being given for wine alone.

**Coldwell**

**Demountable Cutters**

*A Brand New Feature in Horse and Putting Green Mowers*

Coldwell Demountable Cutters (patented) are independent of the main frame of the machine and removable at will.

Two or more cutters go with each machine. You can change them in a minute like the blades of a safety razor. Think how handy whenever blades need sharpening or other repairs.

*"Always use the BEST. The BEST is the cheapest. Coldwell Lawn Mowers are the BEST."*

**"Charge It"**

By IRVING BAGHELLER  
*Author of "Keeping Up With Lizzie," "Shoe Shiner," etc.*

**THE fun and philosophy of "Keeping Up With Lizzie" are excelled in these new pages, which reveal the wonderfully interesting doings of some of the same people—our old friend Socrates Putter, Betsey Sneed, the Warburtons—and some new people, too. Pointview, Conn.—and most of the amused readers of "Keeping Up With Lizzie" agreed that Pointview was much nearer than it looked on the map—is the scene of the new story. Extravagance and love of display have reached their height when the story opens. In fact, young Harry Van Alstyne's slogan, "Charge it to Harry," was the key-note of the whole town. The story is replete with humorously thoughtful scenes, and a delicate love story runs through it all.**

**ABBOTT'S BITTERS**

Abbott's Bitters is a natural product of the medicinal herbs of the West. It is a powerful tonic and a reliable remedy for all the ailments of the system. It is sold in bottles of 50 cents and \$1.00. It is the best of all the bitters.

**The Memory of Fish**

It has long been an open question whether fish are capable of associating ideas after the manner of some of the higher animals. Oiler has recently given to the Paris Academy of Sciences material that may throw light on the subject. Olinger denied that fish were able to associate ideas, since their attention first waxes to be hooked repeatedly. Oiler, also, made observations from this standpoint. He drove up the same fish from an aquarium again and again, day after day, but he thought this did not prove anything except that the hook was so well hidden that the fish could not distinguish it from the ordinary (unhooked) food. In another series of experiments he also did the hook, but put the food a little square paper about five centimeters from the bait. In each pond to which he fed was introduced a kind of fish, most of these recently caught with the net. For several days the fish rejected the bait, and it was not until the eighth day that they bit it. Oiler, after overlooking these caught, put them back into the water. Three days after they again bit the bait, were caught, and returned to the water, but after this had gone on some days longer, the sign of the paper on the end began to take effect. Third of paper was taken off, and the fish bit the bait as before. On the paper being replaced, the fish were shyer for a considerable number of days, even if very hungry. On the fourth day, the paper was replaced, and the fish gnawed about it without actually biting into it. This continued for quite some time. The experiment was repeated many times with various kinds of fish, always with the same results. Oiler concluded, therefore, that there is some association of ideas between the pain produced by the hooking and the escape as the result, as much as that the fish rejected food when the sign of danger appeared—preferring the pieces of danger to the risk of being caught.

**Wooden Cannon**

Are you familiar with the construction of modern weapons of warfare and the explosives used in them would naturally suppose a cannon made of wood would be of little or no value as a weapon. Wooden cannons have been used with considerable success, nevertheless, in recent revolutions in Cuba, in Haiti, and in the Dominican Republic. The wood used in the construction of these crude weapons is a very hard variety, having a close grain that splits about the log in such a way that to split the timber with the ordinary means is almost impossible. The best iron are selected, and a piece of the log five or six feet in length and about one foot in diameter is cut. After the work has been done, the log is made perfectly round, it is swung up on a crane, and a hole is bored into it from one end to the other. The log is wound with strips of muslin over from the skin of a steer. When the cannon is covered with the strips of hide, another layer is wound on, and this is continued until the weapon has increased several inches in diameter. After the log is covered, and the hole is finished, the weapon is treated to a hot draught, which tends to contract the hide draught, which becomes almost as strong as wire. These crude cannons have been used with success in a number of instances, and it is astonishing the number of times they may be fired before they burst or become otherwise disabled.

**The Borgias Poisons**

A French doctor (Lagard) claims to have discovered the principle of the mysterious poisons with which the Borgias were away with their enemies. The strange thing about these poisons was that they worked in such subtle fashion that even physicians could not state with confidence that any had been employed. It now seems certain that the Borgias used iron poisons, one dissolving slowly and the other gradually, and that the first, while the other was a sudden injection of arsenic working instantaneously. Both preparations were imperceptibly absorbed in composition.

**Gifts**

I gave my first love lingerie,  
I gave her second love,  
I gave my third love silver  
Throughout all the years,  
My first love gave me nothing,  
My second, years ago,  
But, oh, it was my third love  
Who gave my need to me!

"Say, Ma, when did your birthday come, the day we hatched out of the day we were laid?"

**Monkey and Cobra**

MANY animals exhibit remarkable sagacity when dealing with snakes. Natanielle wrote us that an intelligent pappy knows, somehow, that snakes may consume, and break them accordingly. If he attacks a snake, he does it with a series of quick jumps and recoils, and occasionally strikes his head against it to avoid a possible dart from the serpent. A horse kills a snake by leaping upon it with his fore feet kept together so that the snake's fangs can not wedging into the horse's head to strike him. The knowledge of these special tactics is a part of the instinct of all animals. There is an record an interesting example of how a monkey treats a snake. The monkey slowly left his perch in the forks of the tree, and quietly with great caution, moved downward until he had approached within about ten feet of the reptile. He raised his head from side to side, as if intently inspecting the object before him. Then he took forward and to the tree with one arm, and snatched his tail closely around the trunk. He reached forward and touched the snake, and then quickly withdrew it. The witness who observed this curious scene was a little doubtful whether the monkey had a realization of the dangerous character of its adversary. The little fellow seemed shamelessly to be playing with death. The hand of the monkey again moved toward the poisonous reptile. It looked as if the monkey was going to seize the snake. The supposition was correct; for, suddenly, like a flash of lightning the monkey grasped the cobra, and the neck, close to the head, in such a manner that it could not bite, while the snake's body coiled round the monkey's arm. An extraordinary scene followed. The snake hissed loudly; the monkey shivered and screamed and danced and leaped in frantic delight. He would crawl now and then in his wild contortions, and seriously examined the snake's head and eyes, and protruded his tongue. Then he would dash about again. When he had had enough of this sport, he began to rub his face with the serpent on the hand ground, continuing this work for some time, with repeated retreats in suspicion of the strength of the snake. Finally he had rubbed the head of the cobra entirely off. Then, with much giggling and chattering, he dropped the mangled body and disappeared away to join his companions.

**"See the New Holeproof, Dad, They're Mercerized—the Twenty-Five-Cent Kind"**

"Do you mean to say, son, they put a fine hole in light-weight sock like that to wear six months without holes?"  
That is exactly what we are doing. We do the overlying ourselves. The process, the latest, adds 25 per cent to the strength so it goes to the bone a beautiful silk yarn. Its pure cost \$1.20, guaranteed six months.  
These new hosiery are not, phable, ugly.

**Holeproof Hosiery**  
Look for the Trademark and Signature, Guaranteed on Every Pair. The genuine "Holeproof" are sold in every store. Write for the dealer names. We also direct where there is no dealer name, direct ground, on receipt of remittance. Six pairs of socks, heavy mercerized, 100 yards, for men, \$1.20 in \$1 per box, for women and children, \$1.00 in \$1 per box. Four pairs of four pair, heavy weight, all sizes and colors.  
Three pairs of all sizes \$1.20 guaranteed three months, for men and women, \$1.00 for men and \$1.00 for women, all colors. Write for free book on "Holeproof."

Wear Holeproof Hosiery and Find the Mead!

**Arizona's Lighthouse**

There are many old lighthouses throughout the world, but so far as is known the oldest one in the world, if so it may be called, is that situated far out in the Arizona desert. This "lighthouse," as it is called, marks the spot where a sea supplies fresh water to travelers. This is said to be the only spot where water may be had for forty days' sail to the west. There is located every night a lantern, the light of which may be seen for miles across the desert. The lighthouse is a tower, most and cold, is mixed in a large barrel made from a barrel. The revolving drum above is propelled by a small boat which just before every round it makes it before the barrel aims to the point a mark it tips itself into a trough.

**CHALFONTE**  
**ALANTICO CITY**  
RESORTS  
ALWAYS OPEN ON THE BEACH

**A Lake of Soda**

In English East Africa in the richest bed of soda in the world. It is estimated that it contains 200,000,000 tons. The lake has a surface of more than 50 square kilometers. During the rainy season, which is this being in short, its surface is covered with a shallow layer of water. When a thick cloud is taken out, another cloud and the water is so hot that it evaporates so quickly that an equal amount of soda was abstracted for a number of years from the same place.

**Half Lion, Half Leopard**

There was presented in the Zoological Society of London recently the skin of a lion-leopard hybrid. The animal was born in India and lived nearly two years. He ate his prey like the lion, but he leapt and hid like the leopard. The skin of the body is smooth and dark. The abdomen is spotted, and the tail terminates in a tuft like that of the lion.

## The President and His Ambassadors

"HOME, SWEET HOME" asked a London columnist respectfully saluting His Excellency the Honorable JAMES HENRY CHAMBERLAIN as he stepped from the Mansion House at the conclusion of the Lord Mayor's dinner.

"Home?" repeated Mr. CHAMBERLAIN, indignantly. "You do not know me. I am the American ambassador. And the American ambassador has no home."

It was a simple statement of fact. The most brilliant and distinguished of recent representatives at the Court of St. James was living in a house which he was renting at a cost somewhat in excess of his salary.

That is one reason—perhaps the chief one—why President WILSON is experiencing difficulty in filling the important posts abroad in his own satisfaction and to the credit of our present country. It was no new trial, that of Mr. CHAMBERLAIN. One THOMAS JEFFERSON, minister plenipotentiary of the United States to France, wrote from Paris in 1784 to JAMES MONROE as follows:

I must say a word on my own affairs because they are likely to be distressed. All the ministers who came to Europe before me, came at a time when all expenses were paid, and a sum allowed in addition for their time. If anyone else had had their outfit. Afterwards they were put on fixed salaries; but still those were liberal. Congress in the moment of my appointment struck off five hundred guineas of the salary, and made no other provision for the outfit, but allowing me to call for two quarters' salary in advance. The outfit has cost me nearly a thousand guineas; for which I am in debt, and which, were I to stay here seven years, I could never make good by savings out of my salary; but be assured we are the lowest and most obscure of the whole diplomatic corps. . . . I have here about as well as we did at Annapolis. I keep a hired carriage and two horses. A riding-horse I cannot afford to keep. This still is far below the level. Yet it absorbs the whole allowance, and returns when I will be America. I shall be the outfit in debt to Congress. I think I am the first instance in the world where it has not been given. . . . I ask nothing for my time; but I think my expenses should be paid in a style equal to that of those with whom I am placed.

That was in 1784. A hundred and twenty-nine years have passed and the population of the United States has increased thirtyfold, but the situation, with respect to our foreign representatives, is practically unchanged. President TAYLOR became it sadly.

"We boast ourselves a democratic country," he said to the National Board of Trade in 1910. "We say that there is no place within the gift of the people to which we may not select the most suitable inhabitant, providing he is fit to discharge its duty, and yet we have an arrangement which makes it absolutely impossible for any one but a millionaire to occupy the highest diplomatic post. Now I ask you whether this is consistency; whether it is not the worst kind of democracy. By democracy I mean the advancement of an argument which seems to be in favor of democracy, but which, when it actually works out, is in favor of plutocracy."

In his Message to Congress on December 3, 1912, Mr. TAYLOR continued:

In line with the object which I have sought of placing our foreign service on a basis of permanency,

I have at various times advocated provision by Congress for the acquisition of government-owned buildings for the residence and offices of our diplomatic officers, so as to place them more nearly on an equality with similar officers of other nations and to do away with the discrimination which otherwise must necessarily be made, in some cases, in favor of men having large private fortunes. The act of Congress which I sponsored on February 17, 1911, was a slight step in this direction. The Secretary of State has already made the limited recommendations permitted by the act for any one year, and it is my hope that the bill introduced in the House of Representatives to carry out these recommendations will be favorably acted on by the Congress during its present session.

The act referred to was "a slight step," to be sure, but it was so deplorably short as to be wholly abortive. The impossibility of acquiring a suitable residence in London, Paris, or Berlin for \$120,000 being apparent, Representative FLEEN, of the House Committee on Foreign Affairs, reported a bill appropriating that amount for Tokio, \$60,000 for Rome and a pitiful \$15,000 for Mexico, but even that failed to pass.

"It probably would have been passed," says Mr. FLEEN, sentimentally, "but for the fact that so much money was appropriated for other purposes"—for public buildings in Sweden, for deepening Ditch-water Channel, and the like.

Even so, the present provision is obviously and hideously inadequate. Former Ambassador HERRY WHITE, speaking from actual experience in nearly all of the foreign capitals, tells the *World*:

I do not think it possible to buy a house suitable for our requirements in any of the leading capitals for less than \$400,000 or \$500,000, possibly more. In the small capitals the sum provided in the present act would be ample, sufficient, if not excessive, within the great capitals are such as they are in our large cities. A \$400,000 house in Fifth Avenue is not a large one.

The embassy or legation house must be in a respectable quarter and of a character in keeping with the dignity and business interests of the United States, and not be immeasurably inferior to the embassy houses of other great powers. This is such a more important since we became, in the eyes of the world, a great power.

An additional advantage in our owning such a house is that an ambassador, he be possessed of many millions or a small income, is compelled to live in it, which from a democratic point of view seems to me an important consideration. I cannot believe that the party now in power will consent to perpetuate a condition of things which prevails to the world that the United States alone of all countries insists on being represented by men of wealth, and draws from such points as ambassadors and ministers to the many important countries those of moderate means or no means at all.

I do not believe it possible for any American ambassador to get on at Paris, London, Berlin, St. Petersburg, or even Vienna, with less than \$20,000 or \$30,000 a year, and of course many of our ambassadors have to spend much more.

In other words, the existing condition impels absurd extremes. An exceptionally opulent minister, like our speculating ambassador at Berlin, makes American representation a laughing-stock by his lavish expenditures, while another, such as his capable predecessor, is obliged to forsake his post because he cannot keep his end up.

Other nations adopted a more creditable policy

long ago. All of the important embassies in Washington are either owned outright or are rented by the countries represented, simple funds are provided for upkeep, and salaries range from \$20,000 to \$50,000. England pays her ambassador at Paris \$45,000; and at Berlin, \$40,000; at St. Petersburg, \$30,000; at Rome, \$35,000; and at Vienna, \$40,000. Germany pays her ambassador at Paris \$50,000; at London, \$37,500; at St. Petersburg, \$37,500; at Rome, \$25,000; and at Vienna, \$30,000.

The French ambassador at Berlin receives \$28,000; at London, \$40,000; at Rome, \$24,000; at St. Petersburg, \$40,000; and at Vienna, \$35,000. The Austrian ambassador receives at Berlin \$31,000; at Paris, \$35,000; at London, \$45,000; at Rome, \$32,000; and at St. Petersburg, \$35,000. Russia pays her ambassador at Berlin \$40,000; at London, \$40,000; at Paris, \$40,000; at Vienna, \$40,000; and at Rome, \$32,000.

Three prefer by President WILSON of the most important ambassadorial appointments have already been declined—a circumstance quite the reverse of complimentary to England and France. Undoubtedly other reasons actuated Mr. OLNEY and possibly Dr. ELDER and Mr. McCOMBS, but the fact remains that any one of the three would have been obliged, in the event of his acceptance, to draw upon his personal funds. Despite the fact, then, that most of those mentioned for the larger places either have plenty of money themselves or have wives who have it and are willing to blow it in for personal gratification, it is little wonder that the President is annoyed and embarrassed by the restrictions in choice imposed upon him.

"It is a great pity," he says, truly, "that the country has to ask such sacrifices of those who are invited to serve it abroad—a service which every year becomes more exacting and more important. The sacrifice of time, of means, and of opportunity at home is very serious for any but men of large means and leisure, and the diplomatic service is unnecessarily hampered."

Secretary BRYAN has formed a like opinion from personal observation, and the press universally applauds Mr. WILSON's apparent intention to urge the adoption of a more liberal and more enlightened policy.

Undoubtedly the President will restrict his special message to tariff recommendations, but he will surely leave the way open for other proposals later—and we doubt if he could do a more popular thing than to put this matter squarely up to Congress in such a way as to demand attention.

The American people rightfully demand attention of any kind, but they are not mean and they neither wish to compel their representatives to appear in an unfavorable light nor want to handicap their President in making fit selections.

Even the justly complaining JEFFERSON received \$12,000 a year at a time when \$12,000 carved much from water and when the salary of the President was just one-third of what it is to-day. But the important thing is to fix a standard which will not only enable, but compel, our ministers to live an official life in which simplicity and dignity will be happily blended.

## Mr. Morgan

Woe comes of the death of Mr. Morgan as this paper goes to press.

A great banker—the greatest of his or perhaps of any time.

A matchless upholder of property, who never encouraged or profited from destructive performances.

A faithful trustee of billions, ever conscious of his tremendous responsibilities and ever ready to protect and defend to the limit of his own resources all interests intrusted to his care.

A man of amazing comprehension and extraordinary insight, possessing a capacity to foresee events which amounted almost to genius.

An optimist full of faith in his country and in his fellow-men.

A most human, lover of humanity who never in his long life rejected an appeal for aid to the helpless and suffering.

A Christian, staunch, devoted, and untiring in fidelity to Christianity as he understood it.

A generous but shy giver.

A proud and sensitive but extremely modest man. A citizen of the highest integrity and the unshaken fidelity.

Above all, a true patriot, the most distinctive and most vivid embodiment of the spirit of his time—a lover of power, but not of money; a great, a very great American.

The life of Mr. Morgan has never been seen in this land and probably never will be. It is a gratifying thought that he lived wisely in the hope and belief that in his last days he had come to be known for what he was, and that he held the affection so less than the admiration of his fellow-citizens of the great Republic which all his life he had secured and loved with the intensity of a powerful and loyal statesman.

## Wrack and Ruin

The rain descended and the floods came and the winds blew, and we have been reading the story of it for a week, and at this writing have not got much further than to have in our minds a great picture of desolation and distress. Both are abating at this writing. The immense mass of surplus water is hurrying to the sea, the rivers are falling, the railroads are clearing their tracks and rebuilding their bridges, the wires are being restored, the dead are being found and buried, the refugees are being sheltered and fed. Happily the early death of a million by flood is steadily diminished. The loss of life in Nebraska, Ohio, and Indiana is large, but it promises to be reckoned in hundreds, not thousands. When the flood was highest at Dayton and other places communication was cut off, there was very little detailed news, and nobody could tell what had happened or would happen before the waters subsided. Even now there has been no chance to take account of stock in any accurate fashion. There is a reckoning of the loss of life which, presumably, is somewhere nearly true, but estimates of property losses are all very wild yet. It seems likely that the property loss will exceed that resulting from any disaster in our previous history, but it is distributed over a very rich stretch of country from Omaha to Albany, and will be met by vastly more people than had to sustain the calamities at Galveston or San Francisco.

The response to the call for aid and relief has been prompt and feeling. Whether it is adequate we shall know better when the tide of loss has more fully receded and more is known about the work that lies ahead. But there is great sympathy throughout the country for our fellows in distress, and abundant means out of which to express it, and whatever is needed to tide over our homeless and impoverished brethren and help them to go on will be forthcoming.

## A Vast Problem Ahead

These floods seem to have been an impossible to predict against as the tornado which dealt so roughly with Omaha. They were due to sudden and enormous rainfall, proceeding out of abnormal weather over some section in Ohio. These floods seem to have been due to similar conditions unimpeded, against which effective provision could hardly have been made, and against which a provision that might have been effective would not

have been warranted by anything that has happened heretofore. What the Seine did to Paris a year or two ago the rivers here done to the cities of Ohio and Indiana, but more so. No doubt future provision against such floods will be more thorough. We have had a new exposition of what is possible, and our engineers and foresters have some new light on a vast problem which they will be called upon to consider. It is partly a national problem, to be dealt with by Congress, and it presents enormous difficulties. It remains to be seen how much new the wit of man can do to solve them than has been done in China, when the Yellow River by its immense destructions has so long been "China's Sorrows."

## In This State

The floods in this state would be notable if those in other states were not so much worse. All over New York state, as elsewhere, high water made a new record. No lives have been lost, or only very few, but the bill of damage will be considerable. The Erie had an early report of a vast damage to the unfinished harbor canal, a damage that looked ruinous to contractors. We shall see. New York has an extensive road system which has suffered very much. If its indebted canal had suffered very much it will make the country glad that our national canal project is being carried on in a reliable climate where nothing worse than leaded hills happens.

## They Differ to Agree More Freely

Some people may find it frightening that already, before the beginning of the special session, the President and other of the Democratic leaders have been exchanging their individual views on the tariff policy steadily, and developing some differences on details. On the contrary, to our mind, the fact is most encouraging. For it is infinitely better that such differences should be recognized, and a working agreement reached, before any bill is introduced, than that they should be allowed to come up later, to cause indefinite delay. That there would be no differences at all nobody with any knowledge of the vast detail of tariff legislation ever for a moment expected. It would be a strange thing indeed if any two Republicans or any two Democrats in Washington should be found in private agreement as to every article of a tariff bill, or even as to a new freetrade or Reciprocity Agreement on principles and on a general scheme of duties in all that is necessary and an ample basis for successful work. It is not only permissible, it is highly desirable, that before the bill or bills are finally shaped there shall be the freest and frankest interchange of opinions.

There is the best way to get the new law right, and it is the only way to secure it in a reasonably smooth and expeditious passage to the statute-book. Of course, there must be ample time allowed for debate in both Houses, and we may perhaps hope for some valuable corrections and improvements from that indispensable process. Nobody proposes anything like railroads, or a reliance on more brute majorities. There is no brute majority in the Senate, anyhow. But experience does not justify us in hoping to see any tariff bill very much bettered on its way through Congress. The opposite has happened much oftener. The Democratic leaders are making no mistake in trying to see to it now that the tariff bill in Congress shall know its own mind clearly when it begins to render the first great service that is promised to the country.

## Careful with the Income Tax!

They are certainly making no mistake in giving plenty of preliminary study to the proposed income-tax feature of their great enterprise. We wish, however, they were more time to consider.

We must not forget that a revenue tariff is after all, a tariff for revenue, and that the amount of revenue it yields is sure to be a very important and by no means neglect criterion of its success. From that point of view too great care cannot be taken of the income-tax provisions. They will be an experiment, and their actual results in revenue will vary considerably, even though a flat rate or a sliding scale is finally preferred.

That is not the whole of the difficulty by any means. There is the practical certainty that any rate or scale of rates adopted will provoke strenuous objections. There is the probability that any federal income tax at all may give a supporting vote to the protection class, even though the country as a whole decidedly opposes the principle of it. There is the question of the advisability of beginning at all, in time of peace and of

reasonable prosperity, to rely at all largely on this new means of raising money.

Of course, there are considerations on the other side, and the strongest of them, we think, is the very simple one that when people pay a direct tax they know it for a tax and they know how much it is. That makes for watchfulness and some other things Americans have been upholding. Nevertheless, we for one, shall not be grieved if the money-raising quality of the tariff bill proper shall exceed present expectations, so that the portions of the income tax may safely fall below them.

## The Decks Out: A Good Idea

No wonder the author of Congressional Government ventured an infringement of a Washington tradition to get an early start at the transformed House of Representatives. Others of us with no such claim as his to special knowledge of the character and functions of our American parliament await with lively interest the results of seating our Lower House on benches instead of at desks.

Yes it is very likely there will be quite notable results, apart from the mere change in the looks of the assembly. Even in that regard some change was worth trying; the desks gave the Chamber an unwholesome aspect, making as they did against compactness and imposing much evident incongruity both on orators and listeners.

Of course, there are considerations to be worked in the Chamber that would have been otherwise impossible, but it was work that ought not to be done there, and they impeded debate not merely by the space they occupied, but by inviting interruption. It was unweary, not to say discourteous, the way members went on reading and writing and clapping for long periods, in utter disregard of the speakers addressed to them unwearily, to the way they crowded, standing, about any speaker they wanted to hear. It was about as fit a place for discussion as a counting-room.

The British House of Commons offers the natural criterion for judging the probable serious effect of the change, though the new seats, unlike those in the Commons, are so low and wide, and there are enough of them for all. If we may indeed judge by the Commons' procedure, the standard of debate ought to be distinctly raised. One specific effect should be to make the House less tolerant of bore; if members have nothing to say there but their, they are naturally less inclined to say more than they are necessary, for our own part—and for the *Record's* sake—we shall not be sorry if they even learn to lose. We shall be disappointed if they do not also learn to accept fewer committee reports and other things on faith. Indeed, we shall be disappointed if they do not get in the habit of attending to all their proper parliamentary duties both more carefully and more expeditiously.

## The Value of Adriatic Trade

Cabled comment on the fall of Adriatic is a trifle confusing. Indeed, if the whole business were not so likely we should be tempted to call the Eastern European Powers the Balkan Powers. As we add, are rather indignant with the Balkan allies for pressing the siege to a conclusion, arguing that more fighting was unnecessary, since peace was already "in sight." Maybe so, but was not peace at least equally "in sight" seven months ago, when the parties to the war all went consistently to London to make it and diplomats of the great Powers undertook to give their supervisory assistance? Was not Adriatic, unspoken, then the main stumbling-block in the negotiations? Until Adriatic finally was taken, was there any change in the situation to induce the allies to stop fighting and try negotiating again?

Somebody, no doubt, has already suggested the analogy between the Balkan war and that other warfare in the East which we read about in *Iliad*. In the Homeric war-making, as we all remember, the actual violent combats were but a part of what was going on. Always, above them, a very human lot of higher powers were intent on winning their struggle, quite regardless of taking a hand in it, and pretty steadily minded, although far from conceivably minded, to have the final say about the outcome. Substitute "greater Powers" for "higher powers," and we have again pretty much the same state of affairs before us.

With this we might think the Homeric example would justify the Balkan allies in abandoning all efforts to control the outcome themselves. It did not turn out that way with the Greeks and

Trojans. Achilles' victory over Hector and the strategy of the wooden horse did count in the end, notwithstanding the gods' supervision. For the gods themselves were divided. Nearly the little nations of the Near East are excusable for perceiving that there is division also among those who would play the part of the gods today. Somewhat they need not disregard the ruffled defiance of France and Germany, the intermingles of Austria and Russia, or Italy's conflicting impulses, or the fairly obvious mind of England to be something like justice done. They would hardly be wise to throw away the possible effort on a note too resolute Europe as of many *foils* accomplish, but as this of taking Adriatic, as they can have to show when the final settlement is made.

What they had themselves won by the sword before the armistice, counted at London in the terms which even then they might have obtained. Will not what they have since won and may yet win also count when negotiations are resumed? Europe would have let them take much from what they merely wanted. They will certainly not be compelled to deal more gently with Turkey completely beaten.

#### Not Flattering to the Women

The intimacy so much cultivated of late between conduct and income got a striking illustration on March 10th, when two thousand girls and men who went on strike at the Oliver Mills in Pittsburg held a meeting at the residence of Senator Quinn, asking his help "to induce your relatives to grant us wages sufficient for our men to support families and our women to retain their honor."

These strikers may put it that way, but it is not flattering to their women, and of course not justified. Moreover, it is not true that where wages are sufficient for men to support families, the situation is saved, for the most part, for both men and women! It was written the other day at the end of a letter of LINCOLN CHURCHILL to the *Evening Post*:

The girls who will bring about a wage for men sufficient to support a wife and family at the early age when most people married fifty years ago, will do more to abolish the hardships of women workers to-day and will add more to the strength and happiness of the nation than any investigating committee now in sight.

To the same effect are the conclusions of Dr. M. G. SCHAFER, neuro-psychologist of Cornell University. At the conference on Mental Hygiene in Philadelphia on March 10th he spoke of the causes of the growing number of insane persons and criminals in every country in the world. These causes he declared to be industrial labor among women and alcohol and blood disease among men. He said that the rate of increase of insanity was twice as great among women as among men, and that in the United States it was 25.4 per cent. of the insane female patients were there through diseases induced by excessive physical labor. And he added:

This is the destructive force that is filling our asylums and jails, killing one-third of the babies born in the first year of their lives, restricting more and more every year the means of mental hygiene, and demonstrating that these physical disturbances are due entirely to industrialism.

The men who employ women in our men's work in our factory leaves they are cheaper in the one who is destroying motherhood and childhood.

While more labor is being consumed than ever before, while specific diseases are on the increase, insanity among corrected women is the greatest plague which we must cure, if we want to save the nation.

#### Industrialism and Women

We seem to be just beginning to learn what machinery has done to us. Industrialism means machinery, a thing only two or three generations old as a controlling element in the life of the world. To machinery, and to the industrialism born of it, is chiefly due the great current disturbance among men.

Now, then, if the social workers and investigators and reformers get wages raised for all the industrial women and establish minimum wages, the upshot will probably be that a good many women will be thrown out of employment and the rest will live better. Both of these results would accord with the hopes of Dr. Schaffer, and probably both would help society. But the woman driven out of employment at low wages will have to be supported, and that will mean readjustment of some kind; more men working at better wages, or else a drop in the cost of living.

When we see movements going on that threaten the prosperity of the present order, and quake

at them, it is well for us to remember that the present order has some very bad diseases, of which it would probably die pretty soon if it continued to prosper at the present rate and on the present terms. One of its most threatening diseases is this reckless using up of women in industrialism.

#### Women's Clothes

The papers do not say whether anybody took advantage of the high water at Columbus or Cincinnati to throw in LOUIS H. CHURCHILL, of Cincinnati, the member of the Ohio legislature who has introduced a bill for a state dress-reform commission for women "to have testimony and collect data concerning the effect of the prevailing wearing apparel of women on the morals of the community," and "to prescribe rules and regulations for the designing and manufacture of women's clothing, and to prohibit such styles and patterns of garments as the commission, after hearing, shall deem detrimental to virtue."

Any state legislator can get no better advertising than this sort of act by introducing a bill of violent absurdity. We suppose Mr. CHURCHILL is the kind of representative who likes that kind of advertising. Of course his bill would come to nothing even if Ohio had not so many other things to think of, and was more in a humor to joke. The legislators of Ohio undoubtedly think that they cannot make laws to regulate the fashions of women's clothes, and if they did not know, they would learn in short order.

All the same, current feminine garb is harmonious with all other current manifestations in being severe than usual. The hobble skirts that still linger on our streets are amazing restrictions of the gait; the way skirts generally tend to cling about the ankles makes observing men wonder at the unnecessary nature of women, and the openness of frocks in the neck and chest makes their women at women's physical endurance. In these very days of spring, so apt to be raw, one sees girls on our streets with hardly more on their arms and chests than in midsummer. There is no incentive about it, but it is something one remembers at "at" that that was the congress of the physicians held in Rome last week and a resolution was adopted to the effect that the fashions in women's dress have largely contributed to the great increase in tuberculosis, and urging that some international arrangement be made for such correction in women's dress as may arrest the progress of the disease."

It was in the papers that WALTER, of Paris, who lauded here one week ago, said that "poems for the summer and fall are to be more daring than ever." Perhaps it is the cubist influence. Where is Brother Box and his American fashions for American women?

Of course no woman has to keep in the fashion, and civilized women are apt always to be fairly sensible dressers. Yet few women, however sensible, discontinue the fashions altogether, or are willing to be conspicuously out of date in garb. It makes a difference to almost all women what the fashions are, for practically they have to follow them. That they control them so little, and have so little choice about what kind of attire they shall wear, seems astonishing. If they were allowed to add in the shop or contrived by the dressmaker, and to get anything else necessitates stronger individual taste than is common, and an ability for original design which is rare.

#### A Soldier of the British Empire

Field-Marshal Lord WOLSELEY, now dead in his eightieth year, was for many years a great name in America, but a rather vague one. We all understood that he had done some things as a soldier, but we were hazy as to details. He had done fine things. He had played the hero in sunny years of the empire. It was his misfortune, however, that these all happened to be comparatively little wars, and in far quarters, and that when they were contemporaneous with bigger wars. But that he it is noted, did not share in the merits by his own government and countrymen. Great Britain never neglects to honor the subject who renders good service to the empire. It were well if in this we followed her example more consistently than we do.

There was one episode of Lord Wolseley's life of us that is particularly notable. Like the Count of Paris and other distinguished Europeans, he sought experience and knowledge of his profession on some of the battle-fields of our Civil War. Serving under Lee, he conceived the highest admiration for that American soldier, and became his subject and to some extent his biographer. Happily, the time has passed when

his playing that rôle might have set against him Lee's fellow-countrymen of the North. In our time the same rôle has been played by an Adams and a Hazard of Massachusetts!

#### Norton and His Friends

CHARLES ELMER NORTON, who died four or five years ago at Cambridge, Massachusetts, in the house he was born in, left some letters that a good many people here have been eagerly waiting to see. They are now beginning to appear in *Scraper's Magazine*. Unless expectation is disappointed, they will be rather extraordinary letters. For Mr. Norton was an extraordinary man. He was for many years professor of the history of fine arts at Harvard, and he wrote several books about his subject. He was also a student of Dante and made an excellent prose translation of DANTE'S masterpiece. But the peculiar interest of his life did not come from those admirable labors. He was a man whom many men loved, and among those who loved him were many of the fine spirits of his time in the country and abroad. Probably no other American ever had such friendships. The mere list of them would fill pages, and on those pages would appear the names of nearly all our greater American writers and artists of NORTON'S time—the last two-thirds of the past century—and an astonishing number of their English and Continental contemporaries. What we may see of his letters to Mr. Norton, and of his to them and about them, will be deeply interesting to thoughtful Americans.

We shall hardly say anything we could not do to see. For these interesting friendships were genuine, and as men ever lived with a keener sense of the sacredness of friendship, or of any other high relation, than Norton had. Most of his friends were of the best of their kind in the world, and he was to see the world as a whole in the right handling of great men's literary remains—CHURCHILL, for instance, and BOSWELL. He was scholar and student, connoisseur and traveler, but the best notion of him is conveyed by the phrase "an American gentleman of the nineteenth century." It is a serious question how many Americans of to-day could conceivably live such a high kind of life as he lived, or even would if they could.

#### Conclusions for Professor Fisher

PROFESSOR WILLIAM U. FISHER, of whose detachment from Wesleyan University mention has several times been made in this WEEKLY, has received from the faculty of Cornell University an elegant resolution of condolence on his dismissal.

The resolution does not precisely commend Professor FISHER'S performance, but records that he is a distinguished alumnus and former fellow of Cornell, and has been dismissed from the chair of economics and social science at Wesleyan by the Faculty of that university. It credits to him the Cornell faculty's "greetings and assurances of regard, with the message that his alma mater still seeks to maintain and extend the spirit of liberality, toleration, and loyalty to truth illustrated by the lives of its founders, ENNA CORNELL and ANTHONY D. WHITE."

#### Our Brothers of the English Toy Fair

The English Toy newspapers have been finding the most of whatever offense could be found in Mr. BRYAN'S St. Patrick's Day speech. Whatever the merits of the controversy they have raised about its propriety, it was simply the same sort of speech that any number of American public men were this morning making in the American galleries. It was the regular thing.

Mr. BRYAN said nothing to make Sir EREWAN GALT, in particular, mad. Is it a good idea, from the English point of view, to make Mr. BRYAN mad? The *Standard* fears that "the Irish electro-mechanical machinery" in this country—whatever that may be—may be brought to heel "in favor of discriminating small tools. Is it not a bad idea, then, to make that mad?"

We are sure it is, if the interest of Great Britain, in its relations with this country, is the main consideration of these papers. That is what we are assuming when we call their course impudent. It may not be impudent, however, if the main consideration is circulation or to delay Home Rule. Even the best English papers make the little effort to inform themselves and their readers correctly and fully about American affairs. Dr. CORMAN'S Anglo-American School of Public Learning" is desirable, but some of our English journalistic brethren need positive instruction as well. That would be an extremely profitable of the CUMMISSEY press fund.

# THE PASSING OF A GREAT FIGURE

Some of the Outstanding Facts of Mr. Morgan's Wonderful History.

The Career of a Great Banker, a Great Citizen, a Great Man

Copyright by Brown Bros.  
Mr. Morgan at forty

**J**OHN PIERPONT MORGAN was born at Hartford, Connecticut, April 27, 1837, of old New England stock. The sons of James Spencer Morgan and Juliet Pierpont Morgan. His father was a successful lawyer, his mother the daughter of Julia Pierpont, an eminent ethnologist. Young Morgan was graduated from the English High School, Boston, and was for two years a diligent student at the University of Göttingen. He was brilliant in mathematics, fond of good books and porters, an excellent singer, and well versed in music. At the age of twenty he entered the bank of Dunham, Sherman & Co., and three years later became agent and attorney in the United States for George Postels & Co., bankers, of London, in which firm his father was a partner. In the following year (1861) he joined the firm of Hoopes, Morgan & Co., and in 1871 became a member of Drexel, Morgan & Co., which subsequently became J. P. Morgan & Co. He married, in 1861, Maria Morgan, who lived two years, and in 1862 he married Frances Louisa Tracy. Their children are Louise Pierpont Morgan (Mrs. Herbert L. Satterlee), Julia Pierpont Morgan, James Juliet Pierpont Morgan (Mrs. William Purson Russell), and Anne Pierpont Morgan.

Mr. Morgan was a power long of success. From the day when, at the age of thirty-two, he won his first great fight and took the Albany & Saratogian away from the veteran Jay Gould and his confederate Fisk, practically everything he did turned to gold. To be asked to join in a Morgan enterprise was to be given an opportunity few cared to refuse. And just there lay the secret of Mr. Morgan's phenomenal power. It was not that he controlled world-wide capital in the sense that he could force it to do his bidding. It was rather that, as a result of successive demonstrations of his genius, it came about that in every financial center in the United States and Europe millions upon millions of capital awaited his call.

Constantly, throughout the half-century of Mr. Morgan's active life, was this great power exercised—in what manner the vision of great and desirable rail ways and industrial enterprises which bear his stamp are the best possible witness. But on three occasions particularly was his power made manifest. The first was in 1865, when, with the government in almost desperate financial straits, Mr. Morgan stepped in and guaranteed to refund the Treasury with gold taken from abroad. The second was five years later, when, having developed in the country's leading industry, steel, what Mr. Morgan regarded as a dangerous condition, he put an end to it by the formation of the United States Steel Corporation. The third was in 1897, when, at the moment when the panic had not as yet, seemed as if it would inevitably grow far worse and involve hundreds more of banks in ruin, Mr. Morgan hurried himself and his millions into the breach and saved the day.

For the profit he made on the first of these three great transactions Mr. Morgan, it is true, has been bitterly criticized. The time, however, has not yet for splitting hairs over the question of remuneration. Work gold steadily going out of the country and the whole supply in the United States Treasury drained down to about forty million dollars. It was not a question of the size of the commission to be paid for getting the government back on its feet, financially, but of whether the thing could be done at all. Mr. Morgan was the man of the hour. He, and he only, because of his standing with the great banking interests of Europe, was in a position to get them to give up the needed gold,

For the second great exercise of his power, the working together of the country's divergent steel interests into the United States Steel Corporation, Mr. Morgan has also been widely criticized, but here again the achievement is in itself the best possible retaliation of the charges made. It is not that the United States Steel Corporation is the biggest company in the

before had been strife and waste. Hereafter, when it was announced that the government intended to bring a suit against the company, Mr. Morgan took his true American custom of silence and came vigorously to the defense of his his greatest creation. "The corporation was organized for business reasons," runs the statement, "and purchased its various plants in pro-

world or that it employs the most men or that it owns the most money. It is that the corporation is what the genius of J. Pierpont Morgan foresaw it would be—a great stabilizing influence in the country's principal industry, a favor for good operating in the interests of harmony and economy of production where all

made such business and not to restrict trade or obtain a monopoly. In all its operations the company has unflinchingly observed the law and recognized the just rights of its competitors and the consumers of its products.

But however Mr. Morgan has been criticized for his financing of the government in 1865 and his formation of the United States Steel Corporation, for his demonstration of power in settling the panic of 1897 not even his sharpest critics offer anything but praise. Following the collapse of the British copper pool and the closing up of the banks associated therewith, the situation at New York had become one of such gravity that there was no telling the limits to which the panic might go. Every one for himself and the devil take the hindmost, that was the principle on which things were being done—that the famous conference at the Morgan offices following which it was announced that Mr. Morgan and his associates stood ready to lend \$25,000,000 to the stock exchange at once. In that moment, by the great financier's display of strength, the back of the trouble was broken. Conference after conference took place at the Morgan library for weeks after, but that was mainly for the purpose of determining the best way of repairing the damage done. When, in that darkest hour of the panic, Mr. Morgan was able to gather round him the disorganized and demoralized forces of American finance and, by the sheer force of his own personality, weld them into an effective fighting unit, the real victory was won.

The passing of a great constructive genius which carried American enterprise to heights previously unknown—that is not the country's principal loss in the death of J. Pierpont Morgan. What the American world of business, rich in any financial strength, had principally lost was a leader.

## THE GREAT FLOODS IN THE MIDDLE WEST

DEWAR'S FLOODS SWEEP A LARGE SECTION OF THE MIDDLE WEST DURING THE LAST WEEK OF MARCH, CAUSING A LOSS OF LIFE AND PROPERTY SO GREAT AS TO MAKE THE FLOODING OF CALIFORNIA AT GRAYSON AND JOHNSON, OHIO AND ILLINOIS REFERRED TO AS THE GREAT FLOODS OF THE MIDDLE WEST. THESE FLOODS WERE ALSO REFERRED TO AS THE GREAT FLOODS OF THE MIDDLE WEST. THE NUMBER OF DEATHS IN OHIO IS NOT KNOWN, BUT IN OHIO ALONE IT IS PLACED AT 500. THE TOTAL PROPERTY LOSS WILL MOUNT INTO THE HUNDREDS OF MILLIONS.

# A SOLDIER'S LETTER FROM SHILOH

Major Robert Barry's Vivid Impressions of One of the Great Engagements of the Civil War, as Recorded in a Hitherto Unpublished Document

**MAJOR ROBERT PEABODY BARRY** was born in New York City on March 20, 1839. His father was Samuel P. Barry, originally of Boston, and his mother was Martha Lewis, originally from Salem, Massachusetts. Robert Peabody Barry was the youngest son.

After education in private preparatory schools, he attended Columbia College. When he first entered the institution it was located at Church Street, between Murray and Barclay, but during the time that he was there the grounds were sold and Park Place was cut through. The college then moved to Madison Avenue and Forty-sixth Street. While at college he became a member of the Delta Psi fraternity, and an delegate attended a convention held at Raleigh, North Carolina. In his memoir he says:

"Here I met members from many states, but what impressed me was the tone of our Southern members. All expressed a sort of dislike for and a repugnance to the Union. It struck me as very strange and most unusual for up to this time I had never heard anything like it."

After the convention he visited friends in South Carolina, and his memoir continues:

"It was a very enjoyable visit to me, but I noticed here also the strange views of my kind which may remark were made about the country, how the government was regarded, not as theirs, but as a sort of hostile one."

The memoir further continues:

"I was at an evening entertainment given by a young friend—a Southern girl—the night the news arrived of the attack on Fort Sumter. Hearing crying 'Extra' ran along Fifth Avenue; some one went out and brought one and, bringing it into the parlor, read aloud the news of the attack upon the fort by the Southerners. An instantaneous still fell upon the guests and the party soon broke up. The next day troops were being mustered to go to Washington, and on the Seventh Regiment, New York militia, being called, I volunteered. I hurried home and told my parents and, without any soldiers, joined the regiment and left with it for Washington. We quartered at the Tompkins Market, near Eighth Street and Bowery, and marched from there through Broadway to the Jersey City ferry. The houses all along the route, also the passengers, were filled with an excited and cheering crowd."

He served as a private in the ranks of the Seventh Regiment during its historic expedition to Washington in 1861, but upon its return to New York he sought a commission in the regular army, and through the influence of Hamilton Fish and other influential friends of his family he secured a personal interview with Secretary Cameron, and received an appointment as captain in the newly organized Sixteenth Regiment of Infantry of the regular army. He was first detailed upon recruiting duty in a salient territory on Lake Superior, but his regiment was subsequently attached to the Army of the Cumberland and sent to the front. They took the field at Nashville, and it was shortly after this that his regiment participated in the battle of Shiloh, which is described in the accompanying letter.

After the battle of Manassas, in which he was

wounded, he was placed in an ambulance to be sent to the hospital at Nashville. A part of the wagon train, including his ambulance, was captured by Confederate cavalry, but he and other officers were paroled and ultimately reached Nashville. When he was wounded his sword slipped on the battle-field, where it was subsequently found and, having his name engraved upon the hilt, was sent to the regimental headquarters. While in the hospital at Nashville, his general called upon him and brought him the sword which had been thus recovered from the battle-field. Had it not been for this incident it would undoubtedly have been taken from him at the time of his capture, but in this rapier of fortune it remains a treasured relic in his family to-day.

After his convalescence he was duly exchanged and returned to the front, where he served throughout the Atlanta campaign, under Sherman, at times acting as the assistant of officers, being himself in command of the regiment. During his active service he has been promoted to the rank of captain, but subsequently received his commission with the brevet rank of major for gallantry in action.

Subsequently to the war Major Barry went into business in the South as a cotton merchant, and in the early eighties retired from business and settled upon a farm of approximately six hundred acres which he purchased near Warrenton, Virginia. Here in October, 1912, he passed away.

The letter referred to runs as follows:

My dear Mother—My last letter was written at our camp at Mount Pleasant. The next morning we were up at four o'clock, and that day made a most fatiguing march. At 10 a. m. we came to a river, where we rested half an hour and were told to fill our canteens, as there was no water for ten miles. We crossed the river and commenced a most dreadful march. The sun was scorching—the road, a light clay, was a continual dense cloud of fire, white dust, blinding in the eyes and choking to breathe. Often I had to put my handkerchief to my face for breath. No shade during our route—oh, it was horrible! When we came to the next water it was barely possible to keep the men from knocking marks in a body and rushing to cool their parched throats. At 7 p. m. we came to one camping-ground on the banks of a lovely stream. Here officers and men battled, then a good drink of whiskey and a short nap restored me. My men, though, commenced to fall and I had to give some frequent drinks of whiskey from my flask, to keep them up. For myself, I never drank till after the march. The next day at 4 a. m. we were again on the march, and this day saw many hours of Union people, who greeted us with waving flags in very rare sight down here. One flag at Waynesboro had on it "Home and Union." We made but fourteen miles this day, the roads were so bad. We had a beautiful place to camp, and, this being Saturday, were told we would not ever start Monday, but some we received orders to have reveille at 4 a. m. Sunday, which indicated a long march; so at 4 a. m. we rose. Mother, let me tell you that the old man, Early had led and early to "rise," etc., an immense host—there is no track in it. I have tried it now for some time, and from experience can say that he who can sleep and drink so well as he is a big fop. This day (Sunday) the roads were still worse than the day previous—they some times became so narrow and so steep, running on they did through deep gorges, that it was difficult for us to march. How our heavy wagons could pass seemed a question; but they did, and indeed it must be a very, very bad and impassable road that will stop any wagon.

About 9 a. m. we first heard the distant sound of cannon, and then they commenced to fire on us. It was terrible, loud. I stuffed my cap with grass, but still could not prevent a raking bombardment. Still we pushed on—up steep mountains, down valleys, till twelve, when we were met in an open field and given an hour for rest. Here word was received from General Buell to leave our trains and press on. The trains of the whole division were left here, covering hundreds of acres. Oh, how hot it was! I took up my coat and left it in the wagon, keeping only my blouse and pants (Cady's set). How I have suffered for that (Cady's set)! Now commenced our march. When the road went straight we followed the road; when the road turned for hills and streams we left the road, broke down trees, and took short cuts, up hills, down hills, over hills, through streams; nothing stopped us. Our general had had orders evidently to bring us there. It seemed as though, too, the sun would kill us. Still on we went—the booming of artillery growing more distinct as we pushed on. There was evidently a battle raging and we were warned. The song and jost were no more heard. We were too tired to talk, too solemn in jest. Once we stopped on a hill where a noble stretch was building; in this the officers of the Fifth and Sixteenth took shelter from the sun. I threw myself down and offered a mental prayer to the Almighty for strength for the coming trial.

Soon the bugle sounded, the men fell in, and again was that mad, mad, mad march up that 4 p. m., when we were within ten miles of Nashville; here we were given two hours for refreshment! Our refreshment consisted in lying down on the river bank and regaling our palates with hard bread and water. I tried to sleep, but could not. I was too cold (all the night we sold) and too tired, as I sat on a log and talked. It was rumored that the Union had got the worst of it, but no one knew anything definite, as I concluded not to bother my head about the numerous stories that were circulating.

Between 8 and 10 p. m. the bugle sounded and we commenced our march to Nashville. It was slow march—the road was filled with troops and the transportation was limited to take them over the river. It was past twelve when we were in the boat. The scene was impressive, the streets filled with artillery and infantry, all moving toward one point. No word was spoken. Only the masses of men drawn up in close columns could be seen, with the occasional reflection of sunlight on the brass cannon. Then, too, the buildings filled with the wounded and the lights that lit up their rooms. To see these thousands of men and these scores of batteries and to hear no loud talking—no shouting—only to be aware that the dusky mass kept moving steadily toward the river. To see all this, mother, I swear, and then to know that many of us would never see another night, was in a measure stunning to the senses. Our battle were frequent, and the men, who were warned out from marching from

# That TIRED FEELING

by LEONARD K. HIRSHBERG  
MD, MA, AB

Drawings by F. Strothmann

**A**T THIS time of the year you feel tired. You wind your way hesitantly to your friendly dragged with discouraged nerves and warring slumps. A haunting fear of impending physical exhaustion and mental inertia shows itself to your nervous neighbor.

"You have spring fever," he insists. You do not deny it.

"Get some relaxed and sane, and Hirschberg's Tired, the spring blood tonic," she promises. "It will purify your blood and make a new woman of you. Ah, you're ready that what my husband had April—"

These are told you the story of what in an entirely different mood, but which she and you believe to be the same. You are comforted, however, and happily accept another prescription from this accommodating pharmacist. Though he tells you is a bit "under the weather," you smile with gratitude the great chance to reconvert your system with "tonics" and "blood purifiers."

You have an "spring fever" and a low "tired feeling." The truth of the matter is that this periodic lagging and "down-up" feeling is a constitutional disturbance due to something entirely different from over-work and long hours.

Bleed throughout the long, weary winter, your muscles, stretched tissues and all assembly like hot-house flowers, forced in their capacity to withstand the extremes of wind and weather, halcyon mornings and frosty nights. Your throat, your nose, your chin, and your hands, though able to adapt themselves to indoor air, or even over outdoor weather for a time, soon reach the limits of their endurance, or, as the scholars say, the point of strain or collapse. Then the mischievous colony of germs, with their devilish sagacity, sweep down into your body, the thickest unguarded opening, such as a chilled nose, a hood-stuffed trail, or a fur-lined hood, not being too much for these small organisms to tackle.

Though ignored because of the wintery cheer, the halcyon hours, the tempting outdoors, concentration of attention or rapid resolution will reveal to you that just before or as your tired, druggy feeling started, you had a strange sensation in your stomach, a scratchy feeling in your throat, a sneeze where from your nose. You calculated, and made them, and then, what on Christmas or the Fourth of July would be blamed upon a "cold" or a "bad strain" in the recent days passed commemorated, the air of prearranged measures or your physician, the trifling ills or redness is ignored.

But this hardly perceived trouble is the usual indication of more serious maladies. What should be immediately brought to the attention of a doctor is hesitancy in the endurance of animal spirits. For as matter how hard you work, how much you worry, or how melancholy you were in the wintery days, a new touch of spring makes you forget it all. Like-spring is nature's cruel ruse.

That touch really is a restorer is proved by the fact that what would have developed from this unassisted organism, other serious conditions, pneumonia, bronchitis, joint diseases, or worse, in many cases now drugs or maldeveloped as your "tired feeling."

How, now, shall you rid yourself of this tired feeling that is not a tired feeling? How can the victory be won, the balance struck on the side of our vital powers? How shall these microscopic enemies of health be driven forth? Can you master them by sulphur and soda-salts, ammonia and nuxia?!

The ignorance of the fathers is here shown in the children even upon the third generations. This is true of disease. Even though you was tissues are a language you know well, by conveying to you the knowledge, writing, and social habits, are needed that you would instinctively employ for help, he observes nature's hint. Instead of wailing like a weeping, wailing, and gnashing of teeth, he lies of relaxing muscular movements, the expenditure of energy, by stopping all work, your blood organs are resting, but light and to work. Pseudo-scientific, synthetic methods, and Lady White's Pink Pills are relied upon to take the place of rest, change of line, and dietary changes.

As means of prevention may always be considered with a pound of cure. In the same way too or more dry rest or bed are better than a Pacific of tincture. A few days of absolute quiet—and this unceremoniously means fat on your back and undressed—bring into immediate action against germs all of the living energy expended in nervous and un-nervous actions. When the body rests from work it is the more powerful against disease. A week in bed in April may save you six weeks in June.

There are various ways of resting your vital forces, but none surpasses your own or a hospital bed. Second in value for the "tired" case, however, is rest of mind and body by a few weeks' visit away from home. Usually, where or when it is possible, the two are combined. The work in bed is then followed by a week or two away. If some beloved friend or sister will rub your exhausted limbs, knead your neck, and stroke your arms and legs rhythmically about thirty minutes each day, beginning lightly and increasing the vigor of the massage slowly, it may be unnecessary after the first day to give Solfista powder, Epsom salts, or the usually harmless cathartic water, again. Should your system require a strong internal washing—and this is avoided in the beginning of more serious infections—the salt mixtures and saturated salt water mentioned are preferable to

cure the threatened trouble herself. At such a time if cellulitis, bone-tissue, thrombosis, or tracheal artery nodules are given they receive unkindly the credit.

Now I shall try to describe the specific dietary and other directions that I advise for the woman who does her own housework, for she perhaps is attacked most often by this kind of ailment. The first thing to do is to rest. You must forthwith go to bed and get up improved, after for a week or ten days. Copious draughts of good water and the diet may be as follows: At first at times it is helpful to give a pre-digestible tincture of effervescent citrate of magnesia, hydrocarbonate of milk magnesia, phosphate of sodium, Epsom salts, or some other salt. If the husband, relative, or neighbor, is unwilling, a visiting nurse—in large towns—is shown how to manage the patient. The bedclothes are arranged so that air may come out above and enter below. Cervical books are read to, and conversation held with, her at alternate intervals of an hour or so. This is begun not before eleven in the forenoon or after six in the afternoon. No tea is expected to have any "effect" for the reason that the stomach is not to give at six in the morning, the massage at eleven, and a tender rub down before the liberal seven-o'clock dinner.

The hours of the "meal" are eight, ten, twelve, three, five, and seven. At eight o'clock, give two level eggs, poached, on wheat biscuits, with a portion of cream or milk, and a grapefruit or an orange sliced. At ten o'clock a glass of milk with vanilla or any amount. At noon shortly, ice-cream, expressed meat juice, sliced apple, prunes, and crackers with jelly. Then, after a three-hour nap, a milk shake (with flavin and white of egg), at 4:00 an afternoon, a small—two egg white water up with sugar, fruit juice, and a pinch of table salt. At seven o'clock broast, chicken liver, asparagus, potatoes, rice, toast bread, and all the water desired. Use water on the hall after, sweetbreads, or chops, have oatmeal or rolled hot milk loaf, french custards, olives, and various tempting delicacies are given at nine o'clock.

By this diet it may be seen that the prime essential is a non-stimulating, nutritious kind of food, one easily assimilated with no extra strain upon the de-toxifying stomach cells. Such especially includes as venison, cold fivers, kidneys, thick soups, soup soups, Irish stew, turnips, fried fish, chicken, mince, cornstarch, cream, coffee, tea, cream, pie, squash, pickles, pastries, and the like are rigidly prohibited.

The plan to be followed is varied a bit for working girls, society women, and school girls, but the general principle is an inviolate law. Thus the working-girl of the salary-giver group receives a judiciously increased quantity of iron-stuffed food, such as peas, spinach, and perhaps some nutral tea. On the other hand, the leader of the social world, the teacher, the writer, and the self-willed worker receive more eggs, milk, and fat than the others, while the most individuals are given butter-milk, whey, and no butter, egg yolk or cream.

At the first sign of spring feelings, whether "tired," "feverish," or otherwise, go to bed and rest for your medical adviser. If it is your baby, or child, it is as "bothering." If it is you, do not rest at more to the drug stores. If the emergency be such that you are unprepared for the first sign of trouble, you may use a "bothering." If it is you, do not rest at more to the drug stores. If the emergency be such that you are unprepared for the first sign of trouble, you may use a "bothering." If it is you, do not rest at more to the drug stores. If the emergency be such that you are unprepared for the first sign of trouble, you may use a "bothering." If it is you, do not rest at more to the drug stores.

Do not run at once to the drug store

ills, powders and lotions. Frequently the diet, accurately regulated, effects this purpose.

The prevalent fallacy about a change of diet from the winter fare to the spring one is on a par with those other popular notions about forwarded medical theories. It is the more serious disease, such as typhoid. The rest in bed also dictates another dietary regimen. The healthy, the average, the timid, unless illness all demand a carefully regulated diet. Allow me to warn you, though, against the omission of skilled medical guidance—and I say this knowing that, strongly enough, "water" will many times

# WHAT IS THE MATTER WITH THE CURRENCY?

BY JOHN D. LAMSON

**T**he present banking and currency system was invented during the Civil War. As with the Monitor, it was a product of the emergency of the moment. The chief reasons of the war found the government hard up for money or other means to finance—that was the necessity. The present currency system—that was the invention.

Some bright mind conceived the idea that if any bank buying bonds from the government were given the privilege of issuing bank notes, a lot of bonds could be sold. That turned out to be the case. Each didn't hesitate long when Egan offered to sell him his bright idea for a mass of postage. The banks didn't hesitate long when they were given the right to issue. The government offered them its bright idea of issuing currency.

The Monitor did good work in '62, and the present currency system did good work in '64. But times change. Egan's invention was a wonder at the time, but you would hardly expect the old Monitor to go up against a modern battleship. No more can we expect to get today's business properly done with the help of the old currency system. In fact, between the old eleven-cent-on-dollar and the modern dollar-on-dollar there is a lot less difference than between business conditions in 1862 and business conditions at present.

You can get up on either side of the question. There are lots of intelligent people who believe that the brain ought to be let alone and let it alone as they think they can do better things down there. But on the question whether or not the present currency system is obsolete and needs to be made over to fit modern requirements, you don't find any difference of opinion. You see men who say they don't know anything about it and so are not competent to judge, but you see men and the statement isn't made for sweeping—and yet one who knows anything about the system saying that the system is not right as it is and ought to be changed. We forget this easily, but the time when practically every bank in the United States suspended payment is only five years away and money has fallen far behind.

Experts differ on the diagnosis, and they differ on the remedy, but they don't differ on the fact that there is something radically wrong with the present system, and we go about peacefully cultivating our vineyards, but we know very well that it won't be long before there will be some radical change, probably, than the last. We shudder at the thought—this glimpse up at the present situation and the time when we are required, and we are required to pay.

For a while we manage to get along, but what happens eventually is only too familiar. Sometimes, as in 1862 and 1864, we get off completely, and the business men who have good collateral to offer paying only a dividend per cent, or so for money. Sometimes, as in 1862 and 1864, the machine breaks down entirely; the banks practically fail, and everything comes to a standstill. Whether it's going to be just a "ferry" or one of these regular bankruptcies is always an interesting question. You can't tell anything about it in advance. All you can know for sure is that as long as we sail along with the present fiat-warehouse currency system we're bound even more so to get into these squalls with the certainty of being badly knocked around and the strong probability of being scuttled.

But to get down to brass tacks, what is the matter with the currency system, anyway? Three things. In the first place, the banks, instead of all pulling together, all pull for themselves. They are all hoarding up stocks of trouble each bank tries to grab all the real money it might get, regardless of how its neighbor bank may be doing. In the second place, the banks are hoarding up the money that passes from hand to hand, hence no relation to the country's varying needs for currency. The third place, things are so bad, so that it is more reasonable and profitable for the big banks to hold their money to speculate than to merchants.

Let us look at each of these banks separately. In the first place, the big banks are hoarding up the money. We have in this country 7,200 national banks, all under the direct supervision of the federal government. Banks located in any one of the three "central reserve cities"—New York, Chicago, and St. Louis—are required by law to hold twenty-five per cent of their deposits in any one of these cities. Banks located in any one of the forty-seven "reserve cities" are required by law to keep a reserve of twenty-five per cent of their deposits in any one reserve city. The rest of their deposits are to be deposited with a bank in one of the "central reserve cities." All the other banks in the country are required to keep a reserve of twenty per cent of their deposits, of which twenty-five per cent may be deposited with city banks and two-fifths must be held in the form of actual cash.

There you have the hoarding up of money in a nutshell. It isn't necessary to go into any long explanation as to why the country's cash drains into Wall Street or New York, Chicago, St. Louis,

and St. Louis are designated in the Bank Act as the three central reserve cities. When business is active throughout the country cash stays out through the banks, and business is inactive, it stays in. The banks don't want it flow into the central reserve cities, just as naturally as water flows downhill.

So, as long as you don't own the money themselves, the interest banks are quite content to let it drain into New York or Chicago. But after a while things get active again through the country, and then these banks want their money back. They can get it without trouble. Sometimes they can get it with trouble. Sometimes they can't get it at all.

It all depends on how New York looks around to let them have it. If the stock market is quiet and the money doesn't happen to be tied up in New York, the banks are all right, but if the market has been active and most of the currency has been loaned out on stock collateral, it isn't quite so easy. The big city banks call on the loans of course, but they are usually to be shortly repaid, so they may not want to do that. They themselves, in the first place, are likely to be interested in the market and afraid of the effect which the calling in of loans in a closed market will have. Then again the people who have borrowed the money may be good friends of theirs and not likely to be "put to bed" by New York or Chicago. So, in some cases the city banks may find it highly inconvenient to send the interest banks the cash they want.

Then, if the situation in New York is "tight" enough—as it has, for instance, at the end of 1907 and all through 1907—there follows a regular scramble for currency. There is only just one and so much to go around and no possibility of any more being brought into existence. So the banks fight among themselves for what there is. There is no question of this bank which doesn't happen to need currency passing up along to that bank, which does. It is a regular question of every one for himself and the devil take the hindmost.

That is the most of thing responsible for the lack of a provision for currency. With this lack of provision, there is no safety in the system. One per cent of its deposits in cash and hoarding up every bit of currency on which it can by its banks, and the result is that there is no safety in it. It's no wonder that other banks that have been hoarding up cash getting their first into the trough have been "put to bed" by New York or Chicago. We can't get enough cash in pay, you see with it. It's all locked up in banks in New York, Chicago, and they simply refuse to let us have any.

Thirty-five and forty per cent of deposits held idle in vaults of all our central cities. It's no wonder that thirty-five or forty per cent of a man's blood should suddenly run into one part of his body and stay there. That is the first great fault. How is it going to be remedied? All the thinking men of our system are co-operation among the banks. By fixing it so that as soon as a demand for money arises every bank in the country would be compelled to grab all the currency it might regardless of the fact that as a result of such action its neighbor bank is likely to "go broke."

The second great fault is that the amount of currency in the country is not in the least regulated by the country's varying need for currency. When business is active in the country, the amount of cash is used that when business is quiet—no extra money around in your pockets, for instance, and the amount of cash in the country is not increased. You test the fact that business is active and that money is in demand, or that business is quiet and that the banks are hoarding up cash, and you find that the supply. The amount of currency is regulated by the amount of government bonds available for banks that want to increase their circulation.

The whole system was started, as has been said, back in the time of the Civil War, in order to give the Union government a chance to sell its bonds. "Buy the U. S. Bonds" is the slogan. It has been said that you can put them up as security and have your own notes against them. It was a good provision and the banks did it until it was abolished. They bought these they loaned notes. The amount of notes they issued depended entirely on the amount of bonds they held.

It is just the same today as it was then. There are no more money government bonds outstanding, and the practice of issuing currency is regulated against them. The government has issued more bonds which the banks can loan notes against and so the total demand is not in demand. But, on the other hand, the banks do it as they do now. If you have the same good times and bad, business active or quiet, currency in demand or not in demand.

Simply this. Take it at its time when business is quiet and all these bank notes aren't needed to carry on trade. What happens to them then? Are they al-

lowed to be left? Hardly. Some sort of use has got to be found for them in order to make them pay for their lives. If they can't be used to carry on business they are taken up in a different way. There is always plenty of speculators around willing to borrow any money that may be offered. While the speculation is not a very profitable thing, it will be necessary, maybe it will be in real estate. While it isn't so much as a bank, what counts is that it will stir up money.

That is, when there is too much money around. When there isn't enough there are naturally even worse. This is a big country, and we do things in a big way. When business gets really active a lot of money is needed. It is just as with an automobile—when you're running you don't need much oil. But when you're running fast you do. With a lot of money in the country, it is just as with an automobile. If the money of a country is in the same place as the business of this country, you are in every case in a while when it gets going too fast on an inadequate supply of money.

That is the second fault. What is the remedy? Clearly, to arrange things so that when currency is needed for business purposes it will be there, and so that when it isn't needed for business purposes it won't be there. In other words, instead of the present rigid currency, to have a currency which is elastic—that will expand and contract according to the needs of the country.

That is the kind of a currency every first-class power expects to have. How can we institute such a currency? By following the example of those who in banking matters are the most successful and wise. They are the commercial notes—the tangible evidence of a business transaction—the basis of our currency. Smith sells Jones a bill of goods and takes five cash notes in payment. Jones's note represents value received. There is no more logical basis on earth for the issue of currency than that note. Why have we added to it anything else? It is a matter of whether reasonable that the note has taken should be readily convertible into money. In all other countries that is the case.

The third great defect in our present currency system is that everything floats the dollar in an artificial way. It is not a true measure of the value of the dollar. We have more or less of a system of discount. It is true, by which the banks lend money to merchants at a discount. The banks are not the chief business of the big city banks being to furnish the money to the country. They are not the chief business to issue our stocks and bonds as collateral.

No one there is just one great wrong which has in an Account in the present law of the United States (of 1864), no national bank can "accept" a sixty or ninety day note drawn upon it by a customer or by some other bank. The result is that the "bank" is not a bank in the ordinary sense of the word, and the result of that is that there is no direct discount market for any kind of paper having a term of weeks or months to run. All bank, having discounted a note for a client, knows that it is "long up" with that note till it matures. Under our present system, for a bank to try to rediscount a note is often taken as a serious admission of weakness.

As plain as daylight in the newspaper. Keeping full well that the bank is not a bank, the bank is not a bank to merchants—they tie themselves up all the paper matters, the banks simply do not buy their paper. It is not a bank in the ordinary sense of the word. If they knew that at any time they could take this paper into the market and rediscount it and get the cash, they would not buy it. It is not a bank. But that's just what they know they can't do. Having bought the paper, they know they've got to keep it—no knowing that, they don't buy it in the first place. They prefer to hold it until they can get the cash or to let it out on call on the Stock Exchange. In either case they can put their money back any time they want. It is not a bank in the ordinary sense of the word. The real lawlessness of it is that the bank doesn't want to let its money out as it would do if it were commercial paper. The making of loans which it can at any time call in, it considers a far more preferable thing than to let its money out as it would do if it were commercial paper.

Who wants to borrow money from banks on that basis? Speculators, and speculators only. They are the only ones who want the money, while the merchant is left out in the cold.

There are the three great defects of the present system. Whether they are remedied by the adoption of the plan recently proposed by the Monetary Commission or by the adoption of some other plan, you can't tell. It is not a matter of whether they are doing the business of the country an invariable amount of time and that they need to be considered.

# THE AUTOMOBILE IN COURT

BY THEODORE M. R. VON KÉLER

DRAWINGS BY PETER NEWELL

**W**HILE it need be admitted that the material of today is not the proven non grata of a few years ago, it still is sufficiently evident that he is not yet rated as an ordinary mortal—especially when he comes in conflict with the law. Theoretically, all men are equal in the eyes of justice; in practice, however, the materialist not infrequently gets what is known as a "raw deal." And even in those numerous cases where he gains a victory in the courts he is compelled to contend a certain antipathy on the part of the lawyers and judges, which vitiates its effects in the greater costs of his trials and the frequency with which he is appeal to higher courts.

The extraordinary growth of the automobile industry in the United States, and the fact that nearly three hundred thousand persons have joined the ranks of the motorist during the year 1918, have naturally tended to diffuse a more intimate knowledge of motorcars and their characteristics among both the judiciary and the laity, with the result that in this country the owner of an automobile receives the same kind of justice that the owner of a horse-drawn rig gets—which may be considered either a compliment or a "knock," depending on how one views American justice in general. In Europe, on the other hand, the automobile owner is still the privileged person, and the chauffeur a sort of mixed breed between a henchman and a villain, for whom special laws must be made or existing laws be defiled in a particularly unbecoming manner.

For instance, there happened an incident recently in Bavaria, which appears almost incredible; it would have been incredible had it happened to a horse-drawn driver, instead of to the chauffeur of an automobile truck. A brewery regularly sent its big motor-truck from the plant to the railroad station, loaded the front with full beer kegs, on the return from the station the truck usually was empty. On several occasions the wife of the foreman of the brewery climbed atop the truck at the station and was carried to the house adjoining the brewery, in which she and her husband lived. These trips had only taken place about half a dozen times, when the brewery was taxed twenty-five marks, the driver two marks, and the motor-truck itself twenty-five marks because, it turned out, the so-called truck had been observed into a passenger-carrying omnibus. The brewery and the driver both appealed; the courts found against them. It

almost gives a "fit" for a few miles.

In another case a stranger, who was touring in southern Germany was injured in a collision with a railroad train at an unprotected grade crossing. When he attempted to sue the railroad for damages the lower courts told him that, because he was a stranger in the district, he should have studied the suspended charts of the same, when he would have learned all about the grade crossing and the dangers. The next higher court upheld this decision, but the highest court of the empire, the Reichsgericht, reversed the former decision and declared in favor of the motorist. And the reason for its reversal was not, as might be expected, a realization of the injustice done to the automobile owner, but the fact that the warning sign placed near the crossing was of shabby gray color, and covered with dust, so that the signs in a light condition the railroad had to pay the damages, but not for the injury to the motorist crossing the tracks at a time when no regular train was due.

That a chauffeur of a taxicab ought to distinguish between fat and slender people and steer his cab accordingly in the automobile decision of the Berlin Superior Court, the chauffeur was driving his cab along a certain street in Berlin, when a somewhat corpulent gentleman rushed into the middle of the street in the effort to catch a trolley-car, which at that moment was passing the taxicab. The fat man grabbed the handle of the car with the left hand, his other hand holding an axially handle and managed to catch the step. An instant later his head slipped and he tumbled back into the street, immediately in front of the taxicab. The wheel of the latter ran over his head and his leg was broken. The chauffeur was sentenced by the court to pay damages because "the plaintiff being a fat man and carrying a handle, it should have been evident to the chauffeur that an accident was within the range of possibilities, and that he therefore should have taken the precaution of slowing down or stopping when he saw the fat one wildly grabbing for the handle of the trolley-car." There being, however, an ordinance about handling electric cars in motion, the court decided that the culpable one was greatly negligent and that the most he could collect from the chauffeur was one-fourth of the damages asked. Strange to say, the trolley car company has not even been sued—something that could never happen in this country, where the street railroad companies are the first to be haled into court in case of an accident.

The fat one grabbed the handle of the car with the left hand

The question whether the present construction of double-deck omnibuses is a menace to the public, or whether this menace is an inherent quality of all trolley-buses, is at present before the Reichsgericht of Germany, after having occupied the lower courts for more than three years. The learned justices of the highest court recently handed down an opinion in which they admitted that the question was too much for them, and that they needed further time to examine experts. The case hinges upon the question of one of the omnibuses will turning a corner at moderate speed through skidding against the curbstone. A passenger seated on the "harmless deck" was flung through the window of a store and sustained serious injuries, from which he died.

They sent the omnibus company for damages, alleging negligence in the construction of the vehicle. The lowest court found in her favor; the higher court reversed the decision; the next higher court again found in her favor, and now the Reichsgericht examines its inability to come to a decision. Technical experts declared that the motor-buses were built according to the best methods and the available data, and that neither the company which built them nor the company which operated them could be held responsible for the occurrence. It was proved that the trolleys were fitted with anti-skidding devices and that the driver was proceeding at a cautious and legal rate of speed. The witnesses for the company claimed that the accident was due to "the influence of a higher power beyond control of the defendant"—and according to experts the legal limit of Germany are also regularly divided by opinion as to the placing of the responsibility. Germany is not the only European country in which strange decisions are rendered, but the precedents of the German mind is often accompanied by a lack of flexibility, especially among lawyers, and those charged with the interpretation of the statutes of the realm.

The wife of the foreman climbed atop the truck at the station

took an appeal to the highest court of the land to convince the police authorities that a truck is not necessarily an omnibus because a third woman is occu-

pancy of possibilities, and that he therefore should have taken the precaution of slowing down or stopping when he saw the fat one wildly grabbing for the

## FROM A WINDOW

BY ADA FOSTER MURRAY

We see the stiered street's sweep,  
The sculptured Palloade;  
Close by the silent people keep  
Their holdings in the shade.

And just across the quai's street  
A wave rattles the rye,  
Where choleraed temples proudly meet  
And carved fanes arise.

The pine-tree's dusky image falls  
Attenuated down of Spain;  
The tumbled spindlers of her halls—  
Not late and long—remain.

But rising morn and setting noon  
Bring back the light of Germany;  
The strain of poets that run  
Wherever darkness dwells.

many people, sir, who would go out of their way to come here and tell us about it, and above all to bring the tire along to prove it.

**CUSTOMER** (suspiciously): Kind of me? Saved me trouble? After my wife and I have trodden three weary miles along a soft, muddy highway—

**SALSMAN**: Ah, that is one of the virtues of that tire, sir. I think we shall call it the trouble-averse—warranted to last within convenient distance of home. When I think of the distance you and your good wife might have had to walk had that tire burst when you were ten miles from home, or fifteen, or possibly thirty—er, ah, it makes me shudder. It does indeed. Now I suppose you would like me to take your order for a supply of those—

**CUSTOMER** (at this point jumps into an orange-plaid rug-car, a self-starter, preferably, and proceeds so rapidly as the laws will permit to parts unknown, before your caller has sufficiently recovered to bring you over the eye with the rubber hose in his hand, which you will doubtless observe is by this time panged in the air, preparatory to a sudden descent.)

### UNCLE JOSIE'S JOKE

"Get!" said old Uncle Josh, as the wall from the parlor wavered under and more piercing. "I wish that three female summer boarders'd stop that infernal practice 'n' be a sign' for a bottle. She for a robe like a fish."

"Like a fish?" demanded Mrs. Josh, severely.

"Yes," said Uncle Josh. "Mostly scales as 'fater's' baby."

### MOST INTENSIVE

"Do you believe in intensive gardening, Mrs. Hoochey?" asked the visitor.

"Well, rather," said Mrs. Hoochey. "I spent all last winter raising one position in a soup-bowl."

### A SUBSTITUTE

"You didn't buy that big touring car you were looking at last fall, did you, Hawkins?" said Hiramway.

"No," said Hawkins. "I got a couple of little runabouts instead."

"Eashtown?" retorted Hiramway.

"Yes," said Hawkins. "My wife presented me with Ernie. Can't afford too many luxuries all at once."

### A BOOMERANG

"I sure've seen you out laugh this way," said the sheriff, as he strolled Dabbledick's car for a short ride to Hilly, and observed that Dabbledick seemed highly amused by it.

"Yes, I just can't help it," laughed Dabbledick. "I only use Higher Five hundred dollars, and it'll cost me three times that to run that car six months."

### ONE MORE UNFORTUNATE

The spirit and brought out the usual crop of Ebb-low wanderers.

"Want help, do you?" said the progress-looking party, who had been up to the assistance by one of these.

"You're a fine-looking lawyer I must say. Why don't you work?"

"My business ain't any good at dis season," said Dusty.

"What is your business?" asked the progress-looking party.

"I'm a pretentious theologian," said Dusty.

THE MARK: THAT'S A FORTY-ROSBY POWER RATING. MAKE ME FEEL.

THE FOAL: GET BETTER, THEY'RE PART OF THE FORTIFY. BUCKLE UP, SIR FAY.

### THE FOOD OF THE FUTURE

Hygienic chemistry is going to provide the world with nutrient meat, with without a cow, egg without a hen, and other marvelous food products to reduce the high cost of living.—Daily Worker.

They're going to make milk from the soy bean, and eggs by a chemical trick; and ribbon corn made of nitrogen they'll serve with a cholesterol stick. Mock-turtle soup very soon, they say, will be hot a species of drink distilled from the head of a one-horn slay and a quart of indelible ink.

A curious book of a lunatic poet to make an epicure share will soon, according to late report, be made of old kernal paste; and the lock-wind culms of the days of yore that set all our hearts aglow will soon be had at the Cheap Food Store in Boston and Milan.

A solid five with a flavor free to cost but a half-cent will soon be made of a page or two of the Starkey equipment; and a sixteen pair for your hill-of-dare and the new food substitutes will soon be served on your table three fresh out from your rubber boots.

A jelly that's pleasantly milk and water, and called to any taste, will soon be fashioned of sugar-free mixed in with photographer's paste; with your coffee hot that you love so well, dark hours of an amber pale, may soon be got, as the prophets tell, from telling a rosy and.

HORACE DOUG GARTER.

### WHY HE WAS TARDY

"Please, teacher, my'n's dog got hole of my pants; that's why I an a little bit behind."

# Tire bill payers!

You have demanded a vis-like rim-grip - with no cutting or breaking above the rim - and here it is

## Diamond

Vitalized Rubber

{ No  
Cinch } Tires

Cross Section Diamond Safety Tread Tire

### with Perfect 3-Point Rim Contact

It's the *rim* as much as the *road* that wears out your tires. So we said to our Engineers: "You must build us a tire with perfect 3-point rim contact."

*They did*—and now we offer you a sane, sensible, No-Clinch tire that will appeal to you, as a hard-headed, shrewd tire buyer—a man who insists on easy riding comfort and good liberal mileage.

Each point of rim contact in a tire is a point of support. Where the points of contact are not perfect, undue pressure is brought to bear at an unsupported point of the tire.

Then what happens?

The result is a terrific strain on the tire that will cause rim troubles, breaking above the bead and separation of the tread from the carcass.

All this is overcome in the "Diamond" because the three points of rim contact are absolutely *mechanically perfect*—the annealed steel cabled wire bead holds with a vise-like rim-grip.

This is only one Diamond advantage.

You get additional More Mileage advantage without extra expense in the Diamond *Vitalized Rubber*—a scientific combination of pure, lustrous, young rubber and a secret toughening compound—nothing inferior in rubber, fabric or workmanship—the No-Pinch Safety Flap inner tube protector—and, if you desire, the now famous Safety (Squeegee) Tread.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims at any of the

**25,000 Diamond Dealers**  
always at your Service

The guarantee on Diamond Tires begins when you buy them. We stand behind our tires. We guarantee them to give you the most mileage for your money. We guarantee them to give you the most comfort for your money. We guarantee them to give you the most safety for your money. We guarantee them to give you the most value for your money.

# THE MERCHANT WHO CANNOT TRAVEL

BY

FRANK J. ARKINS

ILLUSTRATED BY B. M. BRINKERHOFF

**S**OME men develop business by absorbing knowledge from others. The skilful, resourceful merchant, particularly the merchant of the small town, who can not afford long and expensive trips to the big commercial centers, finds this one of the most effective ways of getting on in the world.

He may be a good business man. Perhaps in his younger days he had metropolitan experience and met many men. In a small town or city, however, unable to get far away and see what the "big people" are doing in the great capitals of trade, if he has not some method of keeping fresh, alive, and informed, he is bound to sink into a rut and, partially at least, fail.

The average storekeeper does not realize this. He goes to believe that there are really limits to his trade. What he hears of the great world of commerce outside does not seem applicable to him.

Among such men everywhere are a few who show themselves possessed of talents far beyond the ordinary. They enter their business and into the surrounding country, while others stand still. These are the men who reach out into a world beyond their own far ideas. They learn from those ideas how to outwit their competitors; not only how to hold their own, but how to enlarge ahead. They will by constantly looking out for things they do not know—suggestions, "pointers," the plans of men elsewhere.

And a few such successful men among storekeepers in small towns have obtained their best ideas of progress from the traveling salesman who has visited them. The salesman who operates in the larger field and has traveled extensively views a community with impartial eyes. He has no preconceived notions and no prejudices. Oftentimes if he is made a friend of and listened to, he can point a way of extending business.

More than one merchant has seen this in his own great profit. Instead of treating the traveling salesman as merely an agent to separate him from his limited funds, he proceeds to get into his good graces. He makes a friend of him and makes him feel himself an important personage. If the salesman is a man of ideas the merchant quickly gets to fascination that opens up new avenues of trade.

"There's the chance of a million years"

Into the presence of such a merchant, a man in the Middle West, over, not long ago, the traveling man of a wholesale woman's ready-to-wear garment house. This storekeeper had been very successful. For a year past he had been buying sparingly and had sold his stock by a series of cleverly timed sales. He had reduced his inventory, and had money in the bank. But the outlook was gloomy. There seemed to be little good business ahead. The community for miles around was bankrupt.

He had made a friend of this traveling man, one of a number of others, and now he was glad to see him. The salesman had much to say. The two men chatted as they sat in the corner of the storekeeper's office, the salesman taking of an interesting situation.

Within a radius of ten miles were three towns where the men in the ready-to-wear business were complaining of hard times. They were stocked up on old goods. They did not want to read in orders for new styles, and were literally forcing the peddler to buy what he did not want.

"It's a great chance for some one with the money to jump in and start up-to-date stores in these places," the salesman said. "The people there have money to spend, but they don't want the old stock. Here—say, George, you're the man. There's the chance of a million years." "Why were you with an enterprise and a sea gives to the women that called."

The man was a wealthy one and the two sat long into the night, laying out a plan of expansion. The salesman had another valuable item of knowledge. It was a time when many business men needed cash. The latest fashion in ready-to-wear could be bought cheaper than ever. The long conference proved that it could actually be made possible to undersell the men who had only shop-wares goods to offer.

The next day the merchant visited the three towns and found that his friend's representations had been exactly correct. There was need of quick work, and there was not the delay of an hour. A well-timed sale of ready-to-wear goods was arranged. The first of these "branches" was opened with trash, bright, new, and attractive "ready-to-wears." The other stores speedily followed, and money poured in. The salesman suggested to the merchant two additional little "twinkles" that proved valuable factors in the campaign's success. Each store was opened with an enterprise and a sea gives to the women that called.

The crop would not have been possible had this merchant not cultivated the friendship of traveling men and shown himself receptive of ideas.

"You I was worried. I have reached the limit of my field. I cannot see where I can enlarge ahead. That distress me for the man who feels that he has everything in his hands is just at the point where he is about to go back."

This was the frank talk a dealer in second-hand clothing of all his goods in one afternoon to the farmer of that section. The salesman had accidentally run across it on his wanderings. He had seen it done by men who take second-hand printing machinery in trade, and turn it out again looking like new. It

make his business go. There were several other centers in the same line in the county and competition was brisk. This man had, however, developed his business wonderfully. He knew how to buy and he understood the art of selling. A final policy of his was to get ideas from his friends "on the road" as to methods that prevailed in other sections. He felt that he could never have too many friends among these men, or spend too much time over them.

The salesman was addressed pursued his lips and thought. Then he said:

"You mean you are not satisfied because you can't get more business?"

When the farmer called for his plow on Saturday afternoon he was astonished

"Yes."  
"Will you are really going ahead. And you are who lets be in stopping short and grows red in the eye. All you need is a new idea or two. Will you permit me?"

Any one who at that moment had looked into that private office would have thought the merchant was entertaining his best customer instead of "just a drummer" from the way he listened.

"Here you are, Will. I think I have it. You sold a second-hand plow to a farmer this afternoon while I was waiting for you. The farmer does not want it until Saturday. Let me suggest that you drop that plow, which is rusty, into a fire-bath. That will take all the old paint off the woodwork, and will put it in a condition where you can have it ready for fresh paint and hand it over looking like a brand-new plow. The cost will be so small that you will hardly notice it. It will not only attract your customer, but it will make a friend of him and a new advertiser. Try it. I will wait over and show you how the trick is done."

That was Monday night. When the farmer called for his plow on Saturday afternoon he was astonished to have delivered to him an implement that looked as though it had just come from the maker. He was so delighted that he then and there gave an order for some machinery and was willing to pay an excellent price for it.

The plan proposed by the traveling man was not new, though it was a revelation to the farmers of that section. The salesman had accidentally run across it on his wanderings. He had seen it done by men who take second-hand printing machinery in trade, and turn it out again looking like new. It (Continued on page 10)

# MARMON

"The Easiest Riding Car In The World"

**I**N more than sixty years of manufacturing, this Company has never put on the market anything "cheap," anything "skimped," anything that was not the best that brains, experience, skill and honest intent could produce. Since the early days of the automobile industry, the Marmon car has held its position in the front rank among the world's high-grade cars and today it has no superior.

*Detailed Information on Request*

**Nordyke & Marmon Co.,**

Indianapolis, (Established 1852) Indiana  
Sixty Years of Successful Manufacturing

### *The Marmon "Thirty-Two"*

A sensible, logical car—a car of moderate size and capacity, meeting every requirement for touring and city use with the economy in tires, fuel and upkeep so important to the majority of motorists. Four-cylinder, 32 h. p., 120-inch wheel base, electric starting and lighting system with body types to meet every requirement and corresponding equipment. Touring car \$3000.00 f. o. b. factory.

### *The Marmon "Forty-Eight"*

Six-cylinder, 48-50 h. p., 145-inch wheel base—a large car with small car advantages, a car with short turning ability which eliminates the old objections to long wheel base—a car of wonderful and surpassing riding qualities; electric starting and lighting system, with body types to meet every requirement and corresponding equipment. Touring car \$5000.00 f. o. b. factory.

## The Trouble in the "Newer Industrials"

**F**ORTY-NINE new industrial stocks listed on the New York stock exchange during the summer and fall of last year show, at the time of writing, an average decline of twenty-five and one-half points. Measured in dollars, the shrinkage amounts to over eighty-four millions. This, in odd figures, is the outcome of last year's error over the "new industrials," when the public, reluctant to touch the stock of the dead-payers, rushed in and loaded itself up with hundreds of millions of dollars worth of shares put out by manufacturing and trading concerns.

It was early last summer that the boom in the new industrials really got under way. Before that a number of new issues had been successfully marketed, but it was only then that it was demonstrated that the demand for securities of this sort was such as to allow of their being on a really big scale. That fact having been established, however, no time was lost, but after another the great manufacturing and merchandising companies, which up to that time had never appealed to the general investment public for funds, created great issues of common and preferred stock, and put them on the stock exchange. Mexican Petroleum led the way, listing on the exchange \$4,000,000 of common stock as the first amount preferred. M. E. Supply Company, manufacturers of agricultural machinery, raised the listing of \$27,000,000 of stock to \$15,000,000 of common and \$12,000,000 of preferred. Just as the listing of \$27,000,000 of stock to \$15,000,000 of common and \$12,000,000 of preferred, M. E. Supply Company, manufacturers of agricultural machinery, raised the listing of \$27,000,000 of stock to \$15,000,000 of common and \$12,000,000 of preferred. In September there was listed \$30,000,000 of the common stock of the H. K. Kruger Company, a concern operating a chain of 500 and 600-

stores. Finally, in October, just a little before the trouble began, the listing of \$20,000,000 of common and \$10,000,000 of preferred.

At the time, a good deal of noise raged about these offerings. Not all of them rose equally in price after being admitted to trading on the "Board," but in the majority of cases conspicuous advances took place. Where the public was attracted by the "Board," but in the majority of cases conspicuous advances took place. Where the public was attracted by the "Board," but in the majority of cases conspicuous advances took place. Where the public was attracted by the "Board," but in the majority of cases conspicuous advances took place.

In October Woodworth common sold at 117 1/2, and as late as January 24 of this year at 112. It is at present selling in the 80's. In November of last year Woodworth common sold at 100, and in January of this year it was still an high as 92 1/2. It is at present quoted at less than half of the latter figure. General Investment of 11 last September, and at the beginning of January was still around 70. It is now under 30 1/2.

What is the matter? What has happened? Here only about six months ago the price of the new issues was soaring would have. Now they won't have them, apparently, at any price. Have these shares been "shown up"? Has it turned out that they are not, after all, the good investment securities the public was led to believe?

Yes, that is not what is the trouble. Wall Street is apt to be harsh in its judgments, especially in a case like this which comes up close to the common stock of Wall Street is not imputing the intrinsic value of most of these shares. There

and there sharp criticism is heard, but it is also inevitably said at just one of the "newer industrials" as a "show piece" has "shown up." It isn't because they are new concerns, or because they are "shown up," but because they are selling as much lower. For that something entirely different is responsible—in the first place, the way in which these new shares were marketed and distributed, and in the second place the financial conditions which have since developed. That is the combination which has made the trouble.

When these new industrial shares were first brought out they were marketed in the most careful and thorough manner. No pains were spared to get them into private investors' hands—so they got placed where they could be relied upon to stay and not come back on the market. Such a distributive process took more time and entailed a greater selling expense, but the bankers handling these earlier issues considered it well worth while. The business was new and the issues of issue proposed to handle it in such a way as to obviate all danger of a "come back" on themselves.

As the great success of these first issues stimulated the public interest, and as the most for the business learned, the earlier careful methods of distribution and sale were abandoned. The result was that it was possible readily to place the new shares with greater investment bankers and less care. The result was that the profit in handling the business being less reduced through competition, and the possibility of a "come back" on the market became a distinct object, bankers began to distribute as to the public with whom the shares were placed. If the stock could be sold in a few days instead of where it would "stay put," so much the better. If, on the other hand, some other issue was to be marketed, it was essential to get the heads of the issuing house a block of the stock for distribution among its own clients. It was an opportunity not to be passed by. And so, instead of the original painstaking distributive process

by which the home of issue placed practically every share of the stock with its investment banker, it came about that a large part of the primary distribution consisted merely of the placing of considerable blocks of the new stock with other houses. In the case of some of the later issues, indeed, practically the whole amount was thus syndicated and re-sold.

None of the stock thus taken was adopted by the investment banker of the syndicate participants, but a good deal of it was not. A number of houses took stock (getting it, at once, before the market) for the sole purpose of retailing it to their own customers. Others, however, had no such object in view. Some after issue had been a "show piece"—that is to say, had risen satisfactorily in price after being listed. Why, then, these houses began to distribute their syndicate participation at all? Why not simply hold on to it, and, when the market in the stock had been "made" and the syndicate agreement had expired, sell it in the open market at the advanced price?

With this all over the "show piece" carrying a little of this and that new industrial for their own account. It is no wonder that their example was followed by individual buyers of securities. If a price standard which they had been accustomed to buying took place—and by people who had looked into the stock and believed in it, but by people who figured out that it was going to be put up in price and so was a "show piece."

It is therefore, then, there was going on a steady change in the character of the buyers of the new shares. In the beginning they had been mostly individual investors, but now they were mostly institutions and who bought these securities with their own money for the purpose of putting them away. But now, instead of moderate amounts of the new shares being placed

(Continued on page 26)

## Three Pursues of God

\$2000.00—\$500.00—\$50.00 to successful Artists painting a great subject,

## "Dangerous Servants"

The purpose of this competition is to secure original paintings so skillfully executed that they will express certain human experiences and send their meaning to the mind of any observer.

Preliminary color sketches are required. The sketches will be judged and the artist whose sketch is the most pleasing and most fully the six artists, who can then finish as he will.

The principal figures to be not less than one-third life size.

When the six finished paintings have been passed upon by the judges, the artist accepted first prize will receive a purse of \$2000.00 gold. Each of two others will receive second prizes of \$500.00 gold. The remaining three pictures will be returned to their owners. The sketches to which the accepted picture will be transferred to me and they will be hung in my collection at Buile Creek. Final printed rules governing the contest will be furnished by mail on request.

Each artist should thoroughly consider the subject, and choose the facts in order to produce a great work of finished realism and art with such skill that the finished picture will tell the story of these servants who appear in many men's lives, and who might be vital-ly if used only as servants in time of need, but first familiarity become tyrannous and cruel masters.

They gain a power that seems hyptic, under which the employer appears powerless to dismiss them even when their smiling faces and charming manners are later followed by demoralizing grim countenances as they rob him of health, power to properly conduct his affairs, and frequently humiliate him before others.

Carefully observe the men you know, and perhaps start with your most acquainted with the "dangerous servants." TOBACCO, ALCOHOL and COFFEE.

It will prove a most interesting occupation if conducted under proper guidance. (The writer has "enjoyed" many precious experiences.) Start with the premise that each one of us knows drug, two of them in possession in certain conditions

of human dignity, when administered by a skilled physician. Hence at such rare times, when under control, these servants are useful. But drugs are intended to combat disease and their use otherwise is resisted by Nature.

When used in excess in some form or other, light or heavy, sooner or later it soon to follow continued use. Frequently, however, "they don't hurt me." Let us not so much remedy with they never would, for most cases of that kind can be done through the same means.

By watching men who are now living, it will be observed that they use the Whiskey, Tobacco, or Coffee in a search for serene rest and happiness.

Think it over carefully and see how close you come to that condition. Now suppose that no harm to the body, mind, business or friends resulted from a man's keeping well drugged day by day, certainly one could then object that when the final breakdown of the nervous system comes that it would be better to have some other organ, caused by the lack of nervous power to properly operate them, then we realize that the daily introduction of the drug was permitted by Nature under mild protest at first, but a rapid accounting demanded later on.

So long, however, as the use of drugs hastens the belief that they bring him happiness he will stick to them.

A man, in a supreme effort to find himself of the whiskey habit may go to some cure and be told, but whenever he again believes that whiskey will bring him happiness and forgets the harm and humiliate, he will go back to it.

So with the man dominated by Coffee or Tobacco. When he runs for a car and has "a free heart" or "Tobacco heart" late him and sudden death looks before him, or when some other ugly organ appears, he may break the hyptic spell for a time, but go back to his habit and he is better and his life is happy. One day he would make him happy. One day he shakes

himself entirely free from the hyptic spell and from his standard on the fact that health, strength of muscle and mind, power to do things and win and hold position, bring happiness, and when he remembers that heaven of rest, the peaceful sleep of an undrugged body, and the peace of mind and the falsehood behind the promises of the servant who slued him so cruelly.

That's the story. It will not be believed by the man still in the hyptic dream of "drug happiness" until some day Old Mother Nature, tired of old protests, will give him a sound thrashing and, with blinking eyes and returning consciousness, he will begin to wonder if the story isn't true after all.

It would not be thought that Nature will not allow tired and worried mankind a respite from weariness by drugging and not demand the wretched bill, but Nature's law is fixed, and finally man comes into the knowledge that only rest and happiness are enjoyed by a clean, clear, and undrugged body, with a perfect and undrugged body.

(Get that great fact clearly into your consciousness. There will doubtless be a variety of ideas as to the most effective way to tell the story with a truth.

The inequality of the artists will have full effect. Each servant should depict in some manner one of the drugs and be shown with a beautiful, alluring face, and some kind of an unhealthy body, possibly with a white haken dagger, a cross may tell the story of death, the fading process of rest and peace to be achieved in pain and distress.

"There's a Reason" for the picture; and the reason so forth in it.

All preliminary sketches must be presented before July 1st, 1913, and the finished pictures before Sept. 15th, 1913.

Artists who may be interested can address the undersigned at Buile Creek, Mich.

C. W. Poor,

## The Knapper and His Trade

Imported away is an antiquated center of England is a flourishing industry, in which the world at large knows nothing. This is the manufacture of bogus prohibitive implements and relics, in Brandon, the low country about Ely. Here a community of "knappers" or flint-chippers, who use such the same tools and work in much the same manner as the men of the Neolithic Age.

In this little byway of England the "knapper" finds his market ready to hand in the extensive streets of flint lying amid the chalk beneath the surface. He cuts the flint into the "flint-stones," and from these barrows are made into the chalk. This means is all done in the most primitive manner. The knappers for the most part work singly, without fear of syndicates or "concerns." Each has his own "flint" and his own workshop. Quite often, though, he employs help in getting his wares ready for market. The claim is about a week's length, and there is not wide. Generally he digs down about thirty-five feet, and from there in a horizontal or slanting line cuts out the flint, or his pick is used like a square set, and he goes down the shaft by figure-eight, according by the same means, with the blow of his pick on the lead. His workshop, like his mining, is also primitive, being a rude, open shed in which the flint or the flint-stone are a block of cut iron break, rather smaller than a butcher's block, a saw, a little, and the only things of value are some old tin cans.

We had formerly supposed that flint-knapping had not of late years been the Revolutionary War, but those knappers still find the steadiest and most important branch of their industry in supplying the flint for the manufacture of flint-locks. Five million flints leave Brandon a year. The flints are carefully packed in small kegs, and the kegs are sent to a stream to prevent the edges from getting chipped.

When do these relics of bygone days go? To make ornaments for the negroes in Africa. Some are shipped to South America, but as yet there has been no decline in the demand. Another odd shipment was made during the War when fourteen thousand flint-stones were sent to British troops so that they could get light when wet and the matches.

Remains of the Neolithic Age, now to be found in many museums and private collections, were manufactured by the little community in England. They consider their business entirely legitimate, and in a way it is, for it is the only occupation of the knapper that will give a goodly price these "valuable antiquities" to the inventor. A great many schools and public educational institutions are supplied by these knappers, and, whether the objects are known to be imitations or not, they are such much valuable than those of history and geology.

Flaking the flint can only be done by the most expert worker. Taking a large block, he will, by deft strokes of his hammer, cut a piece from the block of the length, attack so thin there will be a ridge running through the middle. These are the first steps of the work. Then the flake is held over a small iron upright on the wooden block and struck off and slipped in the hole. The process of chipping is called "knapping."

Knappers are frequent in the knapper's work, but ideas certain implements are shaped quite by accident in the chipping. Sometimes it is a spear head, sometimes a chisel, but the most valuable of the work is the making was a perfect chisel shaped to a beautiful long edge, with a back fine-pointed. This is the "knapper's" best stroke of his implement cut through a stick of wood. Another tool necessary for the knapper is a hammer, intelligent and expert worker among these men believes that Neolithic stone was left-handed the men who used it, and that tool must be turned from right to left.

How can we detect the difference between the imitation and the genuine article? The expert "knapper" knows. The genuine flint implement of ages goes in and out of the hole. The other may look smooth, but with good sunlight or a magnifying glass you will find little chipped spots which the genuine will not possess. "Belton" is bottled in a bottle for six weeks to give them an appearance of age and give them a slightly rough surface off if put to the test. Examine closely, and you will see that these products of the flint are not as shiny to the extreme edge.

Knapping, called the oldest industry in England, is not only a profitable one, but the flint splinters often enter the lungs; and the work seems to have descended from father to son in a family ever since descended from remote times, along with the work are some strange words and

phrases apparently related to no known language. For instance, when a flint or chisel wants to say he is not a flint-stone on the sheet, he explains that he is "belonging to the soil."

## The King's Six Thrones

KING GEORGE has six thrones. The world naturally suppose that the King would "sit upon his throne" at Windsor rather than in the "palace of the six" "official thrones." While, however, there are both a throne and a throne-room, but each with a different history. One is probably the very last one of all others one might find the English sovereign. The throne at Windsor is the throne of the more generally used, inasmuch as the greater number of coronation functions occur there.

The King of England may be said to have a set of thrones. In the case of one throne—the coronation chair at Westminster Abbey—the coronation is but one. This is the worn, antique, battered, limbooled old oak with the reclining throne that has been used since the days of Edward I. It has been crowned all the rulers of England. This chair was made by the famous "throne of the British Empire," since it is by far the most ancient of the English thrones. To be crowned the ruler must sit upon his throne, and no other.

You may be sure of one thing, however, in that the throne of the King of England, or any one else for that matter, would voluntarily seek a seat on this ancient throne more than once, since it is a throne of such notable rest-giving. It stands, year in and year out, in the Chapel of Edward the Confessor, and it is remembered as the occasion of coronation. They, covered with gold bourns, it is set under the lantern between the choir screen and the altar.

The throne with which the British public is most familiar is that which stands upon the steps in front of the House of Commons in London. The House of Parliament contain another throne—that in the King's private rooms, that is occupied by the King when he is dining in his regal garb previously to entering the House of Peers to read his speech.

Another throne is that at St. James's Palace, which is a very ordinary-looking building at the foot of St. James's Park. The throne is a very handsome one, standing under a magnificent and costly canopy. It is here that the foreign ambassadors who are accredited to the Court of St. James's are received.

The throne at Windsor is made of one of the most valuable materials of ivory. It was a gift from one of the princes of India.

## The Food-value of Toadstools

The food-value of toadstools has been rather discouragingly presented by Professor Humphreys Hastings in a recent paper on mushrooms presented to the Royal Chemical Society. It is to be remembered in the first place, the author states, that from Tricholoma in some species is almost entirely in others is only water. The solid remainder considerably of mushroom is water, and a mere trifle of digestive nitrogenous matter, no starch and only a little fat, cellulose, and similar matter. The mushrooms are so soft as to be eaten as an aliment. If all the toadstools the common cultivated mushrooms is regarded as a food, it is not a very desirable food, yet it is only one forty-seventh of that in beef, and one sixteenth of that in lettuce, and one thirty-eighth of that in cabbage and potatoes. The percentage of fat equals that of cabbage, while the carbohydrates are only one-fifth of those in potato. "Clearly, then," he says, "we do not see as well as cabbage as an any standard."

Nevertheless, mushrooms, properly cooked, are excellent constituents of a meal on a diet of cereals. This benefit is in part psychological, for pleasant flavors and aromatic aromatics are present in the extract and the secretion of the digestive fluids. Hastings concludes, however, that the mushrooms are not a very good food, but it is always a good idea to have a little of the medicinal susceptibility of the water, but with the character of the soil, the temperature, etc. In the case of those mushrooms, the case of those mushrooms usually known. It fact, in some parts of the world even the dried portions are used as a food. In India, for instance, with impunity, and in Siberia an extract of mushrooms is used as a very good system in the case of those mushrooms. Hastings concludes his paper with a note on the mushrooms, but that there is no safe rule for distinguishing an edible from a poisonous mushroom. He says in view of this and their low food-value, all wild fungi should be left alone.

## White sheep give more wool than black sheep—there are more of them.

REMINGTON stenographers do more of the world's work than other stenographers—there are more of them.

Nature only knows why there are more white sheep than black.

All the world knows why there are more Remington operators than others. REMINGTON is the machine in which the most operators have confidence—and the machine which gives them the confidence to make good.

REMINGTON is the machine in which the majority of good business schools have confidence—the confidence to turn out competent, efficient operators—the thing on which the very life of those schools depends.

REMINGTON is the machine in which business men and business houses have confidence—because the majority of good stenographers are Remington trained and "go to work the first day without breaking in."

## 12,500,000 Remington Letters mailed in the United States every business day in the year.

Isn't that the answer to the question, "which machine?" for your office? Throughout the world Remington is a synonym for typewriter efficiency. It is the voice of the business world.

# SCIENTIFIC AUCTION BRIDGE

By E. V. SHEPARD

## "KNICKERBOCKER WHIST CLUB.

"I have read all the books on Auction Bridge. E. V. Shepard's is the best of them all. I doubt if a better one will ever be written. Other writers teach by illustrative hands which you may never hold. He gives simple rules for bidding and playing any hand possible to deal. Every feature of the game is discussed in a way to aid both beginner and expert player. He gives valuable facts concerning the game which have never before been put in concrete form. The rules are clear, practical, and easy to remember. The work is not based upon personal opinion, but is founded upon mathematical facts. No other writer has ever delved in the principles of the game to an equal extent. The results as given through his simple rules are startlingly clear. Every player should own a copy of this work."

River-power

The rivers of the world are being called upon more and more to contribute to the world's industry. Even where no falls exist, the current of a river constitutes a store of energy, the harnessing of which is becoming widely recognized.

These rivers whose upper courses are marked by many waterfalls are, of course, furnishing the greatest available power. German engineers point out that the Danube is capable of developing, with its Alpine tributaries, something like 2,000,000 horse-power. This statement applies, moreover, only to that part of the Danube's course which lies in Germany.

Such a statement, however, could be so definitely used only a little in excess of 75,000 has actually been developed.

Along the Danube it is a common sight to observe large water-wheels along the banks driven by the swift current. At one point, not far from Vienna, there is one developed to some extent. It is bounded.

In this country two methods are employed in controlling the waters of rivers. If the volume of water be large and the stream sluggish, so that the river is apt to overflow, its banks lower are constructed to confine the water in the channel; but if the water seems so small and the slope rapid, systems of dams and locks are built in order that the water may be held back and the level raised, thus insuring the navigability of the river. This method is also used in river navigation, and a stream thus treated is frequently described as a "reservoir in motion." In some cases a series of steps has for which the water would all run out in the dry season. When the water is high the locks are thrown open, the boats preferring to use the natural stream. One of our most important industrial centers—Pittsburg—would be a good deal better off if the water were not for "dark-watering" in the Ohio and the Mississippi.

It is in her course to contain a river that looks at present to run out too fast that it is busy along to the sea now that such a serious devastation of the country will be avoided. Millions of acres have been spent on levees in the lower Mississippi and much yet remains to be accomplished in this line. The various methods of artificial irrigation have proved both wasteful and impotent.

Cochineal

Quantities of cochineal are still made and sold a market as a dyestuff, a spite of the ancient color which has so largely replaced all old-fashioned dyes. More than 1,000,000 pounds are imported into the United States annually, and used as a coloring matter for fine fabrics, certain kinds of ink, and cosmetics. It is also used for tanning solutions and medicines. Formerly it had a supposed value as an antidote. Cochineal is the body of a small insect that feeds upon certain species of the prickly pear or cholla, group, whose fruit is the cholla tree. The insect is a native of tropical America, and Van Humboldt gives a most interesting account of its culture as he found it in southern Mexico in 1811. He believed that this insect was going on since prehistoric times there, and it is certain that it was a very extensive native industry at the time of the Spanish conquest.

The insects and its powdery white scales were long ago transported to various parts of the world and cultivated until a total annual product of about 7,000,000 pounds was reached. Lately the Canary Islands yielded three-quarters of the quantities, more than 2,000,000 pounds in 1873, after which the industry rapidly declined. As it has been determined that it requires about 20,000 insects to make a pound of the dried product, the extent of the culture plantations in those islands may be imagined. We have in the northeastern United States a closely related scale, the cottony cochineal, whose blood is a deep crimson. It differs from the true cochineal in having a heavy covering of cottony wax.

The Eskimo's Digestion

We hear much of American dyspepsia, but our own country is not the only one that is certainly not troubled in this respect. The Eskimo draws all the laws of hygiene and diet, he eats until he is satisfied, but he is not satisfied until he has a shovelful of his frost-revived soup. His capacity is limited by the supply and by the quality. Not so far as the blubber or fat of the arctic animal is concerned, the Eskimo consumes about the measure of eating it. In

fact, he may be said not to eat it at all, he cuts it into long strips an inch wide and an inch thick and then lowers the strip down his throat as one might lower a rope into a well.

Despite all this, the Eskimo does not suffer from indigestion. It may make a good meal off the fish and skin of the walrus, provided he has had plenty that in eating up the annual blubber must be continually sharpened.

The flesh of a little Eskimo child will, it is said by those in a position to know, melt in a bit of walrus skin as the flesh of an American child would melt in a fish of an apple, although the skin of the walrus is even half an inch to an inch in thickness and bears considerable resemblance to the skin of an elephant. The Eskimo child will bite it and digest it and never know what dyspepsia means.

Balkan Perfumery

ONE of the incidental consequences of the conflict in the Balkans is the rise in the price of perfumery. Of late there has been a demand for perfume in Bulgaria is said to have practically monopolized. Various attempts have been made to create a rival product both in the chemical laboratory and in other ways than that of Central Europe, but Austria is in the sole quarter that offers any promise, while the material which the Balkan perfumers so hard and gritty that is superior to all others. These Balkan materials come from in great abundance. The forests of the Balkans yield marvelous amounts of the extract.

The Copper in Our Pennies

A SILVER penny is made from almost chemically pure copper, which is obtained from the native copper. Formerly the refining of copper was an expensive process, but with the utilization of electricity the expense has been materially decreased.

The copper is placed at one end of a tank filled with water. This is called a cathode. The other end is connected with the positive electric current, the copper carries it through the water, and deposits it on the negative, or anode, pole. The result is what is known as an "electrolytic" or "refined" copper. This is the material of which pennies are made.

While the "electrolytic" is the purest known copper, the "Lake" copper brings a slightly higher price in the market. This is because silver is a small amount of silver in all the copper from the Lake Superior region. It is, however, of such limited quantity that it cannot be separated at a profit. Silver, moreover, is a better conductor of electricity than copper, and therefore for commercial purposes the "Lake" copper is in such demand that it brings a higher price.

The Uses of Tale

Tale, derived from compositions found in various quarters of the world and in many states of our Union, is not a general thing marketed as rough from the mine. It is used in various ways, from which are manufactured various objects, and it is ground into powder.

A great deal of the ground tale is employed in the manufacture of paper. It also enters into the making of colored rollers for use in printing, inks and paints, but the form in which it is most familiar is the taler powder.

Not only is taler used in the manufacture of various taler and similar articles. The very best grades of taler from these areas are used up in the manufacture of crayons. Gas-tips are also made from tale.

Ancient Mural Decorations

It is probable that the earliest wall paintings were those of the Egyptians. These people employed a distemper consisting of crushed lime, and their principal pigments were red, yellow, blue, white, yellow, white, Egyptian gamboge, blue powdered glass stained with copper, and black. The walls of the tombs of the Pharaohs were treated in much the same way, but the colors were not only colored with plaster was certainly in vogue in Assyria.

It has been believed that the Greeks understood true lines work, especially on the strength of a plaster covering in Persia. It is said to be a red ground. Vitruvius also speaks of a wet ground and says that colors placed upon a surface so prepared are permanent, which certainly is characteristic of true fresco work.

The Winged Message

Noah's messenger was a dove. In Solomon's time, pigeons were trained to carry messages. Brutus used them at the siege of Modena. They served the Turks in their fights against the Crusaders. In medieval wars they were more useful than ever before.

France had a carrier-pigeon mail service, with messages reduced by photography and read through a microscope.

Even today carrier pigeons are utilized as news-bearers in isolated parts of Europe.

In America, the land of the telephone, the carrier pigeon is bred only for racing. The winged word has taken the place of the winged messenger.

Pigeons may fly more than a mile a minute, but the telephone is as quick as speech itself.

The dove is the emblem of peace. The telephone is the instrument of peace. The telephone lines of the Bell System unite a hundred million people in one national family.

**A Motor Road Over the Canadian Rockies**

Those who know the magnificence of the scenery among the mountains of British Columbia—probably anchored within the accessible area of North America—will be interested to learn that a motor road, about one hundred miles long, is approaching completion near Banff Park across the Rockies to Lake Windermere on the Sturtevant River. From Banff it follows the Bow River up to Castle station, where it turns west and ascends Vermilion Pass over the main range, reaching in six miles an altitude of 5,000 feet. Here magnificent views are presented in several directions, and a hotel will be erected, so that tourists may halt comfortably for the trout-fishing and other attractions of this alpine region. Thence the road descends toward the Kootenay and Columbia valleys through the gorge of Vermilion River, and the engineers say it will be possible to coast for sixty miles, broken by only one short ascent. A short distance down the valley widens out for a space, and reaches Kettle Creek, so named from a deposit of red oxide of iron, which is so called, as that locality may halt comfortably for the trout-fishing and other attractions of this alpine region. Thence the road descends toward the Kootenay and Columbia valleys through the gorge of Vermilion River, and the engineers say it will be possible to coast for sixty miles, broken by only one short ascent. A short distance down the valley widens out for a space, and reaches Kettle Creek, so named from a deposit of red oxide of iron, which is so called, as that locality may halt comfortably for the trout-fishing and other attractions of this alpine region.

From Kettle Creek to the mouth of the Vermilion the valley gradually widens, and its walls are scarred by the channels of many streams descending from plateau and mountain ranges in various directions. The road turns away from the Vermilion, at the head of an imposing canyon, and extends to the top of a low ridge giving an extraordinary prospect. The surrounding region is very little known. It is totally unexplored, and offers a fascinating opportunity for exploration and survey. It is terms with game, and an effort is being made to include it as a national reserve within the area of Banff Park, including the precipitous Rielson Range, separating the Kootenay from the Columbia. It is a region of great scenic interest, and a disheartening amount of time, labor, and money was spent before the road could be completed. To save space there could be completed. To save space there could be completed. To save space there could be completed.

There are two main roads, one to the north and one to the south. The northern road is the main road, and the southern road is the branch road. The northern road is the main road, and the southern road is the branch road. The northern road is the main road, and the southern road is the branch road.

**THE BEND IN THE ROAD**  
By **TRUMAN A. DE WEESE**

"The Bend in the Road" is the story of the rejuvenation of an abandoned farm by a city man, who found health, diversion, and relaxation through a return to pleasant pastoral pursuits. The city toiler of moderate means will learn from it how easy it is to acquire a small "country place" not far from the scene of his daily employment where he can spend blossom and fruit time, where he can find that rare contentment which comes from living simply in intimate relation with the soil.

The contrast between city and country, the description of rural types and their attitude toward the city farmer, the loving companionship of dumb animals, the sermons in apple-trees, the poems in cherry blossoms, are drawn with delicate humor and quiet philosophy. It is not a manual on agriculture or horticulture, and yet it abounds in suggestions that testify to the author's practical experience in "making things grow." Pen-and-ink sketches by Clarence J. Munn fit most charmingly into the atmosphere of the text.

them. It is possible to play ball games by means of balls containing bells. Much games, however, are not so adapted to the blind boy. At football, for instance, he cannot trust himself to run at full speed unless he can see his opponent. In these, checkers, and other indoor games, not to mention aerial and literary functions such as debates, lectures, and concerts.

**The Doll Industry**

Texas, and especially the town of Houston, are said to be the great birthplace of the doll. Most of the poorer families in and around Houston are engaged in the manufacture of dolls, and in this industry is derived the principal revenue of the population. The work demands a great deal of skill and practice.

The inhabitants begin early in youth to learn the art of making dolls. By constant practice they eventually become able to work with astonishing speed and accuracy. In the doll industry only special parts of the doll are made by each person. Some make the bodies, others the heads, and still others the arms or hands.

The heads are first molded, and when sufficiently dry the eyes are set out by a skilled worker, and the eyes are set in. This is an extremely delicate work, and the eyes do not fit, or are not so placed, unless the hands are placed, depending on the material from which the heads are made.

The arms, legs, and hands are produced in a similar but simpler manner, as the painting consists only in giving the necessary color to the parts. The dolls are made of heavy shreds, red lips, and dark or light eyebrows, depending on the color of the eyes. The dolls are made of heavy shreds, red lips, and dark or light eyebrows, depending on the color of the eyes.

The industry is a restricted one, "character dolls" is restricted numbers. The model is made by an artist and the dolls are then copied from this model. The painting of these dolls is done with special care. Consequently, their price is considerably higher than that of the common type of doll.

**The French Tobacco Monopoly**

It is said that the French tobacco monopoly has netted nearly \$2,000,000,000 in the last ten months, year after year, which it has been in existence.

On December 20, 1910, a decree issued by Napoleon created the Tobacco Rights and reserved to the national government a monopoly of the importation, manufacture, and sale of tobacco in all its forms. It was estimated that this monopoly would add \$6,000,000 francs to the annual receipts from taxation.

While this expectation was not immediately realized, a few years later the estimate was more than met. The revenues from the tobacco have continued to increase as the practice of smoking has become more general, and the consumption of tobacco has increased. The revenue has augmented with the increased luxury of living. Thus, too, there will be considered the country's revenue, which is more than met.

From 1911 to 1914 the revenue from the Rights averaged \$2,000,000 francs (\$313,330,000) a year. The receipts for 1911 approximated \$50,000,000 francs. There were 1,200,000,000 cigarettes and 67,387,390 cigars from the monopoly of the manufacture and sale of tobacco. It is estimated that the revenue which are derived directly from smokers are among the solid and reliable assets of the French government.

**\$4,812,734 a Day**

The government of the United States last year made money at the rate of \$4,812,734 a day. The total of bills printed amounting to the next little over \$1,450,000,000. There were just 328,187,173 separate bills, ranging from the fifty cent to the mighty \$10,000 note. It is estimated that the government prints a couple of dry-leafs. If these notes were laid out and they would reach nearly the ground. If the government were to governmental choose to spread them on the ground, they would cover an area of 1,230 acres. But should they be scattered, the last note, when placed, would be something like twenty-seven miles from the earth. The only other note printed in the United States in a year are about 17,000,000 five dollar bills. The government prints a thousand to print them at \$2,000,000 for the yearly total of \$2,000,000.

**Blind Boys at School**

To make the blind boy as normal as possible is the aim of the blind school. Blind boys are required to do the same work, to pass the same examinations, to be subject to the same discipline, and to be included in the same recreation as their sighted fellows. The result has been that the blind boy has in many instances completed successfully in after-life with the sighted.

School training for the blind at a typical institution differs but little from that of ordinary school life. On rising the morning exercises are held with an equal speed as those with vision. The day's work begins with half an hour in the gymnasium, where the pupils are made acquainted as the parallel and horizontal bars, the rings, and the rope. The walking home or about the school is made a regular part of the day's work, usually beyond their powers.

In the classroom the work performed by the blind boy requires a high standard. Books, whether classics, mathematics, or music, are in Braille type and reversibly composed. Pictures, for example, in 14 fourteen volumes and costs eight dollars. All writing is done in large little wooden frames filled with a loose grid of white with style or small screw-down machine. Blind boys are well as fast as the average sighted boy, and their writing is always legible. Typewriters are easily used. The working of mathematics is done with a mechanical slide rule, which can be made to represent addition signs, and the use of spiral compass and rulers for geometrical drawing in of course elementary than the ordinary. In the natural sciences the blind boy finds himself much handicapped. However, in the study of modern languages, and history chiefly at first-class examinations, there is a wide

Finance

(Continued from page 22)

with individual buyers here and there, one big issue after another was being brought out and sold to syndicates, new syndicates, and speculators. The original idea had been to people who had had the slightest loss of feeling for years to come. This better distribution was very largely, if not generally, among banking and brokerage houses and individuals determined to hold their shares until the price was just a few cents below what they sold as fast as possible.

It meant, of course, the borrowing of a good deal of money from the banks, but then the banks were willing enough to lend on the new shares. Were not the very best people interested in them? Was there not a good market in them? Besides which, money was not much in demand and the banks in no position to be over-cautious.

So it came about that a very large amount of these new industrial shares, thought to have been "distributed," were not really "distributed" at all, but merely scattered around the city among those having facilities for carrying them on borrowed money.

That is the first chapter in this new industrial financing. It is a story of how the quick shift in money-market conditions last fall and the consequent change in the attitude of the banks toward the new shares held by them so collapsed for a time. To lend money on these securities then, money was a thing on the market and hard to lend on at any price was one thing. To lend on them in the form of a financial statement of demand, the first and with money readily in demand was something quite different. Arrangements as to rates and conditions which would have been attractive enough from the banks' standpoint at the end of the summer became decidedly unattractive in November. It was realized then that a good deal of readjustment would have to take place.

For the banks at once to throw out all the newer industrial shares held by them as collateral and to demand satisfaction of some amount of stock was, of course, out of the question. But without any delay a movement in that direction was started. Letters made by the banks to "all individuals" and coming out were not renewed. Whether possible, heretofore, the banks insisted that they be requested to take back at least a part of the new shares and to send the bank something else in their place. Towards the end of the year, the banks of these new industrial shares were, of course, very generally turned down.

When the money-the-money-market dried up unexpectedly, and for a while it seemed as though the trouble threatened by the presence of the new industrial securities on bank loans had been averted. Heretofore, however, and the banks taking an even stricter attitude toward the new shares as security for their loans. Where the banks had been many cases, had been allowed, real pressure began to be applied. We want you to substitute these new shares for something else and we want you to do it in a hurry—that was the attitude very generally assumed by the banks. The first result was naturally to cause heavy legislation in the object-to-shares themselves. With the banks' insistence on the kind of money which they carry there was just one thing left to do and that was to sell them out. The market, then, however, as we have been expected, at once proved exceedingly "thin." Knowing very well that to substitute for loans the new shares was taking pretty much everybody was afraid to buy them. The inevitable result was that on the subject of new industrial securities, the stock market should break "wide open."

The selling, too, was hastened in great measure at the time and served greatly to aggravate the trouble. With no cash stock around which its owners, standing secure at the bank, could now sell to "lend out," the opportunity to be left these shares short was not so to be regretted. Operations which were formerly everywhere were no big case. There is no doubt that by the liquidation forced by the selling of the shares very considerable declines in all these shares could have been brought about anyway. But there is no doubt, either, that the liquidation which took place, the decline was much more abrupt and extensive than that which would have been the case had the market proved to be strong.

A second result of the banks' attitude toward the new shares was to cause a general withdrawal of funds from the market. In some cases withdrawal of banking facilities in connection with the new industrial resulted in those holding them selling them out without further delay. In a good many other cases, however, holders, rather than their brokers, their shares had been marked previous to their withdrawal.

"Hey, there! Got a puncture?"  
"Oh, no. I'm just changing the air in the tires. The other lot is worn out, you know."

## Insures Light In Emergencies

*The tank, the lamp and the match.*

These three simple elements give unequaled dependability, efficiency and economy to gas lighting.

Add the Prest-O-Liter, or any other good automatic lighter, and you have every feature of convenience the most complicated system can offer you. You may light or extinguish any or all of your lamps from the driver's seat.

But remember this—should this convenience ever fail it does not leave you in the dark as the failure of any complicated system must. You can light your gas lamps with a match and you still have brilliant, dependable light.

The first rule of the manufacturer in the equipment of his car should be reliability. Any feature that sacrifices dependability lighting to convenience alone detracts from the value of the car.

Prest-O-Lite's absolute reliability is unquestioned. There are no delicate adjustments, connections, or complicated attachments to get out of order.

No matter what self-starter you have on your car—insist on gas lighting. Almost any manufacturer will equip your new car with Prest-O-Lite and an automatic lighter if you insist. If your car is now equipped with Foot-O-Lite, any dealer or any of our service stations can install an automatic lighter at small expense.

If, by all means, before you decide on any lighting system, send for the vital facts on automobile lighting. The coupon attached will bring you a free book on this subject by return mail. Send for it NOW.

Exchange Agents Everywhere

**Insist on Gas Lighting**

decided to fortify themselves by selling something else and hold on. That took place, for example, in many instances where brokers carrying the new industrial shares for clients informed them that, as the banks were no longer willing to lend on that sort of collateral, they would have to sell out or take up their shares. In many clients choice of the latter course meant the necessity of selling out holdings of other stocks and bonds, but in a great number of cases that was course chosen. Why should anybody say anything at all, let alone say anything at all at a big loss, more than our holder of this sort agreed, when by selling out instead of those other securities, including I can hold my stock till this morning, I can get?

The great deal of selling of the general lot has been this winter has, on a number of occasions of late, been made only too painfully evident.

When these new industrial shares were first listed on the stock exchange the banks lent freely on them, and now they won't—that, in a nutshell, is what is the matter. Whom fault is it, the banks? Well, Street, especially that sort of that has been directly affected, declares that it is. Why did those banks, it asks, lend on money on these shares when they were to take it away from us now when we need it most?

That is the issue, is what happened, but whether the banks can be blamed for it is another question. The banks are in business to lend money and have to take conditions in their making of loans. Last summer was a time when there was more money around than was needed, and when the banks, if they wanted to get their funds placed at all, were in no position to turn up their noses at the industrial collateral offered them. The present situation is very different. Things have changed, and the banks are now in a position to demand better security than they would as they see fit. It is very much of a question, indeed, whether, under present conditions, they would be willing to lend money on the same terms as last summer.

But of really greater importance than the question of whose fault it is in the question as to how long the general market is going to remain under the influence of the conditions in the making of new loans. A bad situation in these new industrial shares was developed—it is like that, but it is not a question of whether it is cleared up? The latter, fortunately, appears to be the case. Legislation and its consideration of despatches to and from the banks, and the great bulk of it has undoubtedly been accomplished. The heavy selling season, however, and the volume of bank loans has been pretty well cleared up. Whether selling may still have to take place is not likely to be sufficient volume seriously again to upset the rest of the market.

Electricity in Modern Warfare

The electric telegraph wires over the land, and the cables under the sea, and the wireless through the air, in times of war become of vital value in the quick transmission of despatches to and from the front in the field. Distance is annihilated, important movements are revealed with the best of speed, and war is thus shortened.

In addition to these applications, electricity is now used to a great extent in modern war. Moreover, new applications are constantly being discovered. One of the most important is a modern mine field for coast or harbor defense in an electric solution akin to electric blasting. This mine field, as we are assured to be fired by a battery, current sent at will from some central station by the simple closing of a circuit.

Heavy charges of high explosive, called mines, are so distributed and constructed by means of a central station that it is difficult to imagine a hostile ship or fleet traversing a well-organized mine field without destruction or some serious damage.

Another terrible method of destruction is now in the hands of the modern navy—electrically controlled dirigible torpedoes. Moving and moving itself in response to electric signals, they are controlled by wire or cable. It carries a charge of explosive sufficient to destroy in an instant the most formidable war ship.

The light and powerful, and complete submersible war, even if its approach is discovered, and the torpedo is not fired, is regarded as an explosive mine, would directed, and fired by the agency of electricity.

The effectiveness of some of the more recently developed electrical devices has not yet been tested in actual warfare, but it is safe to say that their use will make the day when war will pass to be an electric war, and the world will be transformed, and fired by the agency of electricity.

we hope he did not meet the last—triumph of Democracy." The next day, six millions of men, in fact, and he was only "one of the multitude." But he was glad, more than glad, "to live in such a time." There was in his judgment no age "so golden as this"—an incorrigible fact deeply impressed upon his mind by a thoughtful review of the issues and results of past campaigns.

The President was "convinced" as a matter of course. So was that Brother who has not done it a bit strong when he declared that "standing before the American people, Wm. W. Walcott called them as did Jesus Christ call Lazarus, 'Come forth from this grave'; but it all depends, of course, upon how fully off we really were prior to general reorganization. So far as he personally was concerned, Brother BRYAN didn't know and didn't seem to care what his "place in history will be." In any case, he agreed with Assistant President HORN that it was "a privilege to be associated" with Mr. WALCOTT and he was going to stand "ready at all times to go forth and meet his foes." A most beautiful spirit then that which we have already identified with his personal and political activities. It is to our recollection, found rhetorical manifestation.

It was indeed, as the honored guest declared, "a delightful time." And when it was over and all had shaken hands, he went around to the office of his paper and made a few impromptu remarks to Brother CUNY and the other editors and publishers. "You were all here," he said, "but the change in the tone of the paper since your connection with it. It has been its duty to comment on the administration and often that comment has been unfavorable. I am sure that the change is pleasing to you." Just what he meant by that we confess utter inability to comprehend; but whatever vague apprehension we might have had, was promptly allayed by his subsequent commendation of the purposes of the administration "as far as I have been able to understand them." So we guess it is all right.

Belatedly, owing to Brother CUNY's unaccountable delay in getting out his paper, but no less cordially, we took our place at the banquet which marked the transformation of a Brother into a Secretary of State for Very Foreign Affairs.

After all is said and done, the fact continues to be evident that the great economist will stand first and deeply included in the hearts of his countrymen.

#### As to Raw Materials

Free wool or free sugar or both?

A decidedly important problem. By no means a matter to be settled in hurried and whispered conversations. By no means a matter to be submitted to committees or to a majority party or caucus. On the contrary, a matter to be studied out carefully, candidly, thoroughly.

Nevertheless, not a matter really involving the integrity of the party in power; not a question which, if answered mistakenly, will convert the party in power of bad faith.

The Democratic party is committed to a tariff for revenue, not to free trade. It is committed against the practice of taxing the masses for the benefit of a few freed enterprises, not against the promotion of the general welfare. The general welfare is, by constitutional warrant, a proper object of taxation.

A small element in the Democratic party, headed by former Senator BAYNE of Texas, has insisted that "raw materials" should be taxed just as heavily as anything else. Apparently this school has thought that a tariff for revenue meant equal taxation of all commodities without regard to their relative value as producers of revenue. The idea of the party has never held the notion of the idea of taxing lightly, or not at all, the raw materials of American industries has always commended itself to the majority of law-tariff men. In our judgment, there has been no inconsistency in this discrimination. As other nations almost uniformly admit free the raw materials of their industries, to put burden on the raw materials of ours would be to impose a positive handicap. Moreover, in the actual working of the thing, to do it is to create and in a measure to justify a demand for "compensatory duties" on the products derived from the taxed raw materials. As a matter of history, that is the way some of the worst of the existing duties, particularly the proposition of Schulze-K., have been created.

It is good Democratic practice to admit raw materials free unless there are sufficient reasons for taxing them. This is true, notwithstanding the lack of precision in the term "raw materials."

Wool, for instance, is the finished product of the spinner, and is properly taxable as such. The same is true because it lies at the basis of countless other industries. Raw sugar is, of course, the finished product of the people who grow sugarcane and beets. It is raw material to the refiner.

Not, however, of a series of industries. Therefore sugar does not derive a very strong claim to exemption from taxation from the raw-materials exemption. Its strongest claim is on the ground that it is a necessary of life and that to charge it would be to confer a boon on practically all of us. On the other hand, it is a superb revenue-maker. The tax on it yields us over fifty millions a year. If we surrender that sum, we must make good the loss either by other tariff taxes or by a general increase in the income tax.

To take off the duty on wool is to give up some, but not much, revenue; to help, legitimately, a number of industries; and to deprive those same industries of their sole honorable basis for a demand for governmental coddling.

Weight for yourself the two sets of considerations. But what the President and the Democratic Union in Congress have been doing. They have differed somewhat; but that does not mean a division over principles. It does not mean the slightest apostasy to principle on either side. It means adherence to principle, and a common endeavor to apply the revenue-tariff principle to a great mass of facts, difficult to care accurately. The program would be to raise the tariff on wool. So would a high-protection campaign. But nobody is shirking the job of giving the country the kind of tariff it needs and has demanded.

#### The Seventeenth Amendment

As a matter of fact, there is no such thing of this writing, but the ratification of only one more state is needed, and probably, when that is secured, Secretary HORN will not have to wait more than a year for proper official notification.

It is remarked concerning the SEVENTEENTH Amendment, relating to the income tax, that there is a question whether it really altered the Constitution at all; good authorities contain the view that it merely settled a doubt as to the Constitution's original intent as to the matter it dealt with.

Apparently the SEVENTEENTH Amendment will alter the Constitution. Yet of this amendment, as of another similar alteration may be made. It will not essentially alter, it will rather confirm and compel, what is substantially the present usage of a number of states in the matter of choosing United States Senators. It is the culmination of a change that has been going on for some time, not a sudden and abrupt departure from what the Constitution contemplates. The absolute control by state legislatures of elections to the Senate was disturbed before the Civil War, when party conventions began to name candidates, and party majorities in the legislatures began merely to ratify the choices thus made for them—as in the famous LINDSEY-DUNHAM election of 1848 in Illinois. Followed after a while the practice of choosing candidates by party primaries, a kind of dictation to which the legislatures proved equally amenable. When at last a state held what was in effect a Senatorial election, and a legislature, obedient to its results, sent to Washington a man whose party affiliation was a majority six years ago, the practice of the popular vote, the direct election of Senators was already achieved.

But to say the change has been gradual is far from saying that it is not a great change. It is already a very great change indeed. The effects of it in the Senate are already quite apparent. Doubtless the same will be true in the future. They have willed to take whatever risks it may involve in order to make an end of abuses which the old method permitted.

Time alone can show whether or not the change is as the whole world. Two reflections occur to us as of a nature to excite such as most seriously doubt the wisdom of it. One is this: They are, they are, and we think they will give to the several state electorates an opportunity to correct the mistakes made in party primaries, now so general. For they will give a chance to independents, and they will give comparatively weak opposition a chance, by putting forward their best men, to beat the party's own nominees. The other reflection is that it is one about democracy. Its true strength lies not in the avoidance of mistakes, but in the fact that it can always change its mind and correct its errors.

#### The Bull Moose and the Elephant

Historical Long Island has just figured as a strategic point in politics, and naturally the outcome of its recent municipal election appeared only in obscure paragraphs in the newspapers. It was the same way, too, with a few other places that have had municipal elections recently. Municipal elections in general are rather unreliable signs of political weather. Still, they are frequently all we have for our only means of determining what it is nature to pay some attention to them.

If we may judge at all from Hempstead's and some others, the wind is not blowing quite as the Bull Moose herd would like. More broadly, such indications of public sentiment as we have and are so far from indicating any serious, and doubtless—do not indicate any progress of the Bull Moose party. If they indicate anything, it is the contrary of Brother FRANK E. LEITZKE's contention. Brother LEITZKE thinks it a mistake to consider the Bull Moose party merely a ROOSEVELT party, and he also thinks the Republican party decidedly well dead. On the contrary, so far as we can see, it is not dead at all. It has not yet much to observe, the Bull Moose party 'won't run very well when it isn't in some fact,' says ROOSEVELT, and the Republican part, scores considerable defiance of the roamer and very little consideration for the undertaker.

Sufficient material for prosperity, undoubtedly, but for the sake of the nation, we may serve a few straw to guide and to encourage such Republicans as may still be refusing to despair of their party and studying seriously the best way to rehabilitate it. On that point nothing has happened to discredit the movement, inaugurated immediately after the election, for a reorganization of the party to set it right in respect of the ways in which it has in recent years gone wrong, and thereby lost the country's confidence. Some time ago the papers reported that Senator BAYNE had come to favor such action, and we have seen no denial. There is one thing in particular the party must do. It must convince the country that its nomination is not a mere concession to the Presidency, as is usually made, in obedience to the will of the majority of its members. It must cleanse itself of the reproach of the manipulation of Southern delegations and of bad practices in the choice of delegates from other sections. Other reforms are advisable; this is essential. To the neglect of this essential, the party is already, in the eyes of the honest following, but has lost its temper. The change of policy in this regard cannot be too soon made and advertised. Until it is made, the party's only possible gains will be such as can be derived from the wholesome and perhaps needed discipline of an opposition role.

#### The Budget Question

The President would like to have a budget system. It is not surprising. Anybody who has studied either the President or the character of our appropriation bills ought to have known in advance what his general attitude on this matter would be. The paper report that he wishes to continue President TAFT's economy commission. That is not surprising, either.

This journal has several times pointed out the practical impossibility, under our system of government, of having a budget system comparable to Great Britain's, for the reason that we have no such separation and accord between the Executive and the Legislature as the British system insures. We are glad to be confirmed on this point by the speech in which, near the close of the final session of the Sixty-second Congress, Representative SHERMAN SHERLEY proposed a budget committee of the House, for Mr. SHERLEY has evidently studied this matter long and thoughtfully. But in the case of Mr. SHERLEY, we have before us also the reason why a budget of some sort, no matter if it does lack authority, is desirable. It is the same reason we have been saying:

Why is it the American people are so indifferent to expenditure? Is it that they accept in a loose way the continually repeated statement of a former Speaker that this was a billion-dollar country, and therefore we should have a billion-dollar Congress? Or is the cause the same? No, it is not. It is because they have never been interested in questions of expenditure, because they have never had brought to their attention in its broad aspect the question of expenditure.

In other words, a budget such as we can have under our system will at least secure some publicity in advance, for the appropriations contemplated.

Pending that reform, there is one thing that can be done at once. The Ways and Means Com-

mittee of the House and the Senate steering committee can at least decline to intrust the framing of appropriation bills to men who have already shown themselves amenable to pork-barrel considerations and indifferent to such matters as the decent pay and housing of American andalousians and the proper upkeep of the American navy.

#### Honor to Mr. Bryan

It seemed odd to read that the American ambassador at Rome had offered the medal as a place for funeral services over Mr. Bryan's body. It is a distinction of Secretary of State WILLIAM J. BRYAN.—*Springfield Republican.*

It did not seem odd to us. In the eyes of the world Mr. Bryan's honored name as the first citizen of the Republic. At home, as the multitude of testimonials clearly prove, his character was held in highest esteem. Practically all of the rulers of Europe, including the Prime Minister of Great Britain, the King of Italy, the Tsar of Russia, and His Holiness the Pope, paid fitting tributes. The Emperor of Germany sent a floral wreath to Rome and this message: "Mrs. Bryan:

Accept the expression of my sincerest sympathy in the great bereavement. Your husband's death is a loss not only for you, your family, and your country. Many friends in all parts of the world will grieve with you."

Would it not have seemed strange to foreign peoples, who are accustomed to civilities in death as in life, if no word of appreciation had come from the government of Mr. BRYAN'S own country? Mr. BRYAN'S official act and personal virtues were those of a generous and truly representative American gentleman.

#### Mrs. Pankhurst

In your paper now we shall have news of Mrs. ENRIETTA PANKHURST. She has been highly successful in drawing attention to herself, and incidentally to her cause, though she and the cause seem to be getting a good way apart. The British government, apparently, cannot do anything at the moment about votes for women; cannot change its procedure or make any of its mistakes, for some time to come. All it can do is something about Mrs. PANKHURST, and we are all interested to see what it will do next.

It is being heartily availed for its dealings with the militant, and probably it has been shrewder than it gets credit for. The militants seem to have a great volume of popular sympathy behind them. Their destructive expedients annoy and scare a great many people, most of whom are quite indifferent to their cause or the merits of their case against the government. It gives the people of England an uneasy mind at the militants, and such certainly at the government because it has not subdued them. To have so managed as to allow public opinion to reach that condition seems considerable to the government's advantage. Its objection to letting the militants starve themselves to death in prison is based, we suppose, not so much on humanitarian as on political considerations, and if it ceased to be politically dangerous to let Mrs. PANKHURST starve herself we suppose she would be allowed to starve.

And when the British Home Secretary concludes that public opinion has reached a stage where it is safe to let Mrs. PANKHURST starve herself, Mrs. PANKHURST, who is not a fanatic, will conclude, we suppose, that starvation is a short-cut and one of no further use in the eating way. And then, if she has strength enough left, she may well for her supper.

It is all very like poker, but then poker is not a game that average British statesmen know.

#### The "Titanic," a Year Ago

Next Monday, April 14th, is the anniversary of the loss of the *Titanic*.

We have just been through a period of some of the great disasters and great loss of life by torpedoes and floods, and public sympathy has been greatly stirred by them. But when we have just remarked that these recent disasters, had to have been, have not taken hold of the public mind like that single disaster a year ago. Three times as many lives (1,285) were lost by the sinking of the *Titanic* as in all the floods in the West. That made some difference, though the property loss was fairly nearly equal.

But guess whether they concern lives or property, do not, in situations of this sort, measure the effect on the mind. The loss of the *Titanic* was one of the most dramatic disasters that ever happened. As a story, sudden, vivid, tragic, and crowded with familiar characters, interlarded with suspense and fully alive in the imagination, it has details, it far exceeded in penetration the whole

survival collection of recent flood stories as the papers give them. We notice advertisements for agents to sell books about the floods, several of which have been published. The papers could not begin to tell more than the outlines of the story of them; they were so spread out. But the whole story of the *Titanic* was told while it lasted, and it got home and it will be remembered long after we are all gone who heard it.

The story of Lockwood made a great story that lived. The *Johnston* flood made a story that was complete in one narrative, like the battle of Lexington. So the *Titanic* disaster. It seemed as if the imagination could grasp it all, and it stays as clear in memory as though it happened yesterday.

#### Senator Lewis

It must be a good many years since our dear oration, the *Sax*, began to call attention to the public utilities question of Illinois. JAMES HANCOCK LEWIS. It was while he still resided in the distant state of Washington, and he moved to Chicago ten years ago. What interested the *Sax* in him we forget, but it was a good deal interested and has maintained its concern and spoils of his again in the old familiar way last Sunday. It is so good to see that JIM LEWIS has a t. f. advertising contract with the *Sax* office. At any rate, he has thrived under its notice. His record is worth looking at; forty-seven years old; born (1849) in Virginia—the popular state nowadays to be born in; raised in Georgia; educated partly in the University of Virginia; studied law, was admitted to the bar (1884) in Georgia, and then (1884) lit out for Seattle, where he got promptly into politics and was elected to Congress in 1890. It took him ten years to get to Congress from the state of Washington. He moved to Chicago in 1903. He was Democratic candidate for Governor of Illinois in 1906, and was elected long-time Senator from Illinois in 1913. Ten years again.

Nothing that the *Sax* has said about JIM HANCOCK LEWIS seems to have been a detriment to him. To move to Chicago and gobble up an Illinois Senatorship in ten years seems a considerable exploit, for Illinois is a great state, and has sent great names to the Senate. Though it may be that her best choice before LEWIS was LEXINGTON and he had to take him back.

Mr. LEWIS is still young and may yet move to New York and be a Senator or something from this state. He seems to be closing in on the *Sax*.

#### Mr. Schuon's New Captain

We seem to recall that a long time ago—so long—before the life-insurance disclosures, when 1878 had just passed across the picture screen, and the times were boom times, and the Captains of industry were the greatest of living men, that FOLLOWER-UPON CALVIN SCHUON was projected to the front of the stage as a leading Captain of Industrial Captains and made a speech about education. So much water has run through the mill-wheels since then that we can't remember precisely what he said, but his speech strikes vaguely in mind as a discourse in disparagement of the current processes of education as practiced in the institutions maintained for that purpose and in praise and profanity of the training of steel mills and such industrial seminaries.

It is so special discredit to any one to disparage, right or wrong, the current processes of academic education. Everybody's child "it is not good, and they are very valuable, and the best authorities do no better than guess what they ought to be. But those far-off words of Citizen SCHUON are recalled by a piece in last Sunday's newspaper that tells of the advancement of E. C. GRACE to be president of Mr. SCHUON'S Bethlehem Steel Company.

#### Look at the record of this Mr. GRACE:

Mr. GRACE is the son of J. W. GRACE of Cochen, New Jersey, a retired sea captain. His earlier school days were spent at Pomona, New Jersey, where he was an athlete, sang in the choir, and was a member of the Y. M. C. A. Mr. GRACE entered Lehigh University in the electrical-engineering course. At Lehigh Mr. GRACE was valedictorian, was a three-time played baseball four years, and was captain of the team for two years. On graduating in June 1890, Mr. GRACE went to the Bethlehem Steel Company and set to training as electrician.

And now at thirty-eight he is captain of Mr. SCHUON'S steel-works, in spite of going to school, going to college—the engineering course, to be sure—being at the top of his class, and playing earnest academic baseball for four years. So at least, if our memory of that far-off speech is right, Citizen SCHUON is a wise man, who cares no more than ENRIETTA for consistency and does not let a

provocative theory stand in the way of his appointment of facts.

#### Dancing the Trot

We read about the prevalence of the turkey trot in certain restaurants in New York with very much the same sense of amazement with which we read of the operations of the Montenegro before Senator.

Who would have gone to restaurants to dance the turkey trot, and why, why, why do they do it? It seems that the Mayor has ordered these places to be closed at one o'clock at night, which seems reasonable enough.

Who has the strength and strength to eat and drink and dance the trot after one o'clock?

But it seems they do it now in the afternoon, too, enough to disturb people.

#### Amusing!

Who has time in this working season of the year to dance in the afternoon? People used to do it at summer hotels, but the trot. Not that the trot seems to be so bad now. We read that it is not so bad, as a rule, but that it is a prevailing error.

Well, will this be a strange word and very much explained with partly dissonant people, here in our President and Congress working season, to be told that the public can submit, and how's our Mayor, a good deal bothered, apparently, because so many people insist on dancing in restaurants in the afternoon and after one o'clock at night.

So hard it is to reconcile the facts of life!

#### Taft and Yale

The country approved and applauded Mr. TAFT'S decision to go back to Yale and become a teacher of law. It was a fine solution of the problem of "what to do with our ex-Presidents," which in this free country is really the problem of what an American who has been President shall do with himself. He could make no wiser or more blameless use of his abilities and his experience.

Excellent, too, was the way Yale received him—a bit heterodoxly, as is the habit of youth, but heartily and joyously and for himself. As one American rises to the highest political eminence, so another rises to the highest academic eminence, and from that same eminence to academic retire. It is good for the colleges. It is certainly not bad for the country.

#### Irving Trouble

In recognizing the emancipation of the Chinese the American Republic reflects a new emancipation of its own.—*The World.*

The Chinese have overthrown a dynasty and are now living under a dictatorship. "Is that, in the opinion of the World, the sort of 'emancipation' that has come to the American Republic? Nobody living can foresee the consequences of recognition by the United States of Mr. YU'S Republic as the government of China. It is a leap in the dark and full of peril.

#### Responding to the Eagle Call

The Colonel seems to think he is still President. Anyhow, he sent this message:

To the Progressives in Congress: I greet you, the men of the stout heart and firm faith, who dare to stand up for your colors and fight the people's contest.

Whereupon the men of the stout heart calmly marched into the Republican caucus, voted for JAMES R. MANN for Speaker, and grabbed all the committee assignments they could by their greedy hands upon.

#### Wherein We Differ

HARRY'S MESSAGE, in its favorably by President TAFT, sets of the Taft wing of the Republican Party. What is it that our party still stands for? For creation and aid for destruction, for sense and not for sheer and unadorned impulse. That is as near as we can get to the straight white road. The difference in its sympathies be. If it were Taft, it would play on with GRACE, DRUGG, and the other party wreckers.—*Warren's Democratic Review.*

But, being disingenuous and notoriously thick, it merely reiterates its preference for presentism to destruction and for a government of sense to one of unreasoned impulse.

#### From the Olive Tree

The people of Greece, and affection of a million-people by the gifts with which the sovereign nation of the people donor GRACE C. GRACE at the sixty-third anniversary of the birth of the man, the Republic is proud to congratulate him.—*World's Republic.*

Some Timely Gossip  
of the Balkan Courts

By C. Powell-Napier

## King Ferdinand of Bulgaria

Many people who know Bulgaria have felt that King Ferdinand's court will give way to a republic, with Mr. Durrail at its head; that Stoyan and Moustourgo will follow suit, possibly under Prime Minister Pashitch, and that Romania's monarch will be sent back to Germany, where he came. Who knows? Events move quickly nowadays; photo reports in modern Europe and daily papers have yet to be written in Balkan history, even miss the Turk.

For general tone and direction the Bulgarian court comes first. You find on trace of "Royal Wishes," or "Balkan Princess," atmosphere here, it is dignified—and dreadfully dull. The King can hardly be blamed for sweeping from it wherever state affairs give him the least excuse for ransacking over to Vienna, Paris, or Petersburg. It is even duller than the Russian court, where various forms of spiritism make time pass unawares, if not agreeably.

And yet there is no denying the fact that King Ferdinand is the greatest personality on any throne today. His autocracy and voracity are enormous. He is so well informed that no almost forgets one is listening to a monarch. He talks well, he is a brilliant linguist, a distinguished historian, an astute statesman, and, all bottom, a simple, kind-hearted gentleman. He has done more for his adopted country than the Bulgarians themselves could. He lived from his twenty-five years, he has taught them how to exploit the natural riches of their country, and has spent much of his own large private fortune to help them on the road to civilization. Why is he unpopular? Why has he given the cause between war and exile in that peremptory way? Why was he justly so ahead of his own safety at the beginning of the association that he crept quietly back to his capital, without any of that pomp his heart loves? These are questions he is credited with asking himself very often. After more than twenty-five years' reign he has failed to retain himself on the throne that the Bulgars themselves offered him.

King Ferdinand's enemies say his ruling power is unbroken. From his mid-and-latter days he has kept for a throne. He has enjoyed almost every moment of his reign, in spite of plots, gang wars, and a morbid fear of infection. But one morning lately he felt weary, he is said to his doctor, "I must be really ill to-day." For the first time in his life he asked himself, "I wonder, is it worth while being a King?" Nothing throws him more than to be called "Your Majesty" at frequent intervals, or said he is King Edward. He loves freedom so passionately that, even when down at the front, his table, in the railway-car that was his home, had to be decked with those dainties. He passes of his meals to his children with his little, shapely hands, of which he is so proud as a woman. He will not allow an army surgeon near him, nor would he go within eight of cholera tents. He puts his family and household into quarantine for the slightest indisposition. He refused to see the Queen for weeks, she returned from nursing the cholera patients down at Adrianople. This quarantine rule has become quite a joke in the palace, and some suspect that he keeps it up to keep away from troublesome courtiers, or family foes. He never forgets a face, and makes up to his humors by delicate little strokes and compliments, so graciously that they take their value. When angry, he is very angry, but soon recovers. He has his home-land watched, even when at a distance. He knows just how each member has spent the day and covers him with doctor's who dare not even a short call at any foreign embassy. He cannot bear to think they are discussing affairs behind the back of the great Power. "Diplomats always speak everywhere, and who and my wife" he says. Dining or luncheon is in taking, every one is invited. His wife is jealously cut off from the outer world. This ac-

counts for much dullness. He is an excellent father, and was a devoted son. Even now he cannot speak of his late mother without emotion. She seems to have named Romania's civilization of her as "The only man in the Italian family." When she died, her son, who had already lost his first wife, in whom he was devoted, became her heir and son.

Some four years ago he married the Princess Elizabeth of Russia, one of those small German states whose rulers have been there for centuries, and intermarried with all the great reigning houses. The lady was veering on fifty. She had lived the semi-independent life of the unmarried woman, had been much in Russia, where she took charge of her own hospital during the war with Japan. She is a lifelong friend of the Tsar and Tsarina. Ferdinand came often to the Russian court, where he had been coldly received ever since he accepted the Bulgarian crown. For years he worked to better his position there. One day, it was kind to him that an alliance with Princess Elizabeth would do in a day what he had vainly striven after for years. But the lady did not attract him. Her cleverness is not the kind to appeal to

Helene Vaccarone

him, who shows an imposing intellect, as his mother had, or a very noble one. He has first wife's, it is long he for some time. The Russian court grew chillier that way. Even Kings are human. One more suitable gave way to inclination. The marriage was "arranged." He could not complain that his bride was indifferent.

And so one of the most admirable women in European courts is now a full-fledged queen. The past and the wounded soldiers here, how sad. Such society, except those just around her, does not. A more lovable woman never shared the onerous drudgery of a throne. She has been described as ugly. It is a lie. Her nose is too broad and fat, but her face is so noble, her hard eyes so full of kindly humor, her soft voice so full of music, that her one ugly feature is more than redeemed. She shows a keen sense of humor with the rest of the family. She is a splendid housekeeper and rules her more charitable institutions in a way the best-trained maid might well envy. She is never happier than when relieving distress, and

takes good care her money is well spent. Having given her own private fortune for her husband's poorest subjects, she is often hard pressed for funds; but she generally manages to get them, and philanthropists cannot do better than help her whose spending is so wise. She reads a great deal, especially English books. She can talk and enjoy a good story. Were they a simple, every-day couple, you would say to your bosom friends, "flat, my dear, how could they be expected to be it off."

Still he left in disgrace, some months ago, old Baron Kolkhorst, the prince's over-governor, gave the royal children more fun than anybody. He was a rigid, dignified Prussian, always complaining. Last spring, under the plan that his neighbor, Baron Bernsdorf, started on land that he could not sleep, he thought his rooms from the wing to the main body of the palace, north of the disposal of the prince, who determined to get rid of him. They took him on a plan. His new quarters were on the top of the telephone that he had to pass many corridors and cross a large hall to get to it. One morning he got an urgent call that he hurried out to his pajamas. The key way back he found the way stopped. Each corridor and hallway had a soldier, who solemnly declared his Royal Highness the Crown Prince had given orders that nobody was to pass. The prince himself guarded two exits, and the poor old Baron spent an awful quarter of an hour pushing wildly about the large hall and dodging behind pillars when a minister passed through on his way to the King. The soldier, having seen of his master, came to look and laugh. The job worked so well that the Baron petitioned the King to go back to his old quarters that very day. But he never reached and another. The crisis was reached when, furious that a reception was going on in the palace when he wanted to sleep, he went, he led all the waiting room down, and took the key to his room. Some of the household gave him a good shaking, the King heard of it and sent him off on a sickbed leave. His greatest foe, Baron Bernsdorf, had had no intention to go to the King for work and work, and was getting quite uneasy, as the man who does not enjoy real conversation frequently soon loses prestige at court. But at least a gentleman came and told him he was not to stir from his room that day, as the King might visit him. Bernsdorf waited and waited. At last, three weeks later, somebody mentioned his name before the King, who exclaimed, "Good God! I told him to wait in for two weeks ago. The rest and I had thought the poor old Prussian still waiting; through three weeks of glorious Balkan spring weather he had not dared leave his room."

The King of Romania has not mastered the language of his adopted country even after forty years. His German pronunciation is not quite something as strange when he delivers an address in Romanian in Parliament that some of his listeners pretend to understand what he says. In Romanian, as in Italian, it is especially hard for foreigners to pronounce well. The Queen speaks it much better. King Carol is another popular monarch, and recognizes that he has done much for his country. But they cannot bear his pro-Prussian policy, which he keeps all to himself, as it were, after taking outsiders into his confidence. The events of the winter have aroused discontent. But he has many good points. Though he is now less able to entertain the affairs of his own day. The character of the Romanian court of twenty, and even ten, years ago is lost. The King no longer holds court in a courtyard, but in a palace, who encouraged all the arts, wrote poetry, played, and drew himself, also wrote the people's will welcome, but there are so more recipients who saw once met the flower of the world's talent.

When Crown Prince was in Romania as a bride the ladies of the higher class treated her with marked

# FROM DESKS TO BENCHES

The change in the Seating Arrangement of the House of Representatives is Symbolical of the New Order in Washington

BY A. MAURICE LOW

WASHINGTON CORRESPONDENT FOR "HARPER'S WEEKLY"

It is symbolical of the new order that the first session of the Congress of the new administration should see the old desks of the members of the House of Representatives replaced by benches—symbolical of progress, and the workmanlike execution of affairs that have imposed themselves upon the country since the fourth of May. If ever there was anything that invited to the alighted transference of the public business it was the desk of a Congressman. It made life entirely too easy. Seated at his desk he could read a newspaper or write letters, do anything, in fact, rather than apply himself to the purpose for which he was supposed to be there, to listen to or take part in debate. To a man inclined to do the desk work of his constituents, how many millions and hundreds of millions those desks have cost the country as one will ever know, but unluckily only they were the most expensive pieces of furniture in the world's history. Had they been made of solid gold, scarcely wrought by the hand of the master

mission and others who carefully examined the question favored benches because they believed it would result in a quicker dispatch of the public business. As long as a man has a comfortable chair and a desk on which to rest his arms he is content to sit in idleness and is less inclined to having to listen to or do anything else; if less attention is paid to his physical comfort he will become mentally impatient.

The new benches are not exactly instruments of torture, but they are not so inviting as the old desks and chairs. The benches are very much like the ordinary seats in a theater, although somewhat wider, so that even a man of Mr. Telford's build will have plenty of room. They are upholstered in leather with cow seats, and under each seat is a small drawer in which members can deposit their papers. The benches are somewhat similar to those in the House of Commons, but they are more comfortable and their arrangement is different. In the House of Commons the benches are arranged in lines at right angles to the speaker, the government and its supporters occupying the right and the opposition the left; while in the House of Representatives the benches are arranged

the needs of the service and the means why they seek for more money or additional legislation. The presence of members of the Cabinet on the floor of Congress might prove a dangerous convenience, and such a course is not a precedent. Besides, it is an imitation of the English system, which is impossible of application in this country, since the Cabinet is not a government, as is understood in England. In England the Cabinet is the government, and all legislation must have the support of the Cabinet, and if the House of Commons refuse to give its approval to its recommendations the Cabinet resigns and offers a new Cabinet to take over affairs; but in the United States, on the contrary, no authority except that which it derives from Congress, which Congress at any time has the power to revoke or curtail, there is no analogy and really no precedent why members of the Cabinet should be admitted to the House or Senate. Furthermore, while the English system of the Cabinet is always a number of Parliament and as such can advise and vote, the American Cabinet Minister might be awarded the privilege of taking part in debate, but of course he could not be permitted to vote on any measure.

While the supporters of the proposition admit a certain soundness in the arguments of their opponents they say the net advantage to be gained is overlooked. The fact that by admitting members of the Cabinet to Congress the barrier between the executive and legislative branches is broken down does not benefit them, for the simple reason, they say, that it is now broken down and has been for several years. It is not a question of whether it is that the country looks to the President and not to Congress to initiate and carry through legislation, and holds the administration responsible, or not done when there is a majority of his own party in Congress, so that he is regarded as the responsible power in government without having the power to enforce responsibility. He is allowed to influence Congress indirectly through a message, or through a member or senator who is recognized as his spokesman, or by the ministerial and bribery between them, but it is not the official representative of the President; or, more remotely, through a member of the Cabinet. If Cabinet members were permitted to speak from the floor of Congress, whatever they said would of course be official and have as much weight as if the President himself said it, just as in England, when any statement made by a Minister is known to be the judgment of the Cabinet as a whole. A speech made by a member of the Cabinet on the floor of the House or Senate for or against a bill would be much more effective than a dozen reports or memoranda, questions and answers, and resolutions, and reasons given why the measure is defective or the passage is necessary. The President would have to travel the necessity of a vote if a departmental head were able to say: "This bill is bad for the reason that I shall give, and if it passes against my protest I shall consider it my duty to advise the President to veto it." When there were no Cabinet members the President was prepared to veto the bill unless it was modified, for the member of the Cabinet would have spoken only after he had consulted the President, and Congress would understand that the President's intention had been officially communicated through the Speaker.

Legislative veterans in Washington say that one of the reasons why so much of the legislation in Washington is so controversial, and friction between the President and Congress is more common than otherwise, is because of this divided responsibility. Instead of the President being held responsible, he should assume the effective carrying out of a programme, the division of power and rivalry and jealousy and the fear of the least slight of his own ability, always increase the difficulties of meeting needed legislation and make it easier to pass laws that are not in the public interest. If the President has a policy of his own, and is not to be interfered with, he is not to be interfered with and overlapping the limits of his office, and his firmness and determination almost always comes only after he has consulted the President, who may be driven to do what he wants because they believe the country is behind him, but who do so only after it is a controversial matter; who lose an opportunity to discredit the President in the eyes of the country, and are often successful in making the country believe that the President is not to be further consulted. On the other hand, the President is a weak or amiable man who has an stomach for a fight, and is not to be interfered with, and especially his party men, and yields to Congress, allowing his judgment to be overruled by his good nature, or the least slight of his own authority. It is fatal for the President to quarrel with Congress, then the country turns on the President, the eyes of Congress are fast on his door, and it is almost impossible for him to escape being made a rotten sacrifice.

No matter what the exact words of the Constitution may be, it is a well known fact that in recent years the people have almost unawares the Constitution and made the President law-maker as well as law-keeper, in keeping with the spirit of the times that there should be a strong sentiment in favor of giving members of the Cabinet seats in Parliament and in holding within the power of the President over the control of legislation.

The new style of seat which has driven the time-honored desk from the House of Representatives

craftsmen, inherited with previous states, the expense would have been trifling compared with what has been paid for these simple desks of mahogany. Nothing of the kind it was an easy for a member to vote without sitting on a bench, which is by no means as comfortable, members will feel less inclined to be present, or to waste time in speeches, merely for the sake of hearing themselves talk. The substitution of benches for desks ought to shorten the length of sessions, and it will be sufficient to make it less this effect.

While this change coincides with the opening of the 53rd session, it is not the first time that it has come about, as most reforms do, after a long period of discussion and agitation, and not overnight; and incidentally it may be added that the reform which seems inevitable will also come as quickly as it is born. As far back as the time of Thomas B. Reed's speakership the proposal was made to take out the desks and replace them with benches, but that was too "radical" a suggestion to meet with approval in that conservative time, and nothing came of it. It was revived and forgotten, and then again revived, and even such a step as to be fixed in the record standstill on Mr. Reed's bill, but it was not considered it worthy of serious consideration. With the increase of population and the corresponding increase of the membership of the House, it was evident that something had to be done, and either the bill had to be enlarged so as to allow room for more desks or space had to be economized by making provision for more members in the same hall. Mr. Telford appointed a commission to study the subject, which offered alternative plans. One was to retain the desks but enlarge the seating capacity by lowering the walls separating the House proper from the members' lobby, the other was not to disturb the existing chamber but to save space by substituting benches for desks. Nothing was done at the time, but the report favoring benches was adopted at the last session, and the change seems made immediately after adjournment so as to have the House ready when the special session convened. The members of the com-

mission, thus enabling a much larger proportion of the members to face the Speaker. In the House of Commons there are many more members than seats, and on important occasions members must either stand or raise early and file their names by depositing their hats on the seats they select to occupy, if being one of the novitiate rules of the House that a hat on a seat is a valid title. In the House of Representatives there is a seat for every member, and when there are more desks, members obtain their seats by lottery at the beginning of every Congress, which often resulted in prominent members being driven to the back rows and new men getting the most desirable places.

It would be rather curious if with this change in the seating arrangement of the House there followed the adoption of the office-dinner custom to give members of the Cabinet seats in Congress and the privilege of taking part in the debate but not to vote. Bills for which will be offered at the coming session. The opponents of throwing the doors wide open to the Cabinet have one objection, and it strikes a blow at the theory on which the American system of government is founded—the strict demarcation of the line between the powers of the executive and the legislature. Congress has one function, and the executive, the President, and though his Cabinet member, and it was intended that they should function separately and not interfere with each other's authority, since the admission of members of the Cabinet to Congress would inevitably lead to the usurpation of executive power. The further argument is advanced that little practical benefit would be gained. The views of members of the Cabinet regarding any proposed or pending legislation are always accessible to Congress, almost invariably they are communicated before action is taken, and in making up appropriations bills, committees and the Senate then the estimates submitted by the heads of departments, who then go before the committees and explain

# The Science of Not "Firing"

BY CROMWELL CHILDE

ILLUSTRATIONS BY J. J. GOULD

"UNFAVORABLE! Getting more and more useless! Has he been tried at anything else than just this work?"

"The general manager was in the midst of a council with his department heads. A score of important matters had come up and been passed upon, and now the case of William Jones had been reached. A commercial fate insignificant in the world at large, but vital to one young man, hung in the balance.

William Jones was a favorite. He was the very black business sheep in a very brilliant staff. Every chance had been given him and all possible favoritism had been shown. The sub-department head who was his immediate chief had but hope. The department head over him had looked into the case and agreed with his subordinates.

A few years ago such a matter would never have come into the general council. William Jones would long since have been eliminated from the world of his immediate "boss." But here the big affairs of a big corporation stopped while little, in comparison, forty-dollar-a-month Jones was talked over.

It was a busy morning. Each one around the council table was urgently needed on his own big room, where papers were piling up at an appalling rate. Why bother about William Jones, who could be replaced instantly by a good man?

The department head was speaking. "Hoopless, Mr. Green," he said. "We have never had such a poor chief. He was never good, but he has steadily been growing more nervous and worthless. The records he keeps are full of errors. He takes no interest in his work and looks at his desk."

It was then that the general manager asked the best and wisest of the council set down at the head of the table. He followed this by:

"Had you been Jones's card-records?" This was handed him. He read it aloud. The most modern and best equipped of modern big businesses no longer keep records of their stock, their sales, and their finances only. They have carefully set full records of their employees, not only of their names and home addresses, but of their characteristics and capabilities. Information for these records comes from several sources. They are confidential papers, and none but the biggest chiefs know what is written on them.

This card-records give in full the story of Jones in the company from the time four years before he had been taken in as an office-boy. He had climbed, but slowly. At each stage was noted the opinion of the chief in charge as to his work and development, and alongside of this the view of some independent observers sent through the staff to "size up." In business today it is realized that the "little boss" chief of a few men and a score, may be prejudiced one way or the other.

Such a personal prejudice as this is very capable. It would fill with wonder those who think that the big commercial subscription of today is necessarily heartless and only regards its men and women as numbers. A score of men-records of employees, manfully up to date records of each person as a distinct, individual being and center of energy and accomplishment.

Several different subjective and objective lines make each record that person's opinions, inventiveness, responsibility, procedure, originality, executive quality, conscientiousness, adaptability, "up-grades," ability to make friends readily. A human scientific analysis is what it becomes in the course of a few years, one of the most valuable assets a company can have.

Young Jones's card-records looked black. How was such a piece of heartless and cold-hearted thinking out. But the general manager studied the card as if the coming year's dividend depended upon it. He read by unobtrusive criticism and finally noted these three on a just life basis.

"I see here, and by read of slowly," that Jones

has some traces of originality. It is noted down below that he has a good approach, though evidently undeveloped—yes, and on this line it is suggested that there may be the making of a salesman on the top.

"Inventiveness" and the general manager looked steadily from one man to another with the nearest, compelling glance that made him feel the power he had given to be. "It is our fault, I think. We have set Jones at something he is not fit to do. He has failed—yes, but we have made him fail. I have never seen the boy, but this record makes me believe that he will be a good man."

"Frank"—he turned to his big and brilliant sub-manager—"will you give Jones a chance? Will you put him out as one of your juniors? Let us see if we haven't been wrong and if, after all, he is not really good. I may be mistaken, but—"

Perhaps this modern way of not discharging men and women, over they have entered into the supply

the company employ. Worse than useless in the dull work inside, he became a "star" in the getting of business. He was magnificent and never known it. It took a commercial genius like this general manager to guess at the trouble and make track of his theory.

The idea of not "firing" is logical from the corporation's viewpoint when one ceases to think of it as a means to train men and women. Every salesman, executive, and clerk of a company represents an investment. The longer a person is in a concern's service the greater is this individual investment. In the case of frequent discharges money and time must be spent in training other people. Thus, if a company's personnel changes more, this employee investment grows. The new policy maintains this expense. In the words of Napoleon, "every private soldier is a merchant's son-in-law in his grandeur." Any one in a big business, however far down the line, has the possibility of being one of the great executives a few years later. He may be the one man of a critical hour a quarter of a century distant. Unless it be essential, the modern well-off company considers if he had judgment to let even one of its privates slip away.

As an evidence of the value of this policy of holding the men and women, of hoping the ranks will rub through long years, business men who have a thorough inside knowledge of affairs point today to a company of industrial firms close to thirty years old. Practically every high executive in it started low down, when the concern was in its infancy. If there were difficulties and necessities inside the organization, these were thrashed out with the foremen and the youngsters were not dismissed. If here and there a man was being threateningly bad, he was kept. When severely ailing, individual men were neglected, but not for the betterment of a war—something out to let them go.

With this system this concern led in its day and generation. The people who have its ways when it was a struggling young company with some few much money realized, naturally. Now many an organization does, a worthy the same thing as possible. In this and some other cases the idea that has recently come so much into vogue seems to be justified.

"I think," said a certain very able American business man as he and a friend one day passed the office of a bank that, while prominent, as longer ago had been relatively insignificant, which of late was prominent. "That if the idea we have today of not 'firing' men like that, the existence twenty years ago I would still be with that bank and pretty well near the top. I would not like to see the man who would think I may say without opinion and judging from my record that if I had not been so firm they had failed, or a good deal better off than I am today."

Should you like the story? It always made a great impression on me, and it has taught me in my own business never to have a "first" but to say one myself—never even an office-boy or the most insignificant girl stenographer in one of my branches. If any one is to be "fired" I will do it. My books of departments may recommend as they please; I will examine all the evidence. At the worst I generally do not "fire" but transfer the boy or girl, woman or man, give them some other work, but then under some one else. That is apt to solve the problem.

I need have been twenty-three or four. Probably I was not a hundred miles from home, but had not worked down. One day was a cynical, rather childish man. He was a fair man, except for his disposition. He was a fair man, except for his disposition. He was a fair man, except for his disposition. He was a fair man, except for his disposition.

That was the fault of the old system. With it the word of just one man was taken. He could both advise and train. If he had the confidence, I certainly had not had much. For his unsuspected statement was necessary. This opened the way for

He received card-records

of the big companies that transfer their "people" by hundreds or thousands and, if they do not "fit" and do badly, of trying to give them other work that they can do well, may not be right, but it has become a definite policy of the day and appears to bring success. It is by no means a universal policy as yet and seldom an official one, but it is adopted in many of the most progressive corporations and not a few outside it and perhaps in the first place. The man given above, that appeared as one of the best-known companies in all America. The man whose "card" was in print in many smaller concerns, would have let us strongly, their policies when he has become one of the best of the younger salesmen

was other work, but then under some one else. That is apt to solve the problem. I need have been twenty-three or four. Probably I was not a hundred miles from home, but had not worked down. One day was a cynical, rather childish man. He was a fair man, except for his disposition. He was a fair man, except for his disposition. He was a fair man, except for his disposition. He was a fair man, except for his disposition.

countless little battles in all the corners who could shake a threat over the men under them and make things mightily uncomfortable. In these days officers of campaign and heads of firms never thought of questioning such resolutions. "How can we expect results from our men unless they are satisfied with their subordinates?" they would say.

Some critics think that the big complicated company of today does too far and "cooies" its men and women, that the average employer takes advantage of the chances given him in definite shapes and to exploit. There is altogether too much explanation now, these critics say. They appear of former days, when the "old man," as a firm's head was always called, summoned some quaking employee into the private office and there discharged him.

The great steel corporations a few years ago instituted an elaborate system of cost-finding in order to ascertain whether they actually understood the science of employment. They objectively demonstrated to themselves that they and many other business concerns had made to learn, that employing today is very often carried on in haphazard fashion. In some cases the result of the investigations was most astonishing. It was discovered—and the facts hadered incredible until they came to be proved—that seemingly very competent, greatly trusted officials had no real knowledge how to employ. Again and again it was shown that they had hired men for the wrong work.

These men hired, and when they found that a man could not do what they had figured he should they indignantly branded him as " incompetent." The investigation put its finger on the real weakness. The trouble was not, primarily, with the man who had not "made good" and after a time were "fired" but with the people who had done the employing.

Since those investigations were made and the plan was adopted of giving the so-called " incompetent " a chance along other lines there have come to be far fewer discharges in the big steel companies. The " failures " have been reduced to a minimum. The theory now is that there should be practically no " failures." The old system, or, rather, lack of system, has been replaced by an intelligent and thoughtful effort to find the work for which each man is best suited. It is black and white in case there is one report made. It shows how in case after case men originally employed at one thing and shifted to another were able readily to earn an appreciably higher wage, whereas before through " incompetency " they were on the " ragged edge " of discharge. The men had not

William Jones was a failure

strived. They were the same. It was simply a case of knowing how to make use of human material. The big chiefs of the companies learned, to their amazement, that really valuable men, men that could be turned into money-makers, had been struggling along against hope over work they were quite sure to do.

In New York today are two rival concerns exactly alike. A man went with one five years ago. Within a year he was almost literally kicked out as being of no use. By luck he got a chance to fit in the organization of the other company. He went rapidly up the ladder there, and three years after the first concern had discharged him he was invited to come back to it at his own figure as to salary. It had been a matter of surprising him in the original instance. Some minor pretense who thought he "knew it all" had not sized up the man and had not realized his possibilities and his genius at certain things. The first company hate him now on their staff under contract and he is a treasure.

A prosperous American railroad has in its archives a story which shows how it is best to look before you leap when it comes to a question of " firing." This railroad had an employee in its general manager's office for whom no one could say a good word from a business point of view. He was very much of a candidate for dismissal, and in the ordinary concern there would have been no hope for him. But this general manager had in him the stuff of a real shrewdness of consequence. Before dismissing the man he first made careful inquiries to see if there was not some other department into which he could be made to fit. The rest of the story is in the words of the general manager, who found later on that he had divided reason to blame himself on the way he had looked about.

I realized that very many times a man does not

suspect the ways in which he is profited. This case interested me. I couldn't seem to find a hole to look anywhere else, but by asking many questions suddenly discovered that he had a facility for sending papers to our city ticket-office. He was no good at all in our department, but people took his advice and used our line. That gave me an inspiration. I arranged for him to turn his attention to that work. The outcome was simply inevitable. The man proved a marvel. He had been up to that moment a failure of failure. Within three weeks he had an offer from another line at a better salary.

" Here came in the science of business as it is at the present day. I think I can take credit for heading that case rightly, for the real building of a big man—for that he certainly eventually became—has to me with that offer. Without consulting myself I asked whether he intended to accept or not. " Yes," he answered decidedly. " I shall say no. You gave me a chance when I was about to be dismissed. When you treat me that way I have no hesitation about sending my future with you."

" He did not ask for an increase in salary, but there was only one thing to do. When he received his check at the end of the month, was for the same amount that the opposition line had offered him. Some after that something remarkable happened. The freight department demanded that he be transferred to that division. He was now beginning to divert in our line shippers that we had never been able to reach.

" And this was the man we had decided to ' fire ' because he was no good at all. Think of the mistake we had been in the verge of making, but somehow back!"

" The two departments kept on arguing over him—and I indicated that his salary should be still further raised. I anticipated that the opposition would be coming on our trail and I wanted to forestall our rivals. They came, but without effect. Maxima refused to leave me. He was by now doing wonders."

" Once an experiment was tried. The man we were going to ' fire ' was sent out into the country with the title of traveling freight and passenger agent. He stopped in conventions, gathered up church societies, and obtained a monopoly of parties and excursions. He rubbed up against men who shipped without regard to the line over which their goods were going, and received order orders.

" The only thing we were afraid of was a case of scolded back. Something like this is apt to occur at just such a stage. Through a friend I had a justifiable little fit thrown to him. It was to the effect that the opposition line predicted that within sixty days his head would be on a badly cut of shape that he would be discharged and land in the constantly growing scrap pile. It was estimated that there was a chance for promotion if he kept on as even level. It was as though a lash had been applied. He worked harder. I called him into consultation from time to time to test his judgment. I found, to my delight, that he had made a deep study of traffic. When the position of general freight and passenger agent was created he took the kick and, while strict, maintained the respect of all.

" When our traffic became so great that it was congested and our yards were hopelessly blocked, I consulted with him. He proposed a perfectly simple plan to open the blocks and keep the freight moving. Of course I received the credit for being able to select good men. When I became persuaded shortly after that the man who was pronounced incompetent at the outset followed in my footsteps and later became the managing director of the road.

## ONE OF HISTORY'S

On April 6, 1865, a report was received by Longstreet that a break had been found in the lines of the Army of the Potomac through which the Army of Northern Virginia might pass. Colonel J. C. Haskell, who had a blooded mare that had been carefully led from Petersburg, volunteered his services. He and his men were not seen until the gallant rider had dashed by him. As Colonel Haskell pulled up, General Lee walked to meet him, exclaiming, "You have ruined me!"

DRAWN BY SIDNEY S. PRINGLE

## OST OPPORTUNITIES

This might force a passage. He called for a swift courier to carry the information to General Lee, who had passed outside the lines, under a flag of truce, for the mounted he was told to kill his mare if need be, but to bring her to General Lee. He rode like the wind. General Lee had dismounted beyond a turn of the road until mare! "Why did you do so?" The swift dispatch came too late, for General Lee's note to General Grant requesting an interview had gone beyond recall.

## Deceptive Lights Along the Business Shore

ALLOWANCES WHICH MUST BE MADE IN READING THE SIGNS GENERALLY TAKEN TO BE INDICATIVE OF THE COURSE OF BUSINESS

It is a long time since there has been so much talk of the "business shore" as at present, not only for scrupulous care in reading the "signals," but for a clear understanding as to how they ought to be read. To know that things and things, for example, generally indicate a "business shore" is not enough—it is perfectly possible for bank clearings to be increasing while the volume of business is actually falling off. To figure that an increase in railroad receipts uniformly show an increase in business is on the up-grade is another unsafe conclusion—there have been plenty of times in the past when earnings have increased while the tonnage actually being handled was on a declining scale. And so it is with the other lights along the business shore. Intelligently observed, they form the one sure way for the business man to lay his course. Observed without appreciation of their changing characteristics, they constitute an serious form of danger as a set of lights which a navigator thinks he recognizes, but in the vicinity of which he is mistaken.

But if increasing bank clearings and railroad earnings don't necessarily mean increasing business, why may rates be low while the real position is one of strain and all the other signs are false to mean just the opposite of which they usually mean, of what we call these so-called "business of business?"

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

Take bank clearings, for instance. Ninety-five per cent of the country's business being done on checks, it might be thought that the volume of bank clearings passing through the clearing houses is an increase in the business which gives rise in the drawing of these checks. But this is not the case. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

Another important thing to be noted is the fact that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing. It is not that the volume of business is actually increasing but that the volume of business is actually decreasing.

## Science and the Burglar

Science, while aiding mankind in all manner of ways, is at the same time aiding the crookman to pursue his nefarious work with more weapons and appliances, and with less danger to himself, than ever before. The modern burglar now carries the cleanest outfit of cut-throat and window-breaking tools. He carries a few ounces of nitroglycerin, a cylinder or two of oxygen and acetylene, and a blowpipe. With these easily concealed tools he runs free his way through the toughest steel.

Nitro paper is the deadly enemy which the safe manufacturer is now trying, with the aid of science, to circumvent. Under the intense heat that it generates the strongest steel crumples up like paper. A rivet some two feet in diameter can be cut through the metal, even if an inch thick, in a few minutes.

A steel plate which a shell from a 4.5 gun fails to dent will melt in a few minutes to a few cubic feet of oxygen and acetylene gas in combustion. When the thermite process for welding iron was discovered, scientists used immediately tubes of this for the purpose of burning through plates of steel.

They have never been headed with care and an exact knowledge of the power of which they are capable. It is not for the wisdom of the burglar to test with nitro blowpipe or nitroglycerin. No Russian sets to work to acquire a scientific knowledge and skill of the kind that, if put to some legitimate use, might open up to him an honorable career.

Only recently a manufacturer, whose successful career was evidently limited by the law, fairly amazed expert scientists by the completeness of his library, which comprised a valuable collection of books in French and German written by scientists for prevention in technical societies, and a series of the most important works of the genre of the blowpipe or metals. He admitted that he had spent three years in this study, a laboratory very similar to his library was small and respect, but for completeness of equipment would have been found in a science school. In his laboratory he had made some improvements.

One wonders how the scientist discover new treasures faster than he must act to work to construct that force in the hands of the criminal. It is said that recent experiments have produced a steel that will even withstand the blast of the blowpipe.

## How to Grow Strong

It is not logical for a man to bring in the air lungs on two rings by his hands, according to George Diller, French naval lieutenant who has devoted himself to the study of physical culture. One cannot obtain physical strength which must be harmful because they do not respond in any way. For the same reason it is impossible to maintain and hold the arm in the air while holding the rest of the body motionless. The man who acts in this manner develops a habit which should be avoided by throwing something, by climbing or by being, and the legs should be exercised by running or swimming, because these essentially natural movements have a happy reaction on the whole organism. A better movement may be had in the case of the involution, when the subject is capable of ordinary exercise but whose arms are weak and nervous to become strong there is only one means of obtaining physical improvement, and only one of efficacious physical culture: that is to carry out such exercises as are suggested by nature upon the men of the forests and work in it in some manner. These are walking, running, leaping, climbing, lifting, jumping, boxing, fencing. All the activities of primitive life have a place in these eight natural exercises.

## The First "Pure Food" Labels

AMERICAN "pure-food labels" are issued in pursuance of an act of Congress dated June 30, 1906; the first "pure-food labels" appeared, were of a date somewhat later than 1906. They brought to light by the Harvard Pathologist, and thought to be the first instance on record of a government's look upon itself the lack of which its products were really what they were represented to be.

These early labels were found among specimens of ancient Hebrew writing in the city of Samara. They were employed at such an early date as to be deposited in the cabinet and they date the vineyard where the wine came. The wine was supposed to be pure and free from a government stamp on the oil

press the label reads "A Jar of Pure Oil," with the name of the district producing it. These records, now nearly five hundred years old, indicate that not only the king himself, but many other men, stored their wine and oils in this warehouse. This is indicated by the fact that in which the inscriptions were drawn up in the Phoenician, which was widely current in antiquity. It is quite different from the modern Hebrew manuscripts of the Bible are written.

## Nature's Freaks in Australia

The animals and plants of the world are divided into regions almost as clearly marked as the political boundaries of countries. The Australian region is perhaps the most clearly marked and the most peculiar of them all. Its indigenous inhabitants, both animals and plants, belong to a separate group of the world. Because the island continent of Australia, itself, with Tasmania, the Australian life-region includes New Guinea, the largest of all islands, 200,000 square miles in area, and the large islands stretching from New Guinea toward Java and New Caledonia, and the New Hebrides. At a remote spot this whole region was continuous land. At a period still more remote, in the primitive age of geology, only one part of the whole area was above the sea, that part of Australia which is on the side farthest from New Zealand; and this large southeastern island had already received the ancestors of its animal plants and animals, probably from southern Asia.

At the period when this southeastern island was first populated by mammals, man assumed one of the most important positions in animal life, namely, the production of the young, was still at a very early stage, and the very early manner of the old fashion of laying eggs, inherited from reptile ancestors, still remained, even though the young were fed with milk after they were hatched. In Australia there are still some of these primitive animals which lay eggs: the duck-billed platypus, or *Ornithorhynchus*, and the echidna, or porcupine anteater, which is almost equally primitive. But the great majority of the Australian mammals had already, even at the remote period we are considering, got on stage beyond the egg-laying and they were producing their young alive, though still hardly beyond the fetal stage, small, blind, unformed creatures which had to be suckled into a skin pouch on the abdomen of the mother, and kept there, while convenient sources of milk supply, till they got their proper growth, and were better able to feed for themselves. These pouch or marsupial animals are characteristic of Australia, though they have a few stragglers, like the opossum, in the New World. Most conspicuous among the Australian pouch animals are the kangaroos, the hoppers, of which there are also species of large size, and forty smaller species, as well as a enormous tree-shaking kangaroo, in New Guinea. The largest, the great red kangaroo, stands five feet high and weighs as much as a man.

## To Outwit Oily Thieves

There was when the horse-couper was the perfect personification of ways that are dark and tricks that are vain; but in these days of motorized some garage-hoppers are up to more devious ways of tripping the unwary than any horse-couper ever dreamed. Most garage-hoppers are honest, but retain one or two bad habits, for example, the habit of shifting their lubricating oil at the highest price and under the same old best makers—though they say the oil in bulk. They have a saying that it's a poor helper who can't draw from the same barrel any oil that is desired. The intelligent motorist can easily guard against these thieving oil men, by doing in its original package—sealed and in safe. But he must insist and he must be sure that the seal is intact.

## Joss-Sticks

Joss-sticks, which are almost as familiar a sight to us as they are to Orientals, are made in vast quantities by the Chinese in the East. They consist of bamboo rolled in steam, in different odoriferous drugs, two of which are especially useful to protect the teeth against the decay which is caused by acid and sugar, which causes them to decay steadily without being periodically esthetic.

5c for P. A. in the tupper roll bag

## There's just one joy smoke in this world for you

That's Prince Albert—pipe and cigarette tobacco made by a patented process that removes the bite and the "parch" and gives every man the privilege of smoking as much as he wants every day—without regrets!

We've been game enough to spend a fortune to perfect the Prince Albert process and another fortune to tell you about this smoke. How long are you going along with the "ranks" and "biters"? You try

PRINCE ALBERT  
the national joy smoke

Can you get behind the fact that millions of pounds of Prince Albert are being consumed in jummy pipes and cigarettes by men who switched their brands because they took us at our word and gave P. A. a try-out? If P. A. pleases millions of men, we declare it will please you!

The "soft smokable" does not burn, so, in neither end and you can smoke, smoke and eat. It's a mighty handy little package for cigarette smokers. The tupper roll bag, 5c, is a handy little package for pipe smokers. Prince Albert is sold everywhere.

## A New Book

## THE MONTESSORI SYSTEM

In Theory and Practice

By  
DR. THEODATE L. SMITH  
OF CLARK UNIVERSITY

This book, written by an American educator, and including certain results of American experience, affords a simple and practical introduction to the system of elementary education which bears the name of Dr. Marie Montessori, of Rome.

The methods of Dr. Montessori, which have been tested in various American schools, are here set forth fully for the first time, together with a complete account of the results obtained.

The book will be found of great practical value to parents, teachers, and every one interested in the education of children. Illustrated with Photographs Taken Especially for this Book. Post 50c, Clark, 60 cents net.

## THE VOICE OF THE PEOPLE

1908

UNEASY HEADS

(Continued from page 2)

the court that you find those whom you cannot trust.

King Nikola of Montenegro has two amusements—writing poetry and playing poker. He is as keen on the game that he has been known to play on the top of a hill full view of the battle-field, with a military band going down in his ears. But he runs tight, too, and has taken his shot at the Turk more than once during the war. His great characteristic is a disposition. He only gave his country a constitution because he found his own family elope getting too powerful. He has got his opposition in the Parliament down to six for the simple method of imprisonment. There have been several plots against his life, but he always managed to nip them in the bud, put the ministers who were supposed to be involved into chains and kept them there. Several influential men, including the country's own liberal Prime Minister, the baroness Radovitch, have been in that uncomfortable state for eight or ten years. And yet King Nikola will bring the tears to your eyes with his eloquence, when he gets into Austria, Hungary, and Mr. Paulinich's perpetual stringing up of discomfited. "The trouble is," he once said to me, "is that I really do not know what my subjects who go to Belgrade to study come back with radical ideas for which my country is not yet ripe. There are some who are just ignorant, but because my son-in-law, King Peter, hopes to reign here. But he is wasting his time. I can save him."

This is King Nikola's vice. American ideas have got in, too. His American Minister came back from America to fight for Serbia, and are spreading republican ideas in the camp and tavern. If Serbia goes to Albania, it will be a bad look-out for the old King's dynasty for his subjects have an idea that his plaudits with Austria will save account for his loss. The old man loves money. He begs from all his rich neighbors, Austria, Russia, and Italy give his large family. He said they are for the development of Montenegro, many Montenegrins doubt it and believe it to be the royal family. He credited with having several million francs invested in America. He has two children to provide for in the royal family. His greatest hobby is money. M. Kokotoff, Russian Premier, beyond words. There is generally a promise of arms between them, when Nikola visits St. Petersburg, but last time Kokotoff was not. As usual, King Nikola proposed after-dinner sport-rapping, and the Tsar asked King Nikola to play the ghost of Alexander the Third. There was a long conversation, and the ghost finished by saying that Nikola ought to have 100,000 rubles (\$200,000) from the Imperial purse. Next morning, the Tsar, a confirmed sportsman, told Kokotoff, who is an esprit, but knows King Nikola's weakness. "When was this, Sir?" he asked.

"At about ten o'clock," replied the Tsar.  
"No I supposed," said the wily Kokotoff, "I was having a drink, and I will play the ghost of His Imperial Majesty, Alexander the Third, at two o'clock. He told me that he had wanted to get into conversation with Your Majesty, or with me, because he had thought over the matter of King Nikola and come to the conclusion that Montenegro was costing too much, and 600 rubles would be quite enough for this." And six thousand was all that King Nikola asked for that trip.  
One thought that politicians are not all others as I observe the Italian courts in the connection that the idea of the Italian monarchs are nearly over. Even Bonaparte, with their aristocracy, speak more of a republic. The germ of republicanism seems to have got into the air. It will be interesting to see how far it will spread.

DRAMATIZING THE PRESENT

(Continued from page 15)

parts that commands the eye, mood, and state, the sun, and sky to speak.  
So much that the idea of a revolutionary has been said about the lighting of my production that I have always been desirous to recognize to devote my utmost efforts to that direction. If the success of my light effects were a matter of national interest, they would be adaptable to any theater, but they are not. There are always distinguished people, who can read the article benefit of an entire picture, that the idea of the artist and the original painting still retains its identity. In a lower degree, the lighter scene seems to be developed in a new and original picture, which retains its identity even if I have painted it. My process of producing light effects bears the

Clag Pear

WAITER: "And how did you find the steak, sir?"  
CUSTOMER: "Oh, quite simple. I lifted up the potato, and there it was."

Coldwell Lawn Mowers

Near the first hole, Polton Park Golf Club, N. Y.

You get practically two horse mowers in one with Coldwell Demountable Cutters.

These cutters are removable at will, like the blade of a safety razor, and two or more go with each machine. If one cutter needs sharpening or repair, it takes less than a minute to remove it from the frame and attach another.

No waste of time sending the whole mower to the shop. No heavy freight charges. Send for leaflet giving full description and prices, together with practical booklet on the Care of Lawns.

The Coldwell Company makes lawn mowers in six different styles and sizes. The Coldwell Combination Mower Roller and Lawn Mow is the best and most economical of any ever made for use on large stretches of lawn.

Demountable Horse Mower

Always use the BEST. The BEST is the cheapest. Coldwell Lawn Mowers are the BEST.

same relation to the stage that the painter does to his canvas. Where the painter has his work in front of him, however, the theatrical producer is obliged to rely upon his memory. I have often sat in an orchestra seat, and witnessed, and painted myself some of my best scenes, and on an actual one. I have directed the distribution of lights on the canvas as a painter manipulates a color. I have directed, by lengthening them, till the effect was complete. It was all done at one sitting for the first time, but I could never repeat that picture. Once I have directed the lighting of a scene, sometimes I sit almost blind, there are no changes but the production completed, it is but the inspiration of a few hours makes a

To return to the question of the spectator in his relation to the theater. There is no such track in the supernatural as there is in the actual, but it may be more difficult to visualize. I am inclined to believe that the expression of supernatural truth is, in itself, a supernatural message to the artist, and I say this from the logic of experience.

"The Return of Peter Grimm," for instance, was a play that grew out of supernatural causes. I was told over and over again, that I could not sustain the ghostly light situation on the stage, which is the traditional green light and was white stage lights. I had to violate stage tradition almost to ignore my knowledge of the theater, that I met another way for a new and suited stage effect. To tell the story of this play, to convey the supernatural suggestion without obvious staginess, I selected the month of April for the episode, the rainy month of the year, when the air is full of whistling and murmurs. This for effect, of course, but chiefly to emphasize the truth of supernatural influence.

"The Case of Bevy," the play which Mr. William T. Locks brought in to me one night, was written around a theme I had suggested of a dead personality in one being. In the past we had seen "Zerkyl and Hyde," but in "The Case of Bevy" there is shown something between the power of ideas and experience to help. No green lights, no dark stage, no horrible stage contrivances in accomplishing the physical change. It is done as we see it done today in life; as it frequently happens in the full force of a light stage.  
"The Return of Peter Grimm" is a play that has touched the edge of the rainbow, a forecast of the wonderful possibilities in the new dramatic medium, which lies in the unexplored field of supernatural influence.

"The Case of Bevy" is a play that I believe points the way toward the realization of the future—toward a realization that conveys a message to those who think, but also those who do not think.

Roman Roads in England

There has been revived by British motorists a certain degree of interest in the project to reopen and put in use certain of the Roman roads that lead out from London to other cities. The ancient highways, built by the Roman government for military purposes, were well constructed and had an excellent drainage system, but they have in many instances been practically abandoned.

Very few people in the country are aware of the great network of highways which was drawn across England, Wales, and Scotland by the Roman government. The straightness of these roads is explained by the fact that the stone and brick which were loaded subsequent to the road-making were used for the construction of military purposes—the substitution and control of the traffic. These naturally had their importance in many instances where the conquerors withdrew, and their very sites are forgotten.

Odd Ways of Fishing

It is said that at one time the Islanders taught some boys to jump into the sea and catch mako. In China fish are equally well for a signal they dive into the lake and bring up large fish grasped in their bills. In Greece the fishermen use branches of pine stuck in a pit and lighted; the inhabitants of Athens used Cyprus-leaved oaks, which they stuck in a hole, and in Italy the fishermen fish in the deep with the improved bamboo placed in a manner to resist the force of the moon upon the water. These methods of fishing are not new. The fisherman in a large net and seldom fail to draw out considerable quantities. Another method is used for a similar manner.

## President Wilson on Capitol Hill

"Nothing does so much honor to a man newly risen to eminence as to make new regulations devised by himself. If these, when once established, show that they have grandeur in them, then they will render the man an object of respect and admiration."—NICCOLO MACHIAVELLI.

IF THOMAS BURNETT MACAULAY had been alive and well and in Washington on April the 8th, as he used to mark time, we should have had a fitting portrayal of the memorable event which signified the entire new freedom of a pretty new President. Be-fitting sermons-at-arms would have stalked glumly about great miles of the plains would have stalked in from the headwaters of the noble Missouri, anti-slavery and anti-slavery would have appeared resplendent in gilt and lace, bright eyes would have blinked at the unaccustomed splendor (with a sh), and more than one lady would have been carried out in a fit. But Mr. MACAULAY's calculation that the Republic would die before he had having gone wrong, we are compelled, as usual, to turn to our neighbor the Sun, for a preliminary sufficiently vivid to satisfy a natural craving for details.

Be it understood that April the 8th was the day on which the speech-making spirit of JOHN ADAMS was what the present able Secretary of the Navy would call incarnated. President WILSON had served due notice upon Congress that he had accepted the President to address the House on the opening of the session instead of sending the address by messenger and letting the clerk read it personally. I thought that the dignified and natural thing was to read it. It is a precedent which, it is true, has been discontinued a long time, but which is a very respectable precedent. He also hinted through Secretary TOLSON, who is becoming a sort of Loon, that he meant no reflection upon THOMAS JEFFERSON, who had to do originally with the discontinuance aforesaid.

Nevertheless, as the painstaking Mr. MACAULAY would have taken note, the information aroused widespread interest in the minds of living statesmen. In point of fact, on the day preceding the event mentioned hitherto, three Senators, unlike in temperament, disposition, and physical appearance as can be easily imagined, although each of the Roman type, rose in their places and spoke their minds. The first to make deliverance was our old friend Historicus of Massachusetts, who now finds so little of interest in the present that he is writing and printing chapters of what Mr. ROBERTS would designate as possible reminiscences.

"It is well known to all here," said Senator LOON, with far greater confidence than we should have felt, "that under the administration of WASHINGTON and ADAMS it was the practice for the President to come either to the hall of the Senate or to the hall of the House of Representatives and deliver his message in person." The custom, he continued, with historical accuracy, had been borrowed from England, where kings and queens were wont to open Parliament in person if they were so constituted around. But the Jeffersonians disapproved of all such non-parliamentary proceedings, and said Senator LOON:

When Mr. JEFFERSON was elected he altered this custom over for all, and we have always adhered to the Jeffersonian change. I suppose Mr. JEFFERSON's

meat have had, possibly, the feeling in regard to it that was expressed by his followers; and I think he was not, as a rule, much given to speech-making. At all events, he addressed a letter to the President of the Senate on the 8th of December, 1801.

What the Senator meant to say was that Mr. JEFFERSON thought he was altering the custom "ever for all." The fact of course, is that it remained unchanged only 112 short years. Mr. JEFFERSON had not foreseen a politically liberal development with a strong Hamiltonian strain. But that is neither there nor here. The letter addressed to the President of the Senate by the original THOMAS, who, by the way, was so proud of his given name that he never dropped it for a minute, reads this way:

Sir,—The circumstances under which we find ourselves in this case present the most favorable prospect of making by personal address the first communication between the legislative and executive branches of the government, by message, as used on all subsequent occasions throughout the session.

To convince that I have had principal regard to the convenience of the Legislature in the economy of their time, to their relief from the embarrassment of immediate answers on subjects not fully before them, and to the benefit thence resulting to the public affairs.

Trusting that a procedure founded in these motives will meet their approbation, I beg through you, to communicate the enclosed message with the documents accompanying it to the Honorable the Senate, and pray you accept for yourself and them the homage of my high regard and consideration.

To Dr. HUSS Mr. JEFFERSON merely remarked, "By sending a message, instead of making a speech, I have prevented the bloody conflict to which the making of an answer would have committed them." So they were able to "see into real business" without losing several days "combating an answer."

But we are forgetting Senator LOON, who proceeded in this wise:

I do not know, Mr. President, whether it is the plan of this session to continue the very dignified Federalist procedure to outline it, and make an address in reply to the personally delivered message. It seems to me it would be very appropriate to do so. But Mr. JEFFERSON's change was accepted by the majority and has been followed from that time to this. I do not recall at this moment but see no wise comment after it had once gone into effect; and that, certainly enough, proceeded from JOHN RANKIN, who stated on one occasion that he thought it very unfortunate that the old plan of the President reading and delivering his message in person had been discontinued, because he said the consideration of the message and the delivery of the address were two things which opportunity to review what had been done, to compare and criticize the message, and it seemed to him that it was a great pity to be given up.

We record with pain a suspicion that the distinguished Senator's procedure is not as good as it used to be. Our own is very distinct to the effect that a far broader statesman than the provincial JOHN RANKIN, of Bonhomie, found occasion to make "advance comment" upon JEFFERSON's act. We can, indeed, recall his very words, to wit:

JEFFERSON killed this single occasion, and substituted the written message, the written message, and read by a clerk in the midst of talk and bustle, which is the form we have today. JEFFERSON's act was not only a great loss to the cause of liberty, and also because he was never to public speaking. From the latter point of view it is

reasonable enough, but the ostensible cause was that he was not, as the story of the French nation by which it is the President, as it is well for the head of the state to meet here in face the representatives of the same people who elected him.

We are quoting from memory, but the Senator can easily determine whether our recollection is as good as his by turning to page 79 of the second volume of the *Life of George Washington*, by HENRY CANTON LORER.

We have to admit it, but the truth is that we could not detect the point in the Senator's speech and, as usual, had to go to Boston for it. They here made a study of him there and understood him, as witness the following from the Boston Herald:

I incline to think that Senator LOON's historic criticism of the President, reading his message in Congress were chiefly intended to play with the Democrats. Their great apostle and prototype, THOMAS JEFFERSON, had abandoned the idea, and Mr. LOON failed to call attention to the prospect of the new freedom in the act of returning to discarded Federalism. The Hon. State Senator also had some sport in his emphasis on the importance of an address to the President in reply, as in keeping with the precedents of the old order. He knew there was no reply to be made, and nothing that could be said. But it was all very clever. People make a great mistake who think LOON acting in humor.

It is a guarded utterance, but that is their way. They never lose vulgarly of thinking in Boston; they merely admit an inclination in that direction. But we surmise that the divination is correct and we cheerfully attribute our own stupidity to the fact that we are of the very people who have made the great mistake referred to.

In the temporary absence of Mrs. MARTIN W. LITTLETON Senator JOHN NAYLOR WILLIAMS spoke as the second representative of the immortal JEFFERSON. He regretted exceedingly that the President had resolved upon a procedure which involved a revival of "the cheap and tawdry and tinsel imitation of British methods." It was not, in his judgment, without reason that every President had followed Mr. JEFFERSON's example and he hoped they would not imitate the "pompousness" and "evangelicalism" which he considered "out of keeping with the American spirit and American institutions." Apparently the Senator thought the President was going to prance up the steps of the Capitol, but in any case he would not oppose the resolution, because it would be discourteous to do so although he said not but only the Senator from Massachusetts his happiness over the fact that the infraction of the time-honored tradition came from a nominally Democratic source. The sadness of Senator WILLIAMS evoked the sympathy of all present, but it was evident that he spoke rather in sorrow than in anger.

Senator NAYLOR also advanced a few trite observations, but he was originally a Clark man, so no attention need be paid to what he said.

They took the matter less seriously in the House of Representatives, where, according to the papers, "when the committee reported that Mr. WILSON would appear before Congress in person there were shouts of laughter."

Such preliminaries. We now revert for a moment to the Nation's account of the actual happening. It was "a scene of unusual interest" because "there were twice as many holders" as usual, and "statesmen's wives stood upon one another's

form with good-natured awkwardness." In fact, the wife of the Vice-President "was turned away by the doorknocker," one of whom, apparently thinking it was none sort of game, curtly announced "a full house." Finally, however, a suitable place was found.

The British and French ambassadors and their consorts arrived early, but Mr. JOHN BURNETT was a little late and it looked for a time as if the ceremony would have to be postponed. A sign of relief went up from Speaker's nostrils when the Director General of the Western Hemisphere finally appeared leaning upon the arm of Mr. DUNAY FIELD MALCOLM, who also is soon to become a third assistant public servant.

The Speaker himself was repudiated in "his black coat and a white waistcoat," brilliantly supplemented with "a rich purple" and "a big white cravat" in his buttonhole on the left. Later the *EMERALD* was immaculate, as yet, in long, cut, creamed trousers, and his Moses Live smile. The others looked about as usual.

The Senators came in, like the animals on their way to the ark "two by two," the Vice-President leading with a slight limp occasioned by his previous endeavors to master the brutal game of golf. Both SENATOR WILLIAMS and SENATOR MARTIN's countenances were somewhat wet, although the latter was illumined by his own consciousness of proprietorship. Senator ELLIOT BART also smiled. The President was "warmly applauded." When he had "smiled and bowed his acknowledgments" and "stepped briskly up the dais," it was observed that he had discarded the pepper-and-salt suit in which he had received the Supreme Court, and "was attired in a frock coat with dark-green trousers of modest stripe." He spoke, "in a strong, clear voice," these words:

Mr. Speaker, Mr. President, gentlemen of the Congress. I am very glad to stand in the presence of addressing the two Houses directly, and thereby verifying for myself the impression that the President of the United States is a person and not a mere department of the government having Congress from some isolated island of jealous authority, sending messages instead of speaking in their presence; in short, that he is a human being trying to cooperate with other human beings in a common life.

Hereafter, after enjoying this pleasure and privilege, I shall feel absolutely normal in all our dealings with one another.

He then advised Congress to reduce the tariff and the tariff reform commission. When he finished there was much applause, led by Secretary TRACY, who was present in his personal capacity as a private citizen of Jersey City. "In exactly thirty-seven minutes after his departure on this seventy-third morning journey," the *Sax* concludes: "President Wilson descended from his automobile in front of the White House," "graciously to the relief of Assistant-President Hoot," who had been watching anxiously from a sequestered nook in the upper story.

It was a very pretty performance all through, and nobody has found any fault except our hypercritical neighbor, the *Times*, which says that the innovation was "a lead to unfortunate results" in the form of hoisting, which "would certainly be deplorable." But there is nothing in that. Members of Congress are not only invariably polite, but they are also well aware, as Mr. DUNAY now remarked, that they get their real message when they go to the White House to inquire about the business. Another is the point in the *Times's* little insinuation, that the President's underlying purpose was to "air his vanity." He told plainly enough in the words quoted above why he went in person. He was sick of living like Robinson Crusoe on an island, and he wanted to show that he was really a human being in his "other human being," "hereafter, after enjoying his pleasure and privilege," he would cease to feel abnormal. Nobody but the *Times*, or perhaps the *Evening Post*, would think of criticizing an act so wholly natural and unassisted.

We are proud and pleased to be able to record the fact that our other public journal has unimpairedly seen the happy day, and that it might lead to our the honorarium of the new administration.

#### Not a Whisk

When President WILSON goes over to the Capitol to read his message to Congress, it is not a mere whisk.

It is an action with thirty years of thought behind it.

It is not an act of desperation nor of abandonment, but an experiment, duly considered to facilitate government.

Perhaps that is why Mr. WILSON'S innovation seems to have been so successful. He is not an impatient rider of stunts or of methods or of theories, but a thoughtful man. Just what important actions have deep foundations.

Unluckily, in this instance, his purpose was to rivet public attention upon tariff legislation and, incidentally, to emphasize his own leadership.

#### Taking Authority at Its Source

The President had no good time on April the 8th that on April the 9th he again roved over from his island of jealous authority and made another visit to Capitol Hill. This time he went to confer with the Democratic members of the Finance Committee of the Senate, who had been summoned previously from their duties in the Chamber, about the tariff. Just what happened has not found its way into the public prints, but the President went so far as to remark laughingly to the correspondents, when he emerged from the marble room, that there was really no "crisis," and that in the end harmony would prevail or he would know the reason why. Something was also said of "the tariff," which was not to be. It was a mere visit of courtesy—in fact, the return of a call, deemed advisable to effect two cooperation, a sort of drawing together, so to speak, in the service of the people. The Senators themselves were obviously touched by the attention, and everybody else seemed at least pleased.

It was a situation when we found our accustomed neighbor, the *World*, guide-vice-chief of the administration, breaking into double leads over the incident. "We cannot believe," it said, finally, "that President WILSON was well advised,—whom does the *World* suspect?—in visiting the Capitol." Not that there is any objection to "the visit of a man of such an obvious plan of an insidious form of Executive intimidation." All that, of course, is absurd. What the *World* is concerned about is "the prestige of the Presidency itself." It continued, with undisguised anxiety:

The President of the United States cannot afford to take the chance of being publicly faulted by the Chamber of Deputies. The commission which he took the chance of leaving his leadership publicly rebuked as private meddling. But this is what he does every day in the Capitol for conferences with members of Congress.

At the other end of Pennsylvania Avenue there is a little talk with commission. When he is notified by the secretary law of Washington the President may see whether he wishes to see. The Senator or member of Congress is to be summoned to the White House, or let himself be deficient in the ordinary routine of official life. It is impossible for the President to be involved in the White House. Congressional efforts may agree with him, or disagree with him, but in a line that none of them may come without, in a sense, embracing himself privately.

It is quite a different matter when the President goes to the Capitol as an advocate of legislation. Then he is an express presence in the Chamber of the situation.

It is proper enough for the President to read his messages if he prefers, but in the matter of consulting with Congressmen it is wiser to follow the better part of tradition. It is far safer to assume, the President, who is to be sure to carry the White House to the Capitol.

Highly as we esteem the *World's* marked ability when it engages in demonstration of its independence and fidelity to principle, we cannot even pretend to get excited over this. In truth, there is an question of principle involved at all. It is not a matter of policy or of method. It is a matter of principle. The *World* thinks he can do better more quickly by going up the hill and removing some of the blinders that Mr. MALCOLM found Senator WILSON wearing, there is no good reason why he shouldn't do so. At the worst, like a certain famous gentleman of France, he can always go down stairs—"in a hurry," he did the other day—unfired and in good order.

Time and experience invariably straighten out little matters of this kind. We, too, have our doubts of the efficacy of the President's plan because, as a continuous performance, it seems to lack sense. A President embodies an entire department in himself. It is paid ten times as much as a Senator, and presumably his time is worth more than ten times as much; he has a great deal to do, and occasionally needs to step and think; he also has to eat and sleep and converse with disinterested strangers who spare the thought of seeking office. Incidentally, therefore, as the *World* says, he would do well to let Congressmen walk on the outside of his White House. It is, practically, however, the way it will work out eventually. Despite his feeling of need to spare that he is "the other human being," Mr. WILSON'S liking of novel ways is sufficiently obvious, and he

is entitled to his flag. It won't last. He will have to go to the Capitol once or twice more to prove that he was right, but as soon as his presence and the presence of his flag in the Chamber of Congressmen go on attending to their own business and pay no attention to his comings and goings, he will go back where he belongs and stay there.

The *World* won't lose sleep. A century-old precedent is far stronger than a month-old President. The *World* is a long-suffering old man, who inured entirely well, he remains on the little old island which lies between the Departments of JOSEPHUS DANIELS and JOHN SKELTON WILLIAMS.

#### The Underdog Tariff Bill

HARPER'S WEEKLY appears to treat the UNDERWING tariff bill precisely as it has treated other tariff bills—that is to say, on its merits as we see them. For many years an advocate of the low-tariff policy, we naturally welcome the introduction of a low-tariff bill with good prospects of passage. We sincerely trust this bill will pass in the form currently with that policy; and that the country will adhere to the policy, as it did from 1848 to the Civil War. But it is so part of our advocacy of our faith to deal disingenuously with any specific measure.

Moreover, anything said now about the Underwing bill will be said too late. At the present writing, though already before the House nominally, it is in fact still subject to amendments by the House Democratic caucus. We must add, to be candid, that we do not prefer to have matters treated already the immense detail of the measure.

Nevertheless, a just judgment of it must rest on the way it deals with the great mass of articles subject to tariff taxation, not merely on its treatment of the particular commodities—sugar and wool, for instance—which as subjects of lively controversy are naturally singled out by the newspapers. The great enterprise of Mr. UNDERWOOD and his associates should be taken as a whole.

Taking it that way, and confining our acquaintance with it to be still imperfect, we nevertheless feel justified in saying this much about it: It is a thoroughly honest effort to carry out the low-tariff, non-protective policy. It is a substantial, even radical, downward revision of existing schedules and will, if it passed substantially as it stands, be the first step of the long-needed theory of tariffs applied with intelligence to present conditions.

It is both a revenue tariff and a competitive tariff. It does not for a moment lose sight of the principle that the tariff is a tax to raise money, yet it steadily keeps in mind the actual status of productive industries in this country and abroad. The two aims are consistent. The bill offers our producers all the help to be derived from the cheapening or even the making free of what they need in their several lines of production, but resolutely denies them immunity from competition. What it puts on the free list is not one which non-protective of its inventor's purpose than its taking from the face that a number of articles, mainly luxuries, for the revenue they will yield.

It adheres to the principle of taxing luxuries heavily and taxing necessities as lightly as the equivalents of revenue permit; but in our judgment it is better in having the tobacco and liquor taxes practically unchanged, without the revenue-making possibilities of those excises. This, however, is a matter to be considered only in connection with internal-revenue legislation.

It is right and consistent in endeavoring to reduce the cost of living to the mass of Americans, and the masses in business, in that it remains persistent in the fact that adherence to this purpose permits a demagogue appeal by its opponents to the farmers of the country. We trust, however, that the mass of American farmers are quite intelligent enough to see that they gain more from the removal of really and highly protective duties on the things they buy than from the removal of illusory protection on the things they sell.

We think, therefore, that as to the great mass of commodities and industries it deals with, the bill is honest, thoroughgoing, intelligent; that it is truly Democratic and deserves the support of every Democrat and of every independent opponent of the high-protection form of privilege.

#### The Politics of It

So much for the foundation work of Mr. UNDERWOOD and his fellows. They have done as well as WILSON and his fellows could do in twenty years, and that is no mean feat. They have a far better prospect of seeing their work carried on to fulfillment and practical effects. But the prospect is not unclouded.

True, they can look to a party still apparently united to support them; there has been no preliminary quarrel over another matter, as there was in 1883. They have the aid of a President successful, brilliant, persuasive, who possesses the prestige of the traditional new leaders and is naturally alive to the supreme importance of enacting his own and his party's pledges into law.

The difficulty and danger is where it has always been in the Senate, now controlled by a scant and increasing Democratic majority. The situation there is unusual and nobody can yet say with any assurance what will come of it. The Republicans, in a will, of course, co-operate in any plan to defeat or emasculate the bill. The Progressives and Progressive Republicans would support a less thoroughgoing revision downward and probably favor certain parts of the bill as it stands, but doubtless only one or two of them at most would vote for it as a whole without substantial alteration. But the chief uncertainty is as to the final attitude of a very few Senators elected as Democrats who are either protectionists at heart or subject to immense pressure from protected interests in their several states. These men, as it happens, are most disturbed by the prospect of free wool immediately and of free sugar after three years of reduced sugar duties.

It is a situation to be handled both with delicacy and with courage, with tact and reasonableness to avoid a rupture if it can be avoided without sacrifice of principle, yet to be faced bravely if principle and honor cannot be maintained otherwise. For our part we are ready to support the movement consistent with principle and honor to be attained and we are extremely hopeful. We do not expect the UNCLE TOM'S bill to go the way of the WILSON bill.

#### Gloverville Is Alarmed

As we go to press, Gloverville is panicking in the afternoon, with all places of business closed, and holding mass-meetings in remonstrance at the UNCLE TOM'S bill reduction in the tariff on gloves. Gloverville announces that adoption of the UNCLE TOM'S bill will mean the end of the city. So long as the Hon. LEVIN S. BRAYTON and his Congressional friends on the other side have made the tariff, all went well and there was no need of these demonstrations. But if Gloverville is entirely dependent on the will of Congress for existence it is in a bad case and ought to vary its industries, no matter what the tariff is. But it is really ready to confess that it has submitted all these years to a parasite on the taxpayer, and that the withdrawal of even a part of the people's housework will ruin it!

That must be a very startling confession for any community to make, either privately or by a parade and five mass-meetings.

#### And There Are Others

Gloverville is not the only mourner. We don't know how many more there are, but Mr. UNCLE TOM'S is doubtless in the process of learning, and report sets the volume of wail by telegraph is very heavy. Flood-razed Louisiana lifts a voice deeply distressed by the prospect of free sugar. Everybody has a finger on the taxpayer's industry, and that the withdrawal of even a part of the people's housework will ruin it!

#### Mr. Marshall at the Bat

We may as well confess that the JEFFERSONS birthday dinner given by the National Democratic Club in this city was only about half as many guests as usual attended, and those who were there were almost all optees. Even the customary toast to the President of the United States was omitted, and there was a good deal of silence when Mr. MARSHALL expressed his personal belief that Mr. WILSON is the authorized representative of the Administration.

It is hard to deny why this was so. One would have expected much enthusiasm at a Democratic dinner when the Democrats hold full power in nation, state, and city, but there was nothing like as much as there used to be when they held no office worth mentioning; in fact, there was practically none at all.

MARSHALL, of course, didn't help much when he gave what the World calls "a magnificent toast to Jeffersonian doctrine and 'hell up to

wealth the terms of confederation as constitutionally possible through the taxing power." The idea is strongly imbedded hereabouts that, when Mr. JEFFERSON drew the Fifth Amendment guaranteeing that no officer shall be deprived of his property without "due process of law," and that no private property shall be taken for public uses without "just compensation," he meant what his words seem to convey.

It was a sly, swashbuckling speech and, as the World remarks, "wholly uncalculated for by the times and the occasion."

#### Wayne Mac Veagh

Eighty years ago to-day the stork brought WAYNE MAC VEAGH to the great Republic which he has served so well as public officer and as private citizen, and which he still loves so dearly as anybody we know. We respectfully tender our most cordial felicitations and good wishes.

#### Hon. Mr. Cockran is in Massachusetts

It is remarked, under very large headlines in the Boston Journal of April 12th, as follows:

SOUTH FRAMINGHAM, April 11th.—In a great speech here tonight, BUCKNER CUCKRAN declared the UNCLE TOM'S bill was another important provision designed for the purpose of protecting the special interests. He charged President Wilson with vague generalities in his recent tariff message—generalities which, he said, were purposeful and intentional in their closing of ideas.

Why, the dear man, is he so it again! One is almost inclined to wonder what he said, but that would hardly be fair, for of course he does not speak to be read, but to be heard.

But what took our BUCKER off to Massachusetts to denounce us Democrats, root and branch!

It seems that a candidate named NORMAN H. WHITE is running for Congress as the Bull Moose champion in the South Framingham district, and that he is being made to give him a good send-off. Recent candidate HUN is on the stump again for him, and somebody else has turned the spirit of our good BUCKER'S eloquence in the same behalf.

Wonderful man! Wonderful sentiments! Wonderful party!

#### The Michigan Election

Michigan is something of a straw—quite big enough to serve as well as any other straw to show which way the wind is blowing. We ourselves did not attach too much importance to the national election mentioned last week as indicating whether or not the Bull Moose party, as a party, had gained a footing in the country, but Michigan is too big not to be really significant.

And the change there is too striking. Last November the state gave ROOSEVELT his biggest victory. Now the BURNETT party is a bad thing in the Republican and the Democratic parties.

For the life of us we can draw but one inference. It is that the Bull Moose strength of last autumn was not Bull Moose strength at all, not at all the expression of a fall and permanent commitment to a new party, but something else.

We do not pretend that our answer is more than guesswork, but we should say that the great showing made by the new party last autumn was due mainly to two things—ROOSEVELT'S personal popularity and indignation with the Republican party. Perhaps we ought to add a third cause—the example of revolution in the States; but that is the clearest; but that is hardly worth considering in any reasoning that looks to the future—save the immediate future.

The immediate future is quite worth considering. The Democrats are engaged in passing a tariff bill; they indicate a purpose to deal strongly with the country with other matters not less important. They are considerably manly and we sincerely trust they will use their power so wisely and conscientiously as to strengthen themselves even in their first appeal to the country. But there is an objection that such success as that is extremely rare in the history of parties, either in this country or in England. Ordinarily the strong and best administered are the most successful, and have favored reactions of public opinion, and have suffered reverses, the first time they went to the country.

If there is such a reaction in 1914, which of the two opposition parties seems most likely to profit by it? The one that does will be the one that is likely to survive. The few indications in the public mind that we have had since November are distinctly favorable to the view that the

Republicans rather than the so-called Progressives are likely to be the real opponents of the Democrats in the 1914 elections. ROOSEVELT'S personality remains, however, an important factor in the situation, much as HAZARD and his party have long been in this state. Of course, too, it is possible that the few signs we have are misleading.

#### Boiled Down

The abundant and wholesome siring of the ambassador question seems to yield two conclusions.

One is that we should pay our ambassadors living wages and provide them with great nations, after the manner of other great nations.

The other is that rich ambassadors ought not to embarrass others who are not rich, and at the same time put this country in a false and unfavorable light before the world, by a too lavish use of their wealth.

Put still more succinctly, parsimony and extravagance are the two things to get rid of.

Both amendments of our practice are quite attainable if both Congress and the Executive will do their duty.

#### Ambassador to London

MR. WALTER H. POSE has spent most of his adult life trying to make himself interesting, through various publications, to the public. He has worked long and hard at this employment—as well as a one as there is—and it is generally admitted that he has succeeded in it.

He is a very interesting man indeed; knows a lot, and is practiced in imparting it. Moreover, he is conspicuously a modern person, whose thoughts have been busy with the problems of this generation, and who knows the facts behind those problems—intimately and accurately as few people know them here in this country.

We do not think that our cousin in England will like Mr. POSE and find his presence in London beneficial to their spirit and understandings. And of course, since he is a friendly and very social man, he will like them and have due enjoyment of life in their society.

#### Taking Notice of Our Governor

Our neighbor the Springfield Republican, which looks over often in a friendly way to observe what is going on across the Hudson, has this to say about the people's foremost representative at Albany:

The strength of Governor SELTZER of New York is not so much in his political record as in the period in which his constructive ability and his staying power are to be tested relentlessly, and in which pitiless nature was so largely able to meet the requirements even of the daily news. For a time it seemed that those who had heard their estimates of SELTZER upon the strong suggestion of his friends, and the support of his own performance, might have misjudged their man and failed to appreciate his real ability. Their view today seems low and of the mark, that it did when Governor SELTZER took office. But the record is far from being all in.

Yes, the record is far from being all in, and so is the Governor. But the feeling about him is about as the Republican says. Governors were to be less anxious if it were not that his pneumatic quality exposes him to constant risk of puncture.

#### Just

We record with pain that the Los Angeles Municipal Area, in which Mr. HIND, of Massachusetts, lately pointed in a letter to the WEEKLY as an example of a fair and truthful newspaper, has died.

Its trouble, as disclosed, was not that it was too good to live, but that it was too expensive. After thirty-two weekly appearances its upright labors were discontinued because—so we read—it cost \$26,000 a year and yielded no revenue.

But that is not the only case in which a sacrifice is the cause of truth that there must have been some other reason for stopping this honest paper.

Can it be that nobody read it?

We suspect that that was the real trouble.

#### The Answer

The laying of an income tax has been approved by the Independent, and we cannot see how the desired \$100,000,000 or \$100,000,000 can be raised by a tax of one per cent on the income of the country, even if the rate be graduated upward by much larger incomes.—The Independent.

It can't. According to the Treasury estimates, 1 per cent on incomes from \$4,000 to \$10,000,000 would produce \$21,520,000, and a two per cent on incomes exceeding \$10,000 would yield \$105,000,000—total of only \$126,520,000, or nearly \$100,000,000 less than is now derived from the income tax alone.

## Of Nerves and Space

It is not by dint of professional knowledge, either medical or psychological, that the Hermit dares not open his remedy for the nerves, tension, and quivering under the shocks, vapors, and delayed conditions of our complex life, as it is rather as one who suffers years to speak to the neck of his symptoms and needs of relief. None will deny that his like all the ethio-male and painting, modeling and sculpture, are, even thought and the representation, becoming daily more and more difficult to "play up to." It is a time of high tension and head locks. One partially directed and bewildered efforts are recognized now, for good or for evil, as an independent, creative task. It is watered with it, and the representation (making like) and let us have the fact, we are making it higher and better, or more world and ignoble, not for ourselves alone, but for humanity in common. Impressionist type, a revolt, and the representation, not dropped, are for encouragement, feeling of all the facts; one to demand our entire equipment of common sense, feeling, and intuition. But in the end it is not he who falls fainting in the fight with his destiny, but he who knows to death, still standing in his life, to hit back just once more, so long as he can breathe, at blind Fate, who is truly defeated by life. But he is satisfied who, turning from the right of the struggle, manages to keep a mind occupied by prejudice and to stroll through to Death unscathed.

In such a mighty battle it is only human to lose nerve, now and again, and to have to pause to catch one's breath and to get one's bearings. But the nerves are not saved only by a fair fight. The most satisfying pains come from thinking or actual effort. The thought gets caught in a trap, geometrical figures and pure reason and round them, like a lion caught in a net, something nothing but the beginning of a trap. Back and forth over the same small space the thought turns till the soul is sick and palsy. Then it is time to turn in the wounded body and say: "But the world isn't happy; if this is the way things are, I will have to hate the losing returns of the same thought; if from the hollows of the same pillow the insistent tears materialize that sleep is unneeded and will not do again, then it is time to turn the consciousness to the other things, however the truth may be contained in one room or yet one had not on one star. As there is infinite space, so there is infinite possibility, and now how far yet is what we callings and what we callings the manner of the same things.

An old Scotch shepherd, an English writer tells us, who had lived his whole life under the open sky, was asked to do his trouble while suggested that she will in the future to bequire into the state of his soul. "No, no," he answered, "that would not do any good, but you might call it for Robert Ball if you know where to find him.

There is a certain close relation to modern life in the old shepherd's answer. He knew, from sitting out beneath the watery skies at night, something of the wide ranges of the spirit and he, his soul was to be taken account of, would a man who had lived in the infinite distance of the sky, and who had seen the soul was to escape the walls of his soul and go wandering. It was not the writer's wall-in heaven with pure gates he wanted to visit, but the great commoner's senseless sphere, whirling through space.

So when the armchair chair and pillow become the ghosts of dependent thought, catch a bolt for the spirit. Give larger rooms for consideration. There is something infinitely soothing in a high-pitched note and distant walls. Go into an empty cathedral or a big and vast church and look up and around, and the turbulence is quieted, and soothing sounds dropping like the lifted eyes.

But better yet, sit alone at the sea, or in long hours looking up at the sky, and so physical danger, no mental anxiety but will respond somehow to space. Be cheerful and unexcitable, and when you are in the worst hours of Fate had not yet been calling on a suffering neighbor, said: "I don't wonder you are ill. Any one who tries as hard as you do to be God would have to be ill." It is with our preceptions striving after virtue that the allies to evil, but the over-visions carrying of the daily burdens of life that he only a God could bear; burdens whose solutions lay beyond the graspwork of the limited intelligence; even beyond the boundaries of the human mind. After all, except in the field of virtue where we know that defeat is forbidden, it is unwise to shoulder the burden of God. Though one may suffer and rage and cry out at the burden of the world, one must with which one and agony are won, but the over-visions carrying of the daily burdens of life that he only a God could bear; burdens whose solutions lay beyond the graspwork of the limited intelligence; even beyond the boundaries of the human mind. After all, except in the field of virtue where we know that defeat is forbidden, it is unwise to shoulder the burden of God. Though one may suffer and rage and cry out at the burden of the world, one must with which one and agony are won, but the over-visions carrying of the daily burdens of life that he only a God could bear; burdens whose solutions lay beyond the graspwork of the limited intelligence; even beyond the boundaries of the human mind.

she can hardly waddle from the door of her vehicle to the top step of her dressmaker's establishment, or to the crowded girl in the company of a man who should have a paralytic father and a blind mother as well as six younger children to support on the twenty-five dollars a week she can earn by working twelve hours to eleven hours a day for all days in the week. Who can say what all this means and how it can be remedied? Indeed, when one begins the perpetual struggle with the sorry scheme of things entire, it is a wonder that nerve give way. It is well enough not to be too sure of one's footing and to feel a silver thread. This gives pause from pain, though never health. As a matter of fact, there just chance to be in that little dress-maker's ruff, called home, some comforting suggestion. It happens that the blind man and the paralytic father, blind and lost, and that the highest ambition of all the younger children was to help her along. There was in the house a consulting opinion of sympathy, trust, love, and a teaching sense of faith and desire for service.

Has one caught the clue to the sorry scheme then and to some of the evils of the world when one says that only by suffering on the boat of prayer he choked by each of us and that most spiritual quality, pity, pray in its place? And still back that that reads the question, "Why should an infinite good create such infinite evil and then leave such frailty manufactured creatures to cope with it?" The question remains through the world, and we who are here, and yet we do know that, after all, the top notch of misery and failure is to be inevitable to the world's pain and never to alleviate it or cure so little.

When we are weary with having facts, when every back of the body seems covered with a network of quivering nerves, we may, by simply enlarging the space in which the mind and body move, give more space, quietude, and pain strength for any sort of work to do. If we get our feet through the clanks and crevices of this prison of daily custom, we shall see, at any rate, stars and moon and all the shifting scenery of infinity, where merely feeling has place for the mind to move. If we had but been taught the eye, we should become aware that life is not all of a piece. If there is suffering, there is delight; and side by side with crushing agony waits the joy of creative effort.

Destiny, who leaves the surface with courage revealing his own nature rewards. Perhaps he hopes his own "will reap incentive from such reward." Every burden heavily borne on the edge of down and the foundation of a nobler order of life. To bear this thought in mind is to bear, and a little nothing loneliness under wide skies and in face of vast spaces will feel the least or tortured mind till it can endure again. It takes no more than a sudden resolve, a spirit of will to pull loose from the daily round and go where eye and mind can roam over great spaces.

There is refuge to be found on the top of a great wind-swept, stinging mountain, where near a track of man's invasion may stand, and where a seaview of green sea writes forever round the cape, while to the west a swirling forest rises, slowly straight to the sky. Only one could and clearly more whirling across space, and wild deck in groups (two dark a spit of sand. Then one breaks it steeper and steeper, almost insensate, in-out along on hoisting the wind, the clouds, the low wind whistled melody the wild play on the dyming rock.

But when the doors are shut on poisonous thought and one enters the open world of calm possibility, one must be sure to take the delighted eye, the soul catching the light of the world.

There is a little song an English rustic poet sang his dead friend. To repeat it while the eye sees over deep landscape, hill and vale and chartered stream, or while the eye plays on the sky, the depths of blue and green, bordered with splendid, sparkling clouds, is to draw breath with this sounding warfare which life is.

"To read the lines  
With all his love,  
Mellowed the woodland with the soothing dews,  
That Nature is the dew,  
May lead the daisies with the nightingale,  
That we might find his comfort in the vale,  
Though never to his source,  
Happily to hear our words,  
To hear the birds,  
To drink the landscape's goodness  
With every step."  
It is certain.

At ending spread around him everywhere  
The everlasting goodness and surprise.

## Correspondence

## APPRECIATION

Editorial, Nov. 20, 1912.  
To the Editor of Harper's Weekly:  
SIR:—This is written to compliment you upon the article on "The World of the Future" and "Good Evening" in the Weekly of Nov. 12.  
I think your diagnosis was only correct, but very appropriate at this time, and I think your observations on the "World of the Future" are very apt. You are right in saying that we have never had practical training in politics and had never before a candid and intelligent political convention. It is a reform in his career for election without any real

preference of the election that bound his party to the domination of the most selfish and exaggerated views of protective schedules over any other government.  
I am, sir,  
K. K.

Cambridge, Mass., March 14, 1912.

To the Editor of Harper's Weekly:  
SIR:—I am most gratified that you should so generously number of HARPER'S WEEKLY. I thought your Arnold Bennett illustrated issue rapped the climate, and I am sure that you will continue to do so easily over the national trophy. It is absolutely impossible for me to express full appreciation of such a remarkable journalistic feat.  
It is however, I prophesy of the significant political changes foretold by the industry into national life of the present socialist administration, Wilson and the great spirit "Hope" in his letter for our great republic.

May HARPER'S WEEKLY grow apace with the marvelous strides under the new.  
I am, sir,  
EDWARD U. MURPHY.

New Orleans, La., March 14, 1912.

To the Editor of Harper's Weekly:  
SIR:—It did not require the editorial, re-printing just published, entitled "Public Service and Public Rewards," to receive a life-long record of your journal, but you have, through your kind and wise Wilson to the attention of the nation, and to the work of a master in holding his life in position to receive the admiration of his party and the votes of his constituents for the Presidency.  
It is the irony of politics that the man you have effectively opposed for President should have wrought the policy which you have so ably supported for President and is holding a commanding position in the cabinet. I deem it the fitting of reflection and commendation that you, Wilson you and Hayes should write. This "blending" of opposing forces is but another evidence of the wisdom of compromise in a republican government.

President Wilson appears to be an excellent compromise and will soon probably give this country a highly satisfactory administration.  
I am, sir,  
WEEKLY READER.

AMHERST, N. C., March 14, 1912.

To the Editor of Harper's Weekly:  
SIR:—Your editorial in the last issue of the WEEKLY is the best specimen of journalistic independence and power, and your appointment of the Independent of journalistic-political propaganda yet produced in this country, is a proof to me of your ability to forecast and promote true reform. I am, sir, your sincere friend and admirer, and look back upon it with respect and thank.  
I am, sir,  
GEO. T. WOODS.

Cambridge, Mass., March 14, 1912.

To the Editor of Harper's Weekly:  
SIR:—When you suggested the president of Princeton for the Presidency of the United States I said to myself that it is ideal but that is not politics. You are, however, a man of vision and a man of action, I want to congratulate you and also to thank you. For, as a matter of fact, it furnished me the opportunity for the first time in forty years to vote for the successful candidate for the Presidency. I began in North Carolina with Greeley in 1872. I was so placed in 1884 and 1888 as well as in 1892. I was in the line of the "New York Times" in 1896. I was my first successful Presidential vote. I hope you will give me another good chance in 1916.  
This vote was held back until Mr. Wilson should be actually inaugurated, for I did not know but that something might happen to prevent. For I remember that in 1876 I elected a President and he did not get inaugurated. But now I am safe—my vote held. For a good many years I have been a diligent reader of HARPER'S WEEKLY, and I have been a regular correspondent page on back as during the last six or seven years.  
I am, sir, your most devoted friend,  
W. W. HAYES LEWELL.

Cambridge, Mass., March 14, 1912.

# "THE NEW BOSSISM"

## President Wilson's Concept of the Duties and Responsibilities of His Office Has Led to a Change in the Relations between Executive and Legislature

BY A. MAURICE LOW

WASHINGTON CORRESPONDENT FOR HARPER WEEKLY

THE session of Congress that began at the opening of this week will prove to be one of the most momentous in the history of American politics. It does not refer especially to the fact that it marks the full maturity of the House as a political party after it has been so many weary years in opposition—although that is memorable enough—but because of the importance of the tariff in connection with the popular will, which alone is significant enough. More important than either, it marks the beginning of what, in the future, may be called "the new Bossism," the change that time and circumstances have made necessary in the relations between the two great organizations of the government, the executive and the legislature.

Mr. Wilson signifies the new system by putting the same emphasis upon the public service. In American politics the word boss has the sound that it has because of the fact that it is a word of disapproval, because bosses usually have less dignified, dignified men specially of disapproval. In a boss was generally inferior, to be a leader was generally inferior. It is a leader who has the power to lead, and it is a leader who has the power to lead. It is a leader who has the power to lead, and it is a leader who has the power to lead. It is a leader who has the power to lead, and it is a leader who has the power to lead. It is a leader who has the power to lead, and it is a leader who has the power to lead.

In this sense is the lesson of President Wilson. He has seized leadership with both hands, and he holds it with a firm grip. It is of course, too early to say whether it will be wasted from him, whether even any attempt will be made to do so, but that is not the point here. What is important for present consideration is the new leadership—the manner in which the President has liberated himself from traditional restraints and brought about the new system.

It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office.

Every one could do nothing except by introduction. Every one remembers the sensation that was created when President Cleveland objected to the House in the management of the tariff. It was great in a letter to Representative Caldwell, which he read from his place on the floor of the House. That is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party.

It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office. It is doubtful if any President—certainly no President within our recollection—has taken such a firm and steady grip upon the reins of his office.

President Wilson has set the machinery of the veto in motion, and before it has anything to do. It is the first time in the history of the country that a President has done so. It is the first time in the history of the country that a President has done so. It is the first time in the history of the country that a President has done so. It is the first time in the history of the country that a President has done so.

It would have needed a great public service. In the past the House made a tariff bill, and the Senate pulled it to pieces and rebuilt it according to its own fancy. It is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party.

The Senate will not dominate the present bill. The Finance Committee has agreed that hearings will be held on the tariff bill. It is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party. It is the only instance of the House as a political party.

It is typical, not only of the changed relations existing between the President and Congress, but also of the new system of government, that the President should direct representative of the people, that he insisted upon his right to take part in tariff making. Whether or not the Constitution has been amended by the people themselves, and set through the machinery of convention or the legislature. It is in the President the people now look rather than to Congress; it is the President who is now supposed to be able to stop legislation to satisfy the demand of the people. It is the President who is now supposed to be able to stop legislation to satisfy the demand of the people.

It is quite natural that this change should have brought about in fact. It is surprising only that it has not come so long in coming. It is a serious matter if the President is not the executive officer. Members of Congress are bold, Senators represent their states, but every district and every state need all the people. Members of the House can vote or engage responsibility by their own names. It is a serious matter if the President is not the executive officer.

President is known and unsharped by any one. Having clothed the President with responsibility, the people are bound to hold him responsible. It is a serious matter if the President is not the executive officer. It is a serious matter if the President is not the executive officer.

# HOT LIFE FROM BELOW

By Lionel Josaphare  
Drawings by F. Strothmann

"Do you know what's wrong with the world?" asked an old dick waiter in one of the big New York hotels.

"The whole thing can be illustrated right here. Back yards and fresh air have gone out of style. In the cities, I mean. It's a poor civilization that can't afford fresh air. Back yards—there isn't even a lack of the hotel, nowadays. There's the modernizer. I once owned a newspaper up in Syracuse. Traded it for a hotel. Then a fellow with pale-green ideas opened an opposition house. I lost my newspaper and \$2500. Now I heard that he quit, with a loss of \$10,000. That was the difference between the old and the new. He lost \$30,000 proving that I didn't know how to run a hotel. I had a dishwasher up there that was no intellectual man, with a scrupulous fall of letters that newspaper had printed from him. Meant a time, when he was at the sink, or sitting in the back yard peeling potatoes, I would go out and hold thoughtful discussions with him. Sometimes I would take out my jerk-hair and whistle a few of the potatoes while arguing. I wasn't one of those managers that look as if groves are from him."

"The old dick waiter waved his hand, and stared at a lot of his kitchen co-workers, always a crowd through of many intimacies, in various hues of underkirts."

The waiter is not supposed to make a speech in favor of the dick

"It's all done by machinery now," he remarked, drily, "even the drying. This glassing is wiped by hand. Machinery for every thing. Human nature has a chance down here. Machinery and rules. Makes to get this and to hand over that. Do that this way, and don't do that that way. Don't go over there or you'll be discharged. Don't have my name here or you'll be discharged. Rules for everything. You can't remember them, but you're safe in assuming that steady work will keep you out of mischief. Rules against everything except thinking over the past. The only exception is to machinery. I believe, is that there hasn't been invented a contrivance for stringing straws."

"If you have a package you must have it in the package-room, or open it and show the contents on the way out. Maybe you had double reasons for not wishing to do either. No smoking, of course. Men's lives being a newspaper here. Men's wishes, is that human nature? If we laugh or joke, it's using bad and bad-sounding language. After working hours, if we wait for a friend outside. It's looking about the restaurant. The explanation is thoroughly scientific. If you should do it, all would do it. This is on the theory that if one man is allowed the liberty of awaiting his left eye, everybody else would follow suit, and the loss of that would be enormous among a thousand waiters. This and other reasons, and enters the domain of social economics. Well, I haven't a destructive nature, but sometimes I enjoy breaking a plate on the quick—makes me feel so informed."

"He bowed into meditation. If he dreamed of the proprietor dropping in for a thoughtful discussion he was disappointed."

Farewell, dick waiter. He is in the midst of snapping food, evidently in a slow location for tidbits. He is a young man, with white eyes, like a under-20-year man, and a mouth probably good natured, yet becoming stern through lack of exercise.

"Talk about the slip between the cup and the lip!" said he. "It would be a big slip to get caught slipping yourself any of these good things. But I tell you I'm not the man to be looked for, anybody or anything, and if I was to be attacked by an escaped mad chicken or a can of catfish or a bottle of chlorine in concentration, I would draw my trusty newspaper or my revolver, or even use my bare fist, and strike out in self-defense; then I'd remove the evidence by eating it. I

don't know what fear is. Against the rules? Say! Myself hangs up the rules should enforce them. I have nothing to do with enforcing the rules against myself or anybody else. Let us catch me! Instant dismissal is the professional term for what I'd get. And where once they let you go, you never come back, take it from me. I'd like to be blacklisted by every hotel in the city. Then I'd have more time to study the corner. I was within ten minutes' walk from here when I took the job. There's too much discipline here."

"Sure, we get the best of food, but the waiters wouldn't eat it. They try their own food. The dinnermaid'll do down here. There's a saying, the bigger the hotel the worse the food for the workers; and I tell you this is a big hotel. The clerks and other dressy types eat in what's called officers' hall. The waiters are good in there, but not plentiful. A clerk will always take a cracker, like a pull-any cracker, any time of day."

"There's three or four patents on the waddy down here. The management waddles up with blowpipes. But blowpipes in a place like this is about the same as venting a bedroom through a few pen-waddlers. I have a friend in the engine-room. He'll tell you in there, which is better than the boiler-room or the kitchen. We don't feel like talking. You don't have much conversation going on down here, do you?"

"Another thing: in hotels there is very little friendship outside your own department. Class distinction is on tight lines, and you're fighting mad with the other departments, unless you happen to graft with them. Grafting is against the rules. When you meet a lead pencil, you go to the head of your department and get a requisition; then you go to the department that has authority over the pencil, and you get the requisition counter-signed. Maybe you're in a hurry; yet you wouldn't expect the stationary department to see judgment, without a requisition, and give you a pencil on your word of honor that you need it quick in the interests of the hotel. They can't see judgment, because a slight error would knock up the whole system—the mail. A reader has to be sure through; and believe me, when I'm tired of working, I enjoy going through the mail, and all of it. Besides that, maybe you're quarreled with the head of the other department; they'll hold you to the standard rate he can think of. It's a rock and can't talk English, he makes advantage of that fact not to argue with you. But I can usually tell him something he doesn't like, no matter what language he speaks. They can't use a freighting-quicker on me."

Suddenly he became busy.

Here are a few figures, as given by the assistant manager of a New York hotel famous throughout the country. About 23,000 persons enter the house every day. This figure is based upon an actual record made three years ago, when 13,000 persons entered in nine hours, from 6 A.M. to 1 A.M. Employees were not included; they are 1,200 at ordinary times. Three thousand persons leave there every day, and 1,000 die. To maintain these fabulous multitudes there need be military precision.

The manager said: "It is impossible to please the help, and we haven't time to experiment with the

"I've served in the Philippines. Military life isn't as hard as hotel life. He you believe it—there's a lot of highly educated foreigners about those barracks! Some of them are real highbrows. Take me, for instance: I'm a highbrow. I've been in China, Japan, Egypt, France, Germany, Russia, Constantinople, and nearly everywhere else. I can talk to you about everything. I can tell that nightgown! And some of them have known countries. I do, boy! These dudes in the office couldn't carry on a conversation with me. The clerks and managers have no education. The ladies in full of being are from all over the world. I can talk you with any of them in their native tongue. An American came here, he knew about everything except his own name, and he killed it, and said good-night. That was the last I could do for him; but it was enough, wasn't it? He was an American. Some of those Greeks get to work as 'lives' (lives here, you know) when there are three marks in the country. They work up to be waiters."

"If I was to be attacked by an escaped mad chicken I would draw my cork-knive"

"If I was to be attacked by an escaped mad chicken I would draw my cork-knive"

impossible. Still, we give them the most sanitary accommodations, as you saw for yourself. I didn't expect you, and I took you through the house at a moment's notice. The public also is very, very hard to please, and expects us to perform the impossible, as a matter of course. In no other line of business does the public consider itself at perfect liberty to interfere with the management. Why, the woman who enters a hotel they seem to become thrilled with ideas—brilliant ideas of how a hotel should be conducted; and they don't hesitate in making a suggestion. We have to be extremely careful with them. Even when a guest complains about the food, we can't dispute with him. The waiter is not supposed to make a speech in behalf of the dish, but has orders to reason it immediately and politely inquire what the guest will have instead. The guest may have a hat made in his mouth from the night before. We don't argue with him, not even when we are sure that he just wants to be heard and get rid of a growth.

"So you have met that hotel before? Is it what it used to be. Well, sometimes the public forces on us a novelty that is no part of the legitimate hotel business. But there isn't an inch more in seasonal-

ism as there was once upon a time. Ten or fifteen years ago the magnificence of modern hoteleries was new to the public. A banquet they had to be a splurge and show that the food could fire up as the price of his wife's diamond necklace. He would mention some other banquet, and say, 'Let mine beat that. Charge extra for everything, and have it extra gorgeous.' The result was disastrous. Half the food wasn't eaten. To-day dining is an art, and a sport.

"Now and then part of the public objects to the high price of food. Yet some managers are glad if they can come out even on the dining-room. The general rule is that the raw material costs from 22.5 to 25 per cent of the menu price. Suppose, for instance, that a short loin costs us \$18, and we get about \$20 for it in the dining-room. Now, you tell me where some of these restaurants make a profit, when they finish up with really dined displays, music, and elaborate shows, and all that sort of thing beyond the legitimate expenses of condery, service, laundry charges, and linens?"

"Suppose a guest orders a \$2.50 breakfast on the tray—\$2.50 worth of silver goes on the tray. Twenty breakfasts in the room take up about \$50.00

in silver. That's not only a big investment against the profit on the food, but an investment that is likely to shrink and disappear in the course of time. A guest would be highly offended if the tray were asked for an hour or so before, as the silver remains watered about the rooms all morning; and, as I intimated, that's not the best thing in the world for silver. Fifty dollars in silver goes on a little order of coffee, milk, and eggs—\$20 involved against the small price of the breakfast. Fifty thousand dollars is a low yearly water bill, and we use coal like a seven-line.

"No," he drawled, "there's no fun in being managed, and guarding all those huge accounts, with the hostility of the help on one side, the public on the other. The aggressions of the proprietors on the other—"

"And on the fourth side?"

"On the fourth side the managers of other hotels belonging to get your job. Sometimes I think there's more real happiness in being a dishwasher."

"So you ever discuss the matter with one of them?"

"Not, it would be against the ethics of the profession."

# RIGHT-LEGGED VS. LEFT-LEGGED GOLF

All England and Much of America are Intent on the Struggle Between P. A. Vaile and the Old Masters

BY WILLIAM HEMMINGWAY

THE year's at the spring, and spring's at the more mornings at seven the hillside's dew-poor'd—opto on the poet says—but all that isn't helping British golfers a bit. They are in the midst of a furious discussion as to which leg most of the weight of the body rests on at the top of the ball swing. T. N. R.—Some golfers may have of reading at this point if they choose, for what follows is very technical. Mr. P. A. Vaile, the fearless innovator from New Zealand, who in his books and other writings declares that Vardon, Reid, Taylor, and the other old masters are all wrong in their theories—and then deftly gives it—has stirred up a hornet's nest compared with which the honey on the southwest hole of a certain Westchester course is a shield-rod-core. England is a hotbed of golf theories, and London is its vortex.

The old-school tradition is that at the start of the drive, or any long stroke, the weight of the body is equally distributed upon the legs, and that as the

club is drawn back to fall most of the weight is shifted in the right leg—the shifting having taken place without any jerking, either at the knee or at the hip. Mr. Vaile maintains that most of the weight of the body is imposed on the left leg from the moment the club begins the back swing until after

on a rug before it and drive them off in the regular way. The picture of the machine reproduced on this page shows that the weight of Sherlock is divided as follows: right leg, 15; stone (21 pounds); left leg, 9; stone (128 pounds). In other words, the left leg is carrying six times as much weight of the body as the right leg. Moreover, the weight distribution cannot be so evenly divided from the moment the back swing was begun. The left leg at all times carried the greater amount. Sherlock verified to all this.

While the main battle was raging there were many amusing skirmishes. One, *Stuff Hatched*, for example, presented a page of statements of imaginary golf matches, two of which with their captions are reproduced on this page. In serious vein Mr. Gardner G. Smith, the editor, writes:

"We have still an open mind on many of the points raised. Golf is a funny game, and the whole art of writing is so complicated, and the processes are so rapid and inter-related that it is almost impossible to describe them without misrepresentation, or, at any rate, with absolute accuracy of statement. It is quite possible, however, as Mr. Croome suggests, that the professionals have overestimated the amount of weight thrown on the right leg, and apart from that, is it, after all, so absolutely essential to keep the ball immovable, and is any lateral movement of the trunk necessarily fatal to the preservation of balance?"

"May it not be possible that the transference of weight to the right leg is instantaneously compensated by the bending of the trunk backwards as the swing goes to its upward limit? It seems to be not impossible, but with a compensating leftward swing, some players may still be powerful in-

Many leading players argue that in the drive the weight should be on the right leg at the top of the swing. We have therefore drawn a rough machine permanently to reproduce this fact. Should the right leg (A) exert greater pressure than the left (B), the piston (C) will be depressed, thus firing the pressure rod (D) and exploding dynamite (E)—as occurring all fully hypnot.

GOLFER JAMES SHERLOCK AT THE END OF HIS SWING. SHOWN ONLY IN THE FORWARD POSITION IN THE RIGHT LEG AN AMAZING 15 POUNDS OF THE LEFT

the ball has started on its journey and the club has finished the "follow through." Inasmuch as the left leg is the one nearest to the impact of striking on ball and naturally has most to do with driving the ball home, the new prima facie seemed to be in accord with Mr. Vaile's theory. Had the old masters been so sure and dogmatic Mr. Vaile's convictions, and they could prove that the weight of the body rested on the right leg by the fact that the muscles of the right leg were those most tired and the most tired.

"Right as to facts, but wrong as to conclusion," cried Mr. Vaile. "You think the being of the muscles of the right leg is due to the impulsion of the weight of the body. It isn't. It is really due to the forward of the body in turning slowly around to the right in the back swing and turning in the left again in making the stroke. It is a lateral thrust—and downward at all."

Inasmuch as every Englishman here the theory of his game as much as the game itself, and is always ready to shed his ink in its defense, the warlike tendency which suggests an left leg was suggested among the English professionals devoted to golf—most wherever else a letter in the long-suffering editor could be rounded in. Mr. Vaile thus far has been the winner. He had a point at least in that the entire could stand with one foot on each. Then he had golf James Sherlock stand on the machine, he up built

Inexpensive hunter with thousands of dollars; for professional golfers. From the observation that the fact that transference of weight to the right leg is not inevitable, and that the correct amount may clearly be followed, and their erroneous theories corrected.

equal distribution of their weight and of those left, even although it may be true that among great players leg is mainly on the left, and others mainly on the right. Although the striking machine cannot give what is the best method for individuals, it will at all events show pretty exactly what a player actually does, and will avoid loss in correcting any exaggeration of his method."

# INVENTORS AS AN INVESTMENT

BY FRANK J. ARKINS

DRAWINGS BY J. J. GOULD

**W**HAT happens to copper ore when the heat in the furnace reaches a temperature of 5,200 Fahrenheit?" The question was asked by a sheepy man. The person to whom he was speaking said dispassionately: "I don't know. No one ever looked inside a furnace when it was that hot."

"Well, we can't look in and see," the older man plain if they did devised a seeming impossibility. The next furnace built in that plant could be looked into. The scientist found what happened to copper under those conditions.

At the bottom of every furnace the air blast is introduced through little tubes of steel called tuyers. In this new furnace, on the outer side of the flue pipe, a window of heavy mica was inserted. The metallurgist had only to place his eyes to it to look in and study the fire within the furnace walls. With the aid of a microscope and perfectly protected from the heat he could note every detail of the firing man.

When they came to get a good look at the way copper acted in the furnace these metallurgists discovered several new things. The mica window made it possible very easily to revolutionize the entire process of smelting. The experts saw that the bad effect of the air blast was chilling. So they wrapped the "flue" with asbestos pipes to heat the air, thereby hastening the smelting period and taking far more metal out of the ore. They noticed that in some parts of the furnace the charge actually froze, while others were so hot that the particles passed off in vapor. The result was loss.

It is not a few years since copper sold for forty cents a pound and only the sturdiest ores would profitably yield their metal content. The window in the flue pipe started the starting-point of a new day in metal production that has been to the vast advantage of every man who uses a pocket knife, every man who builds a skyscraper, aluminum or otherwise. That window has so equipped the world of all metal that the use of heat is an every day necessity in the life of every man.

Just such a story—differing only in its details—might be told of every other article of American manufacture. As the years go by these tales of business success multiply at a greater and greater rate. This is due to the new inventor, who is very far from the shabby, cross-eyed, long-haired man of a generation ago working in a greasy attic or a slummy and making discoveries bit or main. Some were of enormous value, others quite worthless. He was seldom at the head table to turn any of them to his own advantage. The new inventor lives in the lap of luxury. His expectations pay him well and attract him permanently to their study. He sharpening production and developed processes he is the man that can bring them their greatest success.

The big American manufacturer has too much of sense to sit at his desk and wait for people of ideas

to come to him. That was the old system. It often happened that a concept of minor importance by pure chance picked up something revolutionary from some one whose family was close to starvation, brought it for a song and allowed out the "big fellows" in their fire, making a fortune thereby. The business groups of today would laugh at such a policy as suicidal. The man who can really invent is an asset worth paying big money for.

Take a case in point. It is Schenckel in New York State in a manufacturing plant so big that its buildings and its men make up a great city in themselves. The general writer could not estimate by a thousand the number of employees on the payroll in one of the many buildings, whose annual cost of maintenance is alone more than the total annual output of many plants. Is a little bearded German who is what might be called a master inventor. Sent to Edison, he has more great inventions in his credit than any other American. In some little workshop of his own, with few tools and next to no laboratory facilities, he might—be probably would—have dreamed great practical dreams and translated them into profitable processes. Not much of his wonderful achievement has been due to the great department he has been entrusted to create, for the development of which money has never been lacking.

The old inventor worked alone. He had neither money to hire nor could he take the risk of letting any one else the secret of his shimmering idea. The new man simply presses button after button on his desk and highly paid assistants or, perhaps, independent inventors—"creaks" and their special fields of electricity, chemistry, metallurgy, mechanics, or science—come in to be best to make researches that may consume months or years. An order blank filled out brings any quantity of material, equipment, or instruments. Not long ago Edison had a typewriter idea. He summoned his executive man.

"Send for one of every typewriter made in this country," he ordered, "and the day after tomorrow have an expert from each company here to demonstrate his machine. Get out for me every book in the library that deals with typewriters."

In such a way this expert and every other great new inventor works. At the Schenckel plant not far from fifty men do nothing but inventing, a scientific corps governed and organized in military fashion. Some 250 specialists and laborers aid them. This force is a varying quantity, according to what the executive man sees and again diminished at other times greatly increased. It pays to equip men who can devise practical ideas and gives them staffs with assistants not far behind them in capability.

A problem that haunts the printing world for a long time was to make the first fold in the turning off of newspapers from the press run just with the increasing speed of the machines. It was realized that some simple idea would solve the problem, but just what that simple idea was could not be seen. The high-speed press could not take definite form until this first fold was made faster. The process delivered the papers to the taking machine so as fast that the letter was slugged.

Inventors sat up nights and experimented. One day while working on the perplexing problem which the factory was determined to solve, in order to satisfy a publisher whose press-room facilities were the cause of the invention, suddenly occurred an idea. He seized two broken needles so that the widest angle formed that portion of the press from which the printed sheet emerged. After these he trained the web forming the first fold. It was apparent at once that, an earlier how fast the press was speeded, it could never solve this problem, that of making a very practical evolution, grew the "fencer" that looks like an inverted sawtooth.

The invention was by an obscure craftsman—but the great principle had been discovered after weeks of

It pays to equip men who can devise practical ideas

work and experimentation. There were other things to do—cut the paper, deliver it to the second bed, etc.—but that these were all successfully accomplished the press of today, capable of printing 2,000 papers a minute, is an illustration.

Today a printer calls on a manufacturer and tells him that he wants a machine that will fit in a room of a certain size, to print so many pages of a size, at such-and-such a speed, consisting in bundles of twenty-five, and so on. The inventor is called in and straightaway proceeds to design a press the like of which has not been constructed before. In this way machines that will print a book and deliver it bound at the other end has been devised.

Carbonadium could never have been discovered in a garret. One man worked on the borderland of discovery for years. Clay coils and acid-soaked subjected to great heat produced an indistinct something that showed him he was on the right track. He sought more intense heat in an effort to signify that something which he did not as yet understand. He believed he was on the verge of grasping its unlimited quantity as an alternative purer than any yet known. Sooty comes from an impure substance in nature known as carborundum. The man in question was trying to combine the silica in the sand and the carbon in the coal in an effort to produce a pure alternative. So he went to Niagara Falls. With the aid of water charging great electric mills he produced the most intense heat known to man. These substances he now placed in a furnace and fused by electricity. The result was that they threw down prismatic crystals composed of pure carborundum combined with carbon. The discoverer came to New York with these flat crystals. Stepping into a diamond-cutter's laboratory, he asked the cutter to change a bit his crystal was. A series of tests developed that it would scratch a diamond. A diamond in pure carbon and the hardest natural thing in the world. He said these crystals far more than he could have obtained for diamonds of the same weight. He had produced in a furnace material better than nature itself could make.

No carbonadium could ever have been discovered by the dreamy inventor who worked alone. A great plant employing scores of men and costing a fortune in excess of the wildest anticipations of the maker of hydrogen gas was necessary. Hard fitness was in itself a marvel of construction. Years of work and thousands of dollars had to be expended to produce a few crystals that one could drop into the end of a pipe with a hammer. Each fitness was in itself a marvel of construction. Years of work and thousands of dollars had to be expended to produce a few crystals that one could drop into the end of a pipe with a hammer. Each fitness was in itself a marvel of construction.

The vast plant that this member of the new day had assembled for his production of carbonadium gave him facilities that resulted in another new product of greater importance. Carbonadium obtained the element of hardness, of course, from carbon. But carbon exists in a soft state also. So not satisfied with having done what no other man had ever accomplished, and in an endeavor to make his previous achievement, the inventor placed the carbonadium back in the furnace and sealed it. Through this expedient he turned on the greatest heat manufactured by man in an effort to bore out of his new product also a secret that would be conceded beneath his hard-earned seal.

In a general way he figured that something appears in what he had would result, and careful experimentation covering a period of months brought him to this point. The new heat disintegrated the carbonadium and it fell in flakes of graphite so soft that they would not scratch the highly hardened surface of the most carefully annealed steel. Graphite is heavier than water and hence will sink. But these flakes were so fine that when dropped in water they remain in suspension indefinitely.

The result was a lubricant finer than any thing ever known before. To illustrate: If a machine dye is placed in water and is poured through a filter paper (which is a fine grade of blotting paper) the water will pour out in a clear stream, the dye remaining on the upper side of the filter paper. When the same process is followed with artificial graphite (Lachmann's discovery) and water, the graphite passes through the paper just as easily as the water.

The oil supply of the world is fast being exhausted, but as long as coal exists graphite is lubricant is possible. The machinery of the world will not burn without lubricant. First as to the amount of oil used for lubricating every year. It is small compared with that used for heat. And graphite makes a point that is never really applied, preservative dyes, hair oil, hair, and water resisting.

Millions of needles are sold daily. It was not so long ago when the thread in the needle was cut by the sharp edge left in the eye after manufacture. The smaller the needle, the sharper the edge and the greater the annoyance to users. Then, again, the eye would rust; for a moment will dampen the end of the thread as her tongue in order to make a point so that the needle may be threaded more easily. Complaint was loud and long and orders were passed down the line to produce an eye in the smallest needle that could not rust the finest and softest thread in the world.

The old inventor worked alone

This was done by inventing a new machine in the shape of do-cutters for the making of the eyes. The points on these minute angles are so small that they cannot be seen with the naked eye or detected by the most delicate sense of touch. A microscope is necessary. So it was essential to invent new machines to manufacture the dies and to sharpen the tiny drills. Fileholders and burners had to be made that would finish off every rough edge in an instant instant, because needles sell a dozen or so for a few cents. When this was done the needles were placed in a rack through which the eyes projected and held on tightly that when immersed in water only the eyes were covered. In this way the points of the needles became the negative pole of a powerful battery, and in a few moments the eyes of several million needles were gold plated and hence rendered rust-proof.

## The Disaffection of Mr. Hearst

"He writes for thee rather unsafe print, the Courier,  
An' likely ez not hex a-squintin to Foorier;  
I'll be —, that is, I mean I'll be blest,  
Ef I hark to a word from so noted a pest;  
I sha'n't talk with him, my religion's too fervent.  
Good-mornin', my friends, I'm your most humble servant."

—The Biglow Papers.

WHEN a certain well-known professor of the Court of St. James of Mr. (not THOMAS NELSON) PAGE picked the homely words quoted above from the lips of Mr. HENRY HIGHER, he could hardly have foreseen a poignant political situation as of the present moment. And yet, where is the distress that could supply a nice paragon of the present attitude of President WILSON toward Mr. WILLIAM RANDOLPH HEARST? We cannot recall a letter emblem of Mr. LOWELL'S touch—it was only a touch-of-germs. But it is Mr. HEARST'S opinion of Mr. WILSON, not Mr. WILSON'S view of Mr. HEARST, that is full of moment if not, indeed, of portent. And we have no need to ransack the library for that; Mr. HEARST has set it down in plain typewriting and printed it in heaven knows how many papers from the Atlantic to the Pacific. Without further introduction, we enter upon a discussion of the merits of the case.

We may as well admit at the outset that an aim not so much as Mr. HEARST'S declaration of war upon the new administration. It came a little quicker than we had anticipated, but that is all. Like many other things whose emanation is not essential, it was inevitable, predestined, foredoomed. Although Mr. HEARST permitted his many writers and printers to support Mr. WILSON for the Presidency, he never renounced him as a true Jeffersonian Democrat. There was no noticeable cause for his suspicions, but he could not escape the feeling that a little scratching would betray an insubstantial and noted Federalist. So he never waned particularly enthusiastic and he glided into the White House, because the scratching took place when the President made his only up Capital Hill and revealed himself to Mr. HEARST'S shocked vision as a ghost from the Elysian Fields of Weehawken.

Mr. HEARST says—and there is no reason to doubt his sincerity—that he regrets exceedingly to find that he naturally feels away from the Federalist movement in his hands. He, too, had inhibited on himself of his own for a long time and had become lonely. When the opportunity offered to rejoin the Democratic hosts, therefore, he hastened to avail himself of it. Now that he finds himself unable for reasons of conscience to keep step, he naturally feels away from the Federalist to criticize the policy of the Democratic party or of any man whom I helped to elect," but there is nothing else to do, because he is "an American first and a Democrat afterward." He is not yet without "hope to see the party fulfill its duty and rise to its opportunity," and "shall continue to imbibe it not to be led by a Federalist forth away from the fundamental Democratic principles of THOMAS JEFFERSON."

The impelling reason for Mr. HEARST'S abrupt desertion are three in number. In the first place, as we have noted, he regrets the revival of "a new abatement of the British sag of a speech from the throne." It is, to his mind, "a singular thing" that this revivification of practice should have taken place under a Democratic administration, and he deeply cannot understand it. The new appearance of the President in persona crani be-

fore Congress he regards as "a somewhat sensational performance," and he finds an excuse whereby to Mr. WILSON'S modest declaration that his chief purpose was to show that, although President, he is a human being not markedly unlike others of the same species.

"However," Mr. HEARST continues, somewhat litigiously, "Mr. WILSON'S suspicion is correct, and there has lately arisen among independent and intelligent American citizens a belief that there is something superhuman and supernatural about a President. Mr. WILSON has effectively dispelled that superstition by proving that a President can possess all the purely human weaknesses, including vanity and a craving for newspaper notoriety."

This, we respectfully submit, is very curious writing. If Mr. HEARST will but turn to the enumeration found by MOSES on certain tablets of stone, he will discover that there are many human weaknesses which could not possibly be exemplified by the mere reading of a speech. Moreover, we are convinced that few persons will agree with Mr. HEARST that the President's appearance can justify be attributed to "a craving for newspaper notoriety." It is a hazardous thing always to impute unworthy motives to a high official engaged in the performance of public duty, and, in the absence of evidence supporting his conviction, we can but regard Mr. HEARST'S implication as unwarranted and unavailing.

But, after all, the purely personal phase is of little importance. The real significance, to Mr. HEARST'S mind, lies mainly "in the Federalistic trend" and in the "possible consequences to the American nation of a chief executive with a Federalistic viewpoint." Here, in truth, is a point, if the premise be granted, but does not the danger arising from executive executives inheres in the substance rather than in the form? It is not so long ago when he had a President who became a positive menace because of his dislike of fundamentalism. But it is what a majority does, not the way he does it, that makes for real apprehension. So long as President WILSON continues faithfully to observe the restrictions placed by the Constitution upon Executive prerogatives, there need be little concern over his method of promulgating his ideas. If his novel practices should, as we suspect they will, prove ineffectual or impracticable, they will necessarily result in the end in law of facts. Experience, too, is a jolly good schoolmaster. Point No. 1 may be discarded without further consideration.

Mr. HEARST'S second reason for breaking away is found in his distrust of Mr. WILSON'S sources of information and inspiration. It seems that he has "very reluctantly" accepted the news that he reads the London Times. This, in Mr. HEARST'S view, is a most reprehensible and dangerous practice. It is a publication "absolutely antagonistic with the English prejudices toward all other countries, and toward America in particular." Consequently, it is "astonishing, if not alarming," that "the English publicists should repeatedly be so much soothed. Again, we cannot get the excitement, the Times does print a good deal of foreign news, and, since it derives most of it from the same

agency that supply the New York and various other American, we must assume that it is fairly trustworthy. Maybe if Mr. WILSON had read it more closely of late he would have saved his administration the slight humiliation which attended the report of a quite precipitate recognition of Mr. YU'S Sun Kai as the Republic of China. So long as the State Department continues to be deficient in collecting information, he must get his news somewhere. Even Mr. HEARST does not assume that Mr. WILSON looks to the London Times for his opinions. That, we grant, would be unfortunate; but happily there appears an ground for apprehension on this account. Mr. WILSON knows where to look for sure political guidance; at least, he used to.

Mr. HEARST'S third and last cause lies in economic. "Mr. WILSON," he says, tersely, "is an English free-trader." Obviously this can be true only in part at best. Certainly he is not English, either by descent or in disposition. Whether or not he is enamored that universal freedom in commercial intercourse between nations is sound fundamental doctrine is not known. Quite likely he does; most intelligent men do. What matters? It is a condition, not a theory, which the President and his party are dealing with, and it is by their acts, not by their avowed abstract principles, that they should be judged. Surely Mr. HEARST was aware, when supporting the Democratic ticket, that the Democratic platform proffered "immediate downward revision of duties" in order to establish "a tariff for revenue only," and said not a word in favor of "reciprocity." Surely, too, he knows that the issue thus stated was almost inconceivable in the campaign, and that the voters indigested the Democratic declaration at the polls.

Upon what possible ground, then, could he or anybody justify a complete volte face now? It is no longer a question of the relative merits of reciprocity and a revenue tariff, but one of keeping faith with the people. Surely, wherever, as Mr. HEARST must in course admit, whatever may be the consequences of their conduct, that is precisely what the President and his party are striving to do.

We cheerfully concede Mr. HEARST'S disaffection. We cannot and do not question his sincerity in addressing reciprocity, especially in view of the fact that the proposed tariff measure would have greatly to his pecuniary advantage. But we insist that this is not the time when he should make a stand upon his contrary views; that time expired when he accepted the platform and the candidate on his platform and his candidate. It is not Mr. WILSON who is breaking faith; it is Mr. HEARST.

Not that Mr. HEARST has no standing in the administration court; he has, or should have, distinctive recognition. He put the very great power of his popular newspapers behind the ticket, he lent his prejudices, he invited the distrust of millions of well-meaning citizens who, by attacking the candidate's utterances—reciprocity here, he made a very real sacrifice by supporting WILSON when also-truths of Mr. HEARST's

BOONVILLE. All this gave to him full title, not, of course, to dictate nor to influence, but, but, accordingly to marked consideration.

This, we are chiefly informed, is what he sought and did not receive. If so, from the viewpoint of those who wish the administration well, it is a pity. A President has enough to do in over-riding unavoidable opposition without inviting unnecessary antagonism. And make no mistake, Mr. HEARST has become a mighty force in these Federal States. His influence has grown steadily apace, his force, his speaking, and he is working constantly as he continues to add to his impressive line of public journals. It is not so much that he declines war upon grounds that we have shown to be untenable; the mere fact that his action is without real support suffices for the moment. But other occasions are bound to arise, occasions when he can lead much help, or do infinite damage. We foresee an example.

The newspapers of April 15th contained the following dispatch from Washington:

President WILSON does not believe the SENATE anti-trust act should be enforced against labor unions or cooperative associations.

His attitude on this question is directly opposite to that of President TAFT, who vetoed the sundry civil bill on the last day of his term, and he is widely credited with the expenditure of any part of the appropriation available for anti-trust prosecutions in proceedings against labor unions or agricultural associations.

President WILSON's views on this important subject become known after his call today to the White House with Senator HAYES of New York, and Representative FITZGERALD of New York, chairman, respectively, of the Senate and House Committees on Appropriations.

The sundry civil bill will be reintroduced in the House Monday in precisely the form in which it was approved by President TAFT.

Immediately there arose a storm of indignant protest from all sections of the country. Practically every public journal of standing expressed unqualified agreement with President TAFT, who had denounced the bill as "class legislation of the most vicious sort" and "a crime against the state."

We did not observe a single dissent from the Times' declaration that "the principle, the purpose, the method and the spirit of the bill are the same as those of men hard in respect of the law, and President WILSON's signature to such a measure would be a shock to his most earnest supporters and to the country. We do not believe," it concluded, "that he is capable of such an act."

It is now still in the creature of opinion. Nevertheless, the bill was introduced as reported, is now pending, and will probably be passed and sent to the President. We do not hesitate to record a prediction that if he signs it he will commit political suicide.

But where does Mr. HEARST come in? To see very easy. Suppose that, after the investigation and reflection, the bill should be amended so that the favored legislation is indeed vetoed, and should withdraw his approval. What then? Would not, or rather, as matters stand now, will not Mr. HEARST hold up Mr. WILSON before his multitude of readers as one who, after care according to the demands of labor, finally withdrew his support of the measure at the cost of capital? And who can doubt the effectiveness of that instance, reiterated and reiterated by daily newspaper, in view of the circumstances which already is past recall?

But it is an part of our present intent to discuss this proposed legislation. We advert to it in the present illustration what is likely to happen in those cases than one if the policy of early ignoring fair suggestions from influential men entitled to consideration be persisted in.

"I'll be —, that is, I mean I'll be glad, if I talk to a word from me, what a post; I ain't talk with you, my opinion, for friend."

might see for Hosen Higher, but it simply will not do with WILLIAM BARNHART HEARST.

#### A Nomination

At the risk of seeming intrusive, we nominate Mr. WILLIAM F. McGUIRE for Ambassador to France.

#### Peace in the Family

Both Senator BRYAN and Speaker CANNON have, called in public even by assuming relations which enable them to speak to each other. To do so was the plain obligation of each as a high official of state. Undoubtedly the newspapers overstate the incident when they designate it as a complete reconciliation. That was not possible, but neither was it necessary. It was only the uselessness of personal antagonism of a Democratic Speaker and a Democratic Secretary of State that was objectionable to the public view.

We are pleased incidentally to reveal that the rapprochement was effected with a degree of tact which has the voice of rarity in official circles. The secretary of the Washington Post, writing doubtless by suggestion of that eminent newspaper-maker, Brother JOHN R. McLEAN, had charge of the affair, and he managed the exchange of typewritten civilities with notable skill. Mr. BRYAN came sooner than ever before to admitting that he had been in the wrong, and the Speaker, magnanimous as ever, indignantly waived all personal considerations from a sense of duty to his party and his country.

Peace is an unusual watchword among Democrats, but clearly it has merit at a time when continuance in party is dependent upon division of the opposition. It is better to hang together than separately, anyway.

Felicitations, then, to all concerned!

#### Always "Left"

JOSEPH never could part his helm when BRYAN has in sight.

#### A Sign of Approval

President WILSON had ample reason to leave his box in the theater and send a congratulatory telegram to the Democrat who was elected to succeed Senator WELLS in the thirtieth Congressional District of Massachusetts. The unopposed result was more than an indication of satisfaction with the bill. The bill is being handled in a large open government. Last fall the vote stood: Democrats, 15,881; Republicans, 15,831; Progressive, 5,825. At the recent election: Democrats, 13,134; Republicans, 8,721; Progressive, 5,503. So the Democrats and Progressives practically held their own, while the Republican vote was cut nearly in half. The result is significant in the fact that the combined opposition would barely have won against the Democratic candidate. There is not much, therefore, in the Boston Herald's wall that the friends of protection "are not so much deceived to it as to write for converted action." Nevertheless, it is well to remember that the same thing occurred in 1892, when the same district elected Dr. ESTERLY to succeed Senator LORING, and thus resumed the clothing of Republicans. Possibly, too, the arguments of the manufacturers themselves to the working men that it would be advantageous to send a Representative who would act with the controlling element in Congress had something to do with the result. But facts are facts, and the sign of a favoring sign! My! my! what a magnificent blessing those Progressives are!

#### The House Census and the Tariff Bill

Although quite ready to find fault with anything done by the Democrats' procedure with their tariff bill, we fail to discern any pride, or even any serious mistake, in the careful and gathered debating of it by the House Democratic caucus. It is a party measure. It is the natural first thing to do about it, therefore, is to make sure that it fully and correctly represents the will of the party. It is the Congress' procedure.

That is also expedient and really time-saving; for it should and probably will mean a quiet party behind the measure when it is once put on its passage. As a matter of fact, the House census has given to the work of Mr. VANDENBURG and his colleagues a practically complete endorsement; and there has been no serious caucus. Nobody has played the horse. The procedure has been democratic in the small and wise.

Of course Mr. MUMFORD and Mr. MAXX (the latter, we feel sure, without the slightest desire to conceal the fact that his tongue was in his cheek) have made the most of the "secrecy" of the census. But there has been no secret caucus. If anybody thinks the present recurrence of these caucus majorities in the House could hold a secret caucus if it tried, then the American newspaper is still widely underrated. And the Democratic majority hasn't tried. When Mr. MUMFORD defiantly attempted sarcasm on the point, Mr. VANDENBURG answered, with perfect truthfulness:

"I will state to the audience from Kansas that so far as I am concerned, as well as all the Democrats, are concerned there has been no part of the Democratic caucus that has been secret up to this time."

If any newspaper's readers have failed to find every day a front-page full account of the caucus's proceedings, then they have good cause to stop their subscriptions.

#### Wool, Sugar, and the Income Tax

Not the census only, but everything else that has so far happened, goes to show that the real

uncertainty about the bill's future turns on three things. These are free wool, the proposal as to sugar duties, and the proposal as to the income tax.

There is an good reason to sophisticate any one of those three questions.

As to wool, to cut heavily the present rate on it is an imperative Democratic duty. A bill that failed to do that much would be a plain breach of Democratic pledges, an unpardonable betrayal of Democratic principles. To remove the duty altogether would be tantamount to a plain breach of plain pledges and principles, and it is in itself a consummation devoutly to be wished. Only two considerations can be urged against it. One is the loss of revenue, which will be substantial, but not insuperable. The other is that possibly it might be a letter to attain the end sought gradually, rather than immediately. But it is always dangerous to trust anything to a later Congress, or even a later session of the same Congress. On the whole, the argument for free wool on an even seems to us convincing.

Free sugar is also desirable — but the objections are stronger than those against free wool. The loss of revenue from the free sugar is the principle of free raw material is much less extensively involved; the benefit to the consumer, though apparently plain, is open to some question, at least as to the amount of it. We, for our part, are quite content that the complete removal of the tax is to be postponed.

As to the income tax, for our conviction is that meanwhile we shall have a chance to see how the income-tax provisions work. Frankly, we should like to see a cautious rather than a hounding reform to that method of raising Federal revenues, and a very careful study to find out the most just way to apply it in this country. We are glad that all questions on the passage of Congress to make use of it is ended, but we do not wish to see it on one too much relied on as a principal means of raising revenue in time of peace.

#### Not an American

"I was an American. I would go down into the ditch to die for my country, but I would not be glad to shake the hand of the rich man." — Sir PHILIP HERRINGTON to the Public.

Put it the other way round, Mr. VIEV. If there is anybody in the ditch nowadays it is the rich man. Only hold shilly venture to shake hands with him.

#### Bro. Marshall's Supplementary Remarks

When Mrs. VIEV-President MARSHALL got back to Washington after his visit to New York the implications of the JEFFERSONS dinner were still running strong in him, and he issued a line of supplementary remarks, in the course of which we find him saying:

"People are being told that there are just as many opportunities to-day as ever for those who are any number of jobs ranging from \$10,000 to \$20,000 waiting for the capable man. It may be that a very able man would not need to earn \$20,000 working for the steel trust, however. He might prefer to start a little selling mill of his own, so that he would be independent of any man or company, and he could make \$20,000 a year. It is such opportunities as those that many men are saying are denied to him."

"I might be able to earn \$25,000 a year, but I am firm, for instance, in not doing any more than \$10,000 working for myself. Who would the lawyer say if conditions had worked out in the best profession to the point where he had the money and the privilege of setting up his business for himself?"

If the conditions that had worked out to prevent the lawyer from practicing successfully by himself were lawful and progressive, it would not make much difference what he said, for he would have to grin and bear it. It could not properly be construed by us that he should have elicited if he could not win this, and should not see one he compelled to pay him fees who could get his business better or cheaper done elsewhere. The title-insurance companies have actually taken away from the individual lawyers a great part of the real-estate business that they used to do, but they have not miserably. In this city great firms of lawyers, and the merchant stores have driven hundreds of small merchants out of business, and thousands of individual lawyers make a very scanty living. But there is nothing to do about it. The business goes to those who can get it.

So the shoe manufacturers have driven most of the old shoe merchants out of business, and the department stores have driven hundreds of small merchants out of business, and there is no suggestion of a remedy by legislation, because big business can be done cheaper and better in some lines than small business.

We guess it is an about rolling-mills—that small ones can't compete with big ones in economy of production, and that that business has gone permanently into the stronger hands.

Governor Merrill acts imperfectly aspired as to what kind of world this is that he is living in. He seems to know dreams of an equality of opportunity that are quite hopeless of fulfillment. Any serious attempt to fulfill them by legislation would make the public for the benefit of the individual in a fashion that would dwarf the progressive intellect into complete insignificance. There is a merely any equality of opportunity more important to protect than the chance to buy in the cheapest market. Unfair competition should be restrained. There has been much of that. But that competition under fair conditions is to be protected, whether a first-hand-dollar rolling-mill can sell service or not. We guess the tariff was the best friend the small independent manufacturer ever had here, and Governor Merrill says that "the present tariff monopoly is the chief cause of our success."

#### Amalgams

We are all brethren. But I believe that the aim of people should know what the rest of the people are saying.—*The President* MERRILL to the Public.

They don't need to be told, Mr. V. P.; they can read it in their indictment papers. But, that feeling as, who are the men of power and who the rest of the people?

#### Has the Merit System Been Abused?

It may be that the Government who in both Houses is asking for information about the actual working of the civil-service laws under Republican administrations are not without a pertinent motive. One allegation they make is that neither or other there are at present previous few Democrats—say six or eight in a hundred—in such straggleholds of civil-service reform as the Pension Bureau and the Government Printing Office. It is possible that one motive of the inquiry is to get Republicans out of place like these, and Democrats in.

Nevertheless, true friends of civil-service reform and of the merit system will do well not to resist the inquiry. If there is an wrongdoing disclosed, then the civil-service laws as they stand and the confusion as to standards which exist should be fully strengthened by it. If the laws have been evaded and twisted, or if any of them is stupid and ineffective, or if, as Senator CURRIER avers, the effect of them as a whole is "chaotic," then the sooner and the more fully we know the facts the better for the cause. To attain either object—that is to say, to ascertain truth—that everything is all right or that there have been real and serious abuses—would be quite worth the highest estimate of the inquiry's cost.

Certainly, to use a forgotten phrase of a former president of the examination, when "the investigation are being investigated" it is hard to see how they have any kind of credit. If under these successive Republican Administrations there has been steady manipulation of the laws to fill the offices with Republicans only, we ought to know it. If men have been appointed as from states they never saw, we ought to know it. If Presidential examinations of the law have operated to violate instead of to enforce the principle that everything is for merit only, and have exempted unfit men from examination, we ought to know it. If none of these things have happened, then we ought to have the gratification of knowing that.

#### Senator Root on the New Ideas

We trust Senator Root's two lectures on the Sherman Latta Foundation at Princeton will be received in such form as to be really profitable, useful, and so on, as Americans will have sense enough to read them. Their chief use will be—The Essentials of the Constitution "do not commend themselves either to habitual readers of "gripping" novels or in building stations who find the word "progressive" an agreeably vague "open sesame."

Nevertheless, we believe there are plenty of Americans who will be glad to have Senator Root's views, expressed in Senator Root's somewhat fully clear way, about the true value of certain current notions of the way this country ought to be run; for we think a good many Americans appreciate Senator Root as the best mind in our public service.

Senator Root's lectures are, of course, directed mainly at the extraordinary revival of direct gov-

ernment now being attempted in this country. But he makes a broad distinction. He is not wicrily itself merely at the movement, as far as it consists itself merely with the control of parties. He that subject he actually welcomes it as an exhibition of citizenly interest and energy. He does not, however, welcome the recrudescence of the notion that the citizens of a great nation can dispense with the experience of ages in the matter of the best ways to secure right government. He does not welcome the idea that the University of Wisconsin should disseminate that dissemination of 1876. He finds the Initiative and Referendum rather unprofitably as a final solution of all the difficulties of democracy. He finds the Recall a rather crude and unworkable substitute for senseless and intelligence in the choice of public officials.

In fact, the reactionary Senator finds an cheap and easy way to achieve victories of his speciality and duty to vote right at elections. He thinks the direct-nominations plan will help them to discharge this duty, and that the simplifying and shortening of ballots will also be helpful. Maybe they will; but as we understand the Senator, he does not think that the Republic can safely do anything but the intelligent and virtuous of its citizens for continued existence and prosperity. It is astonishing how many men with reputations for wisdom have arrived at the same conclusion.

#### A Mosaic about Financing Farming.

There seems to have been some curiously crude thinking—since this country found out about the various European rural-credit associations. Everybody, apparently, agrees that the plan is a good thing, and that our farmers ought not to be paying nearly eight per cent. for the money they borrow as European farmers pay only half as much. But, particularly those the notion that the remedy is for government to supply the money that the farmers need!

Not from the European practice. It is not the government's money that the French and German farmers get on such reasonable terms. They get it from banks, just like other people. Nor are the credit societies in any way owned by the government. They are not started by government; they are not run by government; they are voluntary associations that run themselves. All government has to do with them is to regulate them by general laws, just as it does other business enterprises.

Yet many of Americans—plenty of farmers, particularly those who have actual experience of them—that the way to start the scheme over here is to go and ask government—the Federal government at that—for a big appropriation. One would think from such procedure that we Americans had no knowledge of co-operative associations. On the contrary, the best scheme, which Eugene in the States has had actual experience of, and which ought to prove quite sufficient for a successful start in this new line. Our experience with ordinary building and loan associations ought to be sufficient in itself.

Of course, it may be advisable to ask the states for some legislation of a protective nature, though such a state probably have already done so. But that we legislate. But in ask them for money would not be following the European example. That is an example of self-help by co-operation, not of dependence on government or anything or anybody else. To grant such an illegal demand would probably be to prevent, instead of promote, the movement it is sought to inaugurate.

#### Not the Earmarks of Josephus

It is not Secretary DENVER who is responsible for the explosion of the old maritime words "starboard" and "port" from the United States Navy and the substitution of the landlubbers "right" and "left" in their place. The change was wrought by the U. S. S. *Albatross*, the first of the new class of steamships built by Admiral DENNY. The Secretary did not know that approach it.

But that was obvious. Secretary DENVER is a politician from a farmer state, and knows that the new is expensive and always hungry, and that the navy is the backbone of the great farmer state that he is to be approached. If he had made the change from "starboard" and "port" to "right" and "left" we should all have recognized a masterly device to bring into the agricultural mind a fruitful sense of kinship with the sea.

#### Boots, Keys, and Wiffy's Head.

The hundred and fifty Yale sophomores who have rebelled against the three senior societies as at present conducted, had but their feelings ex-

pressed for them by a committee of ten, who voted, as to the selection of members of these societies:

We believe that there should be a recognition of merit not on the basis of actual accomplishments, but to a large degree on the basis of what is to be expected of the man, on the basis of the estimated amount of qualities of character and of personality. We believe that the forty-five men who have gained the entrance to the societies of this year should be selected to class the highest ideals of Yale, and should be elected without undue regard to family influence or personal interests, institutions, that they should be judged as to their fitness for membership on the whole rather than on any individual assumption of false possibilities.

It is to be understood that only such men should be chosen as shall reflect the greatest credit on the societies themselves and not such men as may bring disrepute to the societies by their conduct in entering a long in so small measure responsible for Yale's present high position as the world of learning.

We suggest that every member should be bound in reasonable privacy; that loyalty as it now exists be abolished, and that the greatest care in the choice of men as outlined above be exercised. Such a reform as this can be effective only in proportion to the influence which it exerts on the members of the societies themselves; for we will know that whatever change may occur must come from within.

What these young men are really after seems to be direct elections. They want the senior societies to be reformed. It is not clear that every body will approve. That was the feeling our people lately had about the Senate. They were not satisfied with the line of Senators that were furnished by the legislature, so they took over the job themselves. They have set these Yale gentlemen an example. What the young Yale brethren will have to do is to be as intelligent as the legislature, and to improve into their own hands, and attend to it by public discussion and the ballot. So will democracy again triumph under the class at New Haven, and—

But hold! Suppose the proletariat took a spite against the societies and endeavored to fill them up with undesirable? What could they do?

We can't do that with the Senate, because the Senate has power, and must be efficient, or else we suffer damage. But these Yale societies have no defined power; they are just bundles of young gentlemen who try to enjoy one another's society and be an example to the crowd. They can do what they please, and we have no objection to their possibly engage to elect members that will suit everybody, and we doubt if they could afford to delegate that duty to the disinterested public. Their custody is hard to solve. The simplest way out would seem to be to abdicate all responsibility for the maintenance of the Yale pattern, and come to admissions, and withdrawal from public life. A representative institutions they can hardly hope to give public satisfaction unless their membership represents a public choice. But as social organizations they can hardly thrive unless their members suit one another. It seems as if their dilemma arose from an effort to combine incompatible functions.

#### The Faith that Was In Him

Mr. MONTANA will dispose of great possessions and of works of art of importance and immense money value, in the disposition of which all the world was interested. It was a very long will. The newspaper printed it all, but the paragraph which held the most interesting part was underlined in headlines and put at the top of the columns, was this with which the will began:

I commend my soul into the hands of my Saviour, as full confidence that, having redeemed it and washed it in His most precious blood, He will present it faultless before the throne of my Heavenly Father; and I confirm, and withdraw from public life, my faith in and at any cost of personal sacrifice, the blessed doctrine of the Christian abatement for six thousand years of Jesus Christ, ever offered, and through that alone.

The paper was entirely right in their estimate. It was the most interesting clause in Mr. Montana's will, and, more than that, it was the most valuable legacy he bequeathed to the generation of men that is to follow him. It contains the pith of the Christian faith. What it says is to be expressed, so significant, in other words that would convey the same significance. But these words are often repeated, and they are the words of the faith in the instructor's whole character—the basis, moreover, of all the best and noblest and most useful characters that have developed in this world in the last two thousand years.

To have a man of Mr. Montana's kind and also grand prestige declare himself and in such a convincing way his profound faith in the faith in which he had lived, was a precious legacy of inestimable value to mankind.

## Personal

LIKE MAJESTY QUEEN HELENA of Italy is reported to have won the hearts of the emotional Neapolitans during her recent visit. The little royal princess and her distinguished little brother, the Crown Prince Umberto, walked abroad with the greatest freedom, accompanied only by their governess. Queen HELENA stopped her motorcar before a cottage in the village of Capri and beckoned to a tiny, little lurchback girl whom she used to see every day leaning far out of the window to look into it. The little girl came down and timidly told the Queen her name—Gina. Her Majesty took the child in her arms and kissed her and gave her sweetmeats and a beautiful wreath full of embroidery and a card on which was written: "For the best child in the village of Capri."

In it, then, true, this report that one hour everywhere that M. LEPAGE, distinguished aide-voisin of Police of Paris, has retired from office? It is, alas! true and officially confirmed. His hour is world-wide; his narrow escapes from death are too numerous to array as paper. The Reginald and the Socialist press have often denounced this rule, wise little rule, which white bread, round left hat, and brisk military stride made his conspicuous in the midst of every turbulent demonstration. He has escaped scathless the bullets of anarchists, automobile bands, and misguided partisans of the *Confédération Générale* of France, and has not only taken his usual daily seven years. "But," says he, "there is a telephone in the flat which I have just taken. Should duty call, I shall be there." One wishes for M. LEPAGE a long and happy and undisturbed enjoyment of well-earned rest.

Whenever a judge presiding over a New York criminal court is conducting the trial of some notorious murderer he is sure to receive letters, postal cards, and even peripatetic telegrams written by cranks berating and denouncing and denouncing him with death in some horrible form. The late Recorder FARMAN STURTEVANT, presiding over a murder trial, one day received a reporter friend up to the bench and handed him a letter thus made like this: "You cruel and blood-thirsty old tyrant, you are trying to send this honest man to the Chair as you say and you will never let me do it. I will stay in jail for you and punish you and give you death finally, a friend of Justice." The reporter wanted to publish it. "Oh, no," said Recorder STURTEVANT. "I should like to see only to call your attention to that beautiful new word, 'punish,' which I suppose means to crush and to punish. If you should publish it, hundreds of other cranks would be inspired to write. It's had enough say for their letters taken up on such terms in going through the mailing mail. The writers are not dangerous—merely silliness."

The activity of KRUMPHOLTZ is a previous gift, yet it set in motion a series of activities that scared him out of his wits. He sat cross-legged in his shop at Sinterpark, in the Cross, where a snoring motor-car stopped at his door. In came a Russian captain of Infantry and said to the trembling KRUMPHOLTZ: "Come. For an hour we have waited. They entered to Libania, and KRUMPHOLTZ was led before a great general. The general led him into a great room in the palace, and there he saw His Imperial Majesty, the Czar of all the Russias. "Make me a uniform of the Crimean Campaign," said the Czar. "So that it fits." With shaky hands KRUMPHOLTZ passed the tape around the august person. He withdrew, and prayed the God of his fathers, and felt as never before before. The uniform was produced perfect. KRUMPHOLTZ received fifty rubles as a fee besides a gift of three hundred rubles to pay his debts. He returned in his working family up from the dead. But that was not all. A few days later a general messenger brought to his shop a gold watch with the double-headed of Russia blazoned on it, and the inscription: "To KRUMPHOLTZ for work." Such.

The enormous difference that the point of view makes in human estimates could not be more strikingly shown than by this anecdote that is told of JOHN B. HORTON, JR. Mr. HORTON was speaking of the loss of \$25,000,000 in the Panama Canal, and stopped the financial point of 1907. "It was a fine and patriotic thing to do," Mr. HORTON is reported as saying, "especially when you remember that Mr. Morgan is not a very rich man."

The people of France are opening their eyes wider every day in admiration of their new President, M. POINCARÉ. He is all but simplicity. He declines to keep his old friends from the public eye as often as ever. He has directed the police not to hold up street traffic to let him pass. He has dismissed the Republican Guard, who used to camp and sleep every night around the Presidential mansion. He has discharged the famous *Chasseurs* and installed a plain cook. He has ordered for only the lovers of fat and molasses bread in the Presidential stables. Automobiles will take their place. Moreover, he is showing daily an increasing liking and ability for work. France steps, looks, listens, and applauds.

The house at 163 Aynham Street, Hartford, where Mr. Morgan was born.

## Last Honors to a Great Citizen

THE funeral of John Pierpont Morgan, on April 14th, although celebrated as above explain of the world, was marked by the simplicity by had long before obtained. There was no departure from the service for the funeral of the dead in the palace of the Protestant Episcopal Church, St. Thomas had the last tribute of respect to the body of him who had been the first citizen of the world. In London and in Paris memorial services were held simultaneously with the actual funeral in old St. George's, in New York, the church of which Mr. Morgan long had been warden. Representatives of the King and members of the government attended the service in Westminster Abbey, and there was a similar assemblage at the memorial service in Trinity Church, Paris.

At the break of day people began to gather about the Morgan home in Trusty-street, New York. Thousands of wage-earners went out of their way to linger there in silence for a few moments. At eight o'clock a large force of soldiers, horse and foot, cleared the street between Madison and Park avenues, and through remained close to the lines and upon the heads until the cortege had passed. John Pierpont Morgan, Jr., with his wife and son, went to his father's home at nine o'clock. Mr. Morgan, the widow, with the only children, Miss Anne Morgan, and Mr. and Mrs. Herbert I. Satterlee, and Mr. and Mrs. William Pittman Hamilton and their children, joined them in the library. Together they proceeded by an underground way to the great library in Thirty-third Street, which had been the office of one of Mr. Morgan's most notable triumphs—the sleeping of the ocean of 1897. There the body of the financier had lain since the arrival from Europe, contained in a heavy-iron casket surmounted by a pall of red and green silk.

About 90, George's Church in Stuyvesant Square a vast crowd had assembled early. The police had closed the adjoining streets to vehicles, traffic, and only those who had words of salutation were allowed to enter the church. Fifteen thousand men and women stood at respectful attention in the square, and many hundreds were looking down upon the scene from the neighboring houses. The doors of the church were closed at ten o'clock, and at the same moment the great bell in the tower began to toll. The choir

emerged from the robing-room and passed beneath the north gallery to the door, where they met the clergy—first the rector, the Rev. Carl Holland, and his assistant minister, and Bishop Lawrence of Massachusetts, Bishop Brewster of Connecticut, and Bishop Greer of New York. Next came the twelve honorary pall-bearers, led by Senator Elihu Root and Joseph H. Choate. The others were George S. Bondeen, Lewis Cass Ludlow, Robert W. & Forest, John Fairchild (Deane), Robert Bacon, George F. Baker, Dr. James W. Matthews, Albert H. Gary, Morton S. Patten, and Nath. Low.

The heavy doors swung open to admit the coffin, which had been borne to the church from the library on Murray Hill in a plain horse without padding drawn by two black horses not restrained, the heavily falling in old-fashioned carriages.

The clergy and choir led the procession to the chancel, followed by the honorary pall-bearers, then the coffin and the members of the family.

To tell who were at the funeral would be to re-echo the leaders in art, science, literature, music, finance, commerce, and manufactures in our own New York. Some of the organizations represented were the Automobile Club of America, the New York Green Regiment and Biographical Society, the General Convention of the Protestant Episcopal Church, the Union League Club, the Century Home Association, the New England Society, the Chamber of Commerce, the American Bookbinders' Association, the Southern Railway, the American Academy in Rome, the Union Club, the Fabled States, Steel Corporation, the International Mercantile Marine Company, the Astor Trust, the New School of Applied Design for Women, Society of Colonial Cavaliers, Church Institute for Negroes, United Temperance Society, New York Yacht Club, and the Stock Exchange.

From St. George's Church the funeral party proceeded to a special train at the Grand Central terminal and thence to Hartford, Connecticut. Mr. Morgan's birthplace and the home of his ancestors. During all the railway journey of two hours and a half onwards assembled at every station and stood unobscured as the train passed. Flags were at half-mast every where. All business was suspended in Hartford, Fairlee and schools were closed. In, and a silent multitude witnessed the passing of the cortege to Cedar Hill Cemetery, where the body was interred in a tomb in the Morgan family plot.

know about the Arctic is that there is a current in the polar ocean for America's Enterprise. This was conclusively proven by an experiment of Admiral G. W. Melville, of the United States Navy, and Mr. Henry H. Henshaw, of the Philadelphia Geographical Society, a number of weeks containing messages in many languages were set adrift from whaling-ships in the western American Arctic. One drift-boat anchored near Point Barrow was picked up five years later in Ireland, and another and from Cape Barrow was thrown up on the beach near North Cape, Norway.

The fact that the Melville-Henshaw canals have floated across from Point Barrow and Cape Barrow to Ireland and Norway, respectively, shows that there is a northward current through the Polar Sea, but the further fact that the abundant driftwood coming from the Mackenzie River does not lodge in any great extent upon the shores of Banks Island, lying to the north of the mouth of the Mackenzie, shows that this current cannot be straight north from Alaska across the Pole, but must be a circulation one, streaming for the first portion of its way westward nearly parallel to the coast of Alaska and Asia—a thing which is substantiated by the known drift of the Jeannette after September 6, 1878, until she sank on June 12, 1881, and of the Fram from her leaving in on September 22, 1893, to her becoming free from the ice July 19, 1896.

Because a hypothetical lead mine at Harris has plotted satisfactorily with these otherwise mysterious facts and many others, and because no other explanation is readily discernible that really does explain them, the scientific world has been led to consider that there is lead ore to be discovered in the northern ocean. But be that as it may, a successful expedition to the Beaufort Sea will discover this lead or establish the fact of its non-existence.

From a scientific point of view one result is as desirable as the other, for the true scientist is concerned merely with the extension of the bounds of human knowledge and not with proving that any certain thing is or is not so. The particular problem that most interests geographers is the determination of the continental shelf. In other words, they want to know the distance from the known lands of that line on the sea bottom where the depth of water suddenly increases from one or two hundred fathoms to several thousand, for the presumption is that beyond this continental shelf no land exists, so most of the already discovered Arctic leads lie in shallow water. In other words, the known Arctic islands are the slight elevations of a submerged plateau and do not come up in the manner of mountain peaks from great depths. It may, however, be pointed out that the finding of such a shelf will not be conclusive, for we have striking exceptions to the rule in such bodies of water as the Mediterranean, and even nearer at hand in Baffin Bay, and elsewhere in the Arctic, where depths of over five thousand fathoms have been reached, and yet land lies but a few miles beyond. In other words, a man coming from Greenland, if he were in a canoe when he reached the edge of the shelf of Greenland that we had lay beyond the two-hundred-fathom line, would never discover Baffin Land, although as a matter of fact Baffin Land would not be far below the surface in the end.

But apart from the discovery of new land, or the determination of its non-existence, the expedition has important aims. In Victoria Island and the mainland north of it are Eskimos who had never seen a white man until our visit to them in 1910, and the study of such people is one of the most desired opportunities of the ethnologist, for there are few, if any, other places on the earth's surface where people in so nearly a primitive condition are still living. The historians of the archeologist are engaged in pushing the history of mankind back into periods which our fathers supposed would be blank forever. In one sense of the word we are making history fast today, and our modern period ends

social changes and our scientific discoveries. In an age when the making history such history yet by pushing our knowledge to the past backward era; by contrary said it seems and extravagant to speak of the Pyramids and the Sphinx as modern works of man. The bones of men and their buried implements give us some idea of what our ancestors were like five thousand, fifty thousand, and some would even say five hundred thousand years ago. But the picture is not complete, and by discovering people who are to-day on the level of culture on which our ancestors were ten thousand years ago we seek to fill in the space left vacant by archeology and to give life and color to the archeologist's and historian's records of the past. And these legends that study of the childlike people has intrinsic ethnological interest exactly as the study of the child has psychological interest. Further, as archeologists we seek to determine the prehistoric range of the Eskimo upon the Arctic islands and upon the northern mainland, with reference to those who cry for "unity" and partly, too, from intrinsic scientific reasons, considerable emphasis will be laid on geology. Our last Arctic expedition established the existence of copper in Victoria Island, which is the first plotted discovery of copper on any of the large Arctic islands. We have, therefore, as northern Canada, a known copper-bearing area running from Great Bear Lake on the mainland north to the middle of Victoria Island and from Great Lake east to and including Bathurst Inlet. This is one of the largest known copper-bearing areas in the world, and it does not seem impossible that it may, in time, prove one of the richest. Certainly native copper has, in any case, places in the world been found and used by aborigines in such abundance as the case of the Eskimo in this area.

Another thing of substantial economic value is the study of the sea and land life. Bear Lake has long been known to be rich in food fishes, and we have found most of the fishes running into the Arctic and most of the lower lakes to be correspondingly rich. The ocean bottom has its valuable stores, also, though we know of them but little. The Eskimos along the coast we have caught an abundance of various kinds of fish almost anywhere along fifteen hundred miles of the north coast of America; there is no telling what an investigation of the water life offshore may bring to light. We know there are the northern whales, Greenland herring, the fish of which is well favored, and they may therefore at some time become an important source of food in our country, as they already are in Japan. They have also the walrus, the seal, and the polar bears, all of them of economic value. The study of the ocean so therefore easily be defended before even the most conservative. To the scientist the study of the ocean is of self-evident importance.

The study of terrestrial magnetism has also its already established utilitarian value for the commerce of the world across the ocean is still guided by the magnetic compass, and the relation of magnetism to electricity and other phenomena is yearly becoming more and more vital interest. In cooperation with the Carnegie Institution Bureau of Terrestrial Magnetism we shall carry forward investigations in this field. There will also be investigations and records in meteorology, and it is hoped that our wireless apparatus will be able to send down daily messages which will complete the wide gap between people the two most valuable meteorological stations in the northern hemisphere, those of Iceland and the Alaskan Islands, and furnish thus a certain way of predicting storms from the north—a thing of prime importance in navigation upon the oceans and upon the Great Lakes.

The expedition will sail from a Pacific port of Canada in late August or early June. It will carry a 24-ton ketch with open auxiliary power which, under the name of Aerial, has for many years sailed the Beaufort Sea as a whaler. Although it may seem the whitest in the Beaufort Sea, it is to the north of them and every indication of an open ocean stretching far in the direction of the Pole, the large Arctic Bay, the open water to the northward because their business is to get white, and white, in their opinion, are not abundant farther north than a diagonal line drawn from the north end of Banks Island to Flaxman Island on the Alaska coast. Success in Arctic exploration is almost purely a matter of luck. If we happen to go north in a season of prevailing westerly or northerly winds we shall find the Beaufort Sea closed with ice and our ship will be compelled to long the anchored closely; but if the summer of 1913 happens to be a season of easterly or southeasterly winds, such a season as we have had almost every year since 1906, we shall find the Beaufort Sea open farther north than any ship has ever tried to go and open probably a matter of days. If we happen to do so in a theoretical line. The great plan is, therefore, to cruise northward from the mouth of the Mackenzie as far as it seems safe or feasible to go, and to establish a winter base, or way land that may be discovered. Following the discovery of land, the vessel would head southward toward the known islands (Banks Island or Prince Patrick Island) and our winter base would be as far north as possible along their western coasts. From this point of vantage we should, the following winter, explore the sea-covered ocean, to the west and northwest chiefly, but also possibly to the north, with a view to determining all facts of interest in the latitude in which Banks lies on the ocean bottom, the direction of currents, etc., besides taking tidal and other observations on shore. The following spring our geological, zoological, and archeological work would be carried on in the interior of these islands, while the meteorological observations would go forward without interruption all seasons. A secondary base will be established, if possible, in south-western Victoria Island, and here the general work of the expedition will be carried on exactly as at the main base, except that more emphasis will be placed on economic geology on account of the already known copper deposits and upon ethnology in view of the already discovered primitive Eskimos.

The scientific staff of the expedition will comprise eight or nine men, specialists divided between the two base camps. The vessel will have a crew of ten men, and the intention will be that she return to a Pacific port before winter sets in, but on account of the uncertainty of everything in the Arctic she will go provisioned for two years to inevitable accidents. Like our previous expedition, this one will be more simple in equipment than is generally the case in polar exploration, for we have found the principle of fitting on the country to be naturally adapted in the carrying on of most kinds of scientific work and exploration. Further, the menace of all polar explorations, is a thing as yet not well understood, and we do not know exactly how to prevent it except that it has never attacked any one who has lived largely on the coast which the country itself produces.

The time of the expedition as planned is three winters and four summers, so that, if all goes well, the scientific party should return to civilization only in the autumn of 1916, although the vessel should be able to communicate with their each summer and return each summer to the Pacific coast.

It seems to seem that this is rather a lengthy programme, but the Arctic is an inaccessible place with which to do a thing as you get there. If you are trying to reach a mathematical point such as the Pole, and if that be the sole goal of your explorers, then you can return at once when it has been attained. We shall not be striving for any one point particularly, but for broad scientific results. We have a large amount of work to do, and many problems to settle, some of them ones which in their very nature have to be investigated through a long period of time. The work we have before us is no job for a haphazard crew or for a man in a hurry.

## A MOTOR-CAR FOR WAR AEROPLANES

# MINNEAPOLIS, RICH AND BEAUTIFUL

The Wonderful Resources, Abounding Prosperity, Charming Homes, and Excellent Schools of the Great City of the West

A panoramic view of Minneapolis

WITH its growth scarcely written, Minneapolis almost occupies a prominent position among the foremost American cities. It is the commercial capital of the state of Minnesota and one of the capitals of the great American Northwest—a vast and fertile region extending in extent the combined areas of France, Germany, and Great Britain. The city of Minneapolis is located at the geographical center of North America. It is the focal of navigation on the Mississippi River and one hundred and fifty miles from the head of navigation on the Great Lakes. The city rests on a level plateau five feet above sea-level. It stretches and it miles wide, surrounded by rolling hills. The Mississippi River flows through the city, dividing it almost in half.

Minneapolis is essentially a manufacturing city, but the development of its industries has not been accomplished at the expense of its natural beauty. It ranks fourth of all the cities in the country in volume of manufactures, while it is recognized as one of the most beautiful cities in the world. Its educational institutions stand high in comparison with those of other communities, and it has attained national prominence as a music and art center.

The rise of Minneapolis to its present distinction as a center of manufacturing was but the fulfillment of destiny. It did not come by the prestige through any accidental or artificial influence. It owes its existence to the Falls of St. Anthony in the Mississippi, 200 miles from the source of the great "Father of Waters." When a rush of water from the north encountered this aloft of rock it marked the site of Minneapolis, and the establishment of the city was no certain time as was the coming of Columbus.

From its small beginning Minneapolis has expanded continuously which may in a thrilling recitation long before the first settler reached the site of his city. Other cities might have served as distributing centers for the supplies now furnished by Minneapolis to the vast triple territory, but it was the presence of the inexhaustible water power of the Falls of St. Anthony that enabled Minneapolis to attain the prestige it now enjoys.

Its growth has been phenomenal. A little more than half a century ago its site was an Indian reservation. It rose as a city housing a population of 222,426 citizens of United States Census Bureau for 1912, increasing at the rate of about 10,000 inhabitants a year. With St. Paul, which has little more than three times as many inhabitants, it forms a community with a population of approximately 600,000.

The first industry of Minneapolis was the production of flour. The Falls of St. Anthony furnished power for the sawmills which reduced the forests of the state to lumber. The country surrounding the infant Minneapolis, then known as the town of St. Anthony, was turned by the pine and seen to wheat. The falls were called upon to turn the millstones which ground this to flour. Minneapolis remains today the

world's chief producer of flour. With the domination of the forests the lumber industry in Minneapolis was interrupted, though and other industries were provided to take the place of the sawmills and to utilize the cheap power generated by the falls. In this energy and horsepower to use the Minneapolis of today, with its 1,200 manufacturing establishments, whose annual products represent the sum of \$248 for every man, woman, and child in the city. The factory brands of Minneapolis are known throughout the world. Its flour is sold in every civilized country, and its linseed, mackerel, and machinery products follow the paths blazed by the pioneer flour-mills companies to every part of the globe.

the sky line of Minneapolis a distinctiveness as other cities obtain. The great bank structures picture the story of the city's rich business. Minneapolis citizenship is noted for far-sighted traits. A large percentage of the laboring classes own a their homes and fifty-four per cent. of all the children in the public schools have savings accounts. The bank earnings are among the ten largest in America, being annually nearly \$1,310,000,000. There are sixteen national and state banks, three savings banks, and two trust companies, with a combined capital and surplus of \$10,000,000 and deposits of over \$116,000,000.

Her location has made Minneapolis the center for air railroad systems, comprising twenty-five lines and

The pavilion and band-stand at Lake Harriet

The growth of the jolting business of Minneapolis kept pace with the development of the city's industries, until in 1912 the total business of its subdivisions aggregated \$2,000,000,000. Recognized "Minneapolis territory" extends from Lake Michigan to the Pacific coast, from the Canadian boundary and beyond, for miles into the Southwest. It is the second largest distributor of farm implements in the United States and the third largest wholesale fruit and produce dealer.

Minneapolis is famous, too, as a retail trading center. All of the thronging lines in the retail district are wide, well paved, and gayly lit. Nicollet Avenue, the main artery, is one of the few main streets in America not traversed by a street-car line. The continuous cascade of attractive show fronts on this thoroughfare is not surpassed anywhere in the world. There may be a greater number of retail establishments in larger cities, but they are scattered and unimpressive with "dark spots" while on Nicollet Avenue the array of photographic fronts is unbroken.

Minneapolis is held out on generous lines. Its residence streets, as well as those devoted to wide and well kept. Clean white buildings are made in the downtown business section. A number of the buildings occupy by the jobs are of the most modern construction. The city is full of light and air. There are no "creeper-slugs" in the city, and no slums. Huge elevators near the city give

raising over 55,000 miles of track. Two hundred passenger trains arrive daily at the three Minneapolis stations. January is not normally a busy shopping month, but during that month in 1913 Minneapolis received 20,912 carloads of freight and shipped from the city 25,548 carloads. For every twenty-six minutes, day and night, of the twenty-seven business days of January a forty-car train of freight pulled in or out of Minneapolis.

The company operates all the street-car lines in Minneapolis. This city has more than 175 miles of track, which is of the best possible construction. All parts of the city are furnished with bus, conveyance service. The cars are unusually large and may riding and are built in the company's own shops. Four international lines connect Minneapolis with St. Paul, and there are two fast suburban lines from Minneapolis to Lake Minnetonka points, besides lines to the city of Stillwater and to White Bear Lake. The company also operates a fleet of fast boats to all principal points on Lake Minnetonka, reaching Minneapolis business men to live at the lake and yet be within a short ride from their offices.

Minneapolis now is developing another important avenue of transportation—the Mississippi River. Legislative provision has been made for establishing municipal terminals, with the latest equipment for the economical handling of freight, and business men of the city are purchasing stock in a navigation company which is preparing to improve its river traffic as soon as the terminals are ready for use. The United States government's six best channel project includes at the Washington Avenue bridge in the heart of Minneapolis. A great deal is nearing completion, and it will provide Minneapolis with an excellent inland harbor. Some of the largest shippers of the city are enthusiastic over the development of water transportation, and an inland route has brought from a few of these people of more than 500,000 tons of south-bound freight per annum which they will forward by the river as soon as the means are provided. Minneapolis intends to utilize the new method of river transportation, which entails of a power vessel drawing trains of sail barges with a displacement of 1,000 tons each.

Loring Park, Minneapolis

The city government is housed in a magnificent building costing \$5,344,000, every dollar of which represents actual value. The value of the city of Minneapolis property is over \$215,000,000, while the city debt is only a little over \$14,000,000. The last year the city was being built at the rate of \$100 million of true property value. The city owns its own water works and recently completed a perfect system of sewerage which furnishes, through a system of pipe lines, the purest of drinking water. This plant already is looked upon as a model after which other cities are being constructed. The Erie coastwise route is located in Minneapolis at 38.44 in the thousand, which is lower than any other large city in the world. The climate is delightfully dry and temperate. The average temperature for the year is 50.5, and in 12 degrees above zero, for the summer, 70.5. The annual precipitation is 26.3 inches. While there is frost for an average of 160 days, there is no snow in Christmas (thus affording perfect automobile). There is an entire absence of rain and sleet during the winter, which is beneficial for the exhilarating, dry atmosphere.

The "Land of Lakes" (there are 10,000 lakes in Minnesota) early attracted lovers of art to this locality. The Minneapolis Society of Fine Arts, now in its twenty-seventh year, conducts a school in the public library building, the standard of which is recognized by New York art critics higher than any other west of the Alleghenies. Members of the Minneapolis Society of Fine Arts instituted in 1910 a campaign for the erection of a great art museum. At a gathering of interested business men the sum of \$750,000 was pledged for this project. This included a site valued at \$200,000. Ground has been broken for the museum and it is to be completed within two years. The park house has purchased property facing the proposed museum which will provide a beautiful approach to the art property.

There are many private collections of paintings in the city among them the T. B. Walker collection, and to contain one of the most valuable collections, the number of paintings considered, in the country. This gallery is open to the public. The various Minneapolis musical organizations which have more than local reputations. The Minneapolis Symphony Orchestra supported by an annual grant of \$50,000, has been pronounced by competent critics to be one of the six great symphony orchestras in the world. The city has always been known as a good "skate town." There are four skating rinks, five municipal ice houses, and five summer entertainment places. Besides these there is an auditorium at which, through the winter months, the Minneapolis Opera and other local musical organizations appear and where the leading musical artists of the world are heard. The winter is never at all less for entertainment in Minneapolis.

Minneapolis has had a library association for fifty years and the present central library building for twenty-one years. The library contains 250,000 volumes, maintains eleven branches with reading rooms, and over fifty deposit stations in schools, libraries, social settlements, and fire-engine houses. The annual book circulation is 1,312,000, or an average of over three books for every man, woman, and child in the city old enough to read.

Minneapolis is known as an ideal recreation city. Over seventy country clubs are contained in 1912. The hotels are equal in appliances to those of other cities and new ones are being built constantly. One of the five new hotels cost more to build per square foot than any other hotel in the country. The working capacity of Minneapolis exceeds in large enough to hold half of the entire adult population. There are more than two hundred churches of all denominations and nearly every known faith. It would be mentioned that Minneapolis has maintained for nearly a quarter of a century a "prohibition" law which allows liquor to be sold only in a restricted downtown district. No liquor is sold near residences or schools. All saloons close at eleven o'clock and no liquor is sold on Sundays.

The people of Minneapolis are so well organized that several cities think they are well equipped. It is easy to meet the people with whom you or she wishes to work. There are over fifty women's clubs, forty-five improvement associations, and many social clubs. Nearly every class of business has its organization. Every section of the city has its commercial club. The chief business men's organization of the city is the Minneapolis Civic and Commerce Association, which boasts a membership of 2,000 representative citizens and which in one year of its existence has obtained prominence and had been the off-the-organization of its kind in the United States. The association is organized to supply any information that is desired. Minneapolis is a city of millionaires, although there is not that outward show which people might expect in such a city, but nearly all of

these millionaires were poor boys or their fathers were poor boys when they reached the Northwest. The streets in the residential sections abound with spectacularly planted shade trees. There are one hundred and twenty miles of paved streets and seven hundred and ninety miles of well-kept cement-block sidewalks.

Minneapolis real-estate prices are admittedly much lower than those in any other city of the same population, affording an excellent opportunity for safe and profitable investments. There were more than 41,000 real estate transfers in 1912, totaling over \$24,000,000 in value. The building permits for the same year show 3,583 granted, totaling in actual cost more than \$14,200,000. New buildings are going up everywhere, yet there is no boom or bust or steady growth.

Public authorities maintain that the Minneapolis public school system is second to none in the United

one great park because for thirty years the park board has had supervision of the planting of shade trees throughout the city. These hardly done are placed at even distances, pruned, and cared for by the board. Over one hundred and twenty miles of the city landscape have been provided in this way by the city for the citizen.

Cedar Lake, Lake of the Isles, Lake Calhoun and Harriet are all within fifteen or twenty minutes' car or automobile ride from the center of the city and offer bathing, fishing, boating, music, and refreshments. At Lake Calhoun is the beautiful Calhoun Bath House and the finest inland bathing-beach in America. Sun-baths, lawns, restaurants, and canoes are readily to the public at Lake Calhoun and Lake Harriet.

Minnehaha Falls and Fort Snelling are reached by cars. The fort is a historic spot occupied by a full garrison, while adjoining Minnehaha, with its famous

Minneapolis Court House and City Hall

States. There are seventy graded and five high schools operating under a law of compulsory education. Statistics show that a larger proportion of the population attends high school than in any other city in the United States, and a larger per cent. of the high-school graduates attend college. The greater number of these go to the state university, which covers eighty-five acres of the east bank of the river, carrying 6,526 students in eight "colleges" and three "schools." The University of Minnesota Library contains 100,000 volumes.

Minneapolis has been called "the city of lakes and gardens." There are twenty lakes within the city limits and one knotted waterway, a radius of twenty miles. It is worth while to fish in many of these lakes.

Nearly all the city lakes are now controlled by the park board and held by it for the benefit of the people. Over 3,700 acres, or one-half of the entire area of the city, is in the park system. The city has thirty-five miles of parkways, also, under the supervision of the board. One stretch of park land on the western side of the city, carrying nearly one thousand acres, includes seven large lakes. Four of these are now being connected by lagoons which will afford a waterway with twelve miles of shore line, no part of which is more than four miles from the downtown district. The visitor will notice the absence of such signs as "Verboten," or "Keep off," in the Minneapolis parks. The children are made to feel so interested in the city through the special playgrounds, walking paths, and public walks in many of the parks. Private lawns and well-kept lawns are seen on the lakes. The board maintains fine skating rinks in most of the parks every winter. In fact, the entire city might be said

to be the home which the state has provided for her soldiers.

In St. Anthony Falls and the milling district are the world's greatest flour-mills with a daily capacity of sixteen barrels of flour. In their mill race of the largest grain elevators in the world have recently been erected. Near by is the power plant where power is generated for the street-car service of Minneapolis and St. Paul.

The City Hall and Court House, built of Minnesota granite at a cost of \$2,000,000, is one of the finest city buildings in America. The main entrance and corridor form a most imposing view.

The Chamber of Commerce, which is the center for the grain business of the Northwest, is an interesting point, especially during the trading hours from nine to one o'clock each day. Here each week is sold there than at any other place in the world.

The financial center in the vicinity of First Avenue and Fourth Street, contains a number of the best banking structures in the West and forms the financial center not alone of the city, but of the entire Northwest.

The railway manufacturing district and railway terminals, as well as the grounds of the Minnesota State Fair, the largest state fair in the United States, may be viewed from two of the four interurban lines connecting Minneapolis and St. Paul.

Lake Minnetonka, with its beautiful islands, bays, and wooded heights, with its more than 100 miles of irregular shore line, is one of the most picturesque lakes in America. It can be easily reached by trolley or car from the city and may be best seen and enjoyed by taking one or more of the steamboat trips to various parts of the lake.

## A LINNET IN THE BRAKE

BY ETHEL TALBOT SCHEFFAUER

Little brother of my heart,  
Come and speak with me,  
I hear you shrilling and singing afar  
In the waste by the roadside,  
Little brother of my heart, I pray you  
Come and speak with me.

Or, if you will not come  
Where the loughs meet above,  
Come to the meadow by the roadside,  
Where the wild honey-suckle hums,  
And sing to me of love.

Little brother of my heart, I pray you  
Fly and come away,  
All the love in my eyes shall pay you,  
Little brother, if you stay.

Fly not forth in the Miller's avowal,  
Among lark-crooners' bands,  
Dress in gay garb, come proud wing-bearer,  
And feed from my hands.

Drop down the cruel wing-bearer  
That takes you off,  
And so will be yours together  
Under the good sky.  
Stay with my forever, heart's brother;  
Kiss me shall be sure to reach other  
As the glad days go by.

Fly not forth in the road, little brother—  
Fly not in the way, my true wing-bearer—  
Let an eagle lure you on to the other,  
The old song, and end you.

# MAKING THE TABLE GROAN

New Vegetables Will Put the Potato to Shame and Make the Cabbage Hide its Head

BY CROMWELL CHILDE

ILLUSTRATED BY F. BROTHMANN

**T**he farmer is the most conservative manufacturer in America. He has been the conservative of all conservatives in every generation, era, and country. Ever since our history began he has stuck to a common round of wheat and corn. A few centuries ago he added potatoes; later, within the past fifty years, the potato. He accepted these two innovations unwillingly; now they are among the great staples. But still the farmer relies only from a conviction to twenty different vegetables. Of late years Nature has been pokingquisitely in the earth and among the products and she is now putting the matter to him directly.

"Wah, wah," she says, "listen yourself. I've discovered by years of labor and patient research some new vegetables than the twenty—it's really less than that—which you have now. The new ones are better than the old. They will be more profitable for you because people will like to eat them better. You can raise more of them and sell them cheaper. If you will only plant these new things I have discovered for you the wealth your acres will produce will be doubled. Why can't you see it? Must I join these new vegetables down your throat?"

"Well, maybe there is something in what you say," remarks the farmer, cautiously. "Perhaps I will try some of them next year if you can succeed." "I'll make you," says Nature, shaking her fist. "All my work shall not go for naught. I've done my part toward leading the people, now you do yours." The farmer is at last being persuaded. A few years ago experiments would not have been welcomed by him. But lately science has proved altogether too successful in farm life to be ignored. Moreover, there is a new prosperity on the farms and there are many new processes of agriculture. The farmer who has mechanical equipment and the telephone and drives about his acres in a neat motor-car looks at crops with a different eye from that who worked alongside his hired men and scarcely knew the life of a dollar. The new farmer does a lot of thinking about the ultimate consumer.

There are more than twenty of these new vegetables that show a likelihood of coming into general use on the American dinner table within the next ten years. The show of the domestic is going to be considerably more than doubtful. It will save forty dif-

ferent vegetables from which to plan her meals instead of twenty. There is nothing in the "fad" reputation about any of these new vegetables. All have been and are being grown and already have some market. All have been popular wherever they have been tried and all ran no big losses at a profit. In addition, over and above the fact, there are five or six other vegetables not so new, but still uncommon as foods because they have never been put widely upon the market. Those better have passed the public verdict of approval, but in most cities and towns it is difficult to obtain them. But all the new vegetables, the experts say, are going to be possible for the simplest housewife.

One of the Japanese salad vegetables that will take the place of asparagus very acceptably, is one of these new vegetables. The daikon is another. The daikon is the new potato—one of the new potatoes rather, but unless he lately brought several in American agriculture, such matter proceeding from the point of view of popularity than the last. Nobody doubts that the daikon or any of the others will rule out the "spud" that is regarded with as much affection, but what may happen is that they may prove profitable fruits being produced in such quantities that prices will permanently drop. The new potato can be grown in soil and under circumstances impossible for the potato to everybody knows. Delicious are something between the white potato and the sweet-potato and they have a very acceptable flavor. Considerable quantities of them are being grown today in South Carolina. There is already a market for them, and they pay the farmer.

What the makers of the new crops are not going to do is to turn out a small quantity, and if to market, and then sell down and grow and sell here, because the public does not immediately buy. The men who are the pioneers of the new vegetables are too wise for that. They know how, in the past, popular appreciation of the new vegetable world, they started slowly and without say apparent reason and then took half a century to climb up to their proportions. Of course, in sticking to the same in the main, in our great grandmothers' days and even in our grandmothers' days, the "less apple" and thought it only to be fed to pigs. But now later days supply just as many crops as the new vegetable history.

There is the English vegetable marrow, for example, slightly enjoyed by very nearly every one who has ever tasted it. It is not new in America, though greatly underrated. There are many people here who have never heard of it. Kappa is not any wonder if people don't frequently buy it if it were "headly" at all come properly. But as it is supplied only casually by outside. No one seems to have thought to have taken it up as a business proposition. Those who are the object. It is used in large quantities in the foreign countries. It is used in hospitals and in many fashionable restaurants and clubs, but in many a city and town it is as difficult matter to get. New equipment might never get to be a "acceptable head-bear," but once the loss it would

have a considerable sale if people could find it when they wanted to buy it and if they saw it when they were not thinking of it. Hyacinth leaves under the same disadvantage of never being pushed. It is possible to make a very good soup really—think has everything except the actual presence of the spines. It has the taste, the smell, and the look.

With these instances in mind, the man who will grow the new vegetables are forewarned. Create a popular demand by supplying it. Keep the product to be sold constantly in the market. Have it within easy reach always as a reminder. As an evidence that this policy is successful wherever and whenever these new vegetables are grown it is found that they are easily sold. But far-away markets are not being tried as yet. What is the need and the use of it when the small local markets steadily absorb all that is grown? There will be some time when the product is established on a firm foundation.

The aquatic potato, which jokers, when they get wind of it, are going to designate as a "watermelon" because it really grows, so to speak, under water, is one of the most spectacular of the new vegetables. The scientists and the progressive farmers who have looked into it say that the aquatic potato has a very fair chance of becoming one of the great American food products all by itself. It is good to the taste and it grows where no potato worthy of the name could ever be induced to grow before—on very mud and marshy ground.

Along with the aquatic potato in the middle. The peach also has a brilliant record and has become a distinct commercial success. It is a substitute for cranberry, or really not a substitute at all, but something new and capable of making a jelly that can last cranberry on its own ground and—some day—of surpassing that delicacy. It will grow in southern climates impossible for cranberries and, best of all, a market for it is now established; Texas, California, Florida, and North Carolina have all become peach states. One advantage it has over the cranberry is that it is very easy of culture and can be grown in any garden.

None of these new vegetables, it will be seen, are variations, variants, or mere "improvements." They are really new foods for America. In some cases a new product in the old and old and abundant in their popularity. The big Japanese radish is a new in point. It promises to be a welcome rival of the turnip.

The radish is an American thing. It is very steady and acceptable to everybody. The kind that appears on our domestic dinner tables is small and round, a pretty little ball. But the Japanese radish is long and can be a work. It grows in a prodigious size—sometimes it runs up to forty pounds in weight. The little radish is a radish, the big one is a vegetable for a man. Though a vegetable and nothing else, a Strasburgian brother of the baby radish that all know and eat, it is bold and masked like a turnip. It grows in great quantities and is called Japanese radishes and are rather delicate about them. In Germany this new vegetable has nearly reached maturity. There it gets on many dinner tables, being more agreeable to the taste and not having the turnip's strong odor.

A strong word in the Japanese radish is to be in its low price. It has been produced in quantities very cheaply. This new vegetable has been better than almost any other. It will be possible to cultivate over a tremendous area, practically everywhere. Already it has been grown on the outskirts of New York.

There are few, few long and interesting list of the novelties in vegetable that here and there are getting a strong hold, creating a demand, and being found by hard-headed men to be with the good. The new vegetable, Every American knows of stuffed peppers. Peppers that won't kill, however, come thick enough to fry like beefsteak. They are better eaten sliced than stuffed and generally speaking, are unobtainable. They are not eaten there unknown, for the reason that to a greater or less extent they have been transported from Spain for some time. What is the way in which they are being slowly and steadily established as a standard American crop in accordance with the new idea that the proper should be a delicious vegetable rather than a mere condiment. Peppers sliced and fried, spiced thick, will appeal

"Must I join these new vegetables down your throat?"

to many when they come to be known. There is the Chinese cabbage, which does not look like cabbage at all (though it looks like it), but like lettuce. It is more delicate to the palate than the ordinary cabbage of commerce, and tastes, when cooked, "very fine" (as vegetable enthusiasts say). When it is likely to get a hold on the affections of the farmer, however, is in the fact that it matures early. The factitious variety of it, once Chinese cabbage gets established, can carry it to market and completely take the wind out of the sails of his neighbor who plants only the traditional cabbage.

Scarlet-runner is newer until science discovered that it was really a food, radishes, on kale, celerisks (the latter a Southern delicacy, but now being headed toward the North and designed for southern consumption), corn salad can carry plant that is also called "Lamb's lettuce", Swiss chard, and Chinese artichokes are other interesting scientific contributions to the diet of the American house. The broad bean may be added, too, and Japanese lima beans come into much more general use than most people are aware. Rice from the Orient and also from Italy and Africa is more and more taking the place of the old American rice. Probably the average American does not know the difference, but it is quite likely that he is habitually eating lima beans. Nearly one-half of the rice area of Louisiana and Texas is given over to the better and healthier product of the Orient.

Swiss chard looks more like a narrow-leaved lettuce than anything else and sometimes goes by the name of silver beet. It is raised and used as greens. It has had a remarkable rise as a new vegetable. Also it has a root that can either be sliced or eaten like celery. Cardoons are a thistle-like plant of south Europe, of the same species as the French artichoke. When the leaves are nearly full grown they are tied together near the top, steam is piled around the base, and then earth is banked against it. This is for the purpose of blanching. Cardoons must be blanched in

A Broddingsganger with the baby milk

order to be good eating and the process takes from two weeks to a month. Until very recently the cardoon was very little known in the United States, though small quantities were imported from France.

Even salad is eaten as a spinach and sometimes blanched for salad. The Chinese artichoke seems to have many enthusiastic admirers. It has a flavor which, its devotees say, is going to bring it into great popularity before long. There are already two artichokes in evidence. Some one can make himself of value in the community if he invents a better one for this new use than artichoke. What they speak of as the Chinese artichoke is a good deal like a sweet potato in shape. It grows underground like a potato and people who are acquainted only with the French species of artichoke will be confused when they come across it.

The two artichokes already known are the French artichoke and the Jerusalem artichoke. The former is eaten almost altogether these days when artichokes

are eaten at all. The Jerusalem artichoke has all but passed out of existence for the table. What is eaten of the French artichoke is the underdeveloped flower bud. With the Jerusalem artichoke the root is eaten. In just this one point the new vegetable corresponds to the Jerusalem. It has a taste reminiscent of the French artichoke, but is far more delicate. It is peeled like a potato and cooked with cream. Its progress for the new era of vegetable farming are the best, for it is very easy to culture and can be grown all over the country. This gives it a particular advantage over the French artichoke, for the latter is one of the most difficult of all vegetables to grow and after planting must be steamed through a water before the "bud" is ready for eating.

On the whole, it has been the foreigner that has taught us a new notion the possibility of truck farming, that sort of truck farming that leaves nothing to chance, but studies consumption and is ready to supply real needs and actual demands. The truck farmer plants and harvests to sell. The crop that is most wanted in his locality is the one that he supplies. If he sees something better he changes. He is the true manufacturer of the soil, the real, far seeing, level-headed producer who has the judgment to forecast a profitable demand for a novelty and interest the dollars in his possibilities.

As in everything else, there is a distinct "trick of the trade" in truck farming. In Europe it has grown into a definite profession. A man engaged in it needs to be shrewder and more conventional than in almost any other line. The "trick" of this special trade is getting to market early. That is, it is the secret of competition of the crops of any vegetable or fruit that gets into the market first commands the high price. So positively is this the case that shrewd truck farmers, in buying property, hunt out farms in the "early part of the neighborhood"—the land of a locality where crops mature a little sooner than in other parts.

Truck farmers who are thorough business men and experience market conditions are in the new vegetable that science has brought forward much practical value. Many of them are actual early crops. The man growing one of these—any one, to take a single example—can come into the market and do business at a profitable figure when his neighbors are storing, fermenting, and waiting the few days more that their crops need to mature. There is a big apparatus-growing concern in California that has realized this. It has acted on its knowledge and has set apart a goodly sized portion of its acres for sale. While other apparatus-growers sit down and wait this company rushes to its sale in the California markets. People see eager for apparatus. 'Tis is not that, but it is a very acceptable ritual and, being that, it sells. The new vegetable are rich in commercial possibilities of just that sort.

Each of the new vegetables has just such able growers developing it. Business men who are taking the place of the old-time farmer who, in the words of the popular song, "cola, pea, beans, and barley grows" and could not be induced to think anything else worth while.

1.—"Um—um, but dis chile an jes pham full er misery"

3.—"Dat's what I ask, kin he?"

2.—"Has I bin at yer hen roost? yer kin in a better roost?"

4.—"Wha, 'ese he kin?"

# MINNEAPOLIS AND THE NORTHWEST

## The Causes of the Prosperity that has Spread through this Great Agricultural Region

BY ROLLIN E. SMITH

SOME twenty-five or thirty years ago the Middle West was devastated by a real-estate boom which reached the epidemic stage, swept westward in a virulent form, and finally disappeared off the Pacific coast. The effect was much the same everywhere, though a little worse in some communities than in others.

The "boom" period in the Northwest was followed by the depression of 1893, and then came a season of business paralysis. Business men and bankers who had not been crippled existed in a dazed condition. Could business ever get on in a normal way again? Would other landings ever be filled again? Would the stores ever be crowded again? Would there ever again be employment for every man? These were questions in the mind of every man.

During this period of business paralysis it gradually died itself in the minds of thoughtful men that the trouble with the Northwest was that towns and cities had been built on air, on optimism, or what you like. The towns and cities had gone ahead of the country; there was nothing to support them. They were in the position of a line of beautiful stamplines having nothing to carry. This was the most important discovery ever made in the Northwest.

When it was fully realized that the Northwest is distinctly an agricultural region and that it must

Northwest is probably one of the best examples of farming to be found in the whole commercial world. And it is only possible because the system is of gradual development and by reason of its regular continuance, and because the business knew that it must be done. The money must be so used as surely as that which is required in New York on January 1st with which to pay dividends.

It is impossible to estimate more than roughly the vast amount of money that must be withdrawn from other branches in order that the farmer may receive his annual cash dividend from his land. It may be said that the amount required in the Northwest to move the crops to carry grain in store to January 1st is approximately \$100,000,000, varying largely according to the price of grain. This is intended to represent only the amount of currency, and not of credit, annually diverted from other lines of business, and which local banks and the East are relied upon to supply. A much larger amount is called into temporary use.

Certain conditions obtain in Minnesota that cause an unusual realization of interests. If it were not for this fact the demand for currency would be much less acute, and the time of its withdrawal in the Northwest would be shortened. While the big crops of Minnesota and the Dakota soil call for a great amount of money, Minnesota is a milling state, and its immense amount of wheat is required within its

consumption houses, to store for a time. But, of course, the grain is ultimately resold when wanted by millers or shippers.

The great companies have large reserves of their own, yet they also borrow great amounts of money during the crop moving period.

When the elevator companies have exhausted their credit at their local banks and in Chicago and the East—for the larger companies are borrowers in Chicago and New York—their paper, "grain paper," it is called, is offered through commercial paper brokers to bankers generally who are likely to be in the market. Canadian banks have for years been good buyers of grain paper.

Grain paper has, during the last few years, usually grown at faster names bankers generally as a short-time loan for their surplus funds. This is partly due to increased deposits of banks, but not altogether; for many banks now draw in the Northwest in the fall for grain paper, and they are not so sure of their own when having money to loan. Country banks throughout the Northwest are now, in the aggregate, heavy buyers of such paper in the fall, though the amounts taken by individual banks are necessarily small. The banks of Iowa, Minnesota, the Dakota, and eastern Missouri have become regular buyers. During the crop-moving period the banks of the Northwest have brought as high as \$45,000,000 of grain paper in Minnesota. The banks have increased their purchases from year to year of late.

The importance to the Northwest of farmers raising more food for the army and the navy of North Dakota and Minnesota and throughout North Dakota, has this year been strikingly apparent, by reason of the great quantity of foodstuffs raised and having produced satisfactory returns. If, with record crop yields, the farmer does not receive returns commensurate with his investment and his labor, why would he be going on or on a large scale, now being asked. But it is not within the control of the farmer, except in individual instances, to change his general plan of raising. Yet that some change is necessary is obvious, when the best interests of the entire Northwest are considered and if the present prospect is to increase the crop yields of the Northwest in the next few years. The bankers of the Northwest, alert to changes in the economic situation, are already considering ways and means of cooperating with the farmer in a movement to increase the live-stock industry in the Northwest and thereby and as insure a continuance of the present prosperity.

A Minneapolis merchant, once a banker in southern Minnesota, in a letter to the writer on this subject, says:

When I was a banker I preached that swine would pay off a mortgage on a farm quicker than anything else, but cows and sheep should be added also.

It is of little benefit for a farmer to buy cattle or sheep if his feedstock—that does not materially change conditions. Let the bankers and business men arrange to send a good judge of stock to states east or north, to buy good young stock and bring 500 to 1,000 head into each county, selling ten, fifteen, or twenty to different farmers, on easy payments and at a moderate rate of interest. The value in any county that will do this cannot be estimated. Growing more hogs and cattle will quickly lead to growing more corn, wheat and fodder, and that is far better for the land than growing wheat.

Let the bankers in the smaller towns get enthusiastically behind this idea with the business men, and they will be surprised to see the good benefits that will result within three or five years.

The gentleman who wrote the foregoing practices what he advocates. Last spring he bought 300 young cows and sent them to his farms in Polk County, Minnesota, and he has a good number of calves and more cows this spring, to be sent into the same county. He also has a herd of five Holsteins and another of Short-horns in the same county.

In the Northwest there is an apparent interest in the new agricultural or rural credit movement, advocated by the National Live-stock and Dairy Association, agricultural banks, meaning, no matter what the name, cheaper money to the farmer. Nor is there any reason to suppose that the movement is not in fact, is there any merit in the campaign for cheaper money for the farmer, so far as the Northwest is concerned.

The farmer borrows money at the same rate as the business man in the nearest town, and the farmer's credit is just as good as the business man's. The credit of the farmer is not affected by his own thrift and is less responsible to him, just as the credit of an insurance man is better than that of an attorney. It is better than that of one less fully developed and less sure in the matter of crops. The credit of business is a whole lot better than that of a farmer, for twenty-five to fifty years, and in which the farmer is wealthy, is of course vastly better than in a region where all the farmers are poor. The farmer's credit is not his live stock and should mainly upon one or two grain crops. And the rates of interest correspond to the physical conditions of the country. It is not so high as it would be in a less fertile, prosperous, and diversified farming district of southern Minnesota, the

A view in the mill district of Minnesota.

to develop to profit the cities entirely, and that to "boom" the cities blindly was folly, the turning point in the history of the Northwest had been reached. They followed several years of slow development and substantial foundation-laying. Minneapolis and the Northwest had now passed through all the stages in order to a new and developing region, and were building the foundation that is to last for all time. Speaking in a general way, it may be said that this work was completed five or eleven years ago. Since that time business, financial, and agricultural expansion have been rapid but healthy. A few statistics will illustrate this point better than many words.

In 1903 deposits in all the banks in Minnesota amounted to \$97,300,000; the following year the total was \$111,200,000, and in 1912 the deposits had increased to \$154,270,000.

In South Dakota in the same years the deposits are \$15,700,000, \$25,000,000, and \$35,400,000, respectively.

In North Dakota in the same years the deposits were \$12,500,000, \$19,000,000, and \$23,100,000.

Minneapolis, the financial center of this great Northwest, has naturally greatly profited by the expansion and increase in wealth of the last few years. For example, in 1912 the capital and surplus of the national and state banks in Minneapolis amounted to \$5,500,000, while at the present time the capital and surplus is \$10,700,000.

In proving, it may be said that the Census Report for 1910 gives the following information relative to manufacturing industries in Minneapolis: Capital invested, \$90,204,000; annual value of products, \$165,000,000; value added by manufacture, \$143,000,000; number of manufacturing establishments, 1,180; men, 34,700; persons engaged, 33,920.

Furnishing money for moving the crops of the

border, Minnesota mills, including Minneapolis and Duluth, grind approximately 120,000,000 bushels of wheat annually.

Now in order to insure the mills getting sufficient wheat—to keep the grain from being drawn to other markets—it must be purchased as offered and stored in elevators in the country, or at Minneapolis and Duluth until ground. This results in concentrating and tying up, every fall in the Northwest, a large amount of money which would otherwise be distributed over a greater area. Owing to the contraction time of milling in Minnesota and to the immense crops of the three Northwestern states, the demand for currency every fall from this region has not a parallel in the world's grain trade.

A system of borrowing money or financing the business of handling grain has come of year of evolution, and the most important factor in the system is credit. The rest is largely mechanical. Besides this, there are two classes of borrowers, namely, the elevator companies and the commission houses. The latter finance grain buyers all country-wide.

The heavy borrowers are the elevator companies, and they are divided into two classes—the "live" and the "terminal" elevator companies. The former have a "live" elevator, and are located at country stations or towns, usually on one system of railroad. The number of such elevators owned by one company is from a dozen to one hundred, and they are not cut through two or three states.

The business of the two classes of companies is different. The elevator company buys grain from the farmer, and stores it to the centers and sells it to terminal companies or to millers. Much of the latter would consider mills and so never touches the elevator. The terminal companies buy wheat and other grain from the live companies and the

farmers borrow money, on farm-mortgage security, on three to five years' time, at five and one-half to six per cent. to the borrower—that is, that rate covers maintenance and all charges and costs. Life-insurance and loan companies and individual money-lenders offer a constant supply of money at the rates mentioned. In the same region, the banks lend to farmers whose credit is good small amounts on short time at six to seven per cent.—no commission or charges in addition. But if a traveler several hundred miles to the North-west, to sparsely settled northwestern and northwestern North Dakota, we find that entirely different conditions obtain. Much of the country is still uncalculated; all the farms are new; the principal crops are wheat and flax; there is little live stock; the

larns are poorly improved, compared with those of southern Minnesota, and the farmers are not, of course, as prosperous as those of older-settled districts. The credit of that part of the Northwest cannot be so good as that of the famous Red River Valley, in eastern North Dakota, or of the prosperous, manufacturing region of southern Minnesota. The farmers of northwestern and southwestern North Dakota find it necessary to pay 8 per cent. when borrowing on farm-mortgage security. For short-time loans at the banks the rate is from 10 to 12 per cent. to farmers and business men alike. In eastern North Dakota the rate is the same, on farm loans, covering all charges, 10 to 12 per cent. and on "over-the-counter" loans at the banks, 8 to 10 per cent.

In Minneapolis at the present time the discount rate at the banks on best indorsed commercial paper, is 5/8 to 6 per cent. That is, business houses having the highest credit are paying three rates, whether they borrow \$5,000 or \$100,000; and at the same time a southern Minnesota farmer may go to the bank at his home town and borrow \$100 on his unimproved acre at 8 to 7 per cent. Credit and rates of interest, in a broad sense, follow economic principles, and will be likely to be materially changed by innovations such as rural credit or co-operative credit banks. The latter have been of great benefit to agricultural communities in European countries, and they perhaps might be in some parts of the United States, but not in the Northwest.

## GLACIER PARK AND ITS WONDERS

The New Government Reservation where Tourist and Peigan Fraternize

Other countries have such a remarkable array of national parks as the United States. Each of these playgrounds which Uncle Sam has dedicated to the people is carefully considered from the other end, and in respect, Glacier Park, the newest of the government's nature preserves, is the most distinctive of the collection. So much is this the case that in the third year of its existence it was created by Act of Congress in 1910 seven thousand tourists registered at its two gateways—Glacier Park station, Montana, on the western side of the Continental Divide, and Inleton, Montana, which is on the Pacific slope of the Rockies. The backbone of the mighty range extends from the Canadian boundary thirty miles into the middle of the park, the area of which is somewhat larger than the state of Rhode Island.

In providing for the accommodation of tourists in the park, log-cabin villages have been built at convenient distances apart. These are after the Swiss style of architecture and they lend a picturesque touch to the wild surroundings. These unique timber huts are situated on the shores of the larger lakes, of which there are 200 in the park. These placid bodies of land-locked water are fed by snow living glaciers, the largest of which is Blackfoot Glacier, five miles in breadth.

Free means of travel may be resorted to in leaving the park: automobile and horse stage, by which the main points of interest connected by highways are to be reached; harkies, which ply the big lakes in their enormous boats between mountain towering five thousand feet above the water level, and those who desire to penetrate the mountain recesses and cross the Continental Divide can follow the winding trails on horseback or afoot.

The Indian life is another distinctive feature which is attractive to the American tourist. The little days of the rapid passing of the red man. The trails over which tourists now travel are the same hunting trails the Indians have followed for the thousand years in their chase of big game. The noble Peigan hunters make some wonderful stories of infatigable exertions. The Peigans were among the most 100,000 buffalo-hunters of the Indian race. They lived close to the Rockies because it was there the big woods sought shelter and food during the winter months. The old Indians to this day point out passes in the mountains which formed natural passages through which their hunting parties

cross their prey by the hundreds until the frozen animals would crowd themselves over the cliffs by slaughter. Thus the furbies obtained their supply of winter wool, and skins for clothing and with which to make their kayes.

These are the reasons for the famous buffalo or grama dance which still is religiously indulged in by the Blackfoot tribe. The Indians, who were so dependent upon the buffalo for food, railroad, and shelter, held the grama dance as an appeal to the Great Spirit, thinking he would be pleased and send plenty of rain to make the grass grow luxuriantly so that the buffalo would come into their country to browse, and thus afford the red man opportunity to get what he needed to eat and wear.

The recreation of these Indians adjoins Glacier Park on the east, but the Indians spend much of their time among the park itself, that they may gratify their desire to meet the tourists and have the whole people enjoy their grama dance and wind ceremonies in the open camp which they set up for their diversion.

No other national park in Uncle Sam's domain offers such opportunity of obtaining an intimate knowledge of the Indian and his home life. The highest honor the Peigans have to bestow upon the whole people is their courtesy of adopting into their tribe those to whom they take a liking.

This new region of the Rockies is also much esteemed as a fisherman's paradise. Inside the park proper it is to be found some of the best trout-fishing in the world. Expert dry-fly experts may so, at least. The United States government has very wisely put a check upon the fisherman in this virgin

waters, limiting the catch of each to twenty-five fish a day.

Most striking of all things about this wonderland upon the roof of the continent is that it seems to be one of the earth's outside haunts of beauty for men and wild beast alike. Many of the Peigans are very old men. The most recent evidence that the fountain of youth flows from the roof of the continent comes in the presentation to the annual world by a big game hunting party of horns from one of the oldest elk of which there is any history. These horns have a spread of nearly five feet. An Indian, who gives his age as ninety-four, says that when he was a boy there was a gigantic elk the frame of his tribe used to seek, but which always eluded them until finally this momentous animal came to be regarded reverently as a fete of the Great Spirit sent north to banish the red man. It may be that this is the same one.

Peigans riding from their encampment to greet a tourist party

WHAT THEY'VE BEEN SAVING UP THEIR PENNIES FOR

## Interfudes

### AN INCIDENT OF THE OPERA SEASON

THERE was considerable excitement in the little city when it was announced that arrangements for a season of grand opera had been made by certain enterprising individuals who retained the sparkling qualities of music upon the human spirit, as well as upon box-office prices. Several of the leading singers of the day had been secured, and an advertising campaign of grand magnitude was instituted, conspicuous among the features of which was a fine display three-sheet poster of "Madame Hortense Vecchi," the leading diva of the day.

The great night came, and Madame Vecchi was at her best, indulging the voracious qualities of her great voice in a spirit of enthusiasm for the sake of Lauro which availed the house to a high pitch of appreciation. Everybody was delighted save one lone-headed son of toil, who, after the fall of the curtain on the second act, approached the box-office and demanded his money back.

"HAVE YOU BEEN EATING ANYTHING?"  
 "NO, SIR."  
 "HERE IS A QUARTER. WOULD YOU KINDLY STOPPING OUT AND EATING ONE?"

"Want your money back?" queried the astounded manager. "What for? Haven't we delivered the goods?"

"No, bosh, yo ha'n't!" said the disgruntled customer. "I didn't come here to hear that there lady holler, and screech, and yell the top of her head off. I come in to see her dive, and, by hokee! yo ha'n't even produced a look for her to dive into, an' what's more, after lookin' at her a couple o' times I don't believe she kin dive without splashin' water all over the orchestra."  
 His money was returned.

### UNCLE HIRAM ON EDUCATION

YAS, I know that education is a god-darned useful thing, and the gal that goes to college makes a wife fit for a king. Now's yo grateful on that account they call the fair game, an' yo'd think her pa an' ma to home was mighty fine an' swell. I am glad to think my Mandy's had a chance to fill her head with the fine an' splendid ideas of the gal that's college-bred. But I cannot help but wonder what'll happen in her life when she comes back here to settle on a busy farmer's wife. Mandy was grand to set an' listen, an' to watch her when she speaks all them languages peculiar of the Latins and the Greeks; an' my soul is filled with pleasure when I hear her talkin' French, 'bout or say's it 'twas scak' but a fallin' off a bench. She can talk for seven hours on the ways of ancient Rome, an' in Paris wares and such things she is very much at home. But, bosh, I sometimes wonder what'll happen when she tries to be please a hungry farmer with a lunk o' yonkin pie!

She can tell yo 'bout old Plato, an' that feller Socrates, and there's nothin' that can stump her when it comes to studies. You should hear her on the subject of The Origin of Man back in days before old Adam or his garden was begun. Why, she goes back past the monkeys to a sort of early worm and much blipper than a dust-mite, which she calls the same a worm. But I cannot help a wonderin' of that sort o' learned here in wades to cheer her spirit when she scolds the kitchen crew!

She's a subject called Epigenesis that she talks about all day—it's a curious sort o' theory, an' I cannot truly say that I understand it wholly, but it seems to have to do with a perfect sort of inst' in a kind of never know but she manages to find a-waiter, if we're careful to select for the parents two young people that's in every way correct. I had a wonder of she'll find that them Epigenesis can be wrong when her own old-headed freckled little skunkets comes along!

Yas, my Mandy's educated, an' I'm mighty glad she be, and they ain't no use drivin' she's the pride of me an' me. Epigenesis, the-er-er-er—all o' them is good things, and Epigenesis comes an' handy for the gals that marry kings. But yo see my Mandy's righted to the Willow's oldest kid—she's a big, shuck-headed feller with few brains inside his lid—and it kind o' makes me wonder how those educated opens in a prin' to look majestic when it comes to cookin' beans!  
 HORACE DICK GASTYTT.

"ARE YOU THE OWNER OF THIS HOUSE?"  
 "YES, I'M THE JANITOR. WHAT DO YOU WANT?"

### DISQUALIFIED

"I'm very sorry," said Mrs. Dubbs, in the applicant for a position as her stenographer, "but you won't do. I like your looks, and your references are fine, but I can't employ you."

"What seems to be the trouble?" asked the applicant.

"You don't fit our last stenographer's feet, and I couldn't possibly afford a new set," said Mrs. Dubbs.

# A 4 Day Tour

through

## Glacier National Park

by Automobile, Horseback, Stage and Launch

for \$ 22<sup>00</sup> Low Fares  
Every Day

**B**REAK your journey to or from the coast by a stop-over at Glacier National Park. It will be a *wonderful* experience. A few days in this scenic wonderland will provide material for a *lifetime* of vivid, pleasant recollections—and at a comparatively trifling cost.

For instance, \$22 covers the total expense of a four day tour to exquisite Lake St. Mary in the very heart of the Park, by automobile, horseback, launch, and stage, including a visit to the luxurious Chalet Camps at Many-Glacier and Going-to-the-Sun—the paradise of the lake trout fisherman. An almost unlimited number of other tours covering one day or an entire season, may be arranged on the same basis.

### Low Fares Every Day

The accommodations throughout the Park cannot be excelled. In addition to the famous chain of Swiss Chalet Camps, a magnificent, new hotel has just been completed offering every modern luxury and convenience. It is built entirely of logs on Swiss Chalet lines in perfect harmony with its natural setting. Every room is electrically lighted and heated, swimming pool will be found in basement. Enormous open fireplaces typify and crystallize the spirit of hospitality and generous welcome that is evident from the moment of your arrival.

An excellent opportunity is afforded to observe the tribal dances and ceremonials of the Blackfeet Indians—one of the most interesting and picturesque of all the surviving tribes.

### Write for Aeroplane Map and Special Booklets

Very complete descriptive literature explaining every feature and including a large Aeroplane Map of the entire Park, in colors, will be mailed on request. An interview with one of our representatives who has personally visited Glacier Park, may be arranged. Write for full information today.

**The Science of Yeasts**

SCIENCE has rendered important service to the brewers. Some years ago Professor Hansen, an authority on yeasts, experimented carefully and experimentally in obtaining admission to the old Carlsberg brewery in Germany for the purpose of transferring processes into the original nature of the yeasts on which the production of beer depends. The brewers were familiar in a general way with such disappointment and loss. But within a comparatively short time the professor had discovered the facts the brewers never dreamed of and had made their brewery famous through the scientific world on account of his experiments. Various kinds of yeast cause "disease" in beer and Hansen discovered the means of guarding against it. He also devised methods of preserving "dead" yeast, so that it can be kept pure for years and transported safely throughout the world.

The element yeast has sometimes contained numbers of yeast cells. Still larger numbers are often found in ale and in some beer, which probably gives these beverages certain of their desirable properties. But by the largest amount of yeast, the way in which the yeast and digestive system is introduced with bakery goods which have been made from flour.

Yeast is found in nature in almost the same family as the mushroom, for which most people have a distinct liking. The

age-long use of yeast for bread-making purposes prove that this fungus is capable of thoroughly agreeing with the human organism. In view of this, it is somewhat surprising that immense amounts of beer yeast are annually allowed to go to waste from every brewery in the land.

There are several circumstances which have seemed to stand in the way of employing beer yeast in food production. It has chiefly been assumed that one can be found in its dark color and its bitterness, due to the simultaneous use of hops in the brewing process.

These undesirable qualities of beer yeast may, however, be removed, and easily-kept yeast is not suitable for baking purposes, since it grows in a cold medium and does not possess sufficient raising power for the purposes of the baker. There is no question as to the nutritive value of yeast, since, weight for weight, it is quite comparable in nutritive value to the best flour.

For direct consumption in the fresh condition yeast must be put into a suitable form. This was first invented by Klinschmidt compressed yeast that has been brewed for the removal of its bitter taste, such as yeast, will bring a very "tasty" paste which can be spread in the oven. Dry yeast can be used in the same way, although some of the addition of yeast to certain stews and salad dressings is added in very favorable results. The experts add, however, that this is a question which should receive the thorough study of the gastro-entomologist.

**Coldwell**

**The Finishing Touch**

MANY things are needed in the making of a home. The land and the house come first, of course; then furniture, linen, silver; piano, pictures, books.

Later still, the family notice how rough and untidy the outside of the home is.

So finally the home is finished, inside and outside, by the buying of a Coldwell Lawn Mower.

*A Coldwell is the last touch of refinement. It gives the perfect setting to the perfect home.*

"Always use the BEST. The BEST is the cheapest. Coldwell Lawn Mowers are the BEST."

Write for full description and prices, together with prospectus, based on "The Care of Lawns."

**DR. TALKS ON FOOD**  
Pres. of Board of Health.

"What shall I eat?" is the daily inquiry the physician is met with. I do not hesitate to say that in my judgment a large percentage of disease is caused by poorly selected and improperly prepared food. For instance, experience with the fully cooked food, known as Grape-Nuts, enables me to speak freely of its merits.

From correct I suffer several years with indigestion, palpitation of the heart, and loss of sleep. Last summer I was led to experiment with the new food, which I used in conjunction with good cow's milk. In a short time after I discontinued its use the diagnostic symptoms disappeared, my heart's action became steady and normal, the functions of the stomach were properly carried out, and I again slept soundly and well as in my youth.

I look upon Grape-Nuts as a perfect food, and so one may assume but that has a most pronounced place in a rational, scientific system of feeding. Any one who sees the food from the point of view of the soundness of the principle upon which it is manufactured and may thereby know the facts as to its "merit." Some items by Postum Co., Battle Creek, Mich.

"There's a cream," and it is explained in the little book, "The Road to Well-being," in page.

Ever read the above letter? A new one appears from time to time. They are written true, and full of common interest."

A well-known Editor's view of Cereals

I sometimes drink a cocktail. In fact, I like a cocktail when I'm sick, even the fashionable ones, to help me to get on my feet. I like a cocktail as an appetizer, but especially one like a cocktail like a good one. For a good cocktail, I have kept in mind, whether in the country or in town, the Club Cocktails in bottles, more convenient than any other one. I have kept in mind, whether in the country or in town, the Club Cocktails in bottles, more convenient than any other one. I have kept in mind, whether in the country or in town, the Club Cocktails in bottles, more convenient than any other one.

**The Song of Birds**

When the song of birds is thought to be instinctive, it has been ascertained that young birds never learn the song peculiar to their species if they are not heard it. They very easily, however, learn the song of other species, and it is well known that they will be associated. Barring this has advanced the view that notes in birds are an innate sense that language is innate, and has facilitated much interesting information along these lines.

Dr. Frank Aschaff had educated nesting finches under the same nesting birds—the skylark, the woodcock, and the titlark—every one of which, instead of the finches' song, adhered entirely to that of its instructor.

When the note of the titlark was thoroughly fixed, the bird was taken for three months in a room with two rousers; birds which were full song. The titlark, however, did not become any note from the finches' song, but adhered steadfastly to that of the titlark.

When the note of the finch at two or three weeks of age has been heard already to have learned the roll-side of their species, the same experimenter desires to prevent this, the bird must be taken from the nest when a day or two old. Certain goldfinch's song exactly like a note, without any previous note of its species. This bird had been taken from the nest when two or three days old and had been under a wooden cage in a small garden, where it had undoubtedly acquired the notes of the wren without any previous note of its species.

Still more extraordinary was the case of a rouser, which was taken from a wild state only three, but which learned the song of the finch and goldfinch by being brought up near those birds.

**The Musical Ear**

The well-endowed musical ear is able to distinguish notes where there is not more difference than the average fourth part of a tone. The great majority of people are not able to know the difference in the fourth part of a tone, which some can scarcely tell one tone in music from any other.

The cause of this disparity is due to the fact that the ear has a certain range of the natural ear, the cochlea, to be more definite, which is the point where the auditory nerve ends, thus being the point which transmits sound impulses to the brain.

Of the points in the ear may be the chords of the piano and the ear has its "golden point," also, that prevents sound from being transmitted to the brain in a regular manner. The cochlea, in its regular manner, is the point of musical functioning in the human body; it receives from the middle ear, or tympanum, being distinguished and sent to the central station for the receipt of the message by the cochlea-nerve.

**THE Indian Motorcycle**

give you the fullest pleasure of the open country road without any jolting, jarring or vibration. The new standard features of the 1913 Indian have completely revolutionized motorcycle. The Cradle Spring Frame has abolished discomfort. It's the correct principle. Instantly appreciated by anyone who has ever ridden a motorcycle.

Foot Boards now fixed in addition to pedal gear chain of two available riding postures with separate brake control. New type luggage carrier. The Income in Power. Speed and Endurance unrivaled by any other motorcycle. Can stand up to anything in nature. Easy to ride as a bicycle. Needs no goggles.

## Women Spies of the Secret Service

Not long ago an engineer in the English army was sentenced to four years' imprisonment for having betrayed several secrets. Accidentally meeting a woman whom he had known casually years before, he was led to speak of his life in the service, and all unwittingly to give her the clue to certain vital plans. These she is supposed to have sold to a foreign government.

Many an adventurous life on the side of state secrets, a conflict of affairs that many people believe not to exist save in the imagination of scoundrels. The importance of having women in the service—called "secrets," has been demonstrated time and again in the past few years.

Four years ago, a case was recorded in Massachusetts, where headquarters were situated, ostensibly for the study of languages. Under this pretext people came and went more or less constantly without attracting much attention. Meantime, a young German lady made periodical visits in Massachusetts, where she found the acquaintance of a young naval officer. He had not been more than a week or two in her company when he began to suspect her interest in his department. In due order she admitted that she wished to obtain a quantity of plans. He immediately acquainted his superiors with the state of affairs, and the young lady fell to her lot.

Lord Wolsey says in his *Autobiography* that spies are literally paid when the information they give is of exceptional value. During the Anglo-French War the English employed many women spies. Large numbers were distributed throughout the hospitals, where they exercised their arts of fascination upon the wounded prisoners with telling effect, or in the securing of important dates and sources of supply.

Brief and mysterious was the fate of a young Russian woman of good family who left St. Petersburg during the Japanese-Russian War. Her undertaker, in getting several secrets from a young Japanese official in Manchuria, forgetting loyalty and patriotism, this young man fell into the trap, and told her of plans and dates with regard to the movement of the Japanese artillery. But he was surprised by a companion who kept steady watch of him, and the result was that both the

young woman and the man who had become infatuated with her quickly disappeared. The wife of the young woman explained that some of money to ascertain her fate, but without any result whatever.

Not long ago in Yorkshire a young girl named James's alias Bourne, got herself into serious trouble for the crime of inducing certain naval officers to reveal secrets of the French submarine service. These secrets she sold for large sums not to one but to several European governments. She was only twenty-one years of age, and her sudden expression of propriety caused attention to be centered upon her. A young mechanic in the artillery was finally induced to accuse her and produce all necessary proofs. Some mysterious agent influence protected her, however, and she was not punished.

## The Cleverest of Diggers

It is said that, of all living creatures, the gopher is the one most perfectly adapted to digging in the ground. This creature is short-legged, almost motionless, without visible ears, and with extremely small eyes. In its tunneling work the gopher employs its long and powerful front teeth as a pick to loosen the ground. At the same time the hind feet, which are armed with long, curved claws, the sides of the legs being long, in turn, with bristles that prevent the passage of dirt between them, are bent at work both in digging and in pressing the dirt back under the body, near the hind feet to take it and push it farther back.

When a sufficient quantity of earth has been accumulated in the rear of the gopher, the animal whirls about, and by bringing his "wreath" together under his chin, with the palms of the "hands" held vertically, he pushes the earth out in front. A gopher will move back or just as rapidly as forward, and he can push the soil either way. His movements in excavation are almost as rapid and automatic as those of a shuffler. It has been estimated that a pocket-gopher can make two hundred complete strokes with his teeth in one minute. The jaws are so arranged that different sized particles are made by the forward stroke of the jaw, and right-angled by the backward stroke. Thus, it will be seen, the jaws of this curious little creature may

accomplish a great total of thirteen thousand two hundred cuts a minute when in active operation. He is enormously destructive to crops, and is, therefore, not popular.

The pocket-gopher digs as long as he lives, extending his burrow from year to year. He digs all summer and generally all winter, since he is not a hibernating animal. All his life is practically passed underground, except when, for an instant, on rare occasions, he emerges into the air to push a load of earth from the opening hole. But he tunnels so quickly that it might be said he is never seen.

If a gopher in captivity finds a whole potato he will cut off little slices, transverse them to suitable shape with his sharp teeth, and transfer them to his cheek-pockets by a swift movement. To remove them from the pouch he presses his nose back firmly against the sides of his head and carries them rapidly forward, dumping the contents of the pouch on the ground before him. These pouches are often packed so full of bits of roots, stems, and leaves as to give the gopher a strongly distended appearance.

## The Sun's Path

The sun's path is called the ecliptic. It is a great circle of the celestial sphere, cutting the celestial equator, at two points one hundred and eighty degrees apart, and making with it an angle of twenty-three and one-half degrees known as the obliquity of the ecliptic. The crossing points are called the equinoxes, because the days and nights are then equal, and the points midway between the equinoxes are the solstices, because the sun then seems to stand still for a few days.

The ecliptic is so called because eclipses occur only when the moon is crossing it, or is near it. For the moon's orbit cuts the ecliptic in two points, called nodes or knots, and at other times is above or below it. In the moon, when in either node, or in line with the sun and the earth, we have an eclipse, either total or partial.

The moon's nodes are not stationary, but move backward on the moon's orbit, completing a revolution in about nineteen years, when the eclipses of the period

occur in the same order, and at about the same intervals as before. This period of nineteen years and eleven days is called the Saros, and is named in the Old Testament and the Talmud, and gives their chief clue for computing eclipses.

At the equinoxes persons can trace the sun's path in the heavens. If the moon occurs exactly in the east and sets in the west, it is the time of the equinoxes. If the sunrise and sunset points are farthest north, and the sun at midnight is highest in the heavens, it is the time of the summer solstice. If the sunrise and sunset points are farthest south, and the sun is very low in the heavens all morning, it is the time of the winter solstice.

## From Grave to Golf

An English authority on golf gives the following description of the golfcourse at Trobach, North China:

"The course is 2,284 yards. Mad and sand greens, so it is impossible to give just good enough for greens, the finest of the most sporting courses in the Far East. A large sand bank 120 feet high, with most intricate the course and is utilized for hazards and elevated links. Groups of Chinese graves, consisting of mounds of earth, sometimes ten to twelve feet high, piled over the coffins, which is laid upon the ground, form excellent bunkers. A unique local by-law prevents the lifting of a ball from an open coffin without penalty."

## Paper and Ink for Our Money

To manufacture and print the paper money of the United States it is necessary to import materials from various parts of the world. A part of the paper fibre, for instance, is linen rag from the United States, and the blue ink contains iron-bull from Canada or Germany. The black ink is sent to be made at Niagara Falls from synthetic gas analyzer, and the greenish part of the green ink, is made with white also sulphate, the product of Germany in density. The red color in the seal is derived from a pigment imported from Central America.

# HARPER'S MAGAZINE For MAY

## A NEW NOVEL

by

# MRS. HUMPHRY WARD

BEGINS

¶ Mrs. Ward's novels, "Lady Rose's Daughter," "The Marriage of William Ashe," and "The Testing of Diana Mallory," have been among the most successful of the many famous serials published in Harper's Magazine.

¶ Her new novel, which will begin in the May number of Harper's Magazine, is a love story entitled

## The Corston Family

¶ In this story the distinguished author is revealed in a new light, for she has written a love story pure and simple whose heroine will rank us her most charming portrayal of young womanhood of to-day.

**Wells & Dickey Company**

The Wells & Dickey Company with its principal office in Minneapolis is one of the most prominent lenders in the Middle West dealing in farm mortgages, municipal and corporation bonds.

Founded at Ansonia, North Dakota, in 1878 by Edward P. Wells and the late Alfred Dickey, the company has more than forty years of the big and substantial growth which has taken place in the American Northwest since that time. Indeed, the Wells & Dickey Company has been a considerable factor in the development of that territory through the outside capital from the Eastern States and Europe which its firm, conservative policy has attracted. Bearing thirty-five years ago making loans to the farmers of North Dakota, today the field of the company extends from the Great Lakes to the Pacific Coast. Branch offices are maintained at St. Paul, Minneapolis, Ansonia, North Dakota, and Great Falls, Montana.

With the growth of its business and the extension of its territory the Wells & Dickey Company has perfected a system of lending farm mortgages which is perhaps unsurpassed in the degree of safety which it assures the investor. The management is in the hands of officers and heads of departments, all stockholders in the company, whose long experience enables them to render excellent service, whether it is to the investor company, with its definite interest or to the mortgagee, who has money to transfer his first one hundred dollars of capital from the savings-bank to the higher interest bearing farm mortgage.

The loans are made by the Wells & Dickey Company with its own funds through its own officers or its own licensed correspondents on improved farm lands. The land covered by each loan is inspected by our own surveyors' reports. The record of advances in the main office remains the abstracts of title and draw the papers. There is no question of title matters that the company or its customers have never advised a loss through neglect of formal abstracts of title. Every mortgage it offers is accompanied by a guaranty of title from the Wells & Dickey Company.

After the sale of a mortgage this company feels no relief of responsibility, but its detailed supervision continues during the term and insurance premiums are paid and making the collections of principal and interest. These latter are promptly remitted to the borrower without delay or other charges, so that the investor or mortgagee need not give it a care after purchase.

**A Stone Age Banquet**

During EUGENE HUNT, an archaeologist at Berlin, and a member of the Anthropological Society, lately conceived the original plan of preparing a banquet in the manner of "The Stone Age." There were many volunteers to aid in the work of making the proper preparations for the stone banquet. It was necessary first to select an appropriate spot for the dining place. After many sites were examined, it was finally decided to hold the "banquet" on a small bank in the middle of the Minnetonka River, far from settlement. This was done in order to insure all semblance of the life of today, and to insure surroundings that would make a time when the only habitations were caves, or the shelter of trees.

With the said task as "the table," the banquet was made in accordance with those used in the Stone Age. Those made of wood were fashioned in close imitation of the utensils of that age. Calabash were fitted the best form of the vessel. It was prepared in a wooden bowl by means of stones that had been first heated and then thrown into the water in which the calabash had been placed. As fast as the stones cooled, others were put in to insure the cooking. The cooking consumed, of course, a much greater time than do modern methods, but time was no object to the scientists on this task.

Basted "leg of horse" came next. It was cooked in the same manner. Roast pork, cooked over the living coals, and for better tasting, the learned scientists said, than any roasting of to-day, was an important dish. Roasted water, cooked by the hot-stone method, went with the pork.

Stumps were roasted in the ashes of the fire, the fire-baked part jerked away and then served steaming hot. After this there was a dessert of dried berries and wild honey. The banquet lasted more than three hours, and when it was over the scientists were returning their homes, the guests all insisted that if the Stone Age men lived as well as this he had little of which to complain in the matter of food.

During this strange banquet every possible effort was made to enter into the spirit of the Stone Age. The scientists ate either with their fingers or out of the bowls that were placed before them. There were no knives, no forks, no tablecloths, and no napkins. In fact, nothing in the entire world suggested the refinements of to-day. It was, it became necessary to turn any material that was being cooked, this was accomplished by means of a broad stick. Not a bit of metal was employed, either in the cooking or in the consumption of the food that lay prepared for the scientists.

**99- and 999-Year Leases**

Watters originated the use of the odd term in leases, 99 or 999 years.

In other days leases and mortgages in possession of real estate for 99 or 100 years denoted a lease as an annual rental, retaining a reversion for the last year of the original term. The object of this proceeding was to be found in the unwillingness of the lender to invest beyond the performance of the contract as retained in the original grant and also in the importance in the lease of a reversionary interest, without which, under the old English tenure, he could not receive his rent by distress.

Sometimes this reversion was for only three days or even for one day, but usually he long term the last year was retained. Out of this came the popular notion that the law provided this limitation and lease terms were made for 99 or 999 years, when there was no reason whatever for any such odd period of time. In England there was in special cases a restraint on corporations or individuals persons prohibiting the demise of lands belonging to them for a term beyond 100 years, and such leases were accordingly made for 99 years.

**A Valuable Bug at Large**

Not long ago a Washington scientist, an eminent student of entomology, has captured a few specimens of beetle. On rubbing some of it in a solvent of kerosene, the beetle in a literary taste with his diamond saw file.

When he returned to the library from the dinner, he found his saw file not put away and was flying about with the diamond file glittering from its back. One of the men in the library, who had noticed the beetle, took their first and triumphantly called away, loudly exclaiming the scientist's self extracted hair. Neither bug nor file has since been seen.

The Rise of the "Stovepipe"

The slinky silk cylindrical hat, sometimes called "topper," "high hat," "plug," "high dress," "stovepipe," or "four gallon hat" by the irreverent, seems lately to disappear, after little more than one century of existence. In England, the place of its origin, it was long esteemed the very highest badge of respectability, so much admired that "navy crews crested more and 'tassily' dressmen played rickety in correct, shiny bell-toppers. To Americans who remember the pleasing custom in frontier towns a generation ago of shooting any high hat of loose white cloth was carried through the street on the head of its owner, the following bit of history from the *Pitt* will doubtless seem familiar:

This form of headgear was first seen in London on January 15, 1797, when John Worthington, a haberdasher, emerged from his shop in the Strand wearing a silk hat, and was promptly surrounded by an astonished mob of such proportions that he was arrested and charged before the Lord Mayor with inciting to riot. The officer who arrested Worthington testified that he "appeared upon the public highway wearing upon his head a tall silk structure, which he called a silk hat, having a shiny brim, and a crown of a conical, highway shape. Several women fainted at the unusual sight, while children screamed, dogs barked, and a young man, Colman's Poetess, who was retreating from a church lady's shop, was thrown down by the crowd which had collected, and had his right arm broken." The defendant pleaded that he was merely exercising a right possessed by every Englishman, the right in any headpiece he chose, and had not violated any law. He was nevertheless bound over to £100 to keep the peace. This verdict aroused the wrath of the public, and in its issue of January 16, 1797, the *hat* was by Worthington described as "an article in dress which is not used, and which is bound, sooner or later, to stamp its character upon the entire community. The next day it attracted the notice of a revolution in headgear, and we think the officers of the Crown acted in placing the defendant under arrest.

THE ROOSTER. "Rich? I should say so! He made a fortune selling anti-air to the turkeys."

In answer to your demand our engineers have built a "More Mileage" Tire

Perfect 3-Point Rim Contact

Our Engineers have built up and torn down thousands of experimental tires to give you a road-resisting More Mileage Tire—a tire in which each thread of fabric and every ounce of rubber would be combined to give you the greatest strength and resistance—and the result is Perfect 3-Point Rim Contact.

Diamond (No Pinch) Tires made of Vitalized Rubber

Our Chemists discovered how to get a flint-like rubber that retains all the young, lustrous vigor of the pure gum, with no loss of elasticity—Vitalized Rubber.

Add to these advantages the No-Pinch Safety Grip for inner tube protection, and, if you wish, the now famous Diamond Safety (Squeezee) Tread, and you have the ideal More Mileage Tire you have dreamed of.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims at any of the

A Child  
 Oh, I'm lit' comin' back alive,  
 And you'll see me dead, too,  
 And everybody tries to guess  
 Just what I went down all in, do,  
 For I'm not a dead one, you see,  
 I look at them approvingly.  
 But when they put my mittens on  
 And make my little thumbs go stay  
 In a place all by itself  
 Where it can't watch the others play,  
 I hold it straight in front of me,  
 And look at it mournfully.  
 And when some grown-up girls and boys  
 To come "make friends" with little me,  
 They're in a roused doze, and my back  
 And I'm on my dignity.  
 For I am a grand bromide free,  
 Oh how I love bromine fervently.  
 But when a gray-haired somebody  
 Smiles through their shiny double eyes,  
 And takes you up real rapidly,  
 Your ears and every finger tries  
 To touch and solve the mystery,  
 That's why I look so wonderfully.  
 And when I look far, far away  
 At what is in the coming years,  
 "A penny for your thoughts," they say,  
 'Tis up to you my yawning ears,  
 And if they think you're a nut,  
 They wouldn't understand, you see.  
 Oh, I'm lit' wisest kid alive,  
 And you'll see me stumped, too,  
 The words all wrapped up in me  
 Are hidden off reverently by me.  
 The traps never get my blue eyes,  
 But hidden deep from the wise—  
 They were entrusted just to me.  
 And to one child only you see.  
 MARK LUTHER THOMPSON.

The Whittier Inn Sea Gate—New York Harbor

An Ideal Hotel Home for Summer—Open from May to November  
 The Inn is situated in a picturesque spot, maintained by the local estate company.  
 Rooms with private bath and porch. Rooms are available in nearby cottages to those who prefer them, service and privileges of the Inn being the same.  
 Elite cottages (including No. 3) Newport may be leased for the season.  
 A most loved beach with sunbathing facilities—Tennis, baseball, soccer and sailing.  
 Private boat service to and from New York City. Also frequent train service to Brooklyn.  
 Telephone George  
 A Delightful Place—Just 45 Minutes by Private Boat from New York

The Story of the Other Wise Man

by HENRY VAN DYKE  
 Illustrated by Howard Chandler Christy  
 "To meet the continued demand for a complete gift edition of this classic, well-loved classic to the world which have given it such wide and unbroken popularity, a splendidly illustrated edition of twelve is being prepared. Out of one little detail in the story of the "Wise Men from the East," Dr. Van Dyke has constructed a narrative which includes a sweet and exciting Christmas lesson."  
 With Van Dyke, Christy, Bland & Child, Gift Book, 25c

The examination showed that the average level of the water had varied with great regularity, in a recurring period of four to five months, ever since the tide record began in 1851.

The inference is that this regular change in level must be due to the average rising and falling of the earth, as a result of which the level changes a little less than five-eighths of an inch—also corresponds to a fluctuation of the earth which should result from the supposed cause.

A curious result of the slow changes of level proceeding at various points of the earth's surface has been pointed out by a number of the Geographical Survey of Canada. This is a gradual tilting up of the shores of Hudson Bay, as if some gigantic power were engaged in an attempt to empty that great basin of water into the adjoining sea. One of the earliest indications of what was going on came to the attention of the officers of the Hudson Bay Company when they found that the water at the mouths of the rivers, where their posts are established, was gradually getting shallower and navigation consequently becoming more difficult. Examinations showed that the water was rising with old levels of sand and gravel lying so high as fifty feet or more above the level of the water. In 1851, the survey of Hudson, in 1850, discovered the great body of water that breaks his name, he witnessed with his ships on the west coast of the bay in a harbor that has not disappeared, or at least has been so far drawn off as no longer to be recognizable from his descriptions.

Bottle Brokers

Since the edit of June 6, 1904, the production and sale of vodka, that fiery drink in which most Russians delight, has been controlled by the government. Over 50,000 places engaged in the vodka trade in European Russia, more than half are controlled by the state and the strict supervision of the Ministry of Finance. Most of the employees in the government with whom the citizens are in contact are of doubtful official status. These shops are conducted in an orderly manner and no drinking is permitted on the premises. The fact that a charge ranging from one cent to nine cents is made for the bottle in which the vodka is sold has given rise to a class of so-called bottle brokers, as they are called, behind the neighborhood of the vodka shops, watching for some thrifty person who needs the kind of one or two kopcks (a half a cent or a cent) with which to make the purchase of a bottle of the desired beverage. Perhaps the lawyer has but a few kopcks and he requires eight to get a bottle of vodka; the "broker" lends him the two kopcks to make up the desired amount, and after the proprietor has been drawn out by the vigilance of the state, the bottle is turned over to him. He takes it back to the shop and sells it for three cents, the profit being the two kopcks he took. In Moscow and St. Petersburg there are hundreds of men who earn a living at this strange trade.

The Author of "Fair Harvard"

A Proposed Memorial  
 Few of the men who have borne the brunt of the "Fair Harvard" distinction—meaning of Harvard University, have the name of the author. The words were written by the Rev. Samuel Johnson, born at Gloucester, Mass., in 1791, who was graduated from Harvard College in 1811, studied at the Harvard Divinity School, and was settled over the church in Charleston, S. C., in 1816, where he served for nearly thirty years. He was called to write the lyrics for the Memorial of the university in 1826, and composed the poem known as "Fair Harvard."  
 His memory will be honored by the establishment of a Samuel Johnson Memorial Room in the tower of the Divinity School, which will also be included under his ministry. "An appeal has been issued to Harvard alumni, who are invited to contribute to the fund. Mr. Walter B. Wither, Eng. 35 Broad Street, Charleston, South Carolina.

The Color of War-ships

The color which war-ships sail is painted has long been the subject of much study and has long been a matter to make them as visible as possible. For 1853, England adopted a neutral color, neutral was the color used in the United States. Japan and the United States used a dark blue color, but with a lighter shade in the middle of the hull. The darker, while the German ships used blue.

## Secretary Bryan in California

"The good minister fears no undertaking which he knows to be for the public good. . . . There should be a great distance between the authority of the minister and that of the prince."—THOUGHTS OF A STATESMAN.

WHATEVER may be the outcome of Secretary Bryan's visit to California as the official representative of the President, there can be no doubt of the beneficial effect of the delay imposed upon the legislature of that somewhat tumultuous commonwealth and of the breathing-spell afforded superstitious Japan. To that extent, at any rate, Mr. Wilson has retrieved his original inadvertent error in tacitly conceding the inability of the federal government to interfere in matters of state legislation. Doubtless Mr. BRYAN is now being put to his heels to recollect his mere presence in Sacramento with the President's injudicious declaration, no less than with his own explicit denunciation, in the Baltimore platform, of "the efforts of our opponents to deprive the states of any of the rights reserved to them" as "usurpation." Had he foreseen the present difficult situation, he would hardly have insisted so strongly that "there is no twilight zone between the nation and the state." That there is such a zone has now become painfully and expensively manifest.

The whole question with respect to Japan and California resolves into an interpretation of the Constitution, which thus far for political reasons our governing authorities have avoided. It is idle to attempt, as many are now doing, to discuss contentions by referring to all treaties as "the supreme law of the land." The fact, of course, as explicitly set forth in the Constitution, is that only such treaties as are "made under the authority of the United States" have any binding force whatever. Where that authority begins and ends has never been determined by any competent tribunal. The only certainty is that all powers "not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states respectively or to the people," and that authority to regulate the disposition of lands has never been so delegated.

Nevertheless the courts ever and over again have held it to be a fundamental principle that, since the nation alone is empowered to treat with foreign countries, the scope of its authority cannot be subjected to limitations which would impair the efficiency of its acts. Secretary BRYAN made an odd distinction with respect to this very matter in his note, June 15, 1899, reading as follows:

Were the question, whether a treaty provision which gives to aliens rights in real estate in the states, to come up now for the first time, grave doubts might be entertained as to how far such a treaty would be constitutional. A treaty is, it is true, the supreme law of the land, but it is, nevertheless, but a law imposed by the federal government, and subject to all the limitations of other laws imposed by the same authority. While internationally binding the United

States in the contracting power, it may be unconstitutionally inoperative because it deals with matters in the states as to which the federal government has no power to deal.

That a treaty, however, can give to aliens such rights has been repeatedly affirmed by the Supreme Court of the United States; and, consequently, however such limitation there might be as to admitting a new treaty containing such provisions, it is not open to this department to deny that the treaties now in existence giving rights to this class of aliens may, in their municipal relations, be regarded as operative in the states.

Coming from a pronounced advocate of state rights and Secretary of State under President CLEVELAND, this definition would seem to have a force almost binding upon the Democratic party still rejected by the courts. Under it, clearly the claim of California of a right to deprive aliens of rights in real estate upon the ground that other states have already done so would be disallowed, since the treaty with which such an act would conflict is already in existence. The nicety of the distinction is apparent; it might or might not be sustained; but it certainly does seem to be a pity that Secretary BRYAN is virtually barred from using it, with the authority of his distinguished Democratic predecessor, by the declaration in the platform drawn by himself and by President Wilson's engorged utterance.

Apparently the only weapon left to Secretary BRYAN in his difficult undertaking is moral suasion. In this he will derive great assistance from President WILSON's tactful and almost compelling appeal to the people of California to "leave untouched the international obligations of the United States." It seems well-nigh incredible that patriotic citizens of one state would disregard so frank and earnest an entreaty from their President. But California has always regarded herself as more or less a thing apart, is nearly as disdainful of her Eastern neighbors as of Japan itself, and, unhappily, at the moment seems to be quite under the domination of the ardent demagogue, JIMMIE JOHNSON, who formerly opposed the very laws which he now advocates in response to the demand of labor unions and who makes himself ridiculous by blustering about the one's "rights which he persistently derided during the last campaign.

The lack of real interest of the proposed legislation appears from the government reports. The Japanese in California to-day own a little less than 10,000 acres of land, one-tenth of one per cent. of the agricultural area of the state, and an increase since 1905 of something less than 2,000 acres. The Japanese lease 17,600 acres, a decrease since 1900 of 2,700 acres. In other words, Japanese agricultural activity in California is represented by less than one-third of one per cent. of the entire

arable land of the state, and, counting ownership and leaseholds, they cultivate nearly a thousand acres less to-day than they did three years ago. Nevertheless, we would not put undue stress upon this phase of the situation. Under no circumstances would we uphold outside interference with the people of a state in judging the requirements of their own communities. The question is much broader than that. It involves the moral, rather than a mere technical, right of a member of the sisterhood of states to enact legislation involving international relations in the face of opposing sentiment and material interests of forty other commonwealths. President HAYES felt too far when he declared in his annual message of 1896 that "in the matter now before me affecting the Japanese everything that is within my power to do will be done, and all forces, military and civil, of the United States which I may lawfully employ will be so employed"; but the result indicated that he knew his people and confused his judgment of the need of meeting tranquility with transience. President TAFT achieved the same end by methods which, though moderate and becoming, were none the less firm and meaningful.

That President WILSON will maintain with equal resolution whatever position he may find himself compelled to assume as a consequence of Secretary BRYAN's mediation may be taken for granted. Herding his preliminary slip, which led him into embarrassment to the matter, every step he has taken in the affair deserves hearty commendation. It was quite right and proper to manifest consideration for and faith in the people themselves. It was prudent to provide a breathing-spell for all concerned. And we are disposed to believe that it will prove to have been wise to give full rein to Mr. BRYAN's unarmamented diplomacy, while making it perfectly clear that he himself holds in reserve all of the authority conferred upon a President of the United States, and a free hand to act as circumstances may require. No partiality or prejudice should deter any citizen from standing squarely behind his Chief Magistrate in a contingency of this kind in any event, but the reason for upholding his hands is enhanced tremendously when he craves the sagacity, caution, and tolerance which so far Mr. WILSON has shown in a method degree.

There will be no war. Japan is in no condition to fight. All the more reason, then, for especial consideration, for increased friendliness, and for cordial cooperation in her every endeavor not only to avoid friction with this Republic, but to insure tranquility among her own wholly sensitive and somewhat turbulent population.

Good-bye to Mr. BRYAN!

**Mass Clay Feet.**

Oh dear! oh dear! Can it be possible that HENRY M. LA FOLLETTE is getting his political ideals mixed up with larders and fishes? The thought seems incredible, and yet—well, what about this?

On April 15th Brother LA FOLLETTE sounded a most alarming alarm over his larder and fishery on the front page of his paper. He had detected "The System at Work," and thus entitled his piece. It was all about the appointment of Mr. JOHN SKELTON WILLIAMS as Assistant Secretary of the Treasury. "Until a few days ago," he wrote, plaintively, "it was officially announced that HENRY WOODRUFF, of Virginia, would be appointed." We never heard of Mr. WOODRUFF, but we cheerfully accept Mr. LA FOLLETTE'S assurance that he is "an able, scholarly gentleman," and free from all outstanding liabilities. But it seems that Mr. WOODRUFF had criticized Mr. C. C. GLOVER, the prominent president of the Biggs National Bank. Consequently, declared Senator LA FOLLETTE, "either Mr. GLOVER or some one with like interests persuaded President WILSON to appoint JOHN SKELTON WILLIAMS." And he, in the vigilant Senator's view, is the limit. Necessarily he continues:

Mr. WILLIAMS has qualifications which would be recognized anywhere in Wall Street as naturally fit for the role of Treasurer of Virginia, would be recognized in the Metropolitan (Millwall) Club of Sixth Street, New York. He organized the Seaboard Atlantic Railway System and was general manager of the Norfolk and Eastern District of the Atlantic. Mr. WILLIAMS is associated with H. CLAY PIERCE, NORMAN B. READ, R. F. TRASKER, and other System representatives.

And then the inevitable warning, worthy of Brother BRYAN before he donned the mantle of offshootism. "It is believed," Senator LA FOLLETTE concludes, "that President WILSON has been imposed upon. Let him beware of such influences. The special interests never sleep. They have their friends in every department. Many of them are known. They should all be hunted down and out. But it would avoid little to turn out one man with special-interest connections only to appoint another with like affiliations."

All this was as usual—characteristic and consistent. But let us catch a whiff! Brother LA FOLLETTE'S piece appeared on April 15th. Four days later the papers contained the following dispatch:

WASHINGTON, April 15.—There was unusual interest today in the conference at the White House between President WILSON and Senator LA FOLLETTE. After giving indirect but valuable support to Mr. WILSON in the Presidential campaign Senator LA FOLLETTE felt it is known that he would support President WILSON in all proposals for progressive legislation, but recently the Senator has attacked the administration in his speeches, especially his denunciation of the appointment of JOHN SKELTON WILLIAMS as Assistant Secretary of the Treasury. He charged the appointment was satisfactory to the "bosses."

At the close of the interview it was said the President had asked Senator LA FOLLETTE to go to the White House to discuss matters of mutual interest. This subject was the appointment of Federal officers in Wisconsin. The President followed a custom he had established of consulting Republican Senators. Senator LA FOLLETTE also conferred with Secretary McADAMS today.

Now mark! One subject discussed was "the appointment of Federal officers in Wisconsin," and then the Senator went across the street and "conferred with Secretary McADAMS." Presumably JOHN SKELTON was out.

Now why the distinction (indeed!) is not Mr. McADAMS also a member of the Metropolitan (Millwall) Club of Sixth Street, New York? And if poor JOHN SKELTON has been really contaminated by association with Mr. PIERCE, Mr. READ, and Mr. YAMANA, what does the worthy Senator suspect may have happened to Mr. McADAMS during some sort of intimate association with the Biggs directors? Did Mr. LA FOLLETTE never hear of ANTHONY N. BROWN, the "traction magnate"; of JOHN G. McCULLOUGH, notoriously a capitalist; of PLYM FISK, the banker, and, takes alive of ELMER H. GUY, president of the great steel corporation? Or had he not heard that they were directors of Mr. McADAMS?

Let! Let! Suppose Mr. McADAMS were Assistant Secretary without patronage. Which then would Senator LA FOLLETTE be condemning and which "confering with" about "Federal officers in Wisconsin"?

1.—Handling like a hauling tool! Pshaw!

**The Bad.**

It was heard long on Josephine to have a fine just as he was preparing a statement for the public,

**Window.**

Mr. BRYAN has explained about the window dinner he gave to Ambassador and Mrs. BAVER and seven other ambassadors and their wives. Seeing that this important diplomatic news was out, he admitted that it was true, and disclosed that he told his guests that he and Mrs. BRYAN had given them the window dinner, and their parents before them, and had "never served liquor at their table"; and that when he took office under President WILSON he asked him whether failure to serve wine would be an embarrassment to the administration, and Mr. WILSON cheerfully left that to his discretion, and he decided that it wouldn't. So he gave the window dinner, with wine, and water, and a certain huddling, purple blue—the papers say—made of uninitiating grape juice. And Mr. BRYAN said he never spent a more enjoyable evening than that one with the ambassadors, thus explained.

Surely that was very creditable in all circumstances. Mr. BRYAN as an entertainer who is independent of stimulants, and to the eight ambassadors and their wives, as clever riders on the water-wagon. To be sure such entertainment could not embarrass the administration! Far otherwise! But Mr. BRYAN must remember that he is himself a great and powerful stimulant, and that though his wretched guests, stimulated by him, might be lazier and responsive, the guests of low gifted heads might welcome the following effect of a few snufflers of wine. There rises in the memory the far-away figure of an illustrious Democratic statesman coming in his evening clothes to his own address in his own home in Washington, proceeding rapidly and with a smile to wet his own whistle with his own drink, before going down to the White House to dine with President HAYES. A few years later that statesman filled the place that Mr. BRYAN now holds. We respectfully offer his example to the good ambassadors.

**Relief.**

Just yesterday Mr. BRYAN'S patents were not prejudicial against the use of forks.

**The Report on the Tariff Bill.**

Does anybody read a committee report on a tariff bill? Those who reply to it, perhaps, but precious few others. Of course, too, many of an opinion through the Associated Press report. But practically none of us consider it all the carefully prepared statement which usually accompanies such a measure as the UNDERWOOD bill, now at last fully launched on its difficult course through the two Houses of Congress.

Really, we wish there might be an exception in this instance. It is too much, no doubt, to expect any wide reading of the whole of the UNDERWOOD bill, but at least certain paragraphs which are not only worth reading, but actually readable. BRYAN himself wouldn't be ashamed of them. It is two to one that fifty years from now college boys will have to read them along with HARRISON'S Report on Manufactures and the WALKER report of 1866.

We refer particularly to the paragraphs on the Cost of Production Theory, on the Democratic Platform Pledge, on the Competitive Tariff Theory, on *Ad Valorem* Duties, on Our Tariff Relations with Other Countries, and on the "Dumping" Clause. If Mr. McCORMACK and his committee have the money they wish to do well to put out a statement as widely as possible, for it is the clearest and strongest statement yet made of the Democratic contention concerning the tariff as it affects the precise condition now existing in this country; also the fairest, for it does not in the least pretend that an honest tariff, built on sound principles, should be made to do so. The condition brought about by dishonest tariffs built on assumed principles. "To protect profits," it frankly declares, "of new duty means to protect inefficiency," and it is as free "to proclaim that the party in power will do no *ex post facto* inefficiency at the cost of the vast majority of American citizens."

Nobody is asked to justify himself. The bill proposes a great change in the economic policy of this country, and the report gives candidly and clearly the reasons for it. In our judgment, they are sufficient, convincing, overwhelming. It is not for us to doubt the honesty about the matter. The only question before the American people will take the trouble to understand their reasons; that it is to say, to comprehend their actual situation in respect of the tariff. The other is whether the good and interests that profit by our present in-

ward policy will have money and gain enough to outweigh the loss of some advantage of this promising endeavor to adopt the right policy.

As the bill goes on its way we hope to print out some of the specific injustices and absurdities it aims to correct. The main fact at present to be emphasized is the fact of its fundamental wisdom and righteousness.

**"Schedule K"**

"President TAY" was likable in many ways, but we like him best as the Republican party's *enfant terrible*. There was something of the head of Providence in the train of events, including Roosevelt, which forced that party to make a man as incapable of shrewdness, insincerity, etc., as President and spokesman. Think of a man in that position actually telling the truth when he came to explain why the wool and woolen schedule remained unchanged in the PAYNE bill!

Yet TAY did it, in these words:

Mr. PAYNE, in the House, and Mr. ANDREWS, in the Senate, both in the same speech, in the whole act, found that in the Republican party (Hillsboro) the interests of the wool-growers in the far West and the interests of manufacturers in the East and in other States, reflected through their representatives in Congress, was sufficiently strong to do any attempt to change the woolen tariff and that had it been attempted it would have broken the bill before it reached either committee.

We again run across this famous passage from the WILSON speech in a fairly competent article in the *Crutcher*, revisiting the history of the wool and woolen schedules from 1862 to the present day. That history must surely, by this time, be known to all intelligent Americans—the original bargain between the shepherds and the weavers, the way it has been kept through their joint agent, the Republican party, and the way we Americans have clothed with a shrewd wool in it.

The plain facts are that it has made us pay, for half a century, about two prices for all our woven and worsted and shoddy clothing; that it has leached the rough woolsens of the American laborer far higher than the worsted of wealthy America; that it has set raised the wages of laborers in the industries it protects; that the wealthy heads of those industries and the Republican party have been its sole beneficiaries; and that it has been the source of unmeasured corruption in our politics.

If the UNDERWOOD bill in its final form does nothing but take away the last link of the chain of Schedule K, it will be worth all the trouble it has cost to elect a Congress willing to pass it.

**On the Starboard Side**

Our own weekly Service of the Mary—*per se* Herald. Don't you mean semi-daily or perhaps just semi?

**A "Feeler" on the Banking and Currency Question.**

Somebody at Washington gave last week to the Associated Press a very vague outline of the probable character of somebody's bill to reform the banking and currency system. Some of the papers have taken what is assumed as an indication of the ideas of Representative HANSON, prospective chairman of the House committee on the subject discussed; others take it as emanating from "the administration." The name of Senator AMES, chairman of the Senate Banking and Currency Committee, is also vaguely associated with it.

However, there is nothing really mysterious about the article—and nothing really culpable. It is simply a "feeler," put out to test public sentiment, through the newspapers, on the tentative plans of those most concerned in the framing of an administrative plan of banking and currency legislation, and more, than that the public feelers is well established in Washington. HANSON used it constantly, in reference to appointments as well as measures.

We trust the press will respond to this so fully and candidly. It may thereby give courage to the gentlemen particularly engaged with this great matter, and sure that when they meet Mr. HANSON, for instance, seems to have some available notions about his subject. We trust the press will help him to see that he and his associates on the job will be wise to trust the intelligence of the Americans people, and not to be deterred from doing so, lest they may be lost of the lawmakers and prejudice of the electors. As a matter of fact, we have not observed as yet any very foolish comment on the feeler as it stands. On the whole, we are of opinion that if the party in power fails to pass a good banking and currency bill it will

fall from the incompetence or timidity of its own leaders rather than from any insuperable stupidity of "the people" on the subject. We believe that at present very few Americans out of politics are obsessed with impossible notions about public finance. The trouble is that so many politicians are obsessed with the notion that the American people are so obsessed.

#### We Consent to Be "Felt"

So far as we can make out from the article in question, the intricate plan looks to the establishment of some fifteen regional reserve banks, presumably holding the reserves of all the banks in their respective regions, and also charged with the collection of revenues. By a gradual retirement of the present bond-secured currency we are to be brought to an asset currency, based on commercial paper, which is, of course, what we ought to have. The intimations as to probable devices to prevent inflation—altogether unnecessary if we do get a currency based on commercial paper, which will be automatically adjusted to our varying needs, worth discussing. Really important, however, is the composition of a suggested governing board—the Secretary of the Treasury and of Agriculture and the Comptroller of the Currency, four members chosen "by the banks of the country," and two members appointed by the President. Unfortunately, there is no indication of the precise powers this board is to exercise.

Hazy and incomplete as it is, we think the plan shows a sincere but timid desire to follow the best thought of the country. The regional arrangement for reserves is half a concession to the ALABAMA plan and half an attempt to vary from it. If the governing board has sufficient power, regional reserves can perhaps be used, indirectly, for the same purpose for which a single national reserve could be used conveniently. The composition of the proposed governing board is faulty in that there will be too many more or less political directors. For that reason and others the plan is unworkable, rather, when we are permitted to see it—it is inferior to the ALABAMA plan for the precise reason least to be expected: to wit, that it leaves credit more open to control by "Wall Street!"

Nevertheless, the fever is to some extent enervating. Whoever proposed it had some sense of what the country really needs in the way of sound and currency legislation. We are optimistic, and trust that in time the country's needs in this matter will mature and more prevail, in the minds of the men who now have the power and responsibility to take action, over an exaggerated fear of the country's unreadiness to accept what it needs.

#### The South and the Ambassadorships and Consuls

In view of some current criticisms of certain appointments to our foreign service which the President has either made or is supposed to be about to make, there are some facts which the public, in common fairness, ought to keep in mind. They were brought out and discussed the other day in the Senate, but they are not new. This journal referred to them a year or more ago.

They show that under recent Republican administrations the diplomatic and consular appointments have been so unequally distributed among the sections that the result is grotesque. Here, in brief, is what the new administration found:

Of the 55 ambassadors and ministers not one came from the regularly Democratic states of the South—about a third of the country.

Of the 64 consuls-general, only 5 came from the South, and these were of the lower classifications, with low salaries.

Of consuls with salaries over \$2,000, only 23 were from the South, as against 130 from the District of Columbia alone. The aggregate of salaries paid to all Southerners in the consular service was \$84,000, as against \$1,250,000 paid to those from Ohio alone. The showing would not be even so good as this but for the recent imperfect extension of civil-service rules to consular appointments.

In both cases the total of Southerners was 50 out of 620, and their salaries amounted to \$187,200 out of \$2,445,928.

It is worth noting that in the Senate discussion of this state of affairs no Republican defended it as just or reasonable. It can hardly be said as unjust, unless if the new administration shall in some measure correct it. In the consular service particularly it is evidently desirable that the South, which plays so great a part in our foreign trade, should be better represented.

However, we think it best to mention that we

are at present speaking only of the diplomatic and consular services.

#### A Wise Friend Leaves Us

We Americans are getting nowadays plenty of comment and admiration from distinguished foreigners. We need to file it, else there would hardly be any of it, and our managers and jobbers would hardly pay so well for it. The parting words of JAMES BRYAN, at the Pilgrims' farewell dinner, were not commercially inspired, however, and there is another reason why we may well pay attention to them. Mr. BRYAN has studied as long and knows more about us than any other foreigner alive. Indeed, it sounds wrong to call him a foreigner.

He tells us two things that are encouraging to us all. One is that we have a sort of middle class now, between the millionaires and the labor unions, on which we can rely for a real strength and stability. The other is that if his trained observation of the standard of civil duty among us were to be strictly rising and falling.

We trust Mr. BRYAN is right. We are sure he is sincere. He is not flatterer us. He does not need to and must know it. He must know that in the minds and hearts of nearly all decent and intelligent Americans he holds a secure place with CHAMBERLAIN and CANTON in that fine company of Englishmen whose knowledge and appreciation of America has been free alike from prejudice and from ignorant enthusiasm. In this day and generation he is only first among America's friends in Great Britain.

#### On Reception.

From the *Sunday* (Ohio) *Journal*:

HARPER'S WEEKLY takes exception to this item that appeared in the *Saturday Freeman*:

It seemed odd to read that the American ambassador in Rome had offered the Embassy as a place for Mr. MONROE, Mr. MONROE's son, and the director of Secretary of State WILLIAM J. BRYAN?

To HARPER'S this does "not appear odd." Nor should it appear so to any right-minded American. Mr. BRYAN would not agree with Mr. MONROE in any particulars. He sincerely believes they were diametrically opposed. Mr. BRYAN would have cursed the good fortune which Mr. MONROE held, and likewise the Nebraska was probably one of the last ones when the "money king" would have wished to see in power at all.

It does not follow, however, that one need not see greatness in the other. No matter how much Mr. BRYAN and many of the rest of us may have opposed to Mr. MONROE and his financial methods and system, we recognized in him a great man. While enshrining him and his associates in the minds of so much for his country. He did what he deemed best to insure sound financial conditions. Possibly it is true that the criticism he provoked a great many pains. Certain it is that he gave vast scope for philanthropic purposes, and did more than any other man to advance the cause of art in this country. While he had no son, he was always an American. And surely a man whose death brought such surmises of confidence from the German Emperor, the Pope of Rome, and other great rulers was deserving of the country, in death, of having his country's Embassy located as a place for his funeral. Mr. BRYAN took the proper course, that of a true American.

The trouble with some folks seems to be that they cannot imagine one man opposing another, or taking issue with him, unless it be in all things, even unto death.

It is most gratifying to be able to record that the *Sunday* *Journal* is but one of many public journals who have expressed themselves in this wise.

#### A Shift of Scene

There seems to be some basis to the stories that the great German economist, who has been promoting war situations in order to sell their goods. Probably the promotion was done by irresponsible persons, but at any rate a shift of scene in Germany from the government to the arms-outlet makers seems a thing to be thankful for. The arms-outlet business has been extremely profitable since the war, and it is tempting and likely to become so, but the business seems to have been overdone. A sharp attack of KATYER names in Germany might bring relief to all the world.

#### They Won't Let Her Starve

London *Truth* weekly declares that Mrs. PEVERETT has (in effect) sold herself short and is prospering mightily in the speculation. It points out that she, being in reduced circumstances on the death of her husband, got a job in the office of the Registrar of Births and Deaths, she has given constant evidence of great improvement in her social condition. It maliciously suggests that the greatest obstacle to her personal success was the possible expense, or inconvenience, of the most prolific misanthropes. Accordingly, it finds her break-

ing with the old-time suffragists, like Mrs. FAWCETT, and attacking first Sir ERIC AMERY, "the most honest suffragist" in the Cabinet; next the Premier, CAMPBELL BANNERMAN, who wanted to give women the vote; next discovering the House of Commons by an uproar when it was on the point of giving an overwhelming division in favor of suffrage; and so on, and so on.

These are her aspirations. Yet if they are believed by the present Premier and the Home Secretary they may help to prevent for the sake of the government of England that Mrs. PEVERETT'S health shall suffer no permanent hurt from imprisonment.

#### Baseball in the Philippines

EDWARD S. BROWN, physical director of the Y. M. C. A. at Manila, is quoted as telling in San Francisco about the progress state of civilization by baseball in the Philippines. He says the entire younger generation of the Philippine is baseball mad, and has no time for revolutions. He tells this story:

A few months ago a company of constabulary landed from a steamer on Jolo Island. As the soldiers were marching they saw a crowd of natives watching and betting their eyes, the only company, believing that a whole village was being introduced, except through the force of the natives. They were so interested that they reached the edge of the trees and peeped through the leaves, they peeped about a thousand natives dancing the *tinikling* on the top of the tables. A forcing creature, clad in a loin cloth, was traveling toward a palm leaf spread upon the ground to designate first show and a crooked little brown man afterward identified as one of the chiefs, was informing the multitude that the hit had been "fair."

Mr. BROWN says that three-fourths of the children going to the Filipino schools are identified with some sort of sport. The boys play baseball, and the current epidemic is probably the more violent because there are no winter months to check it. The boys play every day in the year except when it rains.

That is very interesting. We are used to baseball as a sport, but perhaps we have not given it all the credit that is its due as a process and safeguard of civilization. It may be that the propensity of the college boys to neglect the proceedings in the most academic tent for the side-shows and a crooked little brown man afterward identified as one of the chiefs, and if necessary, to California!

#### Why Have Public Service Commissioners?

The legislation of New York is open to the criticism directed at the man who kept a dog and still did his own banking. It passed a "failure" bill. Last week it passed the State Street bill making it a misdemeanor to operate horse-race in first-class cities. It has under consideration and near passage two bills abolishing ferries, one bill increasing the number of "colleges" one, and one regulating telephone fares, and yet it keeps two "expensive and ineffectual Public Service Commissioners" (as the *State* aptly expressed to study and attend to all such matters as these.

#### A Few Big Men Will Do

If our new idea is to give those who possess property a voice in the administration, there is no reason why it is better large, but also, we must have because there are so many men in public life whose dimensions are not at all impressive. There is hardly another office in the gift of the people, besides the Presidency, acceptance of which by a first-class trained man does not involve sacrifice of his private life and private interests. That does not deprive us of the services of a good many very able men, but it does probably contribute to our acquisition of the services, in all our various legislatures, in Governorships, and offices generally, of many ineunents whose abilities are not imposing. The able men are usually discovered and employed, and find employment for themselves, and are not so too busy to run for office and though a few of them, after they have made decisions for themselves, would be glad to work for the people, they can seldom get for into politics after devoting the more active years of their lives to private concerns.

What saves us is that a few first-rate men go on at the head of the parade in administration. They are important matters have to fall to men concerned to handle them, and the less competent have to follow their leadership. It only takes a few superior minds to plan and give orders. When too many of them crowd into that employment, they are apt to encumber one another.

TRYING TO MAKE THEM BALANCE

DRAWN BY C. J. BUDD

# EUROPE'S ABLEST DIPLOMAT

Great Britain's Foreign Secretary, Sir Edward Grey, and His Remarkable Influence in Preserving International Peace

BY SYDNEY BROOKS

LONDON CORRESPONDENT FOR 'HARPER'S WEEKLY'

THE outstanding figure of European diplomacy at this moment is an Englishman, the British Foreign Secretary, Sir Edward Grey; and when it comes time to look back on the events of the year 1914 and on the institutions which have since sprung from it, the world will again turn to him as the chief credit for the preservation of the major peace. Four or five times at least within the last half-year Europe has stood on the very brink of a struggle that would have hurled the Teuton against the Slav in a terrible and decisive struggle. The Russian question, the Balkan question, the Moroccan question, the Montenegrin question have all in turn proved eerily provocative. I remember remarking in this journal when the war first broke out that, wherever its course, would, it was more than likely, it would save. The event has not shown the prediction to be altogether wrong. We may perhaps be well advised half-century hence to bewail the least failure of the diplomacy of the past six months. But nobody with even the smallest acquaintance with the politics of southeastern Europe, with the aims and feelings of Austria-Hungary, with the passionate fond of Pan-Slavism in Russia, and with the insensate hatred that animates the Teuton and the Slav, one could that Armageddon time and again has been a possibility at the next few hours and that all the great continental Powers were involved. It is true that the Balkan war never broke, and the expectation grows a little stronger and a little more confident every day that it never will be kindled. It is true that there was some, may be a dozen considerable independent expert calculations and prognostics a European war. But so many crises have weathered since the Alliance took the field, so many decisions have been made, so many of them smoothed over, that those which still remain to be dealt with are faced indeed without apprehension, but with only a diminishing anxiety. Diplomacy may fairly be said to have justified itself as a profession since that occasion, and now it is in a position to regard itself so little in evidence, so pertinent in suggestion, and so persuasively calm and moderate in his choice of words as Sir Edward Grey, that one can hardly easily shake the war again, but on such occasions his words have been direct, conciliatory, and stamped with the spirit and authority of a man who has seen the latest instance was when in a brief statement to the House of Commons he explained and justified the moral demonstration against Montenegro, which had been ordered by the War Council of the London Times, one of the stoutest observers of Continental politics, as having "rendered a veritable service to Europe." His efforts to strengthen the hands of responsible statesmen, to calm the irritation somewhat artificially worked up at late, and to check the after-effects of the Balkan war, still are, proving to speak of the moral demonstration a precedent for drastic military action against Montenegro and Serbia.

Sir Edward Grey's speech (even on the same correspondent), his freedom from controversial or compulsory terms of phrase, and his steady confidence in the power of Europe to endure but will without inept or capital violence, are recognized to make it a model of consummate expression. As a general and impartial observer in Europe, he has been able to give a good and sober appreciation.

Throughout the whole Balkan convulsion Sir Edward Grey has, in what I take to be the best of Europe together. His handling of the crisis has been considerably happier than was his handling of the much smaller crisis of the Balkan war of 1908. In 1908 when Bulgaria proclaimed her independence and Austria-Hungary annexed Bosnia and Herzegovina, the British Government had to sustain the diplomatic defeat that meant almost it is said for the statesman who advocates a policy he has no means of enforcing. Sir Edward Grey, on the side of his ally "in joint armor" and Russia gave up beneath their joint pressure. It became clear that there had been no room for maneuver, and that a consolidation of the forces with which he was dealing, and that the conference for which he had proposed as the final means of regulating the new state of affairs was destined to come into existence. He was, however, of ability to avoid making the same mistake in 1914. When the storm broke in 1912 Sir Edward was not long in showing that he was fully the equal of his experience of 1908. He was the first to denounce last autumn the premature and isolated raising of questions that could only be considered in connection with the conference discussed but soon and incompletely, and that might, on the other hand, be disposed of with complete ease. He was the first to suggest a wider settlement, and he was the first to suggest the novel and fertile machinery of an ambassadorial conference for settling the Balkan question. There has been no other in line, with one exception. One was wise, timely, and fruitful contributions to a general understanding, and an appreciation of the part which the Powers may be able to play in Sir Edward's initiative and personality, and to the peculiarly disinterested position that Great Britain has occupied throughout the crisis. The almost absolute lack of support of Great Britain from the independent countries that engaged the thoughts of St. P. Bernhart, Grey,

and Vienna, her palpable and acknowledged disinterestedness, and the reputation which Sir Edward Grey had deservedly won as a statesman of greater and straightforward dealings, were of enormous assistance in lowering the barrier in playing the honest broker between the great Powers. It is very likely, too, that the general uncertainty as to the British course of action if a European conflict were to ensue has also been to Sir Edward's diplomacy an added advantage. Everybody recognized that London occupied a position apart and that in no other capital could the helplessness available under circumstances of some proportion to a peaceful line or could the conference of ambassadors be in so favorable and impartial an atmosphere. Making the preservation of peace its supreme objective, friendly with Russia and yet able and willing to cooperate with the Teutonic Powers, the genuine impartiality of an single woman or group, an arrangement has been better placed than the British to induce the spirit of reasonableness and to indicate the diplomatic strip-teasing that might save Europe from sliding into the maelstrom. Of all these advantages Sir Edward

Sir Edward Grey  
GREAT BRITAIN'S FOREIGN SECRETARY

Grey has made the fullest possible use. He has worked early and late, his moderation and good sense had the implicit confidence he always inspires in his integrity and veracity have been a valuable asset in the time of power, and I have heard from more than one observer which have so materially helped to harmonize the differences between the great Powers, the modesty of his bearing, and the practical character of his policies he has put forward have revealed him to his brother-diplomats for the first time as a really big man.

One of the reasons for the influence he now exercises in every chess-player in Europe is that Sir Edward Grey has held the post of Foreign Secretary without interruption for the past seven years, and will apparently continue to hold it so long as the Liberals remain in power. No Continental politician who is now in office has enjoyed the extended affairs of his country for so long, nor does one of them enjoy such an assurance of tenure as Sir Edward Grey. That is a great advantage in his favor. Not only are the men he is called upon to deal with never to the game than he is, but there is every probability that he will be playing it after they have given it up at least three separate occasions. He has never been out of the British foreign policy has been years of almost constant trials and tribulations. They have rarely thoroughly tested him and by the universal judgment of friend and foe he has stood the test. He has headed Downing Street just when the Franco-Russian feud over Morocco was in its opening stages. He took at once a definite line and unhesitatingly backed France for all he was worth. It was a course of action that at least three separate occasions involved the risk of war with Germany, but Sir Edward did not shrink from it; he held that Great Britain was bound to support the Third Republic with all the diplomatic, and if necessary all the material, power at her command, and after some anxious months the issue abundantly justified his persistence and tenacity. The triple entente is now more solid than Britain, France, and Russia is very largely his work.

He is the first British Foreign Minister who has sought and concluded an accommodation with Russia, and he has done so in the face of the opposition of the two Powers. The value of the Anglo-Russian agreement was abundantly proved when Berlin imposed its ultimatum on Serbia, and when the British Government, London and St. Petersburg, and the demonstration of British and Russian "episodes of influence" in the realm of the Balkans, all the old issues would have revived and a war could with difficulty have been averted. It is true that many Liberals have strongly objected to the virtual partition of Bosnia, just as they were objecting a few weeks ago to the cession of Montenegro, and that the continuance of the Anglo-German quarrel has been regarded by many of them as a proof of Sir Edward Grey's inability. Many others, however, have taken vehement exception to the will of silence behind which he has preferred to work; and it is an undeniable fact that the country has early known less of the various moves and developments of its foreign policy than during the past seven years. Sir Edward has spoken as little as possible in Parliament; he has time and again presided the House of Commons with an accomplished fact which it might, indeed, discuss but was virtually powerless to reverse. The country, however, has been well satisfied to let Sir Edward go his own gait. He has completely redeemed the old reputation of Liberal governments for a vacillating neutralism in the conduct of foreign affairs; and by the firmness and consistency with which he stood by France, by the moderation with which he has dealt with Russia, and by his handling of the great political upheaval in southeastern Europe, his fame and authority are being rapidly established.

The nation that makes people trust or distrust statesmen, like the nation that makes them like or dislike sovereigns, are often obscure, irrational, and the product rather of instinct than of knowledge. Sir Edward Grey is a rare in point. His acceptance, after a good deal of hesitation, of the Foreign Secretaryship in the Liberal Cabinet that was formed in December, 1905, was a greater relief to the nation than even to Sir Henry Campbell-Bannerman himself. Abroad and at home his friends and enemies were alike praising and praising effort. Among the members of England or among those who stood to profit by a change in British policy, his appointment was a relief, and the presence in Downing Street of a minister governed by the Gladstonian tradition, his effort was not less felt in the eyes of the nation. It was a relief to the nation. If Great Britain and her allies felt that a danger had been avoided, other Powers were no less conscious of an opportunity, and away, and yet to the world to know that Sir Edward Grey, who was almost altogether an unknown quantity, and even among his own countrymen he could not be called a dominant figure. One can see so many of the signs of his system that the British are still able to recall the theory of assimilated democracy with the practical rebirth of such men as Sir Edward Grey of men, that is to say, who are the antithesis of demagogues and whose influence upon the public mind is shown everything else the preponderant influence of character.

For many thousands of quiet Englishmen Sir Edward's year in the neighborhood of British public life has been a most useful one. He has given us the benefit of his own mind, and he has done so in a way that is not only of moral and elevating, combined with a balanced judgment and an air of being detached from the party and the strife of the day. He has spoken more instinctively for that he is saying what he believes, and his opinions have been formed only after a long and careful study of the facts of the case, and that he means to abide by them. He is one of the least theatrical of men. He never talks in a manner that is calculated to attract attention, but his attention. He is always and simply himself, just as the late Dr. Chamberlain was; and his political friends are the friends of the man who has become a man of a more serious atmosphere about him than about any of his colleagues, a note of authority, a distant remoteness from the everyday worries and passions of the day, and a certain aloofness and a certain aloofness. Yet Sir Edward has his passions, and he is an ardent football and a devoted supporter of a team of which he has been a member. He is a President Taylor's supporter of an Anglo-American Arbitration Treaty surprised the House and the country in the form of a bill. He is a member of the Wardour Club and a disciple of Walter. Sir Edward has in his something of the philosopher. In the ordinary course of his life he is more than a politician; so completely in his participation devoid of all personal aims. One can easily imagine him withdrawing altogether from the world of politics, and spending the remainder of his life in quiet contentment among the beloved hills and streams of his Northumberland. He has been open to the world more than most of the poets and novelists and parliamentary debaters, and probably never he met Mr. Roosevelt ever spent a moment of his life in the United States, and he met together through the New Forest and noted the song of every bird they heard.

# THE LITTLE THINGS THAT COUNT

The Secret of the Value of the Modern Automobile lies in Standardization

BY HAROLD WHITING SLAUSON, M.E.

**S**TANDARDIZATION plays an important part in our every-day life, whether we ride in automobiles or not, but its application to the motor-car has become so common that many of us have never met the hand the wheel of a foreign-car standard.

Standardization merely means the adoption by various manufacturers of certain sizes and shapes for parts that are common to all

and the average driver cares not how his plug is made so long as it does the work well and fits the opening provided for it in the cylinder. But if each brand of plug was made with a thread of different size or shape, and if each motor-car manufacturer carried out his own idea as to size of sparking-plug needed, so that there would be but one kind suitable to that particular motor, every a touring-car that is now able to satisfy the needs and be placed in running order on payment of a dollar to the first cross-roads blacksmith shop encountered would be ignominiously towed home.

This is a feature of standardization with which every motorist is familiar—so familiar, in fact, that he does not realize that it is a source of irritation. But it annoys him on every side, and now, in 1912, it represents the principal feature of advanced motor-car construction, though it may be that the car-owner will never appreciate the full advantages of some of these features until his car breaks down many miles from home.

Of course every automobilist owns the best car he can buy—the best wheels, doors, and so on, but he does not consider the possible ease of his friend Jones, who has not been so wise as himself in the selection of a machine and has chosen one that, through misuse or other neglect, breaks an important part while Jones has been taking a Saturday afternoon spin fifty miles out into the country. Jones hires a farmer to fix his machine to the cross roads blacksmith shop, runs by a village and back, half maddened. He examines the broken part, calipers and rule, looks through his stock of bar steel or tubing, and announces:

"What he announces may depend entirely upon whether Jones's car has been fully standardized or not. If the designing firm of Jones's car has issued its dimensions and specifications without regard to the practices of other manufacturers, they may call for special sizes of steel tubing to be used in the construction of the machine. The order he makes may differ less than one-sixty-fourth of an inch in diameter from a size that is already carried on stock. If other motor-car makers follow the same procedure there may be hundreds of different sizes of steel tubing in the mills, each size suitable for use in but one car. Steel tubing is taken as an illustration because there are both an infinite diversity of sizes and a variety of diameters that must be considered. The common sizes of these two diameters is from six to six and one-half inches. In fact, a few years ago it was found that the various automobile manufacturers, all told, used some six thousand different sizes of steel tubing in the construction of their cars, and in hundreds of instances a design calling for a special size of tubing could not be substituted the nearest stock size with the result that it would have required a delicate mill-press to have delivered the change in diameter.

Therefore, if Jones's car had been designed

under these conditions, the chances are ten to one that the measurement of the blacksmith would have been to the effect that, while he carried over a hundred regular sizes on stock, the part in question was made from a piece one-sixty-fourth of an inch thicker than he carried on stock. The result would be that Jones must needs have an car towed fifty or a hundred miles to the city, where the agent might have the part in question already on hand, or Jones would leave his car at the local shop and telegraph to the factory for a new piece. In any event, several days' delay and a considerable expenditure of money would be entailed.

But the car manufacturers have "got together"; they have compared notes; they have adopted uniform sizes, readily made have met and have discussed alternatives with this and that size and material—and the results have been nothing short of astonishing. The sixteen hundred different sizes of steel tubing that were called for by the various automobile manufacturers have been reduced to one hundred and fifty—and all without the slightest loss in effectiveness or design. The steel-plate mills can treat these out ahead of time, knowing that the demand will be restricted to these sizes. The automobile manufacturer can now that a steel order for raw material will be filled at about twice the rate that is probably on hand—or, if not, there are no special adjustments of machines to be made and the mills can produce the desired size almost as soon as the order is received. But most important of all is the knowledge that an emergency repair man has made at almost any well-equipped machine shop from the material that is usually carried in stock.

Therefore, if Jones's car has been made under these conditions, the blacksmith will draw the desired size of tubing from his limited stock, will cut it off to the proper length and had Jones could make arrangements with the nearest farmer for a few hours the new part will be finished and in place—and Jones will be on his way rejoicing, under his own power, with the motor chugging a piece of pie to that body of men who "got together" to standardize all parts common to even different makes.

Take these instances of "hidden" standardization, and apply it to many of the rods, bars, and plates that enter into the construction of the parts of a motor-car. Extend it to crank-arms and transmission-case bolts, axles and axles, to washers, brake-rods, ends, spring clips and eyes, and all of the hundred and one small parts that may unexpectedly need to be replaced, and you may begin to realize to what an extent standardization makes easy the way of the modern motorist. A leather belt on a transmission case need cause no trouble for the motor-car tourist, for there is scarcely a country hardware-store that cannot supply the size of the desired size with the required shape and pitch of thread. To be sure, the new belt may not be of the same finish or quality of workmanship as the former piece, but it will serve to take you home and to every you around until one of the proper material can be sent from the agent or the factory.

The inspector must be able to detect variation in measurement of one-thousandth of an inch

machines or devices of the same nature. Suppose the electric-light bulb in the library brass set, one does not need to have the name of the contractor who wired the house, in order to obtain another light. If there are an extra bulb on hand the householder goes to the cellar or attic and takes one from a light that is seldom used. He knows it will fit in its own location, that the threads will be the same, and that it can be operated by the same key, and takes this as a matter of course. This is an example of interchangeability, and may be applied to the motor-car by making that the trademark of modern manufacturers is to make all similar parts for cars of the same model that now pieces can be obtained without the necessity of re-fitting.

Just suppose the householder wished to buy a new stock of electric-light bulbs, and did not happen to be in the vicinity of the company that installed the fixtures. He goes to the first electrical-supply store that he sees and asks for bulbs of the required voltage in whatever else he may desire. It may happen that these lights are made by a dozen firms of the manufacture of the bulbs that he uses at home, and yet he knows, without asking, that the new ones will fit his fixtures, and that there is no need for him to have "light to lose" with no more trouble than trying the fresh lamps into the sockets. Any lamp will fit any fixture; he does not have to go around writing this and describing that with, by a process of elimination, he has found the only bulb that is suited to that particular socket. For the electric-light-bulb makers, manufacturers have "got together" and have adopted a certain size of screw and thread as standard, and have agreed that all of their products shall conform to these specifications.

In spite of the more complicated mechanism and intricate of alternate and generally accepted design, the motor-car required to be as thoroughly standardized as are electric-light bulbs. Were this the case, there could be no more originality or distinctiveness of design in an automobile than one would find in a basket of Logans apples—which differ only in age, and consequently in performance. But standardization of modern-cars extends far deeper than mere outward appearance and suitability of control; every motorist will have this forced upon him whenever he has occasion to change a spark plug. He knows that, if his car is provided with eight light cylinders, the least provisions garage or cross-roads supply shop will be able to fill his needs so far as spark-plugs are concerned. The make of the car or the brand of the plug makes no difference; practically all of the new standard fifty automobile manufacturers and the old ones have adopted the same size of opening and shape and pitch of threads for the accommodation of the spark plugs, and consequently the one hundred spark-plug manufacturers conform to these standards. Even the spark plug itself has been divided, and certain specifications agreed upon as to size and shape of some of its component parts. But these are of interest only to the manufacturers of spark plugs,

By means of the milling machine all crank cases are planed down to exactly the same size

The wonderful resilience of the modern motor-car has only been made possible through the use of special alloys and heat-treated metals that represent a summation of strength, hardness, or toughness with a minimum of weight. Many of the formulas by which these alloys are obtained are secret, closely guarded in the laboratory that forms one of the most important parts of every great automobile-building plant. And yet even the standardization of materials has fallen within the scope of the body of manufacturers who are endeavoring to bring all parts of automobile production to a common basis. It can well be said that the standardization of the composition of certain materials does not directly benefit the motor-car, perhaps this is true to a certain extent. But it is not of advantage to know that the vital parts of the car, the chassis and engine alloys, meet with certain high-standard requirements demanded by the automobile-manufacturers as a body? It may sometimes be a matter of life and death whether the aluminum crank case of the engine is "up to standard," or is deficient in some element on which the strength and resistance of the part is vitally dependent. And if automobile manufacturers make in demanding alloys that have been proved to be the best-suited for the purposes they are called upon to fill, it is practically certain that all material so purchased will be of uniform high quality.

But does not this wholesale standardization of engine parts and auto-bodies have a tendency to suppress originality of design, and thus prevent progress and invention? No more than the standardization of the electrical field prevented the perfection of the light bulb. In fact, intelligent standardization aids invention and progress, for it eliminates the useless and places the subject on a substantial basis. It

is not going to create inventive genius in the head to suggest that, wherever one uses half-inch nuts, there have a certain number of threads per inch.

It may seem a far cry from a wooden wheel of standard dimensions to an aerial sailing in wire road and upkeep, but this is one of the results to be derived from the standardization of wheels by the manufacturers of automobile parts. The wooden wheels on many cars are made in one factory, the steel wheels in the tire, of course, is another thing. If all wheels of a certain diameter are made with a given width of flange, the rim-manufacturer may know of what dimensions to make his product. But suppose there is a lack of uniformity among these wheels, the rim-manufacturer must vary the width of the rim to fit every different kind of a wheel that is made. The rim-manufacturer will therefore "be against it" for he has worked out the size pressure and corresponding shape and thickness of rubber required to give a certain grip and traction. These measurements may either force him to construct a new tire or to run the risk of unsatisfactory service from the one of them which he may apply. The tire is the most overworked portions of the car, anyhow, and they must be loaded with every consideration. It is bound if the tire is made to the shape of the flange of a rim may never make use of that portion of the tire and not stand in half what should be, under favorable conditions, a long service life. It is fortunate for the owner of pocket-bills and the good of the motor-car industry in general, wire, rim, and tire manufacturers have come to a sort of understanding that has resulted in uniform sizes.

And so it is with every field—and there are near a score of them—there has something to do with the

manufacture of your car. Each is dependent on the activities of the other, and the results of the work of the first may be felt in the problems of the twentieth. This interlocking and interdependent absolutely necessary a certain uniformity and standardization of design in order that the thousands of different parts will fit perfectly into an complete grade pattern and result in that modern wonder—the present-day auto mobile.

It is possible, of course, to carry standardization and interchangeability too far, but that day has not yet been reached, and probably never will be. The use of the modified repair nuts in the garage a few years ago, when, in reassembling a disassembled automobile, placed the two halves of the rear axle end for end, so that the completed car was provided with those springs reverse and one forward, was not so much an example of interchangeability carried too far as it was of a warning to those repair men who think that standardization can replace brains and that one part belongs in a certain place solely because it "fits" there.

It is this feature of automobile construction, however, that is the most interesting and valuable of the motor-car exhibition, on which we must rely for any future reduction in the price of those all-but-obsolete. Each year it seems that the lowest price consistent with a fair profit has been reached; each succeeding year "less money" and "more automobiles for less money" and the coming years will progressively lower prices until so long as intelligent standardization of materials and parts continues to stir cars on the increase, when that limit has been reached, the rock-bottom price will also have been reached. It is in this manner that standardization is of vital interest to every present and possible motor-car owner—and that means practically every citizen of this country.

## The TRUTH About NEW YORK SINGING TEACHERS

By PIERRE V.R. KEY

PICTURES BY ALBERT LEVING

**S**HE does with her husband in an advertisement New York "fall" on the "New York" side. They are for quiet and the greater number of this days is behind them. Sign of the times, but, however, some good news until the trouble in his throat comes. They share then he has not been able

But some one in the family had to make money, but while the public could afford to forget Signor Manito's broken voice, the home and school, he certain facts connected with the great and the husband. Thus required money is gradually larger and increased the cost of living at that time had taken care of the matter.

So Madame Manito decided to teach singing. She reached the same decision, some with institutions, others without it. In the case of Madame Manito there was a reason for her choice, at the age of fifty, of this condition. Not, however, because she of the race which is erroneously supposed to give our best voice-teachers, but because she had mastered and practiced a difficult craft in some comparatively early life.

If this were a faithful record of a "fact" story, it could be suitably fitting to carry this downy woman through a series of adventures that would end in her finding among New York's singing thousands all the people she could reach.

Unfortunately for Signor Manito, the congenious wife did not find her as he found them. You see, she is an old man and her fat is well, it is stable. Signors came to Madame and stood away, they too of the downy race, regarding her as for an instructor such as they needed, one back. Thus Madame Manito taught at some much, and the price paid by other pupils to her compared her to her commercially fortunate colleagues.

Notwithstanding the Manito, if you asked them, could not singers derived in the church—ramped room called "stalls." And talking, they would give on "chambers" over a particular young teacher, a motherly

labored, constraint, and a separate with talked and bred, all of the same kind under Madame's direction from back into fall class.

One day, a Manito pupil or two may get the favored class at public singing of the night sort. Then if they have in their the quality of the work, for professional success, in other words, they also have critical audience as well as in the upper and side status show there is less of risk—Madame Manito's reputation as a teacher should be established.

Obviously, with the shifting tides of fortune, Madame Manito may obtain these material adjuncts to her triumph as a singing teacher which thus far have been denied her, in a fitting manner, without complaint, and the due recognition; but will it come?

For other downtown, over the heart of New York's voice-teaching center, is another grade to the ambitious singer. This instructor is of masculine sex and of all purposes an American.

His craft is known wherever modeled on ultracritic hand. It is bound if the tire is made to the shape of the flange of a rim may never make use of that portion of the tire and not stand in half what should be, under favorable conditions, a long service life. It is fortunate for the owner of pocket-bills and the good of the motor-car industry in general, wire, rim, and tire manufacturers have come to a sort of understanding that has resulted in uniform sizes.

ing on ignorance, capidity, and hypercivness. And yet for they take money they false professors being nothing in return, but they grow financially but by the most quiet means, faintly assuming a knowledge not only so long as intelligent standardization of materials and parts continues to stir cars on the increase, when that limit has been reached, the rock-bottom price will also have been reached. It is in this manner that standardization is of vital interest to every present and possible motor-car owner—and that means practically every citizen of this country.

The average man and most women who go to the opera and to concerts frequently complain over the achievement of some star and see in their minds' eyes an imaginary road path that has been traveled to the summit of musical fame. Nervous singers are certainly living a life of such comparative ease that few who do not know ever seriously think of the element of luck which has helped them out in their position.

"Luck" evinces some one. "Where does luck figure in singing?"

is finding her teacher. That is the chief problem that young people who seek singing voices and other singing essentials have to solve for they take money they false professors being nothing in return, but they grow financially but by the most quiet means, faintly assuming a knowledge not only so long as intelligent standardization of materials and parts continues to stir cars on the increase, when that limit has been reached, the rock-bottom price will also have been reached. It is in this manner that standardization is of vital interest to every present and possible motor-car owner—and that means practically every citizen of this country.

What, then, is the situation in which most of the

Signor Spaghetti strongly three a bit

thousands of young Americans find themselves when they reach New York, bent on study and singing for professional purposes?

For a pitifully larger number of them it is a grandeur and a staid, and they say that they are not content with vocal recommendations to patronize official, pampering instructors or that voluntary or aided selection has led them to the right student. Assuming that out of New York's two thousand who claim to be going singing there are two hundred qualified to go to the right student, the remainder, of course, are not appreciative of the pupil's task of being put out in one's class. A certain amount, a singer of considerable experience and had studied off and on, and sang in church concert, recently set out to find some. He had his troubles.

This man visited, in the course of two weeks, twenty-two teachers of singing. Five were women, the rest men. They were chosen at random, very much as various masters of varying degrees of experience and intelligence would select their own disciples. The prices they asked for half-hour and full-hour lessons ranged from ten dollars each down to the low dollar. So far as could be discerned, each of the twenty-two possessed the moral right to ply their adopted profession.

The number one began in a certain well-known building where musical instructors of every sort monopolize. Mr. Cursons examined the bulletin board announcing the names of the teachers, and stepped off half a dozen, and entered a waiting elevator. A minute later he rang a bell communicating from the outer corridor with the teacher's sanctum and stepped inside.

It just happened that Mr. Cursons wasn't here. He turned as the door opened, plucked the five from his pocket, and rang it down. The man who answered to which he had been playing music. He seemed relieved to find his visitor out of the way. However, though his plumage was professionally calculated to impress the ladies.

This specimen was looking for a fly to buzz into his parlor when Mr. Cursons' name was called. He stepped up the prospect and grunted, for no unusual other swallows the look, hue, and savor with more dispatch than the business man of thirty-five or thereabouts who is seized with the desire to sing—and Mr. Cursons looked the part.

"Unfortunately for this matter for now and subsequent papers, he didn't know it was loaded." Both men looked at each other, with utter amazement. Cursons was making an attempt to give an official profession he assumed to be able to teach; Mr. Cursons was pretending to know as little about singing as his teacher actually did. It wasn't a bad situation. Mr. Cursons smiled. From a man concluding that this was an indication that his prospective services were being regarded with favor, went his visitor on better. He looked at the man.

"La, la," said the fake teacher, repeating the phrase many times, as if to show his intimacy with French customs, and relating an anecdote of a Frenchman at the dining parl of his wife. "A horrible, eh?"

Now it happened that Mr. Cursons did have a certain note. He recalled the name, he considered the assumed surprise and made some remark about Professor Cursons' marvelous powers in voice classification without ever having heard of the man. Impression struck, he having been made by Cursons' fetching phrase, his semi-artistic studies, and a correct guess of Mr. Cursons' voice, he commenced an impression under two-thirds satisfied by the piano. He was one of those "big" pianists who have a certain natural facility which, though unaccountable, serves a purpose. The professor, though somewhat nervous as himself on his rather—the chance he couldn't have played them if he had wished. But he did undertake to impress the prospective teacher. Mr. Cursons the idea that Professor Cursons was a former pupil of his.

It was only for half a minute that Professor Cursons went through his "big" piano set, but he omitted nothing. He went his two minutes walking with each other up and down the stairs, and through various classes steps, started them on even terms at the middle of the boys to be walked to remote ends of the instrument. He had a good deal of a good deal of digital characters. In the course of his exhibition he probably played two hundred and sixty-six wrong notes of four hundred actually touched, which gave him a low lasting average.

"Now," commanded the professor, assuming his weightiest air, "we will try your voice." He turned then to Mr. Cursons, who was to stand near the grand piano, having him. Then he played a scale slowly. The newspapering voice pupil indignantly sang notes that were faulty in pitch and in all other respects. His lesson closed and ended like a lot of the faintly sung hanging from the line on a windy day.

As honest teacher would have instantly informed Mr. Cursons that at his evident age a voice with no easy ascending characteristics would be of no service on any. Not a few instructors of the better grade would have instantly directed indications of vocal skill in the very manner the voice was made to be available.

But this professor didn't know and didn't care. His natural and vocal indications were on a par with his unaccountable method. He had no special in military with various methods of vocal training, a very rough vocabulary common to most students, and a degree of pliancy which he had but little discerning mixture of superior intelligence—though

some of these four teachers were accused in enumerating their exact status from real experience—that a better time.

Well, Professor Cursons, instead of halting of the piano closed and hurrying himself to his feet over the attempt of his pupil to sing a simple scale, merely raised his highly polished eyebrows.

"Very pleasant," he said, "I will show you the secret of something, then we shall try again." The professor left his seat at the piano, stepped close to the investigator, and spoke in the confidential manner. He was putting in his steady work and it took a minute or two. After a while the curtain went up on act two.

"Grip the breath here," said Cursons, placing one

finger, that you need instruction. I am pained that you should come to me.

That was another type of singing-teacher. If all were like him there would be no singing save evil which was centers in the weakness of the vocal science system, due to the intangible factors surrounding it and the havoc caused by partial and fallacious "facts." When it is known in mind that a pupil cannot see the vocal apparatus the difficulty confronting the teacher—who must create a mental picture of the kind of tone sought for and how it should be produced—is of some approach.

Teacher number three—who was a woman—proved to be an odd sort of mixture. She manifested unquestioned knowledge of some vocal essentials, complete ignorance of others, and a musical ear that could

"Now," commanded the professor, assuming his weightiest air, "we will try your voice."

hand in the small of the prospective pupil's back, "and also here," taking Mr. Cursons somewhat forcibly to the solar plexus. "Now sing something scale."

This one was delivered slightly better than the first.

"See? You already show improvement under my hand." He turned, you are singing on it.

"No, no; sing on it. Let me tell you." Cursons tried to do his gliding exercise, but he stopped in a steeple, though he didn't know that his vocal science knew. The baritone sang another note and gave to the upper note a slight kick, so to speak. Cursons stretched his eyes, surprised, but not aware that Mr. Cursons was playing with him.

"La, la, you have a voice. I know it when I heard you speak. I knew I could bring it out in one lesson—this lesson. In a month I can put you in a church choir. You have a future. Oh, yes, I strongly advise you to study. That comes over here when we arrange for your lessons. I shall make you a reduction to four dollars for each one and you can get on the word that you are satisfied with the lessons. My studio was in the same building with Cursons's, but very different. A young woman secretary received the visitor, asked intelligent questions, and presently returned from the next room. In five minutes a pupil went out and Mr. Cursons was meeting a real man.

This teacher, who wore his hair close cropped and an ordinary masculine suit of clothes, walked slowly along one wall of the studio while Mr. Cursons loomed his lesson. He is one of those instructors who know that one person cannot satisfactorily teach and at the same time play accompaniments.

"What's the idea?" he said, when the singer stopped. Mr. Cursons didn't understand.

"What is your idea in coming to me when you know that you sing as well as you probably ever can? We both know that you do not intend to make a profession of singing."

"What gains you to assume that I am not in the profession?"

"A matter of facts. First, you have shown to me a voice that is not at all good. It is like a good horse that needs exercise. If you were a professional man you would not be in my condition. Then I noticed that your money slipped for an instant in a few places in some of your songs. Isn't it plain? You are one of the very best amateur singers I have ever heard, a good musician. I don't think, for your own

not be depended on. Her failures on any pupil cannot be other than unless, yet she teaches—and she showed means—operations would be professional.

Teacher number four, who was a man and of a kind. They made a rapid class of four teachers, this was an advance of singing by "scientific method." He made his baritone voice sing with the handle of a spoon kept half-way down his throat. They displayed the muscular contraction that caused.

"Here you require," he explained, "there is an acute difficulty."

Unhappily he was right, but he wanted his visitor to control so many sets of muscles involved in such a simple phrase that it was embarrassing to discuss the matter, so any nothing of developing a dexterity requiring one to keep himself upon one's own Adam's apple and off again without as much as leaving the skin.

The climax came one morning toward the close of the "hour." Mr. Cursons had taken credit, but though it took the "edge" from the voice, there was no visible evidence that the baritone was really improved. Signor Whiffletti looked to a few phrases from an operatic aria and promptly threw a fit. The extent of his admiration for the American's voice was beyond the singer's powers to convey. There was no doubt that he was the equal, in natural endowments of the greatest baritone ever heard at the Metropolitan Opera House.

"But how about the recommence?" asked Mr. Cursons. "I wish you know. That is right; you need have the recommence and I bring home. With my method I made you a student. It would be a good idea to study in an office of education."

"What would you say," demanded Mr. Cursons, with an expression, "if I were to tell you that I have a solid little town in my throat and that I actually have several times the recommence you have heard?"

The Italian shuddered, thumbed his fingers, and then coughed. His face became more white until it resembled an overgrown hen. He had wondered: his Baritone had played him false.

"Never mind," said the investigator, sympathetically, placing a bit of powder in the singer's face's and then in my real money. If you don't remember it, call up the Opera House, where your money can be refunded."

No return, the singing teacher stood. Others, with some intention of making a career in the profession are now here on the same studio in which many hundreds will talk. But how, under existing conditions, can he be able to do anything? The average applicant the curls are all stacked.

PRICELESS

BY H. D. LOWRY

In the dark of the night while I slumbered  
Thirteen rings on my hand I counted,  
They told me of gold and of silver,  
And all of it they took for wealth.

No your gown shall no more be silver,  
Nest bread nor I give you to eat,  
About your feet shall no silver slip,  
But be bare to the dust of the street.

Dear God! Had they dreamed of my treasure,  
They had taken these dollars and pence,  
What use had they then for a mine?  
In the love of a girl.

## BACK TO NATURE

UNEXPECTED RETURNS FROM HIS VACATION OF THE NORTHEAST GOLF'S BUTLER

hang them on the line in the drying-yard and sprinkle them with your garden watering-pot with a solution of castor-oil and crocus. The moon will be full even in Prohibition States at

6.30 p.m. on Tuesday, May 29th, possibly as the inevitable result of having spent the first quarter after close of dark on the evening of Tuesday, May 12th. It may be distinguished under these and conditions from the village hawk by the fact that it will have no bands or trace of the same.

# Interfudes

### YE HINTS

Be careful of the number of clean collars and shirts you wear during the month. There are only four wash-days in the May calendar this year.

There will be a grandiose moon on the evening of May 6th, and if you are careful to catch your first glimpse of it over your left shoulder you may rest on getting what is coming to you.

All the birds should have returned before the middle of the month save the seven breeders that disappeared from your camp shortly after Uncle Rastus departed from his stall last October.

Revenge your dog will not get dog-biscuits these spring days, do not give them up altogether. They may come in handy to throw at cranes or tramps that are likely to appear in the office now or any minute.

If winter has ceased digging in the lap of May in your vicinity, now is a good time to plant sun-flowers on your lawn-shoulder, and hang the letter on the parlor wall as an ornament for the edification of your expected summer boarders.

To get the odor of camphor out of your spring clothes, lately released from the chest in the attic,

ST. PETER TOLD HIM  
NEW ARRIVAL: MISTRESS M. PETER, WHOSE STUFF  
I DO NOT SEE HER SEVERAL TIMES A WEEK?

### AN EXTREME CASE

"Saw me on Miss Wright's gas-gauge (residual of beer)," said Miss Hampton.

"Yes," said Miss Jingles. "It has been affected long ago. She and her wife for some Sabbath or so if it were Sabbath."

### THE MITTOM-CHURCH

"Have you seen anything of that mittom-church they are sending around the country, Haddock?" asked Winkles.

"Yes," said Winkles. "Saw it this morning stuck in a ditch down by the golf links. When I got the mittom was sitting on a fence-pail watching a lot of unappreciative owners trying to pull it out, and nodding his approval of the language they used in doing it, fast."

### THE QUEEN OF THE MAY

AN ELEGY ON MODERN CUSTOM

I've got me a bottle of nice cold beer, a sledge-hammer head and a couple of picks; a cross bar or two and a piece of steel as straight and as true as a battle-ship's keel. I've got me a bagful of cobble and coal, and paving-stones hard as a petrel's bill, all ready prepared for the glorious day when I'm to be Queen of the May, Mother. The Suffragette Queen of the May!

I've got me a bottle of nice strong 'Yorod out up a god-bless from handle to prong to drop in the middle to show level men what woman will do when she finds that she can. I've kerosene, gasoline, paraffin too, all ready for tanks that a woman used to show that she's level and determined in steel, a Militant Queen of the May, Mother. A Suffragette Queen of the May!

I've practised at throwing by day and by night at my old target that hangs in the night, and got to a point where my aim is so fine I hit what I aim at three times out of five; and windows of glass, shellings, and shops are crashing before me in spite of the caps whenever I am, wherever I am, cushioned as the Queen of the May, Mother. The Suffragette Queen of the May!

You need not expect me to dinner or tea. It's nine-thirty to me. I'm the center for me, and back in the '30s as long as I go to land on my traps (against the tyrannous law) to work up Hibernia, and can get her to me there's never for once till the sun on shall sets; my place at the fore, in the love of the law as Queen of the Beautiful May, Mother. The Suffragette Queen of the May!

THE SUFFRAGETTE QUEEN OF THE MAY  
WINDHAM'S JOURNAL

HEED! Feels her best belly out, to her who is eating May: Oh, there, she's eating all her BELLYN MATERIAL.

You - as a tire bill payer - now demand a vis-like rim grip-with no cutting or breaking above the rim-and here it is →

It's the *rim* as much as the *road* that wears out your tires.

So we said to our Engineers:

"You must build us a tire with Perfect 3-Point Rim Contact."

*They did*—and they also added the No-Pinch Safety Flap for inner tube protection in

Then we called in our Chemists and said:

"Tire buyers are demanding a tough, flint-like, but resilient tread—a tire made of lusty young rubber—a tire giving the utmost mileage at no additional expense."

And the answer is

Vitalized Rubber

# Diamond {No clinch} Tires

Perfect 3-Point Rim Contact

Here is a No-Clinch tire that appeals to the hard-headed, shrewd tire buyer—the man who insists on easy riding comfort and a good liberal mileage.

Each point of rim contact in a tire is a point of support. Where the points of rim contact are not perfect, undue pressure is brought to bear at an unsupported point of the tire.

Then what happens? The result is a terrific strain on the tire that results in rim troubles, break-

ing above the bead and separation of the tread from the carcass.

All this is overcome in the Diamond No-Clinch because the three points of rim contact are absolutely *mechanically perfect*—the annealed steel cable wire bead holds with a vise-like rim-grip.

Add to this the No-Pinch Safety Flap for inner tube protection, the Vitalized Rubber advantage, the famous Diamond Safety (Squegee Tread) and you have bought rubber shod mileage that has no equal at any price.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims at any of the

## AMERICAN ARTISTS AT THE PARIS SALON

SOME EXAMPLES OF THE WORK OF OUR PAINTERS AND SCULPTORS TO BE SHOWN IN THE FRENCH CAPITAL

### "The Last Cartridges"

A famous French battle painting, called "The Last Cartridges," the work of Alphonse de Neuville, represents the desperate defense of one house at the end of the day by a handful of French men against great odds. Doubt having been cast upon the authenticity of his picture, the French government has published the official report made by Lieutenant Lambert, who commanded the detachment at Bavielles.

It is a plain and straightforward report, without any dwelling upon brilliant details. Lambert had been wounded at the fall in the leg, and was unable to walk more than a few steps. With a few doctors and a detachment of his soldiers, cut off from the main body of the French army, he took refuge in an isolated house on the highest point in Bavielles, and defended it against the Germans. Firing from the windows and any other openings that they could find, the soldiers inflicted heavy loss upon the enemy, who advanced through the streets of the town. They believed that they would soon be rescued by their own troops. They still heard the sound of their artillery and the directions of the French divisions, which they could distinguish perfectly from the sounds of the guns of the Bavarians about them. They did not know that their rescue came from a French force as hopefully waited in its own trenches, and that the main body of their comrades had evacuated them.

At one time, seeing a chance for their escape, Lambert tried to send his comrades to the bottom of the hill, where they were to remain and hold into the hands of the enemy, but they refused to go. Minutes after the fall of all sorts were raining into the old house. Bullets perforated the doors and windows until but little remained of them. The house was, therefore, surrounded by the Germans in various directions.

Finally shells crashed through the roof, leaving down by six several men, others were cut down by Bavarian bullets. But the fight went on for a long time, and the French were able to keep their position at bay.

At last, however, the ammunition gave out, the last cartridges were used. Then, Fred, the son, having heard the Germans demand that no quarter should be given, and that the French were to be killed, the heavy losses they had inflicted, proposed to leave from the building with charged guns, and would carry their dear life in a hand-to-hand conflict.

But their commander, the wounded Lambert, would send the last cartridge to Fred, then jumped through the door and confronted the snarling Germans alone. He declared that if they lifted hand at it, it would mean the death of soldiers to die, and it was possible that their commander could make some sense.

As soon as he stepped out and stood with folded arms, a dozen bayonets were thrust at him. He would have been killed at another instant if the Bavarian captain had not, at the risk of his own life, precipitated himself upon the French officer and threw back his own men. Fortified by the faithful lion which the Germans had inflicted upon their own regiment, they would have put the detachment to death.

Revolving pistols pointed, and the French were ordered to surrender. The Bavarian officer complimented the French commander warmly upon the desperate courage they had shown.

### The Charcoal Burner

The men who make charcoal—"cutters," as they call themselves—are not all directly engaged in obtaining the wood. Many of them merely chop up the trees and cut them into cordwood lengths. The "cutters" stand the middle of a cordwood pile, and use long poles to bring in the wood. This pile is formed by laying sticks of wood in a square with the ends crossed, and so placing tier after tier until the chimney is about twelve feet high. All around this chimney is placed the wood. "It is burnt slowly," as the cutters say, "the chimney in a layer after layer, which is about twenty-five feet in diameter at the base, about thirty rods of wood are usually placed in one pit.

The wood in this covered with a layer of earth and covered with earth. The object being to prevent the escape of air, or fire showing at any point where the cutters may observe. When covered with earth the pit is ready to be fired.

This operation is accomplished by dropping coals from the top of the chimney upon a little ladder held at the bottom. As soon as the fire has "taken hold" the

top of the chimney is covered with earth and a draught of air allowed except such as flows slowly through the covering of lava and earth.

Great care must be exercised by the cutter to see that the wood which he wishes to keep smoking does not burn entirely, yielding, not charcoal, but ashes. The cutter previous to each smoking coming from any part of the pit he climbs up on a rude ladder and sees a kind of window box to increase the thickness and stability of the earth covering there. Sometimes it happens that a crater appears at some point where the earth has fallen in or crumbled away. Then the cutter must stop the hole with more earth.

In rainy weather he must be so careful in the work that if the wind is high he must be on guard day and night. A period of two weeks is commonly required to do such a job as is described. But if the wind be light and the weather windy a pit may be opened at the end of a week. If a man be industrious he may cook two pits a month and earn from forty to fifty dollars, according to the quantity of charcoal, for which he is paid by the bushel.

Late in October the wagons make their last rounds of the camp and haul away the charcoal remaining at the pits. The cutters gather up their camp effects and start on five or six miles, again to build, chop and cover.

### How "Marbles" Are Made

Most of the "marbles" so beloved of the children of our country are made of "glass alloys," of course, made of glass; while alloys, in some extent, refer to the manufacture of special and finer "marbles."

The clay is put into a "pig-mill" or "churn," and the heavy wheels revolve over the clay. It drops in, is returned into a bin beneath the mill. There it lies for an action elevated to storage bins.

The next step is to form the stiff clay through the perforated face of the pug mill, from which it emerges in the form of clay strings, the diameter of which is regulated by the round holes in the lower end. These rolls or strings of clay are pulled from the pug-mill when they have attained a length of about eighteen inches, and are cut into small pieces and conveyed to the clay shops, where the "marbles" are made.

And the rolls of clay are deposited evenly in a trough, and a workman runs them into rolls, according to the order. The finished rolls are accompanied by means of a saw. Some rolls may be generally speaking, from two hundred little "marbles," and it is from these rolls that the "marbles" are rolled.

When the rolls have been cut, they are placed in an ordinary tin pan and turned on a lathe by a workman, generally a girl. A handful of rolls is picked up and these are placed, one at a time, in a grooved tin. The tin is turned, and the rolls are placed one by one in the groove. A chock block is adjusted in position on the end of the rolls and pushed forward and back, until the rolls become perfectly round and level true. This operation is one that requires but little time. The finished "marbles" and the clay "marble," as it is known, are placed in a tray.

A worker who has acquired skill in her work, it is said, makes from 25,000 to 30,000 "marbles" in a day. They are weighed by weight; also by the cubic foot. The small clay "marble," measuring nine-tenths of an inch in diameter, weighs six and one-half pounds in the thousand, and is valued at the rate of 20 cents every eight millions.

### Elephants Made Heavy Swells

A BRITISH reporter, formerly in the Eastern trade, tells a queer elephant story which is worth telling in a way he had an organ for heavy elephants. The vessel was anchored in a perfectly calm sea off the coast of Madagascar, and therefore, the steamer began to roll every one on board was greatly surprised. At first they supposed the question to be due to the ground swell, but when this motion continued to increase, general alarm was expressed. Then it was revealed that the elephants were in the hold, and it discovered that by swaying to and fro in motion they might produce a rocking motion that would be very dangerous. So the great heads and bodies rolled and rolled, together with the steamer, which was a very great deal of shaking, and an imminent danger of rolling down the side. The steamer hurried down into the sea and the great deal of shaking and thumping managed to stop the dangerous movement.

## The Power of Silent Service

If the crowd on the stock exchange kept quiet and let one man talk, that man could be heard in every corner of the room. But the shouting members produce a composite of sound, so that no one trader is understood except by a small group around a particular trading post.

If everyone were able to shout twice as loud, the result would be only a greater noise, and less intelligible.

For communication to be universal there must be silent transmission. In a noisy stock exchange where the voice, unaided, cannot be understood across the room, there are hundreds of telephones which carry speech half way across the continent.

The telephone converts the spoken words into silent electrical impulses.

In a single Bell telephone cable, a hundred conversations can be carried side by side without interference, and then distributed to as many different cities and towns throughout the land. Each conversation is led through a system of wire pathways to its proper destination, and whispers its message into a waiting ear.

Silent transmission and the interconnecting lines of the Bell System are indispensable for universal telephone service.

Without such service, our cities would be slow of speech and the States would be less closely knit together.

## Unstable Chinese Currency

Of the many strange things in China, the least strange is its currency. To the manager of a business, that business can be transacted successfully with such a medium of exchange. It has been described as chaotic. Nevertheless, business and trade flourish in China, which speaks volumes for the business acumen of the Chinese. Perhaps the fact that trade flourishes in China long before such a thing as currency was known accounts for the fact that the Chinese, with such a lax opinion as they now possess, still stand in the front rank of commercial nations.

In China all forms of exchange, from barter up, are in use. A very large part of the country's business is done against the actual delivery of weighed silver. For convenience silver is melted into rough ingots having the shape of the Chinese character. These silver discs have stamped upon them their fineness and weight. The unit of weight is the tael, which is equal to a quantity of silver weighing 366 grains, troy, and is worth about sixty cents in our money.

The tael is not an ingot or a coin, but simply an abstract term signifying a unit of weight, such as a "pound" of butter, or an "ounce" of gold. Though an abstract term, it is the measure of wealth and the unit of value throughout the length and breadth of China. A man buys a business for so many taels of silver, his profits are computed in taels. When he makes payment, he weighs out the silver according to this unit.

The silver shows very in weight from one to seventy-five taels. All silver shops and banks have scales, where the silver is melted in iron ladles and poured into molds. The smelters, with their ladles and molds, remain one of the oldest of the silver with a pair of metal sheepsheads. To see out events of what they were doing, it would be natural to suppose that they were engaged in conducting something good to eat. In the process of smelting the ingots their fineness is often changed by the addition of copper or lead, whichever best suits the interests

of the shop. Bankers and money-changers are able to determine the quality of the silver by the action of touch. The sellers or depositors are always at their mercy and must often submit to the operation of having their silver discounted on account of "bad touch."

In the interior of China small purchases are made with copper coins with square holes in the center. These are called "cash" and are threaded on strings so that they may be carried across one's shoulder or on a pole. A string of one thousand of these cash is worth about fifty cents in our money. Sometimes lots of silver are shipped from the silver shops and used for small purchases. When traveling in the interior one must take with him a large amount of silver shovels and used for strings of cash at the various shops. The money-changers have two sets of scales, one to be used in the purchase of silver and the other in the selling of it.

In an attempt some years ago to introduce a currency based on Western models, the Chinese government purchased and put into circulation several million Mexican dollars. The people fastidiously to the new coins and called for more. The provincial governments then set up mints and began to coin Chinese dollars of approximately the same weight and fineness as the Mexican dollars. They also coined an enormous amount of subsidiary forms in the shape of small silver coins and copper pennies.

Now it was discovered that the new currency was as unstable as the old. The value of the dollar in relation to the subsidiary coinage varied from day to day. The coin was never worth the nominal part of a dollar. Some days ran hundred and ten cents were required to make up one dollar, and on other days it took one hundred and thirty cents. Similarly the value of the dollar as compared with the silver dollar, was constantly fluctuating. Some times \$100 would bring seventy taels, and at other times only fifty. It was the result of the very profitable sale to the money-changers.

## No-Rim-Cut Tires 10% Oversize

## Legions of New Users Won Every Month

Stop and consider how and why Goodyear tires are dominating Tiredom.

Sales for 1912, over a million tires. Larger by far than the combined sales of our previous 12 years put together.

This year's demand from users is running now twice last year's demand.

And motor car makers alone have contracted for 890,680 Goodyear tires to go on their new cars this year.

### This is Why

We control the No-Rim-Cut tire. And that new type, wherever used, has completely ended rim-cutting.

With the oblique tire—the clincher tire—25 per cent wet road wear by rim-cutting. That's a big waste which this invention saved.

Then these tires save 10 per cent over the rated size. And that, with the average car, adds 25 per cent to the tire mileage.

These two features alone have saved millions of dollars. And legions of tire users know it.

### We Don't Skimp

Another reason lies in the fact that we don't skimp these tires.

Our double-cure process, which others don't use, adds to our cost about a million dollars this year.

In making ways to better tires we spend \$100,000 yearly.

To every new idea, material or method we employ the mileage tests. Hundreds of tires are thus run out on a metered machine in our factory.

About 200 formulas and fabrics have been compared on that machine.

After years and years of this constant advancement, we have brought these tires close to perfection.

### About Price

How we give such tires at the Goodyear price is one of the wonders of tire-making.

It is partly due to the fact that we make more tires than any other plant in the world.

Our factory is new, our equipment is modern. We employ the latest machinery, much of our own invention.

Our capital cost is exceedingly low, because of small capitalization.

Probably no other plant in existence can build an equal tire for as little.

### Our Profit

Then our profit is always kept at minimum. In times past it has averaged 8 1/2 per cent, and we do not expect to exceed that.

Out of that profit must come the interest on millions of capital invested.

That is why, even in times, No-Rim-Cut tires—tires of Goodyear quality—can be sold at Goodyear prices.

### Please Try Them

Hundreds of thousands have tried these tires, and our figures on miles show the result of their tests.

Your verdict is bound to be similar. You can't overlook the savings. They are too big, too apparent. For your own sake, prove them out.

Write for the Goodyear Tire Book—14th year edition. It tells all know ways to economize on tires.

## VACUUM-CLEANING LONDON'S ROADS

DEMONSTRATING A NEW AUTOMOBILE ROAD-CLEANING MACHINE IN LONDON

### Old Roman Cement

Twenty spans for the Boissac wall at Carreent was demolished recently by a natural movement of the soil. An accident of this kind never in the only thing that in the natural course of events can really damage a Roman wall, of which there are several hundred still standing in England. The secret of their permanence is the cement. We do not know the method of its composition, but it is far superior than any modern cement. Indeed, when some part of such a wall as that mentioned has to be demolished it is necessary to use dynamite.

All that we know of Roman cement is that it is made from a considerable element in it. For the rest, Roman walls were built with stone and lime from a recent hotbed.

The finest specimen in England is the wall that crosses Northumberland from about Newcastle to Carlisle, having along the ridges of a series of small hills that fall short to the north. The facing of it will be still in admirable preservation in most parts, and where the lower stone has been used the mortar is the intense red and cream.

the breaking away of a length of the facing, the may practically say that Roman walls are absolutely unchangeable, except for the slipping of the soil. Nothing hinders the repair; it is harder than the stone itself, so a rain, that when the soil becomes moist and looses, disastors to the walls are natural accidents.

### The Force of a Jet of Water

A PAVOISE in Grenoble, France, utilizes the water of a reservoir situated in the mountains at a height of 200 yards. The water reaches the factory through a vertical tube of the same length, with a diameter of considerably less than an inch, the 5-1/2 being used to move a turbine. Experiments have shown that the strongest man cannot cut the jet with the best tempered sword; and in some instances the blade has been broken into fragments without softening the water. The water, and with no such violence as a piece of glass may be shattered by a blow from an iron bar. It is not so invulnerable that a jet of water a small fraction of an inch in thickness, moving with sufficient velocity, could not be cut by a rifle bullet.

## Worn-Out Tires Made New

Your old tires can be made like new at low cost. Don't throw them away, don't buy new ones. Our exclusive process makes your old tires puncture proof and non-skid. Hundreds of motorists are getting thousands of miles out of old tires by having them retired by our

## TRIPLE TREAD PROCESS

which makes old tires like new. We use the old treads as a foundation. After the old treads surface is removed we cover it completely with treads, we use a special French Chrome leather, three plies where the wear is greatest, and three rubber treads where some special wear fighting treads give you extra with the resilience of a pneumatic, with the durability of the best quality gutta-percha. Improved and such on the tread protect you against skidding and fast treads in the sand protect you against rut wear.

The Triple Tread will not chafe your tire, cannot cause overheating at low power. It's guaranteed for 3,500 miles.

Write for the full particulars and prices.

## TRIPLE TREAD MFG. CO.

1545 Michigan Av., Chicago

INCORPORATED IN ILLINOIS

Ten million dollars is a conservative estimate of the amount of commissions we pay London each year for financing mercantile business we ought to be able to finance ourselves

A well-known Grand Street office importer and the treasurer of a firm which annually ships several million dollars' worth of miscellaneous manufactured goods to South American ports were talking shop the other day in one of the downtown lunch clubs. Comparing notes, they found that for marketing facilities in London required in connection with their business they were better than paying the New York agent of one of the big British banks commissions amounting to something like \$50,000 a year. "And that's only what we pay," the office importer remarked. "I'd wager that for doing this business, which we might just as well be doing for ourselves, London mercantile banks at least \$10,000,000 out of the United States."

The office man's estimate, if anything, was low. Fifty-five million dollars probably is nearer the amount American merchants pay the foreign bankers each year for services in connection with exporting and importing goods, the pretty nearly all the merchandise that comes into the United States and the greater part of what goes out. The London banks get their little "take-off." Not very much—just a matter of a few cents on each dollar of one year cost—but enough, on a turnover of such size, to amount to ten or fifteen million dollars a year.

If you get that to tertiary business men not familiar with the ion and ions of trade overseas he looks at you and asks you why he can't do our own banking business instead of paying the foreigners such an amount as that. Can't we do it? Don't you know how? Haven't we got the facilities? What has London got to do with a shipment of rubber put on board at Santos on board for the United States? Why should there be any "take-off" or commission or anything else in it for London when a Japanese house charges flat fees of raw silk across the Pacific to New Francisco?

There shouldn't be; there is no reason on earth why there has to be; but as the system is now—there it is. So, if he'll be so good as London is the "world's financial center." That sounds pretty well as an explanation and has been fairly handy "out" whenever the question was asked, but, as a matter of fact, explains nothing. London is the world's financial center of course, nobody doubts that. But what has that got to do with London being able to exact its toll on most of the business passing into and out of the United States? If that is the reason, why is not London able to exact the same toll on merchandise passing into and out of Germany for instance, or France? Ask a Berlin or a Paris importer, how much of a commission he has to pay on goods on an export or import from Brazil, and the chances are he will look at you in astonishment and ask you what you mean by a commission being necessary for him in any country.

Just where does the difference come in? In position come in? Perhaps this Berlin and Paris and the other big money centers are equipped to finance foreign business—business in a way that New York is not. Now Berlin or Paris importer desiring to bring in human hair from London or Australia is at a position to use securities to make the necessary banking arrangements. Your American firm desiring to ship out or bring in even rubber or coffee or any other staple article in which the business man can get big figures has got to make deal with the bank and the London bank and get both bank and the importer a substantial commission for handling the business.

Take the case of a shipment of miscellaneous merchandise from New York out to Buenos Aires. You know that the London is the institution how is the shipping agent his own? Can he draw a commission on the transaction? What is he to do if of what size would the draft be in London—there being no direct banking connection between New York and Buenos Aires in America? Is anything anybody or else to take care of it? How is the payment New York to be made? Will you not get a commission on it? How is it to be made? Had advantage by Buenos Aires bank, are keeping debit accounts with New York, or not? In which case will the office man's estimate be low? In the latter case, why not get the office man's estimate? Some other will get to be the case of the bank and the office man to make it a third party with you both larger and will have some special advantages.

## Finance

BY FRANKLIN ESCHER

A Waste of Millions

That is where London comes in. New York has a lot of money to spare, as does Buenos Aires worth speaking of, but does a big business with London. However, if South American ports were dependent on New York, but are in the usual kind of touch with their correspondents in the British capital, the result is arranged in London the payment shall be made. Some New York bank (acting through its branch in London) will be asked to take over the bills of lading and other papers and see to it that the merchandise, when it gets to Buenos Aires, is accepted and paid for. Payment having been received, the money will then be forwarded to London, from which point it can easily enough be withdrawn to London.

Full description of one of these transactions would result in obscuring the whole point of issue, which is that a third party has to be brought in and will pay for his services simply because the other two parties expect to business direct. "I could do business direct"—so that an exact statement? Yes, unfortunately, it could. But it is not so simple as that. London or Paris or any one of a half a dozen European cities does do business direct with Buenos Aires, but not with New York. To that there is at present an insuperable obstacle. The New York bank has to make its deal with the best in the world. The factiousness of our money market? It is no more than that. The money market in Berlin, what does it have to do with Buenos Aires? Simply this, that as long as our banks are prohibited by law from "accepting" drafts, then it is not possible for the foreign countries will never keep any considerable amount of money on deposit with us.

Again steering carefully away from confusing details, it may surely be stated that the difficulty of the existing part of the banks of any given market to "accept" time-drafts drawn on themselves means all the difference between existence and the non-existence of a discount market. It is in the case here in New York that we have prohibition by law from "accepting" drafts, obviously there can be no discounting or rediscounting of accepted paper. And if there is no discounting or rediscounting of bills possible here, then nearly no bank in a foreign country is going to be so foolish as to accept a draft on deposit in New York. Some little deposits, of course, they may elect to keep here just for convenience sake, but accounts of any considerable size, no. For the conduct of any kind of business in exchange between two points, it is vital that one or the other market should be "free"—that is to say, that there should exist the facilities for any man to get his own money paper into ready cash through the process of discount.

But what is the "accepting" by banks, and what is the "discounting" by banks? A time-draft drawn upon them is an important, and if the whole difference between the existing and the discount market depends upon the latter being allowed to "accept" such drafts, why are these banks not doing so? Has never been taken off. Back at the time the present bank act (1863) was passed, such a provision was made that has never been taken off. It is in fact the prohibition was put on a long time ago when the banks were not to be allowed to do so. But these banks must be that has never been taken off. Back at the time the present bank act (1863) was passed, such a provision was made that has never been taken off. It is in fact the prohibition was put on a long time ago when the banks were not to be allowed to do so. But these banks must be that has never been taken off.

That is why it is that a third party has to be brought in to take up the money end of a large part of our exports, and, incidentally, paid half a dozen millions of dollars to the House of Representatives with our money! Take the case of a lot of coffee that is to be shipped from Brazil, but direct to the United States in order to get a share of raw silk out on board at Yokohama and billed direct to New York. Where does London figure in this transaction?

Exactly where she figures in the export transaction previously described—that is to say, in the case of the House of Representatives. In the case of imports it is just the other way round, and are the case of the House of Representatives, but so far as the need of a third party was concerned, it is just the same. Still, we will

say, has been purchased in Japan. How is it going to be paid for? To buy a draft on some point in Japan and send it out to imperialism—just as much out of the question as it was for the Russia. Also importer of aerobandine to send up a draft to New York in payment for his purchases. Now can the exporter out in the Far East draw on the buyer here in New York for the value of the silk which is being shipped; no bank would be willing to take the draft off his hands, and give him yen for it.

That is how it comes about that no make payment for the greater part of our imports and of the various points from which the goods come, but in London. How is that arranged? Usually who has bought the silk goes to the New York agent of some London bank and gets what is known as an "import letter of credit." This is simply a document signed by the "seller here, which states that it authorizes the shipper at the silk out in Japan to draw a draft on London for the value of the silk shipped. The letter of credit" the importer here sends out to the firm in Japan which is going to ship him the silk. That document, once received, the Japanese exporter is at once in a position to ship the goods and draw on London for their value. Able to show him the authorization for drawing, he will have no slightest difficulty in selling this draft in his local market at the current rate of exchange. The bank in London, the importer, of course, agrees to send funds to the London bank with which to pay the drafts as they are presented.

All this, of course, is very well, and a satisfactory way of arranging things, but, what, an expensive one. The London bank, naturally, is not going to allow itself to be drawn on for nothing, nor is the bank in New York which is to accept its agent in business for its health. Both the New York bank and the London bank have got to be paid and paid well. In the case of coffee imports from South America the commission is usually one-half of one per cent. In the case of shipments from the East it averages about double that.

Now who pays these commissions? The importing and exporting firms which send London astronomical, of course. Very true so far as having over the actual cash to the bankers is concerned, but not at all true with regard to the actual cost of getting the money. The import and export firms pay the banker, but what they pay him they simply take to the credit of which they sell the goods to the public. The banker's commission is regarded exactly as in the charge for freight or insurance, or anything else incidental to the handling of the business. Every cent of it in the long run comes out of the pockets of the people who buy the goods, and for every cent of it which they sell the goods to the public. The banker's commission is regarded exactly as in the charge for freight or insurance, or anything else incidental to the handling of the business. Every cent of it in the long run comes out of the pockets of the people who buy the goods, and for every cent of it which they sell the goods to the public. The banker's commission is regarded exactly as in the charge for freight or insurance, or anything else incidental to the handling of the business. Every cent of it in the long run comes out of the pockets of the people who buy the goods, and for every cent of it which they sell the goods to the public.

That brings it right down to a matter of dollars and cents. For as not to be able to handle our own banking business is too bad, but, from the viewpoint of the great majority of people, not a matter of any particular moment. Unquestioned, however, in the light of the fact that our banking to call to somebody to help out makes things cost more in the consumer, it becomes a question of real and practical interest. Things cost enough, as it is. Anything that tends to make them cost more is certainly worth looking into with a view to seeing whether it can't be changed.

As the situation stands at present, we are liable to go on colliding with our neighbors out with our exporting and importing—and to pay the necessary millions in commissions. It is not that we are not out to better our London is "the" world's financial center" or for any reason like that, but simply because we are not equipped to do the business ourselves and we must hand it over to somebody who is. As long as the only banks outside the country with which our banks do business on any considerable scale are those located in Great Britain and on the continent of Europe, we shall naturally not be able to do so to finance commercial operations with South America and the East.

The introduction of a change in our banking system is required to make possible these closer relations. It is no mean, far-reaching step. It is the creation of a new sort of a "Reserve Association" corresponding to a central bank would distribute the foreign financial members of our banks over the available funds. It is absolutely not necessary to the development of such relations. Let us see what is the nature of the change in our banking system. In its present condition, our banks, and banks, are only national banks, and are not able to carry out the work which we desire to carry out. We need a central bank, and we need with these a bank, would, of course, allow direct financing of export and import business, and that the third party out of the transaction altogether.

**P. A. for pipe grouches**

Everybody's mighty strong for Prince Albert, because it's a tobacco with a smile.

Sort of taste on the sunshine—and every time you fix-up a penny pipe or roll a cigarette say to yourself: "Old Man, here goes for another joy smoke." Thousands of men who never smoked a pipe or rolled a cigarette have been "led to it" by P. A., because it's so good, so sweet and fragrant and so fresh.

**PRINCE ALBERT**  
the national joy smoke

It tobacco without a bite and it won't parch your throat. You see, P. A. is made by a patented process that cuts out the bite.

Why, you can keep fixed-up all the time and never get a tingle on your tongue or a dry spot in your throat.

According to Hoyle, that's *going easy!* And there's just one way to prove it. You be game enough to exchange a nickel for P. A. in the tippy red bag or a dime for the tidy red tin. Then you'll know for yourself why Prince Albert is King of 'em all.

There's a lot of ragtime cut talk about "just as good as P. A.," "just like P. A.," "Get this! No other tobacco can be like Prince Albert, because the patented process is owned exclusively by the R. J. Reynolds Tobacco Co. P. A. won't burn your and not on brothers or sisters. Remember that!

Buy P. A. everywhere. Tippy red bags, 5¢; tidy red tins, 10¢; handsome patent and half-patent tins.

**PLAYING WITH DYNAMITE**

(Continued from page 7)

of his to the throne. Anson had one hundred men with him, and under the lead of the Chinese he took the mine free to seek service with their arms and other matters. But fifty-five loyal men deserted that day and chose to obey the higher precept of Confucius: "Thou shalt not live under the same sky with the slayer of thy father or thy lord." The fifty-five were executed. They scattered far and wide. They became farmers, fishermen, woodsmen, and some were made to live as become serfs. But always their leader, Gishi Kuramasche, knew where they could be found. He sought to ally the apprehensions of the suspicious King by breaching the town drawn up of Kyoto, but even so he had to wait nearly two years before King Anson's was for one instant relaxed. Thus the secret roll spoke to the faithful and they set to Yoide. They forty were living. They took their arms and armor which had long laid hidden. They ate a farewell supper devotedly and in the city of wild guess in light could be heard as they marched to the post-office to the mountain King. Ten warriors crept the spiders over the wall, silently killed the watchmen, and opened the gate. Gishi attached the rocks of iron and powder. There was a great battle—one hundred and fifty men against the Forty seven—but in the end the latter were prevailed. Gishi humbly offered King the sword of Anson, that he might use it as his blade to commit vengeance, and when King and his three refused, Gishi politely whipped off his head with the same blade.

All Yoide through the streets to see the Forty-seven pass, leading the head of the insuror to the town of Anson. Only fifty of the Roman were able to see. The remaining thirty-two were so grievously wounded that they had to be carried to Yitien. Yet they all knelt at their lord's grave and threw him the head, newly washed, on a sacrificial table of white pine, with incense and prayers that their lord would pardon them for not doing his honorable revenge, since his revenge was mighty and they were like ants among the grass. And at the end of the Forty-seven, the oldest survivor—one year old and the youngest seventeen, was condemned to die by him and, with each one died with a cheerful smile of satisfaction on his face and roving a grateful prayer should he had composed that occasion. King's head had been thoroughly wiped out at last.

And what has all this ancient history to do with the making of Japan by the Spanish Califfonians? Simply this: at the time of the war with Rains the nation of Senpaku had not guarded the towns of Ithai, the brother of the Forty-seven, and of Ithai's son, his own son, and they had to cover the tombstones with wood. Every Japanese soldier who could get to Senpaku, they killed outside of Ithai, except off the mountain summit a big eye bigger than a mustard seed and wrapped it in a prayer-book and sent it inside his coat. An accident, a chance accident, that? No. With the power that he, the soldier of Ithai, might die as gloriously in avenging Ithai's head to the Emperor as Ithai had died in avenging the head to his head, Anson.

That is the spirit of the Japanese people at this moment. Much of the old religion is gone. Christianity has been but imperfectly assimilated. Perhaps much of the sacred veneration for the person of His Majesty the Emperor has departed. Socialism is springing up, where feudalism has been abolished. One thing has not faded, but has rather increased and become more sensitive by reason of Japanese war and seems to be the crux of a first-rate world power, and that is the national racial pride and susceptibility to affront. Is it wise for the Californians to keep on wistfully irritating that pride and susceptibility? Will the people of the United States permit them to continue in that course?

**Jade**

Most people in the Chinese conception of life—the least essence of the jade is "Jade." Jade is viewed a precious stone partly by reason of its severity and partly by reason of its unchangeable durability in working it. Many pieces of intricate carving represent the work of years over the lapidary work.

The crude stone is derived from Chinese Turkistan, the Hith-known region adjoining mysterious Tibet. The Chinese miners in the rough stone must undergo journeys requiring a period of three to four months, arrive in the country with the labor of taking out the jade blocks is peculiarly arduous. The jade is so hard as quartz, and the only way

"Sure, it was not worth me while aggering the thrack, the wint by so quick."

whereby it can be made to yield to the lapidary's tools is by the use of powdered glass of a superior hardness. Every dent is sprinkled on the drill for the more delicate work of carving, and a diamond-pointed drill used going out the stone from the interstices of the more intricate patterns. The fast tool is the only modern power, and a close hand and steady eye are the guarantees of perfect work.

Hard Celadon is an under the impression that jade is essentially green, but this idea is erroneous. Green jade is the common form, the one most readily procured by India and Malacca in China. As a matter of fact jade exists in every color of the spectrum: deep red, molten green, and a clear blue and jet black. The most highly prized is the pure white, a wonderful and irrefragable glowing white. The yellow jade is peculiarly the royal color. Most of the red jade now procurable is red only by accident. Jade ornaments which have long been for centuries in India are valued for the spirits of the dead acquire a blood color by slow oxidation, and these relics of the tomb are almost priceless in China.

A peculiar standard of excellence has been set in the jade-cutting's art, and carvers must all give the effect of lost just giving its shape at the melting point. No sharp angles or clear lines are permissible. The premier master of the jade finds itself lost to this indelicacy of outline. The Chinese art-lover is wont to frown and censure his jade ornaments, and a certain joy in having his fingers played over the softly undulating outlines of his work.

The Gable of jade is sweet to the ears of the Chinese. Emperors and sages have set it down in their writings that there is no metal that the jade when struck, it is crystal pure. Furthermore, one who wears a jade ornament will stilling be his killing, he who takes joy in the sense of distinction which the same emblem.

Jade has been extolled by philosophers and sung by poets because of the perfection of human virtue which it typifies. By its hardness it represents inflexibility of virtue; its durability is emblematic of immortality; its lustre, acquired only by slow and patient work, is the perfection of human wisdom which comes with laborious study.

There is no life in the carved jade that does not have its significance. The stone is made a vehicle for the expression of thought no less dignified than the rigid form of the classical vase. Every conventional plant or animal appearing under the lapidary's tool is a metaphor in stone. Some of the carvings in the settings spring from the very sources of Chinese literature. These are the swanlike, the universal symbol of purity, the plastic bird, the hat, and the bursting pomegranate. Each proverb in the impenetrable armor of the jade conveys a message of wisdom or some fancy of poetry.

**GRAFLEX CAMERAS**

On a day like this

or indoors like this

**THE GRAFLEX**

will be your most "snap shot" yet, though it is not clean cut corners, and will give you enough to make dozens of finished prints.

Outdoors on bright days you can make pictures like these—over a 1,000,000 of a second. If you wish. And there is no shutter to get in the way. It is as simple as looking out on the Graflex. Number in this camera is the only camera in the world that uses the image right side up. The eye will appear in the finished picture as the subject of the scene.

Small and light, weighs 2 1/2 lbs. All about \$100.00. Write to your dealer.

**FOLMER & SCHWING DIVISION**  
A FOLMER COMPANY  
174 California Street, SAN FRANCISCO, CALIF.

**WANTED—SALESMAN AND SALESWOMAN**

FOR THE SALE OF THE FAMOUS CORTIZ CIGARS

**FOR MEN OF BRAINS**  
**Cortiz CIGARS**  
MADE AT KEY WEST

**The Elephant and His Driver**

There is a position to speak authoritatively on the subject none so true, as of the world's original nerve-industry services, although it can be trained to perform all manner of work. He will, however, perform any task he can be so ordered by his driver or mahout, to whose guidance he submits for the simple reason that he is aware that disobedience brings punishment.

Sitting on the elephant's neck, the mahout governs the big beast by his hands and feet, which resemble a basket-like and weighs from four to six pounds. The mahout drives the elephant forward by digging the pointed, the spike into its head, and pulls his back by inserting the hook in the leader line of the reins.

An elephant whose mahout rules him responds readily to the secret signs of his driver. The pressure of the mahout's foot, the compression of his knee, the tap of his foot, or the slightest winking of his body to one side, will constitute a driving system whereby the powerful beast is guided to every mark the same way in which a ship responds to the rudder.

**The Five Pauls**

Here is a good example of what frequently happens in the polyglot Balkans. A man named Paul settled in Athens. He was a very well-to-do man. He had himself Parolopoulos, the Greek form of Paul; the second name to English Paul; the third name to Paul; the fourth name to Paul; the fifth name to Paul. He made his home in the heart of Athens. He was a very well-to-do man. He had himself Parolopoulos, the Greek form of Paul; the second name to English Paul; the third name to Paul; the fourth name to Paul; the fifth name to Paul.

## The President in an Obdurate State

"A prophet is not without honor, save in his own country and in his own house." ST. MATTHEW XIII. 57.

NEW JERSEY has always been a perniciety state. At the very beginning of the great revolution which created the Union she rebuffed the famous Virginia resolutions and brought forward a set of her own. She alone of the sisterhood of Northern states gave her electoral vote to McClellan in 1862. And to this day she is the only one of the whole number who maintains in full vigor the old English sherry courts. A most obdurate commonwealth, as any one can see. Instinctively she strikes to her sherrifs.

That is why President Wilson, who mistakenly supposed that he had been living in New Jersey while he was really living in Princeton, returned discomfited from his recent visit to the state which he had come to regard as his own. What ever may be the ultimate outcome of his mission, his discovery of the clearly evidenced fact that his former constituents no longer regard his dicta as propels must have been a bitter disappointment to his zealous and confident spirit. We doubt if he is at head of New Jersey as he was. Lack of reciprocity is apt to produce a reactionist influence upon the affections.

It was an ill-advised visit, of course. To begin with, New Jersey isn't paying Mr. Wilson for his personal use. She used to do so, and she used to, and to her credit be it said, she made little complaint when he felt upon occasion that duty called him elsewhere. But at the moment he is drawing his salary from the country as a whole and Arizona feels rightfully as much entitled to special attention as New Jersey or any other member of the Union. And however open a President may be, one never lived who could make the rounds satisfactorily.

Then again, New Jersey has another Governor in consequence of Mr. Wilson's resignation during the term for which he was elected. A very good man, too, everybody says, and wholly in accord with his predecessor's advanced views. So why should one renege to a higher sphere by the will of the people, seemingly in conformity with his own inclination, persist in rebutting local concerns? The action, we grant, is provincial, but, as we have noted, New Jersey herself is provincial—and persistently.

We know little of the merits of the case in issue. That is to say, we suppose we know more than most people, but not enough to warrant an expression of definite judgment. From such understanding as we do possess, however, we infer that President Wilson is wholly in the right as to the main point. Unconformably to the old English practice, the sheriff of a county in New Jersey from time immemorial has exercised the privilege of "drawing" or naming grand jurors. Inevitably this prerogative is of peculiar significance, especially to those who may, in an unguarded moment, engage in nefarious pursuits. Since precisely a stream cannot consistently rise higher than its source, so a grand jury is not likely to transcend its creator. It follows that in these circumstances the friendship of a sheriff may readily spell favoritism, or even immunity, in case of stress. True, the citizens of a county elect their own sheriff and are free, of course, to choose whom they will, but it is argued that in practice the bosses really pick the candidates and continue to dominate his acts after his election. That this has been the case quite generally in New Jersey is testified by the Newark Sunday Call, which seldom errs in a matter of fact.

The desirability of a change, then, we may safely take for granted. But a change to what? That has been and still seems to be the question.

Mr. Wilson, when Governor, urged the transference of power of appointment of grand jurors from sheriffs to Supreme Court judges, making it "a judicial process from top to bottom." But, as the Jacksonian Democrat said of the doctrine of eternal damnation, the people wouldn't stand for it. They of each county know one another and preferred their own choice to any one designated by an outsider, even though he was a justice of the Supreme Court. The spirit of home rule was evoked inevitably, and upon that principle New Jersey has always been adamant. The next-in-home, as the Puritans saying is, "couldn't no other."

Then it was suggested that the Governor might be empowered to name jury commissions. But here again arose the doubt and prejudice against the exercise of authority from without. With a perfectly good Governor like JOHN PARKER or WOODROW WILSON in the Executive office, that sort of thing, but what would happen if so great power were centered in a shaky or incompetent Governor? That surely would be dangerous to liberty, life, and pursuit of happiness. Anybody in Trenton was too far away from home, anyway.

So the battle raged, to no effect, throughout the Newark session. The various committees (Legislative houses, including the present incumbent, naturally flocked to the forward-moving bills of President Wilson, and the sheriffs and their bosses of both parties and a large proportion of old-line Democrats mixed those children up till nobody seemed to know quite where he was at. Finally the opposition proposed a referendum and granted. They knew, or thought they knew, that the people would vote down the whole scheme. Apparently President Wilson suspected so much himself, because, somewhat inconsistently with his frequently reiterated determination to let the people rule, he rejected this proposal with some few reservations. Had not the gladiators pledged jury reform? What were the grounds for if not to be kept? Were not the bosses against it, anyway? What further evidence of the need was required, etc., etc.

That was about the situation as we get it when the President put aside routine duties and ordered his car lurching to a train bound for Elizabeth, on his way to Jersey City. Whether he anticipated an easy triumphal tour, enlivened by enthusiastic meetings and followed by a peaceful evening with Assistant President Hoar in this great city, we have no means of knowing. It made no difference. He had promised—almost threatened, in fact—to keep one eye on New Jersey, and had no means if he detected any danger of his doing of her blowing out to sea and getting drowned. So he went, as in duty bound, and did his best.

The net results were varied. Most gratifying, perhaps, was the powerful evidence during which it must have seemed like old times to see the Assistant President roll by his slaves and hold court in the grandest and most dignified manner of judicial scrutiny. It must have been a great comfort, too, surprising well for the future, to be able to join the horny hands of the Secretary of the Treasury and the possible ambassador to France, commonly known as the two McGREGORS, and bid both to sit at the head of the table.

So long as New Jersey was somewhat confined. The public meetings were satisfactory enough. No admission was charged and everybody felt that he got the worth of his money. Not a boss got a cheer and one would have been blamed if Mr. Wilson had been there who was meant. Even the *Apprentice* Sunday Call went home en-

chanted with the music of the organ's voice. All this was to the good and eminently satisfying.

"But dear! dear!" did dissent ever contain so many flaws? To begin with, the newspapers were lukewarm. Over the utterances of Brother James Stewart's public journals, see, naturally, draw a veil. But even the tried-and-true *Jersey Journal* edited and owned by Brother Dear, the President's old college chum, was nearly as bad. Listen to this:

President Wilson's speech in Newark last night was probably rivaled, not only as regards jury reform, but equally so as regards the constitutional convention. He did not come within a mile of hitting the nail on the head.

What the people of New Jersey would like to know and what they expected he would tell them in the particular kind of a jury reform bill he demands and the particular kind of a constitutional convention bill he thinks should be passed. These are the core questions at issue. Mr. WILSON merely intimates that he is willing to accept a compromise in regard to both, and that he is willing to accept any kind of compromise he would consider.

President Wilson's denunciation of bosses and the "same old gang" is interesting and in the way, but it does not touch the quick of the great situation. Why should not the bosses and the "Same old gang" consider themselves free to haggle and compromise on jury reform when the President himself does not seem to know, or at least does not say, really?

Others mingled indignation and levity in like measure. Several quite ordinary Assemblymen denied that they were bossed by bosses and intimated with no little emphasis that if anybody but a President should say they were there would be a small of blaming ears. Others asserted that they knew what their people wanted and didn't try to tell. One charged the President to a joint debate. Another spoke so vehemently in favor of pitiless galloping in preference to a secret conference that Governor FULTON had to call him down. Even the *Indy-cars* assumed a non-vindictive air, one of their overly upsetting the Presidential motor and firing a most unbecoming shot from a revolver, even so they were sent until, to the relief of everybody, in the words of the *Evening Post*, the President returned to Washington "charged" and looking "tired and disappointed over the discouraging turn his fight had taken."

It is too bad. For the sake of nature, New Jersey ought to have behaved better, even though she doesn't and never did recognize Mr. Wilson as a Jerseyman, like plain old JOHN PARKER, for example, or the aristocratic COSTANZO PARKER or even Mr. FERRAZZI YVES or JOHN P. STRATTON or even Mr. STRONG of our present day and generation. Despite apparent evidences to the contrary, Mr. Wilson was in New Jersey, was he not? And when he left the State House at Trenton he took his authoritativeness with him. His appeal for jury reform may get a change of size and sort and may get none. We doubt if the country cares much about it one way or the other. Folks out West and down South are at it, say that if the people of New Jersey are in New Jersey, want to elect their own sheriff in their own way and abide the attendant shabby, why let them go their gait. When a shiner does not want to be saved, "what," asked the Hindu, "can you do?"

Keep on trying, of course. But, however unwelcome our intent, perspective and method may be considered, and we frankly recognize our own humble project already expressed more than once in these columns, that there is no place in the world from which a President of the United States can exert so great an influence in his own little island at the far end of the wide stream which leads from Capitol Hill.

## Why a "Competitive" Tariff?

The phrase "competitive tariff" is new. It will probably be credited and justly, to Mr. Utica, and associated with the pending tariff bill. But the idea is not new. It is at least as old as the tariff policy of the Democratic party properly so called, and defines that policy very well indeed. It means, of course, a tariff made for fair competition with other countries so distinguished from a tariff made to protect certain industries from any competition.

It means, therefore, a tariff which will cause to give protection to industries that cannot stand fair competition—industries that can be kept going only by the mass of Americans are willing to be taxed to keep them going. Possibly there are industries which, under certain circumstances, it is worth while to favor in this way. For instance, when we were young and weak, Japan favored a general sacrifice in favor of industries necessary to defense in time of war. The argument for such a sacrifice in favor of infant industries, provided they are such as can maintain themselves when once established, is also quite sound. But we are no longer young and weak, and the Uticaism bill deals with hardly a single industry that is really an infant. It deals with many that have proved their ability to stand fair competition, and will, on the whole, substantially aid them and make it possible for them to extend themselves into new fields, no longer hampered by taxes on their raw material or by unjust interference with the natural course of an infant industry that other industries which confess and advertise their inability to stand fair competition and to their discredit outcry for further sacrifice by the American people in their behalf—that is to say, in behalf of the wealthy aristocrat who can then, not of the men and women and children who work for him—make money, and who are weak and firmness; "Gentlemen, we will not do it; we will not longer tax the American consumer and weaken other industries for your sole benefit. The time is past when America could afford to play favorites and maintain parasites. The era of privilege is ended."

## The View of a Scientist

The justice and righteousness of this stand seems too obvious to need arguing. But striking, because unobscured, approval of it comes from our highest authority on tariffs and on our own tariff history. Professor TAYLOR, of Harvard, in an Atlantic article that was first written before the Uticaism bill was given to the public.

Professor TAYLOR discusses, quite generally and dispassionately, "What Industries are Worth Having," and arrives at very practical conclusions. Like every other intelligent student of American realities, he takes his account of the disappearance of the frontier and our arrival at the point where we can no longer meet economic pressure merely by opening up fresh lands and other untapped resources. He recognizes, of course, that we still have a marked advantage over the really old and fully occupied countries, and that we are at the best nearly our high standard of living and our high general rate of wages—real wages as well as money wages. But he finds that we must discriminate between the industries that we can and those that we cannot successfully prosecute in face of the precise kinds of competition which we now encounter.

He is highly instructive, not only in his cool judgment of the sources of efficiency in the really efficient American industries. One is, naturally, the superior efficiency and intelligence of our high-priced American labor. Another, equally to be expected, is our superiority both in the manufacture and the use of machinery. The third and fourth are our comparative advantage in view of our vast importations of foreign and not very intelligent labor, is the superiority of American management and leadership in industrial enterprises. In general, the industries which best combine these four points of superiority seem to him the ones we must job on.

But the particularly pertinent thing is that he tests them by the practical test of importations. He finds slightly protected but really efficient American industry keeping out importations. He finds foreign goods coming in, notwithstanding the high wall erected around other American industries. "Labor," he says, "is applied with the greatest efficiency only when it proves the effectiveness by sustained ability to hold the field constantly against rivals."

America is entering upon a new era in its industrial history. The Democratic tariff bill is

essentially and substantially right because it candidly accepts that new era's conditions and demands.

## The New York Collectorship

We don't know why, but collectorships have made a lot of trouble in American politics. The collectorships, postmasterships, have made more trouble, but postmasterships are much more numerous than collectors. We mean particularly collectorships of ports, not the internal-revenue kind.

The classic instance, of course, is the one that occurred in Garfield's administration, when a collectorship, such as the one now before us, looked for the part of New York started a series of rows that indubitably affected the course of history. It ended CLEVELAND'S career, for one thing, and it may quite reasonably be said to have caused the defeat of BLAINE for the Presidency. In GARFIELD'S time there was the untidy and still mysterious affair of the Boston collectorship, with BEN BRYAN playing a role which we may never understand. Then there is the still fresh remembrance of CUMMIS and the collectorship at Charleston.

Now it is in this port that again comes into the limelight. We sincerely trust the matter may be amicably arranged; the quiet collectorship, even if it is arranged so quickly as to destroy this paragraph's interest before it is read. All that most of us want is a good man on the job. Mr. POLK, who is Secretary McADAMS'S choice, is certainly a good man; so maybe are those indicated by Senator OVIENHANS. As the Times confesses, the fitness of the man, at first consideration, not the political color of his backing.

Still, there is the other consideration, and the instance we have mentioned prove the danger of ignoring it. That was what occurred to us when we suggested that in referring an applicant for office to the Cabinet members the President might be acting a little thoughtfully. Established political usage seems whether it ought to or not, and there is no doubt whatever that according to political usage Senator OVIENHANS had a stronger claim than Mr. McADAMS to be the President's adviser in this particular matter, though an other office it would seem more reasonable for the Secretary of the Treasury to select the man who has more to do than anybody else with the actual administration of the customs laws.

Fortunately, Senator OVIENHANS is quite as much a friend of the President as Mr. McADAMS; and the President does not confound impressionable with firmness. So we are confident the incident will not prove politically disastrous, and hopeful also that Mr. LEXA'S successor will stick to his high standards of honesty and efficiency.

## Disrupting an Emergency Measure

The plan for the relief of our ambassadors and ministers which has been introduced by Representative HENRY, who attributes it to former Minister HENRY TAYLOR, seems a fairly sensible one. It is certainly better than anything doing nothing about the matter. As it is also a plan to relieve the President, who has confessed most candidly the embarrassment he suffers from the present state of affairs, Congress cannot act on it too quickly.

Really, it proposes to make things easier for our representatives abroad, not by an increase of salaries, but by renting and furnishing suitable residences for them until such time as Congress shall either buy or build them permanent quarters, following recommendations which the Secretary of State is to make.

The main thing is the renting and furnishing, which is to be done at least one year, the furnishing will subtract only \$357,000 and the renting only \$190,000 a year from the funds available for pork-barrel legislation, perhaps we may even hope that this much actually will be done at once. We are satisfied more public money than that has been spent to help a single Congressional session.

Even so, one hardly feels like venturing any criticism of the proposal, but our impatience in it is taken as an excuse for spending this money on post-offices where they are not needed and the dividing of rivers that will never be irrigated. Moreover, some of the salary might have been used to help our own people who are without shelter. We wish the provision for renting and building could be made more surely effective. But we welcome with goodwill what is offered now—if we can only get it now.

## Are the Californians Both?

It is not true that our fellow-citizens in California should ask themselves if they are not a bit soft. The forty-niners were not soft. They were, or came to be, smart, well-sensitized folk. But who have gone from the East in recent years to California? A great many excellent and valuable people, without doubt. But we take it the greatest gains in population have been made in the southern part of the state, and we have an impression that the newcomers here have, very largely, grown up to be looking for an easier life. Southern California has been an oasis for people who were tired, or disgusted in some way or habit or fortune, for people who could not swim any longer in the strong currents of competition and wanted long days of rest, time to think, time for true recreation, a protected life in a gentle climate.

The results these facts in the effort to discover why the competition of about 3,000 Japanese agriculturists should so disturb the nerves of a state with a population of 2,600,000. It seems there are about 41,000 Japanese in California all told; less than two per cent of the population. It appears that the greatest of the hardest-working folk in the state and the most aggressive in industry and thrift. If we had them here in New York our industrial machinery would take care of them without being conscious of their presence. But that is partly an advantage of concentrated population. If the 40,000 were spread out this country would be the hardest-working, and would be comfortably lost. But being intelligent and able, they are team workers, and groups of them working of intensive agriculture in competition with white Californian neighbors seem to be able by superior activity, diligence, and knowledge to quite outmatch and outsell their rivals.

Back of this activity is a another thing—the condition of agriculture in California. It is bad. The wheat-lands that need to give good crops to give tillage are pretty well exhausted and need fertilizers and diversity of crops. And we hear that a majority of the old farmers are not at all up to the times and don't know how to make a living. The great center of agriculture at Stanford University and another in the University of Oregon, and the agricultural hopes of California seem to center in these institutions and others like them. There is an urgent demand for knowledge of the new farming, and we find that competent and instructed young men head sure employment at high wages and with excellent business prospects.

So, perhaps, after all, the worry about the Japanese is chiefly a symptom and may be useful in the end to put Californian agriculture in a better case. The agriculture of the whole country is bad. To bring it up to date is a work of the greatest importance. The great aim for Californian agriculture is to wake up her farmers and teach them to farm as well as the Japanese. If they have the hope that comes of knowledge and the confidence that comes of training, surely they will not find this insignificant and diminishing number of Japs such a hazard.

There is a very real reason why the problem seems rather to be Secretary HOWLAND than Secretary HENRY. There is a great work to do in that state for the Department of Agriculture.

## Marching On

The women paraders in New York had a beautiful day of it, and they were met and greeted and welcomed, and made a handsome appearance.

A suffragette has been defined as a woman who wants something and thinks it is her duty. It is an interesting and fairly intelligent definition, to be especially commended to the attention of those of our friends who think that the cause for equal rights and privileges has been decided in this state. But those ten thousand marchers last Saturday were evidence that there is something still coming to her and that she is out to get it.

But they do want something, don't they? The ten thousand who marched last Saturday afternoon were the expression of a need that was felt and that is real. Nowhere is woman's position better than in this country, nowhere are her rights and privileges better protected than in this state. But those ten thousand marchers last Saturday were evidence that there is something still coming to her and that she is out to get it.

Undoubtedly the condition of women is changing all over the world, and changing, we believe, more slowly in the latter. The change has its entering wedge, and it is a change toward a fuller and freer life in a more respected and advantageous position. The suffragettes are very confident that women will get

the same wherever you have it. They may or may not, but they are constantly gaining in public influence, public power, opportunity, usefulness—all the details in which the race is expected to help them. All the worn suffragists and anti-suffragists breathe the same air and imbibe what is in it. All families, whatever their views, adjust their lives and methods to the new and growing influences. There is a great adjustment going on in response to a spirit of which last Saturday's parade was one of the outward signs.

#### The Minimum-wage Remedy and Others

For a while are more thankful than ailing reformers, and more confident than the reformers are sincere and when one sympathizes with their object and even approves, to some extent, their method or methods. Yet can any kind of service to reform be more plainly necessary? Is not that very order which makes men reformers, admirable and indispensable as it is, sure to make most of them impatient and over-sanguine, and is there any danger to any cause greater than that of over-dependence on untested means of promoting it?

Nobody surely can fail to sympathize with the growing and indignant movement to better the lot of working-girls in cities, and particularly to give them a fair share of what men can get. But can it befall them. We wish O. HEVAY were alive to see how his countrymen are reacting to the heart-breaking appeal of his little masterpiece, *An Unfinished Story*. Nevertheless, we think it was a needless as well as a wise word spoken by Professor Stewart of Columbia, at the meeting of the American Society of Men of Letters, when he warned enthusiasts not to expect too much from the device of a minimum-wage law. For if we expect too much from one remedy are we not likely to neglect others—such, for instance, as social insurance, which Professor STURGEAN mentions?

It is surely desirable to keep working-girls' wages high enough to support them decently, but to assure this object can be attained by merely putting a law on the statute-book! Economic laws do not yield readily to statute law. Are we sure that such an attempt will not actually result in throwing some girls out of employment entirely? Are we sure that the rate of wages has quite the relation it is said to have to the terrible evil specially aimed at?

Let us consider all possible remedies, including this one, and do whatever we can rather than too hastily put our trust in a single remedy. We are dealing with a very great evil and abuse of modern industrial methods and conditions. Let us apply to it an adequate amount of patient study as well as of energy and generous indignation.

#### Distinction

Writing to the *Times* about Yale senior societies, Mr. OWEN JOHNSON says:

Forty years ago the senior society membership was predominantly intellectual; the seniors, scholars, writers—the intellectual leaders—were almost entirely of this class. Today this element has declined, scarcely yielding to any other.

In an address in which he noted the changes he had seen in the House of Commons in the thirty-five years since he entered it, Mr. ARTHUR BALFOUR said:

Democracy seems impossible in any way as regards an assembly representing itself in which it can pay no tribute to its own past. I do not think that a debate in the House of Commons will be with the same respect or interest or intention as it was when it was a younger parliament. If that be so, it is a great tragedy.

Discussing this remark of Mr. BALFOUR, the *Kenneth Post* says:

Any one landing with it [the Senate], as it was at the beginning of President ROOSEVELT'S administration, could not fail to be struck by the change that it presents today. It is not merely that so many familiar old faces are gone. Time and the fortunes of politics will bring in these changes. But the complexion of the Senate is simply different; it is altered. A composite photograph would show a variation in the type. In place of the good gray hair of the Senate of 1880, there is now a preponderance of black hair. It is as if we were to see from the Senate galleries, and which may be called without offense the business portion. Most of these one visitor in Washington has been heard to give up in transformation, which seems to many a clear indication of a decline.

Here is the same story in three different forms. The gist of it is that here and in England, and doubtless generally in the world, as prosperity has become common, distinction has grown scarce. Men of prominence, leaders of this generation,

have less of it than they had forty years ago. They have more of what the *Past* calls "the business process." Distinction is intellectual; a matter of mind and character. The promise of it is sometimes visible in the young, but not so much so. Mr. JOHNSON thinks, in young leaders of his day in Yale College, as in their predecessors forty years ago.

If this is true, as that the prominent and important men of our day lack distinction, the reason is not far to seek. It is because the predominant interest in life in the last forty years has been industrial and commercial. The head zero have been the men of business and the bankers. But the possibility of what is important in it have waned, and though they do not much appear in legislatures (being more profitably employed) their type is faintly reflected there.

Now if our great period of industrial expansion is over, as some observers think, another type of leading men will gradually come to the front, and the possibility of legislators and other selected bodies will change again and perhaps advance in distinction.

#### The Powers and Little Montenegro

Like most controversies, that between the Powers and Montenegro has had two sides to it. The Powers are right in being impressed by Sir EOWAN GORE and Mr. ASQUITH in the House of Commons.

One is bound to respect Sir EOWAN'S view when he points out that the self-restraint of the Powers, and particularly those most directly interested, has so far saved Europe from the general war, and the possibility of a possible consequence of any war in the Balkans. One need not be in favor of his contention that the allies themselves would have the most to fear if, the war being prolonged, one or more of the Powers should intervene, "not as mediators, but as interested parties."

Yet it was hard not to sympathize with little Montenegro when these came to her Premier from a British admiral, speaking for the fleet blockading her port of Antivari, such language as this:

I desire to call your Excellency's attention to the presence of the fleet in a port that the great Powers are trying to conceal and report that their action has not been further delayed. I trust you will immediately that your government is ready to carry out the wishes of the great Powers.

It is hard not to feel a thrill of admiration for Montenegro and her king, because the assurance thus demanded was not forthcoming, "immediately" or otherwise; because they flung refusal to abandon the newly captured Scutari; because they kept on they took Scutari.

After all are the Powers quite sure they are wise to insist on making an independent country of Albania, with its turbulent and untrained population? Are they sure that in thus hastening the end of a present menace to the peace of Europe they will not be incurring formal and settlement their continental neighbors will be permanent? Unless they are sure, then it is certainly a question whether it is yet time for them to abandon mediation for coercion. It is now said that Montenegro will probably get "a territorial compensation" for abandoning Scutari. This should get something for taking it. In any case we trust she will have enough gain that the ends here who help themselves.

#### Dr. Friedman and His Friends

Senator HOLLAND of New Jersey and Governor PERDUE of North Carolina are intimate friends of the sufferer from influenza. He is well in all things who have tried to make it easier for Dr. FRIEDMAN to practice on consensitives or to sell them his vaccine without submitting to a thorough scientific test of its value or revealing the secret of its derivation.

The true interest of the vast number of people suffering from this disease lies in ascertaining, scientifically and precisely, what, if anything, Dr. FRIEDMAN'S alleged cure will do for them. It does not lie in the putting on the market of an extraordinarily patented medicine, of which they and their physicians really know little or nothing. There are already plenty of people who get more relief from consultation by receiving the same claims from FRIEDMAN'S friends, but no other help, than had such help from the press and from public officials. It is a shame that our laws do not compel such people to submit to every possible test of their claims. It is to the last degree disappointing when public men of pronounced intelli-

gence, posing as friends of "God's unfortunate," weaker instead of stronger, have been interested in ways against such human beings as work early or chiefly to make money out of their helplessness and desperation.

We are not passing judgment on Dr. FRIEDMAN'S cure. We know nothing authoritatively about it. Neither do we know Senator HOLLAND or Governor PERDUE, or any other man, acting on this. That is precisely the point of our remarks. Yet thousands of consensitives all over the country are neglecting ordinary methods of improvement because of Dr. FRIEDMAN and his claims. Apparently the gentleman made no mistake in coming to this country. We can only trust that eventually, as the influenza passes, and to medicine and the medical profession, will be inspired by the incident of his visit.

#### Cooks in Chicago

The United Cooks' Societies of Chicago want a steady work and no working for the purpose of a new contract. A bill has been introduced to the state legislature which provides for fines ranging from twenty-five to one hundred dollars for employers who exact more than six days' work in a week from cooks.

Oh, well, it might not work at all! Anything that would bring pay to the kitchen would better life. To read of this every day in the work book might be very instructive to families, to come down to a very simple and restricted diet day in the work would probably improve the public appetite and benefit the public health. The present condition of domestic service is not satisfactory. To improve it is difficult because it depends on the mood of the employer, and kindness of individuals. The manager of a large number of employes is usually selected because he seems to be fit for the work, but the manager of a household is not selected at all. Her work is done at will, and she has to make or lose the day as she can at whether she is fit or not. She gets a good deal of indifference and contempt, that some of the traditions of domestic service are out of date and need revision. There are those indeed who hold that domestic service is the last refuge of the feudal system.

Anyhow, it is a matter of trust importance, and legislative experiments with a view to improving it will be well worth trying with great discretion, especially if they are made in Illinois and the workers remain safely in New York.

#### A Situation Misconceived

G. F. SMITH writes from Boston to the *Springfield Republican* to say:

When Mr. BRAYAN as Secretary of State gives a dinner to the embassy from the King of the United Kingdom, it is not to be supposed that Mr. BRAYAN served invited at the dinner. The fact that Mr. BRAYAN's dinner party has nothing to do with the matter. It is provincial to marry such personal prejudices into dislike with foreign diplomats, and be would, very properly, be postponed and postponed should be after his personal convictions to influence his action.

Mr. SMITH'S suggestion is interesting, but it seems to be a little out of fact. The embassy of the United Kingdom would expect when in Washington to do so as the Washingtonians do, and it is a long time since they served a fat boy for dinner. No man can properly be expected of Mr. BRAYAN then to observe the ordinary usages of Washington and in other polite capitals. And yet if his private sentiments refuse to let him little fault will be found. His position will be understood even where it is not approved.

#### Pending Improvements

There are two times and once where the modern political arrangements come in very handy. "Women voters," we are told, are chiefly responsible for recalling the Mr. FRANCIS PHELPS judge, CHARLES L. WELLES, and electing WALTER F. CHASE, a lawyer, in his place." It seems that WELLES had a propensity to accept low bail bonds in criminal cases and had several times refused to be bound by the rules of the WELLES and fled. And then WELLES was recalled.

There being no recall as yet in this state and as yet no women voters, Justice GARDNER was probably safe last week for rebuking a woman out of her seat in this city for "indecent exposure" because he considered that too much of her leg showed as she sat.

There was an innocent exposure, to be sure, but it seems not to have been physical, and the woman's attire seems not to have been the culprit.

TO THE PRESIDENT! WE BEG OF YOU DON'T SIGN!

DRAWN BY C. J. BUDD

## TEMPERING THE JINGO SPIRIT IN CALIFORNIA

Secretary of State William J. Bryan, as the Administration's emissary, addressing the state Senate of California, at Sacramento, on April 28th, urging the legislators not to violate the treaty of the United States with Japan and inflame Japanese resentment by passing a bill prohibiting Japanese from owning land in California. As a result of Mr. Bryan's intervention an anti-Asian land law, less offensive to the Japanese, was passed.

# The Tenth of Muharram

BY GEORGE MARVIN

DRAWINGS BY H. H. PAGE

The Valideh Khan is an ancient rectangular stone barrack surrounding an open court

WHAT the Persian Play at Ghormuzgan is to some Christians the Ma-burrow festival is to the Shiak sect of Mohammedans. But that is a very rough and laconic definition and needs qualifying. The Muharram is observed annually, instead of every four years, like the Christian apostle. It commemorates a supreme tragedy of religious history, but the difference in the event commemorated is exceedingly typical of the difference in the character of the two faiths. The expiatory sacrifice of the Crucifixion affords occasion of sorrow and compassion which are transformed, in religious music, by the later and benediction of the Resurrection and Ascension. But the martyrdom of Hussein arouses annually in the breasts of some thirty millions of Mohammedans, in Turkey, in India, and in Persia, a grief which is passionately mournful.

Hussein was the grandson of Mohammed, and in his death the Shiaks believe the true succession of the Prophet perished, since Ali, his father, and Hassan the Beautiful, his brother, were murdered before him, and his sons were slain with him on the bloody plain of Karbala.

The "Sunnis," who form the great majority of Mohammedans today, acknowledge the authority of the "Sunna," body of traditions and aphorisms, the succession after Mohammed of Omar, Uthman, and Ali, and in whom Hussein and his family were exterminated. When on Friday Muhammad the Khalks ascended the high pulpit in Mecca Mecca to preach his weekly Sermon, he carried in his hand an unadorned sword. Truly it is the religion of the sword.

Primed with all the information I could get on the subject, I set forth with my dragoman on the afternoon of the Tenth of Muharram, the first month of the Mohammedan year, for the Valideh Khan in the heart of the Persian quarter. To take that walk from Isfahan across the looking glass and up through the labyrinthine streets of Meshed is to pass from this year of our Lord 1913, over the waters of forgetfulness, into the thirteenth-century times of Mehad and Mohammed the Conqueror. Toward midnight this impression is stronger, and generally the Mohammedan religions festival takes place after sunset by the light of firing torches. But this time, it was in the day, it was held in broad daylight, so that the Festival, which came to pray, and the Ghaize who paid kashak to me, might have been again without the assistance of a Turkish jester.

The Valideh Khan is a stone wall many times the thickness we paid to see the magnificence performance going on inside it. Khan, pronounced "Han," is a combination of iron and brass, and is Constantine, combined generally in an ancient rectangular stone barrack surrounding an open court. The Valideh Khan is the center of the Persian quarter, is one of the largest and marks the most picturesque in all Meshed. Any section of its latter court would make a first-rate back seat for some such play as "Ali Baba and the Forty Thieves." As we climbed up the steep street to get to it we could see its high gray sides, tilted here and there with green growing things, looming over the house-tops like the walls of an old fort. The street was full of people of all nationalities hurrying in the same direction, but when we arrived opposite the cavernous black gateway we found there was an occasion for which many were called, but few chosen. Three or four very big gentlemen were in the middle of a small riot were busy checking each other out and passing others in. Luckily my dragoman had brought a man, written out in Turkish and bearing a seal, and in his water, as he waved his creditable over-shoulder. I went smiling through the gate, as though through a misting rapid, into the quiet waters of a Boulevard passageway which slanted up steeply and crookedly into the open, central court.

Once inside, we found ourselves with Hassan-ul-Rashid, Ali, and probably many more than thirty others, part of a great and silent company. Persians, recognizable by their black faces, predominantly, but there were many red faces on the heads of Armenians, Greeks, and Turks. For the rest it was the comprehensive anthropological exhibit which a Mohammedan crowd is sure to be. Several gentlemen were on duty, and a few soldiers of duty. Here and there, as I was entering, stood groups of Europeans.

The center of the court was occupied by a twisted kind of pavilion whose lower story had a barred top with the rectangular sides of the Khan, but something had been happened to her, or her, or a earthquake came, or perhaps it was a curious accident had broken

upon the village of Lebanon which are to be had here by. Around this accidental structure rows and streets grew, and from its sides branched out wooden trusses from which still hang the trunks of last summer's trees. A few trees here and there softened the outlines of the lack severe; females high and dark, and full of strange springs—half window, half door; covered balconies with rugs hung; black archways—the whole composition contrasted so well with small domes like the farthest road a mosque.

In all the crowd spread laterally around this shape the only women were three ladies from the diplo-

They beat upon their breasts and cried aloud

matic regime of Persia. But up in the windows and on the balconies of the Khan I saw many Greek and Turkish women, several of the latter with their yashmaks pulled away from their faces the better to see, and apparently to weep.

Around the back of the courtyard we heard at once a maddening clash coming from the far end where the crowd was thickest, and, making our way over there, found a circle of thirty or forty men beating their breasts. In the Hindu law read that So-and-so beat upon his breast and cried aloud, but for some unknown

reason the idea never struck me literally until I saw that group of Greeks and Persians. To see things so familiar done gives more value to familiar language. These men were beating their breasts severely, not only with the hand and the lack of self-consciousness which a Mohammedan brings into all his ritual. The method varied somewhat with the man, but all were keeping time to the beat.

Early devotee held back his feet with his left hand, bearing his left breast. Pivoting back on his right hip and at the same time bending his knees, he swung up his right arm like a full, landing on himself with the force of a blow from another man. Notwithstanding their somewhat feeble general appearance, nearly every one of the men had a very creditable muscular chest, although not polished under the repeated blows. Merely as a matter of endurance, the actual exert has been trying to an ordinary man. We watched those more than half an hour and they had been at it some time before we arrived. Toward the end a few of them, who give a little more in well-doing, were only suffering short-term spasms, but the rest kept at it hammer and pound.

By all odds the finest formation was being done down at one end of the ringed-off circle by two leonard warriors who stood facing each other in what appeared to be a prearranged competition. From time to time, stirred by a heart-rending cry from some one, generally a priest who walked with amplified pace in the center of the circle, additional participants would grip the file, and then these two old shapes would hit up their stride like a crew "giving her tow" in the last drive of a slow race. The older of the two was graying in his hair and his head rolled from side to side drunkenly, but he was pain. The other, though past middle age, was a splendid, big, healthy brawler. He simply couldn't hurt himself. Clear-eyed and racy-shocked, he kept on backsliding away, all the time gaining faster, with a kind of wild-eyed cry, upon his now exhausted brother.

The priest in the middle led the chant, referring occasionally to a mural he held in his hand. The only reason I could see why the mural did not continue indefinitely was because this man never at last to the end of the book, afterwards all finished by shouting three times together: "Hossein-ab, Hossein-ab, Hossein-ab," tapering off at the end in a despondent wail.

The routine of this performance was evidently the signal for the principal ceremony to begin. I discovered by so, a crowd had been gathering at the gate through which we had come, and now as the mournful shouts died away three adventurers upon us as strange a procession as ever a disordered imagination could conjure up. Deans were laughing with a fellow, but would, and to their accompaniment we could hear faces waiting the stream, looking, outline some of the East, and rough voices raised in a leader and three shrill cries.

First came a great pile of black banners born in a double line on high poles and written over in tarnished gold or yellow thread in Persian characters, with now and then the strange Moslem symbol of a white hand. The end of one banner was held by the men carrying the next staff behind, so all together they formed a waving, funeral shroud. In the middle of this, mounted on a white horse with two shining swords crossed in front of him, came riding by a little, sword-faced boy. He could not have been more than five or six years old, but he sat up gravely in

his black clothes, looking over the heads of a commander. Behind him another white horse was led whose bridle and empty saddle, on which a white dove was tied, as he came nearer, were more glistened with red paint or blood. Then followed the drums and futes, and in front of them a double line of flagellants scourging themselves with whips of heavy chains. But we hardly noticed the flagellants because, on his round of his swinging chains, came a musician. The Russian painter, Vremontchik, now drew those terrible figures; I was partially prepared for that by having seen a photograph of his drawing in one of the shops in Perm. We stopped back momentarily as a crowd of fanatics in white robes came by yelling and hacking at their heads with swords.

A double line of flagellants scourging themselves with whips of heavy chains

Three times that procession passed slowly round the coast. By the third time the oval faces were liberally covered with blood, blood which streamed down over their faces, blinding them, and disfiguring them beyond recognition. Blood which vividly soaked their white robes until they became more red than white. We were heartily sick at it by the third procession, but mortally fascinated by the music and the sight. The men with the chains had raised red welts on their bare backs and broken the skin on their shoulders. Some of the martyrs, whether from loss of blood or sheer exhaustion, emotion, and blindness, staggered and had to be supported. Others had laid their swords taken away to prevent them from inflicting serious injuries, and two of those who walked, whose friends tried to drag them away, struggled very much as an injured man in a college football game will blindly fight to stay on the field.

But, worst of all, some one had chained the boy commander who led the procession on his white horse. As the poor little fellow rode by for the last time, a splash of red stained his forehead and trickled down over his nose, white hair.

In years of peace, when martial law does not affect the gongs and cinnings of witness, the darkness of night must greatly help that ceremony. Those who have seen it in other years by the light of firing torches describe it as an impressively weird and magnificent cavalry barbarism. But in the unappearing grey daylight of a late winter afternoon it seemed but more an ordinary spectacle than a weird and mystic ceremony. No characters shrouded details; there was more of soul here than of ornament. Dirty, old clothes, sword blood, the evidence of falling efforts were too vividly at close range, the incongruity of European operators standing calmly and critically about so ill at a moving picture, also well produced an impression much more desirable to forget than to remember.

Right in the middle of the picture, and as if on purpose to emphasize the incongruity, a singular event occurred. There came an insistent buzzing noise across the horse tops, and looking up, we saw a monoplane, less than 500 feet overhead, flying overhead in the quiet blue sky. Doubtly it was a Delagrange from beyond Yeholtschik, for we were told afterward that none of the Turkish aeroplanes were in its condition to fly, but whatever kind of bird he was, his flight produced no impression at all on the Oriental part of the crowd in the Yalshah Khan. And that was the surest proof to me of the different effect upon Occidentals of all that we saw and heard in an observance which to the Mohammedans takes part in it or watching it was a matter of permanent personal sorrow. The Christians looked up, the Moham-

medans, such in their grief, did not notice what must have been an exceedingly rare sign in the heavens. Shaking with soba, shrieking and wailing as if calling on the names of lost parents or children, the procession at the end of the third round stopped and, patting with many of the spectators round the chief point, all seemed to spend their last efforts, led antiphonally by him, in a despairing, frenzied, finale of their chrest.

A crowd of fanatics in white robes came by yelling and hacking at their heads with swords

As the crowd streamed away toward the pole we walked up the left side of the Khan, beyond the twisted knob to the next shop of old Costelli, the Persian

merchandise. After the bloody confusion and outcry of the court, it was a grateful change to settle back in the warm peace and comfort of his room. Even the sizzling of his typewriter in the outer office was an agreeable sound after the din of the Old Testament. Numerous Persian servants brought us tea in glasses and lit our cigarettes, and old Costelli himself, gruff-voiced, white-haired, and white-bearded, made us gratefully welcome as a stranger's visit to his tent in the desert.

"In Tehran, now," he said, in answer to our questions, "or Teheran—his name, too, they have a play all the ten days of Muharram. Fifty-two acts. They tell the story of Hussain. All the Shahs go there, all of the people. Here this is not much, only the common people. The priests do not ask for this, but the people, you understand, they believe that they get credit, that it makes them better."

He stopped for a moment to take from his cupboard a long, slender-looking *tschak-shak*, one of the sacrificial weapons, which a servant had brought him.

"But this is nothing," he went on, holding the sword in his hand. "You see it is very sharp like the razor. They do this because Hussain had a sword cut first on his head at Kerbala. One little cut with this makes much blood. They are not hurt, those men. Many small cuts that heal up tomorrow. It is nothing. 'The boy on the horse' Ah, that is Abdulrah, the little son of Hussain. Before they killed the father he held in his arms to say good-by to Abdulrah, and an arrow came and killed the little boy. That is why. And the other horse is of Hussain himself. From him he fell at the river Euphrates."

"But what does the horse mean?" I asked, "the white band on those black banners?"

"That is the Shah's belief," Costelli answered. "They believe the five holy ones are of the family of Mohammedan. The five figures show that, you understand. One is for the prophet, one for Fatima, his daughter, the wife of Ali, and then the two sons of Ali, Hassan, and Hussain."

"And the dove," he said, after a moment's pause—"you have seen the dove which is tied to the bloody saddle? That is for the white soul of Hussain."

THE READY REPLYER

BEING A TREATISE ON EXPEDIENT IN EXHAUSTIVE MOMENTS FOR THE OVERTHROWING UNPREPARED

(For a brilliant example of the art of the retort, see a Billiarder about to start for the Green, holding a Pool Trotter in his Right Hand.)

**B**ILLIARDER (suddenly entering the room, which is only dimly lighted): What the Dickens are you doing here?  
BETTERMAN (turning, with a polite bow): Ah, sir, with what singular provision you use that make sense of Dickens! True, you have used it in an expeditious fashion, and in a purely colloquial sense, but how aptly it fits at a moment when expeditious would have been most pardonable! In this dim light, and with this snarl upon my face, you of course do not regard me as, but, most that you have surprised me in an equivocal position. It is only proper that I should conform to you that in the world at large I am known as Herbert Walter, or Hamilton, either of those popular names known, The Third Wife of Hamilton Keston, and Kismet the Sultan's Bride, all of them favorably known to the trade as best sellers, although of which the works of Shakespeare, Milton, and Macon rank into the insignificant realm of the straggling flag. My whole life, sir, from my very beginning, has been spent in this dramatic moment has been devoted to the knowing of life, the definition of character, and the analysis of perplexing problems of high and low import. My quest is truth. Never have I stooped to pen a line that was not based upon the results of my own observation. By day, by night, even as did Dickens, to whom you have so impecuniously referred, I have sought the real and the true, and every human experience that you find narrated in my works, you may rest assured have been an actual experience of my own along the precise lines therein indicated. Do I wish to depict an heroic rescue of a drowning maiden from the treacherous waters of the sea? I employ a lady to jump into the scolding waters, myself plunge in after her, save her from her fate, and as the emotions derived from that perilous act have the psychological reactions which my romance is designed to set forth, do I wish to portray the sufferings of a man overwhelmed by debt and pursued by debtors? I never rely on my imagination in writing about the details of his stress of mind. I plunge myself deep into debt with lenders, jewelers, and restaurateurs, and from the ever-acquired agitation of my own soul with all the fidelity of my pen I draw my picture of that style of human misery. Analogous to this method was that of Dickens—as you have suggested. He drew his nar-

"CAN'T YOU UNDERSTAND, ENGLAND, I'M TRYING TO GET AWAY FROM NATURE!"

my effort to keep myself true in the highest standards of realism I have temporarily indulged upon a profession which I abhor, but which—  
[At this point spring upon the billiardier and, after gagging him and shoving him under the bed, swallow the game, put on his fat overcoat and silk hat, and walk quietly downstairs. Leave by the front door and, jumping into his waiting automobile, tell the chauffeur to take you in the Grand Central Station on foot as he can; take the 3rd train to Chicago, disembark at Albany, and return by the night boat, thereby successfully doubling upon and covering your trail.]

retirement. Most of his merry quips have been borrowed from the forgotten corners of the dearest libraries."

READY FOR THE FRAY

"Was do you suppose that man was who just went up the street in the taxicab, dressed in a suit of 'military armor'?" asked the visitor to London.  
"Some advertising agent for a costume company."  
"No," said the policeman. "That was the Prime Minister going to address a suffragette meeting, sir. He has to wear scissor-proof clothes."

AN EFFECTIVE PRESIDENT

"Boss!" said Mr. Newtop, after Mrs. Newtop had expressed the wish that a certain night President of the United States for just one week. "What could he do?"  
"What could she do?" retorted the lady. "I tell you this, James, that if I could get into the White House with a couple of good Sweden to help me I'd do more in a minute than any President we've had in twenty years with both houses of Congress and his Cabinet behind him!"

HER BALLOT

"Well, my love," said Mr. Dobbins, after her return from the polls, "did you get your vote of her?"  
"Yes," said Mrs. Dobbins, with a happy smile.  
"There it is!"  
She threw the ballot upon his desk.  
"Why," said Mr. Dobbins, "didn't you cast it?"  
"Oh!" retorted Mrs. Dobbins. "I cast it! You don't suppose for a moment that you think I've got it? I'm going to let you do it, my dear. Not if I know myself—I'm going to help!"

THE EVIDENCE

"You think old man Watson was angry, do you?" said Walker.  
"You'd have thought so if you'd seen the postman look he gave me," said Walker.  
"Profess look! What on earth is a profess look?" asked Walker.  
"Why—a sort of rummy glance," said Walker.

THE PEACE-LOVER

"You believe his peace at any cost, do you, Jump?" said Binks.  
"I do," said Simpson. "I never cherish wrath. If I have a hatred of any kind in my life I bury it, even though the only place I can find for its interment is the neck of some adversary."

THE ILL WIND

"HURRAY!" cried Binks, joyously. "Hurree for the suffragettes!"  
"Oh!" retorted Mrs. Dobbins.  
"Why," chattered Binks, "they've just dropped a

## RIDING SHANKS'S MARE

BY WILLIAM INCLIS

DRAWINGS BY F. STRECHMANN

**I** SPEAK for the revival of an ancient art, an art unknown to Americans today. Primitive man lived by it. He conquered the world with it. Ancient peoples, whose very names are long since swallowed in the black pit of oblivion, found great profit in it. The art is still practiced by all wild tribes, and it survives to a great degree among the people of Great Britain.

The lost art is the art of walking. We Americans do not walk. We take the railway train, the trolley-car, the elevated road, the subway, the automobile, the elevator, the escalator, the moving sidewalk—our, rather, these things take us—and we crowd our legs of their rightful exercise. At this point I seem to hear an interruption. "Exercise against! Dangerous! I can't take exercise!" wails the timid American. Very well, sir; then you shall take pills or a trip to Carlsbad or the deadly perfid of a surgical operation—probably all three—if you won't take exercise. . . . Away he goes in a cage, shuffling off to his fate. Poor he, such his, poor devil; he won't be with us long.

Now that we are rid of the peskic interrupter, let us take a calm survey of this walking proposition. Do we really need to walk? Wonder, if you will, but have the patience to stay in the end of this scroll and then you truly decide that you need so walk. I will humbly promise to do all your walking for you as long as grass grows and water runs. Let me make the pace of the motion, and I care not who makes its laws.

But, you may say, here is one who is quite daft about walking; I have no time to waste on such a belittling. Haven't you, though? You'd better read on, waddy caper your time. Suppose I can not only prove that walking is a splendid exercise (I would say the best except that risk falling scares his own feet) but that it is a spirited game, that it is far more entertaining than firing through duck-ponds in an automobile, that it is an overrating sacred delight, of fascination, of joy, their day or fond from bounding youth to shuffling age—then will you not give heed? And when I add that it will make you eat like Garretton and sleep like a night-walker, will you not attend? It is really a great game; the first we learn and the last we lose; let us go to it.

First of us refuse to acknowledge in our diet habit what we owe to the animal race. Though we be wise as Solomon, or mighty as Napoleon, or as full of over-ween as Shalby, we are still animals, carnivorous biped animals that need most sedulous care. Though the eye be the eye of a sturgeon, yet while it alights in this world it must receive treatment and raking upon its animal part. Treat the animal with justice, and he carries the eye barely to blink high thoughts and the great device; neglect or abuse the animal man and he stumbles and pitches his eye with more or less torture out of this world. There is no escape. Feed the horse in idleness; he spoils. Do the same with the higher animal; the result is worse.

What has this to do with walking? Everything, sir. Walking is the safest, surest, best, cheapest, and most excellent way of exercising the human animal. Whether he live in the most congested city or in the most desolate wilderness, the means is always at hand.

There, I've done it! I am an uneducated rhetorician, but I became befuddled with my own trap-saw, and my legs ran away with me at the end of the last paragraph. It was a lowering, gray, early spring morning. I did four miles along Riverside Drive in fifty-five minutes on pleasant jog on the wet, slippery ground. What a joy it was to throw down the road gun, with the propellant balling a down of ink on the point, and go for a brisk ride on Shank's mare! Time there was very little as I also should have cleared the big concrete in Central Park, were

Yet in the meager four miles along the Drive there was far more entertainment and fun than the tired business man made in his stuffy theater. From the hilltop at Grand's Tomb I looked north along the Hudson, past the misty gateway between the Palisades and toward, and far off into infinity. When ladies by the score had brought their autos out to take the air and have a few thousand words with the guardian police, the buses and motor-cars piled north and south full of fat and foolish folk, the food for silent

laughter as one swings along twirling a sprig of black-thorn. At Eightieth Street a dainty horseman—was he was a mere passenger—dismounted to tighten the girth. When he tried to remount the good bay mare regarded his efforts naively as an invitation to dance, and, like Willie in the song, she walked him around again—no need and no-mind and none. He threw me an appealing look, but I remembered doing a similar dance with a degraded gray mare under the rides of eight of Fido Garza's wretches in Cuba, while black benzoin hovered near and leaped for the best. That memory settled the dainty passenger's fate. Let him stop his own horse. He was better off.

Half-way home I became aware of a greater light in the sky and turned and looked where the sun ought to be—a little past the meridian. The cloud-bank was dissolving, and little by little the sun himself

appeared first as a pale silver ghost in the deep mist, then with more and more strength and the adverb slowly growing, but good, and at last a great grey gale, full blown blizzard. The mist upon the saddle river and the snows moved along the shore—-all as if the spirit of Turner had kindly come to paint me a picture.

But let us return to the sober discussion of the walking proposition. For, of course it is best not to introduce to Dr. Dudley A. Sargent, who for many years has directed the physical culture of the students at Harvard University, I quote from an interesting dispatch from Cambridge.

"Walk and get well. Walk regularly and keep well," said Dr. Sargent.

"Dr. Sargent has seen many thousands of men in his day; has tested their lungs, hearts, and muscles; has taken measurements of their lungs and every portion of their bodies; has seen men grow in stature and strength from gymnastic work, has followed the physical development of members of the various athletic teams in Harvard far more than a generation; has learned wisdom to become teacher of physical culture; and has applied the tape and stethoscope to all the pugilistic champions and strong men of modern times, and yet, according to the presence of a good collection of gymnastic apparatus he announces that the greatest health producer and preserver is within the grasp of every living person who walks."

The reason for this high praise of walking is not hard to understand. Perfect commotion of food and elimination of waste by the body go on only when proper physical exercise burns out the right amount of tissue each day. The best exercise, not only because it is the most natural, but because it is least apt to be overdone, is walking. There is no temptation for the tired man to "play just one more set," as in tennis, or go a few rounds more, as in boxing.

How should the walk be directed? Very simply—start from any point you like and walk home. Always let the walk end at home, where both and dry clothes await you. Never run, lest that they walk down to business every day.

Light.

Besides, there is the danger of catching cold as one sits around in moist clothes. And if the clothes are at all moist the man is an walker, but a more serious danger, beneath the notice of himself. Also, one should never stray so far on to wood or iron or lead to fetch his home. Hiding in any convenient hole, damp, and tired is a strong bid for joints—made of lead.

Put on old clothes. Carry a jagged knucklener to disengage strings from your dress. Wear a flannel shirt and a sweater and wool socks or soft wool hat, also loose, old gloves. Of course, you may wear, if you like, smartly laced skirts of muds or greases; but these are not what you need. Think socks of outdoor grip wool that has never been dyed are the best, Edward Payson Weston tells us.

"I can't tell what makes them," says Mr. Weston, "but I always recognize them at sight, and I've bought them all over the country. They never run more than fifty miles a pair."

Mr. Weston ought to know what he's talking about. He is the Weston who walked evenly from Portland, Maine, to Chicago, when he was seventy years old, twenty-four hours later than he was the first when he was only forty. He also says the shoes should be lined, of medium weight of sole, broad and comfortable, with broad, flat heels. Shoes that are too loose let the feet slide and are iron and mine blisters.

It is well to leave the front of the shoe loose, the part over the instep snug and binding, and the part around the ankle loose enough to allow free play. That is the advice of Mr. Weston, who is probably the most blizzard-wise man in the world; also the advice of Tom O'Leary, when Will Jack O'Mara used to roll "the president-probationary that came over me."

Are we, then, to become Westons and O'Learys? Far from it. That would tax our nervous powers too heavily. But we shall do well to borrow from these

masters who have learned by experience over thousands of miles just what is the best equipment for the game. And by the way, shoes one is best snug over the instep and free elsewhere by a very simple expedient: lace them very closely half-way; there to a firm square knot, then lace rather loosely up to the top.

Now to the walk, always remembering that whether in town or country the journey's end must be at home, or at least at a place where a bath and fresh clothing are to be had.

The important question now arises—shall the walker go single or in company? The answer, on Sam Weller would say, depends upon the facts and fancy of the walker. One might cite a score of authorities on either side, and each would carry conviction—if the

Should the walker go single or in company?

reader happened to be already of his mind. What says Edward Louis Stevenson, the Master of Unknown? Here is his rule:

"A walking tour should be gone upon alone, because freedom is of the essence; because you should be able to stop and go on, and follow this way or that, as the track takes you; and because you must have your own pen and scriber (not alongside a champion walker) and money to time with a gold. . . . There should be no crutch of voices at your elbow to jar on the meditative silence of the morning. And as long as a man is musing he cannot surrender himself to that fine intoxication that comes of much motion in the open air; that begins in a sort of dizziness and sluggishness of the brain and ends in a state that passes comprehension."

True; all true; every word truth. And yet who would deny himself the pleasure of companionship, even for the sake of that fine intoxication that comes of much motion in the open air? Indeed, he need not be slow to feel that; and I am sure that all who practice fairly long walks, or runs, or rides, or skating journeys will recall most instances of the delightful intoxication R. L. S. describes that have

been shared with friends. It seems to me that Stevenson was one who loved solitude for its own sake. Rightly, too, if one reflects how infinitely more exhilarating and how much more restful, how much more than the crutch or drone of voices at his elbow, though his poetic and kindly mind would be the last to think such a thing, the solitude of the walk. The Puritan on the links (I think it is) when he says, "I was a great solitary when I was young." The vast open world spoke to him, exhilarated him. Yet (although he has gone to the length of the walk, never almost into collapse in order to secure of a horse) I must record my humble opinion that good company enhances the delight of a walk on it does the delight of a swim or of a good meal. Nothing pleasant, it seems to me, can be done well alone. Even reading, which some might think a single-handed pastime, is vastly improved if one has at hand a loyal and patient friend to whom he may exclaim, "Oh, hates to this!" and the pleasure in the twofold joy of the owner of the author's thought and the ever-living fascination of his own voice.

But, to return to our path, do we really need in reason as we go? Friends, that, or a little business or mental joy in the honors of the road, are wonderfully entertaining on a walk. It can most certainly go alone—which happens far too often in those days of hot-dog dresses, and their capricious antebellums—then the mind will derive a thousand amusing pleasures which are not to be had otherwise. The feet are always a matter of few speculations. The walker asks himself, "How am I going to-day?" and, being minded that the smart must not be crushed and that a shoe pair at the beginning is the best, it is happy to find that the first mile is done in fourteen minutes. No speed is this. Changing wouldn't waste a word on it. Very well, then, let them see their walk, and you and I, friend reader, find it comfortable; go; write a word or so on a note, but a few, exhilarating pace that turns the legs like wine and makes the upper chest heave high over the deep history of full breaths.

It is good fun to loaf along the road side or two, and then, after a few moments' rest, to try a little bit of pace. The generally path around the big reservoir in Central Park is not bad for this. It becomes an even mile and three-quarters, and is broken in only two places, by the falling and rising steps and plaza of Union, at the gate-house. The air of the region is especially bracing, but, as the learned Dr. Gilman points out, it is revolutionized by great quantities of smoke brought down from the Croton works in the aqueduct and first set free as the water comes boiling and swirling into the reservoir.

However, the scene is inspiring. Miss Dutton and Charles O'Leary, and Tom Harkley and many another good man have trained her battle by often running its length. Here the risk Andrew Carnegie and first set free as the water comes boiling and swirling into the reservoir. However, the scene is inspiring. Miss Dutton and Charles O'Leary, and Tom Harkley and many another good man have trained her battle by often running its length. Here the risk Andrew Carnegie and first set free as the water comes boiling and swirling into the reservoir.

How nice and slow to the crossing note of his birds. I like to do the distance on the walk—20 minutes; 20 minutes; 20 m., 20 m., etc.—as the link of the day may have it. There is no more amusing business than to do a few miles and then sit on the bench.

As for the picture that passed themselves in sky and woods and water as one goes, I refer to speak first I should be thought a mad enthusiast. And after the journey and the shower, a ball-bow's rest and a good meal, what a reward would not repay the walker? Let us take our last look at him through the eyes of Stevenson.

"If the day be fair and warm there is nothing better in life than to lounge before the inn door in the sunset, or lean over the parapet of the bridge to watch the woods and the quick fishes. It is then, if ever, that you taste dewily to the full significance of that delicious word, 'Your muscles are an agreeable shock, you feel so clean and so strong and so life. Did whether you move or sit still, whatever you do done with pride and a kindly sort of pleasure.'"

## LIFE'S HERITAGE

BY BLAKINEY GRAY

When on a heavy bed shall rise to smile me,  
And sore afflictions come to near my soul,  
And consolation round about afflict me,  
And rills of sorrow from all sides assail,  
When soul within my eyes are every burning,  
And child unadvisedly greiveth my despair,  
And spite of all the thing that God hath bearing,  
Within my heart finds an responsive love;

When sturdy friends I've counted on are wanting;  
When enemies rejoice to see my fall;  
And in my troubles my eyes are every burning,  
Fear of a ruin imminent assail,  
When all my days are days of gloom and sadness,  
And where was light no hint of light appears,  
And every hope I hold to prove but madness,  
And they who used to serve me now to jeer;

Still in my breast, despite its load of sorrow,  
Despite the pressure of overwhelming care,  
I know the thrilling joy of a tomorrow  
When dawn shall lighten up the darkness there.  
I know a moment's light when, now starlight,  
I'll tread the path that leads on to release,  
And find a more far freer life awaiting,  
Made in the everlasting arms of Peace.

For Life and Love so close are interweaving  
That none can live and yet be partless;  
And days must come with hours, not withdrawing  
The freer years of undimmed happiness,  
And be whose share of Love is not yet taken,  
Whose measure of its joy is not yet known,  
Need only keep his Faith both sure and steady  
To come sometime, somewhere, into his own!

# SCIENCE AND POLE EXPLORATION

BY WILLIAM HALLOCK

**T**HE most professional explorer of the arctic, or antarctic regions has been considered what he is, according to the action advantage of science in any proportion to the scientific.

There are many things that he discovered on or about this globe on what is important and what he does discover, but the most valuable result to be hoped for from any expedition of danger to human life is what it may contribute to the knowledge of the world. The lives themselves of the men who undertake these expeditions are not so important to the cause of science. No one man does that the fate of Scott and his companions was very terrible, and there is no doubt that these men were brave and went through great physical privation, but just what the stresses of the Scott expedition would have meant to science, to the information of the scientific world, it had succeeded in accomplishing. It would have meant comparatively little. Scott followed the exact tracks that Shackleton had made in a previous expedition to the north pole. He was merely pursuing the plans of reconstruction in his intention to go a few miles beyond Shackleton's record. There are so many things in the Scott expedition that are not derivable from the knowledge of the world, but it is very likely that we must not attempt to judge anything about it until we get the final facts. However, aside from the information that it has given to the history of the Scott expedition, little has been contributed to science by its work. Yet if Scott had been successful, would it have contributed to science? It has been contributed to the information we already have.

### Scott's Journey Fully Justified

If we retrace the journey to the north pole to verify our suspicion that there was land there. That discovery will give us geographical information which will add to geological science by justifying a scientific theory that the north pole or the antarctic region was at one time joined to the South American and South African continents. By examining the strata and the fauna of this land at the north pole we should be able to decide the question. In this respect both the Peary and Scott expeditions to the north pole were more easily justifiable than any dash to the north pole.

Most of the men whose names have been glorified by the world for their discoveries in the great regions that lie north and south on the world have been professionally engaged in these manifold work. None of them, if not all of them, I am sure were perfectly sane that they would make no great discovery for the benefit of scientific men. They were quite sure also that their fame would be established and that their records in the popular history of their time would make history for themselves. The explorer is a peculiar type of man. He is ambitious for the highest. The contributions which are always at hand for him the perfect hero does have a material bearing upon the success of a career. The man who jumps off the Brooklyn Bridge becomes an explorer in the great herd of humanity from which he leaps. Every one who wants to more he will be left when he jumped, how he suffered, how nearly he died, and how he was rescued. All this makes essential reading matter and is read by millions of people every month whether, by jumping off the Brooklyn Bridge, the man has done anything for humanity or for science, or for himself, for that matter. Now your pole explorer, your mountain climber, are seldom accomplishing more for science than the man who jumps off the Brooklyn Bridge.

### Peary Taught Science Nothing New

Take Peary's discovery of the north pole, for instance. Scientifically it was not at all necessary for Peary to discover the pole, which it is assumed he did. It had been discovered by scientific men before his first series of dashes. We know exactly where the north pole was and we know that there was an ocean there. Peary, of course, revealed the fact that we were wrong. He discovered the water at the north pole, and he thrilled us with somewhat unverified information that it was an "unhatched" sea. But he had no instruments to measure before he got a chance to use them in this water. Without desiring to criticize any individual explorer, so far as the records of the world are concerned, the explorer's veracity is established, they can be manufactured in New York City with perfect accuracy.

I ran against a set of figures representing the records of an expedition to the north pole right here in my own study. It is a dash to the north pole that has never been there. This fact alone proves that science has a very thorough knowledge of the surface of the globe. It is in fact, there is a very little left on it to discover. Poor Cook, discarded upon the ground that his figures could not have been so accurate if he had obtained them by observation in his own study. It is a dash to the north pole that has never been there, after all. There is no such thing as an actual correct barometric measurement of the height of a mountain, because of the fact that the barometer corrects the delicate measuring instrument. And yet so find men coming back from mountains they have climbed, telling us the exact number of the height. This question of the right and wrong information supplied by explorers themselves is very confusing to the simple scientific mind. For, for instance, described having discovered on his approach to the north pole some animal tracks, possibly a fox's, which would indicate land near by, he was so sure that he would not venture very far away from land, where they must find food. At the same time, Cook described a mountain, for which he was afterwards accused of being a fabricator. Now I do not know but what Cook may have seen the land which Peary supposed was near by, in which case Cook's claim to have discovered the north pole is perfectly correct. As another of them determined the exact geographical location of the antarctic land, however, they concluded that the continent, because of the fact that the pole was open water, was very definitely sure of that from scientific information already at hand. Various other tracks and observations were set out and there actually had at the pole. But the scientific preparation is not "dashing."

I have often listened at lectures by men who have climbed dangerous mountains. Their experiences, as they tell them pictorially, have been hair-raising; they have thrilled me as they told of my own and my own, arriving at the top of the mountain, say, about five o'clock in the afternoon. And then they left me nothing but a trail and told me they got down that night in the dark. The return trip of an explorer seems to be no significance. Unconsciously the chief concern of the world at large about the explorer is how he got back. It is very often of no interest at all to science.

### Amundsen the Ideal Explorer

The man whom I consider an explorer with the quiet, scientific temperament best adapted to the service of his work is Captain Amundsen, who located the north magnetic pole, an invaluable contribution to science. While it is generally known about where the magnetic pole should be, Captain Amundsen's determination of its exact location will enable us to find out whether the magnetic line of the earth runs in unison with the magnetic pole, or whether the magnetic pole is stationary when these various facts. Captain Amundsen did not intend to get out, without any previous arrangements of what he was going to do or how he was going to do it. He had fitted out his expedition simply and went at his work, and said nothing till he had accomplished his purpose.

Now Amundsen also discovered the north pole, which has recently been verified by the flight of the dirigible. Captain Amundsen did this in a very quiet manner in which he made this "dash" to the north pole described exactly his private opinion of the scientific importance of the trip. He made no preliminary promises to contribute anything to science by making this expedition, because he knew there would be nothing to contribute. Nor did he announce that he would like to make a little side trip by a short cut to the north pole, and in a sportmanlike state of mind he made the trip. He made a little side trip by a little recreation after the long consecutive work he had accomplished in his location of the magnetic pole. Among the men who have seen extensive service in the arctic are the antarctic explorer, Captain Amundsen has had no less say about the physical and human side of that life than any of his contemporaries. His experience with one of the most arduous expeditions, Nansen, seems to have stood him in good stead. Doubtless he has personal sufferings or risks to be met with in different expeditions, but compared to the pleasure of a successful scientific discovery.

Another case where the return was fortunately considerable in comparison with the outlay was that of the expedition to the north pole by the British. The return was not so great as that of the expedition to the north pole, it was fought with human interest and was of real value. In proportion as it was not particularly important to the cause of science, it was a little outside in a region where neither man nor animal sea life is quite different from a systematic study of a branch of the human race. Amundsen's plan to discover the north pole was well be far more important to the scientific knowledge of the world than anything that has been done recently in north polar regions. I was a young man and felt free to make the journey, nothing would please me more than to apply for the position of a scientist with Captain Amundsen's expedition, but I must admit it would be chiefly a job to me.

### The Youth of the Race

The student of geology replies by his studies that the human race practically only arrived on the earth yesterday. The destiny of human life in the evolution of the earth itself is rarely impeded by our volitions of nature. For instance, if the north pole never to take a notion to change its geographical position and occupy Manhattan Island, there would be a great immigration of people from New York and Canada. Amundsen's plan to discover the north pole, by a shift of position, however, would probably take thousands of years, so that human life would not be endangered by the change. It is a matter of time to migrate gradually. I mention this to emphasize my recent statement that there is no reason to become terribly excited about a new sea and does not an unshaded part of the world, because their discovery will consist principally of their own courage and endurance, or perhaps their scientific skill or some other offering of the age.

The fact that men like Stanley or Livingston have done is particularly interesting to the human race because they have discovered something about the earth. But to go to the farthest end of the world where people do not live and where animals cannot live is merely a test of human endurance with very often showing revelations of the dangers and sufferings encountered. When men undertake to create of their own a new continent, however, at the world, such as those polar expeditions amount to, it seems necessary to establish a severe military law among themselves. The shocking revelations of the discovery of a new continent are a case in point. The shouting of a member of a party for the ultimate relief of the rest necessary if, through physical incapacity, he becomes a burden upon the rest of the party. The fitness of a man for human endurance is the cause of exquisite horror or sickness in the only requirement of these exploring expeditions. They contribute much to the glory of those men who aspire to scientific distinction perhaps, but the scientific temperament is not inclined to spectacular revelation.

### Adventure a New Form of Mania

When I read about the Dash of the Albatross climbing the Himalayan Mountains, I wonder if adventure is not becoming a new form of nervous mania. No one seems to care for the water in the Pacific Ocean, but instead, and yet there are some interesting things to be learned from the dash to the north pole. The professional explorer prefers a far-off place, a trip with all expenses paid for several years, if possible, all in the name of science. The amount of money that has been spent and the number of lives sacrificed in these polar expeditions would have been better spent in the study of the human mind, or in the scientific research. Everything that concerns the magnetic currents of the earth is in which there is no amount of money, and it is not necessary to go to science. There is no reason to believe that the axis of the earth changes or that it is subject to change, and it is not necessary to go to the north pole to find out. The dash to the north pole, however, is a matter of the human race has become so merged into one great frenzy by the other hand, which the telegraph and telephone have made. That the report which comes to us of the disaster to the Scott expedition makes us very pitiful and sad, for the first of those who have gone to the north pole, who are left behind, however, are not going to consider the deeds of explorers who persist in discovering places for quasi-scientific reasons, so much for themselves. We must ask whether the pleasure of scientific contribution is sufficient justification for the toll of human life.

## THE ROSE

BY JOHN KENDRICK BANGS

I AM the Rose, the promise of the spring  
That water's fresh ethana, so alluring,  
That water, whether by their power be,  
To bid the seed for life in slavery.

A messenger in apron bowed in rear,  
The happy and the sad, the glad and rare,  
The message that I spread throughout the land—  
Held fast by fate's! Behold me close at hand!

A messenger of love, I have, am I,  
I hold the kiss of love the night's night;  
The love's kiss, I have, that fills  
The heart's heart with a divine thrill!

And there that was the way the way,  
The love's kiss, I have, that fills  
The heart's heart with a divine thrill,  
The love's kiss, I have, that fills  
The heart's heart with a divine thrill.

The glowing colors of the dawn are mine,  
The floral hues of sunset all combine,  
To clothe me in a creature all I least,  
With peace and joy andapture and content.

And when the fragrance of my presence awakes  
The heart's heart with a divine thrill,  
The need of life in sorrow or in death,  
The everlasting sweetness of the earth!

"RIVER BOTTOM" RAISED AND LOWERED TO SHOW TIDAL EFFECTS.

The United States Model Experimental Basin, showing the general scheme under which the New York pier problem of the Hudson River was investigated.

Illustrating the effect upon speed of a tidal current when the width of the channel narrows. Flow and return areas may be produced by a vessel anchored in a strong current, or a ship moving at corresponding speed when the bottom is slant. These areas of different lateral pressure are the great influences which create what is now termed "action between ships." The relative positions in these areas of neighboring craft or their draw them together or repel them.

WIDE → SLOW ← WIDE → AREA OF ACTION LATERAL PRESSURE OPPOSITE AREA

The section of the Hudson River that is narrowed and where most of the big locks are located on the New York side. Ship No. 1 is leaving her slip and ship No. 2 is entering hers. Each of these vessels is 1,000 feet long, 1 and 2 are piers that have already been experimentally extended beyond the Gutierrez at Pier P, a pier so it would be if lengthened for a ship 1,000 feet long. This is the portion of the river that was reproduced on a small scale in the U. S. Model Experimental Basin.

A ship being turned to keep clear of the side of a channel because of an eddy current following and over taking her. The plus distribution caused by the eddy current repels the ship and probably holds her overboard.

Conditions induced by a steady eddy and its outside plus area. The inside picture shows the stream of water around a ship passing upstream. An eddy current if the channel might engender this eddy current to keep her overboard and create havoc.

## TESTING THE TIDAL PULL OF NEW YORK'S RIVER CHANNEL

# SOLVING NEW YORK'S PIER PROBLEM

BY ROBERT G. SKERRETT

See illustrations and diagrams on opposite page.

**T**HE problem of accommodating our busy river traffic which has been crippling the New York Harbor authorities for some time, has been repeatedly tackled by the engineers of the United States Army.

Most of the big steamers engaged in the transatlantic trade which dock on the New York side of the Hudson River have their pilots at a point where the stream is narrowed. The dock authorities of the metropolis had no money finished the building of especially low piers for existing steamships that the Olympic and the Titanic were laid down. In order to make proper provision for the berthing of those outgoing goods it became necessary to extend two of the piers each a hundred feet farther toward the middle of the river. The Secretary of War specifically stipulated that these extensions should be merely temporary—the understanding being that suitable docks of the required length should be provided for permanently at some other points along the river front. Such has not been done, however, and bigger ships and longer ones must now be berthed with berths within the harbor. Again the steamship lines asked that they be ready, and the municipal dock officials proposed extensions to the existing piers facing Castle Point.

The army engineers declined to agree to this, and their reasons were cogent. Those governmental experts knew that various circumstances upon the river and tidal sweep in the past years have astonishingly increased the speed of the current passing between Castle Point on the New Jersey side and the Chelsea docks of New York City. They reasonably believed that any further choking of the river's trade of way would augment tidal velocities and add both to the difficulty of docking big liners and to the hazards of navigation for the numerous craft passing hourly up and down there. You must know that when the ocean sends the flood tide inland up a river it arbitrarily fixes the volume of the water that must be received. This quantity must reach its equilibrium of distribution within the hours set for the flood-tide movement, and, again, when the sea recedes, the old flow, plus increments from streams, springs, and rainfall, must move seaward to the point of low tide with the same force of momentum established by nature's forces. Accordingly, the volume of water flowing through a restricted passageway must travel at a higher speed than where the right of way is wider and the progress more leisurely. Whatever mass does to interfere with the normal movement of tidal waters invites consequences for which he must pay.

In New York the recent increase in the dimensions of ocean liners has reflexively made the usual channels choked by congestion, and in built ports of regular length would aggravate these circumstances. The 1,100-foot steamship is probably the next development,

and we have shown just what would happen if the piers were lengthened at the narrow part of the river. We also picture some of the dangerous conditions that might arise when one or more of these great ships are entering or leaving their docks. Inevitably a great deal of water, they constitute temporary obstructions to the normal current flow which would set up serious disturbances, and one of the momentary dikes would be a sudden suggestion of the tidal velocities. Where some of lower craft are moving in the same waters these abnormal conditions might well endanger both life and property alike.

In Job's speaking of the levitation, it is said, "It smother like deep to hell like a pot," and such, in truth, is what those modern steel monsters of the sea also do. These agitators breach the surface of the water and far more powerful and of wider influence than was realized until of late; and it is only recently that these phenomena have been investigated scientifically. One of our diagrams illustrates a 1,000-foot liner passing across the entrance to a pier at which other steamships are moored. The arrows indicate graphically the all-round repulsive and attractive forces created by the passing vessel. Two actual occurrences will serve to give a better conception of the magnitude of the energy at play. When the Titanic got aboard early one day from her dock at Southampton, the water following after her induced a current strong enough to pull the 11,000-ton steamship New York away from her moorings—snapping the heavy hawsers as soon as they were taut. Moving on a little farther, the Titanic passed a dock at which wreckers were working upon a wooden barge. The nature had the barge gripped in big loops of chain and was ready to lift her. After the Titanic passed the wreckers started their hoisting, only to discover that the barge had mysteriously disappeared. Days, some days later, discovered the lost lighter eight hundred yards off and directly in the path which the Titanic had taken. The motion induced by that mighty outward-bound liner was responsible.

The army engineers were familiar with these incidents and were, therefore, particularly anxious that the interrelation between incoming and departing liners and near-by piers and passing shipping should be clearly demonstrated in the case of the port of New York before diving finally what was to be done. Accordingly, Naval Constructor David W. Taylor, collaborating with the military officials, began a series of experiments at the Model Basin in Washington—the tank, you know, being converted into a reduced scale into a veritable double of the vessel portion of the Hudson River with its flanking piers. A portable bottom was installed which could be raised or lowered to suit tidal conditions or to represent the different draughts of water at various points of the channel. Between the pier models of vessels were placed sand left free to move under six distinct velocities.

As we have seen in the case of the Titanic, the force

of these reactions is largely evolved below the surface of the water. In order that a visible indication of these perturbations might be had, Navy-Constructor Taylor moored in rows little leaves in which were attached this rock resting above the surface of the Basin. As the model vessel approached these, their movements clearly showed the direction and the mass of underflow motions, and the whole history of these actions could be successively traced with striking realism.

Mass pictures cameras were placed at strategic points, and scenes were made of each run of the model up or down the basin. In order to indicate exactly where the carriage was at every instant of its travel a great dial was arranged showing in proportionate parts the total length of the run, and the moving hand traced the progress. This register guarded against any deceptive perspective on the part of the cameras. The imaginary or model liner advanced down the tank, following the saddle of the basin, and then in succeeding runs was made to pass nearer and nearer to the ends of the pier. All the while the cameras were taking records of every movement, not only of the ship-like leaves, but of the other models flying by between the docks.

In this way the whole story of every one of the runs was graphically caught, and what would otherwise have been far too complex to follow was perpetuated so that every detail could afterward be studied and analyzed at leisure. These runs were again made with the simulated river bottom at different depths, so that it might be learned whether or not the amount of disturbance below water rose disproportionately or seriously increased at low tide. Further, the models were tested at a variety of speeds representing the double effect of speed on the ship's part opposing increased tidal velocities. Of course the water in the tank was still—the one at which the model was tested answering for the twofold purpose of moving liner and the tide flowing opposite.

In order to make these comparisons a guide for the future, one of the experimental models tested was a reduced representation of a liner a thousand feet in length. This miniature craft was put through all of the maneuvers which she should naturally have to make in approaching and in leaving her dock, and for infamy upon other models in the fairway of the river, and the degree to which these smaller craft were affected, were carefully observed.

The net result of the series of tests has been the disposal of a thoroughly vexed question in which the harbor authorities of New York and the army engineers hold opposing views. The growing size of the ocean liner has emphasized the need of greater precautions in restoring ships in confined waters and in guiding across an narrow of the basins within those waters by further narrowing of the tidal paths. The wealth of data obtained will have the value in solving the port problems of other oceanic cities.

**PARIS'S "HAM FAIR"**  
 A Singular and Amusing Introduction  
 of the French Capital

By J. M. MAGIE

LAZARUS is strolled in the heart of Paris twice as wide as Fifth Avenue and as long as the distance between Twenty-third and Forty-second streets. Lazarus, also, is the center of the street there in a park with trees. On each side of each tree is posted a number, which marks a booth and the location of booths in the *Fête en l'honneur de l'Ham*, or, as the Americans call it, the Ham Fair.

It is in the place which makes one understand why Fourth Avenue exists, and why the desire is second-hand article in New York are able to own modernities. Many articles of no use to any one are sold here that in any other fair which has come within the range of my experience, and in no place can be found greater bargains.

Go to the *Place de la Bastille* some morning in the week preceding Easter, and walk up the Boulevard Richard Lenoir as far as the *Place de la République*. You will find near the monument which marks the spot where the Bastille stood many tables selling mouth-washes, dental plates, remedies prepared to cure all illnesses, cosmetic articles which benefit the complexion, and there a long row of booths from which the women rush out with long knives, holding on the end a quantity of orange, lemon, or green liver. "That's, monseigneur, *c'est le vin*," the *habitués* read these, several of them in kindred cases are hanging or laid on plates, and descriptions of the wares are written on large sheets. *C'est-à-dire* signs are often used.

Though called the *Fête de l'Ham*, the same holds the fair. It is possible to buy nothing from a *Louis Quinze* toothbrush stand—hardly to procure vestments, neck-ties, and, a ready eye without a hand, old silver snuff-boxes, colored receivers, labor-saving laboring signs of hand saws, silver and silver plate, oil paintings, furniture of every description—ready for sale. The only things which did not see were glass eyes, but I have no doubt that they were there. Tobacco, of various kinds, was the sale of articles which goes by that name being a monopoly of the French government.

There are three French terms which the American needs to make ourselves. The first is "*Comme par magie*" another, "*C'est trop cher*," and the third is the slang, which is another cry. These are for the fair only. The reply to the first question is usually about the real value; the second means, "The response."

"Comme par magie, monseigneur? Comme ça va domine?" and the third means that they matter to him. It is impossible to say that my French *habitués* are here was detected, or the English which my friends used was overheard, and then the reply would be "*c'est pas cher* pour votre pays, monseigneur."

Six rows of booths, each usually about twenty feet long, and six feet deep, stretch along the boulevard, and between these rows—between the rows a crowd as large as that in the *Spring Garden* section of Ninth Avenue wanders from morning until midnight. It is an amusing crowd, and one treats it as a joke, and it laughs with you, and as it likes to laugh. It will not get out of your way; it will push you out of its way without a word. You may look it over and over because it has been brought up that way, and because it would seem strange to do anything else. No one seems to take offense, and a smile in Paris goes miles farther than a frown.

An old man, with curly beard, and shaggy, hair over a tray filled with coins and articles, standing each piece—as report, perfume, something for a woman to do anything else. No one seems to take offense, and a smile in Paris goes miles farther than a frown.

During the three days which I spent in wandering up and down between the tents my purchases were as follows: a remarkably well-designed *Blasfield* plate mandoline, which cost twenty cents, a pocket coffee-pot and teapot, both ball-mounted out of fine brass, though showing signs of use for which I paid a dollar; and a cashmere about of very old pattern, about sixteen feet by eight, run in several places, but beautiful color and design. For this I paid three dollars. To obtain such pieces in New York I would have paid about fifty, and at an antique shop in Paris about half that amount. One of my friends bought an old *Blasfield* plate warming-disk for forty cents and, as

antique French warming pan for fifteen francs. Another member of our party picked up a half-dollar old pewter spoon for six cents each, and two brass scoops with curious patterns, which looked as if they had come from an old kitchen of some French abbey. These cost \$1.50.

Let an one go to the Ham Fair, however, who either does not know the difference between the real piece and their imitations, or who has not a commensurate price. He will be the American, say, "amercifully stars." I would venture to say that out of a hundred thousand articles, not more than one or two, and that the chances were either that the particular article would be an imitation, or that it would be damaged so as to make it useless.

The real bargains are to be found in the most unperfected places. That of a box of iron screws I picked a better three inches in diameter, which, after being washed, proved to be silver of beautiful design. An article here a year ago found among a heap of atrocious paintings one which he bought for a few francs. It was a *Blasfield* and a good one.

It is always wise for Americans who can afford to wear Pagan gowns to take old clothes to the Ham Fair, to speak the language which Parisian says every Englishman uses and nobody understands. One ought never to pay the price asked. The dealers take delight in bargaining. A studio-lantern, for which thirty-five francs was demanded, was bought by a member of our party for fifteen.

Where do all these articles come from, and why are they so cheap? Even my acquaintances tell me that many of the result of forced sales of the goods of the late Emperor, and that the others are things which no one wants.

There is a million over all. Noble old warming-pans, with ornate-brown and red, rare new-fangled that seem to be made almost entirely of better design, obtained by someone with crystal gazing reflecting the sunshine of today—old snuff-boxes with silver lining, the diamonds of a noble one of the French of long ago, with the great aristocracy, and the nose of a blacked which marked the diamonds of the aristocracy. Each long Moorish gun, Malacca kris, or Spanish athletic comb—diamonds with a story of *malice* death. It is in this line that one's fortune and to make one wish that some of these hidden stores might be known. They are gone now and it is, as a rule, only to catch the glim of an antique past and ponder over the things that are.

**Coldwell Lawn Mowers**

HAND, HORSE AND MOTOR

are to be used exclusively on the grounds of the Panama-Pacific Exposition, at San Francisco, in 1915

The managers of this great exposition wish to show the world the best that America can produce in every line.

In the Lawn Mower line they choose the COLDWELL Mowers of all the rest.

So, in previous years, did the managers of the Big Fairs in Chicago, St. Louis, Buffalo and elsewhere.

No other Lawn Mower on the market has ever received such high and consistent endorsement.

"Always use the BEST. The BEST is the cheapest. Coldwell Lawn Mowers are the BEST."

Made in 150 different styles and sizes to suit every need. Ask about our patent Demountable Cutters for Horse and Hand Mowers. Full description on request, with free booklet on the practical Care of Lawns. Write today.

COLDWELL LAWN MOWER COMPANY  
 Philadelphia NEWBURGH, N. Y. Chicago

Gems from the Tombs

On the making of curious epitaphs there is a novel festival in the Forest of Dean, in England. Mr. Arthur O. Cooke has discovered the one to the memory of a young man named Tom:

As I was riding on the road,  
 I never knew what was to come.  
 A Bull that was legged and posed,  
 After me came a running.  
 He with his legged did me strike,  
 He being more offended.  
 I from my horse was forced to fall,  
 And thus my days were ended.

"Legged," it may be noted, is a block of wood attached to an animal to prevent it from being troubled by the horns of a bull. In the old English, a cleve had been reserved to the memory of William Peck, who was fatally injured in a railway car crash in 1847. He seems to have left a comical, as witness these lines:

Bright rose the moon, and vigorous rose  
 poor Peck.  
 On the train he used his wonted  
 Gait,  
 Ere soon arrived a mangled form they  
 were.  
 With pain distracted and overwhelmed  
 with gore.  
 The crossing men to climb the fatal day  
 A mutilated corpse the sufferer lay.

How Fish are Drowned

PARADISEAS is it may seem, fish have been drowned, just as human beings have been smothered by a too great pressure of air. One experiment consisted in putting fish into a water-tight tin, which was brought about death by suffocation. If a living and healthy fish be put into water under a bell, from which air has been driven off the glass ordinarily pressed in distilled water, the fish dies in the same way.

## A Combination That Commands Attention!

One that thoroughly and profitably covers the morning and afternoon field of Pittsburgh, Western Pennsylvania, and including liberal territory in Eastern Ohio, West Virginia and New York.

## The Pittsburgh Post

(EVERY MORNING AND SUNDAY)

is a home newspaper and covers its territory very thoroughly. Its editorial strength is measured by real merit which has given the Post a distinct individuality in the field of Journalism.

It is newsy, clean, complete and reliable; gives the best market and financial reports and all the world's happenings hot from the wires.

During 1912 the Post (daily and Sunday) gained 916,566 agate lines of paid advertising over the previous year, including marked increase of circulation, which comes from the substantial class who want what they want and have the price to pay for it.

Send for Sample Copy, Rates and Information in Detail Regarding the Daily and Sunday POST.

**This valued combination serves a vast multitude of buyers who read advertisements because they believe they can serve themselves best by taking advantage of the many commodities offered through newspaper advertising.**

Here, then, is Concentrated Combination Circulation that is as practical as it is powerful for its efficiency in reaching buyers to gain through economy, advertising. Let us give you more details about this combination.

## THE PITTSBURGH SUN

(EVERY AFTERNOON EXCEPT SUNDAY)

is the favorite Afternoon Newspaper of all classes in Pittsburgh and the well-populated zone it serves. Over a million and a half dollars are paid out in wages and salaries every day in the district covered by the Pittsburgh Sun. Hence "there's a reason" why local advertisers are liberal users of the Sun's Advertising Columns, which resulted in a gain of 665,868 agate lines of paid advertising during 1912.

It's China

The progressive record of notable achievement in advertising and circulation gains of the Sun during the year past tells the story of its value and efficiency as the best afternoon medium in this territory.

## Outdoor Books for the Outdoor Season

**Harper's Book for Young Naturalists**  
By ALPHUS HYATT VERRILL

Will help boy collectors to gather and arrange their collections intelligently. Taxidermy, trapping, cutting, and mounting insects, dwelling at the seashore—all are explained. Fully illustrated. Crown 8vo, cloth, \$1.50 net.

**Harper's Camping and Scouting**  
CONSULTING EDITORS:

GEORGE BIRD GRINNELL DR. EUGENE L. SWAN  
Editors "Forest and Stream" Director Pine Island Camp

THIS most comprehensive camping book for boys and girls yet written—the work of experts. A full and practical explanation of everything connected with organized camps for boys and girls. Written for the most part by a physician. A wealth of drawings, diagrams, and photographs illustrate this book. Cloth, Crown 8vo, \$1.75

**Motor Boating for Boys**

By CHARLES G. DAVIS

THIS is a simple, practical handbook of water-boating which has been prepared as the result of large practical experience. While this book is intended to be as clear and simple that any boy can use it without difficulty, yet it will be found of immediate value to motor-boat owners of mature years. Illustrated. Crown 8vo, 50 cents net.

**Harper's Outdoor Book for Boys**  
By JOSEPH H. ADAMS

A PRACTICAL book with clear directions how to make all kinds of outdoor things like windmills, tents, boats, tree huts, etc. Illustrated. \$1.75

**Harper's Boating Book for Boys**  
By CHARLES G. DAVIS

INSTRUCTIONS how to make model boats and other craft; then the making of boats for actual use. From boat-building the reader advances to boat-sailing, the choice of a boat, its outfit, and care and management. With Many Original Illustrations. Crown 8vo, cloth, \$1.75

**Harper's Guide to Wild Flowers**

By MRS. CAROLINE A. GREEVEY

"ONE of the best books of the kind we have ever seen—clear in description and giving a very complete list of American wild flowers."—Western Christian Advocate.

"A readable and workmanlike aid for botanists and all who roam through the country."—N. Y. Sun. Illustrated. Photos in Color. \$1.75 net

## In Commemoration of the "Titanic" Dead

The lighthouse tower shown in the accompanying illustration forms a corner of the new Naamans Institute, on South Street, New York. It faces all the way from the street, and is surmounted by a regulation lighthouse with a keeper and lantern-room which send green light will shine, visible far and at sea. An oval tablet of bronze at the base of the tower will bear the following inscription:

THIS LIGHTHOUSE TOWER IS A MEMORIAL TO THE PASSENGERS, CREW AND CREW OF THE "TITANIC" SHIP OF LONDON WHO DIED ON APRIL 15, 1912. It was erected after collision with an iceberg on April 15, 1912. Erected by Public Subscription 1912.

The total cost of the Institute was more than a million dollars, of which some \$250,000 has yet to be raised. The New

The lighthouse tower of the new Naamans Institute, erected in commemoration of the "Titanic" victims

York's Benefit Society and the American Naval and Historic Preservation Society were responsible for the obtaining of the contributions, from which the late J. P. Morgan gave \$100,000 and John D. Rockefeller \$50,000. The Institute has sheltered 50,000 men yearly, with lodging for sailors and officers at board, day to sixty cents a night. There are also a chapel, savings bank, medical clinic, employment bureau, relief society, and lyceum.

## A Map for the Blind

It is reported from the British capital that the most remarkable map of London yet conceived is now contemplated for the use of the blind. It is a map that will convey to the sightless, through the sensitive tips of their fingers, a true mental impression of the position of the main thoroughfares, the principal places of interest along these thoroughfares, and the means of access to them. This map will be "drawn" in relief and will consist of a combination of dots and dashes, a medium that has already provided for the sightless what had before been denied to them.

Already the blind of London are in possession of the most complete series of plans of London's underground railways that are available for public use. They are able, by the aid of eleven embossed charts, in study in detail the routes of each line system, the Metropolitan and the district railways, and can follow without any possibility of error the complete-line charts on the whole network of underground services. There are even diagrams demonstrating the construction of the lines, and the fact, and always realized by normally sighted passengers, that a tube station is itself a tube, only of much greater diameter than that provided for the passage of the cars between the station.

**The Chemistry of Toadstools**

Five exceptionally large number of acres of toadstool poisoning which have occurred in France lately have led chemists to analyze these fungi and publish their findings. The general conclusion is that the advice that all fungi, except the cultivated mushrooms, had better be left alone. It is difficult to say which are wholesome and which are not, for they may affect one person injuriously and others not so. The character of the soil, its degree of moisture, the temperature at the time of growth, and other factors control the chemical quality of the fungus, making various varieties even in the same locality. Some species are poisonous when young and not later. Others are comparatively harmless alkaloids, which have been isolated from several species of toadstool, changes on decay to the deadly strychnin, which resembles in its action strychnin, the poisonous principle of the acacia-tree (*Linnaea maritima*). This alkaloid takes its specific name from the fact that insects die that feed upon it; and it used to be made a mixture for killing flies by soaking it in water which was allowed to poison the flies. Yet even this so-called "toadstool" is said to be regularly eaten in certain parts of France and Sicily, and in Siberia it is widely prepared for the purpose of intoxication. The toadstool are collected in the woods, meadows and hung up to dry. When required for use they are rolled up and wrapped in paper, the paper or tree small will, in a couple of hours, produce an intoxication that lasts for twelve to twenty-four hours.

A very rare relative of this is the death cap (*Amanita phalloides*), which, like the scarlet fly-cup, is widespread in the United States and Canada. This and other species contain poisonous and narcotic elements which cause a distressing death in at least half of the cases where they are eaten. The action of the poison on the system is chiefly to dilate the red capillaries and congest the brain. The alkaloid strychnin, and probably also phalloin, acts in precisely an opposite way to atropin, the alkaloid of the nightshade (*belladonna*), for it paralyzes the heart, while atropin stimulates it, so that the latter may be used as a remedy counteracting the former's effect. Curiously enough, the toadstool contains a second alkaloid, phalloidin, which neutralizes the toxin of the muscarin; and it has been suggested that in those places where the fly-cup is eaten this element in the toadstool must be relatively large, so that the antidote is swallowed with the poison.

In cases of true toadstool poisoning, which can be distinguished by the fact that the symptoms do not appear for several hours after eating, the only remedy of any value is sulphate of atropin, six-sixteenth part of a grain to be given hypodermically every two hours.

into the flushing apparatus. Light causes the sensitive bar to expand longitudinally, and as the fly breaks it gradually closes the valve till it entirely shuts off the supply of gas. The waxing sun, causing the bar to shrink, gradually opens the valve and liberates the gas, so that it runs again past on to the burner.

It will be readily seen that this light might light itself perfectly in different seasons, and it has been proved that not one foot of gas is wasted.

**The Breadfruit Tree**

One of the gifts of the Eastern tropics to the West is the breadfruit, which is now extensively planted in the West Indies. This can be done only by cuttings, as the cultivated variety develops no seeds. In the wild form the chestnut-like seeds are eaten, but the pulp is discarded. The tree is of moderate height, but spreads a broad crown of large, ragged-edged, glossy leaves, making an excellent shade. The fruit, which is a compound of the massive clusters of blossoms, is about the size of a coconut, and is incased in a rough rind. This, when broken in hot waters, or in an oven, breaks open and is scooped out with a spoon, tastes like mashed potatoes and milk, or like sweet bread, which is also known in appearance. It is a little fibrous toward the center, but elsewhere is quite smooth and soft. Sometimes it is eaten as it is made of it, and it goes well as a vegetable with meat or gravy. "With sugar, milk, butter or treacle," Wallace writes, "it is a delicious pudding, having a very slight but delicate and characteristic flavor, like that of the chestnut, and is polished, one never gets tired of it." It is also highly nutritious. The green (*artocarpus*) contains several species, one of which, the jackfruit, is also cultivated for eating. The timber of the tree is also useful, the bark can be prepared for a sort of cloth, and the sap, when boiled with milk, is a mucilaginous liquid very useful for soothing the sores of wooden pulp, cankers, and the like, water-tight.

**Caviar**

Fresh caviar, or sturgeon roe, is of a light color and is contained in a membrane. The roe is cut out and placed on a silver tray, through which it is rubbed carefully without breaking the grain. In order that it may be rid of any refuse it falls into a preparation of brine, and after remaining therein for three or four hours is required to sink in water, when the brine gradually dissolves off, leaving the caviar ready for consumption. For local consumption, or when it can be kept conditionally on ice for a few days, the slight salt is omitted.

Salted caviar is prepared in the same way as fresh, except that the brine is stronger and the caviar remains one day in the salt in drink, after which it is allowed to rest for the brine to be removed. For the production of good caviar the brine must be boiled and cooled.

Caviar is prepared from the sturgeon. The roe is cut out and blown into a preparation of brine made of nitrate of soda and twelve ounces of salt per pound. It is then carefully sorted and the refuse is cleaned off, when it is ready for packing.

For about a month this caviar is sold but it gradually becomes solid. For good results cold weather is required and the caviar is taken out of the salt when it is bought. This caviar is more perishable than the fresh. It will not keep caviar if it is prepared from the fish cooked. It is strongly salted and carefully packed to keep it whole.

Most of the caviar comes from Russia.

**A Wooden Orchestra**

Texas has been found in Brinsford, Lombardy, a unique orchestra, or, more properly speaking, a band, the instruments of which are all made of wood.

The pipes are made of reeds, and are fastened together side by side after the fashion of those seen in pictures of the Gipsy Pans. Each man plays pipes of a different size and length, the base pipes often being several feet long. Besides the pipes are other instruments, such as drums, flutes, French horns, and even a rub of wood.

The members of this odd band are all gipsies of a kind of music—that is, they are knowledgeable in the art of music. But they must have a quick and sensitive ear for harmony, since their entire opportunity for learning is the music they hear. Consequently these most primitive of musicians often learn their selections from that most modern of instruments, the gramophone.

The music produced by this strange band has a curious, weird sort of effect, but is not unpleasant.

**The Forty Beaches**  
of the  
**New Jersey Coast**

These summer playgrounds of the American people are made easily accessible from all parts of the country by the comprehensive and convenient train service of the Pennsylvania System.

They are all described in the Pennsylvania Railroad Summer Excursion Book, copies of which may be obtained free of Pennsylvania Railroad Ticket Agents, or they will be sent postpaid on application by Jas. P. Anderson, General Passenger Agent, Broad Street Station, Philadelphia, Pa.

**The Automatic Lighthouse**

The lighthouse-keeper, about whom has gathered so much interest and romance, is to be driven from his post and replaced by an automatic device which lights the lamp and extinguishes it without the aid of human hands. The inventor is a distinguished physicist named Daniel Pratt, and he has received the Nobel Prize. It seems tragic that one who has done so much for the world should be driven from his post by his own invention. Doubtless his great brain, which has done so much for the world, is being driven from its post by the action of the sun. The light may be from one hundred to several thousand miles power, and will work for months without any attention.

Anything plays an important part in this invention. Had it not been for the discovery of the French chemist, the lighthouse light would not have been possible. How anything is dangerous to health, and not easily cured. The new process renders it comparatively harmless in working, and without risk in transportation. The only real danger is large welded steel cylinders, such as are used for compressed oxygen and other gases.

Daniel Pratt invented a flushing apparatus, whereby the light, instead of being extinguished through the lens, is blown out by a characteristically powerful power are operated by the action of the sun. The light may be from one hundred to several thousand miles power, and will work for months without any attention.

**Light-measuring Bacteria**

In the world of bacteria there exist many wonderful and curious forms and processes. For instance, there is phototaxis—the influence of light upon the locomotion of these simple living organisms. There is a kind of bacterium, shaped like a very minute red rod and of a pinkish color, which exhibits this influence of light in a wonderful way, so wonderfully, indeed, that men of science have termed it "the light-measuring bacterium." Should a drop of water containing bacteria of this family be placed under a microscope, and a narrow beam of light be thrown upon any part of the field of view, the organisms immediately flock to the illuminated spot, and, if their presence in great numbers, they impart to that part of the water a color like that of wine.

Moreover, these bacteria discriminate between colors, for when there is thrown instead of a beam of white light, a narrow spectrum into such a drop, the bacteria avoid the purple and crowd into light of that color that is absorbed in passing through their bodies.

Another bacterium, the culture of a red or orange color at the forward end, invariably advances toward blue light when a choice is afforded it among the colors of the spectrum.

Still another phenomenon in the world of bacteria is that which scientists know as "chemotaxis." This depends, not upon light, but upon the presence of certain kinds of agents. An instance of this is furnished by the behavior of the common bacteria found in the water of a stream. If, immediately the organisms flock to that part of the water where the oxygen is being liberated, the bacteria find other organisms are attracted by sugar or by acid.

A most wonderful case is that of a kind of plasmodium called *Dictyostelium*, an organism that consists of transparent, structureless, living amoebae that crowd together along a wet surface. When a bit of fungus is placed near the edge of this flat, shapeless, yellowish thing, the amoebae crowd toward it, and the plasmodium becomes greatly excited, and streams of living material begin to flow through it toward that point. Then the organism begins to grow out toward the fungus and gradually envelops it, and the operation ends with the absorption of the fungus.

These various phenomena convey to us a new interest, not only in learning that what we call "inflammation" is a result of chemotaxis. Whatever distinction it takes place through injury inflicted upon one of the living tissues of the body, it retains organic cells that exist in the blood and other fluids conveyed to the products of distillation. It has, therefore, been suggested, that those chemotactic cells are like extraneous in the blood, which tend to fix it from infection.

**Swords of the Orient**

The manufacture of the exquisite swords of Japan is attended by curious religious ceremonies. The wields of these houses in which the work is done are representations of the god of the sword-makers and the chief匠人 (craftsmen) are also of singular bits of krypter wood and ropes of straw—charms to keep away evil spirits. No man will touch any of these things, since the presence of women is supposed to be conducive to the appearance of disease, and the hands being clean, the work is the more perfect. Prayer is offered before the work begins, and various religious rites must be performed before any of the swords can be declared well and truly made.

Just before the final polishing and sharpening of the swords they are offered, one by one, for the blessing of the sword and. The weapon is placed in front of the workman on the wall, with a pair of white, silk, and ornamented, after which prayer scrolls are read and a blessing on the work is invoked.

Whenever the making of metal swords may have originated, the chief fame belongs, of course, to Damascus, and these weapons have been made from time immemorial. But almost equally famous are the swords of Khorasan. The steel used is also of singular bits of krypter wood and ropes of straw—charms to keep away evil spirits. No man will touch any of these things, since the presence of women is supposed to be conducive to the appearance of disease, and the hands being clean, the work is the more perfect. Prayer is offered before the work begins, and various religious rites must be performed before any of the swords can be declared well and truly made.

The particular treatment of the steel used for the manufacture of Asiatic swords had been known to the West for a long time, and the reputation for the letter, for the Damascus, or "waking" of color Persian and Indian arms since the middle of the century was evident in the making of

**What Pleasures Have the Summer Months in Store For You?**

Why not give yourself a real vacation this year. Not only for a week or two, but the whole summer through—yes, and next summer and many more to come.

Get a motor boat and know the thrills and exhilarating emotions of a real sport—get the real enjoyment and pleasure of motor boating.

Show your family and your friends what a wonderful and splendid sport motor boating really is.

Motor boats are safe—simple and easy to operate—the upkeep cost is wonderfully low, simply gasoline or kerosene and lubricating oil—and with a tiny motor for power you have an economical and dependable outfit. A small boat will give you all the thrills of a big boat with perfect ease.

The first cost is low, you can get a motor boat and sail motor boat for a very reasonable cost.

**Our Boat Buyer's Service is For Your Special Benefit**

We can undoubtedly help you in getting the right boat at the right price. Write us about your needs—tell us what kind of a boat you are interested in and how much you wish to invest in it and we'll get our best builders' estimate and the best of this special service.

**A Gray Motor in Your Boat Means Absolute Satisfaction**

**Boat Catalog Free**

We will gladly send you a complete Boat Catalog which contains a full description of many different types and sizes and gives prices of complete boats with Gray Motor installed.

**One of The Specials From Our Boat Catalog**

**18** Through longshore work made suitable for 12-16-hp. and will give a good work out. A perfect motor for use in lake and river work. For use in 12-16-hp. boats. **\$142.50**

**GRAY MOTOR**

Gray Motor in motor boats, 12-16-hp. and 20-hp. and 25-hp. and 30-hp. and 35-hp. and 40-hp. and 45-hp. and 50-hp. and 55-hp. and 60-hp. and 65-hp. and 70-hp. and 75-hp. and 80-hp. and 85-hp. and 90-hp. and 95-hp. and 100-hp. and 105-hp. and 110-hp. and 115-hp. and 120-hp. and 125-hp. and 130-hp. and 135-hp. and 140-hp. and 145-hp. and 150-hp. and 155-hp. and 160-hp. and 165-hp. and 170-hp. and 175-hp. and 180-hp. and 185-hp. and 190-hp. and 195-hp. and 200-hp. and 205-hp. and 210-hp. and 215-hp. and 220-hp. and 225-hp. and 230-hp. and 235-hp. and 240-hp. and 245-hp. and 250-hp. and 255-hp. and 260-hp. and 265-hp. and 270-hp. and 275-hp. and 280-hp. and 285-hp. and 290-hp. and 295-hp. and 300-hp. and 305-hp. and 310-hp. and 315-hp. and 320-hp. and 325-hp. and 330-hp. and 335-hp. and 340-hp. and 345-hp. and 350-hp. and 355-hp. and 360-hp. and 365-hp. and 370-hp. and 375-hp. and 380-hp. and 385-hp. and 390-hp. and 395-hp. and 400-hp. and 405-hp. and 410-hp. and 415-hp. and 420-hp. and 425-hp. and 430-hp. and 435-hp. and 440-hp. and 445-hp. and 450-hp. and 455-hp. and 460-hp. and 465-hp. and 470-hp. and 475-hp. and 480-hp. and 485-hp. and 490-hp. and 495-hp. and 500-hp. and 505-hp. and 510-hp. and 515-hp. and 520-hp. and 525-hp. and 530-hp. and 535-hp. and 540-hp. and 545-hp. and 550-hp. and 555-hp. and 560-hp. and 565-hp. and 570-hp. and 575-hp. and 580-hp. and 585-hp. and 590-hp. and 595-hp. and 600-hp. and 605-hp. and 610-hp. and 615-hp. and 620-hp. and 625-hp. and 630-hp. and 635-hp. and 640-hp. and 645-hp. and 650-hp. and 655-hp. and 660-hp. and 665-hp. and 670-hp. and 675-hp. and 680-hp. and 685-hp. and 690-hp. and 695-hp. and 700-hp. and 705-hp. and 710-hp. and 715-hp. and 720-hp. and 725-hp. and 730-hp. and 735-hp. and 740-hp. and 745-hp. and 750-hp. and 755-hp. and 760-hp. and 765-hp. and 770-hp. and 775-hp. and 780-hp. and 785-hp. and 790-hp. and 795-hp. and 800-hp. and 805-hp. and 810-hp. and 815-hp. and 820-hp. and 825-hp. and 830-hp. and 835-hp. and 840-hp. and 845-hp. and 850-hp. and 855-hp. and 860-hp. and 865-hp. and 870-hp. and 875-hp. and 880-hp. and 885-hp. and 890-hp. and 895-hp. and 900-hp. and 905-hp. and 910-hp. and 915-hp. and 920-hp. and 925-hp. and 930-hp. and 935-hp. and 940-hp. and 945-hp. and 950-hp. and 955-hp. and 960-hp. and 965-hp. and 970-hp. and 975-hp. and 980-hp. and 985-hp. and 990-hp. and 995-hp. and 1000-hp.

**GRAY MOTOR CO.**  
 532 Gray Motor Bldg. DETROIT, MICH.

"Dynamite" gas-barrels until it was discovered that steel was preferable for the latter, at least from the manufacturer's point of view.

In the case of second steel the "witness" effect is produced by a process of crystallization so that when the second is struck out a more or less regular pattern is seen resulting through it. The effect is pleasing to the eye, though it is said that the quality of the metal is neither better nor worse for being treated in this fancy manner.

**The Horseshoe**

It is not particularly difficult to give any horse of horses care in using the horseshoe as a layman skilled in shoeing horses were held to be especially responsible to the satisfaction of clients. If previous care and taken these laborious operations would ride the horse at least of night over the hills, and when the mare came in the stable in the morning he would find his anatomy in a better and stiffer condition. A horse shoe placed over the stable door was believed to ward off evil.

There is an superstition more deeply ingrained in all classes of society than that which pertains to the horseshoe. As an emblem of good fortune it holds pride of place. Nelson did not decline to sail his fleet to the coast of the victory. In the early part of the nineteenth century the horseshoe was highly prized, and it was worn by the mechanics where it was not displayed, while hammer blows were given great pains to fasten it over their doors.

In Greece and Rome horses were not shod. The ancients were content with wrapping their hoofs with the best of the horsehair to resist weather, or when it was necessary to pass through icy districts. Instead of driving the nails through their hooves, they used to harden the heads of their manes. Now, however, who ever stoole in outdistance his contemporary, covered his hooves with shod with silver, but an axle were driven into the hoof. The practice of shoeing horses by driving nails into the hoof was introduced into England by William the Conqueror, but for centuries the practice did not gain much headway.

The Indians, who had no spurs as horsemen, never thought of shoeing their mounts in any way, and yet they were capable of performing some of the journeys over the most difficult country. Even at the present day in Japan the manure horse is a very strong competitor in the old-fashioned modes made of steel, which are fastened to the horse's feet by means of what they call a man's feet.

**Freezing a Mine Shaft**

RECENTLY, at a colliery in England, there was presented an engineering problem of considerable difficulty, in shodding a shaft water had been encountered. It was being pumped out at the rate of one hundred gallons a minute, and it looked as though the engineers would be beaten. But, luckily for the colliery, certain German engineers came to the rescue with their freezing process. They bored holes around the shaft to a depth of four hundred feet. These holes were filled with lead tubes and an inner tube was inserted down which brine was pumped from the freezing plant. The brine converted the water into ice, and the shaft was frozen from the bottom. The sinking of the shaft was through the ice. When the bottom of the ice had been reached, iron tubing plates were fixed and the water then run off permanently.

When the work had been completed warm water was pumped down the tubes to thaw the ground gradually. The frost wall was of such strength that to thaw it required a period of about three months.

**Electricity in the Preparation of Peat**

For a long time peat was made into coal, and for fuel by a slow fire. The process was based upon air drying. But the steadily increasing demand for peat led to the invention of a new method of drying peat, which ordinarily contains eighty per cent. of water. The process is based by the heating of the peat from air to the peat. Since 1860 large numbers were adopted in England to combine dry and electrical processes. The peat is placed in rotating cylinders, where the centrifugal force, aided by an interior vacuum, causes the water to be driven off. Electrodes connected with a dynamo are then introduced in the cylinders, and the peat is dried by the action of which a afterward pressed into briquets.

A Journal of Civilization

EDITED BY GEORGE HARVEY

WEEK ENDING SATURDAY, MAY 17, 1913

[12 CENTS A COPY  
\$1.00 A YEAR]

## An Appeal to the President

"Equal and exact justice to all men, of whatever state or persuasion, religious or political. . ."—FROM THE FIRST INAUGURAL ADDRESS OF THOMAS JEFFERSON.

"We reaffirm the principles of Democratic government formulated by Thomas Jefferson."—FROM THE DEMOCRATIC PLATFORM OF 1912.

"Equal rights for all, special privileges for none!"—THE DEMOCRATIC CREED.

To the President:

WHILE I set up no claim of special or tacit right to address you directly. Neither do we conclude that our doing so at this critical moment can be fairly regarded as a presumption act. It is from a very deep sense of duty that we feel impelled to speak out frankly and earnestly in a time of greatest peril, not to yourself alone, nor merely to your party, but to your country and to the fundamental principles of democratic government. We may be speaking too late. You may have chosen the road you propose to travel before these words shall appear upon the printed page. And our appeal may be in vain. In any case, we cannot remain silent while you stand at the parting of the ways.

The most vicious bill ever enacted by a Congress of the United States now awaits your approval or your dissent. There is and can be no question of its intent or its certain effect. It divides the American people into two great classes. It provides the means for the prosecution of one set of citizens who may violate the law. It explicitly withholds means for prosecuting another set of citizens for breaking the same law. No amount of specious reasoning can obscure that our ritual act. It stands out as ludicrous as day. Punishment for some; exemption for others. That is the measure which reveals your signature or your veto.

You know it. You recall that you do when, as Governor of New Jersey, you killed a precisely similar provision.

The thirty-eight Democratic and the three Progressive Senators who passed the bill know it. Their political attempts to excuse themselves may only too plainly betray their perfect understanding of the impurity of their performance.

The thirty Republican and the two Democratic Senators—POWERS of Ohio and TIMMONS of Colorado; honor to their names!—know it. Their arguments were exclusive and irrefutable.

The country knows it. If any doubt on this score lingers in your mind, we beg of you to study the public journals. From Maine to California has arisen a universal chorus of protest. But one other note has been struck. It is that of incredulity that you, WOODROW WILSON, of the bravest intelligence, of profound knowledge, of boundless spirit, should be ever suspected of intent to betray your country and belie your convictions. Does not that speak for a serious situation? Is it not in truth crucial?

We shall make no extended analysis of this infamous measure now. That duty, if it must needs be performed at all, is for the future. It suffices for the present to recall the faithful words from the Appropriation bill:

For the enforcement of anti-trust laws, assistance of process. That no person shall be permitted to speak in the prosecution of any organization or individual for entering into any combination or agreement having in view the increasing of wages, shortening of hours, or bettering the conditions of labor, or for any act done in furtherance thereof not in itself unlawful. Provided further, That no part of this appropriation shall be expended for the prosecution of providers of farm products and necessities of farm life, and no person shall be permitted to speak for the purpose to obtain and maintain a fair and reasonable price for their products.

The plea was made in the Senate that the exemption applies only to any act "not in itself unlawful." It is asserted by many delegates from Washington, bearing a semblance of authority, that this claim will constitute the basis of your own defense if, at this early and most important juncture period in your administration, you should unwittingly assume the defensive upon an utterly indefensible proposition. One need not be a lawyer to perceive the fallacy of this contention. Nothing could be plainer than that the portion of the provision dealing with the words "or bettering the conditions of labor" is complete in itself. There is in the crux of the whole business. The succeeding words were added craftily to distract attention from the real prohibition, for an reason which is hardly worth leaving but to derive. Even their face they are unmeaning and futile. What nonsense to forbid prosecution for "an act not in itself unlawful!" What sense in saying that one was entering into a lawful combination shall not be prosecuted! More obvious chicanery was never written into a statute.

There is absolutely no limitation in the first portion of the provision—the portion that has teeth in it. The Attorney-General is fully and unqualifiedly forbidden to prosecute any combination or agreement, criminal or not, which may have in view the increasing of wages or the shortening of hours or the bettering the condition of labor." President Taft struck the quick of the matter with the sanity of judicial analysis when he wrote in his veto of this very measure:

The provision is subtly worded so as to be narrower in content its full effect by providing that no part of the money appropriated shall be spent in the prosecution of any combination or individual "for entering into any combination or agreement having in view the increasing of wages, shortening of hours, or bettering the condition of labor, etc." But that organization formed with the best-laid purpose described in the provision might later engage in a conspiracy to destroy by force, violence, or unfair means any employer or employees who failed to conform with its requirements, and yet because of its originally avowed lawful purpose it would be exempt from prosecution so far as prosecution depended upon the means appropriated by this act, no matter how heinous the crime, but within the scope where it was purely, so to say, by the following sentence in the act, such an organization would be protected from prosecution "for any act done in furtherance of the increasing of wages, shortening of hours, or bettering the condition of labor, not in itself unlawful." But under the law of criminal responsibility acts lawful in themselves may become the means whereby by an unlawful purpose is carried out and accomplished.

It follows necessarily and indubitably that, under this infamous statute, any one who openly and deliberately breaks the law for these ostensible and indeterminate objects are made liable to punishment. They can do what they like in any way they like without incurring the slightest danger from the Department of Justice. It is the plain English of it, clear and unmistakable.

"The real meaning of these provisions," quoting the "official statement" of Senator Root, "is that the Government of the United States gives no aid to the Executive that a labor-organizer who commits the crimes described in it, to SENATORS, act, or an agitator equally criminal, shall not be punished."

What can such action mean? What involved? Consider the broader aspect.

"Let me ask you, sir," continued Senator Root in words that DANIEL WEBSTER might have spoken, "how will this present issue to the multitude of our citizens not included in these exempted classes? Where will be the willingness to abide by the law; where will be the confidence in the justice of the law; where will be the sense of obligation to the law because it is law on the part of those multitudes of American citizens who find themselves constrained against doing what is necessary for the protection of their livelihood and other classes permitted to violate the law for the same purpose? How can we fail to create a sense of initiative; how can we fail to create opposition to the law, to create a feeling that it is right for men themselves to assert and to exercise the same freedom that is given to their neighbors?"

And let us ask you, sir, if this exemption were granted to employers instead of to employees, what would be your opinion? Would you regard it as a shadow of doubt? Does not that simple question effectually dispose of any specious insistence that this is not class legislation—that it does not, as we have declared it does, divide the people into two great parts, one of which must keep while the other may break the law?

We shall not dwell upon the evasion and evasive method adopted to achieve this purpose. That is all too plain. Even those Senators who tried to make sense admitted that it would be more natural, more proper, and more rightful to amend the SUSPENSIVE law itself. Why, then, did they not do it? Because consciously an amendment reflecting a designated class of citizens from the consequences of criminal acts would be unconstitutional. The Fourteenth Amendment stands as an insurmountable barrier. It was so held by the Supreme Court in a precisely similar case. What, then, is this but an attempt, avowed and brazen, to subvert the Constitution by individuals—by withholding from the legal officers, the means to prosecute, by striking down the arm of Justice, by rendering law itself impotent?

Can you, Mr. President, stand for that—you whose chief merit in the eyes of the people is your love of straightforwardness and your detestation of deceitful practices?

In answer to those who urge you to accept responsibility for this legislation as showed policies on my lecture! You were not elected by the nation-and-beyond. That element in the Democratic party went to Mr. BOVENYER. Your plurality caused for millions of conservative Democrats and approximately one million of Republicans. You won through by their faith in your sagacity, your integrity, your conscience, and your fidelity to constitutional government. Surely you would not willingly doctory or inquire that. What could take its place? The support of the working-men and the farmers! Believe it not.

The farmers do not want this law. Study the facts elicited by the Senate debates and you will discover, as Senator CHAMBERLAIN declared, that "no farmer's organization presented such a demand to the committee." Assembly the great number of working-men who are not members of unions do

not favor it. Nor is it at all certain that thoughtful union men are for it. They are also enough to perceive the danger of reaction from flagrant class legislation. So far as outward indications afford basis for judgment, it only Mr. Sherman who, in characteristic excess of zeal, insists upon overreaching. As against that agency, avowed none too reputable by Mr. Gonzalez's present position before the courts of law, weigh the proverbial sense of American fair play, the protests filed by merchants' associations, and the universal silence manifested by the press, and note how the scales balance.

Don't do it, Mr. President. Don't disappoint your friends who have declared your sincerity. Don't justify the enemies who have immolated you a demagogue. Don't set aside previous loyalty. Don't crush out the faith in you that has just where you are. Don't think to make adequate excuse by saying other opportunities may be employed in the face of this mandate of Congress. Above all, don't let yourself be convinced that you can put up or even share with Congress the responsibility. It shows you can show conclusively that this bill was moved upon you against your will, that you have no right to attempt to shift it when there was no need, the credit or the blame must be yours and yours alone.

Can you do that? We fear not. It stands before the public as an administration measure. But you can and should, and may God you may, disregard any implication of commitment in conspicuous performance. Don't think to make understanding of the truth, of your public duty.

Two facts are certain: The fate of this infamous measure, involving your own and your party's political fortunes, is in your own hands. And you stand, as we have said, at the parting of the ways.

So all will hope and friendliness and with an small confidence we say in conclusion:

Remember the "equal and exact justice to all men" promised by Jefferson!

Remember the "equal protection of the laws" guaranteed by the Constitution which you have promised "to preserve, protect, and defend!"

Remember after the receipt of your party and the pledge of your own platform!

This above all: to think only of your true!

#### A Prediction

We predict to-day—May 17, 1913—that the next Republican candidate for President of the United States will be WILLIAM E. BORGES, of Idaho.

#### The House Has Done Its Part

HOUSE IS CHAMP CLARK AND OSWALD ENTIREMENT! And we needn't worry over the question of the precise share of honor each of them is to have. Neither of them is disturbed on that score and there is honest enough of our gratitude for both. When they sent the tariff bill practically unchanged to the Senate, it was plain that not only their own following, but the Republicans as well, recognized in those both the fine quality of loyalty—loyalty both in principle and to party. They had both done it. It does with the score it had and had none for a moment cloyed an insular plique or jealousy, whether directed at each other or anybody else. Their behavior looks to us extremely like plain statesmanship and old-fashioned patriotism.

Not that the bill is perfect or nearly perfect. There are details in the tariff schedule one would like to see changed, and we hope to get up to mention these before the bill is law. We have freely expressed our doubt about the wisdom of resorting so eagerly, at this time, to the income tax as a source of revenue. But it is invariably the best and soundest and the most beneficent tariff bill since 1815.

Here is the human test of its honesty. It was framed mainly by Southern men, every one of them politicians and thoroughly alive to the importance of pleasing their constituents. Yet whence come the strongest protests against it? Indisputably from the South. Of all the interests whose interests it does with, the Southern cotton-mill men have made the loudest outcry. The one state in the Union most literally opposed to it is Louisiana. Even the cotton-planters have got a notion it is unfair to hurt them—as indeed it may be for a month or two while American cotton-mills slide home—and from Texas comes an appeal from the Southern cotton-growers to Assistant President Bacon to impress on President Wilson that he mustn't go so fast. There are nearly as many workmen here, but that was to give other way and more Southern than Western tariff work

of it really owned by Western lumber kings, experts in working Congress—stretchers out upholding members to Congressmen with confused ideas about economics and very clear lines as to the value of the most conspicuous contributions. Yet the bill goes to the Senate impermissibly Democratic, sectional, national, sincere.

The fact is—and it has been so for some time—that the South is the one section of the country where arguments for high protection are most plausible. Now England, on the other hand, is the only one most anxious for free trade. Nevertheless, most of the Southern Democrats in the House have stood firm for the right national policy. We respectfully call this honorable circumstance to the attention of our direct-government friends, who insist that it is impossible to secure honesty in representatives unless they are subjected directly to constant instructions from their constituents on pain of immediate recall. As to our other friends, the readable makers of the cheap magazines, we have no doubt they can supply thrillingly perfidious reasons for the straightforwardness of CLARK and ENTIREMENT and the mass of their following.

#### The Senate

Of course, however, the real fight against the bill will be, as has always been foreseen, in the Senate. That is understood by the forces of privilege no matter how old for the fray. Fortunately, however, it is equally well understood by administration and by every individual American who wants to make an end of high protection.

It is going to be a hard fight, make no mistake about that. There will be, as always, plenty of money to be used, if it can be used, in behalf of the men who for so many years have been leading the way in high-protection tariff. They will have skilled representatives in the Senate and parliamentary maneuvering; a majority of the old hands will be on their side. The nominal Democratic majority is slight and these are new men in it whose records show, only too clearly, that they are individually none too hot for the Democratic side.

On the other hand, however, everything has been done that could be done to give the line time to hold every Democrat to his duty. There has been unprecedented preliminary consultation between the House and Senate leaders, and the President is entirely alert. Senator BURGESS, chairman of the Finance Committee, has made a case in his record on Republican tariff-making, the equal in political shrewdness of his shrewdest Republican opponent, and there is no fair ground to question his shrewd adherence to his duty in the matter of this Democratic tariff.

We repeat that we do not expect a focus like that of the tariff bill. We expect a focus like every low-tariff paper and every low-tariff man should keep right on helping in every way it is possible to help.

#### What We Want

The Executive Council of the American Bankers' Association, in session last week, while insisting on the urgent need of banking and currency legislation, declined to take any action on the vague indications so far received of what the party in power wants to do or say as to that line. These gentlemen were quite right. The party's definite plan or policy is put before the country in plain language, and it is up to give their opinion of it, solidified or unsolidified. We'll then see only what, like the rest of us, and perhaps put in a word here and there for such a policy as they have sought to be adopted.

This is the biggest task of the administration and the public is behind it. It is also the most difficult, in view of the party's recent history and leadership. It is possible and right, therefore, for us all to be reasonably patient and reside with the administration. We should all give the weight to the report of the chairman of the bankers' committee on legislation to the effect that the party behind the bill in charge showed an "extreme distrust" for practical suggestions, and that he and his executive associates could not prevail on the bill in its indefinite state.

Nevertheless, this is a matter in which good will should not count for much and participation must not be allowed to count at all. We will be wiser if we accept the administration and the party as they are, and try to do something for it by some measure—scientific and up to date, framed with an eye to the needs of the country's business—and with no concessions to the real or imagined demands of political expediency

It is rarely incidental, but true, that to pass such a measure would be the best politics the administration and the party could conceivably play.

#### AN American Man De-American

A number of American representatives the United Kingdom have crossed the ocean to confer with a similar company of American gentlemen concerning the proper celebration of the hundredth anniversary of the signing of the Treaty of Ulster in 1914, since which time there has been an unbroken peace between Great Britain and the United States. Such a celebration will be timely and appropriate and ought not to be interfered with. There is no cause for interference with it by Americans of other than British descent. Such interference is certainly in very bad taste, since everything considered, the two great powers of the earth. Does any American, of whatever origin, object to their celebrating the end of our hundred years of peace and at the same time doing what they can to insure peace in the future? We trust not. The measure of any man's opposition to the idea is simply the measure of his opposition to it to be an American, but something else.

Is Professor MONTAGNARI of Harvard an American? We have no idea whether or not he has gone through the process of naturalization. If he has not, then this matter is one he ought not to have meddling with; it was one of his business if he had. If he has, he is entitled to it as an American, not as a German. His notion that the celebration is an affront to Germany is absurd. Germany, if she is wise, will promptly repudiate it.

Germany, if she is wise, will repudiate all similar attempts, if not now, American, ever American, to give a high or deprecate the fratricidal Germanic wars, for Americans, our friendliness toward any other group. Real Americans, whether derived from Germany or not, will promptly and vigorously reject all such teaching. America is America. It is made up of many races, but with a natural and mainly reciprocal partiality, and it is not the least demands of such and all precisely the same loyalty—single and undivided—that other nations demand of their subjects or citizens.

Professor MONTAGNARI is in this country, so-called as a professor. His speech before the previous members of the Peace Conference was not good practical psychology. If he will still a German, then it was also very bad diplomacy and ought not to commend him to the German department of foreign affairs. It is this gentleman's own fault if, in his various conspicuous activities in this country, he has inspired a suspicion—not confined to Socialists, Marxists, etc.—that he particularly desires that department's approval.

#### Over-stimulated Industry

Athens, New York, has been having an epidemic of strikes. The ailment started in a trimline factory, and affected a good many other persons. The wire-factory employed about four thousand workmen. The strike was the first of the kind it was witnessed for the most part by cheap and not very rational work-people from Europe (Poles, mostly) whose earnings were not large, and their measure of life not up to the standard of the city. They struck for more pay and other improvements, and being unusually ignorant, were unusually misled from their own selfishness. Athens has a population of 25,000, of which about 5,000 are non-members of the C. P. C. The militia has been lately called out to keep order. Now, to provide usual employment for the working-people of

a city and promote its natural growth in a valuable service, but this kind of stimulation by a sudden attraction of a small army of low-class Europeans to work in factories seems a very doubtful means of doing it.

At any rate, it has its embarrasments, as Auburn can testify.

#### Brother Wallace is With Us

The newest make-maker is the venerable ALBERT WALLACE BOWELL, co-discoverer with DARWIN of the theory of evolution, who is out with a book in which he attempts to combine a synthesis of modern life, and reaches the conclusion that the current state of society is "rotten from top to bottom." There has been so much fuss lately about one thing or another that many people have suspected that something radical was wrong, and it will be almost a relief to them to have an eminent scientist as Dr. BOWELL confirm their fears. He reviews in his book the details of human misbehavior with which our attentive newspapers and magazines have made us so familiar, including especially the industrial drawbacks that have come with vast increase of machinery. The trouble he finds to be due to our lack of a system of universal competition for the arena of existence. The remedy he points out is universal cooperation. He says:

Our system is also one of monopoly by a few at all the expense of the rest. It is a fact that seems to which no life is possible, and capital, or the result of stored-up labor, which is now in the possession of a limited number of capitalists, and they use it also as monopoly. The remedy is freedom of access to land and capital for all. Also, it may be desired as social legislation, inasmuch as the law in each generation is allowed to inherit the stored-up wealth of all preceding generations, while the many, who have no means of inheritance, to adopt the principle of equality of opportunity for all, or of universal inheritance by the state in trust for the whole community.

We believe that if Brother WALLACE should come out here and go into politics he would sweep a success that would make all his former trials seem insignificant. Brother ELIZABETH DANE stands ready to endorse him. Brother WILSON would reach him the glad hand; the Colonel and Miss JANE ANDRUS and all the lesser Moose would want to make him theirs, and he might supplant Brother Vice-President MARSHALL in the regards of the whickered Democrats.

One son, Brother WALLACE, will all be with you. What you say is good deal so, and nothing but the habits of mankind stand between our present forlorn state and the improvements that you suggest. But what you say, *dear sir*, is not news, and you cannot copyright it in this country.

#### A Story of the Fall-er-er

One of the complaints made about the passed bill which our New York legislature passed and Governor SELIGER signed was that it was an assumption by the legislature of duties that had been delegated to a commission. Similar bills were voted by both Governor HUGHES and Governor THOMAS for that reason. The fact that we have not noticed in print that this question of the number of men required on trains did go to the upstate Public Service Commission and was passed upon. After the railroads in New York had laid off a good many men, in 1908, a test case was prepared and put before the commission. The commission then recommended it to go on the train did not be understood, and concluded that beyond a doubt that train did need another man. When the question came before the commission a majority of the commissioners voted to direct the road to put on another man. But the road asked for a rehearing; it was granted; the commission on the remaining afternoon it to go unheard, and the opinion on which was based the action of a majority of the commission ordering a full crew was never printed with the other opinions.

It seems to be a fact, therefore, that the fall-er-er bill did not become a law until the Public Service Commission had attempted to deal with the matter and had been partially frustrated in their efforts. In the case concerned the railroad did, we believe, put on an extra man pending the rehearing, but, the rehearing being dropped and the protested opinion being left unperited, it was not made clear that the commission was never to force the employment of an extra man when needed. Three followed from that default this law which compels the employment of the extra men whether needed or not, and which seems to be a pretty wasteful statute.

#### Schools of Agriculture on the West Coast

There is a school of agriculture at Stanford University in the University of Oregon.—HARPER'S WEEKLY last week.

The Oregon Agricultural College is at Corvallis and had more pupils last year (1,200) than the University of Oregon (1,200) at Eugene. A friend who writes to put us right about it says the college and the university are not connected. He also says:

The leading agricultural school in California is a department of the University of California at Berkeley. That school is said to be the best school in the agricultural situation in the state, and is about to spend a large amount of money in the building of a new building. The Federal Department of Agriculture in cooperation with the General Education Board is the Southern States.

A California farmer with whom we talked two months ago operates on a considerable scale in the Sacramento Valley and speaks of the difficulty in bringing the publications of the Department of Agriculture into the hands of the farmers who needed them. It takes some enterprise to get the catalogue of the department's publications and one of our correspondents that the California farmer ought to have. Our friend had tried to arrange for the distribution of these publications through the county post-offices, which might supply the lists of publications, but had not succeeded. We suppose that co-operative agriculture, such as Sir HENRY PAWSEY has introduced in Ireland, would help California considerably. It is the co-operative activities of the Japanese that seem to make the most trouble for their Caucasian competitors. A hair of the dog might cure it. If the American Californians could learn to work together and also get proper direction about their crops, the Japanese competition might turn out in the end to be to their advantage.

#### A Century in a Good Interval

Memorial Day follows the spring month. In the South they take their early when the early blossoms are out. Texas remembers Sam Houston on April 21. In Alabama, Florida, Georgia, and Mississippi Memorial Day falls on April 26th; in Louisiana on May 10th; and in Tennessee on the second Friday in May.

It was three weeks ago, therefore, that Dr. GEORGE PETER, of the Alabama Polytechnic Institute, in his Memorial Day address at Opelika, made the suggestion to which attention is called by the *Montgomery Advertiser*. He said:

In two more years it will be half a century since our great war ended. Shall we let that date go by unnoticed? The trials and the perils of reconstruction are not over. We are one country at last, not only in name, but in spirit; and no serious witness this country of our past perils and tribulations, and no country than so do. Would it not, then, be a fine thing if this semi-centennial could be made the occasion of a national celebration of the great good feeling between all sections of our country, and of the genuine union which has at last come?

Of course! And the time being only two years off, the *Advertiser* calls for specific suggestions for the celebration.

There is the main difficulty about celebrating the reunion of the states is that they are so united. A very great majority of our citizens, North and South, have never known any but a united country. The end of the Civil War seems perhaps a little too new to need to be recalled, and not far enough off to have a suitable historical or preparatory significance. There are, however, close, one hundred years ago, of our last war with Great Britain. Perhaps the hundred-year period is better for these exercises. Local celebrations of the close of the Civil War then, can, and doubtless will, be two years hence; but for a national celebration, to revive historical memories, we incline to think that the more favorable date will be 1905.

#### A Good Sign

Even the *Tribune* concedes the rightfulness of President Wilson's order subjecting to competitive examination the fourth-class postmaster from Providence. The only objection dropped into the classified series. "Many of those transferred," it says, "may give way to better appointees after competitive examinations are held. The public doesn't care very much about the individuals who may qualify for the post-offices. But it is greatly interested in creating a bar against the employment of any party patronage." It continues truly and wisely:

It is highly gratifying to learn that the President will also try to get second and third class post-offices transferred to the classified series. It is both

ask to burden the President with the responsibility of filling those minor posts. The time he is obliged to spend on them is a waste of the country's money. There are enough really important things for him to wrestle with without being handicapped by reforming petty branches of public affairs. If Mr. WILSON refuses to submit any longer to an intolerable executive burden he will have contributed materially toward increasing the efficiency and relief of the administration of the President of the United States.

Other Republican journals will do well to emulate the wisdom that looks out more for the gratifying success of honest-mindedness in the columns of their famous leader.

#### Public Hearings

Why should a tariff bill be framed in the secrecy of a state committee rather than public hearings be given on a matter which so concerns the public? The five Democratic Senators who may avert their leaders and vote with the Republicans for open consideration of the CANNON bill would seem to be acting on the true principles of democracy and on the principles declared by WILSON WILSON.—Waterbury American.

Logically, Brother CHERRY is in the right. Publicity cannot be pitiless behind closed doors. But it is all a question of degree. If the real purpose of public hearings is to delay matters it calls for little hearing. The country wants prompt action. Nevertheless, we candidly admit that the matter is one requiring delicate adjustment if consistency is to be considered.

#### Time for the Hook

The Chicago City Council is considering an ordinance imposing a fine for singing indecent songs in public. Such a law may not be effective; opinions of what constitutes indecency differ with respect to subjects which are matters of taste. But if the passage would tend to arrest public opinion on the subject we hope it will pass. Some of the "songs" that are divulged in public places nowadays are positively abominable.

#### Brother Abbott's Case

When it comes to being all things to all men, the Scripture, revelations, grand-leader, LYMAN ABBOTT, has a performance which is not excelled. It was a mistake for the American Peace Society to remove him from its list of vice-presidents. The reason for doing so was that Brother ABBOTT endorsed the Navy League's appeal for suitable appropriations for battle-ships. But surely Brother ABBOTT shows himself a friend to peace when he favors expenditure for battle-ships.

What is the weightiest argument nowadays for peace?

Is it not the immense cost of armaments?

People don't grow by ailing being killed. Those who do not die are a complete waste, and those who survive derive no advantage from their service.

But people dislike exceedingly to be taxed, and there is nothing they hate worse to be taxed for than arms and navies. Nothing puts them more out of conceit with war than to feel the cost of perpetual preparation for it. Nothing is working harder for peace today than the armies of the world. Their cost is so much that in Europe they are an almost intolerable burden; they are too valuable to use for fighting purposes, and are good for nothing else, and are the weight of all yokes on the course to the junk-shop. Navies work all the time for peace, and the more they cost the more effectual their efforts are. Dr. ABBOTT is for our army and for peace; two pretty contradictory positions. The American Peace Society had better put him back on their list. Their policy seems to be to stop the dose just as it is doing the patient good. Brother ABBOTT knows better.

#### Parson Tomes

The contrary of the Treaty of Ghent, for the celebration of which arrangements are now being made, falls on December 24, 1814.

It calls for some confidence on the part of our friends, the British delegates, to plan for a peace celebration a year and half ahead with their country full of militant suffragettes lighting back-fires on their faces, the government expending a number of strange expedients to produce a constraint among the people, and all America stammering under an immense armament.

A lot may happen in a year and a half. A vast deal happened in the space of time a century ago, winding up with Waterloo in 1815. It is a question whether the present conditions will be arranged to celebrate a hundred years from the close of the two hundredth anniversary of the end of Waterloo or the centenary of some great explosion not yet touched off.

# TRANSATLANTIC MATING

BY ANGLO-AMERICAN

ILLUSTRATED BY F. STROTHMANN

A FEW days ago there appeared in the *Standard*—the London standard, of course—the American standard would never stain its pages with such frivolity—an article by Mrs. George Critchley Mills on "Anglo-American and American Anglo-Marriages." That in a very fascinating theme, and Mrs. Mills handles it with the right amount of promotion. Her general conclusions were to (1) that an Englishman who marries an American and settles down in England has the best of either country (an offer); (2) that he is not irreversibly doomed to subparance even if he lives with his American wife in America; (3) that the American husband of an English wife had better, for the peace and contentment of his household, make England his home; and (4) that the English wife of an American husband is almost invariably made of her element in the United States, can scarcely ever assimilate her new environment, and is not only uncomfortable herself, but the cause of discontent in others. In the hope that it will help to precipitate a first-rate international feud I propose to set forth and to comment on the grounds on which Mrs. Mills justifies these conclusions.

But first it should be said that she has a mind and a standpoint of her own. Take, for instance, her treatment of the always interesting case of the American woman married to an Englishman and living in England. Scores of philologists have been devoted to this absorbing topic. An English novelist who writes under the pseudonym of "Rita" made it a year or two ago a pug for a furious diatribe against the lives and influence of American women in London. In "Rita's" opinion the American woman is responsible for pretty nearly all the ills of the "Smart Set." She has brought, it seems, "her sleek, her free and easy manners, her vulgar modes of eating and drinking and speaking, into halls made sacred by a long use of noble ancestors. She brings by 'smoothing up' society. She has ended by vulgarizing it. She has loads of imitation instead of critics. She has flouted all opposition in her own history, determined manner, and she has gratified her own modest, airy grace upon the once-famed 'manners' of the great lady. Dignity, reserve, and culture are not things that appeal to this alien 'smart' woman. . . . She it was who introduced 'mixons' which were too shabby for the nursery, but eagerly welcomed in the drawing-room. Who set society prancing and looting over the costly delights of the gymkhana contest in which women were identified and drawn in ribbon harness by men over a lawn confined with champagne bottles. . . . To the American 'smart' woman wisdom seems other people's bricks. Her 'hot horsebuses,' her expensive parties, her spectacular dinners, her bakings, dress parties, her social teas, her 'color' suppers, and her societies in cotton square have been largely imitated. She has an inveterate knack and a mania for organization. She has shown us how charity can be made a playground for vicious display and social functions turned into wild orgies of an unbridled creep. In fancy-dress a charity, in Smart a bazaar, to which a millionaire is invited—these are the things we have learned from our transatlantic neighbor. With their advertisement is an absolute case, the first law of their nature, and wisely and well have they capitalized it on their 'smart.' The 'Washington Post' reporting through our ballrooms, and when we get tired of that they introduced us to the supposedly desirable, who walk.

How much truth is there in all this? Just as much, in my opinion, as can be expected from one who tries to look at a condition through a microscope. There has been a "Smart Set" in all countries of all countries in all ages, and to pretend that there is anything new about the frivolities of the "Smart

Set" in London is in part with history, reason, and even common experience. Things are pretty much as they always have been, and there is scarcely a folly of today that one could not parallel from the past—and a past antedating the American invasion. Perhaps the "Smart Set" is more paragoned and probed at, and therefore slightly more public, than it used to be. Perhaps it pays its debts by a slightly more indiscriminate hospitality than was common thirty or forty years ago. But fundamentally it is just the same as ever and just as truly insignificant. As for the responsibility of Americans for its extravagance, the truth is that a few American women have joined it, and have led it, as they lead everything else, by virtue of a superior cleverness, ingenuity, and liveliness. Given a set where amusement is the thing most sought after, and you may be sure that an American will be more fertile in devising ways and means than her English sister. Given a milieu where freedom of speech and conduct is the mode, her satellites will take on a better sweep. If the pace is naturally fast, she will increase it by the largeness of her liver, more thoughtfulness, and more expansive personality. She cannot help herself. Her natural exuberance, her vivacity and buoyancy, drive her inevitably to the front, and if she prefers to stroll behind in the "Smart Set," nothing can prevent her from being a little "smarter" than her English friends. But she did not create the "Smart Set."

All that she has done, or rather, all that the very few Americans who have joined it have done, is to make it more inventive, more amusing, more daring, more grotesque. London, after all, was and probably is the home of a boresome society even before the American invasion. They did not put her out of her stride or least at the sight of a pack of cards. Even if no Americans had ever landed in London, the "Smart Set" would have been just as foolish, but considerably more handsome and better than the dash of prosperity which Americans cannot help throwing even into their wildest phantasies. This seems to me about the face of the case. But another and swifter critic than "Rita" came forward not long ago in the pages of an English monthly review to denounce the American wives of titled Englishmen under the pseudonym of "Colonial." He distilled their conspicuousness, their passion for display, their delight in "fancy plays which are brought over from Paris in defiance of the Lord Chamberlain, elaborate supper-bush decorations, and sexual luxury generally," their restless liveliness, and the fact that several-liners of them have only one hundred and seven children. He thought their influence a bad one. They are irremediably cosmopolitan. They do not come from "the usual American aristocracy of intellect and public service." Anglo-American marriages "have no sound basis whatever." They are an alliance "between a vile and a vile." "I saw only their selfishness from Americans and how much would one hear of them in the great world?" They might have made London society brighter, but they have also made it "shallower, more extravagant, and more vulgar than it was before." All this the critic contradicted with the influence of the colonial wives of titled Englishmen, who are "waxed and waxed in their native land," who are self-sufficient, who are not married for their money, who are not into mere tradition and a mere social and who never join the "Smart Set" who save themselves with all that is best in English life, and society, fit of whom have borne two hundred and sixty children, who put it shortly," he summed up, "colonial influence for themselves, masculine, vigorous, and wholesome; American influence for themselves, feminine, frivolous, and boring." But if it is boring, why should we care about it? Some Englishmen, indeed, prefer to see no hope ahead for themselves and their countrywomen until the whole of the aristocracy has made at least one wealthy American mar-

Deeply absorbed of having an American father

# IS MODERN DANCING INDECENT?

## A Calm and Unbiased Consideration of a Remarkable Phase of Contemporary Life

BY WILLIAM INGLIS

**M**ANY able critics say that it is and would gladly go to the stake for their belief in the outcry against modern dancing hypercritical if not hypocritical! Do they thousands of devotees of the lively art, quite as ready to criticize, if not to beat their lives, their souls, their consciences, their consciences in its defense. The nation has been joined, and the contest is raging throughout the land. We find the Mayor of the city of New York writing in an official letter, "The heinous orgies going on in so-called 'respectable' dance-halls in this city . . . have grown to be intolerable." Hundreds of similar protests by bishops, clergies, and teachers throughout the nation could be quoted by the page.

It is, then, with the utmost diffidence that I, a mere observer, dare to set down on paper the things I heard and saw privately on several evenings of dancing at a fashionable American resort. When battle rages the innocent bystander usually gets the worst of it; so that I add trepidation to the diffidence with which I begin this task. Nevertheless, nine-tenths of the American people are innocent bystanders so far as the dance, the overstep, the turkey-trot, and similar modern dances are concerned, and it is to their representatives that I venture to make my observations. It is only fair to state that when I visited the resort it was without a thought of writing a word about dancing or anything else. Two of us had gone to spend a fortnight at a Great Southern playground where there were golf-links and tennis-grounds and a score of other health-giving recreations on every hand. It had been here and wearing winter, spring was at hand, and we felt that a few games of golf would send me home fit to work hard there over the next few months. We proceeded, doubtless, tired early and moderately, and after reading for an hour or two, went early to bed for long and refreshing sleep.

It was on the fourth or fifth evening of the simple routine that a sudden change was precipitated by a chance remark.

"Judge," said young Channagally to my host, "you're missing a lot of fun in the evening. Haven't you seen you missed of the turkey-trotting and the turkey-trotting."

"No," replied the Judge; "I've looked in at the ballroom and it's better than a Russian bath—couldn't breathe in it."

"Oh, that back what I mean," said young Channagally. "The ballroom is only for the infant class. When the big orchestra stops playing in there, at half past nine, and the dancin' pipe up in the Oriental room, you'll see the real thing in dancing. Better come in."

"Thanks, I'll have to see it," the Judge agreed. So that evening, instead of going to our apartment to read before a crackling wood fire, we set out on the multitude in the great drawing room, or, rather, the worst of drawing rooms, card rooms, writing-rooms, smoking-rooms, etc., in which five hundred representative American people were taking their own after dinner.

There were many, many beautiful women and many more who believed themselves beautiful; they were scores of debutantes, a sprinkling of little brothers and sisters, a great many slender, dainty youths who were identified as college "men," several dozens of pen-occupied and grey-haired fathers who looked as if they could be happier anywhere than in this meeting, a throng that wanted so rebelliously at their play, also, filling the room, and there, various tall, slim, luscious-eyed, well-to-do-looking fellows of any where from twenty-five to forty years, who looked with a certain appearance of grave condemnation to the debauchees who effusively greeted them. Three happy personages were the "dancing men" as I will to leave later—the heroes of the ball, the trick, and the traps. In spite of their luscious air one could not fail to be impressed by the grace and ease of their carriage, the supple balance of their little bodies, though in their pale faces and their slender eyes there was the inevitable suggestion of life spent unobscurely withdrawn, of late hours, and sleep by day.

visible at this place are characteristic of the very best people and resorts in all America from Canada to the Gulf and from coast to coast. He who has seen one has seen all, so far as the conduct of the dance is concerned.

When the people emerged from the beautiful but sterile ballroom and began bidding one another good night and departing for the elevators, a slender stream of promenade began to drift down the long drawing-room, past the billiard-room and café, and into the Oriental room near at hand. We drifted with them. The long, narrow room was decorated

reed cozily among the tables near for orders, and the ladies and gentlemen who sat there ordered ginger ale, mineral water, iced tea, lemonade, orange juice, or beer, as they chose. The young girls sipped lemonade or the water, the matrons the rum. With the exception of perhaps one that the highballs, with its profuse addition of water, had quite supplanted the ruminous old fashion of drinking whiskey with little water or no water. This was true temperance.

Just within the west-door of the ballroom that separated the Oriental room from the rest of the hotel sat eight negroes who during the daytime had served as waiters, bell-boys, etc. They were now strumming mandolins, banjos, and guitars, and the music they made had the bounding rhythm of African tom-toms, or of a Havana orchestra, or of ragtime down in the levee—the swaying, sensuous suggestion that is characteristic of the music of the black man everywhere. A tall, heavy-shouldered deity, like a man with a face shining like a polished ebony frame for his splendid white teeth, was half-propping himself to and fro as he chanted the chorus of his song:

"Way down in Mississippi! Way down in Mississippi!  
Whom dem lanta goes white! down;  
"Way down in Mississippi! Way down in Mississippi!  
Da's!"

The seven other lanta chanted the chorus with him, twanging his instrument with great vigor and enthusiasm and affording a few pictures of the old-time jolly darky life. Then they changed to another song descriptive of the associations they enjoyed with "Wanita" led by Robert K. Lee, a Mississippi River steamboat jolly which probably most of the readers of this page have heard. It was a roll and swing and abandon in the performance which carried the hoarse deep into the heart of the black country, where negro customs, negro music, and negro customs prevailed.

Another song was begun and here and there men and women arose from their drinks and began to dance in couples. Some of them were middle-aged, carrying weight in proportion to their years, and they labored diligently at the dance.

It was serious and distant business for them. The greater part of the dancers were slim girls of from eighteen years to the early twenties. They seemed to float away on the flood of melody as slim girls that age have always floated away since time began and brains being full yet that could be expressed only in music and motion. Could anything be more beautiful and charming? Not!

And yet—there was something so strikingly familiar in the manner of the girl's partners—most of the partners, that is—that

one could not help feeling that he was intruding on a scene that should have no witness. The forms of the dance was not startling. The man took the girl's right hand in his left, and they held their arms up, down, or curved, as a fancy prompted them. The man held encircled the girl's waist with his right arm and drew her as near to him—or as hard pressed against him—as he wished or she permitted. They walked or shuffled alternately forward or backward and then spun around together in a ball a dozen times. In the spinning or shuffling progress (I don't know its technical name) there was a certain resemblance to the waddling trot of the red-wattled turkey-pheasant as he struts among ferns in the spicy days of spring. This, I suppose, gives the dance its name. At various intervals in the music there came an overture at which the dancers took their knees half-way to the floor, springing again, and resumed their rhythmic whirling. The music to which these men and

middle-aged people were dancing was a ragtime song depicting the courtship of a pair of love, not at all in the characteristic manner.

So my little lady lamb—how around, how around, how around, how around!  
Bring here all the heavy love, to me—little love, little love, little love!  
Let me spend the happy hours

Turkey-trotting—the "approach"

Turkey-trotting—the "clutch"

Turkey-trotting—the "wriggle"

with pants and breeches intended to represent Sam—what we call it—well, happily, the effect was really so more like those than a boy-garden in like the Argosyll.

Tables round and square were scattered throughout the great inclosure, and they were much frequented among tables and draped in which two or four persons might enjoy a delicious selection from the throng. Quenched and slightly-faded waiters

Roving with you 'mongst the flowers,  
And when to get where an one she can see—could  
up, riddle up, riddle up!  
He my little baby lambskins—bazz around, bazz  
around, keep a-buzzin' round!  
We'll be just as happy as an one—he and me, you  
and me, you and me!  
Downy keep abuzzin', please; I've got a dozen eggs  
less!  
But I want you to be my baby lambskin.

The song, I may add, relates that, in the court-  
ship of Queenie Lee, "Hinky Humble used to stum-  
ble round the roadway, where she would see him, greet  
him, and then trust him to some heavy grocer." All  
quite right for purposes of dancing, if you wish to see.  
Why not? Who would be a grocer? A fig for all  
pretend!

A charming girl of nineteen years came to rest at  
our table. There were some nice or less in our party,  
one for the Chaucerians were popular boys. The  
girl beside me came back flushed and smiling from  
her baby lambskin dance. Her eyes were like  
stars, her hair a heavy silken veil of black that  
seemed almost blue where it colled above the exquisite

and spun together it was hard to guess where the  
outlines of one ended and the other began. A grim-  
acing yellow negro sang for them this song:

Oh, it acts just like a hole to my low-neck heart—  
I cannot wait till evening till that thing will start.  
Do I love it? Sure I love it! Of my life it is a  
part;  
Like the noise of cupid sending me his little dart,  
Say, ain't that music sweet? Ain't no' your eyes ever  
loved?

Nay, don't you be askered? Listen—

Thus the entire eight agrees, eyes gleaming at  
the dancing girls, fingers plucking the plucked  
strings, their bodies swaying to the rhythm of the  
song, and their mouths stretched in sugar grin,  
sang the chorus:

Go-oo-oh! e-ry evening hear him sing—  
It's the cutest little thing—  
Got the cutest little swing—Hinky Koo, Hinky Koo.  
Do-oo-oh! simply meant for kings and queens;  
Don't you ask me what it means!

the dance. There was no essential variation in the  
songs. The theme was always the same, always the  
recital of one function. There is the whimsy of the  
and long had caught my attention.

When I got you alone to-night! When I got you  
alone to-night!  
You know we'll sit by the window, pull down the  
shade—

Oh, oh, oh! Don't be afraid!  
There'll be no one around to hear; there'll be no  
one around to faze!

We'll be leavin', leavin', leavin', just like everybody's  
doin'—

When I got you alone to-night!

In this succession came the symphonized ballad of  
Johnny Jones, who "had a cute little boat," "was a  
rowing hand when he was young by the water," "he  
went where the town were no grand—the  
know just where to land."

I have verified the text of these songs by referring to  
the original records, so as to give you the most ac-  
curate of it as it is quoted here. And here is the  
chorus of the "Johnny Jones" song as it was whistled  
by the negroes and danced by the girls and boys in  
the presence of their admiring parents:

And then he'd row, row, row;  
'Way up the river he would roam, roam, roam!  
A big he'd give her, then,  
He'd kiss her now and then; she would tell him  
when.  
He'd fool around and fool around, and then they'd  
kiss—  
And then he'd row, row, row;  
A little further he would row, row-oh-oh-oh-oh!  
With her head on his breast, and by the water, "he  
Then there's trouble here read—  
And then he'd row, row, row, and then he'd row!

Quite so! And whoever questions the propriety  
of it as a parody. A fig for all pretend! say I. No  
one in that assemblage of some two hundred peo-  
ple—American men and women, boys and girls,  
seemed in question by so much as a stare or the  
lifting of an eyebrow the propriety of the perfor-  
mance. Young Chaucerians and his wife got up and  
danced with the best of them; and so did half a  
dozen of their friends, all without the least suggestion  
of any offense. And yet side by side with these, or  
colliding with them now and then, were couples so  
intertwined and interlocked that one vertical strip  
of a woman's dress (then most inevitably black) of  
the girl of nineteen in a clinging gown of white, by  
reason of her tall, gliding slowness, her tiny head  
with its low hair, her eyelids way of flicking her  
parted lips with her narrow tongue, and the strange  
grace of her movement, I remember as the White  
beauty, was so completely merged with her partner  
that he was felt more for the agency her dancing lines  
was catching him. He was perhaps twenty six years  
old, presumably bald, with prominent, heavy-lidded  
eyes and a face chummy white, like the body of a  
dead fish. His dancing was truly the poetry of  
motion. He and the White Beauty occasionally spun  
together, but he did not, the beholder dazed to watch  
them. Then she would spin away out of his arms  
like a whirling cloud of moonlit spray, only to float  
back again to a new embrace.

And as they swung and eddied round and round  
near the right negroes, the leader of them, gazing  
exactly at her, was singing hoarsely:

E-rybody loves a chicken—everybody wants a girl  
that's hot and hot!  
All the boys they have the small ones; they don't  
care for old or tell one;  
They love them this and sweet;  
E-rybody wants to love a chicken—  
And that is why, when girls pass by, you'll hear the  
boys all cry:  
Chick! Chick! Chick! Chick! Chick!  
Chick!  
Chick! Chick! Chick! Chick! Chick!  
Chick! Chick! Chick! Chick! Chick!  
E-rybody loves a chicken.

The slim girl's eyelids fluttered down continually  
—whether in joy at the negro's hearty compliment  
or from her pleasure in the dance I cannot pretend  
to say. But she did not, the beholder dazed to watch  
the right point of view! If we only knew the right  
point of view we can thoroughly enjoy seeing one  
after another of the girls, some of perfect beauty, right  
after night in the music of restless negroes, as  
years ago the girls of the present used to dance  
with their masters at the "Satan" as in the back  
of the "Sweet-Dime" black-and-tan joint in the  
Tenderloin.

A turkey-trotting "the dancin'" in a popular New York restaurant

leary of her work. Her sweet lips were still slightly  
parted with the excitement of the dance. She was  
radiant.

"Tell me what this dance was," I asked her.  
"I've never seen this sort of thing before. Was  
this a turkey-trot or a tango or a one-step, or  
what?"  
"Why, it's neither one nor the other, but a mixture  
of all of them," she replied. "I said it just  
dancing. Don't you think it's heavenly?"

"Yes—well, yes, I suppose so," was my answer.

"And quite American, don't you think?" she con-  
tinued, earnestly. "The symphonization is character-  
istically American, and the dance, too. A young  
Frenchman I met at ——— Beach last winter just  
told me that he was dancing every moment he  
could find a girl to dance with. He said the Ameri-  
cans were so charming, so impressive; that in France  
no one would dare to suggest such a dance among  
nice people; yet ever here it was quite all right."  
"What are you laughing at?"

"Nothing at all," I hastened to explain. "Really  
nothing, a mere picture in my mind of a Frenchman  
seeing his wife or his daughter dancing like this  
and then—poof! his furious gestures, his denuncia-  
tions, his dramatic leaps of the glove on messenger  
the partner's cheek, the challenge, the duel. Of  
course it would be all right at the Ball Room or the  
Ball Room or that sort of place; but among nice  
people—here?"

"Just what the Frenchman said," the charming  
girl continued, calmly. "They're not fully  
rehabilitated up to yet, but civilized up to it. It all  
depends upon the point of view. . . . Yes, Mr. New-  
bury, with pleasure."

She was off, whirling away in the arms of young  
Newbury, and as they shuffled and bobbed and rose

I just how that Hinky Koo, Hinky Koo, Hinky  
Koo!  
May he do us just like an one could.  
When he does it—say! he does it good!  
Do-oo-oh! e-ry evening hear him sing—  
It's the cutest little thing—  
Got the cutest little swing—Hinky Koo, Hinky Koo,  
Hinky Koo!

When the radiant girl returned to my side I asked  
her, casually, "Do you happen to know the words of  
that song?"

"No, I don't," she answered, frankly. "What  
odd questions you ask! What difference does it  
make about the 'signatures' of words? Why don't  
you dance? Aren't you a dancing man?"

"No, thank!" I declared. "I've not danced in  
this fashion; I had one drunken sailor exer-  
cise in various parts of the world, and wild-eyed sin-  
dents in their festive dances on the left bank of the  
Seine; but never anything like this in the pres-  
ence of fathers, mothers, and daughters. Times certainly  
have changed wonderfully in the last few years—  
but, then, what would be a parade? A fig for all  
pretend!"

Have I mentioned that of about one-third of the  
young girls displayed official complexions? No?—  
Well, they did; the whiteness of the skin made whiter  
than the dead white of lilies, the rose of the cheeks  
bobby laid on as if with a spatula—in the fashion  
most familiar in Faber's paintings—the cyano-blue  
and the cyano-blue blacked with some cosmetic  
Somehow there was nothing incongruous in the ap-  
pearance, besides to being with the throbbing music,  
the lascivious-eyed and grinning negroes, the swayed  
outlines of the partners' clothing and whirling in

## THE AWAKENED WARRIOR

### A Slavonic Vision

BY ETHEL TALBOT SCHEFFAUER

Thus that art grayer than the pedestal—  
And thy heart colder than the stone on red,  
Who art thou, alien warrior, and where?  
"Out from the habitation of the dead."

"Out from the darkness where the trumpet is,  
Like a strong man in pain perpetually  
Groaning for old forgotten memories,  
I heard the old war-thunder coming on."

"Laughed I loved and wine, laughter and love,  
Tired laughing and the little death of sleep,

And battles and the tangled night thereof;  
But they that love the boys of life to keep

"Loved me in one stark hour from all these things,  
Thought me great warrior in a many hour,  
And brought me to the plain where no bird sings,  
And here is not, and laughter cannot come."

"This is my sister pain, that I go hence,  
And here not the good wars shall overland—  
I that am greater than the pedestal that I see,  
And my heart colder than the stone on red."

# FAMILIAR FACES IN NEW UNIFORMS

BY EDWARD BAYARD MOSS

Roger Bresnahan, who has dropped the manager's scepter for the catcher's mit.

**T**HAT Noah Webster was not a baseball "fan" is certain. Neither was he a prophet. If there is any disposition to dispute this statement it is only necessary to refer to his "best seller," the "Charter P" you will find the word "fan" defined as: "A small flag; a banner; the herald's flag."

Even after giving Noah doubt on a technicality, it can be seen that he had but a vague idea of what "fan" really means. The fact that he classified the subject with a broad explanation fixes his status at least should have been devoted to "fan."

To-day millions of words and dollars too are devoted to sports and the end is not yet. Fanatic winners are, after all, but fairly balanced baseball machines. Victory one year does not mean a repetition in the following campaign. The wear and tear on muscle and nerve of the player is a factor that must be considered. The star of to-day wears out quickly, and the clever and foresighted manager is always training a younger recruit for the time when the diamond hero shall be "let out" for the time in fast company. His problems are as nothing compared with those of the club leader who would bring his team from the second division into the first and thus become a real factor in the race for the pennant. Baseball players of championship caliber are surprisingly scarce in view of the thousands playing the game in major and minor leagues. To gather a winning combination in five or six years, to train, purchase, and the slower method of gradual development are all done as circumstances may dictate. The last award, in the opinion of many baseball experts, the only satisfactory one is the long run, but it never leads to the spectators. Casey Stengel of the Athletics, and John J. McGraw of the Giants, are both great managers and developers of talent baseball talent. It is added, however, that they figure in conditional terms. When they do it is a prediction that the other club to the deal will discover,

Johnny Evers, who succeeded Chance as manager of the Chicago Cubs

later, that it was not Mark or McGraw who was overlooked. Other managers and magnates are always willing to try the short cut to a possible pennant, and in this respect the interim between the 1912 and 1913 seasons stands out as a most remarkable period in professional baseball history. It is doubtful if the annals of the game can show a series of sensational deals as marked the six months between October and April.

When the empire's call of "Play ball" went the sixteen clubs of the National and American leagues away on their long race for 1913 pennants, there were more familiar faces in strange uniforms than have confronted the "fans" in several generations. Not only were famous players involved, but managers as well. Frank Leyton Chance, winner of four pennants and two World's Championships, while manager of the Chicago Cubs, not only quit the Chicago Club, but the National League as well. His escape from the senior to the junior league was one of the cleverest pieces of baseball strategy ever engineered by rival league presidents and magnates. In his new role as manager of New York's Americans he is viewed as the largest salary ever paid a baseball field leader and attracting thousands of "fans" in the parks when his team appears.

It is doubtful if more than five or six of the men who were prominent in what is many respects was the greatest deal in the history of professional baseball know the real sum that Chance will receive. He has been variously exploited in the press as ranging from twenty-five to forty thousand dollars annually. Owner Frank Farrell, of the New York Club, and Chance were considered for a whole day in a Chicago hotel before the deal was completed. Chance recently signed a three-year contract at a salary close to \$19,000 per annum and a percentage of the net profits. A successful season will undoubtedly net the so-called "Puritan Leader" \$25,000. For this next season he can thank in part the confidence of Charley Murphy, of the Cubs, the generous donation of Harry Hershman of the Cincinnati Reds, and Farrell's ready bank roll.

Chance was not the only one of the all-time Cubs to break away from the Murphy orbit after the explosion of last autumn. Joe Tinker, whose brilliant play at shortstop made possible the famous time which appeared so frequently in the headlines of the "Cubs," "Tinker to Evers to Chance," assumed the managerial reins of the Cincinnati Club, leaving Johnny Evers, the peppery second baseman, to step into Chance's shoes. Between St. Louis, Evers and Murphy effected a sweeping reorganization of the Chicago Club. In the series of trades Chance, Tinker, Pitcher Landis, and Pitcher Chapman went to Cincinnati, and the Reds turned over to the Cubs outfielders Mitchell and Kinsley, infielders Phelan and Red's Corcoran, and Pitcher Baumgarten. Hershman had first to secure Corcoran from the Detroit Club by purchase at \$7,500. Another new Cub is believed to be playing in Evers's position after years of service with the New York and Boston clubs of the National League.

With the Chicago "fans" could not see that Murphy had eluded a pennant by the deals which released Chance and Tinker, and when Chicago "fans" have an idea they talk right out on their hands. So Murphy proceeded to step on Roger Bresnahan, erstwhile star pitcher of the Giants, who was released to manage the St. Louis Cardinals. Roger and the body president of the club did not agree, and Bresnahan was ordered out. He showed his contempt, but was told that it was no good. Still Roger collected about \$75,000 before he departed. Cincinnati secured a former Cub star in the person of "Three-Finger" Brown, whom Murphy turned aside. Consequently, the National League will have to look elsewhere when the Cubs and Reds invade his particular town before he can sell one club from the other.

The small money game continued to revolve. Chance, Tinker and Evers are not the only ones to wrap strange managerial legs about themselves. George Stallings to-cede the big league again as manager of the Boston Nationals. After Bresnahan had accepted the St. Louis Cardinals' treasury, President Helen Hathaway Britton decided that Miller Huggins should rise from the ranks. The two other clubs continue to experiment with managers elected during the closing months of the 1912 season. Joe Birmingham will direct the Cleveland Stars campaign, and C. "Big Mike" still heads the St. Louis Browns. Other "players" have decided to sell out early. Tom is now believed to have sold out John McGraw of the Giants, John Stahl of the

World's Champion Red Sox, Fred Clarke of the Pirates, Connie Mack of the Athletics, Hughry Jennings of the Tigers, Clarke Griffith of the Senators, or Jimmy Gilliam of the White Sox, which is perhaps wise, since their equips are not packed up every day.

Still, it must not be understood that the managers are passing up any free advertising. If not with a new manager, there are still other ways of attracting attention. For instance, the Giants, aided and abetted by McGraw, prepared a new contract for the little Napoleon of baseball, which it was announced contained terms calling for a salary larger than that paid Chance. In addition the Giants held the other club in the scramble for the services of James Thome, the famous Indian athlete winner of the World's Olympic all-around championship. To date Thome has not proved a world's wonder as a ball player, but he has proved good advertising. If he one day to the big league team he will make the fifth real reason why will wear a major uniform this year. His more experienced brethren are "Chief" Meyer of the same club and "Chief" Bender, leading pitcher for the Athletics, George Johnson of the White Sox, and Mike Ballert of the St. Louis Browns. All this shuffling back and forth on the check-board of big-league baseball adds a spice and uncertainty to the 1913 season which is clearly reflected in the evermore capriciousness of "fans" during the exhibi-

Manager Frank Leyton Chance of the New York Americans, the highest salaried team leader in baseball

George Stallings, who returns to the big leagues as leader of the Boston Nationals

"Hank" O'Day, who decided that umpiring was easier than managing the Cincinnati Reds

tion and early-season games. The sight of Mike Doulin in a Goucher uniform, Hank O'Day again calling balls and strikes, Hank Lucker playing for the Reds, Harry McLean with the Cardinals, and Harry Davis again in the Athletics hold only moderate interest and conditional value made for the magnate while dust gathered on hat and glove. What the outcome of this upheaval will be cannot be accurately forecasted at this time. The impression is growing that the American League has the edge on their other rival for as big-league, clever managers are considered. The playing strength of the various clubs is another, and sympathy of the prophet. A consensus of the leading baseball experts leads to the belief that the American League in the National League will be found in the trio of clubs composed of the Pirates, Athletics, and Cubs. The leading candidates for this season's title are the Athletics, Senators, and Red Sox. Beyond this point (Special Copyright 1913)

The great parade for woman suffrage on May 3, in which 10,000 women participated, passing up Fifth Avenue, New York. In contrast with earlier parades, this was distinguished by a total absence of disapproval on the part of the spectators

## THE WOMEN'S CAUSE—AT HOME AND ABROAD

# Awards to the Brave

A Record of Courageous Deeds Whose Authors Have Been Honored by the Carnegie Hero Fund Commission

DRAWINGS BY G. W. BRINKERHOFF

He clung to the bull's neck while it tried to toss and gore him.

**S**IXTY-SEVEN hundred and twenty-three heroes, male and female, have been identified, proved, and glorified by the Carnegie Hero Fund Commission in the nine years of its existence. The latest reports of the commission, just issued, describe one hundred and forty-two pages to the brief recapitulation of the deeds of these heroes who have received awards. The ages of these worthies range from tenderest childhood to venerable years, and in every instance the animating principle has been the same—instinctive forgetfulness of self in the effort to save a fellow human being in a danger of death.

No man can read these pages without feeling a glaze of pride that he belongs to the great family whose members are capable of such sublime sacrifice.

ing investigation is made into all the facts, so that we may be sure that every one included in the Commission's list of heroes is genuine. Here is a typical case:

W. Roy Stokes, aged twelve, school-boy, died attempting to save Lorenz J. Sorell O. and Charlotte Kealy, aged twelve, thirteen, and eight, respectively, from drowning at Cord, Pennsylvania, August 16, 1910. The girls, none of whom could swim, were together on the ice on a reservoir, when the ice broke and they fell into water nine feet deep. Stokes, who could not swim and who knew that the ice in the vicinity of the hole was not safe, started to the hole from a point four hundred feet distant. Lying face downward, he pulled Lorenz up on the ice and three or four of them, or Stokes and Lorenz together, attempted to pull one of the other girls out, when they fell into the water. All were drowned.

A silver medal was given in honor of the boy, and \$1,000 was bestowed to help his father and mother. In the strange case that follows a silver medal only was awarded.

Justin M. Morgan, aged fifty-five, real-estate dealer, saved William E. Mecca, aged thirty-nine, minister, from assassination, at Cleburne, Texas, December 7, 1907. In the dark Mecca was attacked in his yard by a man with a revolver, who fired twice at him, one shot piercing through his body. The man then shot Mecca's mother and his wife, Mecca, calling for help, ran toward Morgan's house, where he heard the shots and calls for help and ran from his house to the street.

With his revolver in his hand he charged on the assassin firing again, the bullet striking Mecca, who fell at Morgan's feet. With their revolvers hot two hot spots Morgan and the assassin exchanged shots, neither being hit, and the latter then turned and ran from the scene. The wounds of the injured were of a serious nature, but all recovered.

Coil E. Kartberg, a newspaper, nineteen years old, attempted to save Roy R. Titter, aged twenty, machinist, from hanging, at Wood River, Oregon, May 14, 1908. Titter was working at a gasoline lighting machine on a machine-shop, when a stream of string gasolene started from the tank. His clothing was ignited, and the building was set on fire. With his arms around his face, Titter backed into a narrow passage to get out of the flame. Buggess ran to Titter from an adjoining room, passing through the stream of gasoline flame, which was then six inches deep. Titter was somewhat hindered, and Buggess put his arm around him and nudged him toward a place of safety. They passed through the stream of flame, and though flames which ran from the floor, but before Buggess could get Titter from the building Titter expired. Buggess escaped, but he was so severely burned that he was thought at first to have died. He received a bronze medal, \$250 disbursement benefit, and \$1,000 for a worthy grave.

True courage rarely makes a mark of weakness of any, as witness this incident taken from page 149 of the Commission's report:

Richard N. Stokes, aged twenty-four, retired, saved Lillie B. Kertis, aged fifteen, R. Ashley Graves, aged twenty-one, assistant bank cashier, and Eva Foster, aged fourteen, from drowning, at Leonora, Texas, July 18, 1911. Graves and Miss Foster, who could not swim, started into swift, deep water, in the Colorado River, thirty feet from the bank, and went down. When they came up they clutched each other and called for help, and Stokes, not heeding the calls of his wife and daughter but to the sea, swam toward them. Miss Foster, who could not swim, crept into the deep water shortly after Graves and Miss Foster. When Stokes was near Miss Foster she grasped his collar with one hand. He continued to the others. Graves threw one arm around Stokes's neck from the side opposite Miss Foster, and Miss Foster clung to Stokes. Stokes swam fifteen feet diagonally across the current to a narrow ledge, where he stood in water reaching to his chin. Miss Foster became unconscious just as they reached the ledge, but help arrived almost simultaneously, and the rescued were taken to shore. Stokes was very tired. He received a silver medal and \$1,000.

Here is another instance of man, whose achievement appears on page 147:

Michael O'Laughlin, aged sixty-eight, laborer, attempted to save Patrick McMahon, aged sixty-two, laborer, from suffocation, at Stroudsburg, Pennsylvania, October 11, 1909. O'Laughlin descended into a sewer tunnel in McMahon, who had been overcome by gas at the bottom, over eight feet below the surface of the ground. O'Laughlin was overcome before he could render McMahon any assistance. Both men were gotten out and were revived. O'Laughlin lost his life a year later in another sewer accident. A bronze medal and \$1,200 were bestowed upon his widow, a slightly younger and of a wonderful agility was the hero of the following:

Stable boys, aged fifty-six, bank cashier, saved Walter Novakovich from an unusual fall at Salem, New Jersey, June 11, 1910. Novakovich entered a pasture and was attacked by the bull and knocked

Forced back to the floor and smothered the fire with a rug.

men. They came from nearly all the races into which humanity has been divided, and every one of these seems to have acted without one moment's delay, often in the face of frightful odds. Most of the deeds of heroism were in the course of driving assassins, slayers, food victims, or shipwrecked mariners; many were of fire, others in saving persons from crashing earth and rock and fire-damp explosions. There were many cases of men fallen unconscious upon electric wires carrying high current. None of these were saved alive, but in many cases the injured and their would be recoverers perished together. Perhaps the most remarkable instance in the report was the death of Lincoln J. Partridge of Bristol, Maine, on November 23, 1907. George H. Tapp, a fisherman sixty-two years old, eyed the help when his sliding had caught in a belt wheel. Partridge reached over a circular saw making fifteen hundred revolutions a minute, slipped, fell, and was out in twenty. Twenty-five dollars a month was awarded to his widow, with five dollars a month to each of his children, a silver medal was given also.

It is the rule to award a medal, whether of gold, silver, or bronze, to deserving heroes, and to give money when money is needed for the support of the hero's family—if he has died of his heroic act—or for educational purposes or to purchase a home. There is an thought of money awarded in the giving of the money. As Mr. Carnegie phrases the idea: "I do not expect to stimulate or create heroism, but I do expect that heroic action is impulsive; but I do believe that if the hero is injured in his body at least to some or even to his fellows, he and his dependents upon him should not suffer pecuniarily thereby."

In every case reported to the Commission a -451-b

Morgan held her about twenty minutes.

to the ground. He clung to the bull's neck, while it tried to toss and gore him. Giles ordered the pasture from a road and went to Nymkowsky's aid with a four-foot length of a four-rail, with which he struck the bull on the nose. Nymkowsky let go of the bull when Giles shouted to him to do so and staggered to a fence and left the pasture. The bull charged at Giles, and he struck it again. Backing toward the fence, Giles continually struck the bull with the rail on the animal's side about charges toward him. When he reached the fence, Giles struck the bull three or four blows, and while it was somewhat dazed he vaulted the fence. Nymkowsky had been pained in the thigh, his clothes had been ripped open, and he had a number of flesh wounds and lacerations.

Tardar-rader, Illinois, did not care to take any money, but he did accept a bronze medal.

Here is the story of an aged author when all the world should honor:

Sarah B. Killybilly, aged seventy, author and editor, died May 1. Killybilly, aged twenty-six, from burning, at Pittsburg, Pennsylvania, September 28, 1908. With her clothing a mass of flames, she fell rear through several rooms calling for help. Miss Killybilly covered her face and smothered the fire with a rug, her tongue and hands being burned. The maid sustained very serious burns of the body generally. Miss Killybilly received a silver medal and a life pension of \$75 a month.

There are in the report many instances of the heroism of negroes. Here is one:

Marlin Geneva (colored), aged fifty-seven, housewife, received Peter M. Malinow, aged nine, from electric shock at Wilkes-Barre, Pennsylvania, July 25, 1908. Unable to release his hold on an electric light wire carrying twenty-two hundred volts, the boy was being jerked about when Mrs. Geneva grasped him by the neck and received a shock which temporarily paralyzed her arm. She applied to bystanders to

aid him, but none responded, and then she freed the boy again and succeeded in pulling him from the wire. Her hand was disabled for a week. The boy's hand was badly burned. A bronze medal and a life pension of \$20 a month were awarded to Martha.

One of the most thrilling cases reported is this, on page 47:

Thomas W. Moran, aged forty-two, contractor, saved Anna E. Eggers, aged twenty-eight, from an impending fatal fall, at Pittsburg, Pennsylvania, September 4, 1910. Moran, by striking his fingers and the toes of his shoes into the meshes of a wire lattice supporting the northern end of a hospital, climbed to the woman, who was insane and was trying to escape on the outside of the screen. He reached her as she stood on a two-inch ledge of the screen, forty-two feet above the ground, threw his arms around her waist, and got behind her to keep her from falling. Moran held her about twenty minutes, during which time she screamed for help several times. A hospital attendant went and shouted for help. Firemen dropped a second rope from the roof, and Moran and another man who had climbed the screen fastened the rope around the woman, and she was hoisted and taken into the building. The rope was lowered again, and Moran tied it about himself and was lowered to the ground. He received a bronze medal and \$1,000.

William R. Edwards, Commissioner of Street Cleaning for New York, knocked down and captured the runaway grizzly bear, at Pittsburg, Pennsylvania, September 4, 1911. He felt himself growing weak and shouted for help. Firemen dropped a second rope from the roof, and Moran and another man who had climbed the screen fastened the rope around the woman, and she was hoisted and taken into the building. The rope was lowered again, and Moran tied it about himself and was lowered to the ground. He received a bronze medal and \$1,000.

William R. Edwards, Commissioner of Street Cleaning for New York, knocked down and captured the runaway grizzly bear, at Pittsburg, Pennsylvania, September 4, 1911. He felt himself growing weak and shouted for help. Firemen dropped a second rope from the roof, and Moran and another man who had climbed the screen fastened the rope around the woman, and she was hoisted and taken into the building. The rope was lowered again, and Moran tied it about himself and was lowered to the ground. He received a bronze medal and \$1,000.

A silver medal was the award to the heroine of this tragedy.

Marie V. B. Langdon, aged twenty, housewife, saved

Nephe, Henry I., and Estelle M., and attempted to save Gertrude N. Jacques, aged twenty-two, four, one, and two, respectively, from freezing, at Trion, Washington, January 31, 1907. With the thermometer four-hundred degrees below zero, and the snow six feet deep, Mrs. Langdon, without snow-shoes, went six hundred feet from her house on hearing cries for help, and met Mrs. Jacques and two of her children, only partly dressed, who had fled from their burning house. She relieved the woman of her baby and carried it to her home, followed by the mother; returned and got Henry and three struggling through the snow about three-quarters of a mile, where Gertrude was found; the mother having been compelled to stand by her, after having removed the only skirt she wore and wrapped it around the child. When Mrs. Langdon carried Gertrude half-way back to the house, she discovered that the girl was dead, and, as her own strength was fast failing, she was compelled to abandon the child and was barely able to reach home herself.

Men of all walks of life are among the heroes, as witness the following from page 121:

William Mcweeney, aged thirty-six, bartender, died attempting to save Charlotte J. O'Brien, aged twenty-eight, from drowning, at Utica, New York, November 4, 1911. Mcweeney dived and swam about seventy feet toward Mrs. O'Brien, who, unable to swim, was drifting downstream in the Erie Canal, at night, in water eight feet deep. When within six feet of Mrs. O'Brien, Mcweeney sank beneath the surface and drowned. Mrs. O'Brien was rescued by men who extended a pole to her. Fifty-five dollars a month was given for the support of Mcweeney's widow and children, with a bronze medal in honor of his brave effort.

Every page of the report of the Commission is worth reading and rereading. Its pages make the work of the firefighters of the most fervid abolitionists seem pale and dull.

## AN EARLY AMERICAN INDUSTRY

The Navajo Weavers and Two Specimens of their Remarkable Rugs now in the Museum of Natural History, New York

BY WALTER L. BEASLEY

Spinning yarn for weaving

AMONG the last gifts of the late J. Pierpont Morgan to the Museum of Natural History, New York, are some magnificent Navajo Indian rugs, considered the finest specimens of aboriginal weaving to be seen in this country. These are especially noteworthy and valuable as they represent some of the most remarkable of the early examples of Navajo work, William L. Edwards, who observes with regret that the art is fast disappearing, and that the majority of the rugs produced to-day are not so skillfully woven, and are colored with synthetic dyes, which are not permanent. Two of the most beautiful of these Navajo textiles, splendidly decorated in diamond and olive geometrical patterns, are here pictured. Also of interest is the picture of the primitive loom on which these rugs are made.

It is believed that the Navajo did not weave before the coming of the Spanish in 1542. They seem not to have woven or used cotton so did their Hopi neighbors. Since the Spanish occupation they have acquired large flocks of sheep. They have learned how to shear their wool, to wash the wool, to spin it into yarn, and to dye it.

The wool, after it is sorted, is washed by pouring over it hot water containing an extract of yucca root. The carding is done with a pair of ordinary European hand-cards. The spindle, a small stick at the base of which is a wooden disk, is similar to that found in the prehistoric Old-World. It is twisted by the right hand while the wool is held by the left.

The loom is a simple frame in which the warp is placed vertically. The weaving is begun at the bottom, the blanket being lowered as the work progresses. The wool is inserted by the fingers without the aid of a shuttle, containing only so far across the web as that particular color is needed. The next color is then taken up, and a rug has both sides alike in pattern and color. The wool strands are pressed down with a fork of wood and then firmly beaten down with a batton.

**Engraver vs. Counterfeiter**

It has been claimed that not only do American engravers do as much work as all others in the artistic quality of their designs, but that they likewise excel in the magnitude of their projects against counterfeiting.

It was Jacob Perkins of Northport, Massachusetts, who invented the method of electroplating designs from hard metal plates in steel cylinders and of transferring to lead plates, thus enabling the engraver to draw designs from another engraving, the geometric letter, which renders difficult the successful counterfeiting of paper money.

For the most part the European governments depend, in the production of their paper money, upon color work. Several of the large banks of some European cities employ in their bureaus of engraving and printing, a circumstance that is always a mystery to American experts, who cannot see the connection between engraving and engraving. Many Italian bank notes are colored, but the principal example of this is the bank of Spain which is obliged to abandon its own plan, since its notes were imitated so successfully that the counterfeit was a serious question accepted by the bank itself. A private contract was soon done the work.

The bank of Columbia has the same American method, having suffered a loss and experience with notes of Austria, Germany, and England made.

American experts have time and again demonstrated as a "with" the bank bill demolished that the notes of the Bank of England cannot be counterfeited. Counterfeiter of fact, these experts are, these notes are imitated readily enough, for little effort is made to make the paper go beyond the use of a water-mark paper; and this water mark can be easily reproduced, and the counterfeit is made of good water, after contact with an original water mark, will show every detail of the original. A thin film of gold is placed upon the paper, the base upon which a mark is realized is made. If a sheet of paper is printed upon this gold surface and rolled up, the gold sheet will appear as a ribbon in the water. In the United States, the English have never in their counterfeiting. One of the greatest of great effectiveness in the system of the bank of England of rendering every note in relation to the imitation of any note another in its place. This and the practice of keeping a record of the numbers of all bank notes made, every bank in the United States has a list of responsibility which adds to security.

The American style of bank-note has become the standard of the countries of Central and South America. The experience at the Brazilian government led to this. From the experience of the American system, the notes being engraved and printed in England. They contain a feature, which is the water mark. The Brazilian then took the notes made in France, and these were promptly and extensively imitated as soon as the counterfeiters got the designs and paper notes. Brazil has tried German and British establishments, but still without securing adequate protection in its bank-note circulation. At last it turned to the United States and found counterfeiting of bill paper impossible to counterfeit successfully.

Italian war for freedom, and Garibaldi had been one himself, serving in the French army and in the army of the Holy Roman Empire, and in the present Uruguay. Even when he had attained the height of his fame he, with his sons, served in the French army during the Franco-Prussian war.

In the wars of North and Bulgaria there were Austrian, Russian, and many other foreigners, while in Spain we have but to consider the names of certain statesmen of recent years to see how many adventures have served to make the history of that country. The wars in Africa were won by D'Almeida, who was later in Spain, but whose ancestry is well respected. He became the Duke of Tofano.

A warrior named O'Connell played a chief part in the wars of Cuba, China, the leaders here time and again have been of Western race, and it would be interesting to learn how many graduates of American have served in the Chinese army. In Mexico but a short while ago it was King M'Lean who was the most noted agent in affairs.

There are now many things that combine to render the trade of the soldier of fortune less attractive, that it formerly was. War today is a much more highly organized affair than it was years ago. Before they fight nations are apt to equip up carefully the forces with which they have to contend, and every step that is taken in organization means one less place for the soldier of fortune.

**New York's New Collector of Customs**

James Pranger Murray, president of the Board of Aldermen of New York, has been named by President Wilson to succeed William Lawrence, Jr., as Collector of Customs for the Port of New York City, on July 10, 1873. His ancestry is Scotch-Irish, and his father, John Murray, served as an officer in the Continental army. Mr. Murray attended St. John's College, Fordham, and the Columbia Law School, from which he received his law degree. His father, John Murray, he is not yet thirty-four, he has been writing in public life for the last six years, serving in the United States Corporation of Customs for the Commissioners of An-

The counterfeiting this year will be even more elaborately observed in the cities which are the great banking centers of the country.

Strictly speaking, lock beer should not be set forth for sale before May 14th of this year. This is the general date observed in Germany. But in America the appearance of lock beer is a movable festival. The earlier the spring, the earlier the date of lock beer being set, and the drink they advertise.

That May 14th is the long ago because the custom is to lock the beer in its original producer evolved it in order to arrive an annual spring festival that means the beer is fresh. The custom never has been known to fall later than May 15th; therefore the day following is popularly expected as the first day of spring. It is quite natural, therefore, that this beer of outside strength should have been thought of as a regular spring festival. When the air still has a keen chilliness that marks the spring length of winter.

Lock beer, properly speaking, is a spring beer, nevertheless the name is used, especially in Paris, to designate a beer that is not only fresh but also of the best. In America it may be had almost everywhere until the end of summer.

Who is properly made beer should be better than any other beer, and is not so in the ordinary kind. Also there is an additional fermentation process. A great mass of water will be added to the product, and weaker still it seems stronger than their favorite beer of the ordinary kind, and also they find the potency so quickly. It is the strength of lock that gives its name. According to the old tradition, the beer was brewed in a place that was so named so many times as "lock beer" after drinking it, that some one would say, "lock beer it is."

"Lock" is German for dilly-gout.

**Electric Barber Poles**

It is within the last few years that the electric rotating barber pole has been introduced. The electric or rotating barber pole has for a middle section a glass cylinder, the ends of which are made of wood or metal, and are about eight inches in diameter, the section being supported on an ornamental stand, or a metal stand, and is rotated by means of a hand crank. The top of the pole is ornamented by an ornamental cap.

The glass section of the pole is another cylinder made of thin, lightweight, transparent material upon which are painted the traditional stripes of red, white, and blue, the familiar sign of the barber. This inner cylinder is given rotation by means of a motor by means of a tiny electric motor attached at the top. Current is carried in the middle of the wire around an electric-light fixture in the building and up or out of sight inside the pole's base. Within the inner cylinder of the electric rotating barber pole are two or more electric lights by which the pole can be illuminated at night.

It is not only the pole that has a base support, it is also made in the form of a hand crank which can be attached to the front of the building. Both these styles of rotating barber poles are also made to be wind driven.

**Will Musical Voices Disappear?**

The severity of musical voices which are at the same time sweet and of good range and of almost unlimited in quantity, is a matter of great importance. The question should be studied attentively by those who are interested in the human condition. Without lack of error it may be said that, among a thousand persons, hardly one is found who is naturally good singing voice. Among fifty of such and fifty thousand inhabitants contained by one musical director in the West and in the West, the number of voices was found to answer his requirements as members of a symphony company. These, with one exception, were women.

The severity of musical voices is seen in a number of other places, and is largely impossible of evasion.

It is the desire of the various nations have increased to being about this condition. Men who smoke get into habits of breathing which are fatal to their voices. It has been found that the various nations have increased to being about this condition. Men who smoke get into habits of breathing which are fatal to their voices. It has been found that the various nations have increased to being about this condition.

John Purroy Mitchell

**Soldiers of Fortune**

Many famous soldiers and adventurers served under flags not their own. Henry Hudson, an Englishman, sailed under the Dutch standard; Christopher Columbus, a Genoese, who discovered a continent in the name of Spain; Kowloon, a Chinese, who got the first glimpse for American independence; and Herkules, who gained distinction in the wars of Chinese conquest, are examples.

Descending the obscure periods of the world's history, we find that men have done us to fit over all Europe, who has only to study the immensity of Russia to be content with the idea of the highest type of soldier of fortune. Russia, at the present juncture, needs leaders of every kind—soldiers, statesmen, leaders, organizers, and men who are being sent from the East. At the helm of these three elements remain today.

In somewhat similar manner, when America was fighting for her independence, there were several—such as Foreman, an Englishman; Stearns, a Frenchman; Strachan, the Prussian; Paddock and Hicks, the Poles; and Lafayette, St. Francis, were the men who led the fight. In all these it can be said that they were fighting for the cause of freedom, which was also their own; but they were soldiers of fortune, and their names were many adventures in the

counties, and Commissioner of Accounts before becoming president of the Board of Aldermen. At the time when Mayor Gray was elected he became acting Mayor of New York, and he was prominent in the inquiry into the public-school system of New York, and was a prominent figure in the recent sanitary reforming.

Aside from a place in the cabinet, and possibly one or two of the foreign ambassadorships, the office of Collector of Customs for the Port of New York is one of the most highly paid jobs that the President can bestow, and one that requires great executive ability. The number returns at that port amount to nearly five million dollars a week.

**Bock Beer**

Bock beer, as a beverage is fast becoming popular in this year. It is called an international institution for its most creditable name its usual appearance is a small, handsome of spring and some of its most successful placements.

It is a beer that is first brewed in Bavaria, M. A. Beck. This is one of the oldest and best. The 125th anniversary of the discovery of lock beer was the occasion of a "white celebration" in the Kaiser's town, a twenty-five years ago.

under, being reduced to opaque white with very limited range. For each million of substances it is not easy to find a regular coloring machine. Some of these colors are at the same time powerful and sweet.

It is the color the hairline has on a piece in the chair, while today its importance is considered.

If this is the case with men's voices, it is also true equally with reference to the female high soprano.

**How Asbestos Is Spun**

WHEN it leaves the rubbing-disk, asbestos is spun in the form of fibers, each containing about one hundred pounds. It is first spun by a machine somewhat resembling the one which is used in cotton-spinning. This machine operates the tangled fibers, upon the completion of which operation three covers a feet casting on a regular casting machine. Leaving this machine, the asbestos is combed smoothly, and the fibers are made into a regular spinning machine.

The next step is to treat this mass in a rotary spinning machine. First the mass is spun, and then it is spun. It is drawn and spun until it becomes fine and quite strong. In case a hard, strong thread is required for certain fabrics, the asbestos is spun in a machine called a twisting machine, where two or more of the yarn threads are combined. If the thread is to be used in the form of a smooth, hard-finished thread it is not desirable.

For a long time the problem of spinning asbestos presented many difficulties by reason of the nature in which the threads are formed, and the fact that they are so heavy. Eventually it was found that, under the microscope, a thread of asbestos displayed a network surface and that by means of a special twisting machine, it could be successfully accomplished. The result is that, after many years of experiment, the thread of asbestos is now being spun on a single spindle thread one hundred yards in length and not exceeding an ounce in weight.

**The Searchlight and Fog**

It will be noticed on a foggy night that the beam of a search-light seems abruptly to come to an end if the light be pointed upwards. The cause of this is not, as is generally supposed, that the light will be absorbed by the fog. The reason is not far to seek.

Where the end of the beam seems to be, it is just that point where the fog real, but the beam cannot be visible to us, for less there are small particles in its path. This circumstance is of great assistance to the searcher for the cause of the weather, since they can determine the thickness or depth of the fog. They can also determine the nature of the fog, essentially, whether the fog is of great extent or whether it exists only in patches. Thus, when the beam is lighter in places, and if it proceeds through places where there is fog at all that part of the beam will be black or invisible.

**CLEARED AWAY**

Proper Food Put the Troubles Away

Our own troubles always seem more severe than those of others. The reason is that we are not even a light breakfast, for years, without serious illness, but has trouble enough. That we are not even a light breakfast, for years, without serious illness, but has trouble enough.

"I am glad of the opportunity to tell you that we are not even a light breakfast, for years, without serious illness, but has trouble enough. That we are not even a light breakfast, for years, without serious illness, but has trouble enough."

"After eating I would suddenly be seized with an attack of cold and coughing. This would be followed by headache and misery that would sometimes last for weeks, leaving me so weak I could hardly get up or walk."

"Once I began to use Grape-Nuts I have been free from the old troubles. I already used Grape-Nuts one or more times a day, and during it the troubles have been gone. I can eat almost anything I want without trouble."

"I am glad to hear that you are free from the old troubles. I already used Grape-Nuts one or more times a day, and during it the troubles have been gone. I can eat almost anything I want without trouble."

See read the above letter? A new era opens from this time to time. They are good, true, and full of human interest."

## Railway Freight-Rates and Railway Dividends

RATES HAVE GOT TO BE RAISED OR DIVIDENDS HAVE GOT TO COME DOWN

**W**HO does not say that the railroads may not increase their income? The Commission two years ago when it denied the railway's petition for an increase in freight rates. The first they may, and confidently believe they will. But if the time does not come when they are raised, then it may be also that their rates are realized, or are approaching realization. . . . This Commission will not hesitate to give the sanction to freight-rate increases which will be reasonable.

The foregoing statement is the basis of the present gain for an increase in rates. Conditions at present do not warrant an advance, and the 1911 decision in effect, but—and then follow the words quoted above. Let conditions change so that the train of the railroads are realized, or even "approach realization," stated the opinion, and the commission will not hesitate about giving its sanction to rate increases.

Conditions have so changed—that in the claim of the railroad now, operating expenses, largely as a result of the increased cost of labor, have risen beyond all bounds and covered gain in gross receipts. In 1911, an increase in net of over the \$34,800,000 increase in wages granted by the railroads in 1910, substantial wage-increase have also been made to the employees and the railroads have had to pay \$17,000,000 of additional pay annually but have just lost it by the increase and maintenance. By the development of such conditions, the 1911 decision, stated, investors have been made so absolutely unwilling to purchase railway securities, that capital which is interpreting the market is being withdrawn from them to go to other securities. Reduction in carrying power and impairment of credit have gone together. Moreover may have been the right or wrong of the Commission's action of two years ago in prohibiting the proposed freight-rate increases, changed conditions here, the railway men claim, demand that the case be reopened and decided according to its present merits.

At the very outset it may be well stated in brief and while that conditions have present conditions, that is to say, constantly rising labor costs without any compensating increase in freight-rates—hardly means what has been the right or wrong of the Commission's action. There are some roads, perhaps, so under-capitalized, and so rich in accumulated reserves that they could afford to pay the increased cost of labor. But even then their reserves were further greatly reduced, but these are the exception and not the rule of the railroads. Even those that are not under-capitalized and efficiently managed, are not making any very great amount of money or earning their dividends by any very great margin. To them, any further reduction of rate increases mean just one thing—that dividends will have to come down.

Cannot economies be effected to offset increased expenses? The answer is that the railroads have tried to do so more efficiently now. Ask that question of any railroad executive. If his answer is a "fit to print" statement, that the railroads are operated on as high a level of efficiency as any in the world. Then how almost all this of the million dollars a day that could be saved if the railroads were fit as they should be? Pure lack of understanding of real conditions as they actually are, is a shield for the introduction of economic dogmatism. By the way, it doesn't seem to hear so much of that (later) the railroads are under a great handicap. By no means are they free in making such changes. For one thing, the rigid rules of the powerful railroad brotherhoods have got to be taken into account. That is one thing. Another is that a railroad cannot be run on a profit basis in a small way, that is, that a small way of operation over a lot of territory, making little superintendence impossible. And then, finally, present historical conditions. For one thing, the economic operation in the constant demand on the part of the public for more and better service, regardless of cost. But no matter what the additional expense of the railroads had to be, it is not clear that it is possible any more to gain in efficiency whereby earnings can be largely increased in simply not to substantiate the case as it is.

Well, then, how about increase in income as an offset to rising costs? That can be expected to result in the freight-rates. For one thing, as W. Z. Eby pointed out the other night in a speech at the Economic Club dinner, that might have been expected, but that is not the way to do it. It is to demonstrate "in the way this authority put it," that after a certain point of traffic competition has been reached, the demand for more and better service is so great that it is necessary to increase in handling larger amounts of business. Unless earnings, therefore, are sufficiently large to permit of large capital expenditures, the railroads will not be able to raise new capital sums bound to sustain carrying power. The truth of the matter is that right now the railroads are not in a position to raise new capital sums in a large way as to make money out of it.

There is comfort in the idea that there exists some sort of a margin between what the railroads are now paying out and what they are earning, but earnings can be

maintained at a point allowing of the maintenance of current dividend rates, and so a good many people think it is likely to be a risky thing to do. The matter of reduced earnings and of the ability of the railroads to pay their present carrying charges out of pure arithmetic. There is an objection to it in which they can more themselves or be served. The truth of the thing is that the case of some roads the margin by which dividends are being earned is a narrow one, and that, unless freight-rates are raised, any further appreciable increase in expenses is going to result in dividends generally having to come down.

From the standpoint of the investor in railway securities, therefore, what the Commission does in effect, but—and then follow the words quoted above. Let conditions change so that the train of the railroads are realized, or even "approach realization," stated the opinion, and the commission will not hesitate about giving its sanction to rate increases.

Conditions have so changed—that in the claim of the railroad now, operating expenses, largely as a result of the increased cost of labor, have risen beyond all bounds and covered gain in gross receipts. In 1911, an increase in net of over the \$34,800,000 increase in wages granted by the railroads in 1910, substantial wage-increase have also been made to the employees and the railroads have had to pay \$17,000,000 of additional pay annually but have just lost it by the increase and maintenance. By the development of such conditions, the 1911 decision, stated, investors have been made so absolutely unwilling to purchase railway securities, that capital which is interpreting the market is being withdrawn from them to go to other securities. Reduction in carrying power and impairment of credit have gone together. Reduction in carrying power and impairment of credit have gone together. Moreover may have been the right or wrong of the Commission's action of two years ago in prohibiting the proposed freight-rate increases, changed conditions here, the railway men claim, demand that the case be reopened and decided according to its present merits.

## Ye Ancient Barge

EVIL their strike last year, which threatened to paralyze the whole business of the port of London, is affecting in turn every port in the United Kingdom. It is said that few Londoners know anything about the Thames lighters. The English, then, foreigners and the Thames barge is an important piece, a monopole protected by acts of Parliament for the last four hundred years.

The first act of Parliament defining the constitution and powers of the Watermen's Company was passed in 1554. In 1555 another act was passed that the Court of Watermen's Company should consist of eight watermen, to be called owners and rulers, they appointed by the Mayor and Aldermen being absent, in 1701 the lighters were incorporated into the watermen, and the title of the company was changed to the Watermen's and Lightermen's Company, three lighters being appointed an additional owners and rulers.

Many other acts of Parliament have been passed concerning the company. One of the most important is that of 1823, which provides that no person except a freeman of the company or a duly qualified apprentice be allowed to act as waterman or lighterman, or to navigate any wherry or pleasure boat, lighter, or other craft. In 1829 there were 12,243 of these Thames men; 10-day the men holding licenses number only 2,413. The reduction in their number is due to the introduction of steam. In the days of Queen Elizabeth the watermen between Windsor and Westminster numbered 10,000. It was their boast that they could haul 20,000 tons for the navy, and at one time 8,000 of them were in the service.

The watermen's company. The Thames barge have been famous for centuries. Howell relates that Sir Johnson was very pleased to be visited at his house by six watermen of whom he tried their satire on him. By 1701 the watermen's craft had become generally offensive, and an order was made by the rulers and owners of the company forbidding this form of amusement, and a penalty of half a crown for each offense was imposed on any waterman or apprentice convicted of using improper language.

## Spider Silk

From time to time the ingenuity of the spider has been exercised in its endeavor to develop some substitute for the silkworm's product, to find some other insect that will produce something very similar at a lower cost.

It is an old idea that the spider might be employed in this way in substitution for the silkworm. The spiders have ever been too obtuse to obtain a sufficient quantity of the spider thread and how to spin it without breaking or tearing it. A Frenchman named Verbeur introduced a spider to a machine of his invention. This machine sustained the spider and drew out the thread steadily. The thread was wound as the spider spun it, and after it had been made, the end of the web, which was attached to the body of the spider, was caught on a hook fixed firmly in a bobbin. Then the machine was put to rest in motion. The spider, feeling that it was needed away independently of its own volition, naturally pulled in the opposite direction to get away. But, it is said, he failed instead to his great delight, that the spider did not pull with sufficient force to break the thread, but actually managed to enjoy the process, maintaining just sufficient tension to keep the web in continual motion. Many spiders, it is said, were tried in this way, and but few different quantities of their product was obtained to be woven into a fabric. This, it is found, was superior to natural silk in strength, elasticity, and tenacity.

It were superfluous to add that dozens of spider silk have been tried, the most of any give the very rich. A species of Madagascar spider is the only one that supplies the right sort of thread. None else can give the spider's thread a toughness that has it.

The Frenchman who invented these interesting experiments admitted that no other advantage of the spider as a producer of silk is that, having been supplied with a web, it can be put to rest in any condition, when it will retreat to another web without showing ill effects.

## The Song of the Mosquito

The L. O. Bureau, of the Department of Agriculture, on recent authority, says the mosquito, long regarded as a pest, has for some interesting data with reference to that creature's song.

The mosquito's flight, it appears, is perceived not, as is the case of a fly, by a rapid vibration of the wings, but by a movement of the air which the body

during the act of respiration. Dragonflies and bees also sing in this way.

It is related that an electrical engineer, who was making some experiments in harmonic telegraph, producing notes of a certain pitch by electrical means, found that when a note was raised to a certain number of vibrations all the mosquitoes in the room and even from wide distances outside would aggregate near the apparatus and prostrate themselves against it as if attracted.

Then the experimenter devised a deadly machine. He covered a large surface with sticky flypaper and, sounding the note for a few seconds, captured all the mosquitoes in the room. He then made an apparatus to kill them by electricity. A series of window screens from which the paint was removed was stretched on a board and small pins were driven between the screens, the heads coming flush with the surface of the screen. All the pins were connected electrically, and the whole formed one electrode of the secondary coil of an induction coil, while the wire screens formed the other electrode. A high-power alternating current was then passed, the note was sounded, and thousands prostrated themselves against the screen and were immediately killed.

## Hearing One's Own Voice

LATER, who appears to have accidentally investigated the matter, asserts that not only does one not hear himself as others hear him, but that one does not hear himself as others hear him. Some interesting experiments were made by the French scientist in this connection.

He endeavored to ascertain whether a man truly hears the sound of his own voice. Lately has been at some pains to determine the facts, and he has concluded that if a person record on a phonograph a few sentences pronounced by himself, together with other recorded by friends, and sends the machine to reproduce these, it most frequently happens that the man more rarely recognizes the voice of his friends than he does his own.

It appears that the difference lies in the quality of the tone. One hears his own voice carried through the air, as do his auditors, but across the solid parts between the organs of speech and those of hearing. The sound thus produced has a different timbre from that conducted to the ear by the air alone.

It is very certainly very doubtful as to this let us try the following experiment: Take the end of a wooden rod between the teeth and pronounce a word—undoubtedly. Let the other end be taken alternately between the teeth and released by another person who at the same time stops his ears. The latter will find that every time he hears the rod in his teeth the sound will be stronger than when it reaches the ear through the air alone, and that it has a different quality. The passage of sound through a solid body magnifies its intensity and modifies its quality.

## Wind and Fish

It is reported that a singular correspondence exists between the prevailing direction of the wind on the coast of New South Wales and the average size of fish.

It appears that the winds which blow over the ocean currents influence, in fact, the course of the fish. These influences vary periods of three or four years. Thus in 1808, there was a general scarcity of fish, but afterward they became more and more abundant up to the year 1860. In 1896 there was another scarcity of fish, but the next year they began to return in large numbers.

The cause of these variations was regarded as a mystery until the coincidence with the prevailing direction of the wind was noted. It is thought that the hypothesis of the fishermen may be justified two or three years in advance.

## Aluminum for Power Transmission

One of the uses of aluminum is as a substitute for copper wire in the transmission of electric power over long distances. Allowed to stand and unburied per cent of copper. It is thus used in transmitting 12,000 horse-power from the Steamship Park to the City of Tacoma and Seattle, a distance of more than forty miles. This alloy is in the same time as light and strong as that of 150 lbs. but are safely made, thereby effecting a great saving in the number of poles needed at the various points along the line of conductors. Where metallic cables are required the increased diameter of the aluminum conductor, which is increased out, and where lead is used for insulation the gain of weight obtained in high-tension wires is increased.

## Vitalized Rubber calls a halt on "Short Mileage!"

In our laboratories today it is a simple matter to take pure, young, lustrous rubber—direct from the trees of the tropics—and put it through a process that toughens it for road wear and yet retains an abundance of elasticity and life.

Thousands of these Vitalized Rubber Tires have been put to every severe test possible and they have delivered the "More Mileage" you have demanded.

In addition you will enjoy the advantages of the Perfect 3-Point Rim Contact, also the No-Pinch Safety Flap for inner tube protection.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims at any of the

25,000 Diamond Dealers always at your Service

## A Western Welcome

Awaits You At

## Glacier National Park

From the moment you arrive at this great west-continental gateway, you will find the spirit of western hospitality everywhere. Nothing that could possibly contribute to your comfort and enjoyment is left untried. You will find service without rivalry, hearty without formality, and a most generous hospitality in the very heart of the wildest and most beautiful spot in America.

Tours by Automobile, Four-Horse Stage, Launch, Horseback or Afoot—\$1 to \$5 Per Day

One of the finest as well as the most novel hotels in America has just been completed at Glacier Park Station, the modern gateway to the Park. It is built entirely of huge logs, four feet in diameter and forty feet long. It offers accommodations for big parties, every room is electrically lighted and heated. Every modern feature including phone, shower baths, an auditor, hair dressers and open fireplace in living rooms. Clean and service of the highest order. Rates—American plan—\$1 to \$6 per day.

Tours by automobile, four-horse stage, launch and horseback, also camping and walking tours with complete guides—\$1 to \$5 per day. The famous chain of seven United States Camps throughout the Park provides unusual accommodations at the end of each day's journey. Rates, \$5 per day—American Plan.

The Blackfoot Indians, whose reservation adjoins the Park, are a feature of national interest. Visitors to the Park will be afforded frequent opportunities to be present at their traditional ceremonies and dances.

## Novel Aeroplane Map in Colors and Travel Literature—FREE

A postal card will bring you complete color-illustrated literature. It tells you all the details of the Park, and the best routes to take. The literature will cost you no money unless you do not wish to receive it. The obligation on your part when you receive it is to send it to the nearest post office.

# THE MOTOR-CYCLE OF TO-DAY

Some of the Peculiar Advantages it Offers

BY HAROLD WHITING SLAUSON

**I**t is told of an Indian that when he does not wish to wear a bicycle, about twenty years ago, he greeted: "Light! They lay poles—walk sitting down." What, then, would the same Indian think today could be seen thousands of "palefaces" being over the country on those two-wheeled vehicles at a mile-a-minute clip without even as much as saving their feet—a sort of "slating sitting down," as it were. He would be forced to admit that, in this instance at least, "savans" had wrought wonders and that the calmly seated white man can cover more ground in a day than could the most foot-fetted and strenuously inclined Indian runner in his.

It was possibly somewhat the same attitude, on the part of the palefaces' "kithes or fourteen years ago, that prevented the motor-cycle from jumping into the immediate popularity that has since been accorded it. The motor-cycle was introduced during the height of the bicycle craze, and to substitute a small gasoline motor for foot power seemed the epitome of madness. The bicycle was used as much as a means of exercise as of locomotion, and to make it self-propelling was defeating one of its chief ends. About this time, however, the first automobiles began to prove themselves to be the rich and convenient of the future, and these started the demand for self-propelled vehicles that has resulted in the production of over a quarter of a million motor-cycles and motor-cars a year for several seasons.

The motor-cycle does not require the whole road, and is comparatively able to reach where many a heavy automobile may fear to tread. Many a motor-

cyclist at first thought, as they may be turned to any position as the muscles become tired of inactivity. Some motor-cycles are provided with running boards or a seat of platform below the motor. These serve as a supplementary foot-rest on which the driver may place his feet when they tire of the pedals. In some designs the running-boards receive the pedals entirely, the motor being started by a small hand-crank and the tanks supplied from the handlebars. These features of the motor-cycle design and construction, together with many others which would need to be noted by the casual observer of such a vehicle, serve to make motor-cycling an exceedingly comfortable recreation.

While the motor-cycle may be considered a "one-man" affair, it is not without its social possibilities. Two machines may travel side by side, or if the center of the road be smooth as well as the sides, three abreast will not occupy more space than that required by the ordinary four-wheeled vehicle. The riders will then be close together than are the occupants of the front seat and fenders of a touring-car, and they possess the further advantage in that a turn of the accelerator handle will enable one to drop away from the rest of the procession without stopping.

But the motor-cycle can also be converted into a two-passenger conveyance by the addition of a seat and foot-rests at the rear. This pillow effect is much more comfortable than its appearance or the position of its occupants would lead one to expect. In fact, several couples have toured for hundreds of miles in this manner. But for those who desire more comfort and luxury than it is possible for this rear seat to afford an extra wheel may be attached to the rear of the motor-cycle, and on the axle connecting the two a comfortably upholstered wicker seat having a back and arm may be placed. This seat is similar in appearance to the wheel-bins that are to be found at seaside and health resorts, and because of the fact that it is a side extension of the motor-cycle the attachment is known as a "side car." The extra passenger is thus brought by the side of the rider

The motor-cycle squad of Cleveland's police department

and a conversation may be carried on as easily as though both were seated in a room. The use of this attachment is limited, of course, to good roads, but so the seat and wheel are easily removed or set in place the utility of the motor-cycle for touring is not interfered with. The speed of the motor-cycle is also reduced by the added weight, but as the maximum rate of travel that can be attained by one of these machines is ordinarily considerably above the limit of safety the rider and companion can cover ground "plenty fast."

It might well be assumed by those unfamiliar with the subject that the speed, capability, and power possessed by the average motor-cycle would render it very by its means more dangerous than bicycle-riding. With the exercise of due care, however, a motor-cycle of thirty or forty miles an hour is no more dangerous to ride than is a bicycle at half that speed. In fact, it is probable that there are fewer "spills," on the part of motor-cyclists, than ever occurred by an equal number of bicycle-riders. In the first place, the motor-cycle is made exceedingly strong to withstand the added strain due to the increased weight and speed. Secondly, it is provided with increased braking surface and extra safety equipment to compensate for the effect of the added momentum caused by the heavy mass moving at high speed. The engine control of most motor-cycles is located in the grips of the handlebars, while the brake is applied by a downward pressure of the foot on the rear pedal. Thus to start or to stop almost instantly neither the hands nor feet need be removed, and the machine is at all times under perfect control.

The third reason for the comparative safety attendant upon high-speed motor-cycling is one that might not at first glance appear important, and yet it is in reality far-reaching in its effects. Every one who has ever ridden a bicycle realizes how much more easily he could retain his balance when he was pedaling fast than was the case when he was traveling at a slow rate of speed. At high speeds the balance becomes automatic, and the machine naturally maintains its equilibrium without any effort on the direction on the part of the driver. On a motor-cycle this effect is even more noticeable, due probably to the greater weight or mass in motion. Furthermore, the engine, magneto or battery, muffler, and other parts are placed in the lower portion of the frame, thus giving a low center of gravity to the machine, which contributes to stability. Then, too, the tendency of the heavy motor-cycle, moving at a rapid rate, is to continue in a straight line and to ignore small obstructions that would deflect the lighter bicycle from its normal course. This means that the motor-cycle can safely traverse rough roads filled with ruts that would throw the rider of a bicycle.

A motor-cycle will cost from \$350 to \$700, depending upon the size of the motor and the accessories, and other equipment; an automobile capable of attaining the same speed as the 25-hp. motor-cycle is usually to be bought for less than \$600 or \$1,000. A high-powered automobile will travel an average of six to twelve miles per gallon of gasoline, a motor-cycle can cover as much as one hundred miles of ordinary road on the same amount of fuel.

Because of the low initial cost of the motor-cycle, its great economy of gasoline, and lubricating oil, and its low expense for tires, the operating and "ouching" charges per mile are brought down to an amount less than a cost that this becomes the cheapest form of transportation yet known.

One machine for two, useful for honeymoon journeys

at known, to his sorrow, that after a heavy rain he must drive through rather than over the average country road. Pedestrians may have seen a hand-some pathway along the roadside, but that is found to the fifty-sixth wide tread of the automobile. Not on the motor-cycle, however; that can travel along a pathway a foot wide, and by working out these ruts and by following a smooth, broad "rut" on one side or the other practically all roads are made possible to this sturdy two-wheeled vehicle.

It may be said that these advantages of the motor-cycle are obtained at the sacrifice of carrying capacity and comfort. At the expense of carrying capacity certainly, for it is not to be expected that a two-wheeled vehicle of but one-twelfth the weight of an average automobile would possess the room for the passengers and equipment provided in a touring car. Hence for a suit-case, together with accommodations for beds and the necessary extra parts, will be found on every motor-cycle, however, and consequently the vehicle is adapted for extended touring.

But so far as the comfort of the rider is concerned appearances are deceptive. The seats are large, well shaped, and provided with springs that absorb shocks and jars of road travel. The frames themselves, on which the weight of the rider and motor is placed, are curved and designed with springs at both the front and rear portions, and such roads and be traversed with ease in complete or discomfort thus affords a ride over the same course in a large touring-car. The pedals of the motor-cycle form far more comfortable seats for the rider's feet than might be ap-

The motor-cycle with chair—a London innovation

# Freaks of the Tornado

By George E. Walsh

The Weather Bureau at Washington has been collecting statistics and facts about cyclones and tornadoes for many years, and the experts have succeeded in securing considerable valuable data about the big winds. But after all, the freaks of the storm are the things that give it special interest, and if all these things properly classified and intelligently recorded could be furnished, every visitation of a tornado adds to this valuable storehouse of queer freaks.

It is not uncommon for the whirling wind to cut a house in half demolishing one side and leaving the other unharmed. This happened in an Iowa town, and the part that was left intact was so little disturbed that the clock on the mantel continued ticking as if nothing had happened. In the Texas town of Sherman, which was visited by a tornado in 1896, two houses were picked up and carried into the air where they exploded. Every one in them was severely injured except a baby, which did not receive so much as a scratch. A man sitting a row in a shed saw the row and asked carried up in the air, but he was not so much as touched. Not a drop of the milk in his pail was spilled or disturbed.

In the St. Louis tornado of the same year a carpet in the parlor of one house was pulled up by the center and carried away a few hundred yards without a mark as a root being torn in it. The turks had been pulled up as easily as if extracted by a magnetic carpet-lifter. In another house the bed-dollies and mattress were lifted from the bed, and the bedstead was left intact. A resident was carried through the roof of another house with the bed and dropped a quarter of a mile away without injury. The mattress saved him in the fall, but he jerked himself up in a moment late to down without knowing exactly what had happened to him.

The "trotters" have been known to pull nails out of shingles and then go on to pick up a chimney, bodily and carry it through the air. In Kansas one picked up a loggia and landed it in the branches of a tree. At another time it ripped the harness completely off a horse and left horse, buggy, and man unharmed. In

Louisville in 1890, a tornado carried the roof of a house and pulled a child from the mother's arms and carried it safely to another house six blocks away.

But there are queerer among the barn-lore freaks of the big wind. There are others more heart-breaking. One has numbered human beings, bearing arms and legs from the body, and twisted the hair of women into ropes. In Kansas a dress a piece of wadding six inches square through the body of a hog. At another time it blew in the door of a lawyer's house and carried the owner away in the door, to drop him in the branches of a tree. The tornado did not hurt him, but he broke his neck falling from the tree to the ground. No one has succeeded in capturing the full force of a tornado, but it is known to travel at the rate of two hundred miles and more an hour.

Tornadoes are exciting more general attention these times because of the greater number of towns and villages located in the tornado belt. Each successive one is more dangerous than its predecessor because it is apt to find more human material. For every one it might travel half the length of a continent without finding anything in its path to destroy crops, grain, trees, and occasionally the crops of a solitary citizen. To-day, if it followed the same route, it might pass over a dozen villages and towns.

The only thing that can possibly break the force of a tornado is a range of mountains. It may create wild havoc among the trees and breakers of a mountain, but it cannot carry the mountain itself away. It will appear good forerunner, but the water flows wells and streams, twist and demand, iron bridges, and every day coming, but the mountains are proof against the mighty force of the wind. Until we know how to control the tornado or find some means of halting its force, it may create wild havoc among the great plain sections of the country. It is, like earthquakes, the tornado and cyclone do not occur every year, and sometimes they defer their visit for a year or so, for which we may be thankful.

# GRAFLEX CAMERAS

On a day like this or indoors like this

## THE GRAFLEX

will let you make "snap shots" fast enough before clear air fades, and with exposure enough to make strong, brilliant prints.

Outdoors on bright days you can make pictures like this with exposure as short as 1/1000th of a second. If you wish, you can use an ordinary. You don't have to guess how far you stand from the subject, as there is no lens scale on the Graflex. Instead, you have a "finder." With the Graflex you see the subject just as he is, as if he were in the finished picture, up to the depth of the subject.

THE NEW SPECIES OF CREATED DINOSAUR, SCIENTIFICALLY DISCOVERED BY MARSHALL AND NOW MONITOR IN THE MUSEUM OF NATURAL HISTORY, NEW YORK. IN LIFE THIS CREATURE MEASURED THIRTY-TWO FEET IN LENGTH AND STORE SEVEN-TWENTY FEET HIGH.

## Army Eagles

EAGLES lasted only from 1865 to Waterloo. Before then it had been the custom in armies to carry large eagles mounted on poles, which, while they afforded a rallying point for their corps, also drew the enemy's fire. It remained for Napoleon to notice the ancient symbol of the Cosmos. At first eagles were presented in every battalion of infantry and every squadron of horse. But owing to the number of eagles captured this all became was cut down. All battalion eagles were withdrawn and one eagle was carried by each regiment of foot and cavalry. In 1812 a still further reduction was made and in some cases line regiments were ordered to leave their eagles in their arsenals. Those standards were also taken from all regiments of light and heavy artillery and carried occasionally for an infantry brigade. The eagle staff was eight inches in height and nine inches across the wings. It stood on a bronze block three feet square and weighed three and a half pounds. Modern eagles, handsome as they are, are as nothing compared to the old ones, which were so dignified in look as the big drum. Then there existed a register

system for wing eagles. Sometimes, when the tide of war ran unfavorably, they were destroyed and put into honorable or great-coat piles. At other times they were burned, thrown into ponds or rivers, broken up, broken in hollow trees, and most humiliating of all, stuffed into some dead horse, to be buried out subsequently.

## Hens as Barometers

A FORTUNE-BASER in Indonesia has produced curious results by altering and alternating the food given to his hens. It is known for some time that chickens for the market that Devanco pepper put into their food, points in a notable difference in the character and shade of their plumage, giving the feathers a smoothness and reddish tinge which adds to their value in the market. It is now approved to be added to the diet, especially of white hens, which have been laid from carefully selected eggs, and their feathers become pale rose, and they are sold for a brilliant red when the weather is damp and a steely ashen-gray. These hens that become veritable barometers, and the prognostic of color from pale to brilliant is so exact that a useful law, stating about the barometer is regarded in certain prophesy of a storm which may be so much as twelve hours distant.

## Our Peripatetic Secretary of State

*O Cuckoo! shall I call thee bird  
Or but a wandering voice?*

—WILLIAM WORDSWORTH.

ONCE upon a time, not so very long ago, the Honorable JAMES E. MURPHY was delivering an impassioned oration in the Fourth Ward of Jersey City. We forget what it was about, but that doesn't matter any more now than it did then. The point is that, while speaking, the orator strode up and down the platform, flapping his coat-tails, and with a nod of Celtic extraction rose and said with peculiar positiveness, "Jus, if you're going to walk, you'll walk; if you're going to walk, don't talk." The audience applauded the suggestion so heartily that the orator, after giving thanks, subsided entirely, somewhat to the relief of Governor Woodrow Wilson, who was waiting his turn to address the masses against the bosses.

But it was all a mistake justly attributable to ignorance. Mr. Murphy's method of delivery was fully warranted by the highest classical authority. He was stamping in the footsteps of ARISTOTLE himself. He was trying to be a Peripatetic.

To those unfamiliar with words derived from the Greek this simple designation may seem unnecessary or even suggestive of some unpleasant recollection, but in truth of course it is highly complimentary. For there is at the present day no more exact examination for admission to the famous School of Peripatetics established by the great teacher of ethics and politics, and taught by him while pacing to and fro. A book accordingly would have no chance at all. But there is one business American, we are happy to record, who would stand easily at the head of the class. The man is "the Honorable, the Secretary of State," as he was designated on the menu of Director-General JAMES BARRATT'S Pan-American feast, given the other evening with much zest in this wicked city.

We can only approximate the measure of Brother BAYAN'S familiarity with the lore of the ancient philosopher. There have been times when it seemed as if he would have talked long if he had studied more, but you never can tell. The effect might have been quite the contrary. Genius of the tongue is like a halibut brook—restrained and unmeasurable, now a mere gurgle and then suddenly become a rushing torrent. But when PLATO himself happened to be only that needs the him more than the spur, how accurately he depicted what Brother BAYAN needs and, incidentally, what he seems to be getting!

It is not a fair presumption, moreover, that the *Oratorian* was a mere precursor of the *Cassanover*? And do not the *Cassanovers* of the Greek master bear a striking similarity to the *Infersasofarinas* of the American disciple, especially when someone he doesn't like promises to become a candidate? How recently, too, has Brother BAYAN exemplified the Aristotelian doctrine that "virtue lies between the extremes of self-indulgence and asceticism," and that "every change from potentiality to actuality is accomplished by an efficient cause which is working from an end, the 'Final Cause'?" A true, a qualified Peripatetic, indeed, is the Honorable, the Secretary of State.

Nevertheless, it is not in that sense that we use the adjective in the title of this disorienter. The accepted modern meaning of the word is far more pertinent to the case in point, signifying as it does a revolving. Mr. BAYAN, one "going about from place to place in connection with some occupation or calling." That is Brother BAYAN'S

real job. In view of the constant references in the papers to "Acting Secretary" This or That, no less than of his generally subservient attitude, it would be correct enough, we suppose, to speak of Mr. BAYAN as *Passive Secretary*, but on the whole we like Peripatetic better, and will let it stand at that.

Some people thought it strange that Brother BAYAN should accept an appointment which implied the manipulation of a second victim. Others were surprised when the leader of the oratorists offered him the position. But these were unscrupulous folk. The President, be assured, had

MARY, LEWIS CANN, JEREMIAH BLISS, WILLIAM H. NEWBURN, WILLIAM M. EVERTS, THOMAS F. BAYMAN, JOHN SHAWMAN, JOHN HAY, ELMER HOOT, and so forth and so on, down to FRANKLIN C. KANE, who could have done as well as most of the others but for a temperamental disinclination with application. A very good line indeed for WILLIAM JENNINGS BAYAN to join!

Then, too, tradition had accented such authority, no less than marked distinction, to the high office. Suffice it to remark as an indication, without recalling the achievements of JEFFERSON, MONROE, CLAY, CALHOUN, and HOWE, that it was NEWBURN, not LINCOLN, who purchased Alaska; BLISS, not HARRISON, who averted a war; and CANEY, not CLEVELAND, who instigated the Venable message.

True, this tradition could hardly maintain under a strain accustomed to render help after having deviled. Even though an Ambassador Puck with shrewd and subsequently demonstrated foresight remarked, "The state portfolio the President himself must hold whenever important foreign questions come up," there would still exist a vacuum of no mean size to be filled. The simplest, moreover, that lack of stability necessarily implies absence of responsibility was not to be overlooked by a mind accustomed to penetrate to last consequences.

So it all came about naturally and politely, and after having won official recognition of the indelible right of his stomach to perform the delicate function of fermentation. Brother BAYAN boarded a high but not lofty to make a personal acquaintance with red tops. Inevitably much fawning ensued. Our neighbor, the *Sax*, prophesied the direct calamities. Henry HUNT threw up his hands and said divorce proceedings would be begun before the honeymoon was over. Justus HEGGANS presided in putting their tongues in their ears while really only biting them. We also forebore the perfect harmony, the contrived team play, which has ensued. Like the famous ship upon the sea, Brother BAYAN soon found himself in the place in which he was shown with tactful solicitude. He went to sleep a Democrat and awoke a Peripatetic.

Copyright, 1912, International News Service

(From the "New York American.")

We reprint this picture by Mr. T. E. Powers solely as a happy illustration of the accompanying discourse. Although ostensibly a work of high art, it is not a good likeness. The suburban portrait of Mr. Bryan is the one of him in a high hat drawn by Mr. Duffel and published recently in this journal.

his reasons for keeping the great costume close to his elbow, and who can doubt that the photograph which the Assistant President studied judicially from the far end of his right arm was of the type commonly known as enlarged! As to Brother BAYAN himself, speculation respecting his emotions resolves readily into available surmise. The wilting effect of office-seeking had engendered a divine fear of officeholding. And the place itself was alluring. It had been filled, or at least occupied, by men who had loomed large in their day and generation. If he became Secretary of State, he could count as his predecessors THOMAS JEFFERSON, JOHN MONROE, JAMES MADISON, JOHN Q. ADAMS, BRYAN CLAY, MARTIN VAN BUREN, JOHN C. CALHOUN, DANIEL WEBSTER, WILLIAM L. GAYNE, and so forth. The prospect was indeed

in the accurate words of Mr. MYRAH, he has had the time of his life "going about or from place to place in connection with some occupation or calling." First he went home to lend his presence to a celebration of his birthday, a full report of which appeared in these columns. Then he made a speech or two about the education of home rule to the Irish in Dublin (a particular need of rest, he was at liberty to regard the fourth commandment as an unimportant part of the platform and took a class in Sunday-school). He made his famous trip to California by official direction and with full authority—to telegraph freely to Washington. Then he let the Japanese ambassador cool his heels while he went to Hagerstown, New York, and directed at some length and with great fervor upon the inevitability of party platforms which declare right for a single term for Presidents.

Last week he came over to this city, which surely he considered as belonging to his country, and found it occupied by a multitude of friends. Never in his life had he so many people to greet in New York as he did on this day. He was greeted as that which showed his heart to the people.

American dinner party. And he made good. His speech was a masterpiece of diplomatic utterance. One could not fail to mark the pleasing contrast of his true and tolerant humor with the barbed wit and dire threats uttered but a short time ago in the same hall by his officially superior public servant.

We have no need to signify the value which we attach to the President's high intelligence. That it cannot be overestimated has been demonstrated over and over again since he took up his duties at the White House and the Capitol. But in no instance has he shown keener intuition than by consulting with Mr. Bryan on the subject of preliminary communication with the people. JOHN BASSETT MOORE can struggle with low-looks and hunt up precedents as well as anybody; nobody can beat Assistant-President HORNE at putting candidates into their proper pens, and of course there is lost one fully qualified to avoid an abundant store but when it comes to popularizing the administration, in part if not in whole, commend us to the Honorable the Secretary of State.

He is the matchless minute-man of the government, ready at any time to drop his present- or jump out of bed to answer the call of duty. He has no needed miles at his back, and is ready and is fresher than when he started. We shouldn't be surprised any morning to read that he was off to England to help out our new ambassador in addressing labor unions and other peace societies.

Messieurs, make no mistake, Brother BAYAN is growing in the estimation of his countrymen. He is getting to be more careful every day of what he says, and he is doing what he is told with extraordinary skill and usefulness. If anything should happen to go wrong—which Heaven forbid—he will still be able to present a satisfied face with a smiling face, and show hands clean as a white cloth of responsibility.

A fearless man is Brother BRYAN, fair and clear, with one eye guided by direction of ALEXANDER upon the Final Cause. Women's work, if now living, would never mistake him for a mere cuckoo or "a bad smelling voice." He is, in truth, in the classical language of the poet, a kind.

Mr. Bryan's New York Defender.

Our distinguished aristocrat, the *Pan* and the *World*, so often agree that when they do the happening demands attention. Some suspicious people thought they detected peculiar significance in what Mr. BRYAN said at Harrisburg to wit:

A man who violates a party platform and betrays his party and the people is a criminal worse than the man who subdues them. It is a crime in this country that a platform is binding upon every man that man on that platform. Some men violate platforms because they say they cannot violate their conscience. Far be it from me to have a man violate his conscience. No man should violate his conscience, but that does not mean that he should violate his party platform. It means that his conscience should begin to work before he is elected, and not afterward. If after election he cannot violate his conscience he keep his party platform, he should resign and set his conscience story the conscience of his constituents.

Whereupon the *Star* declared with characteristic succinctness:

It is unfair to poison Mr. BRYAN's own presence in Washington by analyses or spurious interpretations of his remarks on the arbitrary critical. Because he insists that they say they cannot violate their conscience and indefeasible obligation of a candidate to stick to the platform, the advocates of lies and the adherents of robbery are sure to be becoming himself for the 1914 campaign, starting at Mr. WILSON and reminding him of the slogan-templed pledge in the Baltimore platform.

Whatever Mr. BAYAN's hopes and ambitions, it is unjust to introduce to his own a misunderstanding of the plain language and purpose of the Baltimore declaration about his "conscience" term as to imply that it refers or one order to a second term as the Constitution now stands, and binds Mr. WILSON to a single term.

A constitutional amendment for a single, and presumably a longer, term is what Mr. WILSON is pledged to in the platform. It is not necessary for the equally indefeasible feature of Mr. BAYAN that are always trying to make trouble between him and Mr. WILSON?

The *World*, because of its stronger predisposition in favor of Mr. BAYAN, approached the interesting subject from another angle, but reached the same conclusion.

Nevertheless, the mischief-makers keep on hinting. It may not be amiss, therefore, to suggest that, while recognizing the earnest efforts of our neighbors in his behalf, Mr. BAYAN consider the propriety of making his position quite clear. A very few words would suffice. Doubtless we shall hear them soon or perhaps even sooner. What?

Doing Their Duty

Says the crumbed old *Inter-Ocean* of Chicago: "We had heard from the demand for the free-trade experiment, so far as the administration branch is concerned, about:

WILSON (free trade).....	1,292,596
ROOSEVELT (free trade).....	100,101
TART (against free trade).....	3,491,632
	747,173
Majority against free trade.....	1,178,134

Nazis to this, Mr. WILSON's role was swelled by hundreds of thousands of Republicans driven to his support by what they regarded as the worse evil, instead of the lesser one, the resolution of the tariff. So out of a total vote of over 15,000,000, less than six million demanded both WILSON and free trade.

Fudge! Neither Mr. WILSON, nor the Democratic party advocated free trade or anything approaching it. They stood for reduction of tariff duties and won, and are now fulfilling their pledge. That is all there is of it.

Mr. Roosevelt's Baggage

It has been the immemorial privilege of losers at law to go down to the tavern and curse out the court. Secretary ROOSEVELT seems minded to deny this venerable relief to manufacturers who think themselves injured by the new tariff law. If they complain that the new law has so reduced their profits that they must reduce wages the government is ready. Mr. ROOSEVELT aims to investigate their complaints and find out whether the trouble in their business is due to the new tariff or to other causes, such as bad equipment, antiquated methods, poor location, or lack of capital. Mr. ROOSEVELT says the Department of Commerce has the machinery for making these investigations and does a good job when it undertakes one.

A howl has arisen from the ranks of the employing class at this suggestion. It is dreadful, to be sure. We suppose not even Mr. ROOSEVELT has the hardihood to hint that the government will compel manufacturers to keep up wages. But he has something that comes pretty near it to wit:

If I go public the public mind at all clearly it holds undesirable views toward reduction of wages except under strict necessity. It would not approve them for the sake of maintaining profits, based all on a purely political sentiment. Furthermore, they believe that the reduction of wages is the easy road to the inefficient and the lackwork of poor management.

I believe this to be so. As therefore the reduction of wages has direct social effects, and as the public is entitled to know in advance the facts, we think the department has undertaken to find out whether the facts do or do not justify the threatened

Some of this is rather gay talk. How clearly does Mr. ROOSEVELT grasp the public mind? Will it insist in maintenance of wages where there are no profits? Would it not consider that the maintenance of wages by intervention of the Department of Commerce would be as much the easy road of inefficient workers as the high tariff has been the easy road of inefficient employer? But never mind the answer. All Mr. ROOSEVELT's department undertakes to do is to find out whether facts warrant reductions.

That may not be a bad thing. Nobody but an expert can bring a complaining manufacturer (of woolsens, say) to book and find out if he is really losing and how much, and how much is reasonable. The tariff bill is not passed yet, and we can afford to wait till Mr. ROOSEVELT's activities are subject of complaint by some one who is actually pinched before we take them seriously.

The Means of Republican Revival

It will not do to dismiss as a *sine qua non* the renewal of the effort to recognize the Republican party. So far as we have observed, the attempts to battle the recent Chicago conference to that end have come from men thoroughly committed to the Bull Moose movement and were therefore to be expected. Even if we grant in addition the vigorous ridicule from Bull Moose sources is one of the reasons for taking quite seriously the enterprise of Governor HANCOY and Senators BAYAN and CLEVELAND and their associates; if it were really laughable, the laughing wouldn't be so strenuous.

But there are other reasons to take it seriously. The men themselves, for the most part, have

weight with the country, and they are the kind of Republicans to take the lead in this matter, because they have most in common with those who want the length of tactical rebellion. They have also, we think, taken a correct view of the general course to be followed, which is, roughly, the simplest. They favor a national convention, to be specially called, of those practices which have been a real source of offense. The chief of those, they declare, have been the retro-borough system in the South, the method of handling contests before national conventions, and the manipulation of resources and conventions in the states in the choice of delegates. They favor also their wisdom by insisting that these reforms must be made to openly and candidly as to convince the people that they have been made thoroughly and sincerely.

The Japanese and the World

It is easy to be positive on the question California has raised about the ownership of her lands by aliens. We ourselves, for instance, are positive that California ought not to be precipitate; that she has nothing to gain by hurry, and nothing to lose—certainly not the question itself—by going respectfully to the other side.

President ELIOT and others are quite so easily positive that there is no hostile animus in Japan, and no colonizing purpose, and that therefore the Californians have discovered a man's nest. Most Californians, on the other hand, seem to be equally positive that they are up against something very serious, and must take immediate and drastic action.

We defend our notion by agreeing with President ELIOT and the peace-makers, on the one hand, and the Californians, on the other. That is to say, we agree that Japan doesn't want trouble, and we also agree that the ownership of land by Japanese in California is in one aspect a very serious matter.

It is a serious matter because the relations of the Japanese with Occidental peoples—not the relations of Japan with Occidental nations—are a serious matter, and a puzzling one. The main thing is that the individual Japanese, in his relations with Occidental people, is not yet been "placed." Some of us are too ready to treat him merely as an Asiatic—which he is, certainly. Many of us distinguish him among Asiatics, but vaguely, and not to his satisfaction. The truth is, we haven't made up our minds how to treat him, and he on his part has fully made up his mind to be treated as an equal, if not as a superior.

The *London Times* shows surprising coincidence of this wider aspect of the trouble in California. It was in the controversy a world question, and which it might be avoided altogether. We hardly see how that is possible. All our country must be met some time later. But why sooner rather than later? Why, above all, this year earlier than next year? That is the ground of our disapproval of the Californians' course. They can give interesting reasons for taking the stand they have taken, but we can see no practical reason—only political reason, from the Bull Moose point of view—for forcing the issue immediately.

The incident has given to the *Times* Roosevelt of to-day an opportunity of service which we still like to think that a younger *Times* Roosevelt would have risen to. Publicly, he hasn't risen to it. If he hasn't done something or other privately, then we are sorry for his biography.

They Will Think Of It, Abbott

It is a pleasure to find ourselves for once in sympathy with Dr. LYMAN ABBOTT. He has been torn down by the American Peace Society by a cable he sent the appeal of the Navy League for measures looking to an increase of efficiency in the American army.

Dr. ABBOTT's speech at the Lake Mohonk Conference is not the source or explanation of our sympathy. It sounds too much like certain many times uttered by any congressmen as a "filling" filler. We should have liked it better if the venerable doctor had stood more squarely on his own feet.

For Dr. ABBOTT is playing the man in this matter, all past allies to the contrary notwithstanding. The navy is swayed from two quarters. It is swayed by its congressmen as a "filling" filler, in order to get a number of congressmen and to divert the money spent on it to "improvements" in their own districts. It is also swayed by a number of excellent people who apparently believe that it will promote the cause of peace if this country, although it maintains a navy and expects to maintain one indefinitely, sets an example of moral inefficiency.

That is what it comes down to. Nobody, so far as we know, proposes to dismantle the army. Nobody even proposes the up-to-date equivalent of JEFFERSON'S grant policy, which would be, we take it, a reliance on shore batteries and submarines. We are to go on having a navy, therefore, but friends of peace will continue to object to every measure and every appropriation designed to make it a strong navy.

This attitude is so fatuous that it is hard to treat it our bit more respectfully than the merely political and selfish behavior of Congressmen who vote against the navy appropriation bill and vote for such graft bills as they can get, thereby, from their own districts. Dr. ABBOTT is right in opposing both these ineffectives.

He is also right in maintaining that in the present state of human nature and of international relations the United States should have a strong navy, and that our having it will be conducive to the world's peace as well as to our own security.

#### The German Emperor

EMPEROR WILLIAM of Germany has turned twenty-five years. He has worn a military costume almost constantly. Under his Germany has become the first military power in the world and has built up a fleet which is second to none. From the beginning he has been a source of rumors of wars. He was long regarded as an emboldened threat to the peace of Europe. Some of us can still vividly remember our own and the world's apprehensions when he dismissed BISMARCK and French prized his great crown, "Dropping the Pilot."

Yet here is an address to the Emperor, on the occasion of the twenty-fifth anniversary of his accession, congratulating him on his work as a peacemaker and a peace-keeper, and it is signed by the heads of practically all the learned and benevolent societies of America! ANDREW CARNEGIE'S name is there, of course; but so is WILLIAM A. DUNDEN, of the American Historical Association, and others as well that are never named without reflection and disqualification.

On the whole, it is a just tribute. There are still two opinions about the Emperor in Germany as well as in other countries. Whether near or far, you can hear quite contradictory accounts of him. But does anybody anywhere feel about him as we feel everybody did when he was bidding to the throne? He succeeded a much-loved Emperor, his father, whose reign had been so brief that men were still thinking of a still better loved Emperor, his grandfather. The qualities of that grandfather—patience, kindness, mild good-nature—were almost the opposite of his own; for the young man was self-assured, positive, restless, audacious.

Yet look at the record! The old, kind-hearted WILLIAM fought in rapid succession three wars that changed the face of Europe. His name is forever associated with the humiliating of Denmark, with the overthrowing of Austria, with the complete and awful overthrowing of France. The young WILLIAM has never actually fought at all. He has safeguarded Germany and largely in military fashion, but his hands are quite bloodless.

Of course, it has not all been a matter of his choice and decision. Mightier forces than any one personally have made for his keeping of the peace of Europe. But it is impossible to deny that here has been a mighty personality, an emperor, untroubled, and that it has made for the whole, for peace. It has made for more than that. It has made for every form of culture; for music and the other arts; for learning; for all manner of civilized interests.

WILLIAM II. is a great emperor and a great German. Extraordinary as it sounds, he is probably the greatest German of our time.

#### Honors of Theology

The Southern Presbyterian Church has been considering once more the infant clause in the Presbyterian confession of faith with a view to such a change in it as to "improve" the prospect after death of infants who die in infancy. We believe the "confession" at present takes a gloomy view of the future of some infants, and a good many of the Presbyterians would like to brighten it. But it takes a three-fourths vote of the presbyteries to make a change, and this latest attempt has failed.

The right way to amend this clause about infants is to run a blue pencil through the whole of it. No doubt that has been already done in the minds of all modern people. There are a good many details that are much better left to the Almighty to deal with without suggestions from impudent theologians. This detail about infants is one of them. If anybody is safe in the Lord's

hands it must be the infants who die in infancy. There must surely be a ripple of chucking in the Blessed Beyond over the labors of the Northern Presbyterian brethren about infant damnation.

#### The Prisoner of New York

MR. GEORGE W. BLAKE, the special commissioner appointed by Governor SELDEN to investigate the prisons, has not the gift of making a report that carries entire conviction. He is sensational in his use of language, and writes too much like a mercurial appealing to the popular ear. When he says that "stories of torture of prisoners in the Middle Ages sound like descriptions of lawbreakers in comparison with the tales told me of the lives of some prisoners at Sing Sing," we take his declaration with a grain of salt.

But Mr. BLAKE'S defects as a reporter should not be suffered to nullify his useful labors as an investigator. He was sent to investigate, and has reported that shocking conditions exist both at Auburn and at Sing Sing; that unfit men are in charge of these prisons; that gross lachrymatory abuse exists there; and that, especially at Sing Sing, the prison buildings are unfit and inadequate for their purpose, and convicts are crowded into cells unfit for human habitation and disastrous to health.

These last are not new accusations. They are founded on several years ago. Sing Sing was condemned as a prison, and land was bought and work begun to make a new prison elsewhere. That effort entirely broke down. The prison site first chosen was given up because it interfered with a park, the site substituted was found to be suit after a great deal of money had been spent on it. The new prison has not been built, and Mr. BLAKE'S report is now confined to dark, filthy cells dripping with moisture and hearing them crippled and rheumatic is simply what was to be expected after the disgraceful failure of the state of New York to do its manifest duty to its prisoners. The commissioner says:

The worst feature of the prison management subject is of such vital importance to the welfare of the state that no time should be lost in submitting it to the attention of men competent to present a more complete and convincing condition of the mind and body and that should touch the hearts of every man with humane instincts.

That is true and well said. Whatever may be the defects of Mr. BLAKE'S reports, we believe that there are facts behind them that fairly argue for attention. There is other testimony besides his of the unsatisfactory management of the Auburn prison. Prison management is difficult. It should be in the hands of wise, careful, and very able men; experts chosen for their humanity and intelligence and willing to stand themselves in the service of humanity. Such men can be had in the numbers of their services are needed, and they will do their best to do their work. The prisons should be entirely separated from politics; quite as much so, indeed, as the hospitals. The management of them offers one of the most difficult problems in government. Governor SELDEN seems to be in earnest in this work of prison reform, and we hope his commissioner's report may have due effect.

#### Make Good Goods Again

If any manufacturers are driven out of their present business by tariff changes, may there not be an opening for some of them in making better lines of goods than the market now affords?

In answer to the question we say that all current plumbing pipes are bad; that whereas they used to be made of iron and last in use for twenty or thirty years, now they are made of steel and rust out much sooner. We merely repeat about them what we hear, but that is that there are no good steel or iron plumbing pipes in the market and that home-builders who want good pipes are obliged to use brass.

Does it not seem as though there was a living for somebody in making honest old-fashioned iron plumbing pipes?

And consider nails. Anybody that has shingled a house within ten years knows that wire shingle nails don't last as well as a great deal as the old iron cut shingle nails. The bright wire nails rot out in a lamentable speed and the shingles get loose and peck back. But it seems that there are no old-fashioned iron shingle nails to be had. There are no longer made. Won't somebody make some?

So as to tin. They tell us there is no good tin made in this country; that the McKEEVER bill that we got is made on this sheet of steel (not iron) and not tinned thick enough, and the whole product is flimsy and has no wear in it.

Won't somebody who is out of a job please make some good old-fashioned tin? Also some good old-fashioned bicycle tires. Also various other articles, of which we can get a list from various experienced readers and leaders of *Harper's* week.

#### Newspapers as Public Utilities

There is, or very lately was, before the legislature of Colorado a resolution for an amendment of the constitution of the state, which runs as follows:

Every newspaper printed, published, and circulated in the state of Colorado is hereby declared to be a public utility, and the power is hereby granted to the state or any municipality or circulating such newspaper in the state of Colorado is hereby declared to be a public service and offered with a public interest. All persons, associations of persons, corporations, joint stock companies, and corporations engaged in printing, publishing, or circulating such newspaper or newspapers are hereby declared to be engaged in a public service and offered with a public interest.

The amendment proceeds to declare that newspapers, thus certified to be public utilities, shall "be subject to all the laws of the state of Colorado relating to the regulation or control of public utilities."

This is an interesting amendment. We take it that our brethren of the press will not approve it. One of them, the *Synopsis Herald*, denounces it as a naked attempt to muzzle the press, and asserts that the newspaper business is no more a public utility than a department store or an iron foundry. Perhaps not, but how long will department stores and iron foundries escape classification as public utilities? Our brethren of the press may well make up their minds that if business in general is to be conducted under close governmental supervision; if, for example, as Secretary KNOWLTON says, "the public has the right to efficiency in its factory servants," their business will not long escape the common lot. If there are to be laws to regulate the hours of labor in all employments, and the wages paid, and the age and sex of employees, and the proper proportion of profits that may be paid as dividends, make sure that the newspapers and also the magazines will also have governmental medicine offered them, and will have to take it.

Even now they do give entire satisfaction. There is a case in Boston, of Massachusetts, appealing from time to time for something to compel the papers to print the political truth as he sees it, and there is pretty much everybody else of opinion that they could improve the papers mightily if they had a chance.

The liberality of all of us are a constant protest. The freedom of the press will be preserved only so long as the moral freedom of the individual is preserved. If government is going to assume the responsibility for the right management of general business, it will manage the newspapers and all the periodicals, too. It will; sure!

#### Women Never So Interesting

Representative J. THOMAS HERRIN, of Alabama, announced that "the thinking men are beginning to realize that the agitation in behalf of votes for women is one of the gravest perils menacing the welfare of the country to-day."

He thinks so, does he? But at least he will admit that it has set men to thinking more than ever about women, and their part in life, and the condition of the country.

Whatever any one thinks about the expediency or inexpediency of votes for women, he must admit the great value of women as a subject of thought. And that is an excellent thing and due to the prevailing agitation.

Women were never so interesting as they are to-day. Every woman has come to be social pressure to every thinking man. He keeps asking himself what the matter will be; what should and what can be done for her; which kind of woman is the right kind, whether the industrial life for women has been overdone of late, or needs further development; whether marriage as it stands is a fair deal, and if not how to improve it.

That is a good proof of disturbance. Perhaps Mr. HERRIN and other fabricated statesmen will come to the conclusion after a while that the matter with women is that the men have neglected their job, and are not good enough nor wise nor able enough to appease the contemporary women. And then maybe Mr. HERRIN and his kind will try to have votes and be better men. If enough of these should succeed, that might cure all the disturbances.

OUR ANGEL OF PEACE

DRAWN BY C. J. BUDD

confidence inspired by all back of their delusions. If we had in the charge of Mr. Wilson.

"We hear much these days of a revolution and revolution. Each wretchedly possesses great power. None exercises the one fitly. History declares the other to be occasionally necessary. There is yet another here more potent than both combined. That is revolution—the building of the individual from within, the making of the man.

Upon this all depends. We may not should upon the common good, but it is contrary to all our beliefs, theological, political, personal, to assume that we can achieve that common good through the action of the individual unit primarily for individual ends. It was not the mass, but the man, when that created in his image. It was not collective, but personal responsibility, that inspired upon the people by the Pilgrim Fathers. Not numbers, but men, have triumphed in recent wars. It has been said, and is probably true, that any existing nation would be strengthened by the withdrawal of ten thousand of its best minds. Why? Because the great majority of men still had automatic lives and contribute only force, which serves no better than an *exiguo* in arms directed. The notion of all members of the community participating about equally in the life of its total products is pleasing, no doubt, but it is the theory of mediocrity which instinctively takes ability and invariably sets us down advantage. That is why Socialism is not an ideal state, but a means of complete inferiority, a restiagnation for death, a bare-place for aspiration.

It was not to the machines of destruction that Lawrence took his famous march, that Devere gave his quiet order; it was to the man behind the gun. And as it is always. When we were down with ferocious admirability theories, down with contemptible blooded violence of common sense for common good, we ran off and about—sometimes with objects of religion that the one here we have to reckon with and the only force we have to rely upon is gripping and unperfected, yet noble and divinely human soul.

And when this great standing army among the seven hills has heard, will might the voice of Antony, speaking of the nobility of the Romans, have cried through the Forum:

"And the elements

Sho' me in his that Nature might stand up

And say to all the world, 'This was a man.'"

I shall not attempt to depict even the most subtle characteristics of Mr. Morgan. It is not necessary. Happily, if left to his lot toward the best, by his own testimony given under great stress, to stand revealed before the eyes of his countrymen for what he really was. I am happy because I chanced to know that he himself was happy in the consciousness of that fact. Although mentally as strong as ever, physically he was sadly broken when summoned to Washington. At his age and in his condition it was the severest ordeal of his life; but it was for the best, as he himself is wont to remark.

"I hated to go," he said to me, with characteristic simplicity the day before he sailed away—"I hated to go, but I am glad I went. I think I did some good."

It was a comprehensive utterance in his usual few words—a revelation, too, of his inward thought and aspiration. I had spoken of the invariable impression that had been created by his testimony and he had uttered his honest opinion.

"Yes," he had said, "I am convinced that what you say is true. I think they know me better now. I hope so."

That sensitive man, so humble and so kind, Mr. Morgan was too sensitive and good human—could have failed to be touched by the multitude of friendly expressions which had come to him from all sections of the country. But back of all and chief among the causes of his feeling common to the feeling common to the words, "I am glad I went. I think I did some good." There seemed the dominant note of his nature and his life. Because to a larger degree than is given to most men he possessed what Carlyle pronounced the greatest need of the world—a self.

It has been said by those best conditioned to know that Mr. Morgan was deeply religious. And so, no doubt, he was. But he was more. If I may venture the opinion, he was not a patriot that I had ever met; another man had begun his last testament as he began his utterance would have counted for naught as a new manifestation of piety. From his life rang out to all Christians with the power of the world, the city, the day, and golden words, he left, but he left great legacies, the finest ever bequeathed by mortal, were his unexpressed faith in God and his unexpressed confidence in man.

Not a citizen and no patriot that I had like to think of Mr. Morgan. And it was as a citizen that at the end he was most generally recognized. Not as a citizen of the New York, not even of America, but as a citizen of the first citizen of the world. To what else can we ascribe the unexpressed tribute paid respectfully and with evident sincerity by the official leaders of all the great nations of the earth—all that, in spite of his own? Not since the making of history began has the passing of a figure, however notable, in private life evoked expressions of honor and respect so obviously genuine and so nearly universal. Greater glory surely could be the expectation of the best of us now.

It was not by giving an indication of the depth and the breadth of Mr. Morgan's patriotism. It is no secret, of course, that in common with many others he never considered the Democratic party fully capable of governing this nation. It is also well known, as Mr. Roosevelt freely remarked in his study and private friends, that he heartily disapproved of Mr. Roosevelt as an administrative officer and that he subsequently regarded the political views advanced by Mr. Wilson with honest appreciation. Because of contrary predilection of my own as to Mr. Wilson, not so to Mr. Roosevelt, I frankly did not seek opportunity to discuss public affairs with Mr. Morgan during the last few years. As you all know, when he was right in his judgment he was unhesitatingly to betray any lack of positiveness, and there were times when his delicate health so closely approached the dynamic in operation, that one of private political opinion would be very likely to be expressed.

But the election had taken place, the inevitable had happened, and, using Speaker Cannon's phrase, Mr. Wilson had become his President as much as man—perhaps, in fact, a little more. Anyhow, there was

no constant upon our conversation when I saw him for the last time on his library as the day before he went away. He was optimistic as ever regarding the country, and I naturally spoke hopefully of the prospects of the incoming administration.

Thus followed this curious episode. Suddenly from these piercing eyes upon me, Mr. Morgan said: "Do you remember that American speech you made in London?" I remembered very well. It was not a speech—only a few scattered remarks at the close of a private dinner in reply to an Anglican apologist who had mistakenly thought to carry favor with Mr. Morgan by speaking contemptuously of Mr. Bryan, whom he had previously declared, as it happened, I had introduced to him at a reception.

"And do you recall," he asked, "how often from Scott that you quoted when that man—I can hear me now—said upon those ten words—when that man had had the room?"

I did, of course, and began to repeat:

"Blessed thou a man with soul so dead  
Who never to himself hath said—"

I hesitated for an instant and the succeeding words came from the big arm-chair with odd distinctness:

"This is my own, my native land!"

Then very quietly Mr. Morgan said: "If I could recall the remaining lines, I'd quote imperfectly:

"Whose heart hath never within him burn'd  
As home his footsteps by both hem'd  
From wandering on a foreign strand!  
If such there breathe, go mark the well!  
For him no minstrel e'er could swell.  
How high though his life, proud his name,  
Boundless his wealth as wish our claim—  
Despite those fields, power, and pelf,  
The noblest son of earth is he,  
Living, shall feel his life away,  
And, dully dying, shall go down  
To the vile dust from whence he sprung,  
Unwept, unnumber'd, and unsung."

Half a minute, perhaps, is a long time, but for fully that period I should say Mr. Morgan sat perfectly still. Then, unconsciously, leading time upon the arm of his chair as he used to do, he looked so, as if he were asleep.

"Who never to himself hath said—"

"This is my own, my native land—"

and rising with difficulty from his chair, for he sat there quite feebly, he said, with the emphasis that only quietude can give:

"When you see Mr. Wilson talk to me that if there should ever come a time when he thinks any instance or moment that I have not been used for the country they are worthy of his disposal."

Barring the usual bow-talking, those were the last words I heard from the lips of Mr. Morgan. They were the words of a true patriot, of a great, a very great American, spoken from the depths of a passionately loyal heart. Surely I can do no better than to leave them with you to remember, to cherish, and to feel so long as you all shall live in "this, my native land."

## PERSONAL

How ardently and how long would burst the left side of the Rev. JOHN FINN, M. A., of the University of half his angry critic's surge upon the others of his conversation. Mr. FINN is from England. Local newspapers report that at a reception at the home of Bishop BISHOP, in Philadelphia, Mr. FINN was invited to a group of leaders of society. "I take it for granted that you are all of the upper middle class." Doubtless he did take it for granted—just that day, but never again. By the time he is thoroughly enlightened, Mr. FINN will know that he himself was a member of a group of leaders of society. "I am as good as another—yes, and a—right better," also that they are the average people and therefore every man a king. "Upper middle class" still that is a title better than the ruling British baronet who quite innocently asks: "What the deuce is a middle?"

We had in London last the following announcement: "The death of Mr. EDWARD HARRISON, by his own request one of the four members of our telegraph pioneers. He was the elder brother of the better-known Sir CHARLES HARRISON, to whom the world owes the Atlantic cable. With work, we live in his name. After reading this notice of his death, we must say that we are sure that Sir CHARLES HARRISON would have known better, really, than to imagine that a mere American could do so great a thing.

The Rev. EDWARD HARRISON, Secretary of Texas, who will have done with Mexico if he has to fight for it, is a true baseball fan. He visited the training camp of the New York Giants at Martin

in early spring, and the Hon. JOHN McGINN divided his. He left two sides and framed him in a picture. The Governor showed a special attention by seeing the staff photographer and half promising to journey to the Polo Grounds this summer and watch the Giants fighting for the present.

Happiness has at last crossed JOHN D. ROCKWELL. Fortune has blessed him beyond his dream, most during hours. He has inherited a new golf course. He had a London course, Florida, cost \$60,000, his total for eighteen holes. To stroke, X, B.—The length of the course is not given.

Captain THOMAS F. GOSSET, of the Boston police force, has been officially certified as a comedy person. His wife, Mrs. GOSSET, of the Boston Police, of Boston lately the light as nerve-cure that she begged to have "a good-looking policeman" detailed to protect her and her collection of guns valued at \$2,000,000,000. Feb. 22, 1907. They gave the job to GOSSET, (Gosset).

One FITZGERALD, once champion pugilist of the world, now instructor in morals and physical culture, is a good man. He has no one else yet returned to his duties. His life is wonderfully strong and active for one of his years.

Mr. JAMES BAYNE, of His Imperial British Majesty's Navy, has long noted his devotion to his country. When he was of the bar he managed to take a ride in Egypt's Turk every day. As a consequence to popular prejudice, however, he named his horse *Business*; so that if any one called while he

was away on the ride his clerk could truly answer: "He is out on *Business*." Good business.

The Duke of Marlborough, the descendant from London lost, has announced that he is going to place his own flag to protect food for the national food supply. To mark some twelve miles in circumference and well stocked with food is one of the show places of England. Historians may yet dispute as to who did the most for England—the Iron Duke, who served her from Napoleon, or his descendant, who is to see her from Hunger.

Five hundred men of Southampton, England, died in the wreck of the *Finnis*, and on the recent anniversary of the sinking, the local newspaper reporter were crowded with "In Memoriam" notices. The names of those commemorated the passing of NORMAN HARRISON, the second engineer of the ship. A friend wrote him:

Steel true and made straight  
The Great Artificer made my mate.

His Imperial Majesty the Emperor WILLIAM now carries of night or any automobile in which he happens to ride an illuminated equal standard with the world's flag. He is not to be taken for the ordinary wayfarer, whether as foot or wheel. His automobile seems unaccountably exclusive, if not preposterously selfish.

The arts do sometimes pay. JOHN M. CURRIE, architect of the New York Public Library and many other noted buildings, left an estate valued at \$318,000.

# Portland the Optimistic

The Vigorous and Thriving City of the Pacific Coast

BY  
GEORGE HINTON

An already indicated, Portland's distributive advantages are immense. Railways not only follow the Columbia River but into the interior, but two new lines have been built on the margin of the Duwamish River from its mouth to the great plateau of western Oregon, and are preparing to extend south and west, while another line is building from the eastern border of the state westward from Vale straight across to a connection with the Southern Pacific line now being built from Naton to Klamath Falls on the east slope of the Cascade Mountains. The state is now in the midst of a great railroad development, and every mile of new road brings a greater extent of territory into Portland's trade zone. If the greatest railway to the city, also, is the activity in interurban railway construction going forward throughout western Oregon, the Willamette Valley is being gridlined by no trolley systems.

Portland contains one-third of the inhabitants of the State of Oregon. Portland holds commercial sway over the major portion of the Columbia River Valley from its mouth to the Canadian border, a territory greater in extent than Germany. Considerable portions of Washington, Idaho, and Montana had their Portland in their commercial center and market town.

The opening of the Panama Canal is looked forward to with confidence no likely to widen still further Portland's zone of influence, since the new waterway will afford a cheaper route to market for the great staple products of the Pacific Northwest. Besides, it is believed that thousands of immigrants will come by way of the new waterway to settle on the vacant lands remaining here, and carry new acre tilles, give additional arable tree plantations, secure an increase in Portland's trade and wealth.

The year 1912 was a notable one for Portland, and 1912 has begun under such favorable conditions that it will undoubtedly surpass the past year in all lines. Portland's bank ratings for 1912 amounted to \$597,000,000, a gain of over \$150,000,000 as compared with 1911. Portland receipts the past year were well over \$1,000,000,000. During the year nearly \$4,500,000 was spent for street and sewer improvements, and the total length of laid-out streets was increased to 278 miles. Extensions of the city water system cost nearly \$600,000, and the city plan for eight miles of new water main for 1913. During the past year the city spent nearly \$1,000,000 for school buildings and grounds.

Lumber mills of Portland cut 423,794,000 feet of lumber in 1912, which is \$3,000,000 more than the quantity for the previous year. This lumber would build a plank road thirty feet wide from Portland to Chicago. Building permits issued last year amounted to nearly \$15,000,000.

Portland has now taken on a real metropolitan appearance: it is building a new \$1,200,000 court-house, and a central library to cost \$450,000 is being erected. Reed College, a new university, is being established in permanent buildings. Four remarkable steel bridges span the Willamette River in Portland. One immense steel structure was completed last year, which provides for railroad traffic on a lower deck and for general traffic on a higher level. This bridge has the largest deck of its type, the double-deck structure hit span, is the world's. The lower deck of the span is opened independently of the upper, allowing the smaller river craft to pass through without in any way interfering with street car and team traffic. The new Broadway Bridge, just being completed, cost \$1,600,000, and is the largest draw of this type ever built, the distance between the center piers being 276 feet. This structure

PORTLAND, always a substantial city, is now a modern one as well, the every day really big city close to a matter of the past half decade. It now boasts a population of 250,000, although its history covers only fifty-two years.

Its streets, buildings, public utilities and general appearance are suggestive of the best type of American municipalities. The power era is over, and ever before in its history did Portland build so readily or so permanently as now.

The year 1903, when the Lewis and Clark fair was held at Portland, celebrating the centennial of the year when the first white men explored the Oregon country, marked the close of an old epoch and the beginning of a new for Portland. Before that time, the city was built on the most solid foundations, but the people were conservative to a marked degree and the population appeared satisfied with its slow growth. Expectation year brought in new blood and the possibilities of the future

is leader, while vessels drawing twenty-seven feet of water are given quick despatch, meeting no difficulties either in entering or in leaving port. Portland ranks as the first leader manufacturing and shipping city in the world. Visitors to this port had summer, right in the heart of the city, were the latter-day Oregon and the rainier Northwest, now results of sufficient size to demonstrate Portland's advantages for shipping.

The constant improvement of the Willamette and Columbia rivers, and of the outflows to the latter, is going forward. The movement is leading substantial aid to the work, building bridges on either side of the mouth of the Columbia River and bridging the channel. The route between Portland and the ocean is found to

Broadway Bridge, Portland, erected at a cost of \$1,600,000

sure realized. It was during the fair that James J. Hill announced the proposed construction of the Nippon, Portland & Seattle Railway, a new line down the north bank of the Columbia River that gave the allied Hill lines an entrance into this city on their own rails and also a new direct route to the East. It was not until then that Portland realized fully the importance of its geographic position and what the Columbia River gateway was to mean to it in the future.

For this is the chief secret of Portland's vigorous growth. In addition to the tremendous trade territory at 250,000 square miles over which Portland is dominant, the Columbia River offers a low-water grade route from the far interior to tide-water at this city's docks. Fortunately for Portland, this is the only city on the Pacific Coast so advantageously located. Mountain ranges shut off other coast ports from the inland country, forming substantial barriers to traffic. Here the crest of the Cascade range of mountains is passed by the railroads at an elevation of only one hundred feet above sea level. So actually on the Columbia River used by the railroad-borders, that from far away Montana and the slopes of the Rocky Mountains freight-trains roll down to tide-water at Portland with hardly the tug of a locomotive, while on the return trip the grades are so slight that the operating cost of the railroads is reduced to the minimum.

These facts account for Portland's supremacy in wheat shipments over other coast ports, this city being here, for a matter of years, first in wheat exports among all the cities of the United States. Portland's geographic location was primarily responsible for the historic love of the rugged porting plant west of the Rocky Mountains. With such ideal transportation facilities, there is a constant stream of shakedown in freights brought from the cattle ranges of the interior, while the delay from the ranch to the stockyards is so rapid to the extent. The Columbia River gorges through the Cascade Mountains is virtually a free-flowing. Both lanes are clearly indicated by the railroads, which as traffic grows, can be double or triple tracked.

This, then, is the factor that accounts for Portland's position as the chief marketing center on the Pacific Northwest. Coupled with this great advantage is its island, fresh-water harbor, the only one on this coast, where the biggest cargoes of raw products shipped from any coast port are not afloat. The biggest cargo of lumber ever loaded on any sea is claimed for Portland, consisting of 3,200,000 feet of

be susceptible to constant dampening, the thirty-foot channel aimed all four years ago, having become practically an unaccomplished feat. Engineers see no portion but difficulty in severing a depth, ultimately, of forty feet between Portland and the sea.

Portland, for the past two seasons, has led every other port in the United States in the exportation of wheat. For the past seven months of the present crop year this city ranks fourth, being surpassed only by New York, Galveston, and New Orleans. This business, now large in volume, grew from a small beginning. The first cargo of wheat ever exported from this place sailed in 1808 to Liverpool. In 1824 two ships carried the whole crop grown out of the Cascade Mountains to foreign lands. In those days the bulk of the wheat was raised in the Willamette Valley. Conditions are now reversed, and practically all of the export wheat comes from the inland Empire.

# THE SHAME OF THE UNIFORM

BY CAPTAIN M. B. STEWART, U. S. ARMY.

Illustrations by GORDON GRANT.

"If it's good enough to die in, why ain't it good enough to dance in?"

THERE is plenty of material in the streets for either a comedy or a tragedy—depending entirely upon the view you choose to take of life. If you are inclined to look good naturally upon your neighbor's little eccentricities, it may amuse you; on the other hand, if you regard them as the outward, though morose, manifestations of national decadence, it will surely give you food for thought.

It was Green who first directed my attention seriously to the subject. I know in what sense people choose to call a fifty-cent-dollar man, meaning thereby that he is an enlisted man in the United States army and here one who does not place a high valuation on his service. I have an means of knowing how highly Green may esteem either his services or himself. I only knew him as private in my old company, a sturdy, spin-and-spin soldier who always did his duty well and cheerfully and who never saw the inside of the guard-house except when he was on guard, which is about as much as one may say of a good soldier without becoming offensive.

It happened on the target-range, one evening August day during a fall in the firing, while the men were lounging comfortably in rear of the firing-posts. Green, with all of the maternal care of the true "dope shooter," was puffing with his rifle, wiping off a microscopic particle of dust here, touching it up with an oil rag there, testing the trigger pull for a drag that he knew did not exist, puffing it generally from mouth to butt, and getting it much after the manner of a mother with her babe.

"I heard you was at the ball last night, Green," one of the men remarked between puffs of a "Wad-made" cigarette.

Green took his time about answering. He poked a corner of his handkerchief into the opened breech of the rifle and wiped down the muzzle in terms of metal foisting. When he had satisfied himself on this point he replied, indignantly:

"Well, I was, and then again I wasn't."

"Ball a damn one about him because he's lastly out of it."

"How's that?" they asked.

"Agins Green he's out."

"Well, you see," he finally replied, "it was this way: The accident and I left like sticking a leg a little, so we made up our minds to go to the ball down at Marble Hall. We took our "blues" over to the tailor and got 'em pressed, then we pulled ourselves up some. Hazard, you'd thought that we was pretty much for an inspection by the Old Man, and when he let the rag for us he looked like a pair of orderly lookers, and the way to ground went, leg. 'Vay' he said, 'good!' 'I guess we must 'a been aiming to make some hit with the ladies.'"

"Agins he dropped the thread of his story and began fidgeting with his rifle."

"Ah, go on," his audience urged. "What's the answer?"

"Well," was the reply, "that's about all there was to it. We got there all right and the parbo was on post at the door looks as ever and says, 'Gents and ladies and,' and that settles it—'that wasn't your man'—no, then he jerks 'back when I say I wasn't nothing but a 'dope' or 'look'! Was I on the outside, but you bet your

life I didn't chase around with any 'gents' like I was hiding around that ball, or for our little minute I was of ways too scared of the police, And ladies' say—" He caught himself in time. "I wonder if there's going to be any more showin' this morning?"

"Several you right," was the unambiguous answer from a fellow. "You'd ought to know better's as you trying to butt in there in your uniform. Why'd you die up them hand-me-downs of yours?"

Green reddened his rifle across his knees and became reflective.

"In fact, I know you are as far as getting into that thing was concerned, but that's a man got to judge himself for, I want to know! What's the matter with this little old uniform? It's good enough to fight in and get killed in, and when a fellow gets himself killed in it he's a hero and they put up a marble slab for him back in the town hall. It's good enough to die in, why ain't it good enough to dance in? Tell me that, heb?"

No one told him then and I have been trying to make a satisfactory answer for myself ever since.

I have seen men dance in that uniform; I have seen them die in it. I have seen men, both dead and alive, in it outwitted as heroes. I read constantly of men being hanged for the wearing of it.

When the old Fifth Corps belated back from Santiago to Montauk Point we were a begrimed, lathered, and generally sorry-looking lot. Any well-respecting housewife would have been perfectly justified in brown-handling any one of us for premises as a suspicious character. Yet we were awarded the badge of honor, the open welcome wherever the waves close to stray. The country folked in Montauk Point in do as a man and in winter in our warlike. We were brown, hot, and tired, and kind, gentle women who loved nothing else to do for as smoothed our pillows and washed our hair for us again and again, until the last of us by a tropical sun retired disinterested from the fray. When we traveled, countless laundries, the railroad stations and swamped jobs with the probat boys whenever a soldier-man lay in sight. No questions were asked of the man in uniform—what by the way, was a serious mistake, as it enabled fathers for the error to impose upon the generosity of a genuinely aroused public.

No distinctions were drawn between the officer and the enlisted man. We were all treated alike as honored servants of the people who had done our duty as best we could in the line of which speaks highly for the patriotism of the American people, over their true feelings have been aroused, and in mentioned here to emphasize the fact that within the year extended the same, perhaps the same, in that same uniform, except that it was clean and well-kept and probably neatly brushed, were refused the privilege of admittance to places of public amusement and in hotels, and for the sake reasons that they were in uniform! It may be added that the same of this kind occurred within a radius of one hundred miles of Montauk Point.

After the Spanish American War a victorious fleet, unannounced by a popular naval hero, sailed into one of the great ports of the Eastern coast and was received with open arms by the people. The men of the fleet were the privileged guests of the city, from one end to the other, from Maine to Florida. Within the year two warm colors, whose uniform included their rank and position in the way, were barred from public places, one from a hotel and the

other from a place of amusement. This within three hundred miles of the place of their triumphant reception.

In all of these cases public sentiment, by its apathy and silence, gave tacit approval in this limitation of a public servant.

Hardly a month passes when some similar incident is not recorded and heralded from one end of the country to the other. In such occasions Green's question has up itself. "If it's good enough to die in, why ain't it good enough to dance in?"

In making an answer to his question we are, first of all, brought face to face with the unpleasant admission that the uniform of Uncle Sam's professional fighting man is not generally regarded with respect.

The immediate result of our consideration is, we follow up the results of this attitude toward the individual soldier are able to quote one incident after another to prove that such is the case. What is worse, they will point out very convincingly the evil which results from such a condition—namely, that the soldier made himself largely limited in his choice of entertainment and amusement to places of questionable character, where any man's money makes a welcome for him. This, in turn, actually places the soldier in the light of choosing entertainment of this character and leads him color to the conclusion that he is, perhaps, fit only for such a career.

Old or discarded uniforms are permitted to be worn by workmen.

uniformed workmen and organizations throughout the United States to conclude that the uniform of the soldier is the one for which the average American does not cherish a regard. It is true that the uniform of the soldier is in a sense, a luxury and that the idea of such a man in more or less regularity to see our race officers. Not, even considered as a luxury, the uniform may reasonably be classed with the fringed coat and silk hat of the statesman. (Dick

protection, differing only in style and name, but both of them the service of the people, the best of the nation's service, and of a man who stands ready to give his life if it is needed. In this connection, it must be admitted, however, that the government has never given the soldier proper protection. Non-military and non-military organizations are permitted to march in their janics details. Old and discarded uniforms or parts of the uniform are permitted to be worn by workmen and others who have no connection with the military service. Institutions are permitted to clothe their employees in approximations to the uniform which at times derive even the professional soldier.

The writer on one occasion introduced himself to an individual whom he recognized as a captain of industry in dress as uniform, to discover later that he was conversing with the head hall-boy. The two men are an officer of high rank if he remains in a prominent role for the reason that a hall-man or waiter was elected by the uniforms of one officer of the army. To some extent, therefore, the public may be pardoned for not paying proper regard to the uniforms of a soldier, and to the same extent the government is responsible for the non-adoption of its fighting men to some extent of the United States have passed laws prohibiting the use of non-military organizations as individuals of the uniforms of the National Guard, but provisions under these laws are of rare occurrence. A prominent milliamer once told the writer that it would be mighty difficult for any milliamer to attempt to endure such a law.

When we consider the composition of the army, it is hard to believe that it is the man in uniform to which objection is made, for socially the man in uniform in the United States is perhaps as conspicuous as any aggregation of men to be found in the world. As an illustration which will throw light upon the education of some of the men who compose it, I will mention that in one regiment which I have served in, some of the men of one time organized a University Club with a membership of something like a hundred. The graduates of recognized institutions were admitted to membership, and on the walls of their meeting-places they had chalked up the names of Oxford, Heidelberg, and a score of similar institutions from one end of the world to the other. Paradoxically, the man in uniform is the brother of the man with whom he is hated from association. In every regiment in the service are to be found men who are free from every mark in life and from practically every social stigma. In the connection from which they come they doubtless enjoyed social privileges in accordance with their various stations.

That those stations are of little respectability as judged by the standards which certain officers are required to make of an applicant's history. Social stigma do not vary widely and are different communities throughout the country, and it is reasonable to presume that the soldier may find social equality in any community he may choose to go to. That he may attempt to intrude in circles where he is not welcome need not be feared, since he has his own self-defense means of what constitutes civility. Whether may be his social qualifications, he would not, if situated in civilian dress, be hated from any place of public entertainment. To the extent that the soldier has the soldier leads in the service the general public have little knowledge. Their opportunities for contact with soldiers are few and the interest in life are such that they give the soldier only passing thought. When brought in contact with the soldier the average man may at the time be struck by an intelligent, clear-eyed, smart, alert individual, but does he ever ask himself what manner of life this man may lead in his own quarters? He may see corruption of the regulations and the routine which govern the soldier from revolve to tape—and in between? It would be a revelation to many to know some of the details of things which he does to which the civilian never gives a thought, and to learn from the records of the summary court of the lunatic in which the soldier lives up to his requirements.

This should not be taken to mean that the soldier is in any sense a scold—Kipling uses the expression, "a plaster coat"—for he is nothing of the sort. He has all the instincts of a physically perfect and well-conditioned man. His life keeps him fresh and keen and trained to the feather edge of animal spirits. He looks away at times and misbehaves in just the same manner as his brother in civil life. The difference is that, being in uniform, his misbehavior is always more or less conspicuous, and that, being a soldier, he has a trail officer in the shape of a possibly indignant family circle. This attitude on the part of the public seems not to belong properly to the United States. Kipling in "Tommy" solves Tommy's question in the con-

agriculturist cannot pardon the soldier for exhibiting his sons and servants."

He takes the subject seriously as well as analytically, more seriously than we of the United States army would be justified in viewing it. The United States is a comparatively new country teeming with wealth and life; its interests are so diverse as they are widely separated; its population is varied in its origin and scattered over areas which make the people of one state strangers to those of another. Under the circumstances, there can be little unity of thought or feeling in any subject of less than national importance.

The army is small and scattered over a goodly portion of the globe; its activities are such that they

"Looks up over and says, 'Gents and ladies only!'"

plaint of the British soldier who asks nothing more than that the public by its attitude prove to him that "The soldier's uniform is not the soldier-man's disguise."

An eminent German authority some years ago concluded that the feeling, whatever it might be, is directed toward the military establishment as a class, not toward the individual. He says: "One class chooses another only in proportion to the advantages which it can derive from it, or only in as far as it recognizes in others similarity of character and the moderate community in striving for one and the same end. . . . Personal interest, based according to various needs, is the measure of the value of the occupations and aims of one class in the eyes of another."

Continuing, he analyzes the general feeling he chooses after this fashion: "The literary man has been because the masses take flight on hearing the din of war." He apparently did not include war correspondents among the literary. "The statesman is applied by the enormous expense caused by military preparations. The civil bureaucracy is jealous of the power it is obliged to surrender into the hands of the military authorities and often treats soldiers like enemies belonging to another state. The merchant is vexed at the gay life of the officer, while the clergy views him as the first and worst, and the

are not often brought to the serious attention of the public except at considerable intervals. The average man is absorbed in his own interests; he knows little of the soldier and he has little time or opportunity to learn more; in forming his opinion he is apt to be influenced by what he may have read or heard; probably there is no soldier of his acquaintance to whom he may turn to form an estimate of the military character. The result during peace is an unjust indifference toward the army and those who compose it. In time of war it is difficult, and the soldier certainly has no just cause for complaint when the public has once turned its mind to the military responsibilities.

However, it is not a startling thought to the soldier that the people whom he serves take thought of him only when disaster is hammering at the front door. The business of soldiering in time of peace is a monotonous one; its rewards are extremely modest; it requires a devoted effort of the will to maintain the enthusiasm with which to meet successfully the drudgery of preparation. Appreciation goes a long way toward keeping enthusiasm up in the proper pitch. Unappreciation is a sure indication of apathy and daring in a healthy, harmless form of neutrality. What the soldier apparently needs is an occasional pat on the back.

## TWO FAIR WOMEN

BY ETHEL TALBOT SCHEFFAUER

Her two great eyes were like blue porcelain;  
Lone with her dark hair beside her raven lit  
With sweet fire; the thoughts within her brain  
With their electric sparks had scattered  
Beneath her white feet her jeweled sandals clung,  
And when she moved, clanked with a subtle color;  
From her gold hair the heavy coronals hung,  
Her short laugh was untamed, like a leop's.

A golden prince in a golden day,  
In a walled hall of pearl and ivory;  
A diamond crown had the desert way  
With silk and sandalwood from overseas

To please the princess when all men would please,  
Who rode the war-wind in the southeast part.

And the world's worth of fighters take their rest—  
Beneath her eyes' light laughter they were cut!

That of a trampled red rose smelted  
When she went restlessly when evening came,  
To rub the wild vine of its bitter fruit,  
And the young poppies of their sunset flame.

Behind her mood her silent string-mind,  
When she betrayed the woman, she was cold  
Like the sleek panther now shall make a stand,  
Like the black panther in his white pelt.

But no man ever hid his hand from her dark hair,  
To wake the anamorphic prison there.

# THE NORTHWEST'S NEED OF MELT

Where Farms and Homes Await the Thrifty Immigrant

BY  
JOHN SCOTT MILLS

**T**HE growth of the Pacific Northwest has been continuous. Oregon, Washington, and Idaho show an area of over 25,000 square miles, with an accredited population at the last census of 2,140,310. The States of New York, Pennsylvania, Illinois and Ohio with an area of 192,000 square miles, were given a population of 27,141,161. New York has a population per square mile of 139.0; Pennsylvania, 117.3; Illinois, 84.3; and Ohio 90.8. The population of the Northwest states per square mile is: Oregon, 2.1; Washington, 5.1; Idaho, 1.1.

In the twenty-four principal cities and towns of these Northwest States there are 338,922 habitable units, and 1,250,016 live in the smaller towns and in the country. In ten years the increase in urban population in Washington was 100.3 per cent.; in Oregon 115.3; in Idaho, 216.2. For the same period the rural increase was, Washington, 84.7 per cent.; Oregon, 124.6; Idaho, 100.

Further analysis is not needed. A vast domain is aptly populated. It has no need of people. The country requires settlement and population. The cities are overcrowded. City building should come as the result of development of adjacent territory, and not as a prelude thereto.

The soils of the immense mineral deposits and timber of these three states is immense. But the fiscal and perpetual wealth of the Pacific Northwest must come from her farms. The hope of this section lies in the small farm well settled. There is here in this region a foundation upon which may be built an agricultural supremacy unsurpassed in lands of the past, the magnitude and compelling evidence of which would take the greatest of all productive regions of the globe.

This is a broad assertion, but one of unquestionable truth. The claim is based on the soil—the volcanic ash, which predominates in this section, will of its lava deluge there is a fertility of such fruitfulness that the yield is both constant and large. Ninety per

Mr. Raman viewed from the southwest slope.

centing point, and where thirty-five degrees above zero is accounted cold weather, for the evergreen pastures the stock finds abundance of food.

It is interesting to note how the land-owners of this section have responded to the call for development on the farm. The Pacific Northwest, ten years ago, was spending from \$115,000,000 to \$200,000,000 per annum for meat and poultry products, shipped from the East. The railways, the commercial organizations, and the press presented the prospect of diversified farming to the man on the land and he became a convert and is leading his efforts to meet the demand and endeavoring to keep the money at home.

Hogs and poultry thrive in this general climate. Men and women are specializing in pigs and chickens, and the porcine family and the feathered tribe are paying the household expenses on hundreds of farms of varying size. The farmer is the only man who can solve the problem of the end of farms. If he will attempt his ground of the farm must

statements concerning the land, its growth, and its products. The purpose of this article is not to reflect on other countries, but to draw attention to this one. If it will not be taken notice of, those who contemplate going across the line will familiarize themselves with weather conditions, its health conditions, and its industry, compare yields, markets and general living conditions here and there.

There has been some attempt at publicity in connection with the lands of the Northwest, but their general character is little understood by the home-seeker. There are a few lands here, but there are hundreds of locations to be had, land under Carey Act projects, land in irrigated districts, dry farming, and irrigated lands. In some instances there is power work to be done, and an income on the irrigated tracts. But with some labor devoted to clearing the land of the small growth, it can be cultivated without removing the large stumps.

The land in the Carey Act projects and in the irrigated sections will have to be leveled, and the dry-farming tracts will need some preparation. The expenditure of labor in any instance, however, is trivial in comparison with return—trial to the man willing to work industriously for a few years, with the assurance that complete awards him as a reward. The Northwest is not a place for dreamers. There is no invitation set to such. A little capital is such and an abundant supply of energy, and the man who is self-reliant and independent to the man who will do things.

The field is so wide. The commercial organizations and the transportation companies are endeavoring to get settlers on the unoccupied lands, and are also trying to induce holders of large tracts to subdivide them and put them on the market. The men who are wanted are those who will engage in cultivating tracts of not more than one hundred and sixty acres. In this kind of abundant yield, ten acres constitutes a farm, so that a quarter section will give ample scope to any man.

Under present conditions, the farms are not cultivated as they should be. There is too much idle land. There is absence of crop rotation. There is lack of sufficient labor to produce enough for home use.

The tide of immigration is flowing this way. The people of the Old World are looking for homes in the West. There are thousands of homeseekers in the United States who are undecided where to locate. They will be wiser if given more thought to the Pacific Northwest, and to take advantage of the magnificent opportunities it affords for home-making and the enjoyment of life in a region possessing such advantages.

Legislation in the interest of the farmer has just been enacted in Oregon. The agricultural college is to take its work to the farm. Scientific farming is to be taught. Practical men will impart instruction, and there is necessity for knowledge on the part of the land-owner. Demonstration teams, agriculturalists in the employ of the railroads, literature (reading of every occupation on the land are at the command of the farming communities).

The states of the Northwest offer exceptional advantages, and in selling of these the people now here ask nothing other than honest investigation as to the merits of what is to be had. The man who is in search of a location for a home will be wise if he devote some time to looking over the field and make through inquiry regarding the character of the soil, the extent of its productivity, the demand for what may be grown, the distance to market, the transportation facilities, the weather, the church, school, and fraternal privileges.

This country will stand inspection. Honest investigation will disclose the fact that it is not over-rated, but that its excellence is undervalued in the literature descriptive of it, and the assertions made by those who speak of it.

A leading industry of the Pacific Northwest—Scene at a Portland lumber mill.

cent of the soil in these states is of the character mentioned. The hills of Eastern Oregon and Washington and Western Idaho are made of volcanic ash, and broad plains and rolling lands of the inland Empire are covered in a rich volcanic ash with the same rich deposits. These possess an advantage over the acid and alluvial soils in that the volcanic matter has not been washed out.

What a few years ago was barren land has become the home of alfalfa, where orchard and meadow, stock and herd are making men rich. The diversion of a mountain stream has transformed the barren valley of the Yakima into one of the most productive sections of the West. In the Lewiston-Crane district in Idaho there is grown what is claimed by experts to be the finest quality and clearest seed grown in the United States. This is a non-irrigated district.

In the Touret and Walla valleys of Washington, and in the Columbia River basin in Oregon, are some of the best orchards of the hemisphere. In the numerous orchards, where the growers have specialized, are produced the fruits which are in demand in every American metropolis, as the markets of London, Berlin, St. Petersburg and other cities of the land beyond the seas. The strawberries here are of the best quality, and the vegetables are as good as can be grown.

In the western country, where the precipitation is greater, larger yields of celery, asparagus, kale, turnips and other root crops are grown. Here the growth of the fields is permanent, and it is here that the dairyman has his best field. This means a great deal for the country, most of the Cascades is a dairy country. There is no necessity for housing stock as a protection against the winter cold. All winters are good for the dairy animals, but this protection means only shelter from the rain, for the temperature rarely drops to the

he undertakes it in earnest work. From the vintage come the aid to the helpless man and women of the cities of our land. Producing replicates cost. Population has increased more rapidly than production in the East. High prices originate there. The West has here, increasing population on the lands of the Pacific Northwest means augmented production of life. Therefore, the increased need of living being due to paucity of production, the West must be looked to for a remedy for existing conditions.

The farmer in the West should be a simple matter. Multiplied thousands of good American citizens have gone to the Canadian Northwest in the past few years. They were led to change their place of residence and their business in this people by altering

## THE READY REPLY

A COMPANION TO OR CONVERSATION FOR ONE OF EMERSON'S FAMOUS SENTENCES

For a Young Man Confronted by an Editor with the Fact That the One He Has Quoted Has Been Criticized from Broadway.

**THE EDITOR (earnestly):** These lines are taken bodily from the poems of Robert Browning.

**YOUNG MAN (with a great show of grief):** Browning?

**THE EDITOR (with leveling brows):** Who, sir? What?

**YOUNG MAN (with marked enthusiasm):** Why, sir,

I believe in a little dash out at Lamson's, on Long

Island, which was intended originally for the purpose

of bringing together a lot of choice spirits interested

in sport. We called ourselves The Ring and the Book

Club, but because we were at all interested in that

great poem, sir, but rather because our activities took

shape chiefly in betting on events in the prize-ring

and getting up books on the various horse-racing

meets which in the old days were such a constant

source of delight and, I may add, income, to many of

us. Of late, however, as drastic have the laws become

in respect to betting and gambling of all sorts, that we

have had a hard time keeping our organization going.

Every external outlet for our sporting propensities was

closed by the operation of the law, and, naturally, the

reason *inter* of the club having been thus seriously

affected, our members drew away, and we were brought

face to face with dissolution. However, there were some

of us who realized that there were other things we

could do as than horse-race and prize-fight, and

out of our club name, The Ring and the Book, their

enthusiasm agreed me with a suggestion that we re-

sulted in this fortunate reformation for me. I was dis-

cerning the name, and incidentally the poem, with a

number of our dearest plagues the other night, and

one of my friends, who has on literary attainments

whichever, used the remark that nobody had ever

heard of the poem besides myself. In which I related

that there were more admirers of Browning in the

world than he had any idea of. His answer was that he

didn't believe even the editor of so great a magazine

as *Times* had ever heard of Browning, and I offered to

let any or all of them read and there that you'd spot

a Browning poem the minute it was offered to you for

publication, so you may readily imagine, the matter

became more than interesting the minute money was

placed on the result. We went at the matter with en-

thusiasm, and within a week had sent out not only

the *Times*, but other editors in various parts of the

country. We have some ten or fifteen thousand dollars

up on the result. For myself I took the hopeful road.

I bet a hundred dollars with each of seven men that if

it wouldn't take you five minutes to detect the decep-

tion, and I wanted tell you how delighted I am that my

good opinion of your discernment has been so readily

vindicated—and I know that you will excuse me if I

booster of without more ado in inform the club that I

am a winner, good evening, sir! You have done

me a good turn, and I am grateful.

[At this point into the Editor's right hand, shake

it vigorously, and then move out as quickly as possi-

ble, not waiting for the checker to take you down,

but using the checker, sliding down the basement, if by

chance there are any, but you are mistaken.]

## EXPERIENCE

"I tell you," said Bingle, "suddenly," "these women

are right. This pretive of female feeling is an out-

come. It is like to see 'em try that over here an Amer-

ican."

"They'll never have to," said Simpson. "All they'll

have to do with is know that you will excuse me if I

marry a few before her, and she'll walk right through it. I

married an American woman, and I know."

"RAY, COME, WOULD YOU CARE TO TRY WHEN A SHEEP SWALLOWS YOUR BALL?"

## BRUTES

"It cures my blood hell," said Mrs. Oppasitt.

"The above brutality with which these girls treat us

women, isn't the tyranny of these!"

"What have they done now?" queried Mrs. Oppa-

sitt.

"They threw Mrs. Crowheart into jail, and took

little Fluffy, her inanimate companion, away from

her," said the lady.

"Well, you wouldn't have a child spend her days in

jail, would you?"

"Child!" retorted Mrs. Oppasitt. "Fluffy isn't a

child—she's the cutest little Pouterspaniel you ever saw

in your life."

WIFE, IT SAYS HERE THAT YOU CAN GET A WIFE

IN SYDNEY FOR THREE DOLLARS. ISN'T THAT OUT-

STANDING?"

THE WEAKEER VESSEL—Oh, I DON'T KNOW. A

GOOD WIFE'S WORTH THAT.

## A CAUTIOUS DUELLIST

"They tell me you got mixed up in a duel once in

Paris—the year, Dabbling," said Jinks.

"Yes," laughed Dabbling. "I was challenged by

M. Le Vicomte de Chabonnet because I sat on his

back at the opera."

"Well, how did it come out?" asked Jinks.

"Oh, I accepted, and as the challenged party had

the right to select the weapons," said Dabbling. "I

chose broadswords of a standard gauge, and was

an officer of the court reach the other three were no

countless."

## NO EVIDENCE

"They tell me that fellow Whiggish is a man of

letters," said Jernam.

"I've heard so," said Paigge, the tailor, "but I

can hardly believe it. I've written to him ten times

about a little bill he owes me, and sent a letter car

I get out of him."

## NO EXAGGERATION

"You told me you were worth a million, and I find

that you have only a paltry ten thousand dollars."

"And that's just the way it is," said the man.

"Well, ten thousand dollars is a million cents,"

said Hilders.

## OVERHEARD ON THE CAMPUS

Professor (to a student): Ah, Professor, good morn-

ing. Do you smoke?

PROFESSOR (smiling): Why—yes, Mr. Freshlight.

PROFESSOR: Good! I'll be glad to join you, if

you happen to be a couple of pounds in your pocket.

Let me give you a light.

## THE HORRID MAN

"Now, India," said the President, "you

can't get anywhere in Illinois. In the words of some

of the greatest politicians the world ever knew they

do to some things you can only get by knee's 'em

through."

"Never!" cried the Associated Order of Five Spin-

sters, rising as one man in protest.

## CAUTIOUS

"Now, Rankin," said the Judge, "this is a very

serious offense you are charged with. Striking

chickens is not enough, but breaking into a store and

stealing the bill of thirty dollars is worse. Do you

want me to appoint a lawyer to defend you?"

"But depend on what do lawyer here charge for

his services, Judge," replied Rankin. "—'E he's gettin'

it for the whole of our thirty dollars an' one I see what's

goin' to be for his an' s'k."

NEW ORLEANS JUNE 13 A HEAVY RAIN

When I have with a love that's true,

But of her proposed to me I'm afraid

I'll hardly know what to do.

For though she's a maid for your lightest whim,

She's cross-eyed on the one side,

I never can tell if she smiles on me!

Or whether she smiles on me!

Why, I can recall a summer day

Far back in the long ago,

She looked and beamed in her regular way

That set every heart a-glow.

And I was disposed to agree,

And I couldn't quite tell if she looked at Ted,

Or whether she looked at me!

And once at a ball I overheard

Her twitting some remark

In answer made on that little bird

That I know as the starting bird,

"I'm much afraid he's a bit of a snob!"

And I followed her glance in awe—

And one of those eyes looked on Bob,

And Collier was fixed on me!

And so I fear if I should be

In happiness I might fall,

Even though on her touch my pulse may stir

And my heart throb round like a ball,

For if it would be really a pleasant plan

In the midst of our ecstasy

If she had had one eye on some other man

While Collier was beamed on me!

ARE YOU A STRAYMASTER?

—NO, A CLABBER.

# OUR GREATEST "WHITE POWER" REGION

BY B. S. JOSSELYN

A panoramic view from "Oak Grove Mountain," a rocky point of 5,100 feet elevation, situated near the Clackamas River, Oregon

It has been stated that one-third of the available hydroelectric horsepower of the United States either lies in or is tributary to the Clackamas River basin, of which the state of Oregon bears the most important part. Some idea of the extent of this important resource may be obtained when the fact is made known that this basin represents a greater area in land than is possessed by New England, with the states of Maryland, Pennsylvania, Virginia, North and South Carolina added. The basin drains 224,280 square miles. The state of Oregon alone has 95,492 square miles of water drainage, and within this area are located water-power possibilities easily found upon the state's surface. The government, in its estimate, has fixed upon the minimum amount of 5,200,000 horsepower of possible hydroelectric development for the state of Oregon. That is one-half of the entire amount now utilized in the United States. Regardless of this, engineers predict that the minimum given by the government experts for Oregon can be increased to more than double the amount through engineering ingenuity. From these figures Oregon's supremacy in the matter of potential hydroelectric power is easily discernible. The 5,200,000 possible horsepower should be a factor in developing here the largest manufacturing center

upon the Pacific Ocean, and it may be in the United States; for with the raw product at command not only of the forest and fields in Oregon, but of the ports of the world, Oregon must come into her own.

With this stupendous amount of undeveloped power, coupled with the timber resources of the state—amounting to all that is to be found in the United States—it forms a combination that is bound to be productive of much wealth and gives Oregon a prominence in the markets of the world well to the forefront.

Equally rich is the state in its agricultural resources. It has 8,230,000 acres devoted to farm use with 18,225,482 double acres—two-thirds timbered—and 17,252,000 of public lands subject to entry. The farms produced last year \$127,000,000, and that with a population of 625,000 in the state.

Thus Oregon, with its latent water power, its four-billion-dollar forests, and its \$127,000,000 yearly farm production, needs the attention of the world of commerce. Situated as it is upon the Pacific Ocean, with its equitable and solid climate, it should necessarily win the attention it seeks and the favor of those desiring a broader sphere of action. Its chief aim at the present time is to secure the capital and population which will furnish the labor to develop these resources.

There are men of capacity who predict that the theater of action for the world of the future will be on the shores of the Pacific. Upon this vast shore

line of 30,000 miles there are living to-day possibly 200,000,000 people. Each year shows an increase in the consumption of goods made by the Anglo-Saxon. In the years to come the development of this line of commerce will produce figures that, if suggested to-day, would cause the reader to doubt their correctness. Well then, Oregon's chief competitor, today exports more wheat and flour than any other part in the United States. Australia to-day sends the Oregon farmer China tea, sugar, and Japan is constantly buying lumber and other well-known products of the state. Such of the Cascade range and down the Willamette Valley are to be found herds of 100,000 and sheep which find a market in the packing-houses of Portland. The live-stock industry of the state is valued at \$25,000,000. Thus with lumber, grain, and live-stock to further the cause of development, in this new and rapidly growing section, the very elements which have made cities in the east and created wealth of modern proportions are to be found in Oregon.

It is, indeed, a country singularly blessed in natural products, while the water-power necessary to transform these products into articles of commerce is wonderfully abundant in Oregon. With an ocean at the door of the factory to furnish transportation to the ports of the world, Oregon can claim the distinction of being three blessed, and the world must readily recognize this fact.

## A CENTURY OF PEACE WITH ENGLAND

Continued by the International News Bureau

MEMBERS OF THE INTERNATIONAL NEWS BUREAU WHO MET HERE TO PLAN THE CENTENNIAL CELEBRATIONS OF THE SIGNING OF THE TREATY OF AMITY, WHICH TERMINATED OUR HOSTILITIES WITH GREAT BRITAIN. FROM LEFT TO RIGHT ARE: H. S. PHOENIX, C. DE BIAZIA, HENRY SHAW, BRADFORD BROWN, SIR GEORGE BENTLEY BURN, EARL STANHOPE, SIR ARTHUR CUNNINGHAM, JAMES WILKINSON, SIR HERBERT SPENCER, WALTER WELCH, THE MARQUIS OF LONDONDERRY, ARTHUR SHREVE BURN, AND JAMES ALLEN BAKER.

You get more air-room in **Diamond (No-Clinch) Tires**—and it's the extra air-room that does the work.

**T**HE more air-room—the more resiliency, which in turn means more comfort for you and your passengers—*more service from your tires.*

The secret of building a tire that lasts means building a tire that does the work easily—a tire that does not strain under road usage.

This extra air-room is gained for you without lessening the thickness of the tread or weakening the side walls in any way.

To stand the pull of the engine—to absorb the shocks of the road—to travel farthest on the smallest quantity of gasoline—to make inner tubes last longer, were scientific tire problems.

Our engineers have solved these problems for you and all other tire bills payers by building Diamond (No-Clinch) Tires with extra air-room—in a word—the ideal, perfectly constructed tire you have been demanding.

Diamond Safety (Squeegee) Tread for Automobiles, Buses, Trucks.

25,000 Diamond Dealers always at your Service

# Diamond { No Clinch } Tires

## Vitalized Rubber calls a halt on "Short Mileage"

After countless laboratory tests and experiments, our chemists have discovered a process to scientifically toughen pure rubber so that it will give you the mileage you pay for.

Diamond (No-Clinch) Tires made of Vitalized Rubber are tough and flint-like enough to fight the road, elastic enough to absorb shocks, thus preventing rim troubles and breaking above the bead.

Add to this high grade workmanship, nothing inferior in construction or fabric—Perfect 3-Point Rim Contact—the No-Pinch Safety Flap for inner tube protection—and you have the best tire money can buy.

Cross Section Diamond Safety Tread Tire

## Safety (Squeegee) Tread an additional Diamond advantage

Diamond Safety Tread Tires obey your will. No matter how slippery and treacherous the paving, they grip and hold. You drive with safety and you drive with pleasure with Diamond Safety (Squeegee) Tires on your cars.

And that's not all—there's real economy in Diamond Safety Tread Tires. The Safety Tread is added to the regular tread—the extra mileage makes the safety cost you nothing.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims at any of the

## HELPING THE MAN ON THE LAND

In the Pacific Northwest, the land of diversity of resources, diversified farming has received recognition and is growing in favor. The Oregon-Washington Railroad & Navigation Company, operating in Oregon, Washington, and Idaho, began a campaign of education some four years ago. Co-operation of the state, county, and district teams, accompanied by its own specialists, and taught the value of diversifying on the soil. Every phase of farm life was considered, every question intelligently answered, and every problem distributed free of charge.

Many land-owners were advised with the crop-idea. Their forefathers had preferred anything wanted, anything better than corn. But these men made the mistake of looking from the soil every year, getting nothing in return. They learned through experience the

This campaign of education, sponsored by the Oregon-Washington Railroad & Navigation Company is still being generalized. A series of trained men, at least busy twelve months in the year, are visiting throughout the long practical farms. For 1933 a tour of education is under way. The Oregon-Washington Railroad & Navigation Company, Oregon-Columbia Division, and the men who write the letters, who go out to talk to the land-owner, advocate methods which have been proved. The agricultural colleges and experiment farms are engaged in this work, and the results of their labors are at the command of the man on the land. He does not have to experiment. By using selected seeds, following instructions as to preparation of ground, planting, and cultivation, he is assured of a yield.

What has been the great farm product of the inland Northwest in the present decade? The Oregon-Washington Railroad & Navigation Company has helped the wheat-grower increase his yield by producing a larger crop in conjunction with another crop which is raised in volume than wheat grows.

Corn can be planted on greater areas. Corn and wheat can be grown in rotation with wheat. Corn will grow in Oregon, Washington, and Idaho, and as good quality corn may be produced, and the yield will equal that of the so-called corn states. The fallacy of the argument that the nights are too

Field Corn, 16 feet high, well cared, growing in the Yakima Valley

truths expounded by the school workers. They were brought to a knowledge of the fact that no soil is indestructible and that they must replace by crop rotation the elements necessary to growth of which they robbed the soil by continuous cropping of one crop.

The farmers and fruit-growers were taught not to lose. There are "off years" on the farm and in the orchard. Large yield will not be counted on with such regularity. The man who planted one crop or who directed his entire acreage to fruit crops at the harvest was gutted.

The Oregon-Washington Railroad & Navigation Company employed agricultural and mechanical engineers to demonstrate the value and necessity of diversified farming. These men went out and told the farmer that he should grow alfalfa, field peas, beans, and poultry, and that in this way he would be able to crop failure, and his ewes, checks and his checks from the sale of his stock and poultry products would bring him steady and increasing revenue. The same story was told the orchardist. It mattered not the size of the land-holdings. The necessity of diversity was explained to the owner of the ten-acre tract as well as to the owner of the two-hundred-acre farm.

What has been the result?

Increase in volume and value of the yield everywhere along the line of the Oregon-Washington Railroad &

Poland Cross ready for shipment to the Packing House at Portland

Navigation Company. In eastern Oregon, the great grain-growing section of the state, dairy farms, but dairies, and poultry are valued assets. At the stations one can see rows of crates filled with cream for the dealer in the city, in the morning, and rows of eggs for the packing-houses, on the platform are cages of poultry and crates of eggs ready for shipment. What about other farm products?

There has been no falling off. The year 1932 was a year of bumper crops throughout the Northwest. The great water-basins were filled with everything. To the man who had dairy cows, hogs, and poultry the money never ran for the farm and orchard products was all clear gain. The milk cream, pork, and poultry products had paid the running expenses and more. The land-owner had been enabled to pay the taxes for his property, and was enabled to buy the wheat crop insurance in order to pay the premium for the best wheat, and the implement dealer.

Pear Orchard

could have been explained. The man who planted one crop or who directed his entire acreage to fruit crops at the harvest was gutted. The Oregon-Washington Railroad & Navigation Company, Oregon-Columbia Division, and the men who write the letters, who go out to talk to the land-owner, advocate methods which have been proved. Young Orchards and Alfalfa Ranches in the suburbs of North Yakima

to the length of days of the marketable land is given by word of mouth and is passed from boy to boy who know and who are at the service of the people in Oregon-Washington Railroad & Navigation Company territory.

In expanding cereals and hay products, field peas, root crops, etc., the company is not unaided of the fruit industry. It has expanded the apples and pears, peaches, oranges, grapes, and other large and small fruits of the Pacific Northwest. The fans of Oregon and Washington fronts in Washington, the acreages of the land beyond the area are equally an enthusiasm in the American public's view of the excellence of the delicious fruits of the Northwest. But even the fruit-growers are becoming converts to the theory of diversified farming. There has been a great increase in apple-producing districts in the Pacific Northwest than Hood River. In September, 1932, Newell Pappas are known wherever apples are raised, and yet of the Pacific Northwest Land Products there lived in Portland, Oregon, in November, 1932, the Hood River apple market was in a state of collapse. The Hood River apple market, the golden-bell market, the plum cabbage, the cauliflower, and a variety of vegetables bring in the produce. The money grows as free in evidence that they realize the money to be made in bags and they are going to raise pigs as well as poultry.

The productivity of the soil in the states of the Pacific Northwest is comparatively unknown. For instance, in the dryest sections of the Middle West, ten acres of land will produce a yield of wheat for which there is a market for a year. At the Land Products show referred to there was an exhibit of eighty tons of kale grown on one acre of soil in one year in western Oregon-Washington, in the Yakima Valley, or in the territory tributary to Lewiston and Grangeville, in Idaho, where the fans of the Oregon-Washington Railroad & Navigation Company are operated, that will not produce food enough for a cow for a year.

A little land and a good house. A house where climate conditions are desirable. A region free from insect plagues of various kinds, good transportation facilities to good markets. A choice of locations on the land. A five-acre tract which can cultivate any crop, a large holding where he may manage in many varied products. These are some of the advantages to be had in the Pacific Northwest, on the territory tributary to the Oregon-Washington Railroad & Navigation Company.

It is undeniably true that conditions are different from those of the Middle West, but the difference is in favor of the man who secures a holding in the Pacific Northwest. He may have to learn how to irrigate or how to raise crops in the dry-farming process, but he has the direct care of the man who have made a success to direct.

Failure to succeed on the farm here will be the lack of the man and not of the land. Intelligent cultivation is a necessary everywhere, and the Northwest is no exception. The man who has a greater and the labor lighter.

There is no more interesting literature published than the pages which record man's success. Volcanos might be piled, filled with statements of men who have made good in this favored land. There are no simple volumes on the farm that is best suited in the story of how some man achieved success. It requires work. It requires investment. It requires intelligent toil. It requires investment in business harvest. It lightens labor in the common knowledge of distant reward. It compensates for providing income.

There is no more interesting literature published than the pages which record man's success. Volcanos might be piled, filled with statements of men who have made good in this favored land. There are no simple volumes on the farm that is best suited in the story of how some man achieved success. It requires work. It requires investment. It requires intelligent toil. ## "By Their Fruits—"

The splendid dividend record of the unexcited industrial preferred shares

A very few months ago when you spoke of "industrial preferred shares" you meant one thing and one thing only—some share in the ownership of manufacturing and other concerns which were being put on this "quality" ground. You meant the "industrial preferred" of the Standard Oil and the others, not the United States Steel and Harvester and the like. In the list of one year later after the other, each with prospect more brilliant than the one before, they represented such another class of "industrial preferreds" was almost lost sight of.

Recently there has been a big change in that regard. With one of two conspicuous exceptions the preferred shares sold last year have done well enough, considering. But with business conditions slapping themselves as they have, investors have become far more interested in equities than in preferreds. With the greatest buyer just now it isn't a question so much of what a prospective investment is going to earn as it is of what it is going to do. For instance, that through thick and thin, had done good work, one of these all-line industrial preferreds has paid a dividend over some organization appeals to him for more than the fact that by buying one of the shares he can get a little bit more income.

## Stability of Earning Power

Among the preferred shares listed twelve or fifteen years ago when most of the big industrial preferreds were taken place there are some whose record has been anything but enviable, but, glancing down the list, one of these shares has paid a dividend over some organization appeals to him for more than the fact that by buying one of the shares he can get a little bit more income.

Each, after all, is the great test of the first of the three qualities which the investor looks for in making an investment of this kind—stable earnings over some period. We record our dividend twice our last year, more than one of the company recently issuing a stock at a price 100 per cent above the year before that we earned it three times over. Very well, so far as that goes, but how long has it been so that and the year before that? History has been good and a record of the preferreds has shown that earnings over some period, nothing variable. Go back four years, eight years, ten years, to a time when business wasn't good. Suppose you had this particular stock at the time, would you have been able to pay the dividend on it regularly? If not, after all, it is the great test of the indicator of the future. However good a business man you may be, to furnish the yield of changing conditions, the earnings of the company in whose shares you happen to be interested is important; that what you own will pay you as you are required to do with what has happened in the past and from that get some sort of a fair idea of what you can expect in the future. Through the condition of 1913, as will say, and the depression of 1915, the company earned enough regularly to pay the dividend on its shares. It is objected, that it doesn't grow that conditions cannot develop in 1912 or 1913 such as to lower earnings over such dividends. No, it doesn't grow; but nothing can prove it but the next year. But it is true that the company has been grounded for the assumption that if the company went through those trying times without having to stop paying the dividend, it will be able to go through whatever else ahead without reducing its preferred dividend.

## Earnings and Yield

In the second of the qualities essential to an investment of this kind, liberal margin of earnings over dividend requirements, most of the old-line preferreds are richly provided. It is true, however the optimization of some of these concerns may in the beginning have been "overrated." The "industrial preferreds" of the great majority of cases represent not merely good work on earning power, but liberal margin of earnings over dividend requirements. It was done through the loss of common stock not preferred.

Run down the list of earnings of these preferred shares for the last five years or two, and it will be found surprising in how many cases earnings applicable to common dividends are more than twice as much from two to five times over. Not in this because these losses of preferred shares, but because the earnings of the common are small. Most of them, on the contrary, are proportionately large. There is just one reason why earnings make the difference they do, and that is that these preferred shares represent real money laid out work. In the third essential quality, a fair

share of income to the buyer, the old-line industrial preferreds make quite as favorable a showing as is the other class. In these days of a low and a half percent yield on savings-bank funds it is to be expected that industrial stocks should yield a little more, but whether they cover in general quite realize the seven and eight per cent income obtainable from a fixed interest, and whether the industrial preferred shares is very much of a question.

Out of a list of an often dozen, seven preferred industrial preferred shares actively traded on the New York Stock Exchange and every one of which has an unexcited and unshattered dividend record since the organization of the company, just built are at present selling within a few points of par. In some cases the price is a little above, in some a little below, the average yield working out at only a trifle less than seven per cent.

## The Manufacturing Group

The industrial preferred shares actively traded on the New York Stock Exchange and which have an unexcited dividend record divide themselves into six classes.

First and numerically, at least, most important is the all-inclusive manufacturing group, that includes such concerns as National Biscuit, American Woolen, United Leather, and International Harvester.

Among the preferred industrials "Biscuit" is an exception, in price, in spite of earnings that has happened to be held up to a point where the yield to the buyer is only about six per cent. At that the stock is low, it is a little above par just after the price, when it sold down to 100.

During each of the past three years (this is the time of strong and growing competition) the dividend on the preferred stock has been earned more than twice the price. During 1910, 1911 and 1912 it was earned more than twice over.

American Woolen is an entirely different proposition. Since the company was formed, it is true, Woolen preferred has never failed to pay at least seven per cent, but since the company was formed, it is also true, it has never failed to pay the dividend on its shares over some period. What will happen under the new order of things is professional. That there is considerable work in the organization of the seven-per-cent dividend is proved by the decline in the price of the stock to a point where it sells the better at nine per cent.

For the low price at which Central Leather preferred is at present selling, the yield of earnings over dividend is practically responsible. In 1910, for example, the preferred dividend was earned more than twice over, but the year before it was only partly earned. Nineteen hundred and twelve was it earned two and a half times over, but the year before the company's earnings ran. Ever since it was started earnings during each year have been enough to pay the dividend on its shares over some period. In 1911 there was a low year, but the year before it was only partly earned. Nineteen hundred and twelve was it earned two and a half times over, but the year before it was only partly earned. Nineteen hundred and twelve was it earned two and a half times over, but the year before it was only partly earned.

International Harvester is a very common type that has an unshaken record since the beginning earnings have been on such a scale as to leave not the slightest doubt as to the safety of the dividend on the preferred. During no year of the six in which the company has ever been established has the preferred dividend been earned less than three times over. In 1910 it was earned three times over, in 1911 three and a half times over, in 1912 three and a half times over. Certainly to give an average as to the safety of the preferred dividend would be asked. Yet the stock is selling at a price at which it nets the buyer almost six and one-quarter per cent.

## The Steel and Sugar Groups

In the steel group which the only reason that makes an unshaken record in United States Steel preferred. Just why the stock was unshaken, except such favor with the public can be seen from a glance at the record of earnings over dividend on the preferred. During no year of the six in which the company has ever been established has the preferred dividend been earned less than three times over. In 1910 it was earned three times over, in 1911 three and a half times over, in 1912 three and a half times over. In every direction was offering actively on the market, the price of the stock was par, the dividend earned 340,000,000 available for dividends an annual requirement of only \$25,000,000 for the dividend on its preferred.

Whatever the outcome of the dissolution suit against the company and whatever

the effect of tariff action, the dividend on this preferred stock can be as safe as anything could well be. At its present price the stock yields approximately six and one-half per cent.

Among the stocks in the sugar group, American Sugar Refining preferred has always held the same kind of unexcited position as that occupied by National Biscuit among the manufacturing shares. Earnings applicable to preferred dividends are ample to provide for the needs of the company, and the earnings of the company; but in few investors' minds does there exist a doubt as to the safety of the dividend on the preferred. In 1911 they exceeded requirements about four times, in 1912 they exceeded requirements about three times, in 1913 they exceeded requirements about two times. In no year has the dividend on the preferred been earned less than three times over.

It is unusual to see unexcited a position in American Sugar. To a very great extent the company's business has been built up behind the production of the high-land rail, and ever since it has been plain that the sugar duty would be among the first to go. In some cases the dividend has been earned more than three times over. With regard to the preferred, however, it must be borne in mind that it is a very small amount, and that it doesn't take much in the way of earnings to pay a six per cent dividend on it.

## The Tobacco Group and the "Equipments"

In the tobacco group American Leaf and American Tobacco both stand the dividends on their preferred shares as unexcited as that of any of the other shares which they own. This security is in nearly a matter of current income yield. The few of government investigation and presentation, however, having been passed through, and these companies being that "unexcited" position, it is entirely the case that the element proved in the case of many of the big industrial companies. Steel and United preferred, consequently, will get the highest yield of any of the preferred industrials.

Coming to the railway equipment manufacturers, we find four preferred shares, all of which have paid seven per cent, some organization, but of which only one, the American Railway Equipment, has anything to spare. Even in the case of the steel, American Leaf preferred dividend one and a half times over in 1911 and 1912, and again in 1913. In the case of the steel, American Leaf preferred dividend one and a half times over in 1911 and 1912, and again in 1913. In the case of the steel, American Leaf preferred dividend one and a half times over in 1911 and 1912, and again in 1913. In the case of the steel, American Leaf preferred dividend one and a half times over in 1911 and 1912, and again in 1913.

For the low price at which Central Leather preferred is at present selling, the yield of earnings over dividend is practically responsible. In 1910, for example, the preferred dividend was earned more than twice over, but the year before it was only partly earned. Nineteen hundred and twelve was it earned two and a half times over, but the year before the company's earnings ran. Ever since it was started earnings during each year have been enough to pay the dividend on its shares over some period. In 1911 there was a low year, but the year before it was only partly earned. Nineteen hundred and twelve was it earned two and a half times over, but the year before it was only partly earned.

The Fertilizer Group and the "Metals" Corporation, working in view of the position late which they seemed to be making a year or so ago, has been shown that the company is a very good company, but that the long-established dividend on either Virginia Carolina Chemical will have to be a very high yield. For five years running American Agricultural preferred dividend has been enough to pay the dividend on the preferred. During no year of the six in which the company has ever been established has the preferred dividend been earned less than three times over. In 1910 it was earned three times over, in 1911 three and a half times over, in 1912 three and a half times over. Certainly to give an average as to the safety of the preferred dividend would be asked. Yet the stock is selling at a price at which it nets the buyer almost six and one-quarter per cent.

In the so-called "metal" group, American Steel is selling at a price at which it nets the buyer almost six and one-quarter per cent, and that is the line of a government suit, lowering the earnings of "Metals," and the result of the suit is that the dividend on the preferred is not available, but from the figures given for 1911 and 1912 it appears that the company has been able to pay the dividend on the preferred. During no year of the six in which the company has ever been established has the preferred dividend been earned less than three times over. In 1910 it was earned three times over, in 1911 three and a half times over, in 1912 three and a half times over. In every direction was offering actively on the market, the price of the stock was par, the dividend earned 340,000,000 available for dividends an annual requirement of only \$25,000,000 for the dividend on its preferred.

Remarkable uniformity is shown in the requirements of the preferred shares on the past five years, the margin above requirements in no year having been less than three times over; but, on the other hand, they have been so low that the dividend dividend was not forced to spare.

## Breaking the Bonds of Habit

Most of us cling to the things of life which please the senses, and continued indulgence leads to fixed habits—some good, others exacting a heavy penalty.

If any habit, such as coffee drinking, is found to interfere with one's welfare and comfort, it's time to break away.

Medical opinion and the research of pure food scientists agree that the coffee habit is extremely harmful to many persons.

It is hard to induce people to give up coffee, but if they are given the pure-food drink

## POSTUM

they will find a distinct gain in health without loss of satisfaction or pleasure.

This nourishing table beverage, made from choice wheat and the juice of Southern sugar-cane, possesses a rich Java-like flavour, but is absolutely free from the coffee drug, caffeine, or any other substance which could prove injurious to the most sensitive organism.

The ever-increasing demand for Postum amply proves its worth as a safe table beverage for those who seek the freedom and power which come with mental and physical poise.

 Going-to-the-Sun Camp on St. Mary Lake—Trout Fishermen's Headquarters—  
 Glacier National Park, Montana

# A 4-Day Tour in Glacier National Park for \$22.00

By Automobile, 4-Horse Stage, Launch and Horseback

Break your journey to or from the Pacific Coast by a stop-over at Glacier National Park. It will be a new and wonderful experience. A few days in this scenic wonderland will provide material for a life-time of vivid, pleasant recollections—and at a comparatively trifling cost.

For instance, \$22 covers the total expense of a four-day tour to exquisite Lake St. Mary, in the very heart of the scenic region of the Park, by automobile, launch and stage, including a visit to the unique and cozy Chalets at Many-Glacier and Going-to-the-Sun Camps—the paradise of the mountain-trout fisherman. An almost unlimited number of other tours, covering one to twelve days or an entire season, may be arranged at a correspondingly low cost.

## Vacations \$1 to \$5 per Day

The accommodations throughout the Park cannot be excelled. In addition to the famous chain of Best Chalet Camps, a magnificent new hotel has just been completed, offering every modern luxury and convenience. It is built of huge logs in perfect harmony with its natural setting. Every room is electrically lighted and heated, swimming pool and shower baths in basement. Enormous open fireplaces typify and crystallize the spirit of hospitality and generous welcome that is evident from the moment of your arrival. Low fares every day.

An excellent opportunity is afforded to observe the tribal dances and ceremonies of the Blackfoot Indians—one of the most interesting and picturesque of all surviving tribes. Stop off at Glacier Park Station.

## Write for Aeroplane Map and Special Booklets

Very complete descriptive literature explaining every feature and including a large Aeroplane map of the entire Park, in color, will be mailed on request. An interview with one of our representatives who has personally visited Glacier Park may be arranged. Information relative to Glacier National Park fares, tickets, reservations, etc., may be secured from any Chicago, Burlington and Quincy or Great Northern representative, or mail the coupon today.

Portland's Street Railways

Pacific Coast cities will record the largest percentage of growth in population in the next twenty years. They grow rapidly so fast in all concentrations requisite to modern development. The city of Portland, Oregon, recorded an increase of 129 per cent. for the ten years from 1900 to 1910. Considerable such line of remarkable growth there was just as great an increase, if not more, in its street-car facilities and in the distribution of light and power than in the use of electricity. Portland today has a street-car for every 320 of its population, which represents a larger percentage than possessed by Minneapolis, St. Paul, Kansas City, Denver, Milwaukee, and of any city in the United States having 250,000 population. The condition tells the story of a highly developed and modern street-railway system.

Cities today only grow by means of rapid transportation. The suburban population that lives five and even ten miles out from the heart of the business district is just as great a customer of the retail merchant as the man who lives two blocks away, providing he can be delivered in front of the store within a reasonable time. The ratio of city operation, from a retail standpoint, has grown in America only to the extent of the growth of rapid transportation. Forty years ago city centers, as far as the downtown district was concerned, was confined within a circumscribed circle of two or three miles. Today it reaches out ten miles and even beyond, all due to the trolley. In this particular Portland stands well in front when compared with other cities of the country. The street-car lines radiate in all directions, going north to St. Johns, a distance of 10 miles, to the south to Lewis & Clark, to the east, 6 miles. Portland paper has 64 square miles of territory, and within this area is located nearly 200 miles of street-car track.

The city is possessed of but one street-car company, and transfers are made in one continuous direction. During the year 1912, 20,000,000 passengers traveled upon the street-cars of Portland, a number equal to the population of the United States. It is the consensus of opinion that better operation and better service are obtainable from one company than if two or three are in the field providing duplication of investment and a duplication of fares as going from one line to another. The company which operates the street-car line in Portland is known as the Portland Railway, Light & Power Company. It is controlled by the Clark interests of Philadelphia and under the direct management of B. R. America, its president. It not only handles the urban transportation, but is the owner of one of the largest electric light and power plants upon the Pacific Coast. It has steam and auxiliary steam plants which produce 30,000 horsepower of electrical energy—an enormous quantity—and stands third in the respect upon the coast.

Portland is one of the very marvelous cities in the country in its consumption of electrical energy. The company has 27,000 customers within its field of operation, the production of which is about 2,000,000. When it is considered that Philadelphia, with a population of 1,500,000, has not a larger number of consumers of electrical energy than Portland, the remarkable development of this feature of modern civilization is discernible. The company is the owner of four large hydro-electric power plants located at Oregon City, Estacada, Canby, and Mt. Rain. The electrical energy from these plants is brought to the city by means of high-tension transmission lines.

Through successful management, the company has been able to furnish its customers electrical energy at a very low rate, and thus the city has been enabled to grow more faster than if it depended upon other forms of power-generating fuel. Some idea of the rapid growth of this company might be ascertained from the fact that in 1911 the company had 12,291 electric-light customers, and its revenue amounted to \$1,141,143. In 1912 the number of customers was 32,192, and the kilowatt hours of electricity totaled 152,245,292. In 1913 the net earnings of the company were \$1,982,427, and in 1911 \$1,363,705.

The company has made a special effort to provide these services for the manufacturing purposes. It has adopted a policy toward factory plants along these lines, believing that whatever the benefits that may be derived from a continuous power of view would necessarily be reflected in the carrying power of the economy. It has accordingly made special plans for its product and has taken a diversified course in the natural growth of the economy, than has been the experience of other cities.

The Opal

Experts in such matters agree that among jewels the opal alone defies the laws of the industry. This alone sets it apart so much so that in its own intrinsic merits as to the splendor of the rays of light it reflects. It has been called "the coronation of stones" and it has always been a great favorite with lovers of gems. Nearly two thousand years ago Pliny remarked that it "displays at once the purring fire of carnelians, the purple brilliancy of sapphires and the sea-green of emeralds, the whole blended together and refracted with a brightness that is quite incredible."

"The opal is a stone "with a temper." The diamond rises superior to climate, as does the ruby, the emerald and the sapphire, but the opal is of such delicate organization that, when exposed to severe cold, it soon cracks, and under the influence of excessive moisture becomes dull. It is a curious fact, however, that the temperature of one's hand will cause it to resume its wondrous fire and brilliancy, as will also be the case when it is exposed to the direct rays of the sun.

The opal has always been credited with such claims, mystery, and association. The Greeks believed that it possessed the power of bestowing second sight on those under its influence, provided the stone were not employed toward selfish ends. Because of this belief, it was a minor talisman. And so recognized the notion that the opal was unlucky. Successful practitioners have kept alive this superstition, which has been utilized by many writers, among whom may be mentioned the Walter Scott, by whom, in "Anne of Geolayne," the opal is made to play an unfortunate part.

The Romans were so fond of the opal that they considered it to be the stone of "lovely youth," but, curiously enough, they shun it in most of the Greek superstitions. Roman emperors, as a general rule, did not wear the opal amulet.

During the Middle Ages there were few statings those who shared the Roman weakness for the opal and it entirely largely into the advertisement of both sexes.

The Sanitary Laws of Moscow

There has been gathered a collection of facts to prove that the sanitary laws of Moscow were not only on a line with the modern rules of hygiene, but in some cases in advance of them.

The few thousands of years before Christ, settling in a semi-tropical country, man furnished his milk or milk and milk was designated as a source of contagion. In the interval a method of slaughtering animals was perfected which is acknowledged today in our markets as the most sanitary.

Five thousand years ago. Each year to the world the results of his researches in bacteriology the Moslem law placed the dagger to man from tuberculosis in cattle, but did not forbid infected poultry as food. It was only a few years ago that German scientists discovered that beef tuberculosis was hereditary to man.

The Moslem law also entered the bodies of patients with contagious diseases and the burial of the dead outside all cities. These hints the Gothic world did not fully accept until a century or two ago.

The wise lawgiver provided not only for the sanitary condition of the city, but the removal of whole families in summer and to camps, where for a time they could live close to nature. Many of the laws of Moscow were provisions intended for the health of both mind and body.

A Methuselah of the Sea

Titan was broken up lately at Tenerife, the Canary Islands, what was undoubtedly the oldest ship in the world. It was the Italian ship Antio, built in 1518 in 1518, and stayed on every day of the Santa Maria, the famous galleon in which Columbus made his voyage of discovery. The Antio was built for strength rather than for grace or speed. She was broad-beamed and clumsy but she had swiftness, ballast and trypans in all parts of the hull, and escaped unharmed from the perils of the deep, from Cape Horn to Hudson Bay. She was a model of the slowest ship afloat averaging two and a half knots and five days between Baltimore, Maryland, and the Azores. So her lack of speed was being named for her name, and as she would decline to defy the waves in the rough seas, she was named so long as she remained afloat, it was decided to sell her for what she would bring and demolish and replace the proceeds in the construction of a new vessel.

**Willamette Iron and Steel Works**

In the Pacific coast country the logging conditions are quite different from those found in any other locality in the world, in that the country is extremely rough and broken and the timber grows very thickly and to a large size. The result of these conditions is that logging operations are carried on with considerable difficulty and at very great expense. The most accessible timber which was located near water or near a railroad has been to a large extent logged. As the timber recedes from these sources the difficulty of placing the logs in the market cheaply becomes greater and greater. Various methods have been pursued in logging the timber, depending on local conditions, but it is practically universally recognized that the only feasible and economical method now possible is the use of some sort of steam equipment. The cut teams have been discarded entirely and horses are used only in the open timber districts of eastern Oregon and Idaho, but even here the steam engine is gradually displacing the horse.

**The Largest Logging Engine in the World**

A variety of types of steam "donkeys" are in use, but these machines are gradually being standardized, so that two types have been adopted as those best capable of doing the work. These are the tandem drum long-head or road engines, and the narrow drum yarding-engines. During the past ten years these two types of machines have been developed to a very high point of efficiency and have reached extremely large proportions. Ten years ago the average logging engine weighed from 15,000 to 20,000 pounds. The engines being used to-day vary in weight from 35,000 to 60,000 pounds.

As a result of the demand for special logging machinery there has grown up on the Pacific coast a line of industry which is peculiar to this country. Blocks, blocks, spools, and other accessories, with the equipment, that are being manufactured by these companies to the extension of all other competitive manufacturing companies. This is likewise true of the engines which are used, and it is extremely seldom that an engine will be seen in any camp which has been built outside the states of Oregon and Washington.

The greatest progress in the design and manufacture of logging engines for Pacific coast conditions has been made by the Willamette Iron and Steel Works, of Portland, Oregon, who for the past twelve years have devoted their entire efforts to the development of a suitable line of engines that would meet the severe conditions of service placed upon them. Probably no other equipment in the world is subject to such trying service as that of these logging engines. The demands upon them are frequently beyond their normal capacity, and the nature of their work it is difficult to give them the attention that such machinery should have, yet one of these machines is now built, being given reasonable care, so that it will run for long periods without undue deterioration.

Interior

The plant covers four and one-half acres of ground in the northern part of the city, where very best timber for shipment by either rail or water, and when working to full capacity the company employs from three hundred to five hundred men. The annual product is one hundred and fifty logging-engines per year, with a maximum capacity of one engine per day. In fact this record has been surpassed when seventy-six engines were shipped in seventy-one successive days last year. This plant is considered every part of the Pacific coast. The engines are recognized by the highest-grade logging-engines ever produced, and are being used almost exclusively by all the large logging firms.

**Treating Sick Fish**

The "fish doctors" at the big aquaria accomplish some extraordinary feats in treating sick fish and restoring them to health and vigor.

One sick fish, a salmon, was received in such a weak and exhausted condition that it was actually unable to keep itself "righted up," but lay on its side at the bottom of the tank, a faint position for a fish to assume by means of the adjustment thus resuscitated to the gill cover.

Now the gills of the fish are practically its lungs, through which from the water it absorbs the air needed to sustain life. By opening and closing the gill covers the fish controls the passage over its gills of the constant supply of water wherever it extracts the air. It will thus be seen that if a fish in the condition of the one mentioned were deprived of half its respiratory power, as it would be by lying on its side and so closing one gill cover, it could not long survive.

In the case mentioned the fish was "righted" into its natural position, its belly on the bottom of the tank and propped up between two dipnets, one on each side, with the writing of each thumb, so as to constitute a sort of cushion. Propped up in this way, the fish could get its full supply of air for its gills.

Then the water was lowered in the tank, so that that remaining became proportionately more highly charged with air from the tubes. Besides the pump in "intake" water was introduced into a line that could be delivered at any point in the tank. Now all "living" water contains more or less air and this was placed down and far from the nose of the salmon, at a point where the fish could derive the greatest benefit from its flow before it reached with the tank water.

By these means the salmon was sufficiently revived so that it could move. It was then taken before the net and undertaken to look out for itself. But it had lost too "previous" and soon it was down again over its nose on its side. Again it was propped up and soon it again made efforts to move about a bit. A shower taken or more during the course of the day did this several times and in strength all the while and at about the fifteenth trial it proved able to take care of itself. It recovered completely and for a long while was the strongest salmon in the tank.

**Green Gravel**

FIDELE goes sadly and sits in the dust,  
His spine or his slum at the white  
washed dust.  
She has never a visitor all the day long,  
And she sings very sadly this foolish  
and song:

"Green Gravel, Green Gravel, your grass  
is so green!  
The sweetest, the sweetest that ever was  
seen.  
Fidele, Fidele, your sweetheart is dead,  
He sent you a letter to turn back your  
head."

But when it is evening she wanders away  
And watches the children who come out  
to play.

The children are happy and dance in a  
ring  
And over and over they merrily sing:

"Green Gravel, Green Gravel, your grass  
is so green!  
The sweetest, the sweetest that ever was  
seen."

She wants to play with them and join  
in their fun,  
But when she comes near them away  
they all run.

No late in the twilight she slaps all alone  
And dreadsly dreads around a white  
stone.

"Fidele, Fidele, your sweetheart is  
dead,  
He sent you a letter to turn back your  
head."

ALINE KILMER.

**The Ruling Machine**

"Over the primitive methods, 100  
years of double-wrap paper can be ruled  
on both sides with equal lines by the use  
of a single rule, 144 hours,  
against 12 hours on a ruling-machine  
with steam power, a rate of over 12 to  
1 in favor of the modern method. This  
hundred yards of single-wrap paper with  
faint lines on both sides, required 4,000  
hours under the old method of a ruler  
and a spirit level under the modern  
method with a ruling-machine, the work  
is accomplished in two hours and forty-  
five minutes, a rate of 1,300 to 1 in favor  
of the modern method.

### An Electric Hotel

In the Boulevard des Halles, one of the most elegant streets of the French metropolis, there is a marvelous hotel. It is called "La Maison Electrique" and is the result of the genius of its proprietor, Mr. George Knapp. It has the unique quality of not using servants of any kind. From porter, bell-boy, chambermaid, and waiters to bookkeeper all the work done and all the calls are answered by electrically operated machinery.

On getting out of his motor at the door, the arrival puts his foot on a non-slip carpet which carries him to the hotel office. Here, a button is pressed and he is given a smog-free combination which opens his room. His baggage is taken to his room by an elevator and is dumped into a position in his closet.

The traveler ascends in an elevator which is furnished with a series of buttons containing the numbers on the various floors; he presses the one which corresponds with the number of his room and the elevator stops to let him out.

This hotel has an Eot staircase whatever. Everything is rubber elevator, moving platforms, elevators and the person who gets into one or finds himself standing upon the other has not in more solid beds in the city.

Each room is furnished with heat-closets, and by pressing the necessary button, cold or hot water comes out of the pipes. Coffee and milk, for example, can be had by pressing the button which has written over it the words "Light breakfast" "Coffee and milk" "Wine" "Beer" "Breakfast" "Meat" "Bread" etc. By pressing the "Door" button a small apparatus in which is marked the exact time of day. When a meal is ordered in this manner a door under the window opens immediately and a table is pushed forward with a tray on it containing the desired supply.

There are telephones, electric light, electric appliances for bath and massage, electric-lighters, etc.

Use any other and water in the dining-room, and "tips" required. The guest starts himself at a table, takes up the bill of fare, writes his order with a electric pen, finds at the end of the order a receipt automatically to the kitchen in the basement, where the order is filled. The electric light, electric buttons and the clock. The dishes are sent up to the guest by a dumbwaiter which buttons, and he can order to go to another button to have everything deposited in order before him.

And, to top this off, there is a piano in the room that will play for him any tune he desires.

### The Chinese "Boy"

"Cute" "boy" or "wanton" has his virtues—but drawbacks. In appearance, they are not perhaps enough. True, the small boy has been created by nature half of their number at least still stick to the old-fashioned type. Not has the Chinese matter come up to the modern civilization of his Occidental brother. The usual costume consists of a long blue robe open at the side and belted at the neck and wrist by a thin white sash; the whole worn over a blue tunic that fits at the waist. The feet are shod with slip-soled shoes which laste the "boy" to slip easily and silently across tables and along corridors, on the carpet.

These "boys" are born observers, and learn the few Occidental needs which they have learned by heart, and would not let them for their duties, or anything like it, in hotels. They make of their business in fact, to let themselves in their clients, and when a visitor has been attracted by a certain "boy" for several days, the latter begins to understand his habits and anticipate his wishes. Of his readiness in this respect some amusing stories are told. Thus, a guest at a Peking hotel wished to obtain a new coat that he might make some leisure when the host had died. Various he tried in English and French to make his wish known to his Chinese attendant. At length, as a last resource, he drew a picture of the coat, which, with his leaves, he colored in appropriate red and green. The boy, delighted, ran off and came back presently with a rich, in velvet, brown, green, and red robe and shaped long. However, the boy had possibly thought with a error in one the English did not satisfy.

Chinese servants are the despots of household. They are the backbone of the form part of an official system. A boy who considers he has been roughly dealt with from a foreign lord, and who has his fellow servants, and the obedient, believed in placed under a boss. In that situation, which is not very pleasant, a man's nerves-faded in a moment. It happens, therefore, at times, that an

### Killed by Light

Those who have studied the strange incidents of the Munich Case, in Kentucky say that the celebrated blind boy from that town, when placed in illuminated places, was not only killed, but also injured. It is believed that light is deadly fatal to them, for they seem to die if they are in brightly lighted places. The accident of light seems to be a great characteristic of the albinos (white) people in the great world. The albinos are those who are born with the eyes closed to avoid the light and animals from the water of the river hiding under a great stone, or in a hole, or in a microscope. It is thought that the light is their enemy in some manner perceived through the sense of touch.

**The Beaver as Conservationist**

The Northwest, particularly in Montana, tell how the busy little dam-builder served as a conservationist in the pioneer days of the western trail. The beaver was, indeed, so highly esteemed that, it is said, no rancher would be contented to let his beaver be shot in his herd, so to save the life of a single beaver.

Everybody knows that the beavers build dams. These they construct to protect against hunger in the winter by storing everything in piles of sticks as food has lost its sap and nutritious qualities. The beaver subsists on the bark of aspen, cottonwood, alder, willow, and other selected herbs, and it is of service to him as food these herbs would be kept fresh and full of life.

The beaver's instinct informs him that this can be done by keeping them submerged in water, and so he dams the shallow currents of streams so that the collected water above the dam will form a deep pool and overflow his store of shrubs and limbs, thus keeping them fresh and "suppy," they being driven into the soft bottom of the pond. The water, little creature, is fully aware that he must anchor them there upright and keep them intact until they are needed for use by the colony's consumption.

This remarkable instinct of the beaver interested the ranchmen, since water is a constant necessity on the western trails. In the dry climate of Montana, in the old days there were very few beavers in Montana, thus rayvater who he the country, he built up their name wherever they might be; they caused the water-supply in that region to be hoarded as they would be in other ways, and at these days storage dams and irrigating operations had not been adopted.

It is interesting to note that by the beavers just settled the cattlemen, and so, while the other game and far-ranging animals were being exterminated by the beaver, he assured of the friendship and protection of the ranchman so far as it was in their power. The cattlemen, in return, were assured, to be aware of this fact, for in the range country they carried to their industrial operations livestock, in close proximity to human habitations. Old ranchmen have watched colonies of beavers by the hour, in their work of constructing dams. No one has ever not enjoyed this sight can form any conception of the amazing genius for engineering that guides this animal in its toil.

In choosing a place for the building of a dam across a stream beaver first considers the condition of the current. If it is sluggish the dam will be thrown straight across by the beaver, and the current he rapid the dam is built on a curve. A soft-bottom pool is always chosen. The timber for the dam are cut by the beaver at some point up the stream, tops of the proper size and slender saplings being felled by them. The material for the dam is cut in the desired lengths, and floated down to the site of the dam by the members of the colony set to the accomplishment of that task.

The engineers and construction take the timber as they come down and utilize them without a moment's delay. A beaver is not able to stay under water for a single evening five minutes, and old and experienced dam-builder will select a piece of timber that has been cut for the purpose, dive to the bottom, and select a few skillful manipulative animals to man it. It is difficult and sold on the muddy bottom. The laborer, however, is not so much beneath the surface. In an incredibly brief space of time he will have set a row of three timbers in place, and he will branch down crosswise against the planted stakes or piles and before them by weaving the flexible branches to and out among them.

Others are busy carrying mortar made of mud and heavy twigs, and are headed to the proper position and quality for use, with which they plaster over the crevices and fill the holes, utilizing their long, taper-like tails in the process in a manner that would make a plasterer envious.

**How It Feels To Be Shot**

"I was shot in Cuba in '94," says a well-known sportsman, "and I don't know if for a while. It was not of course, a pleasant sensation. It was as if the bullet had struck me, and when the skin is broken, it was nothing in back a man does. I know of no other description of it, with 'twice when a man did not know he was shot until somebody showed him the blood flowing down his shirt or trousers." A similar testimony is afforded by an army surgeon, who has written for many years. The treated army gun-shot wounds

during his time and was himself shot, a double expert opinion. "A blow ball passed through my left leg at Nishik," says this surgeon, "and I felt the ball go through the skin, but it gave no sensation in passing through the muscles. That, of course, is an accurate statement, and patients would not believe it, unless they saw the skin as compared with the muscles. The ball passed almost entirely through the muscles, but it was not until some time later, but I suffered almost no inconvenience."

The kind of groove, meeting, as any wound of the kind will, but I should imagine that the bullet now in my world must have been treated and both very the usual bullet enters the flesh very readily.

There is a great deal of misconception as to the intensity of the pain caused by the entrance into the human body of various objects. Many persons fancy that if a man is shot at all he must therefore suffer intensely. The reverse is true. A slight scratch, or a mere abrasion of the skin, is sometimes far more painful than a wound caused by the entrance of a bullet directly into the muscles or even into a bone. The skin is filled with nerves and when any of them are torn by the ball the pain is extreme. If the groove is directly into the skin into the body, the only nerves disturbed are those in the comparatively small space of the skin, and therefore they are few and far between. The nerves of the skin carry the sensation of pain to the brain. In this case, the pain is not so much the pain experienced in the sensation of an arm or a leg is sensation when the skin is cut, and the pain is not so much the pain experienced in the sensation of the leg, in which all the pain is popularly supposed to be centered, amount to little in comparison.

**The Usefulness of the Tool**

Formerly the tool was considered a useless article, but in our day its utility has been more and more appreciated, and its great value to the gambler has been fully established. Inasmuch as the tool contains many species of insects, we should cultivate its utility.

Every fully housewife details the work made and other matters. For or three domesticated kinds, it is said, will keep any pestiferous class of these and are really more desirable as pests than ants, since they do not enter upon the rights of man as do other flies. The tool is possessed of a kind and retiring disposition, and they are found in nearly every place, but under dark treatment becoming quite tame.

Many instances might be cited of pest locusts ravaging several years in a family and doing most valuable services with no other compensation than that of immunity from preventive. All that is necessary to secure the co-operation of the locust, however, is to provide it with cool and soft retreats by day and convenient access to water. It will then go forth to perform the duties of its natural duty without money and without price.

In Europe locusts are carried to the cities and are purchased by the horticulturists, who by their aid are enabled to keep in check the multiplication of the locusts that prey upon their fruit flowers, etc.

No one can observe the anatomy of the tool without being struck by its perfect adaptation to its sphere. Its tongue, which is capable of great elongation, is attached to the under portion of the lower jaw. Its feet end when the tool is in repose, reaching down to the border of the stomach.

**The Oldest Bank**

It is thought that the oldest bank in the world is the Palazzo San Giorgio in the Piazza S. Marco in Venice. This building has played an important role in the history of the Italian city. It was built in the year 1062 by order of the Venetian Republic, and was the first bank of the Republic of Venice, and also serving as his residence, was the headquarters of the Venetian Republic.

It is held that our modern system of banking sprang from this Venetian edifice. The Venetian Republic, the Venetian Republic, was the first "limited liability company." The architect of the Venetian Republic was the Venetian Republic. Although its architecture has undergone a number of changes, the locale still reveals fragments of the Venetian Republic. The Venetian Republic was the first Venetian Republic, and its wisdom formed of little philosophy are revealingly attractive.

# HARPER'S WEEKLY

A Journal of Civilization

EDITED BY GEORGE HARVEY

WEEK ENDING SATURDAY, MAY 31, 1913

25 Cents a Copy  
\$1.00 a Year

## To Our Readers

The following announcement appeared in the newspapers last week:

HARPER & BROTHERS announced yesterday that they had sold HARPER'S WEEKLY to Mr. NORMAN HARVEY and associates.

We sold the WEEKLY," said GEORGE HARVEY, president of Harper & Brothers, "for the same reason that we sold the BAZAAR. It was losing money and had been for some time. We had a good offer from good people and accepted it. A periodical dealing chiefly with public affairs is necessarily much in evidence, but as a matter of fact the WEEKLY brought in hardly one-tenth of the gross revenue of the house.

"Our experience is that too many periodicals get in the hands of the HARPER & BROTHERS, and the NEW YORK AMERICAN REVIEW, both of which are in progress, are all we need and all we can publish advantageously in conjunction with our book business. I shall transfer my own editorial work from HARPER'S WEEKLY to THE NEW YORK AMERICAN REVIEW, beginning a series of articles in the July number and inaugurating a complete editorial department, 'comments' included, in the autumn.

"I know nothing of Mr. HARVEY'S plans and policies except that he and his associates are quite as friendly to the WILSON administration as I am. Mr. HARVEY'S reputation as an editor is firmly established, and there is no reason to doubt that he will make a notable success of his new venture."

We were astonished some two years ago to find that the power thought to do, when called upon and having nothing in particular to say, is to write a public law, and sit down. That is what we intended to do in this instance. There is really nothing much to add to the brief statement quoted above. The whole story is there. Nevertheless, we feel impelled by a simple circumstance to disregard the mere position for this one. That circumstance is the curious intimacy which has grown up between our readers and ourselves during the past few years and which is illustrated by some letters which we print upon another page. We have received many more, but cannot publish all of them, because, if we should, there would be little room left for other things in this number. It is this interesting and frankly gratifying fact that induces us to add a few words, not for the general public at all, but just among ourselves.

When we said that this journal has been doing money for some time we might have spoken more explicitly and declared truthfully that its publication has been profitable to the HARPER & BROTHERS trust. It is in this interesting and frankly gratifying fact that induces us to add a few words, not for the general public at all, but just among ourselves.

When we said that this journal has been doing money for some time we might have spoken more explicitly and declared truthfully that its publication has been profitable to the HARPER & BROTHERS trust. It is in this interesting and frankly gratifying fact that induces us to add a few words, not for the general public at all, but just among ourselves.

eyes have always been turned forward, never backward. The dominant issue thirty years ago was civil-service reform; in recent years it has been tariff reform. The WEEKLY has been a staunch and persistent advocate, even leader, of both great movements.

The change has been one of method seemingly enforced by varying currents of public demand. Would people read even Mr. CURTIS'S scholarly leading articles to-day? That is, would a sufficient number of persons put up ten cents a week for them to make the WEEKLY pay? We doubt it. It is the idea of a *tabula rasa* for us, for we have less than twenty long editorial on civil-service reform in thirty successive issues, and very little else. They were sound, cogent articles and, of course, admirably written, but how would they take on the newsstands in this hurrying age? How many wayfarers would buy them in preference to some one of the great number of five-cent, entertaining, and finely illustrated magazines? Not many, we fear.

Newspapers naturally respond most quickly to the changing spirit of the times and they abandoned the creditable leading article long ago. This still held vague in a weekly journal of today even if done with conscientious grace and skill, but it, sufficient reason to make the paper paid. If so, why, in the inevitable searching for an excuse to periodical prosperity, has not somebody tried it? No, there is nothing in that. The most successful ten-cent weekly is *Life*, which is crisp as a doughnut and as full of spice and humor as a cocky. Some publisher might venture to put over a magazine written by a *Journal* America, but our best bet would be on *Masters and Mitchell*.

Since we are talking among ourselves, it is not unfitting to note that some complain that our own pen is apt to bite occasionally when scratching what our discrimination friend, the Baltimore Sun, designates as "implied friendliness." Well, that, as the boy said to the quizzing and apprehensive audience, is the intention. We don't know of any way to make a point except to make it. And what is the sense of writing at all unless you can put things in such form that folks will read them? It sometimes happens, too, as you may have noticed, that spiritless language serves well as a covername for serious thought.

It is getting off to a dismal single track. What we were about to direct attention to is Brother BERRY LINDSEY O'BRIEN'S remark in the Boston Herald that we have been too conservative. Maybe so, but if so we didn't know it. True, we couldn't stand for all of Brother BARRY'S notions about free silver, government ownership, and the like, but we rebutted the commonest and spoke up, somewhat to our own discomfort, for a certain candidate for President, whom many regarded as radical, while those who now occupy the benches were still hiding in the cellar. We never thought much of direct election of Senators, and having in view some of the finished products, we don't now. The Initiative and referendum, too, we regard with advance in the light of the actual experience of the Adulterators some years before Mr. O'BRIEN, or whatever his name is, of Oregon, was here, but at the critical moment we skirted around the question as best we could and left it to Fate. As to the Constitution, representative government, maintenance of equal laws for all, a judiciary immune to popular caprice, and observance of established tradition with respect especially to a third term, we admit our invariability. We never have cared and don't now care a hot

about popular tendencies when they conflict with right tendencies, and we have never tried to win favor by catering to the prejudices of anybody or any number.

All this is quite true, but it is equally a fact that we have antagonized the prejudices of our immediate community over and over again with no little fervor. We do not resent being called a conservative. It is a very good title. But the truth is that we have less fair claim to it than to its antithesis. When OLIVER JOHNSON, while on the witness-stand in the BRITISH TRAVEL trial, was asked if he was not a Methodist, he replied, tartly, "Yes, I am, but I'm not a damned fool." That is the kind of a progressive we are.

This reminds us. We regret to see from the public prints that Brother HARVEY thought we mistook his real attitude in the statement printed above.

"Mr. HARVEY gained the idea that I was a Democrat," he said, "probably from the fact that I supported President WILSON in the last campaign, but so naive that I had supported BROWDER it would be as fair to call me an Independent Republican as to call me an Independent Democrat."

This was a misapprehension on Brother HARVEY'S part. We did not pain nor intend to express any such idea. One doesn't have to be a Democrat to support President WILSON. Quite the contrary, some say; it was Mr. WILSON himself who said recently in a public speech that he isn't the one who was taken in at the last election, or would be to the President himself, and his associates, as friendly to the WILSON administration "as we are—which is going some, we admit, but in nevertheless a proposition whose verity we feel to be unimpeachable. Of course, if Brother HARVEY persists to the contrary, we will take it back as a matter of course; but we should prefer to leave it to the President himself, agreeing in advance to abide by his decision.

Again we seem to be jumping the track. What about the pictures? Why don't they sell great numbers of papers as they do in England? The answer is the Sunday supplement, which is a full week closer to the event, and sufficiently satisfying, and costs the reader nothing extra. And the criticism? When NARY was making, he had the field wholly to himself. Now there are hundreds of clever chaps turning them out by the basket. And, believe us, if NARY were living to-day he couldn't touch a fringe of the public fancy in competition with WHELAN or O'CONNOR or BROWN or PURVIS or KEMMEL or COLEMAN or BOWMAN or HANCOCK or KENNEDY or BARNETT or McCURRIGAN, or any one of a score of others. The chief requirement of the public now is the very humor which NARY lacked.

So far as text is concerned, we have only this to say: If there are more competent writers in their respective lines than our regular contributors, supplied by F. M. GARDNER, WILLIAM GARDNER, HENRY LAWSON, COLLIER WILSON, STEVEN HARVEY, A. MARSHALL LOW, LAWRENCE GILMAN, WILLIAM DODDS, F. M. O'NEIL, and FRANKLIN ENGLISH, then we wish that, for our own delinquency, they would get busy. They certainly are not in evidence elsewhere.

There remains one other phase—that of duty to reader public—on which, fortunately, upon that score we have no qualms. NORMAN HARVEY has character, ability, and capacity. Speaking for the House of HARPER, we declare unreservedly

that we know of no living publicist to whose keeping we could consign the fine traditions of the famous old game with fuller confidence that they will be maintained upon the highest standard. It is difficult to see how he can fail to make the better use of his career, and his published programme and doesn't divert too large a portion of his energies to surreptitious politics.

As for ourselves, we feel no particular call to save the country now, anyway. It is in good hands. Mr. Wilson is making a first-class President. Everybody says so. The end it is so. We have handled the so-called jobber business, by saying nothing of his unacceptably equitable assessment of the tariff treasure, is worth all it cost in all ways to nominate and elect him. We still live in hope that he will not sign the Governor's Exemption bill, but if he does we shall derive little comfort from being freed from the duty of saying what we shall think of his act. With Mr. WILSON in the White House most of the time; with Mr. MARRIAGE silenced in the Senate; with Mr. HAYES on the stump guaranteeing peace, and Mr. MERRILL in the papers occupying property; with Secretary JOHNSON's floating demagogues; the seas of our country with Messrs. BLOOMFIELD, BELZAN, and HAYES; a primary from the same platform for some kind of a secretary law that differs from some other kind, we perceive no cause whatever for apprehension of failure of popular government.

Then, too, in a very short while—that is to say, in October or November—we shall receive what we suppose that may then exist by resuming these hostile discussions in *The North American Review*, contributing a few special thoughts to that venerable periodical unceasably. So it will all come about naturally and happily, to the end that, about the time you return from your holiday, you will probably be asked whether Harrison holds the administration's hand in the clouds, and as, as usual, trying to keep its feet on earth—a fair division of labor, surely, which should redound to the advantage and satisfaction of all.

We had some other things in mind to say, but we forget what they were. Perhaps it is just as well. We do not wish to treat this review any more as confidential, because it is unprofessional for an editor to admit that he is ever in the wrong. But, still between ourselves, if you should happen to recall any things we have said that struck you as being unjust or unfair, please try to forget them, and remember only the good things we have had.

And, as good folks, with the most cordial and sincere good wishes for the growth in power and prosperity which we know our successor will deserve, and with hearty appreciation of your many kind messages to ourselves, good-by!

#### Why Not?

"I believe there will be an war while I am Secretary of State, and I believe there will be no war so long as I live," said Mr. HAYES. May this elegant opinion live in me more than a hundred—Philadelphia Public Ledger.

And continue to be a candidate!

#### As to Primaries

Governor SIMMONS's spectacular fight for his primary law will at least, we trust, make a little plainer to New York voters what the fight is about. Apparently a good many people, including the Governor, regard it simply as a fight between him and his friends, as the friends of Mr. MERRITT and Mr. BURTON and their friends, on the other hand. If that were the case, there would probably be a mild preference for SULLIVAN. But that is not the case.

The real issue, and the one to which conscientious voters and legislators must address themselves, is not one of personalities at all. It is a question of the best way to nominate candidates for various public offices. More specifically, it is a question of how far the primary plan can with real benefit to the cause of good government be substituted for the plan of caucuses and conventions.

Not only is this true, but we think the people themselves understand it rather better than either the good or the bad politicians. If they had not understood it some years ago, and had taken the thing simply as a contest between a man like HAYES and men like BURTON and MERRITT, they would then have decided in HAYES's favor. But there were shrewd people who could not see their way to accept Governor HAYES's plan. There are shrewd people now who have doubts about Governor SULLIVAN's plan.

There is, we believe, a predominant sentiment

for using the primary principle as much as experience and common sense justify our using it. But there is also a feeling that the primary principle has its limitations. It seems injudicious to limit the popular choice to men willing to go out and hustle for nomination; it does not seem to secure the interest it should secure, or evoke a full expression of the popular will; it seems to give an advantage to candidates rich enough to make expensive campaigns; it clearly inhibits such debate and discussion as caucuses and conventions permit.

We by no means take the position that for these reasons the voters of New York should reject the primary plan altogether. We are, however, of opinion that they are justified in hoping for a plan of nomination which shall combine the merits of that plan with such advantages of the old plan as can be with reasonable ingenuity retained.

#### And the Seven Wise Men

The Vice-President, in replying to Colonel HAYES, who detected something decidedly amissible in the "warfare" waged by a "Prestigious" against the imminent danger of No-tuition, protests that "if anybody will produce a public reference of ideas for the more equitable distribution of our net worth except by the inheritance tax, I will go to Wall Street and personally apologize."—Milwaukee Leader.

We were not aware that Wall Street deals in inheritances or assets special consideration on any account.

How would a tax of \$74,000,000 on the estate of his recent host, Mr. VANCUT AGEN, leaving to his heirs a maximum of \$100,000, strike Mr. MURKHAFF?

#### By All Means

We wish to detect a sort of surprise in the newspaper reports to the effect that certain Republicans interested in the matter have been consulted by the Democrats who are trying to force a bill on currency and banking. Secretary McALLEN, we are told, has had talks with such men as Senators BURTON and WYMAN; the President himself has had a talk with A. PERRY ANDERSON, Republican, who has studied monetary questions all his life, and who, because of his interest in these and knowledge of them, was special assistant to the ALDEN B. COMMISSION.

Whereupon we are apparently expected to raise our brows!

In HAYES's name, why? If there is any power on earth why this matter of reforming our financial system should be made a party question, we have been unable to discover it. If anybody thinks one of the parties can earn anything by taking a distinctly party stand on it, let him read the various platform planks of last year on the subject and ask himself which is the most fattuous. In our own judgment, we all are bad, the worst is the worst simply because it tries the hardest to make the thing a party question.

If, to be more practical, any competent advice is to be rejected or avoided from a narrow lapse of partisanship, then somebody is looking in vain for a President WILSON who, in Mr. ANDERSON have done nothing better than to show the country that in this extremely important matter they are ready to learn all they can from any trustworthy source whatsoever. We are glad to believe that Senator OWEN and Representative GILMAN have shown the same admirable disposition.

#### A Wise Policy

If President WILSON has any idea of fulfilling his pledge that the "affairs of his administration would be given the fullest publicity" it seems about time for him to open up his executive secretary of the Treasury—Philadelphia Inquirer.

We dissent, Mr. McALLEN is at his best when absolutely silent.

#### The House Committee

No-doubt, since the bitter and dramatic fight in which the Speaker of the House of Representatives had the power to appoint committees, the public's interest in committee assignments seems to have lagged. Nothing of the sort has happened in the House itself, however. Interest there is, if anything, lower than ever.

And incidentally, for the committee, and particularly their chairman, probably have more power and more independence than before the change, since they no longer look to any man with the reverse of a clemency they now feel toward the Speaker. The Ways and Means Committee, which now names the others, subject to the approval of a party caucus only, can hardly have the continuing in-

fluence over them which formerly the Speaker could and doubtless often did exercise.

So the job of Mr. WILSON's side and his associates since they turned back the month has been anything but unprofitable; it has been hardly second to the tariff job itself. We wish the public had been more mindful of it and had made its duties more strongly felt.

For undoubtedly one of the public's duties is to see its own interests better protected by putting the great appropriations committees under the control of the public. It has been the pro-union, honest enough and intelligent enough to insist not merely on economy, but on spending the nation's money for national purposes, in preference of local plans, instead of wasting it on unproductive enterprises and using it to gratify local selfishness and help personal ambitions. For that is one thing the Ways and Means Committee has done so far, without waiting for our budget plan whatever. As the rules now are, the House almost never alters substantially—it does not even really debate intelligently—bills introduced by the majorities on these committees. The rules should be altered, but meanwhile, we are responsible if, by these majorities, we have not done the best we can. The right kind of men, we believe, be found—though the other kind may be more in evidence. The responsibility of making the choice is greater, and not less, now that a committee has it. The need of watching the committee and holding it to its responsibility is also greater; for by one man or a small number of men, a lot of money can be lost, for instance, if this committee retains in power the man responsible for the unproductively bad pork-barrel bills—particularly the Public Buildings bill and the Rivers and Harbors bill—that passed at the recent short session.

The pro-union majority of the power of committees is the chief fact in the recent development of representative government. It is a natural, perhaps inevitable, development; but it imposes a difficult vigilance on self-governing peoples and communities.

#### The Second Look

Enough in its kind," said the President, "that could compromise when I take take my position. I am not looking for or accepting compromise."—The World.

From which we would think that the repeated message to the Jersey legislators about jury reform was a base fabrication. Go to it, TURKEY!

#### A State's Rights in Interstate Commerce

North Carolina is making a rather interesting chapter to the history of our American effort to regulate railroads. She is also revealing, or at any rate presenting with unexampled clearness, one of the main difficulties we have in dealing with the present system, particularly as to our federal form of government.

Several years ago she exercised pretty fully and radically her power of control over inter-state commerce. After a very brief resistance, the railroads yielded and submitted to her demands, including a two-cents rate for passengers. She is now trying to use her process as a state to secure something clearly in the domain of interstate commerce. She holds that the railroads which enter her limits are doing her an injury and injustice in the matter of freight-rates to and from points without her limits, and she has undertaken to make them treat her better.

More practically, of course, she is an old one, is substantially this: that the railroads give much better interstate rates to points in neighboring states, particularly Virginia, than to points in North Carolina, thereby putting North Carolina merchants and manufacturers, and other classes as well, at a great disadvantage in competition with those of Virginia. The cost of living in North Carolina is general. Efforts to obtain relief through the Interstate Commerce Commission having failed almost uniformly, the state has with extraordinary unanimity—not the state government alone, but the people themselves, by mass-meetings, boards of trade, state-wide associations, and the like—set its face to fight what it considers an intolerable imposition.

The merits of North Carolina's contention cannot, of course, be passed on without discussing a great mass of facts. Her case, however, seems a fairly strong one from the figures given by her own statistics. It is strongly in favor of the railroads, even from a strictly economic point of view, and the real total earnings. But that is not, anyhow, the real issue of the matter. Last winter the legislature named a commission, including the Governor, to confer with the railroads and demand

recess. The conferees, having accomplished nothing, were adjourned. Governor CHASE is now universally expected to call a special session of the legislature to take action on the question. What action will it take? What effect will the action call take? Herein lies the interest of the country for the time being.

As the railroads were unimpaired, and as so far as specific programs is concerned by any of the state's champions, they say perhaps for the moment look a little faded. The unanimous resolve "to fight" may seem rather fatuous. But Governor CHASE is a responsible sort of person, and he and others certainly assert that there is a way to fight the fight effectively. The natural conjecture is that they have worked out modes of retaliation. In that case the fight may be not only real, but decidedly nasty.

Meanwhile, here is the general problem for us all to consider. Interstate rates unambiguously may discriminate for or against a particular state's interests. Our regulation of railroads will remain very seriously defective until the discrimination can be strictly prevented without any fighting at all.

#### Query

President WILSON has had difficulty in obtaining the type of man he desires to carry out his policies in the Philippines. The accounts for the delay in appointing a Government-General and in filling other vacancies in the Philippine service.—*The Herald.*

Was not one entire of delay Secretary Garrison's flat notice to the President that if he should appoint Mr. DAVIS Government-General, as promised, he might simultaneously send in the name of a new Secretary of War?

#### A Case of Judicial Realism

In the WEEKLY for May 10th there was a paragraph that began as follows:

"Woman voters," says the *Evening Post*, "were chiefly responsible for recalling the San Francisco reform judge, CHARLES L. WELLES, and electing WALTER CURRY a lawyer, as he explained that WELLES had a propensity to accept low bail bonds in criminal cases and had several times released bonds fixed by other judges in cases of crimes committed by women. HERBERT, favored of white slavery, got his bond so reduced by WELLES and fled. And then WELLES was recalled."

We have a letter from a highly responsible correspondent in San Francisco who says this statement needs a note; and he explains as follows: "WELLES was recalled for the reason that he accepted \$1,000 cash bail from HERBERT, accused, not of white slavery, but of indecent assault; but that WELLES was not a joker with a propensity to accept low bail, and that his error in this case was such a one as any joker would have been likely to commit under the circumstances who he explains."

Our correspondent says that WELLES's recall was a great injustice, brought about by a clash of women and the newspapers; and that as a consequence of it "committing magistrates in San Francisco have apparently lost all discretion," and "every person charged with any crime in which a woman is concerned is held to answer with a high bail without regard to the character of the evidence against him." He goes on to give an instance of the very serious effect of this precipitation of recall on the administration of justice.

We are impressed with our correspondent's letter and obliged to him for speaking up.

#### Wine and Doctors

Wine and doctors. PAUL shared his friends that he would not wear knee-breeches. He is willing to go broke serving his country, but he draws the line at pants.—*Standard Press.*

Knee-breeches are not pants. We don't believe Mr. PAUL said it anyway, he has too much sense not to know that when simplicity becomes ostentation it loses its virtue. The Doctor would have done much better to have served water at his dinner without comment. Grape juice was a feeble compromise, and indigestible at that. The matter would have attracted half as much attention if Mr. HAYES had made his speech. Perhaps, however, that is not what he wanted.

As for Mr. PAUL, we think that the *Journal* will explain of what he means, but it is only fair to assume that as a guest and a gentleman he will conform to the customs of the court to which he is accredited.

#### We Advise Diverse Proceedings

We are not surprised to read in the *Post* that Brother BOWEN and the *Outlook* are likely soon to part company. We doubt, though, that the cause of various "shakes" to compensation. The *Outlook* has paid its Colonel very well for the

work he has done, and Mr. BOWEN is no money-grubber. The truth is that it was a misalliance from the start and doomed to failure. Years of patient, conscientious effort on the part of Dr. AMORY, Mr. MANN, and their associates had built up for the *Outlook* one of the best assets any paper had in the public's faith in its sincerity and sense of fairness. It was never strong, but it was pretty generally sound, and its moderation and prudent expression were particularly appealing to the average run of people who like to have their prejudices taken seriously. So the *Outlook* prospered and wielded a steadily growing influence.

All this changed the minute the Colonel took a hand. For a time all went well. His editorial was a fine advertisement and attracted many new readers. But then two men did a horse one must ride behind, and it wasn't long before the *Outlook* found itself sitting on the pillow. Mr. MANN couldn't stand it, and went away, and Dr. AMORY's obsession became a joke. When the political break came, the paper had to close its doors, leaving its noble journal and a personal organ—and the Colonel carried the day, as any one could have foreseen.

Then it transpired very quickly that a large proportion of the *Outlook's* old readers were admirers of the Republican peculiarities who had a strong leaning to Mr. TART. We guess the immediate break, let him admit advantage and the campaign; looked, it wouldn't be surprising if quite a number of papers were stopped.

What to do with WILSON after election must have caused some anxious thinking. It stood for practically everything the *Outlook* had been advertising for years, but the Colonel was still in political power to do it. Struggle seemed to be the first answer; but that didn't work very well; so gradually the paper has swung around to the support of the administration, leaving the Colonel free only to write of art exhibitions and other things that he knows little or nothing about. Of course, he doesn't earn his high salary at that. How could he? Neither, we imagine, is he particularly bright in his present position.

One or the other should go to Reno forthwith. The sooner the divorce takes place the better it will be for all concerned.

#### There Are Others

Mr. PAUL, the publisher of books and periodicals, is WOODROW WILSON's publisher. And WOODROW WILSON's Ambassador to England is Mr. PAUL, who is Mr. WILSON's publisher.—*The Journal.*

Mr. WILSON has several publishers.

#### Friedman and Human Nature

It is only natural if people have got to the point where they prefer to bear no more of the FRIEDMAN controversy. Indeed, there is a sort of instinctive self-protection in us that keeps us from dwelling too long on episodes revealing human nature at its worst. And this one is of that character.

One can so consider it even if one still tries, with Dr. EMBURY and our own government experts, to suspend final judgment on the scientific aspect of the matter until we have exhausted every device to determine whether humanity has anything to learn from FRIEDMAN's alleged discovery. For the discovery has been complete and Dr. FRIEDMAN has not been the only one. While he answered, the sensational press co-operated. Jealousy and rivalry in others of his profession helped to win his sympathy. Now that he has capitalized his modestly self-discovery, and drops all pretense of philanthropy and public-spiritedly making money, the men associated with him as aids are as openly trying to follow his lead. Government is laughed at, science takes a back seat, and unfortunate man, as usual, pays to learn whether the relief held out to it is real.

Yes, it is an unpleasant spectacle. But maybe it's best to face it with clear eyes. Since philanthropist cannot deal equitably with the obstacles forever presented by the ugly face of this kind of selfishness. For it is always with us, active and persistent and often clever. In respect of this particular problem of tuberculosis, since philanthropist cannot shut its eyes to such truths as that there are always phlegmatics who work for money, always self-interest and ostentation and never-satisfied consumers are heartily commended, that whole community are really sustained by the money of consumers and their families treat them like parasites.

The best there is in human nature must simply, in this as in all things, face the worst there is and prevail in spite of it. On the whole, and in the main it does so well. Most of the well-known agencies for fighting tuberculosis are entirely trustworthy;

one can support them confidently. Most of the well-known sanitarians are competently directed. There are physicians who give their lives to helping and healing, and not to any self-seeking, and nurses spite as conspirators.

The FRIEDMAN episode may well inspire reaction, and we trust it will have something to say to lawmakers, but it should increase instead of lessen support for the true-hearted fighters of the great white plague.

#### A Slip of Memory

Our good friend, WALTER A. PAUL,—*Edna's.*

HE'S WALTER H. JOHN.

#### One Step Further, Professor

Professor ERNEST W. BROWDER, of the University of Pennsylvania, reports to the *Catholic Intelligencer* that he has discovered the blood characteristics of various human races, and that as soon as he has completed his experiments "he will be able to differentiate between the blood of a Chinese, Indian, negro, and other races so as to make his discovery of absolute value in a diagnostic way for medico-legal work."

That is nice, certainly; though perhaps he will cause a stir if he thinks because he is what he is. He is a socialist or an anti; or a Bull Moose or a Democrat or an old-style Republican; or for direct primaries or against them; or in favor of orthodox, because he is so constituted. Certainly his constitution ought to be recorded in the globe's eye of his blood, and it ought to be possible to state it in his mind as he thought of new fields for "expert evidence" in the courts. But if Professor BROWDER would do something really useful, let him carry his researches enough further to enable him to detect a man's opinions by examining his blood. We all know that opinions, especially political opinions, are constitutional; and that a man thinks what he thinks because he is what he is. He is a socialist or an anti; or a Bull Moose or a Democrat or an old-style Republican; or for direct primaries or against them; or in favor of orthodox, because he is so constituted. Certainly his constitution ought to be recorded in the globe's eye of his blood, and it ought to be possible to state it in his mind as he thought of new fields for political purposes so that he can be counted at any time for or against any proposition, without bothering to read his pamphlets or make him vote. That would simplify life and government a good deal, and if any voter claimed to have changed his mind his blood could be re-examined.

#### Fashion Note

The fact is that any dress may be worn as to be immodest, and almost any dress may be worn so as to be modest. More depends on the wearer than on the thing worn.—*Morehouse Times.*

"And they were both asked and not answered," but later, about "the eyes of them both were opened and they knew that they were asked, and they were glad to leave together and made themselves absent."

That happened a long time ago, but there has been no change since except in the size and cut of the apron.

#### In the Cross Out of Date?

We log to call the attention of Brother WILLIAM HOWARD TURT, apostolic for the Unitarians, to the discovery of the Rev. EDWIN CURRIE, of the South Congregational (Unitarian) Church of Boston, that the religion of the cross is a failure.

Brother CURRIE seems to be in excellent standing as a Unitarian, and was a leading speaker at the anniversary-work meetings last week in Boston, which Brother TURT also attended. In his address on Monday, before the Unitarian Union, we find Brother CURRIE saying:

"The religion of the cross is an unfortunate post-mortem tradition. If the Great Master could have lived, he would have seen the darkness of superstition and the empty suffering. The religion of the cross does not save the world."

And again, on Friday, he said at another meeting:

"Instead of the cross I should like to see a white flag on the topmast of every Christian church."

How now, Brother TURT? Is that sound Unitarian doctrine? None of the brethren seemed to take an exception to Mr. CURRIE's declaration. How does it strike you? Should it be included as part of the basis of those high hopes you expressed the other day in Washington for the future prosperity of the Unitarian persuasion? Brother CURRIE seems all for the new deal. He says:

"We have passed the time when we can think with delight of the idealistic spiritual work which our ancestors nobly began."

Dear, dear! How like a Massachusetts Bull Moose talking about the Constitution!

# THE WASHINGTON ASTOR HOUSE

BY WILLIAM INGLIS

The Astor House as it appeared before the Civil War

Do you remember how the men of New Amsterdam loved the news of the death of their grim old persecutor, Peter Stuyvesant? Irving tells us, "As they were a serious, sober, and phlegmatic folk, but never less anxious to relax, nor less ready to meet, was now their duty to put a pebble pipe, and the big drop to stand down his cheek; while the multitude, with affectionate interest and melancholy sighs of the dead 'Well done—hardy Peter, but gone at last!' For Peter had long survived the evil day when his town passed into the possession of the hated English, and had remained his worthy successor, or country son—about St. Mark's Place to to-day—a steadfast, living protest against new people and new ways.

And so during the last generation has the grim old Astor House stood in silent protest against the new people and the new ways that have surged about its ancient gray stone walls. And now that the house has been reborn and the welcome passed that the gray house shall be destroyed, many an old New Yorker feels a twinge at his heart and realizes anew that nothing is permanent, that all is vanity and a passing show. Moreover, these ancient burghers of our day have taken so seriously the fate of the old hotel, that we are surprised to find the old hotel, built into an enormous and magnificent edifice and bequeathed its illustrious fate, that the infelix passer-by may have those for what they really are—and the keen-eyed, sixty-fourth old New York business men of tradition, but self-ordained old boys who deplore the passing of the old days and the old ways.

In the time of Handicapped Port the site of the hotel was furnished so nearly reclaimed from the forest that the Dutchmen never dreamed of using the actual plot on it, much less of the coming of the modern New York route of travel for millions of men which will soon pass under it. The advent of this highway that destroys the hotel, soon after our war of the Revolution killed King, who was to become our minister to the Court of St. James, had his Columbia homestead and garden on the spot where the hotel still remains. John Jacob Astor, the founder of the Astor family in America, bought the house and ground from Mr. King, and there entertained the authors and scholars and prominent men of his day. Here by fire he bought up the property around his garden, including the old Dutch farmstead, with its grange, which until he had acquired the entire block along Broadway between Vesey and Barclay streets.

New York's white marble City Hall had not then been built—while to the north side of rough brown stone, because in one lot the rubble on their way to the harbor would ever be a part of the site of the post office today was part of the city Commons. The neighborhood was doubtless open, so far as it was in existence. Fashionable folks were still living in lower William Street and its back street, facing the Battery. Many of the old Knickerbocker families who divided the dust and turmoil of the city streets were neighbors of Mr. Astor in his rural northern retreat. They were thrown into a gutter when he was reborn in 1823 that he was going to build on the

site of his home the grandest and finest hotel in America, if not in the world. They warned him of the folly of such a thing, inasmuch as few, if any, travelers would venture so far above the city proper. Possibly they had some inkling thought of preserving their suburban homes from the neo-Gothic iron walls of a hotel. But John Jacob Astor, with the keen vision of New York's future growth which carried him and his family over into the third and fourth generations, calmly and bravely proceeded with his plan.

The construction of the new hotel was laid amid much pomp and rejoicing at six o'clock in the morning of the Fourth of July, 1824. There was a parade of militia, and in the center was placed a silver model containing newspapers of the day before and a full-length portrait of Lafayette, America's great and good friend. The great blocks of granite that formed the walls of the monster six-story hotel were hoisted to their places by horse-power, for such a thing as a steam which was still wrapped in the mist of inventors' dreams. When, after three years' work and the expenditure of the gigantic sum of three hundred thousand dollars, the Astor House was actually opened, in 1828, all New York took part in the festivities. Mayor Cornelius W. Lawrence presided, and everybody who was anybody danced at the ball that evening.

The temptation to linger on this page among the memories that marked the little old New York of that day is very great indeed. There is a stables' brand that Dickens stood on the steps of the main entrance, and, looking across Broadway, saw wander-

The Astor House to-day

grewed Harry. "Call this a first-class hotel! True and so-called a day and in a few years it will prove that he could have had an endless ball of pie for breakfast at the Astor House, that most of all that a first-class hotel should be."

Perhaps it is when the old New Yorker with a palette and a masonry look looks at the facade of the early Astor House that he is most in danger of the big drop striding down his cheek. Look at one of the hills of fate of the morning hours, the days of better days, written tall on the Black Hills records, and the brass clapper slips carrying three days' loads of gold, how do any see ask? No, sir, a bill of fare; a list of food; none of your French confections. Here it is, in structure by the structure of the Astor House on the left; then a wrenning spring eagle above the Shield of the Nation, in the middle, and on the right a temple of Liberty, the Phrygian cap on a lofty staff beside it, with the rising sun gilding all. And, look you, the food items, under the title "Gardens of the Valley," excepting only the apple column, or one-third of the page, while the wise list fills the remaining two-thirds. "N. B.—Each waiter is provided with wine Card and French." There are no fewer than sixteen shelves, to begin with, closely followed by some (twenty-one) noble Madras. Let us draw the veil. Each sight is not for mere shallow connoisseurs, with their eyes on the Phrygian cap and their strolling ball canoe of South drenched in a flood of sun. First! And the food! Imagine the slight of the old New Yorker, who, after being by Gerard Leg of Port, Boston, Louis of Vral, Boston, Chelsea and Park, East River, Howard Kitchen, Changoe Faint and Rice Cakes Flavored With Lemons. Ah, me, those were giants in those days, men of old, men of reason! What, shall we light-hearted moderns regard the passing of the Astor House? Let us not be glad that our eyes shall no longer be wiled by the sight of the more fooling and small fountain of those departed, all-absorbing Gargantuan.

And, be it noted forever, to the immortal glory of John Jacob Astor and all the various men who kept the ancestral House, the bond and better were always of the best. Heaven will reward the host-keeper of this day who shall imitate their loyal guardianship of these days of old. And for the sake of a chapter let me say on the after of the old Astor my grateful recollection of one desert, the construction of which was almost crossing which seems I am ashamed to say I never knew. It appeared on the bill of fare under the simple title, "Soft Vanilla Custard." It never to fade in a plain fall glass, after like a lovely French vase. Its color was palest gold, constantly frothed with infinitesimal small mounds of nutmeg, and the ground was of a bright cream, white than ivory. In connection with the above, it is the fact that down the middle of the custard ran a line spine of ice, whence radiated they appeared that looked the pale, slowly melting, which seems I had six of them for dessert the first time—and stopped here only because I was no Grooms and one allowed me to have a little more.

But enough of such creature comforts. Let us glance at the historical associations of the old inn. If I were asked out of the Astor House, I might never again go to New York. I would thank Webster to a friend in 1849. And he meant it. For years after that Webster had kept Suite 11 for Mr. Webster's use, and had studiously refused to present any bill therefor. Somehow the solid old walls that are going to give the New York housekeepers the hardest job of their lives now is a species of Webster. During a span of years they abolished him whenever he visited New York. As for the other giants who frequented the house, the page has no space for them. Here Nathaniel Hawthorne and Washington Irving resorted and Edgar Allan Poe found his material for "Mosses from an Old Manse" in the appearance of the pretty girl who kept the cigar counter. Here came Alway King, Lydia Maria Child, Black Hawk, and the great and mighty British statesman; the Grand Duke Alexis of Russia, and the charming young Prince of Wales who was to become King Edward VII. Thereby was a great loss—indeed, if he had not the checker, most have gratified visiting his party on more banquets.

As for skeletons, the old house entertained hundreds of them from first to last. Here was the grand of his assassination in 1844, Pierce, Van Buren, Buchanan, Taylor, Seward, Choate, Douglas, and Jefferson Davis. There were many more names, and more than one addressed guests from the balcony over the Broadway entrance. The more repetition the grander the old House, in that it is enough to draw the season. It is all over, the old house is going; long live the new!

Abraham Lincoln addressing the people from the Astor House balcony, February 19, 1861  
From a contemporary issue of "Harper's Weekly"

ing pipe roofing and grunting among the rabbits. An early Victorian picture of America's splendid new hotel in winter shows Broadway deep in snow, full of passenger sleighs, each drawn by six or eight horses. One line of sleighs, according to the drawing plan, actually penetrated as far as Eighth Street into the frozen North. It is reported though this is mere legend that Dave Crockett, then who no mightier hunter ever lived, visited the little snow nest, just up at the Astor House. When he heard of the success of money John Jacob had taken out of his fur business he said, "I would like to hold it. He said: "Lead help the poor man and beaver! They must be used to being shot by now!"

And yet on the American plain—made and bulging in-filled—could find the plausibly at the Astor House for two dollars a day. It is a fact, indeed, that there is no doubt evidence that for this trifling sum the Astor guest had not only good food, but interior of fish, but it is revealed that when the illustrious Harry How, and his brave and agile company of New York fire-fighters to a congress at Philadelphia, he was not only pleased a spare breakfast of eggs, fish, beefsteak, and biscuits, and coffee by ordering an apple pie. The warden frankly predicted that there was no pie hot dinner-time. "A fish!"

The arrival of President-elect Abraham Lincoln at the Astor House in 1861

# THE GIANT OF PUGET SOUND

The Growth of Seattle  
Has Been Matched only by  
Her Industrial Development

Seattle's skyline as it appears from Elliott Bay

BY  
R. H. MATTISON

**H**ER natural advantages and resources attracted the first settlers to Seattle. The town was laid out and made for culture erected, including a block-house for protection against Indians. A sawmill was installed at the foot of Yesler Way near where the famous steam pile-lands today. Some "waggoners" from the eastern coast were trying to carry away her timber. This was the nucleus of a timber industry which places Washington, and especially the district tributary to Seattle, ahead of all the States of the Union today. The water of the Sound and the inland lakes discovered within a few miles of the settlement were creating wheat, salmon, trout and bass, and the cost of living was then, as now, a problem of minor consideration. In this manner also developed the industry of Paper Mould and Alaska, now valued at many millions each year and having headquarters in Seattle.

broads and brothers. Shoulder to shoulder in the ditch sold the men of Seattle, prominent banker and common laborer striving together to accomplish more work for their beloved city than the stockpiles and shovels against which they were pitted. Few men had become millionaires, others who occupied high places on the federal bench, and still others who today are leaders in the affairs of Seattle—allowing them, with the astute engineer, horse-bred lumberman, and seasoned Bowman, to start the first rail transportation for Seattle. The spirit in which they labored brought results, and seven transcontinental railroads now have their terminals in this port.

Water transportation grew apace with the development of the community. When the Hudson Bay trading-steamer *Beaver* made her infrequent visits to Seattle she signaled her arrival by firing a small cannon. This brought all the city's population hurrying to the water-front, and on Sundays depopulated the churches and forced the ministers to adjourn services until another day. Some fifty steamship lines now ply from Seattle to coastwise Alaska and (through ports).

Like many other famous cities, Seattle's structural growth was primarily due to the impetus of islands, which were first swept away 330,000 north of 320,000 south of 320,000, which were buried. A few days before the citizens had been told to send a large sum of money to the Johnson family, which lived in a man-movelling boat on the bay following the day they agreed not only to rebuild the city on more substantial and attractive lines than before, but also to forward from the first money raised the sum pledged to the Johnsons afterwards. Since the fire the construction of this city has kept it constantly in the public eye. The business streets with imposing office-buildings, one of the largest in the world, the engineering firm by which bills 300 feet high were born down and started away to fill in the lower places and create a level business district, the elaborate parks, thirty-eight in number and covered by thirty-one miles of level boulevard unapproached elsewhere in the world, the architectural triumph achieved in the schools, churches and other public buildings of Seattle—all have served as the best for many newspapers and magazines across the city, the greater than all those has been the great faculty of seeing the opportunity in its broadest light and making the most of it. A variety of accomplishments has crowned the world at frequent intervals in this city's progress.

In July, 1907, with the arrival in Seattle of the first gold from Alaska, the community was moved to grasp the significance of the discovery, and great were her strides in the next few years. The city now lacks a work's station on the coast, and the debt and celebrates the progress and prosperity of the community by sending between \$75,000 and \$100,000 in satisfaction with a "Pebble" the visitors from all parts of the United States.

The Alaska-Yukon-Pacific Exposition in Seattle in 1909 first brought the summer attractions of the Puget Sound country to the attention of the United States. As a result the heating, fishing and scenic lakes of Puget Sound, together with ideal summer climate, promise to create a holidayland for the tourists of the world who would escape the season's heat and dust.

The next opportunity and the greatest for Seattle is the Panama Canal, and to prepare for the development the city is spending \$20,000,000 on harbor improvements, including the construction of a new wharves and other structures, waterways, and canals, connecting the Sound with Lake Union and Lake Washington, and adding 125 miles of fresh-water drainage for navigating ships to the shore-line of salt-water frontage now available. Terminal facilities are being constructed on a smaller scale. Since it is realized that many of the Eastern lines of coasters will establish branch plants on the Pacific coast after the opening of the Canal, these terminal buildings under special supervision are designed to accommodate

the products of all sorts and sizes of industries, giving them rail and water transportation to every part of the country and world.

With the development of the state of Washington as an unrivalled wheat and apple producing section, the importance of Seattle as a market for these products was quickly discovered. The milling industry rapidly grew, until the city today manufactures more flour than any other Pacific coast city. Other lines of manufacture have developed and are springing into being with similar velocity, owing to the raw material being located in the vicinity of this city or the market for the product being found in Seattle or reached from this port more easily than from any other Pacific coast city. The fact that Seattle is the home port of the Great Circle Route, two days nearer the Orient than any other route, has given this city the advantage not only in marketing Northwest products, but in through shipments, such as cotton, farm implements, cloth, and other raw and manufactured products of the Atlantic and Central states.

The rapid advancement of Japan and the recent awakening of China, whose possibilities are stupendous, also shows that the Oriental market is only opening, while the Atlantic coast market will be unlocked for lumber, fish, and similar Puget Sound products with the completion of the tidewater waterway.

In addition, the city of Seattle, while arranging to attract here only the most desirable class of immigration, is preparing to place the immigrant on the fertile soil of western Washington, where he will become a producer. Working on this program are the schools, including the University of Washington, located at Seattle, which has more churches than schools, the New Chamber of Commerce, and the citizens at large, all of whom are vitally concerned for the future of their city. With an eye to the future, millions are being expended for additional park space, for children's playgrounds and field houses, for the extension of the municipal water-supply, pure as the glacial snows from which it springs, and for the development of every form of protection against disease which raged for Seattle at the International Congress on Hygiene and Demography in Washington, D. C. recently the award as the healthiest city in the world.

The city also has other superior claims, among them being that of possessing the cheapest electric

A part of Seattle's business district, with the Olympic Mountains in the background

As the fame of the Seattle settlement spread through the older towns of Oregon and California, adventuresome young Americans, realizing that here was a wonderful country, flocked to the Puget Sound district, and came, in addition to lumbering and fishing, the industry of farming began to be manifest. The rapid development of every line of industry in Seattle and the thrifty life that is a large measure to the fact that the citizens comprise today, and have since its inception consisted of the youth and energetic here and other sections. Actuated by the adventurous spirit of all pioneers, they have been drawn to Seattle as the Western outpost of opportunity and have given their brains and brains to build up a community destined, they feel, to be second to none in this or other countries.

No obstacle is permitted to interfere with this development. In 1850 an Indian springing down the settlers who occupied narrow lots into the block houses, where they were forced to watch in helpless rage the burning of their little homes and the destruction of their crops by the painted savages. With reinforcements from the camp of war Doctor the whites were finally able to quell the outbreak and the courageous American survivors again united their homes along the river, planted their fields, working and living together as one family until all could rest for themselves.

As the settlement grew until it reached Lake Washington on the east, thirty-five miles in length and five miles across, the news was one day brought to town that coal deposits had been discovered on the lake shore. Soon the district about Seattle was supplying the fires of the coast with fuel, and thus developed the great coal industry of this section. In the same manner, fifty years later, prospectors are today staking their life in this vicinity and in the Olympic Peninsula in search for all of a paraffin base which scientific interest is to be found there.

Water transportation was the only available means of conveying coal, fish, lumber, fruit, and vegetables from Seattle for many years. In 1852 the citizens learned, to their dismay, that a rival settlement had given great land grants to a transcontinental railroad and in return had designated as its terminus. On May 1, 1874, the men, women, and children of Seattle assembled at the mouth of the Duwamish River, flowing into Elliott Bay. While the men stripped off their coats and with an, sick and soon began the construction of a branch line to connect with a rival transcontinental railroad, the women dressed their aprons and prepared lunch for their

A view of Second Avenue, Seattle, with a forty-two-story building in the foreground

power and most complete and attractive street light of any city in this country. The largest lock outside the Panama Canal is being constructed by the government at an expense of \$2,275,000 in the Lake Washington Canal. In this manner the city is building along the most attractive and progressive lines possible. In 1911 the city paid about \$25,000 to a player of national fame for the preparation of a plan of Seattle providing for 1,000,000 citizens.

# DAIRYING IN THE PACIFIC NORTHWEST

Even climate, green grass, and pure water are just a few of the advantages of dairying on the Pacific slope

By  
E. A. STUART

**A**n average of ten dollars per month per cow, for every month in the year, is a conservative estimate of the yield in dairying in the state of Washington at the present time, working with a tremendous and ever-increasing demand for dairy products and a present output that can hardly be a fraction of this demand. The most ideal climatic and natural conditions, both to the west and east, combine to make the Pacific Northwest a real promised land for the coming dairyman.

While the far Western country, by reason of its newness and its advantages, is heralded as the land of agricultural opportunity, the splendid and unexplored lands for dairying in the states of Washington and Oregon have hardly been touched upon. The opportunity of securing speedy and ever-increasing profits from dairy cattle, and the ease and facility with which a money-making business may be built up, have hardly begun to engage the attention of the agricultural writers.

Despite the fact that there are rugged cattle from the North Pacific slope here have taken highest premiums, and regardless of the wonderful records in the production of milk, butter, and cheese, and the many other advantages of the Northwest as a place in which to raise very large profits.

When one considers that this is not a new country, but that it has behind it years of wonderful records in the production of milk, butter, and cheese, and when one realizes the possibilities in quality and quantity of this product from the cows taken in connection with the low cost of production and the easy natural advantages that are readily apparent—when one considers of these facts, and then understands that the importation of dairy products into the state of Washington alone, during the last year, was in the millions, one may gain some idea of the splendid market that is waiting for the dairyman in this section.

As an example of the necessity for a greater domestic production of dairy products, we will take the state of Washington. This commonwealth, by day, has over two million acres of logged-off land that is only waiting for the settler to acquire and clear it and make that fertile its productivity with in a very short period of time. In addition to this vast area there still remain large territories that are already almost suitable for dairying purposes.

Not only does the Pacific Northwest afford abundance of available land, but it is the kind of land and the kind of soil that for dairying has no rival anywhere. The soil varies in different sections in sufficient measure to suit every kind of dairying need. There are the low bottom lands, the high rich uplands, and the new lands from which the timber has been but recently removed. All these classes are an unmatchable fertility, and are an important factor in endeavoring to measure this section's advantages.

Nowhere are there found such ideal climatic conditions for the cow as in the states of Washington and Oregon. Mild, temperate winters, moderate summers, combined with an inexhaustible source of pure, fresh water, are the factors that have contributed to the successful success of those who have embarked in the dairying industry in these states.

Another important factor that is to be carefully considered is the transportation facilities that permit the transfer of the milk from the place of pro-

duction to the hands of the consumer. The steam railway and electric interurban transportation facilities are coordinated, and, in addition, this section is in the van of all states in supplying good roads and ease of communication between production and shipping centers.

On the foothold slope, the dairyman, he be trained in the business or a beginner, has comparatively no competition, because the demand already here is heavy enough to insure supply.

A large and growing urban population, combined with the fact that there are more than 200 creameries in the state of Washington and fifteen extensive condensed-milk plants, insure for the dairyman a constant demand for his product at the top market prices.

The state of Washington has been making unusual efforts to concentrate the attention of the dairying people from other sections and to encourage the migration of agriculturists to this section, and, in this end, it has recently published an exhaustive report covering every phase of the dairying industry, and has helped possibly every chamber of information that will prove of interest to the prospective dairyman.

The fact that the state of Washington offers exceptional advantages in this line has been recently brought in the attention of agriculturists by the world's record recently established for splendid yields of dairy cattle.

The expense of acquiring, maintaining, and caring for cows in this section is subject to slight variations, but the cost of operation is much lower than in any other section of the country as account of the perfect climatic conditions that nature has provided, and which afford practically free pastures. In addition to an ever ready market and its exceptional transportation facilities, the state offers substantial encouragement to dairying in a number of other ways. In Washington specially appointed experts are retained to visit every dairy farm and bring and demonstrate practical and modern methods of handling, feeding, purchasing, and breeding dairy cattle, the care of milk-milk, in addition, they devote considerable attention to the problem of proper field drainage, sanitation, and the care of equipment and utensils, in which work they are assisted, to a considerable extent, by the creameries and condensed-milk plants.

In connection with the Washington State College there are three experimental stations, the reports of which are published in pamphlet form and freely distributed among those requesting them.

In addition to an extensive and progressive State Dairymen's Association Washington has the corresponding associations, which are necessary accessories in a rapidly developing dairying industry.

It is to be understood that good climate for the beginner, as well as the experienced dairymen. The added advantage of abundant capital, however, must not be overlooked in this, as well as in every business enterprise. Just here, nearly one should have in all ways difficult to estimate, as the location, conditions, and previous experience will affect these figures. It is to be understood that a person who starts in this on a new place on a large scale. The best dairies are built up from a few well-bred cows and a good foundation. It is to be understood that a person who starts on 100 to 2500 acres. The pay-bred will cost more. The tendency now among many progressive farmers is to work gradually toward a few thoughtless ones.

There is no special standard of excellence predominate as regards breeds, but for the large producer the Holstein leads in popularity. The Jersey, the Guernsey, the Ayrshire, and the Durham also have their admirers. However, there is a great deal in understanding thoroughly the kind with which one is working.

To arrive at an exact estimate of profits, one that would fit all cases, is difficult in view of the fact that different conditions and experiences have contributed varying results. In estimating profits, all elements that contribute in any way should be taken into consideration—original investment, time consumed, market prices of food, yield of the individual cow, price of products, certainty of market, inexpensive transportation, adaptability of the dairyman to his occupation, milk fed to calves, hogs, and chickens, produce consumed on the farm, average loss from different causes, life of the cow, her value after she begins to depreciate, and many other general points bearing more or less on the art itself.

As an example of what is being done now this report of a national man who took up dairying here without previous experience:

No. of Cows	Am.	The MILK, Yoc.	Average Pails	Average Price	Value.
1	4	2,136	5.20	\$1.00	\$110.80
2	2	2,565	4	1.00	102.11
3	2	2,163	3.80	1.00	107.40
4	4	6,788	5	1.00	129.00
5	4	8,244	6.50	1.00	143.44
6	4	7,008	6.40	1.00	127.54
7	6	9,181	6.50	1.00	170.78
8	11	7,914	4	1.00	151.97
9	11	1,948	4.00	1.00	157.42

—————  
\$1,101.00

No. 8 has averaged over \$120 per year for five years, or \$650.

Average cost of keeping cow per year (estimated)

\$22.

The fertilizing feature of dairying in gives greater salubrious each year, and, in addition to the profits from dairying, the richness of the soil is continually increased by modern methods of fertilizing.

The opportunities for raising one as a milk, very good terms, run from \$10 to \$20 per cow, in either shares or cash.

The dairyman may a suit in acknowledging the splendid profits of the business in this section, which is shown by a recent compilation by the Washington Board of Statistics of replies to questions put in regard to dairying.

Replying to the question, "Is dairying profitable?" every one on this compilation replied with an emphatic, "Yes." To the question, "Are there plenty of chances for others to succeed in your vicinity, the answer in each instance was, "Yes." In another question that was asked, "Is there danger of overstocking?" all were a suit in replying in the negative.

To sum up the advantages and opportunities of the Pacific Northwest, one must take into consideration the universal and extensive demand for dairy products in this and other sections, and outside, in addition, the natural advantages of this section as regards soil, climate, transportation, markets, prices, and other all-important features that are potent in the future possibilities of these two states, and factors that contribute materially in making the Pacific Northwest the most wonderful dairying district in America.

# A CITY OF INDUSTRY

Tacoma's Tidelands Promise Her the Manufacturing Supremacy of the Pacific Coast

BY ALFRED CAVANAGH

The heart of the business section of Tacoma, Washington

ANY one who has traveled through the so-called Far West, especially the portion thereof that is now considered to be designated the Pacific slope, and even those who have not traveled, but who read, will know that every Far-Western city, every Far-Western community, every Far-Western citizen, maintains a high general regard and respect for the leadership or leadership in some particular line of human endeavor or accomplishment. It is a distinctly Far-Western characteristic. From one international boundary to another, it is said, as far, say, as Denver, the existence of the com-

mons lack promptly with one word: "Manufacturing."

As to whether he is entirely right about it, no statistician will differ. Tacoma's own statistics, as might logically be expected, show that Tacoma leads the Pacific coast in point of industrial production, that every other city of the first class on the Pacific seaboard follows statistics as regularly as the years fly by in proof that it is also advanced in industrial production, and almost anything can be shown with this one point stands out clearly: Whatever Tacoma is now, in a manufacturing way, she must some day be the undisputed and unquestionable industrial producing center of the Far West.

Tacoma occupies the one and only such location on the Pacific seaboard having a practically unlimited area of tide-land lands that are adapted for manufacturing purposes. It need hardly be said that these lands immediately adjoin deep-sea and marine terminals, but no manufacturing can be successfully conducted and no manufacturing center can give and hold, without water on one side and deep water on the other, and the advantage is not shared by other Pacific coast cities to have available areas of tide-land lands. But such areas, in all the coastal centers, save and excepting the United States, are limited—and in most instances cramped. This all-tide-land area in Tacoma is in direct contrast.

The "tidelands," they tell this great industrial district at Tacoma, because the extreme outer edge is fringed by the daily tides of Puget Sound, and the whole district, being fringed on a shore, has an extension about one level or greater than twenty-five feet at any point. Most Easterners smile when the word "tidelands"—no words and no thought with possibility to the end of a valley thirty miles long and the miles wide. This valley opens on to Puget Sound at Commerce Bay—Tacoma's harbor—and directly across the eye. A part of it, though only a very small part, is Tacoma's corporate lands. The remainder, although in sight and in direct transportation touch with the city business heart of the city, lies outside the corporate limits, where it occupies the great industrial district at Tacoma, because the extreme outer edge is fringed by the daily tides of Puget Sound, and the whole district, being fringed on a shore, has an extension about one level or greater than twenty-five feet at any point. Most Easterners smile when the word "tidelands"—no words and no thought with possibility to the

Far-Western—falls upon their ears. And smile are in order, for almost every Western city that has opened a city block of tidelands has made those tidelands the subject of the most rapid real-estate speculation that America has ever witnessed. On land almost any Eastern city of hamlet and you can find from one to a dozen men or women, or innumerable school-teachers, who are paying for Western tidelands on the installment plan—\$10 down, perhaps, and a dollar a month all the rest of their lifetime for a lot 25x100 feet. Many a Pacific-coast city has received a newly reduced black eye in the East as a penalty for having allowed the shipping and industrial plan sale of tidelands within its limits. But it is as unfair to hold this speculation against the real worth of Western cities as it is to hold the sale of the Beverly Temple at \$250 against the real worth and integrity of Chicago, where gold-ditch artists for years disposed of Chicago's erstwhile leading skyscraper to visiting investors at the price named. The total number of tide-land lots in Tacoma that have been sold to investors as private but fabulous profits would result from cheaply holding these lots a few short years until some national need for terminals and would pay a heavy price to get them is institutionally small compared to the total area. The bulk of this industrial district that is not already in use for manufacturing has not been and is not being located around the tidelands, but in its subdivided lots, 25x100-foot lots. It is held in reserve and awaits the needs of manufacturers who want to and can put it to productive use. As the impression that we provide regarding Western tidelands, and all of them, can be obtained. All coast cities have some Tacoma has most, and in having them Tacoma controls the key to industrial development on the Pacific seaboard.

One or two farther back lands as to manufacturing on the Pacific, present and future: Tacoma is the heart, the center, and the Douglas fir belt—the last stand of America's timber. With the South's yellow pine stand, and the North's white pine stand, the United States can look in but one direction for its future timber supply. That is to the Douglas fir belt—and every month State some Southern or Northern manufacturer making his way to this belt to continue the manufacturing operations that are no longer possible where the timber has been exhausted.

The only asking east west of the Missouri River is found in the Cascade Mountains within a range of forty-five miles from Tacoma. This coal reaches elsewhere all Tacoma first and comes by coal-gradual all the way. While Tacoma's thirty-four sawmills in 1912 cut 240,100,000 cubic feet of rough timber, while Tacoma's wood-products manufacturers in 1912 produced an output valued at \$3,120,000, while Tacoma's tan and curd mill in 1912 produced 411,012,000 worth of footstock, and while gold and silver and lead and copper valued at \$12,800,000 was run out of the refinery in Tacoma's refineries during 1912, Tacoma and Tacoma best know that the industrial power and leadership of their city is still in its beginning.

The industrial development that has taken place in Tacoma's tideland section

positive adjective seems to have been totally forgotten or, through lack of practice to have fallen into complete disuse. The Pacific slope will tell you, for example, that you favoring timber in the world's tallest; that you great sky-scrapers, rising above the windows raised coloring of the Pacific ocean, is the highest west of Chicago; that you handling, involving several, dipping into the enormous logs that crowd seawards through its spar, is the world's largest sawmill; that you this and you that is the finest and the grandest and the biggest and the strongest of cities on the Pacific.

And by the same token the Far-Western community holds with admiration to the fact that its fishing fleet leads all other fleets, another that its whale-skin trade leads all other whale-skin trades within its respective seas; and still another that its hotel industry and its population of machine and more than, by many dollars, onto the next nearest corner. You never hear a Far-Western community cut such things on a comparative basis. The citrus fruit orchards, the apple orchards, the English walnut groves, and the vast alfalfa fields with their four crops to the season—these and a thousand other matters of material accomplishment are never spoken of or referred to save by way of the superlative.

And it should not be inferred that because more than a million horse-power of hydro-electric energy is developed as possible of development within a radius of fifty miles of one certain Pacific-coast town, and because land that sells at \$1,000 an acre and will earn its fifteen or twenty per cent, net on that valuation every year is within a stone's throw of another certain town; nor because three or four hundred million dollars' worth of Alaska gold has been arbitrarily dropped into still another town. The superlative is the only vehicle of expression that he can use to convey properly an approximately true idea of the Far West's actual resources and actual accomplishments to the world. The Almighty has made in a marvelous way on the Western frontier, and the Far-Westerner has in talk its dependence upon it give an adequate idea of things done and being done.

And so if you roll on the average man of affairs in Tacoma, when the people call the city with a name capital impossible to its desecration, and he is in what particular line his city takes precedence or is going to take precedence over its many big and busy contemporaries up and down the coast, he will

—no words and no thought with possibility to the

### THE CLASS IN HUMOR

"YOUNG gentlemen," said the Professor of Humor, as he wiped the beads of perspiration from his forehead, and injected a strong solution of chloride of iron into his wrist with a hypodermic needle, "it is a matter of infinite sorrow to me to have to do this thing, but inasmuch as no course in humor is complete without some consideration of that abnormal form of wit, the pun, I am compelled to devote this hour to that heart-rending topic. Mr. Witwaffle, what do you understand by a pun?"

"It is that form of amplexuous idiosyncrasy," said Mr. Witwaffle, "that put the pun into punishment, and three-fifths of its name into punch."

"A very fair definition, Mr. Witwaffle," said the Professor. "Mr. Silasides, you may give an example, paraphrasing one of those ham-fisted outrages on the subject of your original forebears, Adam and Eve."

Mr. Silasides rose nervously, and with a quavering note in his voice spoke as follows:

"Well, well, well," said Adam, as he entered Paradise and noted all the gooey things there provided for the delectation of his stomach, "I see now why they call this the Garden of Ereditee."

"That will do, Mr. Silasides," said the Professor. "You may retire to the Adonitashaka for six months until you have quite recovered. Mr. Zanyptic, you may give me an example of the pun horrific in construction with an unsuccessful slantward who beats his business."

"He is unsuccessful," whispered the student, deeply agitated, "because he takes no interest in his life and is down on his uppers."

Mr. Zanyptic dropped unceremoniously to the floor, and the Professor hastened on.

WHAT THE DEACON SAID WHEN HIS LANE GOT TANGLED

"Mr. Babson," he said, "if any one should ask you if Noah was a socialist, finding yourself in a pinching mood, what would be your reply?"

"I should first find if the inquirer were armed, and if he were not I should say, no, Noah was an aristocrat," said Mr. Babson.

A flying brick from the rear row of the classroom hit Mr. Babson on the head, but the Professor pretended not to see it, and went on.

"Mr. Bonshaw, if some one were to ask you if your last-day were given to gossip, what would your passing answer be?" asked the Professor, sternly.

"I should say that she made a bang out of cooties," said Mr. Bonshaw.

"And if the serpent in Paradise had sought Adam holding Eve in his arms, and ordered him to drop her, what would Adam have answered?" asked the Professor.

Mr. Bonshaw's eye lighted with pleasure, for secretly he enjoyed puns.

"Why, Professor," said he, "Adam would have declined because he was not a spy."

"A spy?" roared the Professor, starting up angrily, while the class caught its collective breath in a deep unaccompanied gasp. "What has the spy got to do with it?"

"Why, Professor," answered the unhappy student, "an spy is an overdeveloped, back hat!"

A wild but unexpressed smile issued from the Professor's white lips as he leaped over his desk and grasped the unfortunate Bonshaw by the throat. A terrific battle ensued. Chairs, windows, and desks were broken, and when both were exhausted from the conflict and fast falling to the floor, the agitated class carried them forth and dropped them in a heap near the campus.

### THE RETORT COURTEOUS

"So you were convicted for contempt of court, were you?" asked the visitor.

"Yes," said the ardent suffragette. "You see, after the judge had got through lecturing me on my deplorable behavior I snuggled my fingers and said, 'Fudge, as long as I could. He gave me ten days.'"

"Dear me!" said the visitor. "And what did you do while you were in jail?"

"Oh, I contemplated the wood judge on a sub-conscious, and waltz it with my companions to the judge after I got out," said the lady, with an amiable smile.

### A HARD TASK

"Did you visit the American quarter in Paris?" asked Whitely.

"No," said Hiltless. "I had all I could do keeping my eye on the American dollar."

### VERY ATTENTIVE

"I CAN'T get old Nelp the tailor to pay my attention to me," remarked Dabbledick.

"That's strange," said Hiltless. "He's most attentive in his attention to me. Sends me three or four little every month."

### NO PRIMARIES FOR HER

"Are you going to the primaries to-night, Etheldreda?" asked the husband of this suffragette wife.

"Indeed I am not," replied the lady. "No you suppose that after I have attended the post-graduate courses in political science for two years I'm going to waste my time on those primary elections? I guess not! There's good enough for you too, but we women have progressed beyond that!"

### HIS PREFERENCE

"Now, Basilio," said the doctor, cordially, "just show the jury how you managed to get away with those children without anybody hearing you."

"Now, ask," replied Basilio. "Ah! it's rather piffling, yeh know. Ah! isn't it strange I give dew-fallin' de results 'a' forty years ob experience fish nothin', seh."

STORK: DARN THIS DOD ROUTE THEY'VE ASSIGNED TO ME!

### A TACTFUL ANSWER

"Lose to join us is a case of bridge?" asked the polite postman to the Pullman to the gentleman across the aisle.

"No, thank you," replied the other. "It's very good of you to ask me, but I never play with strangers. You know you never can tell whether a chap's a horse-stealer or not."

### CAUSE AND EFFECT

"It seems to me, Mr. Simpson," said Dabbledick to the milkman, "that your milk is pretty watery."

"Yes, sir," said Mr. Simpson, "owing to the spring freshets, sir, my cow produces a pretty damp and wet, an' the cows consume a good deal more water 'n I wish they would."

# The Future of Alaska

BY ROBERT W. BAXTER

A poultry farm on the Yukon

Harvesting in the Tanana Valley

DEVELOPING a recent trip through the Eastern states, the question I was asked (frequently asked now, "What is the future of Alaska?" or "What is the matter with Alaska?") To answer either query fully would mean a much more extended article than can be prepared at this time, but, briefly, answering the first question, Alaska has a most promising future in the full development of her natural resources, her wonderfully valuable products of lead and zinc. To explain what has been the matter with Alaska in the past is merely to show a misunderstanding has been raised in the minds of a large number of people as to its geography, geology, and general physical and climatic conditions. In the days gone by the chief industries of Alaska were placer gold mining, salmon fishing, and sealing. These three important factors in the development of the wealth of the region were distinctly "summer industries"—that is to say, the work in each was carried on only during the summer, and the annual spring movement to Alaska and the autumn return helped to impose upon the pathfinders the fact that Alaska was merely a region of summer activity.

In this fact lies the foundation for the greatest amount of misunderstanding and misinformation about the Northern Territory. All parts of Alaska for years the year around except those of Bering Sea. Regular winter sailings are maintained from Seattle to all parts from Matlakshin to Dutch Harbor, Inialik. At Kenai, Lachowick, Elmendorf, Jambou, and other places, important development in wintering has taken place, and underground work can be carried on all the winter throughout the entire year. The Yukon River, located as it is almost within the arctic circle, flows over during the winter, and river navigation can only be accomplished during its summer and fall, but the interior regions are reached by railroad, stage, and dog team from southern ports. During a recent cold wave that swept over the

northwestern part of the United States the official figures showed the thermometer at Sitka, Alaska, at 24° for the lowest night figure. Dutch Harbor showed 22° and Nome 21°. These figures were published on January 28, when St. Paul was 6° below, Winnipeg 20° below, San Diego 23°, and Los Angeles 24°.

While these are not daily records, the comparisons of the date mentioned show how warm at times during the winter are the various parts of the Alaska coast, washed as they are by the Japan Current.

The future of Alaska seems assured even in the thorough manner in which the government has recently investigated conditions in the territory, with special reference to the report of its Alaska Railroad Commission covering transportation and the development of the coal mines. Its logical construction based upon either of the suggestions of the commission will have a beneficial result, as each will open new territory suitable of great industrial development.

There is nothing the matter with Alaska except that its conditions and needs have been very thoroughly misunderstood. Now that this misunderstanding has been largely overcome, and the needs of the country have been set forth by proper officials, there is every reason to look for a period of prosperity that has never been known to the territory.

The dawn of a new era of industrial development is at hand in Alaska. The sound of the stamp-mill is heard throughout the land. Plans are in the making for new enterprises, and it seems probable that the transportation question of the interior will be satisfactorily settled. Important developments are about to be made in copper and gold mining, whaling, salmon, and halibut fishing, and the fur industry.

In proof of the argument in favor of the future development of the territory, attention is directed to the report for the calendar year ending December 31, 1912, by the United States Collector of Customs for January, and covering all parts of the territory. In spite of the fact that development had been held back in many districts by lack of proper laws relating to the public lands, which had put a stop to railroad construction and industrial upbuilding in these sections, yet the total value of the exports and imports of Alaska for the twelve months reached the remarkable total of \$22,744,093, which was twenty-seven per cent. greater than that for the best previous

year. The balance of trade in favor of the territory was also the largest amount on record—nearly twenty millions. According to these official figures the value of the exports, products of mines, salmon, fur seals, whale products, walrus ivory, furs, and other merchandise, reached the total of \$43,982,719 as against a total value for the machinery and supplies sent into the country that year, which was \$25,739,541.

It should here be pointed out that the above total value of commerce for the year just of 1912 is more than ten times greater than the price paid for Alaska by the United States in 1867, and Alaska is just on the threshold of her industrial growth.

The future may also include the development of the agricultural areas of the interior, where successful experiments have been made in the growing of grasses and vegetables. With the development of the mining districts will be created markets for all the hay, vegetables, and other products of the soil of the valleys of the Yukon and other rivers. Here the climate and conditions are similar to those of the Pennsylvania peninsula, and thus it will afford a splendid outlet for people who can find success in tilling the soil. The same is true of future development of the timber of southeastern Alaska, now largely held in forest reserves, but which in time will be used by the people for rough lumber and thereby do away with the importation of all classes of lumber into a district which is rich with supplies.

At present all the great transportation and industrial companies here oil, which is taken from the California fields to Alaska in tank steamers. This will undoubtedly be changed within a short time, or soon as the general plans for Alaska's betterment are fully approved.

With her unlimited resources, with additions to the railroad network and such laws governing the territory as apply to other sections of the United States, there is no reason to be pessimistic for the development of the district, the future of the country seems exceedingly bright, and there is every reason for anticipating a steady growth in her exports and imports.

# THE NATION'S TIMBER ASSETS IN THE NORTHWEST

BY GEORGE S. LONG

THE first job of the civilized white settlers of America was to clear away the forests. In yet the land for agriculture. Trees were waste product. Vast regions were cleared of timber by fire and the forest products and the year's timber products and the waste attempts to make of wood growth in any form a marketable commodity yielded but a meager return, and nothing for the raw material. Nothing was so cheap as forest growth on building material so available, so much that could be used for houses, bridges, barns, fences, road building, and structures of all kinds, the more easily and cheaply would the cultivated field supply the forest.

In this environment, as people have grown accustomed to the use of wood as a building material, so that today, in the United States, the use of wood for fuel and building material is nearly ten times greater per capita than in any other civilized country. This free use of forest growth, still a nationwide practice, is largely so because it is still cheaper and more available than other material. Within the past twenty years trees and stave have virtually replaced lumber for many construction and more recently concrete has displaced lumber to an large a degree that lumber is no longer indispensable.

While it is true that the early settlement of our country will stand both the forests on both slopes of the Appalachian Mountain Range and the Atlantic were largely wasted by the axe and fire, and much more for homes and other uses, but more especially since the Civil War, the forests have been utilized with less waste. Including all that has been used in clearing the land for farming, and all that has been lost for lumber and other uses, there is still standing and uncut and more forest growth in the United States than in any other country by man since the landing of the Pilgrims.

The latest statistics gathered by the Federal government as to the extent of timber in the United States (not including Alaska), was given in a report of the Division of Corporation, in the year 1911, as 2,825

billion feet. Of this total, 855-billion per cent. is reported as standing in the states of Washington, Oregon, California, Idaho, and Montana. In the three states of Washington, Oregon, and California there is

A typical Washington forest

reported to be 1,318 billion feet, or forty-six per cent. of all the standing timber in the United States. The Sierra Nevada Range in California and the Cascade Mountains in Oregon and Washington are practically one continuous range, traversing the country

north and south, distant from the Pacific Ocean from one hundred to two hundred miles.

Between this range of mountains and the Pacific, from the Cascade Mountains north to the coast, as far north as San Francisco in California, there is standing today forty per cent. of all the merchantable timber in the United States. The climate of this zone is generally moist and abundant moisture the forest growth has reached its highest stage for size of the individual tree and density of stand, and beyond level it increases any other stand of timber on the globe for size, quality, density, and accessibility to water and air transportation. A half-dozen or more conditions are met in this zone, the best of which are on their way to the sea, and numerous and continuous harbors afford ample facilities for vessel transportation.

There is a notable absence of hardwood species of timber growth on the Pacific coast, but with this exception the forests now standing in this region offer in quality, as well as quantity, better woods for ordinary building purposes than have hitherto been used.

The most distinct type is the famous one associated with the Pacific Northwest in the minds of all lumbermen and foresters, the famous Douglas fir forest of the rainy region between the Cascade Mountains and the sea. In nearly pure stands, or mixed with cedar, hemlock, and Sitka spruce, the Douglas fir here makes the most important contribution to the world's widely useful American trees frequently attains a height of 200 feet, a diameter of four feet to twelve feet, and often yields more than 100,000 feet board measure to the acre. Its frequent companion, Western hemlock, is scarcely less magnificent in size or less valuable.

The Douglas fir is the king of all forest trees. Of the entire stand of forest growth in the United States suitable for lumber, twenty per cent. is Douglas fir, standing in a compact stand, and it is the most widely used of all American trees. No tree in the forest yields a product adapted to as varied uses. For all kinds of structural purposes it probably has no equal, and its quality yields also in length and diameter which cannot be supplied from any other source.

"BLESS YOU, MY CHILDREN, BLESS YOU!"

DRAWN BY C. J. BUDD

## GREAT TREES OF THE PACIFIC COAST

Forest Scene

logging-engine, a machine of from two hundred to three hundred horsepower. The usual method is to attach a large wire cable to one end of the log, the other end being affixed to the drum on the donkey engine, and the log dragged by pure force and strength over the ground, or over the skid road, to the point of landing.

In the Pacific coast coast of the timber is cut in long lengths, especially in the fir district, where it is not an uncommon thing for logs to be cut up to one hundred feet in length, and frequently as long as one hundred and fifty feet, to supply some special order for long timbers. The average length varies between thirty and forty feet, so that a good-sized Western saw log is apt to be one ranging from five to six feet in diameter and from thirty to forty feet in length. To move such timber as this requires powerful engines, especially when it is realized that the logs are dragged loosely on the ground or on skid roads.

A more recent innovation which is practiced in many districts, is the overland logging, described by the average Western logger as the "flying-machine." By this method cable is fastened to a skid log, anywhere from fifty to one hundred feet above the ground, and steel bar fastenings are fastened to the log, and the bar is fastened to the log by the same process of the timber these logs are piled up as they lie where the log was cut, hoisted into the air until they clear the ground, and then hauled over the cable by trawler to the landing-place. This method is found especially serviceable in taking timber out of deep canyons and other places that are almost inaccessible, and it is possible to lift a log bodily into the air for a distance of two or three hundred feet, until the canyon are cleared,

Logging with Donkey Engine

ing that which could not be furnished elsewhere, thereby in special cases of large timbers.

The lumber, however, of Douglas fir and red cedar and redwood is better adapted for ordinary house construction, both in the consumer grade and in the interior finish, than any other woods that are now being used for such purposes. When the freight-rate in the consumer in the Mississippi Valley and on the Atlantic seaboard have been reduced to a point where the cost will not be prohibitive, the Pacific-coast woods will be generally used for all kinds of construction.

As it is now, about the only wood that admits of wide distribution in the red cedar of Washington and the redwood of California, and these two woods have been regarded very largely to shingles and louver-boards, it being a generally recognized fact that these two woods afford the very best material for such uses.

Douglas fir has the merit of being not only possibly the best wood for structural purposes, but likewise equally as good as any other wood for all kinds of interior finish. With the cheaper transportation which is sure to result

**T**HE great size of the trees on the Pacific coast, together with the climatic conditions there, invites in necessitating entirely different methods of handling operations than those used elsewhere. This is manifested largely by the size of the timber, for it is not at all infrequent to find forest trees in the redwood district that measure from twelve to eighteen feet on the stump, and the average size probably is not much less than six feet, while in the Douglas fir district timber which is utilized for lumber varies in size from two to twelve feet on the stump. All the timber has unusual length, ranging all the way from one hundred to two hundred feet in length. These are the famous trees about which the native told the traveler that it took two men to look to the log—two to look half-way up, the other to look the rest of the way.

It can readily be seen, therefore, that the ordinary methods of logging which obtain in New England and in the white-pine districts of the Lake region would not be adapted to logging the large timber of the Pacific coast.

In the first place, there is practically no snow suitable for logging purposes, so the old-fashioned method of hauling logs on sleds over the snow on frozen ground does not apply to the far Western lumber camp. Again, it is almost impossible to handle the large timber on the woods by either horses or men, although in the primitive days

Large Log

both were used, the logs being dragged on the ground from the stump to the landing-place, frequently over skid roads made of wooden timbers which had to be prepared with considerable expense, and were suitable to haul heavy loads.

For a number of years past, however, all of this logging has been done by machinery, usually termed the donkey

Logging by Cable

and then the process of carrying it to the landing-place is a simple one.

The difficulties encountered in logging timber so large and on ground so mountainous and rough has developed on the Pacific coast probably the most scientific logging that is carried on anywhere, and has raised the standard of efficiency to a point where logging, instead of being a job, is now a profession, and possibly one of most importance that is connected with lumbering on the Pacific coast.

Just as the larger trees and logs require larger equipment in the logging operation, so there is required a different and larger mill to manufacture the log into lumber. Therefore the average lumber mill on the Pacific coast is possibly from two to three times as large as a mill of similar capacity cutting the white pine of the North and the yellow pine of the South. Special machinery adapted to handle the largest log that comes from the forest is found in every well-equipped mill, so that the manufacturing end of the business assumes new and most interesting phases, which are not peculiar to ordinary lumbering in any other part of the United States.

The most noticeable feature of the markets which have heretofore been supplied by Pacific-coast timber has been the demand for large and special sizes in timber. Up to the present time Pacific-coast lumber products have not been generally used in the Middle West or the Atlantic coast for ordinary house and barn construction, simply because the cost of transportation has been so great that cheaper lumber could be supplied by the white pine and yellow-pine mills; so that the Pacific-coast mills have had their markets restricted more or less to supply-

Logging by Overhead Cableway

between the Pacific coast and the Atlantic coast when the Panama Canal is opened it is the hope of the Pacific-coast lumbermen that the wider market thus opened to them will admit their supplying to the lumber consumer on the Atlantic seaboard a most excellent material for any kind of house of wooden construction. \*

## FROM CONTENTED COWS

A Phrase Founded Upon Real Conditions

By L. R. HARDENBERGH

Vice-President Pacific Coast Condensed Milk Company

**F**ROM "Contented Cows" is a phrase that has truthfully served to link the great dairying districts of the Pacific Northwest with a food staple whose sales territory covers over half the world. The originator of that slogan has produced in three simple words the real reason for the fame of the district as a productive center of dairy products.

Contented Cows, grown pastures the year around, an abundance of crystal-clear water, simple granite soil, mild, temperate, and even climatic, splendid transportation facilities, and the highest quality of milk, are the conditions which, in any quantity, are the important factors in determining the location here of ten large condenseries of the Pacific Coast Condensed Milk Company.

For upwards of thirteen years, Carnation Milk has been identified with the promotion of the dairying interests of the Pacific Northwest, and from the very date of its introduction, the use and distribution of this product have kept pace with the tremendous advances of the great region.

Carnation Milk has become one of the world's food staples. Its persistent adoption by housewives everywhere and its ever-increasing demand are not the result of mere accident, but are attributed solely to the merit of the article itself and to the great foresight exercised to maintain its uniform standard of excellence.

The making and marketing of Carnation Milk, the only struggle of its originator to produce recognizable one of the resources of modern business. The producers and shippers that had to be overcome and surmounted are a source of inspiration to every man and woman who has to do with its production and distribution.

To produce by evaporation and sterilization a milk that will retail raw milk in flavor and deliciousness, an addition, one that would surpass ordinary milk in richness, purity, and keeping qualities; to take out in a convenient form a product that would ultimately stipend the milk for every household possible—was the task that

First Home of Carnation Milk

Mr. E. A. Stuart, a successful wholesale grocer of Los Angeles, set for himself a little over thirteen years ago.

To produce and put out a high quality of evaporated milk it is necessary to have a high quality of milk to start with. It has been proven that the most modern equipped and hygienic condenseries cannot add quality or flavor to a low grade of raw milk. Therefore, the first question in Mr. Stuart's problem was to locate his condenseries where the best raw milk was to be obtained in quantity sufficient to meet the increase in demand. To this end, every important dairying district in the country was carefully studied, and quality and production tests made and considered to determine the source of the best milk supply.

After extensive investigation, the State of Washington seemed to afford the most ideal conditions, and the first condenser was erected at Kent, a village adjacent to Seattle. Within the first few years, the new industry produced new problems and new angles to be cared and understood, it was not until the production had grown larger and a number of additional condenseries operated both in Washington and Oregon that the real problems of the growing business presented themselves.

To properly understand some of these problems, it is necessary to know that fresh milk in one of the most difficult articles to handle. In the first place, to secure good, clean, rich milk is a constant fight and a constant expense. To handle the milk and insure its purity and quality from the cow to the consumer was one of the problems that Mr. Stuart must have considered had to solve, and solve rightly, in order to keep a business. It was found that, to put out good milk, you must begin with the

Condensery at Kent, Washington

cow; and, while the dairying districts produced and maintained the finest milk cattle in the country, it was necessary to carry a most complete and efficient system of supervision and inspection, in order that the farmers themselves might be enabled to meet the high standards demanded by the milk experts at the various "Carnation" condenseries.

To this end, trained dairymen, inspectors, and veterinarians were employed to assist the farmers and to instruct them in every new and scientific method for the selection, feeding, housing, and care of their herds, and what is equally important, they are instructed in the handling and transportation of the milk from the cow to the condenseries. For example, the rate in which the milk is transported is subject to daily inspection and also standardized conditions before they are returned to the farmers.

It is interesting to note a world market for Carnation Milk. It was necessary to work out the points of supply and distribution to insure that these distributions were well accomplished; the product would be not only available, but it must be uniform day after day, and year after year. The experiments were all made early in the first factory. The means and methods of conditioning, evaporating, sterilizing, packing, and shipping were all developed upon after elaborate tests, and, in each additional factory was reported, it found its problems all worked out to the surety of quality, and the cost of production normally equalled in advance.

In the condensing of Carnation Milk, nothing is taken for granted. There is no guesswork. Tests and scientific methods follow the raw milk from the moment it is received at the factory until it reaches the kitchen of the housewife. The raw milk is bought and paid for according to tests; the better the milk, the better the price to the farmer. Each factory has its trained milk-tasters and they follow each batch of milk through every single process and subject it to rigorous and exacting tests until it leaves the handling platform.

If you will take up a can of Carnation Milk, you will find that it is stamped with its own serial number. This enables the general office to know the history of every single can of milk on the market.

It is interesting to note the laboratory-like cleanliness that prevails in each of the condenseries. All vats, pipes, machinery, and equipment are cleaned and sterilized with live steam twice each day. Every process must not only be accurate, but it must be absolutely clean. Upon the growing exigencies and the perfect system of handling depends the success of Carnation Milk in the markets of the world.

Another successful test and overcome the difficulties of uniform production of distribution. His knowledge the important problem of distribution. His knowledge his product, but that it was not only a quality but a product, and the process of making it a standard in every country. His task was now to overcome the almost universal prejudice against canned or sterilized milks, and to acquaint the consumer not only with the quality but the product, but to the advantage of using every day in the year a milk possessing all the elements of the purest and richest raw milk without any of the dangers and uncertainties of the ordinary milk supply.

The public had long looked upon canned milk as merely a substitute in a sort of emergency for their own milk, but now aware that evaporated milk was not a manufactured substance, but merely the best and purest cow's milk with

part of the water extracted; merely rich, fine milk evaporated to the consistency of cream, then sealed and sterilized. To force home the advantages of evaporated milk—to create an ideal demand—was the test of Mr. Stuart's problem. This meant a campaign of education, and education costs money. This man knew that to hold the method of supplying the greatest and most important of food staples. He knew that his milk was not a substitute, but that ultimately it would replace raw milk in every urban community. The world-wide crusade against raw milk in every city in every country, the success in every part of the world in the minds of the public by widespread campaigns against impure milk, gave him steadfast confidence that, sooner or later, the public would grow to the understanding of evaporated milk of guaranteed and unapproachable purity.

Mr. Stuart's reasoning has been amply justified by subsequent events. From the very start, Carnation Milk has enjoyed an extensive sale, until today the Pacific Coast Condensed Milk Company operates ten factories on the Pacific slope, and it has been found necessary to take care of the Eastern market by the erection of four extensive condenseries in the favored dairying sections of Wisconsin and Illinois.

Despite a demand for Carnation Milk that leaves the capacity of these fourteen condenseries, despite the fact that the distribution covers the United States, Alaska, and the Oriental countries, the real work of educating the public to the economy and advantages of evaporated milk is just beginning to receive attention.

Understand that milk is a greater world necessity than four or sugar; that its use is bounded by neither national nor geographic limitations; that evaporated milk has been known for but a few years and that its practical value has hardly yet been touched upon. Regardless of the immense and extensive campaign of advertising, the housewife has hardly advanced to this important economic factor in the kitchen and the nursery. It still requires years of educating and the expenditure of considerable sums of money to displace raw milk as an article of household consumption, but the tide has surely turned in this more certain, convenient, and economic food staple.

As an example of household economy, it is well for the consumer to appreciate the fact that Carnation Milk is packing but pure milk minus part of the water. Evaporation removes the water, leaving the milk the consistency of cream, and rich in butter fat and solids to the extent of about 100 per cent, more than a like quantity of ordinary raw milk.

A housewife who uses evaporated milk in the kitchen is quick to appreciate the saving effected not only in the cost of milk, but in the water required, but in the butter there is a big saving indeed.

Another factor tending to popularize Carnation Milk is its economy. Evaporated milk is used in every climate for years. It is always obtainable and available, dry or milk.

Since its introduction, Carnation Milk has met with the endorsement of the physician and the nurse. In the nursery, it is rapidly supplanting raw milk, and its advantages as a food for infants and growing children is attested by mothers all over the Union.

Apart from the education of the actual consumer, the Pacific Coast Condensed Milk Company has for years been endeavoring to acquaint the nation with the merits of its product and to show him a new source of revenue from the sale of evaporated milk. While your grocer has not always been true to the milkman to back, he has a special duty of every article he handles, he is, as a rule, quick to improve a growing demand. In certain sections of the country, the grocer has seized the opportunity to divert the revenue that now goes to the milkman to himself. He is not only making more money by acquiring a new line, but he is making new friends, building business and goodwill.

It is necessary for the consumer and factory that have mutually contributed to the growth and importance of the Pacific Northwest, the Pacific Coast Condensed Milk Company, as so he has been as a result of the fact that he has not only the Company furnish employment to hundreds of men and women, but its efforts to promote the dairying industry have stimulated the entire dairy industry to the advancement of the entire section.

The efforts that this body of men are putting forth to acquire the highest quality of milk are not only a result of the corporate and individual advantages of Washington and Oregon for stimulating dairying, but have been responsible for the best improvement in dairy cattle.

To quote Mr. Stuart as he is best known as a result of his work to the cow; she must have good raw, good feed, a nice, quiet and careful surroundings, the most perfect, spaced, well treated, and

BY FRANKLIN ESCHER  
Overcast "Blue Sky" Legislation

Light and Shadow of the very general Movement to pass Laws regarding the Sale of New Securities

THE American legislator doesn't believe in doing things by halves. If he or she says he is discovered that there were grave faults in the way the railroads were being run. Almost immediately we had a crop of regulatory laws and the necessity that nearly put the railroads out of business. More lately he discovered that the public opinion concerning the same thing were begun passing laws making it difficult to sell not only worthless securities, but any kind of securities at all. It has been the old story of passing laws in a hurry and unprepared—and with the same old result.

Remarkable, indeed, has been the speed of the "Blue Sky" legislation idea—they call it that because it is dropped to prevent promotion from legislatures the blue sky—since the state of Kansas put the first law on the statute books three years ago. We had then thirty states, at the time this is written, have taken up "Blue Sky" legislation. Over a hundred bills of one sort or another are at present considered by various state legislatures. Legislatures everywhere appear to have gone "Blue Sky" law mad.

Webb-Kearbit Dues Legislation

Now while it is true that the investor himself should be protected from the promoter of fraudulent schemes, it is also true that credit is about the most delicate thing in the world, and that only the best appreciation of that fact should be reflected by law be undertaken. "Blue Sky" laws, in other words, which regulate the terms on which the borrower goes to the lender, are the most foolish sort of legislation and need to be most carefully considered. In that connection with the law passed by the legislature of two-thirds of the state and now being considered by them. Take for instance the bill before the Illinois legislature which provides that a first selling securities must show upon its face the record of each and every investor who purchases securities of it, even if these securities be the company's. Take the bill in Massachusetts which provides that every separate law must be examined and approved by the state authorities on each separate bill—it would make an effort of the same kind were made and add a dozen times in the course of a month, such apparatus would have to be sacrificed by the state. And is that the worst! How about this one: A bill that provides that no investment shall be publicly offered or sold unless it be "such an investment as a prudent man might make." Think of that enacted as a law.

No wonder that the bills pending before various state legislatures were recently characterized by a prominent investment banker as "assorted selections from a wish-robust dream."

That investment bankers all over the country should be opposed to the passage of half-baked "Blue Sky" legislation is natural enough. But the investment banker after all is no exception to the rule most seriously affected. The real harm comes to borrower and lender—to the legitimate corporation which needs money and can only get it by the sale of securities, and to the investor who is deprived of the opportunity of advantageously employing his capital.

How It Hurts the Borrower

Take the case of the borrower. In some state one of these "Blue Sky" laws is passed, putting all kinds of restrictions on the sale of new securities. This makes it difficult and expensive for the investment banker to do business in that jurisdiction. What is the result? Simply that the banker having occasion to sell will keep away from that territory. Very well, it is objected, but suppose a number of states pass such laws in succession, so that you are simply in "keep away" will be impossible. Then, if "Blue Sky" laws go into here and there in various parts of the country, bankers whose business is to distribute securities will have to abide by their practice of not going where additional expense is necessary. But out of whom will this additional expense come?—naturally the banker, in this case the middleman, in selling his stock at an increased cost of production. No, it will be lost as it is every other case when the cost of production is increased. The added charge will be thrown back on the producer—in this case, the seller of the securities. To raise capital will simply cost so much more.

Moreover, the trouble and expense of

handling new security issues being thus increased, and the service in which they can be conducted of all being thus reduced, the business becomes less desirable and less sought after by investment bankers. The result is that a bill pending by which investment dealers may be required to post up as much as \$100,000 with the Commissioner of Banking as security, such a law, if it passes, would drive many of the smaller firms completely out of business. A side from any question of right or wrong, it is only enough to see what a bad thing that, especially from the standpoint of the small borrower, would inevitably be.

From the Lender's Point of View

From the lender's viewpoint, too, is a large part of the pending "Blue Sky" legislation is highly undesirable. The fact that some states "approve" it is claimed, will show that it is all right and give investors confidence to buy it. But not more than that an issue approved by the state commission or by any other official prove anything as to its actual value? Many a security issue, it must be true, has been refused by the state banking board, only to be taken up by another, and in the end to turn out to be a failure. Many a loan, committed into with the greatest care by the most scrupulous banker, has gone wrong. The most thorough examination by the most competent parties, in other words, are not infrequently fails to disclose an issue's true strength or weakness. If what value, then, is the approval of some state official, not an investment expert, and under the anomaly of passing laws on the basis of the mere approval of politicians every week?

Realize that, what intelligent investor would want to see to sell his securities, and that politicians he may not trust? To have one such regulation, or perhaps several, however is all very well—every state in the Union has its brand laws, as it is. But to have some state officials act as a censor, with the right to keep you from investing your money in any particular security he may and happen to fancy—that is another thing for which an American investor can hardly be expected to stand. When he seems to realize that exactly that will be the result of a large part of the "Blue Sky" legislation now pending he will be the first to rise up in protest. The work and production law to be protected, of course, but that doesn't mean that he is willing to be placed in a tight strait and have his thinking done for him.

Governor Hudson of Indiana expressed exactly that line in his recent issue of an "Innocent" piece of "Blue Sky" legislation which had been pushed through both houses and had come to his for signature. "Is my honorable friend," wrote the Governor, "I recognized 'Blue Sky' legislation, and was very desirous to see it, but I should be content that would protect innocent investors in stocks, bonds, and other securities of individuals, but I should be content the law proposed, as set forth in that bill, would give approval to fraudulent securities investments." The Governor then goes on to say that what is necessary is a commission of public-spirited men to study the subject with deliberation.

Federal or State Legislation?

It is very much of a question, indeed, whether the regulation of the registration of the sale of securities is of fit subject for state legislation at all. Most states now have laws of this kind, but the supervision over the issue of new securities. The public-service commission in New York, for instance, has a number of cases, present one Philadelphia case (Chicago) from from selling securities in New York state, but then it is very much of a question whether the state should not legally prevent it, either. Commerce between the several states is not subject to the regulation of any one state, but that of the Federal government—it is for that particular purpose that there is the Federal interstate-commerce clause. Why is not the same thing true of interstate dealing in securities? Why should one state be in any way of some particular securities market, or "Here, your business cannot sell that security in this territory," while another state law is in force, and the same securities will open areas? Surely this would seem to be a matter to be regulated by the Federal government. But by the way, our states, each for itself, are very busy and for its own particular interests.

## Roslyn Coal

The Roslyn coal field covers a comparatively small area (about seven miles long by three miles) in Kittitas County, state of Washington, just east of the Cascade Mountains and near the main line of the Northern Pacific Railway. For many years Roslyn coal was mined and sold by the railway company. It is still mined by them in large quantities, but more only for their own use. Before it was discovered, California Roslyn coal was known from Pocatello to San Francisco, and from Seattle to Spokane, the distance being covered by river in Montana, as the best steam and domestic coal on the market. It is still very generally used in the Washington and parts of Oregon, Idaho, and Montana, but no longer cuts much of a figure in California since the discovery of oil in that state.

A gradual curiosity in the quality of the Roslyn coal was revealed as it was opened up at various points on the field east to west. It was first opened at Co. River, on the eastern end of the field, it was almost a bargain in quality, but as mine after mine was opened up farther to the west better and better coal was exposed, until at the most westerly extremity of the field was found a high-grade bituminous coal of excellent coking quality that yielded more feet of gas and more heat units per pound than almost any other coal in the state.

The mine was owned by Walter Oakes in 1906. He had formerly been the president of the Alaska Steamship Company, which he had helped to build up from a small beginning, and it was his interest energy that made the operations of the Roslyn Fuel Company (which he formed to handle the property) in earnest. The Roslyn Fuel Company was an independent concern and took over the operations of the Northwestern Improvement Company (which is the controlling end of the Northern Pacific Coal and Coke Company) at the time that company retired from the wholesale and retail coal business. Three agencies are located at Seattle, Spokane, Walla, Walla, North Yakima, and Libbyville.

Excellent steps, as the mine is called, was opened according to the new specifications of standards made for the safe direction of Charles E. Jones, a mine engineer from Pennsylvania. A solid pillar of coal one hundred feet wide and 160 feet between the slope and the main entry, and an eight-foot pillar between the main slope and main entry on the other side. Every other generation was taken, in opening the mine, to insure the safety of the miners. The result has been a low price of coal for every three hundred thousand tons of coal mined, showing that the mine is about as safe as it can be made. A large specification of the latest design was installed to keep the use of the mine fresh and low from numerous uses. The outside equipment, hoists, hoisting-machines, pumps, etc., are likewise of the highest quality and insure a steady output when the coal is most needed. The plant is capable of handling twelve hundred tons per day, and has actually handled for months at a time from five hundred to one thousand tons at a stretch. The coal is conveyed through chutes to give steam, gas, special steam, gas, and lamp gas.

In 1911 the No. 2 mine of the Roslyn Fuel Company was opened and now able to handle five hundred tons to the daily output of the company, with a production of seven hundred tons, making the mine considered the source of both main about six months of engine fuel for the day per day.

Roslyn coal from the mines of the Roslyn Fuel Company has been used by all of the large railroads of Washington with great success, and two of them will continue to use a large quantity. It is used by logging camps in the state on account of its not throwing sparks, an important factor in the use of it from the gas and dust that come from Pocatello to Montana, and the gas and smoke resulting from it is of good quality. For domestic use, it is of an extraordinary quality to better coal than the Roslyn coal obtained in eastern Washington. The best gas and furnace coals are used extensively for domestic use.

It is impossible for many people will insist on using hard coal when a finer coal would answer the purpose better and cost less. This is particularly true of people having coal for their furnaces. They would use a furnace of steam power, with a coking stove, or a gas stove, the coal would last longer and give more heat. There are exceptions, however. In many mines in the East the coal that comes through is the best part of the seam, but in the Northwest the best coal is found in the part that comes out. The lumps are held together by impurities that go to form ash. Lumps in the West burn slowly in such the same material that a chunk of wood will burn in a fire, even if it has a tendency to coke, even more on the top after the fire gets going, and you can break it up into small lumps if a very hot fire is needed, or, if it is desired to keep the fire hot night, you can break it with your feet on the coal.

The main office of the Roslyn Fuel Company is in Seattle, Washington, 609 Lawrence Building.

## Homes for Insectivorous Birds

By John T. Timmons

Four persons actually realize the great good accomplished by many of the more common varieties of insect-eating birds. Every bird that flies on insect life is useful. Its work is gold in the making. In most localities these useful birds have been so destroyed as to be almost exterminated, and the increase of destructive insects that frequent to field, orchard, and garden is appalling. Some of them will be mentioned here, and the kind will be furnished with a very different problem.

The nature of most of exterminating these pests is not for the best. The birds are the natural enemies of the life that destroys and injures the various crops. They are needed as the only kind of us we had stop and consider for a moment.

Instead of depriving the birds of their birds, swans, and purple martins, encourage them to inhabit your lawns, gardens, and orchards.

Every home for the birds. The little common house wren that is always likely either in a well-kept pasture or among thousands of insects, or feeding on their lawn, will greatly appreciate a little of the most perfect shelter. The man, old coffee-stove, or small wooden house fastened on a fence, outbuilding, or other, or placed in a well-kept garden, will answer about the size of a half-dollar, will make every home for the wren, and the number of birds that will be attracted from the nests in the garden will insure a greater quantity and better quality of fruit.

The meadow is another enemy of the hundreds of insects that get in their work in the early spring and summer, when almost all our fruits are exposed to their ravages. They can be induced to remain about our lawns if provided with a well-kept and well-kept lawn. The type of home may vary, but it should not be too large, and never over six inches in height, about the size of a half-dollar, and not more than twelve by twelve inches, divided into four rooms, with an opening into each room and a narrow ledge or shelf about the size of a half-dollar. It should be placed on a pole about twelve or fifteen feet high. It should be well to have the pole attached to a fence-post or some other handy place by a hinge, so the hole can be lowered when it is necessary to clean it out or remove the English sparrow.

The purple martin is one of our great insect-exterminers. It is an annual visitor, arriving about the 1st of April. It never nests in trees. It prefers some well-sheltered house and one that is not of much of the oak. Many years ago the house wren was quite common, and great colonies were to be seen, but during the past quarter of a century the martin has been neglected and one can travel far miles without seeing a bird-house. Every farmer and, in fact, every owner of a house should insist on maintaining these birds. A great variety of houses can be built. Any one can secure a box from the grocer, cut a couple of small holes in the end and place it on a pole not far from the house. Many of pretty designs can be built that will not only serve a good purpose, but make the home more attractive. The martin loves to be noticed and talked to and it will reply one for his trouble in its cheery note, and in time its presence will be shown in the quantity and quality of the products raised by the insect pests.

## A Tower of Gold

ARRANGED in a law provided in Germany in 1871, the protection which France paid in indemnity to the Prussians the previous year was granted in the form of 20,000,000,000 francs. The famous fortress situated 5000 miles from Berlin receives this amount of money. In fact, it is a quantity of gold in reserve for emergency purposes.

In order to safeguard such a massive store great precautions have been taken for the safe keeping of the money. The money is kept in two floors of the fortress and is packed in 1,200 wooden chests. Each chest contains 25,000 in gold. The invulnerability of these chambers is secured in the following manner: they have triple doors with various locks whose keys are held by certain officials of the Ministry of War; and these keys each open only one door, so that no one could get into the vault.

The chests of the vault are sealed and stamped in such a way that it is not possible for them to be tampered with without danger of almost instant discovery. Moreover, the weight of each mark and chest is registered.

## Responsible Banking

Whatever else a bank may stand for, it must stand for responsibility in every phase of bank service. Responsibility is the word and the law and the fact in the Scandinavian American Bank.

Adequate capital and surplus for the volume of our business; rigid conservatism in every branch of banking; facilities that insure accuracy combined with promptness; every convenience and courtesy that a strong, completely equipped bank may extend.

The bank's first purpose is, and must always be, Security. The next is Service. Whether you live in the North or in the South, in the East or in the West—wherever Uncle Sam's mail goes—there the service of the Scandinavian American Bank will easily reach you.

Banks having collections on points in the Northwest and Alaska are invited to write to us.

Our little booklet, "Banking by Mail," sent to any address upon request.

## Misprinted Bank-notes

Misprints and oddities sometimes, but seldom, get the experts in the United States Bureau of Printing and Engraving. Perhaps the most remarkable misprint that ever found its way out of that establishment was fifty-dollar national bank note printed for a national bank in Kansas City, Missouri. The misprint was discovered by Chicago bank clerk, who, in making up his accounts one day, found a discrepancy he could not explain. In his efforts to discover the discrepancy he placed the pile of bills on his left-hand side and, as he counted each one, turned the note over and under several times on a pile at his right. He found that when he counted from left to right his count exactly balanced, but when he counted it back again a shortage of fifty dollars showed him in the loss. As a bank account book was reversed separately, both above and reverse, one of the bills had the design of fifty dollars on the obverse and one hundred dollars on the reverse. The clerk had taken the bill on one hundred dollars. Upon being communicated that such a bill was extant, the chief of banknotes of the denomination of fifty dollars and one hundred dollars had been received in the office. One plate bore the obverse of a fifty-dollar bill at the top and the reverse of a hundred-dollar bill at the bottom. The other plate bore the reverse of the two notes. After much search was made, the bill was made dry before being run through the press for the obverse printing. In some way the sheet was inverted, and the result that two misprinted bills emerged—one with a fifty-dollar obverse and hundred-dollar reverse, the other with a hundred-dollar obverse and a fifty-dollar reverse. The misprint was discovered by the collector of the bank after he had paid out the bill with the fifty-dollar face and hundred-dollar back.

This occurred in 1900. In the cities an error of similar nature occurred, a \$100 note being printed with the fifty-dollar obverse and twenty-dollar reverse. It is reasonably certain that at least four of these misprints went into circulation. Errors in design and oddities indicating fraudulence on the part of the engraver sometimes run the gamut unaccountably. In the case of the two bills in issue a Treasury agent entirely different from any other ever used by the government. The key, which is one of the most important symbols of the seal, shows a handle at the left-hand side instead of at the right, and all other details are in different shape, while the stars are larger. The two ends of the bank containing the seal are also fashioned with a handle, and that in no other instance is found in the design of a Treasury note. The seal is a two-dollar legal-tender note, in circulation, with which, it is known, the Treasury agent is that a wrong description. They are really inverted fronts, for the backs of all bills are printed face to face. The mistake is about on a legal-tender note of 1903. On the face of the note is a portrait of Webster, while in the right is a representation of Ralph Waldo Emerson to Oliver Elizabeth. At the bottom of the note is a small eagle. Upon the reverse the eagle is represented as a very faithful resemblance to the face of a dollar. A number of national banknotes were discovered that have been taken into circulation and accepted as real money notwithstanding which were clearly not such. The reverse of the note, or of both of either of the backs.

pieces were struck with both pierced and perfect centers in silver, copper, nickel, and composition metal, six varieties in all, without counting the various varieties of metal used in the coins issued by the government authorities, and consequently they were never put in general circulation.

The only gold half dollar ever produced at the United States Mint was struck in 1864. It is a very beautiful piece, and the obverse showed a wavy circle around the periphery with the inscription "U. S. LEGAL TENDER" around the border. The reverse was blank. The coin was exactly half the weight of the ordinary half dollar, and was accordingly called the "half." The gold fifty-cent piece with which the public is familiar was not made until the obverse and reverse were manufactured by California jewelers. There has not been any other attempt to introduce the perforated coin in the two pieces of the denominations of one and two cents were issued at the Philadelphia Mint.

## A Photograph Gallery in a Cemetery

MANY novices have been used for making the resting-place of the dead or of the deceased, and the result has been the creation of a gallery of marble and granite to the grotesque towns of the Ancestral Home. The result has been the creation of their last taste in decoration and their discrimination in art matters, and the result has been the creation of a gallery of marble and granite to the grotesque towns of the Ancestral Home. The result has been the creation of their last taste in decoration and their discrimination in art matters, and the result has been the creation of a gallery of marble and granite to the grotesque towns of the Ancestral Home.

A lady is charged into the death or mourning of the dead, and the result has been the creation of a gallery of marble and granite to the grotesque towns of the Ancestral Home. The result has been the creation of their last taste in decoration and their discrimination in art matters, and the result has been the creation of a gallery of marble and granite to the grotesque towns of the Ancestral Home.

This is by no means a new notion in this town. It began many years ago, the one of the first being a photograph placed there in 1865, which was as plain as though it had been put there a year ago.

Though this notion of having tombstones made to hold portraits originated in the principal cities, it has been adopted in neighboring towns.

## Deer as a Source of Meat-Supply

There has been advocated the scheme of using deer as a source of meat supply in this country. It is believed by many experts that deer-hunting could be made so profitable as to pay for the loss of the Virginian deer and the Rocky Mountain elk are best suited in this purpose. Elk have been advocated in many parts of the world and everywhere they show the same vigor and hardiness. They adapt themselves to the most adverse conditions and their increase under domestication is equal to that of ordinary cattle. It is estimated that there are large areas of rough land in the United States, like the North and Allegheny regions, where elk could be raised. The Virginian deer is adaptable to almost all parts of this country and thrives on land unsuited to horses.

## Perforated Coins

PERFORATED coins were never in favor in the United States, though various efforts were made to popularize them. The first United States coin with a perforated edge was a gold dollar issued in 1849, which had a square hole in the center of the placated. It was the forerunner of the gold dollar issued by the United States Mint in 1850. The coin was engraved, and struck from dies. The next United States coin with a perforated center was issued from the Philadelphia Mint in 1850 and was of the denomination of one cent. It was about the size of the present one-cent coin. At the time the large, old-fashioned copper cent was in general circulation and the perforated coin received the name of "ring cent." The design resembled that of the means of the perforation the coin could be distinguished by touch from the die. Another perforated coin, one of the same size, showed two steps in the field, with the words, "U. S. ONE-CENT PIECE." The reverse showed the eagle with the words, "United States of America." The Mint authorities at the time designed a coin that would answer all requirements, and the

## The Ear of the Owl

It is held by naturalists that, in order to capture its prey the owl must depend even more upon its sense of hearing than upon that of sight. The feathers of both ears distinguish the short-curved and the long-curved parts, one of which catch the air, and the true ear of the owl is a most remarkable organ.

The facial disk of feathers that give the owl its characteristic appearance serves as a kind of sounding-board or reflector, by concentrating the sound waves and to transmit them to the ear of the true ear, concealed in the small hollow behind the eye. The feathers of the side flap of the skin, covered by a remarkable web, are so arranged that the owl can hear its prey strike, distinguish its size and shape of the notes and its position. The owl's ear is so arranged that it can hear its prey strike, distinguish its size and shape of the notes and its position. The owl's ear is so arranged that it can hear its prey strike, distinguish its size and shape of the notes and its position.

The Pacific National Bank of Tacoma

It is no small thing to be the greatest as well as the oldest bank in the City of Tacoma, and the officers of the Pacific National Bank of Tacoma, feel a sense of deep responsibility as well as pride in the eminent position their house occupies. "By their fruits ye shall know them," is a maxim universally accepted, and the fruits of a wise, capable, reliable bank administration are the deposits at this bank. Although there are eight excellent banks in Tacoma, the Pacific National leads them all in the vital element of deposits, having over a million dollars more in its assets than its nearest competitor. The substantial representation of public confidence is the result of a conservative banking policy, splendid facilities and unswerving service. In the period between April 18, 1912, and April 4, 1913, the Pacific National Bank showed an increase in deposits of over a million dollars.

The Pacific National Bank was organized in the fall of 1886, but was not opened for business until January 2, 1890, when it was located in the building just completed for it, at Pacific and Twelfth streets. It began with a paid-up capital of \$50,000, and at the end of the first year the deposits were \$102,000. At the close of business on November 30, 1912, the deposits were \$4,557,331.61, and the capital \$300,000.

The directors of the bank comprise some of the most representative business men in the Northwest. The two largest stockholding interests are the Ladd, of Portland, and connections of the Weyerhaeuser Timber Company. The officers of the Pacific National Bank are: Charles H. Bick, Chairman Board of Directors; Ralph S. Stacey, President; H. W. Laid, Vice-President; Geo. H. Laid, Cashier; J. W. Stephen Appleby, Cashier; A. A. Miller, Assistant Cashier; R. L. Mattison, Assistant Cashier.

The bank has purchased within the last four months a half interest in a corporation which owns the southeast corner of Pacific Avenue and Eleventh Street, considered to be, without doubt, the best business corner in the city of Tacoma, and will, in some instances, it gets possession from the present tenants, which will be April 1, 1914, immediately proceed to install one of the finest banking rooms in the Northwest.

A Mail Transfer Apparatus

When the train halts at a small station, and the man with the mail bag peels a heavy sack of United States postal matter through an opening into the baggage-car, receiving another in return, the quickness and delicacy with which the transfer is made is generally watched by admiring bystanders. That human muscles and joints cannot always be depended upon to do so lightly and sure and accurate as machinery. Accidents have happened and throwing the mail is now considered dangerous, or, possibly in the case of fast mail-trains.

A Wheeler postmaster has invented an apparatus for mechanically making the transfer, which has been so successfully tested that it is reported it will soon come into general use for fast mail-trains. Rising out of a base of concrete is a tower about fifteen feet high from the ground surrounded by a small platform. At the extreme top are two cars. One is set to describe a circle on the side nearest the track. The tip of the horse carrying about four feet, one tip pointing up and the other down the track. Each has been a bowl or joint in which can be placed a sack of mail about four feet from the tip. Below the horse, attached to a standard which pivots toward the track, is the delivery arm. This has the mail in an apparatus which works in unison with the outer arm. A track in run along the roof from one side of the car to the other over the center of the door. Resting on this track is a steel carriage on wheels with a delivery arm on each side. The arm is attached to a hook fastened to the forward side of the door of the car. When the delivery arm is pushed into the hook in position for the exchange of mail.

The man at the station fastens his mail bag to a ring made especially for the purpose, which is fast into a slot at the end of the delivery arm on the standard, the horse and arm being brought into a horizontal position. He feeds in one of the papers of the mail, leaving the other pointed out in the direction of the approaching train. The man at the other man puts the bag to be delivered on a corresponding ring, which he fastens on the delivery arm on a rail. As the train nears the station he pushes the sack along the track over the door, then it goes to the doorway, where it tilts with the bag suspended outside in a position to be caught by the hook of the receiving arm at the station. As the

hook catches the bag from the outside it is wheeled into the car, the exchange being accomplished almost instantaneously. The weight of the bag going around the horse causes the horse to bend back so that the contrivance is absolutely safe.

The Largest Stone Ever Quarried

The largest stone ever quarried has been found in Heather in Idaho. It has been one of the mysteries of the ages how it was that the great blocks of granite used in building the Pyramids were ever raised to the heights and swung into the positions they now occupy. Quite as much of a marvel to the modern thinker is the problem involved in quarrying an enormous block of stone so the use discovered in Heather. This monolith is fifty-nine feet long, fourteen feet broad, and seventeen feet in depth. Its weight is estimated at fifteen hundred tons. Near by is the rest of the ancient Temple of the Sun. It is believed by archeologists that this huge stone was intended for the roof of the building. This supposition is based on the fact that in one of the walls still standing are to be seen great slabs of stone which show all the marks of a saw which cut a length of sixty-three feet and a height of thirteen feet.

Most wonderful still is the engineering feat which placed them in the position where they are today, slabs of feet above the level of the ground. No sign of any quarrying mixture is to be seen anywhere to link together the stones of this ancient structure. The slabs have weathered, melted, and traveled into position so evenly that it is with difficulty and only after the most careful search that the joining can be found. No probability is there whether it is possible to thrust between them even the small blade of a pocket-knife. The beautiful granite is so evenly preserved in position in the quarrying, preparing of the stone, and the building of these ancient temples that the weathering still farther increases the assurance of the quality of the metal and steel equipment of these recent ages. No laborer who attempts to lift his hammer in the air at the stroke of the clock ever knew these stones. Much of the work has been done with love or under the awe of a great religious feeling. So it is that the archeologists are considering ever newer problems—the quality of wood and tools in the mass of antiquity.

Gold Leaf

The gold reaches the "beaters" fresh in wide bars or nuggets. It must be weighed, melted, and drawn into leaf-ribbons before the "beating" begins. The ribbon is then cut into leaf squares and beaten with a hammer worked by a stationary workman. It takes each leaf less than ten minutes to transfer to a mold, where it is beaten again for a period of four hours. The beating is accomplished by means of a wooden hammer working from seven to eighteen pounds on a sheepskin cushion resting on a granite block. The gold beater is usually twenty or twenty-five karats fine. A little alloy of copper or silver is added to make it malleable. It would be impossible for the beater to handle perfectly pure gold.

Gold leaf is packed away by the aid of the beater, then that of the hands. The operation of transferring a sheet of almost transparent gold leaf from one place to another is of such delicacy that it is possible to accomplish it only by a slight puff of the breath. The parlor air, for the most part, goes in vain, after beating, the gold leaf is handed. The girls lift the unshaped leaf from the mold with a pair of wooden pincers, and then in a delicate custom by gently blowing on it, cut it into a perfect square, replace it between the leaves of the book, and then it is with the breath. A "book" consists of twenty-five leaves, and a skilled girl operator can pack seventy books in a day.

Siberian Bees and Bee Masters

One would never think of Siberia as a suitable place for bees or the practice of bee-keeping. Yet this is true by the presence of that region, and swarms of wild bees are to be found in the brush forests.

Those who keep bees in Siberia bear the title of bee-masters. Some of them have no more than four swarms, but many have fifty or a hundred, and certain "hobby" men own five or six hundred. The average annual harvest in Siberia, from one swarm, runs from one to three quarts and a half. In certain localities buckwheat is sown to serve as a "pasture," and successfully yields one quart or more of honey a year, or, finally, for the most part the swarms feed on wild flowers along the borders of the great forests.

GOOD ROADS DOUGLAS FIR PAVING BLOCKS

TACOMA, WASHINGTON

How

The Wheeler, Osgood Company of Tacoma, Washington

developed into an institution of national importance in the Door-making industry.

- First—By selecting a spot where the largest supply of the most beautiful fir door lumber is the world's tributary to this plant.
- Second—By looking well to their sawing, knowing that each door ordered from their factory was a good which would bring its kind.
- Third—By believing implicitly in the superiority of the fir door.
- Fourth—By knowing that each step in the march of improvement but opens up new avenues of improvement in manufacture, ultimate perfection being the final goal.
- Fifth—By investing in the most modern machinery for the production of those ply laminated fir panels which cannot check, swell or warp.
- Sixth—By recognizing that the other party to a bargain has well vested rights which must be respected.
- Seventh—By reason of a number of other causes, all relating, however, to perfect thoroughness, better and better manufacture and scrupulous attention to the needs and desires of its customers.

Thus it will be seen why The Wheeler, Osgood Company has built well. It followed the chart outlined above. It couldn't help itself.

Echoes

MR. SQUIBBAN

George Harvey's resolution will arrive in the hands of the committee just before the meeting of the 15th of P. Morgan, it is doubtful to the extent that the resolution will be taken up. It is doubtful that it will be taken up at all, and it is doubtful that it will be taken up at all.

When Mr. Morgan will be in the country, it is doubtful that he will be in the country at all. It is doubtful that he will be in the country at all.

That Mr. Morgan will be in the country, it is doubtful that he will be in the country at all. It is doubtful that he will be in the country at all.

We would not advise the methods by which the House should be organized, but we do advise that the House should be organized in such a way that it will be able to do its work.

Judge says that he is not in the hands of the House, but that he is in the hands of the House. It is doubtful that he will be in the hands of the House at all.

George Harvey, editor of Harper's Weekly, writes that a resolution of his in New York, which would give the House the right to elect its own members, is not likely to be taken up.

It is doubtful that the House will be able to do its work. It is doubtful that the House will be able to do its work.

It is doubtful that the House will be able to do its work. It is doubtful that the House will be able to do its work.

It is doubtful that the House will be able to do its work. It is doubtful that the House will be able to do its work.

## Flowers of Field Hill and Swamp

By CAROLINE A. CREEVEY  
Author of "Mosses in a Garden"

The volume is the outcome of the author's idea that a grouping of plants upon the natural basis of environment, including soil, shade, moisture, etc., is possible. She describes all of the wild flowers commonly met with in the Atlantic States in our country and through a matter that the amateur botanist will find no difficulty in readily placing them in their proper groups and families. The illustrations, about one hundred and fifty in number, have been drawn from the living plants, and will prove to be an irreplaceable aid in determining a few several varieties.

## Feats of Photography

Photographers, professional and amateur, have expanded their skill and energy in obtaining all manner of difficult pictures—racing horses, jumping athletes, flying machines, flashes of lightning, to say nothing of the abiding spiritual form of revolving double stars. But the great stumbling-block to all photographic success, so nearly the insurmountable one, is the very soap bubble. One such has said that for a long time it has been his ambition to picture a soap bubble in the act of breaking. He has experimentally tried this, however, in all respects of this kind, every time occupied in the disappearance of a breaking bubble must be only a small fraction of a second.

Anybody who has watched a brilliant soap bubble burst knows how quickly it vanishes. The authority quoted thought it might take one-twentieth of a second; but by repeated experiments he has found that the time occupied in the disappearance of the iridescent film is not more than one-thirtieth of a second.

To catch such photograph one of these vanishing films between the instant of its breaking and that of its complete extinction proves a most difficult undertaking, but it has been accomplished. It might be thought that it would be equally difficult to catch a lightning flash; but it must be remembered that lightning makes an intensely vivid impression, while the color of a soap bubble is evanescent even in the bright glare of an electric spark.

From printing the image of the flying edge of a broken bubble in the three-hundredth part of a second to disclosing the existence of a great nebula in the heavens by the cumulative effect of several hours of continuous exposure, the modern photographer is still performing many wonders in behalf of science and proving himself one of the most powerful means at man's disposal to attack the secrets of nature.

It has been suggested that it is entirely within the bounds of possibility that the same member of the brotherhood may yet have his photograph taken and so become familiar to thousands, who have never seen the astrophysicist who took it. It is known that the so-called specter is simply the shadow of a person standing upon the mountain, projected on the surrounding mist.

Some years ago, it is said, an official of the Weather Bureau at Washington, while making some observations on the summit of Mount Washington, used to amuse himself by raising the specter of mist visitors to the observatory to appear in the mist enveloping the peak. For this purpose it was necessary only to place a light on the top of the shadow of a person on the foggy cloud above of him. Sometimes a gigantic specter was produced with startling distinctness, though never repeating the phenomena seen from the Beacon, where the coincidence seems to be previously favorable. The Englishman reported to the Royal Meteorological Society the results of similar experiments made by him in the same location for some time. He succeeded in raising his own specter by placing a flashlight at the back of his head. Then he photographed the specter.

## Rest Cures for Razors

It is well known that our razors are conductors of electricity. Steel is an excellent conductor, and when this metal is laid into folds with sharp edges the electric current that is continually passing through the metal will leave the body of the sharp point or edge.

Barbers tell us the razor gets tired and is improved after a rest. This is true in a scientific sense. It is not exactly a rest that the razor needs, although that term will express it pretty well.

It seems that any razor, after constant use on the human face, will become so exactly dull, for the razor can sleep on it, but rather sluggish and refuse to work so readily as when it has lain for a few weeks without work.

Constant use and continued sharpening put the molecules into a sluggish condition, and it is impossible to get the same edge as when the above law has not been used for some time.

When the razor lies idle and the electric current is passing off at the edge the particles are being heated and tempered, and the edge actually becomes more exactly and really sharper and more fit to restore the beard.

It is claimed that a razor wrapped in rubber cloth and placed in a drawer away from any damp will not be benefited by the rest on it will a razor that is simply laid away rather than wrapped without any insulation. It is the same if the razor is enclosed in a glass case, for the insulation prevents the electric current from passing through the metal.

## "That Is Nicer Than Darning Hose, Isn't It?"

"Yes, Dad, Holeproof Socks and Stockings Are Comforts"

Soft as down—easy to walk in. Nothing for travel, or every-day wear. Gives much comfort and convenience.

Six pairs of these wonderful hose will wear at least six months without holes. That is guaranteed or you get your hose free.

From \$1.50 to \$2 a box of six pairs. For women and children \$1 to \$2 a box of six pairs. For infants, \$1 a box of four pairs. All the above hose guaranteed six months.

Silk Holeproof for men, \$2 for three pairs. For women, \$3 for three pairs.

## Holeproof Hosiery

FOR MEN, WOMEN AND CHILDREN

Yet they cost just the same as the kind that wear out.

**Why Holeproof Outlast Others**

We pay an average of 75¢ a pair for the cotton yarn in Holeproof. Common yarn sells for 50¢.

We spend \$90,000 a year merely for inspection, to see that each pair is perfectly made. That's your best quality like this! Holeproof is cotton, for men, costs

Three pairs of silk guaranteed three months. The genuine Holeproof are sold in your town. Ask for dealers names. We show stores where we have no dealer, charges prepaid, on receipt of price. Write for free book about it.

## COMMENT

CONTINUED with the issue of August 19th. Mr. NORMAN HUNTON will take direct personal charge of HARPER'S WEEKLY.

## Colonel Roosevelt's Habits

Once there was a college boy who was suspended for intoxication. A classmate who was questioned about him explained that the trouble was not that he was a hard drinker, but that what stimulated he took ran so fast to volatilization. The classmate said: "There had been a dinner, and HENRY had had some champagne, but was carrying it quiet, not getting across the yard about half-past eight, with SAM; and the yard being so quiet, he said it was like the jungle, and then he insisted on playing lion-hunt, and said he would be the lion, and roared so immoderately that it woke all the proctors, and of course he was suspended."

We guess that if Colonel ROOSEVELT's potations had run to the excess the editor of *Ira's Era* supposed, there would have been no need of this trial that has been going on at Marquette. Can any one imagine the Colonel quietly intoxicated? Would not his case have been simply like HENRY's, who was his own advertisement, but was insisted on having a bad hour? It was reported that the witness for the defendant at Marquette would testify that the Colonel came on the speakers' stand at several campaign meetings supported by his friends. So it would not have been if his potations had been excessive. His friends would not have been supporting him. They would have been adding to the ropes and he would have been dragging them along. We doubt if there was ever a man in public life in this country with a smaller gift for dismissing himself in liquor than Colonel ROOSEVELT. If he had ever been drunk, every one would have known it. He would certainly not have been in a crowd of words-of-mouth stories, but intelligently spread to the effect that he was drinking hard. These stories almost never got into print, and so could not be dealt with effectively. It was to settle them, permanently, if possible, that the Colonel sent the editor of the far-away trade paper in Michigan who made the mistake of getting down in black and white what thousands of people were saying.

And he did settle them. The editor after hearing the testimony admitted that he had been mistaken, but avowed that he had made his accusations in good faith, and on what seemed to him good evidence. The truth seems to be that the Colonel's campaign manager, in its most urgent manifestations, produces in some observers an impression of intoxication. Perhaps it is an impression, but certainly it will not again be charged that his intemperance is alcoholic.

## Eben Ferguson

So fast the times change! Our comparison after overnight. Yesterday we said, "Seber as a judge." Now we say, "Seber as a Colonel."

## The Great Continuing Need at Washington

When BOAZ returns, HANNA H. STRUSSER will be the strongest New York Republican. He enjoys now the distinction of having been voted against by more men who wanted to vote for him than any other man that ever ran for high public office in this state. It is a pleasure to note that he apparently has no mind to give up politics. The contrary can reasonably be inferred from his leading part in the anti-HUNTON dinner and his vigorous proclamation about the way things are run and should be run at Washington.

What he says about the machine at Washington is not so convincing and foreworn because hardly any of it is new. On the contrary, these independent conclusions of an upright and highly trained mind ought to be taken all the more seriously because they confirm instead of dis-

putting the conclusions reached by other intelligent men who have seen the inside of things at the capital. They certainly could not be disregarded merely because they find the chief defect of our system where it has always been found—in the lack of a good working relationship between the executive and legislative departments.

Mr. STRUSSER wants to see responsibility and authority at Washington more concentrated and more clearly fixed, and so does every man of sane mind and patriotism who has ever had a chance like his to inspect things there. As authority and responsibility are dissipated in a legislature but concentrated in an executive, Mr. STRUSSER naturally favors more leadership for the executive. He wants the President to make the budget and to Cabinet members to defend it, for their respective departments, before Congress. He wants the President to have the right to veto separate items in appropriation bills. Inevitably, therefore, he approves of President WILSON's endeavor to establish a more direct and personal relation between himself and the Cabinet, on the one hand, and Congress, on the other hand.

We agree heartily with Mr. STRUSSER's general contention, and again call attention to the fact that in the only attempt ever made to improve on the Constitution by any thoroughly experienced working it—that is to say, in the Confederate Constitution—his two main proposals were actually carried.

Still, however, there is the Constitution as it stands, and we can't help feeling that President WILSON is perhaps already going as far in the desired direction as that document permits. He is certainly not shirking responsibility; he is working and not avoiding a real leadership. Quite as well as would like very well indeed to see his heads of departments face one or the other of the two Houses, so he has faced both; but at present that depends mainly on the inclination of the Houses themselves. So with the budget question: he has and probably will send in budget messages, but is extremely doubtful if Congress will give them the authority they ought to have. As to vetoing separate items in appropriation bills, there is probably no power which at this very moment he desires more ardently to exercise, but it would be an extremely retrospective act if he should assume that he has it. Every President has had in general the contrary view. It is very probable that they ought to have this power which apparently the Constitution denied them.

We are afraid the reforms desired by Mr. STRUSSER and so many other thoughtful men cannot be accomplished without an amendment, and a different and deliberate one; and amendments are always very hard enterprises. Still, we are almost hopeful that our present political mood, if wisely guided, may yet yield at this so desirable and so long-desired improvement in our system.

## Dissents

"Pure-fair" was Colonel ROOSEVELT's answer when questioned at Marquette about the report that he was about to detach himself from the *Outlook*.

## For Investigation But Not For Delay

The way to pass the tariff bill is to speed and gose it. To find out about the bill, by proposing it should be delayed, is in many ways desirable, but it is not essential and it will be something of a digression. Incidentally, to do the tariff job promptly and do it right would be the best possible defense for Senators against all real or imagined intimations that they are being improperly influenced in connection with the bill. However, that we object to a lobby investigation per se; certainly not that we at all blame President WILSON for calling attention to the lobby. If he found a powerful lobby working against his cause of tariff reform he was quite justified, as the recognized leader of his side. If telling the country about it and its methods, if telling the country about it so doing to make more difficult our attempt at compromise or any yielding on the part of weak supporters, so much the better. Granting substantial accuracy to his decidedly general statement, it was perfectly legitimate political fiction.

On the other hand, it was natural, as things turned out, for the Senate to feel itself particularly concerned. It was also natural, and not unpraiseworthy, for the Republican minority to try and make a little capital out of the incident and use it to annoy and perhaps delay the majority; and it was natural for the majority, when challenged in its investigations, to accept the challenge, and then there-

after take sharp of the proposal. But their leaders erred in accepting insinuations, and thereby widening the scope of the thing and making it an investigation of the Senate as well as the lobby.

That was a rather childish display of ferocity, and it made the contract too big for the lobby; limit it to what would have been quite enough to find out and tell us about the lobby itself. For that institution, though perfectly real, is hard enough to define or describe or even to locate. It is in fact ubiquitous; its composition is forever changing; its methods are innumerable. If the few members of the Senate's subcommittee can originally in any way suggest merely the main facts about it, and give the public merely an outline notion of its character and extent, they will do well.

They will do a real service, too, but not if their report again leads the Senate away from its proper business at this time. That business, we repeat, is passing the tariff bill.

## Hitcheck and Durison

The post-office has always been the place where the national government touched most intimately the lives of the greatest number of people. It never has been hard to get the average citizen interested in the way his mail is handled, and it will be easier still, now that we have so many new and improved ways of carrying other extensions and improvements of the office.

Unusual interest, therefore, attaches to some matter given out at Washington about the recent past and the immediate future of the Post-office Department. One finds it in two statements of special significance, the one by the Postmaster General BRADDOCK which is signed by five men—two hold-overs from the HERRICK régime and three new WILSON appointees—who have been acting as a commission to survey their department. It finds a good deal the matter with the way Mr. HERRICK ran things, particularly on the score of special patronage. It also recommends, and we of the thousand care of changes upon his successor; but this is its most significant finding:

Instead of a surplus of \$218,134.14 for that year [1914] as claimed by your predecessor, it is clearly demonstrated that there was in reality a deficit of more than three-quarters of a million dollars. Furthermore, a close analysis of the financial statement for the year 1914 discloses the fact that the assumed deficit of \$1,783,323.10 for that year was understated by nearly \$100,000.

The other statement is by Mr. BRADDOCK himself, and this is the significant part of it:

The thing of first consequence is efficiency; that the people may have the best possible service from their postal system. They also realize that the people are not interested in the way they are more interested in good service than they are in any technical showing of surplus.

Maybe we ought to suspect the first statement of being colored by partisanship, and there is some justice in Senator PRUSSER's reply that the old deficit had at any rate been substantially paid out, by the time the accounts were settling in the end, by the new administration. Nevertheless, those of us who have had occasion to study closely Mr. HERRICK's part in the politics of the Tarif administration will find it hard to be completely incredulous of a charge that he played politics in his own department. His main part in the trade war, and his main concern over the Southern office holders' constituents by no means excluded.

Maybe, too, we ought to find some new-born untowardness in Mr. BRADDOCK'S announcement of policy. But it certainly strikes us as a sound policy to be announced, and those who know Mr. BRADDOCK best seem to think him a man to take such a position. As a matter of fact, people do prefer efficiency in the postal service even to a real surplus of a few hundred thousands. We suspect they would welcome increased efficiency even at the cost of a reasonable temporary deficit.

## California's Land Law

The bill passed by the California legislature about the Japanese precedents is almost identical in character with the laws of the United States and requires land so situated and other things may acquire land to the extent provided in existing treaties between their government and ours, and in addition may lease for three years land for agricultural purposes.

This law seems not to conflict with any other laws of the federal government, and unless it does the federal government must, if necessary, and undoubtedly will, back it up.

## Fruit of Discipline

Remembering MR. CRYSTAL'S recent paragraph in the WEEKLY about California, a correspondent writes:

California's credit the economic efficiency of the Japs, and more especially still their moral and industrial efficiency, in this means anything to you. The trouble seems to be that the Jap can run a hundred horse-power engine on the fuel that a small pony would need. That is what bothers the Californian. He can't get his machinery going at all until the dynamo is well oiled, and he can't develop the efficiency of the Jap with fuel enough for JACK JENNINGS.

The Japs, and the Chinese more or less, and also the Jews, are people of vigorous stock who have been subjected to a tremendous discipline. They also represent, all of them, a survival of this physically hardest.

Time was when there was hard discipline in New England; the discipline of an exacting climate, an exacting religion, an abhorrent soil, and rather meager fare. The Yankee came to be an error on the string of a britch boy, that need for any fair mark with survived accuracy. He had generations of self-restraint and painful effort behind him, a way, always, of coming up with his lay out on time. As the wealth of the West became accessible, "boom!" went New England's bow, and she got her share of it.

The Japs seem to be the product of a discipline comparable to the old Puritan discipline of New England, but harder, and very much harder than the discipline of current life in wild and beautiful California. So long as there are not too many of them—and a decreasing number—in California, it would seem as though they must have a value in agriculture as poor-makers. They have shown what can be done with a little land by hard work, and that is no small service.

As for what our correspondent calls their "ecological efficiency," that of course exists. They are not desired at neighbors. When we probe that situation we come to the fault of the Japanese civilization; that the Samurai had too much of a monopoly of the nobler traits of character. Besides that discipline, while it makes for efficiency, does not make so surely for liveliness. The Yankees were not universally beloved in the period when their discipline was most effective.

## Entirely Mistaken

Remembering upon the change in ownership of HARPER'S WEEKLY, and reviewing with some reluctance its career under the editorship of Mr. CRYSTAL, the San Francisco Argonaut goes on to say:

There came a time when the editor [Mr. CRYSTAL] was required for alleged business reasons either to "close" his interpretations and temper his judgments, or resign. Men of integrity and energy as he was, he quit the post in which he had so long been laboring for himself, his business associates, and for the WEEKLY.

Brother BURNHAM has been curiously misinformed. Mr. CRYSTAL never quit his post. He was editor of the WEEKLY when he died, and active in his duties until his last illness. The Harpers looked him gallantly and with condescension and affectionate fidelity and at various financial cost, in his contradictions with HARPER and his refusal to support BURNHAM. The Argonaut seeks to make it appear that the WEEKLY suffered because of the spiritual leadership. That is entirely untrue. The very contrary is much nearer the truth, as Mr. BURNHAM may learn in detail from a book published last year—*The Harpers and Harper*, by J. HERMAN HARPER (Harper & Brothers). When Mr. CRYSTAL failed in health and was, as it turned out, dying, Mr. SCHERER was engaged as the man most fit, and most acceptable to Mr. CRYSTAL, to take up the pen that had fallen from his hand.

## Wilson and Massachusetts

The President is having an extraordinarily hard time in his efforts to bestow high federal offices upon high-class men from Massachusetts. The refusal of OLNEY and ELMOT to take the British ambassadorship were not surprising, though regrettable, but now JOSEPH R. BROWN, a regular Democrat of exceptional fitness, has declined, and this writing will reveal that he will not stay at home and be collector of the Port of Boston.

Nobody can criticize those traders of office. The offer to BROWN, if anything, more admirable than the others, because the collectorship is a place the Boston machine draws exceedingly and which usually goes to a politician, and because Mr. BROWN, the very able "business" brother of the late Governor BROWN, is not a native of Boston. Yet Brother O'BRIEN, of the Boston Herald does find fault with the President

He finds fault because the traders have been known before the President knew they would be accepted. That procedure, as he remarks, is rather contrary to usage, and perhaps there is something also in the idea that it may somewhat detract from the prestige of appointees who finally accept. But we are quite sure that President CRYSTAL gives a reason for taking this course in Massachusetts, as in some other quarters. He has in that way made plain, more convincingly than he could by words, the extent of his determination to get the best men he can for important places; he has also indicated his dereliction of the task of selecting more factious—and a privileged source of weakness to his party in Massachusetts, as elsewhere in the North. It is probable if he is always get the best men in sight it is not his fault. We trust Mr. BROWN will reconsider and accept. Even if he doesn't, however, we predict in believing—and without definite reasons—that high-class men from New England will have a reasonably active and conspicuous part in the work of this administration.

## Fashion and Mills

Any one who has average powers of observation must have noticed that women wear less clothing than formerly; fewer petticoats, for example. We read that the cotton-manufacturers of New England have made this discovery, and estimate that the modern fashion of women's garb has caused a drop in the demand for the kinds of cotton cloth used for garments which women no longer wear of from one-third to one-half.

We hope the cotton-manufacturers will remember this remarkable fact when they come to speak to us about the effect of the new tariff on their business.

## Justice Coburn's Case

The accusation made against Justice CHASMAN is that in 1894, '95, and '96, before he went on the bench and while a member of Mr. CHARLES MERRILL'S cabinet and a member or grand juror of Tammany Hall, he received from JOHN A. CONNOLLY some amounting to \$5,000.25 as retainer on an city contract prepared for CONNOLLY'S company by the influence of CHASMAN; that CONNOLLY, being in financial straits, complained to his friends that he had had to pay these "contaminations"; that six members of the Ancient Order of Hibernians went to Mr. MERRILL and complained that "the closest man to him in politics had been swindling on a member of their order"; that CONNOLLY thereupon procured protection by MERRILL, gave back the money to CONNOLLY; that CONNOLLY later needed further assistance and applied to CHASMAN for it; that CHASMAN loaned from him a note for \$4,000, the sum which had already passed twice between them, as a preliminary to helping him, but did nothing for him. The subsequent course of events, as narrated by MERRILL, gave back the money to CONNOLLY, returned the note for \$4,000 to CONNOLLY.

These transactions seem to be offered for public consideration as improper. Even some members of Tammany Hall seem for special reasons to consider them so. PATER M. NEELY, one of the six Ancient Hibernians who went to protest to MERRILL about CHASMAN'S treatment of CONNOLLY, has undertaken to give the following account, published in the Herald, of his visit to MERRILL. He says:

"I remember," I said, "Mr. MERRILL, that we're here as a matter of business to-night. I don't know how you would permit any one to bring on to me any of your order if you know it, but we're here to tell you that we've got a man to you in politics to-day has been getting on a number of our order."

"Who is it?" MERRILL asked, angrily.

"DANIEL F. CONNOLLY," I answered, as polite as you please.

"I don't believe him," said MERRILL. "Anyway, if he did, he's entitled to it—he's a lawyer."

"It's not entitled to me the money of Tammany Hall is holding it, even so," I said, "and far less his influence as Grand Juror."

"I don't believe in that," said MERRILL, "and I don't believe in that either."

"It's not entitled to me the money of Tammany Hall is holding it, even so," I said, "and far less his influence as Grand Juror."

"I don't believe in that," said MERRILL, "and I don't believe in that either."

"It's not entitled to me the money of Tammany Hall is holding it, even so," I said, "and far less his influence as Grand Juror."

"I don't believe in that," said MERRILL, "and I don't believe in that either."

"It's not entitled to me the money of Tammany Hall is holding it, even so," I said, "and far less his influence as Grand Juror."

"I don't believe in that," said MERRILL, "and I don't believe in that either."

It will be observed that what scandalized Mr. M. NEELY was not that Mr. CONNOLLY received commissions from a contractor, but that he exacted them from "a member of our organization who is also a contributor to the Hall."

All this is at present only a story, for which Judge CHASMAN has furnished an explanation, but it is a story which illustrates very well the prevailing theory of how the powers of Tammany are organized, and how the able politicians who organize them are subsisted.

## Prison of New York

New York State is not poor. It has found a hundred million dollars to spend on canals, and as much more for roads, but neither canals nor roads are so urgent a need as better prisons. The State Commission of Prisons says in its annual report:

It is undesirable that the State of New York will continue to use indefinitely the prison plant at Sing Sing in its present condition, and the commission to have the plan of its legislature to provide a modern and sanitary prison plant at Sing Sing or elsewhere.

The State Commission would remodel Sing Sing and complete the new Great Meadow prison, now building. Also it would proceed with the plan for a penitentiary at Rikers Island, to replace Blackwell's Island, which is very overcrowded since the Kings County Penitentiary in Brooklyn went out of business.

The more we hear about New York state prisons the worse their state appears. The Governor has appointed a new State Superintendent of Prisons, JOHN BILEY, of Philadelphia, who has appointed Mr. BILLY as his chief clerk, and Mr. BILLY as chief clerk of the State Prison Department. It was Mr. BLAKE who as special commissioner to investigate the prisons lately made a report denouncing conditions at both Sing Sing and Auburn. These appointments may help matters, but there is a work of prison construction to be done which will require very considerable financial resources, and without which the best management cannot do what should be done.

## Harvard Clubs in St. Louis

The Associated Harvard Clubs have been holding a convention in St. Louis. There are a lot of them; their chief business is to advertise the university and they hold a convention somewhere every year. Last year they held it at New Haven, and had a very jocular celebration that lasted three days.

The paper says there were about three hundred delegates at St. Louis. President LOWELL was there and addressed them. He said the democratic spirit was growing at Harvard, and that the new Freshman dormitories would help it. It would be hard something to say about the Harvard clubs, and it is the more interesting because the Yale clubs have lately been so much a subject of public discussion. He said: "The clubs must be open windows instead of ironstones, and in a few years this will be recognized." That is, a few of what is desirable to the student body, and it has as much application in New Haven and other places as in Cambridge.

We find Mr. ALLEN, of Cincinnati, quoted as recommending that Harvard University be popularized, and that the public expression of its exclusiveness be counteracted in every way possible. "In the matter of social life," he says, "we do not stand for exclusiveness, and the idea seems to prevail that Harvard men think themselves a superior class of persons. The Associated Harvard Clubs should try to do away with this feeling."

Harvard University is about as exclusive as one of Mr. WALKER'S recent stores, and inasmuch as the style of the associated clubs is to popularize the university, one can't blame Mr. ALLEN for exhorting the delegates to be active in that endeavor. But there is this to say, that the West, when it goes to Harvard College, goes to get something different from what it has at home, and if the difference is popularized away, the Western trade may fall off. Moreover, it may not have a large market to sell "the better, open door" and good line of advertising, to be thought exclusive. Ask the hotel man if a reputation for exclusiveness hark a hotel. And further, would not the Harvard men be better advised to vindicate their alleged opinion that they are a superior class of persons, rather than to abolish it? Why bother to come East to Harvard if it is not going to make you a superior person?

We are not more than half convinced that Mr. ALLEN, of Cincinnati, is an (un)educated hand to sell educational goods.

## Democracy and Distinction

It has been a frequent complaint against extending democracy that distinction will be lost by being lost in the shuffle; that manners, taste, scholarship, etc. will become extinct. The complaint is loud in all public bodies, the House of Commons no less than Congress, and it has been raised by the compilers against the abandonment of all current literatures, scholarship is so specialized as to appeal only to other specialists, and a man like Emerson writes, addressing a public philosophy of the day, in one of his essays, he is unfortunately right by the rule because he is accepted by the many. The arts need as well such general approval be pushed a bit to the side. "It is not the age for art," admits Ruskin. All these complaints are entirely unjustified, and yet the time for higher things is as far as they ever get in the domain of the untrodden New; that art picture pleasing to more than one tenth of its audience should be at once buried in a worthless hole; can neither attract magistrates with numbers of medals than such matters of taste. As a central style said: we must intrust the choice of our dramas and monuments to those whom we should be free from intruding with the choice of our wives, cigars, coffees, and even our wives.

The difficulty with an overflood of a rapidly rising democracy is that, like other rivers, it moves along the lines of least resistance. It is not so difficult to flood the mountains, and tear away obstacles than to fill up the valleys. So that in a large extent the fate of scholarship, taste, and distinction in the hands of a democracy will be a process of leveling down to the water level. Like the river that flows in the river that was eager to be broad and to include everything that it became a swamp, so the arts that please all are apt to become universal.

Democracy, however, has a great moral significance. It refers to the general needs of man, and distinction and taste are, after all, the luxuries of the preferred. We cannot always afford luxuries. It is becoming a more and more universal rule that the more we have to be had upon something more substantial than the sacred, yearly load of hope deferred, it is trying, but not so terrible, that the classes should issue a little of the decoration of sheltered chains and high breeding. Who is it who in a sudden outbreak of wealth proclaims, "dignity is impossible!" so often distinction seems now assumed?

Democracy, said a lady, was and always so destructive. Times have passed when the man of the world had a small distinction. But probably there is no little element in the idea that our nation after the Revolution represented a pure democracy. If it was democracy at all it was only in the sense that the people means the demand for distinction has not been less democratic than the entire temper and mood of Virginia and North Carolina up to the stately sundering reconstruction of the twentieth century. In England the aristocracy has been more democratic than a democracy. "Not Haugheuse," says Dr. West, "inhabited the cottage at Princeton, North Carolina in 1765, while Mrs. Belcher in Gad, Georgia, and her husband having a freehold of fifty acres at a town led and kept a respectable life. In Maryland, Virginia, North Carolina, and New York the right to vote was based on property-holding and payment of taxes. The qualifications for holding office were exclusive to an even smaller class."

With our happy habit of looking to the past as the time when God was in his heaven and all right with the world it is surprising to see Professor M. West writing: "It is a mistake to suppose that democracy is a stealing powerhouses and legislators, in view of the fact, in estimating and distributing patronage to whom patronage is due, in all friends and tricks that go to make up the political machinery of the time, as to who founded our state and national governments, we always one opinion and often our masters."

Indeed, the sense of fair play, which is democracy, at least a slow growth, and can hardly really originate in a mass. And if of a certain social degree of ease and high civilization must go by the board that the men may have healthy growth and reason to live, it is not so dependent upon the past as we are wont to think.

Even from the standpoint of a real and vital art, the outlook is not so sad. The changes brought down so heavily upon us are still only in the process of change. The actual difficulty was art, industry, with literary and representative art, and the time to enjoy it. The classes are too busy rushing from place to place in pursuit of super-health and enjoyment, and the masses are too crushed by the unrelenting struggle for food and shelter to indulge in art. Nine democratic aims of culture, health, and equal opportunity for all the people, it may tend to a more widely opened house, a more adjustment of pleasure and pain, and a more equality of living level of culture and refinement. At any rate, it will be well to realize that good work can never be done by those who live from hand to mouth. **BARBAR** in the *Century* has written very severely in connection to the life-to-prostitute and to the lowest class.

Just in so far as democracy will extend health, leisure, and interest in life to the masses and restrain selfishness and selfishness of the classes, just in so far as it will be the result for the masses of the highest distinction, find democracy means fair play and the new distinction will be more than mere privilege.

The tendency of the new democracy will be toward power of mind and liberation and a healthy faith in the power of human brains and character to make the best use of their freedom, and to have the courage to hope for a more respectful business of distinction.

LOUISA CAROL WINGE.

## Correspondence

## THE NEW WOMAN

By Mrs. N. J. ANDERSON.

To the Editor of *Harper's Weekly*:—

Some great deal of the discussion over the new woman as something really new ignores facts which even those who believe in the "historical" view of woman are not likely to overlook. The study of the woman's mind ought to include in their thinking.

The female of our species is likely to be the stable conservative element, it largely through the fact that "sports" enter and survive are produced. That is one fact that we forget when we speak and act as if we were the male. The female of our species is likely to be the stable conservative element, it largely through the fact that "sports" enter and survive are produced. That is one fact that we forget when we speak and act as if we were the male. The female of our species is likely to be the stable conservative element, it largely through the fact that "sports" enter and survive are produced. That is one fact that we forget when we speak and act as if we were the male.

There is not, in fact, much that is new in any woman. It is only in her habits, character, and manners that she differs from the woman of the past. The new woman is the old woman under new conditions. She is the daughter, as she always was, of two persons—man and woman—of the old and the new—of the old and the new. She is the daughter, as she always was, of two persons—man and woman—of the old and the new—of the old and the new. She is the daughter, as she always was, of two persons—man and woman—of the old and the new—of the old and the new.

Why, then, the term "New Woman"? There must be some new element in her.

There is not so much difference between the early-Victorian woman as is usually depicted in the popular imagination. She was not so different from us as they are between the fighting, roasting, dandified, and well-to-do of the German tribes who filled central Europe and the downward look, long-suffering and uncomplaining mothers of the ungrateful impoverished child laborers that followed them. A suffrage is not as widely different from a Pillbox, but it is not so different from the woman of the house. They are all women and, in woman's essential attributes, all alike.

Independence, necessarily accompanied by her first-hand intimacy with economic laws, follows as a corollary.

Naturally, with the detachment of women from the domestic mass, so that each becomes an economic unit, there arises a great wave of democracy equivalent to a new birth of importance to the state of the individual and challenging all claims to class privilege.

And finally, with this movement there is a changed conception of the theory of government. Secretary Root would the last of a passing look when he declared that the government is not for the people, but the people for the government. It is not for the people, but the people for the government. It is not for the people, but the people for the government.

It is not for the people, but the people for the government. It is not for the people, but the people for the government.

And finally, with this movement there is a changed conception of the theory of government. Secretary Root would the last of a passing look when he declared that the government is not for the people, but the people for the government. It is not for the people, but the people for the government. It is not for the people, but the people for the government.

# REVITALIZING THE NATIONAL GUARD

The New Spirit of Insistence upon Soldierly Fitness that is Working a Wonderful Change

BY WILLIAM INGLIS

THE major-general commanding the division of the National Guard of the State of New York visited the regiment at the National Guard regiments the other evening. He had been invited to review the regiment. Arriving at the barracks, he arrived at the door promptly at the appointed moment. An officer in uniform met and saluted him and escorted him to the colonel's quarters, where the guard presented arms and the bugles sounded gallantly.

What happened at that review was so new, so revolutionary, so startling, that it is worth telling in detail, inasmuch as it marks a change in the conduct of the affairs of the National Guard of the entire United States which will make it far more effective than it has been.

In the good old days the colonel of the regiment would have entertained the reviewing officer for a few minutes. Then the visitor would be escorted out on the drill floor, where stood the regiment assembled. In the parlors would have been spectators, including many charming young ladies, anxious for the fireman business to be ended and the pleasure of dancing to be begun. The colonel would have pointed out to the reviewing officer where to stand, and he would have been escorted to his box and respectfully told to sit down. The colonel would have taken a drill of the regiment, in which every squad of every battalion knew in advance from long experience just where to stand, and at one o'clock crack on the board floor to be back. Or perhaps there would be the delightful ceremony of evening parade, ending with the national salute ascending in beauty from the ceiling and the band playing the "Star-spangled Banner." Then the reviewing officer would be escorted to the reception-room, the officers of the regiment would be presented to him, and, after a little supper, he would be sent home.

But the review to me now looking at was different—about as different as possibly could be, in the case the major-general asked the colonel if it would be convenient to change the programme. As in the military service a request to do so is tantamount to the colonel replied that the programme could and would be changed. The major-general said: "Will you please turn out a company of men, and have the men engage in closing rifle?"

In a few moments the third company was turned out and briskly at work, while the general and his staff walked along the two ranks, inspecting the men, asked the men questions testing their knowledge of the weapons, the duties of sentinels, and other matters relating to the general order of the work. The reviewing officer and staff found out just how much these guardians knew about that part of the soldier business. Beautiful conditions combined with the provision of the fire of a geometrical line are showing signs to me, besides affording a little exercise and the cultivation of discipline in the soldier business, each man ought to know all about his gun, how to clean it and keep it and care for it, because a thousand other practical services details that have nothing to do with precisely firing a protruded crack in a glass board floor.

In the present case the major-general found that perhaps half the men had no cleaning kit at all, according to regulations, should be in a little receptacle in the belt of every rifle; others had all, but so all. It about the company was quite ready to go through charming reviews, but was not ready for fighting.

The general publicly asked the colonel to have one company raise shelter tents.

"Sir, how can they raise tents on a board floor?" asked the colonel, surprised.

"I don't know," but raise them, please," said the general.

They did manage to carry out the order, somehow, although perhaps of the order, the colonel said better. Another company was called upon to climb ropes and to scale a wall, another to do some marshall drill that looked like boxing, and the very physical fitness and the physical fitness to do the work required. Long before the major-general had finished the review every man in the regiment was in a state of high spirit, being impressed upon the service, the spirit of practicality carried to the highest degree.

All a review of another regiment a few evenings later it was evident that the same sort of practical review had traveled fast and far. For the colonel of this regiment had provided it with five hundred sharp-shooters who were required to have a company raise shelter tents, the work was promptly distributed. Then the company came out upon the floor, promptly at the appointed moment, of double-time, three-hundred yards with the head of the band at the butt of the bayonet, as they would have had just time to do the same sort of work, ropes, and set up the tent. The observation of the device was instantly appreciated by the hundreds of spectators, and the soldiers sang to the clapping of hands and cheering.

And yet—perfection is never attained at one leap. Another company was requested to engage in a little exercise, so that the same sort of work could be satisfactorily illustrated. As this drill is actually performed the men advance in open formation, the squads alternately raise shelter tents and bring down to fire—from behind imaginary shelter, of

course. And on usually the drill is done without any music in the rifles, there is no noise but the clanking of feet and the clinking of the bayonets, so that the officers, while waving their arms to signify the various commands, are able to reinforce the pantomime signals by calling out the order if they should be any delay or misunderstanding.

But this time the battle exercise was different. Black ammunition had been distributed among the company, and within a minute after the advance was begun the crackling of the rifles multiplied and echoed by the walls and lofty roof of the armory, rolled down upon the floor and enveloped the company in such a thunderous racket that no human voice could pierce it. Also for the beautiful precision of battle exercise plan and command! Long before that company got to the end of its advance the squads were all engaged in the delivery of their fire. They were no longer a command, but a lot of free-cared individuals doing the best they could, for in that great expanse of noise—work as they would encounter on the battle-field, of course—the fire could be a word, and a great mass of them forget the meaning of the commands by arm pantomime without the explanatory words.

Company of infantry at war strength—one hundred and fifty men—had service at that school. It is now, after long preparatory training by squads in the home requirements, in operation at the State Camp at Peekskill; and it is expected that the officers and men of the Provisional Company will afford a fine and inspiring exhibit of just what an infantry regiment should be and do when they return from camp. They will carry the new spirit back to their various regiments.

The organization of this school and Provisional Company has been so thorough, so searching, that its members may be regarded as fulfilling the requirements of the infantry service. They come from the seven New York City regiments of infantry. When the first call was made it was found that twenty-five per cent of those who responded were not up to the physical standard required, although as they were in the service they were supposed to have successfully passed the prescribed physical examination. Those who were, of course, rejected. The next step was to require that every man in the company should submit to inspection with the anti-phlog prophylactic. Many of the men had never even heard of it; but when they learned of its wonderful results as a prevention of typhoid in the United States army and abroad they were already beginning to acquire new ideas on its efficiency.

No one who sees the smart, alert Provisional Company of to-day would imagine that its members were selected from among men who at first sight appeared

Major-General John F. O'Ryan, who is revitalizing the National Guard

The instances given here are typical of the happenings in many regiments recently among the regiments which with their first officers and staff are now constitute the Division of the National Guard of the State of New York. Many useful points thus have been brought to the attention of an entire regiment at once, evidence of shortcomings had been made known in the minds of officers and enlisted men in a way that could not have been accomplished in any other less practical manner. The result thus far has been that the minds of officers and men in the regiments upon which this innovation has been tried have been directed into useful activities, away from the old hand-to-hand close-order drills around the armory floor, with half the men keeping an eye on the clock. Ample work is becoming a real, practical, detailed training and preparation for field exercises and maneuver campaigns, which, in turn, are the most practical preparation for war.

But the last clause is true only when the regiments have undergone the necessary elemental, preliminary training. All depends upon that. Any marine has strength only through the knowledge of the strength of his component parts, and if the fighting machine which we call a regiment is made up of officers and men who are not thoroughly grounded in the elements of their duties the regiment will be good for nothing in actual service.

Therefore, Major-General John F. O'Ryan, commanding the Division of the National Guard of the State of New York, has begun the task of revitalizing the service by establishing a school of Application for officers of infantry and by forming a Provisional

infantry—through National Guard. Several infantry officers of the United States army have concentrated all their energy and experience upon making the Provisional Company a fighting machine. The result—now to be heard—speaks for itself when that company appears, wherever it is ordered to do. Inasmuch as the same scheme of betterment is being adopted in the National Guard of most other states, it can perhaps best illustrate its ending spirit by citing part of what Major-General O'Ryan recently said in an address to his officers:

"The trouble with the routine training of the National Guard has been that it was not practical. A man training for a rifle-fight does not practice platoon work. He fights—not necessarily a fight in a trench, but his training is rough and it requires self-reliance of nerve and muscle. It is so with the college athletes, who endure the training-table and other disciplines, but find that more necessary in it for the soldier to have his preparation at least approximate the conditions that will surround his ultimate test—a test which may call for the sacrifice of one's life for the sake of his men.

"The most important factor in military efficiency is discipline. In the Fourth of July exercises relating to the military preparedness of this country, patriotism is placed first and experience with the rifle second. With the trained soldier discipline comes first—second, third, and fourth. Physical fitness and power of endurance come fifth. Then follow organization, tactical training, and efficiency; and these, well done, are the last considerations come eighth, ninth, and the rifle and the 'rah-rah' spirit."

## FOUR GENERATIONS OF MORGANS

# MONTANA'S TREASURE CITY

The Natural Advantages of Butte Give  
Her the Promise of a Splendid Future

BY FRANK T. LARRIMORE

A view of the business section of Butte

**O**n a cold and clear evening in the month of January, 1864, four hardy pioneers were sitting around the smoking camp fire in the valley south of the present city of Butte—Parker, F. Allison, Joseph and James. Their prospectors were ranging on the banks of a stream which they called Silver Bow Creek. Gold was found, the news of the discovery had spread rapidly, and in a short time the mine in this creek were being mined for many miles along its course. A little village, to which was given the name of Silver Bow, sprang up on the banks of the creek some few miles south of the present city of Butte.

scarcity of the present city of Butte. News of Farlin's work spread through this sparsely settled country like wildfire. Its magnetic influence attracted many prospectors to the locality and a little village sprang up and derived its name of Butte from the big butte just west of the city, which stands today as a witness over the greatest mining camp in the world.

The settlement on Silver Bow began to move to Butte, and was reflected in its population that in 1868 an record of it was given in the census. While Butte claimed 2,000 inhabitants. The discovery of the Alton, La. Field, Burlington, Great Republic, and other low lode mines followed in quick succession, and the

city is Columbia Gardens, just a few minutes' ride east of Butte. Columbia Gardens are owned by W. A. Clark and operated under the management of the Butte Street Railway Company. Visitors declare about half a mile from the alps of old-fashioned flowers given there is the finest to be seen in the entire United States. Swimming pools and the usual attractions of a summer park are all found at Columbia Gardens. A complete horticultural and zoological garden is maintained, and from the large greenhouses the most wonderful varieties of flowers are produced. The "sun" contains the finest specimens of Rocky Mountain trout and bass in the country. There are large ball grounds within the park, provided with maple seating nearby. Here many football and baseball games are played.

Two miles south of the city Butte in the valley is situated the Butte Country Club. The club maintains its own club house and grounds, where polo, tennis, trap-shooting and other sports are enjoyed, and where many luncheon and social functions are held.

In the neighborhood of the Country Club is found Lake Avenue, a beautiful little sheet of water, which, together with other park attractions, furnishes an opportunity to spend most pleasurable hours during the summer months.

The Butte Chamber of Commerce, although a young organization, is one of the strongest in the Northwest. Its energies are devoted to the development of the commercial and physical interests of the city at Butte.

The Automobile Association is a newly organized body, but its efforts toward the improvement of roads in the vicinity are already producing results.

The water supply of Butte comes from the mountains and the system is one of the most useful and expensive in the country.

For fire protection the city has recently purchased the most modern automobile equipment obtainable.

The street-car system is constantly being extended to take care of the rapid growth of the city, and cars of the latest type are being added to the equipment as fast as they can be obtained. The number of passengers handled for the past few years averages a little more than 2,000,000 per annum.

The Butte post-office does an annual business of about \$100,000 in postage and collect alone. The building is of modern construction, of large proportions and handsome appearance, and is provided with all the latest equipment for quick handling of the mails.

It is obvious from the foregoing statements of conditions found in the city of Butte that no municipality within the entire boundary of the United States and possibly none in the world offers a stronger foundation for future prosperity. With thousands of acres of rich money, with inexhaustible natural resources, with a capital climate and good modern transportation facilities, Butte today is beginning an era of prosperity and substantial growth which in the future will command the attention of all the manufacturing and trade centers of the United States.

The County Court House, Butte

Fluorite mining was carried on for several years, but in the spring of 1867 the yellow metal became scarce and the prospectors sought new fields. It was known, however, during this early period that many promising quartz veins could be located in the vicinity, and many claims were located, but for two reasons, at this time, it was impossible to carry on quartz mining. First, absolute lack of transportation facilities made it impossible, or nearly so, to dispose of the ore, and, secondly, no one seemed to have the knowledge as to how the ore should be treated.

The year 1868 was, in all things considered, the most prosperous experienced by the camp as a placer producer, and marked the advent of several settlers, who afterwards acquired a wide reputation. Some of them to-day are among the most substantial citizens of Butte, possessed of large holdings in real and mining property.

At the close of the year 1867 the placers had given out completely and nearly every one left the Butte camp. A few, whose faith in future quartz mining had the camp had been unshakable, remained.

The first important record of quartz mining in the camp, struck a good character of ore in the Parrot lode and, together with his associates, formed an operating company. A small another was subsequently laid, but, owing to the insurmountable difficulties, was shortly afterwards abandoned. Silver ore was shipped from the Parrot lode to the Union Mines, for treatment, but the cost was so prohibitive that, soon afterwards, the undertaking was a failure.

An important or permanent development took place in quartz mining until the year 1869, although the faithful few had struggled along, subsiding slowly but surely the lode mines riches which nature had so carefully concealed up.

It remained for William L. Farlin, one of the early pioneers who had worked the placer diggings, to lead the way in quartz-mining. Farlin had been, of course, by examination, with the possibilities of the quartz claims in the territory. He had, however, left the country for the southwestern Idaho mining fields during the late sixties and had taken with him samples of quartz from the Butte territory. Remaining a few years in the Idaho territory, he discovered the method of treatment for the Butte ores. During the latter part of the month of December, 1871, Farlin returned to the Butte district with his own knowledge of ore treatment, and a few minutes after twelve o'clock, midnight, December 31, 1874, staked out the famous Traction quartz claims just

The combined output of these mills reached a total of about 600 tons a day, and in addition to this about 100 tons of silver ore were treated a day in several small centers. The average yield was about 800 per ton in silver and gold. The silver activity continued until 1892, when the decline in the price of the whole metal caused practically a suspension of operations.

The discovery of copper ore and production in great quantities held the foundation for Butte's present prosperity. Its importance attracted the attention of railroad-builders, and on December 21, 1881, the first train steamed into Butte, giving communication with Ely, Salt Lake, and with the East and West over the lines of the Union Pacific.

Among the most beautiful parks in the entire United States, while not located immediately within

A Montana mining scene

# Industrial Growth of Helena

BY RALEIGH F. WILKINSON

The Main Street, Helena

THE city of Helena is situated in the center of one of the richest gold, silver, and lead districts in the world. The gross yield from these sources since the discovery of gold in "Last Chance" in 1864 has totaled the enormous sum of \$111,000,000 in staked minerals. The placer ground in the immediate vicinity of Helena and beneath its Main Street has produced thirty millions in virgin gold, while the quartz areas, from four to twenty-five miles distant from the city, have produced \$131,000,000 in gold, silver, and lead. Copper mining in the district surrounding Helena has just begun, but it bids fair to be more remunerative and productive than other mines when fully under way.

Grizzly Gulch, Dry Flax, Nelson Gulch, Dry Gulch, Helena Gulch, Silver Creek Gulch, and Last Chance yielded \$20,000,000.

The sports have been discovered on Unionville and Park City, four miles south of Helena, produced the quartz mines \$4,000,000; Whitefish Union \$1,000,000; Park, McIntyre, and others, \$2,000,000; Marysville, fifteen miles north of Helena, produced \$4,000,000 in gold from the following mines: Oregon Lumber, 100,000; Wheeler, 200,000; Empire, \$1,000,000; Helena, \$1,000,000; St. Louis, \$1,250,000; Bull Mountain, \$1,000,000; President, \$1,000,000; Dry Creek \$2,000,000; Blue Bird, 400,000; Granite Butte mine, \$1,200,000.

The agricultural land tributary to Helena approximates one million acres, scattered by its location at diversified farming and including dairying, fruit and stock raising.

A large part of this acreage has been under cultivation for over forty years with most excellent results. Until the introduction of scientific "dry" farming, the only farming method in this area was thought to be available for agricultural purposes, so farming being done except under irrigation. When the value of "dry" farming was fully demonstrated, it opened to cultivation large areas of "soak" lands, which are producing splendid crops.

The electric power from the existing plant is generated at the three large dams on the Missouri river, eighteen miles from Helena. These dams furnish an aggregate of seventy thousand horsepower.

The crops raised comprise all kinds of grains and grasses as well as the various root and green crops.

A large industry in the growing of seeds, grains, and garden seeds is being developed in this territory. Garden seed houses, raising their famous for the growing have representatives here and in other parts of the territory named.

Owing to the fact that the Pickley Park Valley, where this industry was begun, at Helena has the longest season of any locality in the state, and that no crop damage has come from there, it presents peculiar advantages for seed-growing.

The opportunities for dairying in all its branches are unexcelled. Along the mountains are numerous small valleys, making ideal locations for this industry. The grasses, both wild and cultivated, are peculiarly rich in the elements needed in the making of high-grade butter and cheese.

All kinds of fruits grown in this latitude do exceedingly well, this being especially true of small fruits, from which the yields are in many cases phenomenally large.

The extensive mountain ranges in this territory present an opportunity for the production of timber, which is carried on to a large extent. A number of high-grade hemlock and fir stands here, the product of which commands a ready sale on all markets.

The climate is salubrious, with mild winters and abundant summers. Very few destructive atmospheric disturbances have occurred in this locality.

The latest agricultural possibilities of the section are being ascertained as part of the Great Tractor stations are being conducted, disseminating a knowledge of scientific farming methods.

The benefits of Helena's great electric power plant, the zinc mining and extensive agricultural districts surrounding the city, make it one of the coming commercial centers of the country.

The present large scale of manufacturing and wholesale institutions covers all the Northwestern states and the Canadian provinces. The trade will be increased and the business of the country. Greater extent of these various divisions makes its full industrial and commercial development.

The extensive growth of the manufacturing in brick and tile, granite and marble products, beer, mining machinery, sugar, canisters, crackers, canines, dry goods, and other goods, all of which would pay good returns on the investment.

The wholesale interests of the city represent all lines, and the great commercial centers of the city is its

schools, both public and denominational. Two church colleges held here draw their students from all over the West.

The commercial interests of the city and contiguous territory are unified in the Helena Commercial Club, which is one of the largest and most active organizations of its kind in the West, taking an active part in all progressive development work. Through the efforts of the club the "Flower" Hotel has been completed. This hotel is one of the largest between Chicago and the Pacific coast, and is now open for the entertainment of visitors.

Helena has a parkable grade in its financial institutions, which rank among the strongest in the Northwest.

During the past few years the deposits, cash, and total resources of the banking institutions have doubled, and they now show a combined capital of \$1,000,000, and surplus and profits of an additional \$1,000,000. The growth has been steady and sure.

During the year of 1907, when returns have been throughout the United States were paying deposits with floating balances, Helena banks paid \$1,000,000 in cash. In view of the fact that Helena is a Montana county city and demands of correspondents at that time average pay well with the banks on an all-inclusive basis, this is a record of which the Helena banks are justifiable proud.

For many years the banks of this city have been the clearing-house banks of the state of Montana. Located near the center of Montana, on the main line of the Northern Pacific Railway and east of across the entire northern portion of the state traversed by the transcontinental line of the Great Northern Railway, by reason of that company's road connecting with the main lines of the Union Pacific, Great Northern and other, Helena occupies a position of great advantage as the home of clearing-house and reserve banks. It is the logical, best clearing center of the state.

The clearing-house, always located upon the main line of the Northern Pacific Railway and east of across the line of the Helena banks exceed \$50,000,000 per annum, and it might not be entirely to state that many clearing-house cities of the United States, with eight times the population of Helena, do not exceed this city in bank clearings, and, with the steadily increasing business of the state, the clearing resources of Helena seem to be assured at a still larger volume.

# THE INLAND EMPIRE OF THE NORTHWEST

BY GEORGE BOSTON

THE spring of 1912 marked the one hundredth anniversary of the first gold strike in the section of the Pacific Northwest called the Inland Empire.

That one hundred years ago, in the year 1812, the first gold strike was made in the Inland Empire, in the section of the Pacific Northwest called the Inland Empire. It was in the year 1812 that one hundred years ago, in the year 1812, the first gold strike was made in the Inland Empire, in the section of the Pacific Northwest called the Inland Empire.

Commercially, the city of Spokane is the center of the Inland Empire, comprising Washington east of the Cascade, the Gemville of Idaho, northwestern Oregon, southeastern British Columbia and western Montana. Besides having the advantage of central location, boundaries protected by nature in the form of mountains and otherwise by distance from other natural distributing points of importance give Spokane the logical and independent entrance to the Inland and north of the Pacific.

Mineral, water power, broad access to farms and orchards, and lands suitable for cattle, horses, and other kinds of live stock—these are the things that have made Spokane what it is today. With their development to date of our civilization, these things are needed to make this city a leader among its

Alaskan outcroppings in the making streams of the great level of the Inland Empire, and the fact that modern methods require teamwork is recent. The farmer has demonstrated the fact that the soil here produces richly a variety of crops and products, 4,000 acres of potatoes, and 18,000 acres of miscellaneous products, in all fifty-three of the Inland Empire.

While many farmers and comfortable methods in the great number have been yielded by the soil of the Inland Empire, the farmer's introduction to the fact that modern methods require teamwork is recent. The farmer has demonstrated the fact that the soil here produces richly a variety of crops and products, 4,000 acres of potatoes, and 18,000 acres of miscellaneous products, in all fifty-three of the Inland Empire.

While many farmers and comfortable methods in the great number have been yielded by the soil of the Inland Empire, the farmer's introduction to the fact that modern methods require teamwork is recent. The farmer has demonstrated the fact that the soil here produces richly a variety of crops and products, 4,000 acres of potatoes, and 18,000 acres of miscellaneous products, in all fifty-three of the Inland Empire.

and returns, in the rolling prairie of the Palouse. Wells, Wells, and Big Bend districts, valleys are often named to have pointed out one in cattle who are rated at from \$100,000 to \$1,000,000. What is it?

But, despite the fortunes made from the growing of this great staple, certainly few have derived that day of the Inland Empire, in the year 1812, that one hundred years ago, in the year 1812, the first gold strike was made in the Inland Empire, in the section of the Pacific Northwest called the Inland Empire.

When it is remembered that the great farm is still the rule, it is readily seen how this resource has been only scratched in the Inland Empire.

The forests of this section constitute still another exceedingly valuable asset. In the territory described the day of the Inland Empire, in the year 1812, that one hundred years ago, in the year 1812, the first gold strike was made in the Inland Empire, in the section of the Pacific Northwest called the Inland Empire.

What the lumber industry does to bring in new capital is seen in the fact that in this territory, so that \$14,000,000 or \$15,000,000 of new money is brought in each year.

# CALIFORNIA'S SIDE OF IT

Why the Little Man from Little Nippon is Giving the Big State of California a Fearfully Bad Time

By

EDWARD HUNGERFORD

If you want to view the Japanese side of the California drive out to Florida, just before the widespread crying of Sacramento, there is in the heart of one of the richest agricultural districts upon the continent. It grows strawberries and lemons, grapes, chiefly the former, heavily as it has added another crop—little flattened, brown-skinned children. And it is because of these children that a problem, at the beginning almost exclusively Californian, has become something more than a national one. It is because of the thing that the changing population of Florida implies that a such of twenty thousand angry Japanese marched through the streets of Tokyo last month exclaiming Americans and all things American.

It was because of this very thing that we drove out from Sacramento to Florida on a May afternoon and over one of the wonderful "country roads" which cover California faster than the wind. The country on either side breaks its prosperity. Like a rain on its stretched eave to invisible horizons, a good level of fertile soil brings forth the most beautiful California farm land can bring, the fruits of the north. Immense, more-lush than the vineyards brought to the earth the moisture of big-dog waters. The road that leads from Sacramento of today to Florida is a busy way. There it are the automobiles of the prosperous, the farmers of the valley, they are all things of a new and good crop.

Florida is a typical California farming village, with its broad main street, its two-story houses, its inevitable yellow dust. It has in addition to that inevitable national station, two general stores, two blacksmith shops, two restaurants, a school, a so-called—a comely little wooden church, and a school-house over which the American flag is floating. Japanese men and children, a general store, a school, a blacksmith shop, two restaurants, a school, a so-called—a comely little wooden church, and a school-house over which the American flag is floating.

It was in 1903 that Japanese immigration into the United States was legalized, although since 1907, the so-called "gentlemen's agreement" has done away with the necessity of immigration. It was after 1903 before California looked upon the Japanese with anything less than a sort of humorous affection. They were the merry lads of a merry land. As labor servants they were very obedient to the Chinese, and so better servants they became. That was in the beginning. It was not until some twelve or fifteen years ago that the Japanese moved to take real customer of agricultural California. And it was the most actual thing in the world that a class of men who succeeded as labor servants because of their ability to do hard and grinding work, and to do it well, should succeed as servants in the fields and in the orchards. The problem of the California farmer and the laborer was following slowly in the track of the similar difficulties in domestic service. So the Japanese began to multiply in the fields of California, particularly in the rich valleys districts around about the Sacramento, the San Joaquin, the Santa Clara, and the Yon valleys.

In a little time they were not only not the shortage of "white help" in those farming territories, where plenty of human hands are necessary for a successful marketing of the products of the soil. The shortage they were doing the white men out of many of the fields of California—Irish, German, even southern-born, American, and Italian. As laborers, they might hardly have been better than manual labor through the years of their lives. The process was simple. The Japanese could live on lower wages. Then, when the white man was unable to take real customer of those fertile valley bottoms had gone his way, the Japs began, with the slow, patient, persistent insistence which is so characteristic of the race, to take real wages. His white employer asked his own in another way. There was a point in which each man's wages might go and still remain a margin of profit for the owner of the farm. But that point was soon passed and still the inevitable brown man demanded their increases. If they did not receive them they went away—and the farmer, who was never for himself, it was all part of a well-considered plan.

It was not until some twelve or fifteen years ago that the Japanese moved to take real customer of agricultural California. And it was the most actual thing in the world that a class of men who succeeded as labor servants because of their ability to do hard and grinding work, and to do it well, should succeed as servants in the fields and in the orchards. The problem of the California farmer and the laborer was following slowly in the track of the similar difficulties in domestic service. So the Japanese began to multiply in the fields of California, particularly in the rich valleys districts around about the Sacramento, the San Joaquin, the Santa Clara, and the Yon valleys.

a hand is making it both strong and great—not one other seems open to them. Generally they are glad to sell and get out, sometimes they leave, but they very rarely are content to work the thing on alone. White men and brown men do not make congenial partners. No more for the typical farm-land situation. Not consider, for an instant, the situation in the cities. Sacramento, where we started in drive to Florida, just before the widespread crying of Sacramento, there is in the heart of one of the richest agricultural districts upon the continent. It grows strawberries and lemons, grapes, chiefly the former, heavily as it has added another crop—little flattened, brown-skinned children. And it is because of these children that a problem, at the beginning almost exclusively Californian, has become something more than a national one. It is because of the thing that the changing population of Florida implies that a such of twenty thousand angry Japanese marched through the streets of Tokyo last month exclaiming Americans and all things American.

Your Japanese is highly different. He dreams of being a landowner, to his own little highly moral, but when his day's work in the kitchen or the laundry is finished he is content to smoke his pipe and dream. He dreams do not vary, however, far beyond that kitchen or that laundry.

He will go into the part of a city that he has—in

the Japanese suffers. Frankly, he has no understanding of the meaning of the word "contract." He thinks the white man silly to stand by the written provisions of a piece of paper with meaningless signatures upon it, when he can better himself by breaking those provisions. That is the Japanese way of looking at a contract. He is quite an honest-hearted and an excellent in it so when he inadvertently lays down his life for a friend or for his native land.

"You can put it down to racial prejudice and let it go at that," your Californian will tell you. "We say that our America is for white folks and not for yellow men."

He hesitates for a moment, then begins again: "If you want to see what we are struggling against take a steamer from San Francisco and to Hawaii. No what the unadmitted labor of yellow men has done for the business and social morals of those islands. . . . The little island is enough for the land. And in a little while the Canal will be finished and our own Portuguese problem will be multiplying, other problems of the same sort growing on transoceanic ships filled with the trash of southern Europe come sailing up to the doors of California."

Here, this, is the fulcrum of the problem. It came to a dramatic point but day a few weeks ago with a hearing on the alien land bill in the big Capitol at Sacramento. Some effective voices had been lifted in opposition to the measure. The management of the exposition at San Francisco—that job show that

The lowest grade of the labor in Florida

Sacramento or Berkeley or San Jose, even San Francisco and he will buy some that he lives. He will pay any price that the owner demands, perhaps up to five times its value. The instant that sale is announced he will buy the property, in that thick he goes to decline. He will probably pick up an adjoining house or two at about its assessed value. After that he and his associates can have the remainder more complicated. For to the holder of the most made a shrewd enough bargain to men that cover the outrageous price that they paid to start the wage.

"Cute!" you begin to say. "Of course, but your Californian is not more particular as to mingling with the brown men than one can be. He has a high opinion of himself and the black man. Of course the Japanese, with better schooling and a far quicker mentality, is hardly to be compared to the negro. That makes the problem more complicated. For to the holder of the most made the Japanese are quite as impossible in even the most distant social consciousness as the negro men as to the whites of the South."

"The negro," you begin to demand. "The Japanese is infinitely superior to the negro."

Probably he is. The most bitter of anti-Japanese agitators would admit that he is a likable little fellow, clean in his habits, unswerving in his fidelity and his patriotism. If he is genuine in his business agreements, notably as in connection with the scrupulous Chinaman, please be honest enough to realize that the Japanese has his own code of business morals and lives up to them. Americans and Chinese have to cater, much more easily understood by all of us, and

is to be California's joy and pride ten years hence—second again the morning of the manager of the show was in rather a delicate position. For it was Japan who was the very first of all the nations to enter with an exhibit.

"We will take any number of acres up to six," she said, "and agree to spend a million dollars on her." She was assigned to the acres and immediately began planning to build upon them, in permanent form, a reproduction of the Mikado's ten gardens which, when the exhibition is closed will be a gift in the city of San Francisco. The management of the exposition left the deal in Japan and stood manfully against the bill. There were other interests that stood against it, among them concerns that had elaborate plans for the reclamation of marshes into rice fields and the employment of Japanese labor for their development. All of these made good arguments. When they were done a lawyer from over near Elk Grove was given the floor. He was a tall, pathetic sort of a man, a double-breasted suit of a man who seriously studied his chin-whiskers as he talked to the legis-

"My neighbor is a Jap," he said, loudly. "He has an eight-acre place set up in mine and he is a smart fellow. He has a white woman living in his house and upon that white woman's back is a baby."

"Now what is that baby?" it isn't white. It isn't Japanese. I'll tell you what it is. It is the beginning of a problem—the biggest new problem that the world has ever known."

And it is that instant every objection to the bill was swept from the minds of California's legislators.

# THE PRICE OF EXPERIENCE

What It Costs to Learn  
to Run a Motor-Car

BY CHARLES B. HAYWARD

DRAWINGS BY J. J. GOULD

ANY man has measured his income and decided that he could not afford to own a motor-car. He could afford to buy one, but the mystery of the unknown expense around it was too much for him, and so all the wiles of the show salesman or of his local dealer, who was lavish with free rides and demonstrations, were enough to put his signature on the order blank. The story is an old one—as old as the industry itself, but with each passing year there are fewer and fewer of the would-be motorists who would like to own a car but who are afraid of the expense around, the exact proportions of which are not to be accurately reckoned in advance. On the other hand, there are many who have plunged. They have taken for granted their ability to run and keep a car, provided the wheeling is nothing it was forthcoming in the first place. While the first class is dwindling and due to disappear almost entirely within a comparatively few years, the second is growing rapidly. It recruits new recruits in large numbers every show season, and those that drop out of the ranks are few and far between. Simply because the man who decides that he is able to buy a car also finds that he can afford to run it and that the expense is nothing like as great as he feared it would be, while the pleasure derived is out of all proportion to the outlay.

It is what he must pay for experience that will make a large difference in the size of his first season's account. If the average buyer could only have delivered to him a large condensed chunk of that extremely valuable wisdom by which a novice first machine is made in a year or two ahead. But experience has to be earned and paid for in small bits, a piece at a time, and even if some fraction of an automobile salesman could devise a plan for handing out this wisdom, it is doubtful if the recipient would have any use for it. He would not appreciate the value of what he had and would not realize just what part it is to supply. Knowledge that is paid for comes high at times, but it sticks.

Valuable could be filled with stories of the merchant that have been paid for the simplest rudiments of modern auto knowledge in the earlier days of the motor-car. Many a man has paid enough for one broken speaking parrot to buy a couple of months' sleep at present prices, and good roads some have been known to be the way to those who put up a respectable bluff at having a knowledge of all the motor-car knowledge there was. These people are like hotel hangers, and bicycle riders, whose mistakes were promptly metamorphosed into "gainers" with the addition of the motor-car, not only bluffed good and hard, but they took it so that the man who was paying the freight did not benefit by the experience which they were acquiring at his expense. They got things going again when they could, and the men who faced the bill departed satisfied, only to pay over and over again for the same bit of knowledge, or, rather, the lack of it, every time the same simple thing occurred.

I can recall one motorist who confided to me that it had cost him fifty dollars in two and three-dollar amounts to learn how to adjust a vibrator coil. And it all went to one person, though with a slight exception after steady experience for roughly eight months, when he had his first season's account for me out about in the proportion of five dollars for the knowledge of tinkering to every dollar of expense that actually represented a mileage covered. The experience was always known, what the trouble was bluffed. He usually found it by the trouble of bit-and-bit guessing—the guessing about a problem proceeding with each every method whose experience does lack several years in familiar. But

in this particular instance the material used his source of observation and noted that while the capacitor, the battery, the state of the generator supply, and a few other odds and ends, such as the wiring and the spark plugs, all came in for attention, the remedy was always found in the coil. By trying the same process of elimination himself he found now to turn a small screw up and down, without having to pay two or three dollars for the results thus obtained.

In another man a friend of mine paid—well, I hesitate to say how much out of respect to him—simply to learn how to put on a tire properly. The amount is difficult to compute, but it must have been over three figures, a large part of it went to the tire-store and the rest to the garages for vulcanizing tubes. "I wouldn't think of going on a day's run without seven or eight spare tubes, and even a trip of a few miles around the city wouldn't be safe without three or four on account of the uncertain punctures. I don't think I ever got out twice in a season without getting a puncture," he told me once, and to prove it took me out with him one Friday afternoon. We hadn't gone five miles before there was a flat on the rear. "You see what I'm up against. There's another dollar gone for vulcanizing. By the time my garages get through putting vaccination marks on one of my tubes it costs me several times as much as the three-dollar flat you say and then pay two-hundred five dollars a month for larders."

One look at the "puncture" revealed the cause of the trouble. It was a clean cut ball on the back on the rim side of the tire, and was quite a little nick as could be desired. It was quite as effective as a good sharp horseshoe nail or a broken bottle when results were concerned, but totally unnecessary. He had never had the benefit of a lesson or run in the proper manner of inserting a tube and putting the shoe on the rim. The defendant tube was simply laid in the shoe and the usual strength gone through to force the old-time clincher onto the rim. It was inevitable that the soft rubber should be slipped at some point by the beads before the shoe was finally

hair, and he was plumb vexed with that marker, to put it mildly. It was before the day when car-tire-removers had assumed a prominent position in the air-valve as a regular part of their equipment, and their latitude of functioning was correspondingly limited. If they got too much gas, too little, the motor suffered in proportion and either by doing it together or what was worse, it would run without preventing enough power to run the car. This was one of the "accus" cases. The motor had been running idle at the curb for the matter of an hour or more while its owner fiddled with automobile adjustments, and it was considerably "hot up." In fact, it had just about finished concerning the last few plants of water in the radiator as I got there and was then engaged in blowing a mixture of steam and mud out of the overflow pipe at some pressure, to which the men under the bonnet was wholly oblivious, so it was desirable to yield the care of a few to his Brooklyn garage and the expense of taking down a series of water in the first thing to do was to shut her off, get into the radiator, check the water adjustment, and bring some out in a bucket for the motor. This, with a replenishment of the oil supply in the crank case, automatic elbow flapper still being a thing of the future, then, put her in shape for further trial. A few turns of the needle-valve of the carburetor and the lighting of the lock nut, which had been overlooked, caused less than five minutes, and she was again "bitting on all fours" with her usual vigor. This was another bit of valuable experience that I had been hearing the rest of "setting them up" as a preliminary.

The bill that has been paid for burning her to make simple carburetor adjustments, taken in the aggregate, would probably make a striking fund the interest on which would double the value of a year's care of a small vehicle and orphan or other maintenance of a car. For ways that were dark and that I had never heard of, Frank Harlow's "Heavenly Chino" had nothing on a motor-car in over three years ago. I came across a dilapidated fellow at the crack one time, who said that he had been burning his head and burnt again until he was a wisp. They had been knocking in the still contents of the woods, and the reason for the party had been sitting on the back corner of the car, and had not given any advice. When the car had been stopped at the corner, he had been promptly begun to flood, and it had kept right on all the time they were there, so the big spot under his foot was a big made evident. But after leaving Ray Three of the book of instructions, he had been primed the carburetor to start. When the bonnet was raised, the water was dripping and drooling powder out of the carburetor. The man was the almost life set-up for a fire that could have been prevented if just one backfire out of the carburetor would have done the trick and that there would have been a new little item to be added to the expense account for experience. He had another case of too much gas. Shutting off the carburetor, draining the carburetor, waiting a few minutes for the excess to evaporate, and then filling up again to the normal level was all that was necessary to start on the first turn over. He was the most grateful human being in sight so that stretch of lonely road.

There are not all tales of old times by any means. Only recently it was my good fortune, no, rather, his, to be able to help out a fellow motorist who was just about to give up in despair and lose any means of conversation that was to be had to cover the nine miles that lay between him and home. Personally, they were further apart than that, for it was midnight and she was wondering what the young man, he told me with the air of an expert who has exhausted his best resources on a difficult problem that the car had not been started for some time. They started back some two or three miles from

"There's another dollar gone for vulcanizing"

in place. As a tube-pitcher he was without an equal, and if he had a superior in that particular line of relieving the rim of the tire will most have been similarly heard to conclude. By putting sufficient air into the tube to "force" it there was enough pressure to hold it up against the inside of the shoe instead of letting it flop down on the rim between the beads. He told me several months later that my two-minute lesson in "tubing" had been worth many dollars to him and that the seven or eight spare tubes had become excess baggage in a large extent, as he had run hundreds of miles without one of his old-time "punctures." I haven't collected yet.

He was a real estate man and used his machine some days in the week, going to the combined clubs upon it for business and pleasure, the day I came upon him in a down town street one hot and cool, and with his upper half bent to view under the bonnet of the car that was the center of the usual little group of hangers-on. When he emerged he was glowing from his own size while cuffs up to the road of his

where they were, but they had managed to limp along in a fashion on low or second until they had struck this hill. Which was the cause of all the trouble. The car simply rolled over the top of the hill, and if I would be kind enough to give them a tow up the hill they could probably navigate the rest of the distance before morning, so there were no other bad hills in the way. As a preliminary the tow was forthcoming. The trouble might have been saved. An examination under the main light indicated as a stoppage at the top of the hill, and it is clear now that the emergency brake lever had not been released fully. It had caught in the notch a few inches from the end of the cable, and it clutched partially out of engagement, but quite enough to cause it to slip badly and prevent it from carrying the load. Fortunately, the two or three miles on the level that the car was in this condition did not burden it out altogether. That our fairly jumped away on the road here within five minutes after reaching the top of the hill, it would have been expensive experience to get a garage man out at that time of night.

I have paid for experience and somehow there never seems to have been a clearly minded motorist on the job around those parts just at that time. On one occasion I was five dollars to learn that a gas-overcharge will not start under load, and that an overheat planetary gear backlash constitutes a load sufficient to nullify the best efforts a combustion motor is able to put forth in the way of starting. One of the dollars was for a tow to the nearest garage, the other four were for the shop part of the season. All things considered, since it was raining at the time, the other four went to the garage man, who put his finger on the trouble, figuratively speaking, the amount he tried to get, the car across the garage floor. He wouldn't let go, so the farmer's team worked a dollar's worth at least in towing her.

He wouldn't let go, so the farmer's team worked a dollar's worth at least in towing her.

I got in the seat and was about to drive off, and then she died, apparently without any reason. My machine is fitted with one of those glow-wire spark-plugs, you can see everything that goes on inside it. There was gas in it when I looked, and at the first trace of the crank the motor started again, and before I got settled in the seat, stopped again. This time there was not so much gas in the carburetor and an more seemed to be coming, and even holding down the priming button wouldn't induce it to come, despite the fact that the tank was full. It did not require the services of an expert to dispose that on a stopped-up fuel line, but it was not probable that a one-eight-inch pipe would be plugged up when a spring fuel tank had been used so conscientiously in filling, so the investigation was begun at the carburetor. The screws of the carburetor intake was practically closed up with a mass of dirt bound to-

ought to be, and an one—but as again could be made to appear at the plugs, and leave no start. I cranked and fussed with great determination. Extended investigation finally led to making off the single over-riding thick coil. Nothing whatever was wrong with it outside, so the conclusion was reached that a wire must have broken inside. I went to the coil and took it to the makers. They tested it, said a wire had been broken, and charged me thirty cents for soldering it—really for experience, since there was nothing wrong with it whatever. I got it back on the car and was no better off. Then I took the magnets contact-off and had a friend turn the motor over slowly while I watched. The contact points did not separate. A few minutes' work with a small screwdriver did the business, and the next moment the car was not in vain. It was a hard fight, but I won't worry, since, if I had started out

He was plumb vexed with that machine.

together with what appeared to be short hairs or threads. A little gas out of the spark can keep handy for cold-weather starting rounded the trouble in a few minutes. No low or high-profile motor had to be put in. In one of the same kind that happened only a few months ago my garage man had to tow one of his auto-loads forty miles to secure a party that had started out in one of his cracked cars the night before. They went to Oney Island and there they stayed until help came over the twenty miles that lay between them and home. In this case the garage man had to start the car out of sealing one of his men on that round trip of forty miles, but it would have been expensive experience for the plain, every-day motorist.

The motorist who ran keep his car in his own barn has an excellent opportunity to study causes and effects, and if he does not give up easily, but continues digging down to the root of the trouble, he will, his experience will be the first season or two will not amount to much, and then he will be proud on bill of know-how that no emergency on the road short of an actual breakdown that renders outside aid unobtainable will make it necessary for him to dig down on his pants." Spending of hours reminds me of a four-hour session I put in trying to start the car in my own last motor. Everything was apparently all right—butteries strong, gas where it

the gasoline-wiring diagram in the instruction book. I would have seen that nothing was wrong with the coil.

Just one more of a bunch of rusting notes about the price that many of us pay for experience in the course of a season's motoring. A group were talking notes and motoring, and one of the party was telling his exploits: how on a certain rate of a season's motoring he had saved himself with enough gas to get home, but not sufficient to take him over a short stiff hill that barred the way. They got half way up, but no further, because the gas in the tank was too low, and there they stayed until one of the party walked a mile to the nearest telephone and called for help. They waited and waited for the welcome sound of a car coming, but there was no sign. After an hour or more had passed a sorry mechanic had snatched up and he driver inquired, "Do you the parties what makes this situation?" They were, and he handed out the five-gallon can. "Frank didn't have anybody to send, so he asked me," the driver explained.

"Well, but it was certainly some heavy experience," the narrator concluded. "What do you think of it, old man?" he continued, turning to me. "What would you have done under the same circumstances?" "Turned right around and backed up, of course." "Why—why, I never even thought of that, and it cost me three dollars plus the price of the gas."

## THE FOUNT OF SONG

BY JOHN KENDRICK BANGS

Go, Singlet! Seek the woods and dale;  
Nix them the mountain heights, the vales;  
Lilt in the music of the breeze,  
And the birds and whistling trees;  
Soothe in the silver summer air,  
Take in the essence of the fair;  
Thou more alive that speak above  
By day, and note the transients  
That fall from their ethereal heights  
(The starry night!

The language of the flowers learn;  
The furrow seek and the fern;  
And all the birds that seek the sun  
And their words and their ways;  
All things that whisper in the heart  
And Nature's stronger impact,  
Be it thou, and then  
Take up thy pen,  
And weave them in thy song array,  
And thou shalt wear the bay!

# Interfudes

## THE READY REPLIER

A COMPANION TO INTERFUDES FOR THE UNREMARKABLE REPLY TO THE INQUIRY AS TO THE STATE OF THE UNION.

(For an Offer-By Let Off Early to the Great Grandfather's Funeral, see *Country Magazine* Face to Face with his Employer at a Barbed Wire.)

**INTERFUDER (sighing):** Why, Jimmie, what on earth are you doing here—didn't I give you the afternoon off to attend your grand-grandfather's funeral?  
**DESPICER (with a great sigh of relief):** Thank goodness I have found you at last, Mr. Goodfathers. I have been looking for you all the afternoon, sir. After I left the office when you were so good as to let me off to pay the last tribute of respect to my dear old grand-grandfather I suddenly remembered that I had forgotten to tell you that you would find your materials and overalls in the little closet to the left of the bookkeeper's desk, where I had placed them yesterday morning, feeling that they would hardly be safe if left in the corner of your private office. There are a many strange people coming and going here these days that it is no longer safe to leave portable objects of even the most insignificant value lying around loose when they may attract the eye of the unscrupulous. If there had been time I should have telephoned you, sir, but it was long after I knew you had gone to lunch that my reticence prevailed on me, and there being no other method of rectifying my error, which I knew you would excuse because of my unhappy stress of mind in the sad circumstances that had arisen from my duties, I resolved to seek you out. The day being fair, and everybody with ordinary human intelligence being bound to remark that I decided that this was the most likely place to find you, and I rejoice that what little discretion and judgment I may be said to possess have prompted me to come to the right place. To be sure, I can see the question even now arising in your mind as to why I should think you would find your materials and overalls on an hot day, and my answer to that is that, while today's skies may be blue-to-morrow's clouds may lower low, and since to-morrow is Sunday, it may very well be that after this pause is over you would desire me to go to the office and completely rehabilitate myself in your confidence by bringing the materials and overalls in to me as a precaution against possible, if unpleasant, incident to-morrow.

At this point you will do well to pause, and in case your employer is seen rigorously protesting against some decision of the empire, add your protestations to his, no matter what the decision may have been, using a style of American that he would like to see himself if his dignity would permit. If, on the other hand, you find him gazing rogly at you with steady eyes and a frown on his brow, leave the grounds instantly, and speed the rest of the afternoon looking up signs reading, "Buy Winks."

## JUNE CALENDAR

Time for mowing and artistic quilts!  
 Time for merry wedding-bells!  
 Time to make the pick-a-shoo  
 You will not wear Angel wings;  
 Time to paint the barn and shed,  
 And to air the brother-hed.  
 So that when the bumper comes  
 You may gather in the pines.

## TAKING ALL THE BLAME

"I was a fool ever to marry you," sobbed Mrs. Winks.  
 "Now, my dear," said Winks, sadly, "I cannot permit you to take the blame for that. It was I that was the fool for ever asking you. The mistake was not yours, but mine."

## A DANIEL COME TO JUDGMENT

"By your Honor," pleaded the plaintiff, "I can not, you cannot discharge this wrong. All the re-

WHY WANTS GOOD RICE WHEN PRICES ARE SO HIGH?

serve goes to show that she threw that brick at my chest, and hit him on the head."

"Which, sir," replied the justice, "is prima facie evidence that the whole affair was an accident. If

## PAID IN ADVANCE

"Now, please, sir," said the man justifying, figuring on the back of an old envelope, "your bill will come to just-forty-seven dollars."

"Forty-seven dollars?" exclaimed the justice. "Why, Judge, the fine for corresponding is only fifteen dollars."

"Yes, I know," said the justice. "The thirty-two dollars is for contempt of court."

"But I haven't expressed any contempt for this Court," protested the gentleman.

"Not yet, my boy," growled the justice, "but ye will, my friend, ye will before ye get a mile out of town. I've made the fine pretty stiff now if ye give ye plenty of room to move round in."

## HER REQUEST

"I am sorry, madam," said the judge, "addressing the elevated scaffold," "but I must commit you to jail for ten days. If you have any requests to make of the Court before sentence is rendered I shall be glad to hear them."

"Oh, no, Judge, thank you," said the lady. "There isn't anything except, perhaps, if you don't mind, I'd like to have my maid committed in the same jail, and if you could arrange it so as to give us rooming-cells with a bath it would be charming of you."

## COMPENSATION

"I never you don't object to my children practicing their music lessons," said the fourth-floor tenant to his neighbor below stairs.

"Oh, the contrary," said the neighbor. "It has given me a first-class reason for demanding a reduction in my rent."

## THE EFFICIENCY EXPERT

"JAMES," said the efficiency expert, annoyed by the cheerful looks which his rickshaw had of whirling while at his work, "you should remember that the greatest fortunes nowadays are made from the by-products of waste. Hereafter when you whirl, whistle in the tires and save me the expense of a pump."

## THE CANNY GARAGEE

"What?" cried the burglar, in consternation—"no plunder?"  
 "Nary a drop," said the garage-keeper.  
 "But what, then, did the thief and I go to do?" said the burglar.  
 "None of our kind," said the garage-keeper, "they've done things up like this. I got a stolen tire where ye kin get up for the night at seven-fifty apiece, or I got a beam that'll pull ye up to Sam Houston's garage on the same terms. Sam's the only fellow round here that keeps garages."

## JUNE

June's a comer, June's a comer, comin' right along.  
 I can hear the bees a-buzzin' 'round a flock with song!  
 I can hear the birds a-singin' in the shadow of the tree,  
 The red buds a-blossom, while the blossoms white are  
 droppin' in a snowy shower.  
 I can hear the larks a-singin' in the shadow of the hill,  
 In low young love's a-singin' laughter in his  
 eye, as the birds a-singin' sweetly with  
 the primrose and poppy, in their dreams of blue  
 a white's beamed hours by!  
 Oh the pinks the tramps are tramping, void of every care,  
 ready for whatever comes' turn up anywhere.  
 All around the lanes are kinder like a lot of kid-a-  
 chittin', and an' soft as fairy tales grow the  
 meadow's wild!  
 Dearly June, I want to tell you, you're the best there  
 be. When I see or even smell yet, soul is full of  
 glory, and no single day that passes but the  
 thought of your presence, love's 'is an' love's  
 leaves fills the heart's joy!  
 Love's the wood, and love's the blue's borders of my  
 time, London, here are love's meadows, meadows,  
 night, an' moon, Love, and I'll, and Merry  
 Launce, who's through wood and water,  
 Naught before, and nothing over June's  
 June!

"I WONDERS WHICH OF THEM THREW IN NEAREST BY  
 JUST THIS."  
 The lady had thrown the brick at your client intend-  
 ing it to hit him. It never would have done so. The  
 prisoner is discharged.

HER MOTHER: THAT'S AUNT STRANGE! THIS IN THE TENDER BREAKDOWN WITHIN AN HOUR.

## No-Rim-Cut Tires 10% Oversize

### Cost 11% Less This Year

No-Rim-Cut tires cost us—and you—about 11 per cent less than last year.

And you may be sure that future savings, as they appear, will also be given to you.

For our policy is, and always will be, the smallest possible margin of profit.

#### Good Business

We deem it good business to bring out of production as low as it can be brought.

To this end we employ the very latest machinery. And we cling to small capitalization.

We also deem it good business to sell Goodyear tires as low as they can be sold. To assure you of this, each year, as you know, we advertise our profits.

In times past this profit has run about 8½ per cent.

Thus you may know that no maker can ever supply equal tires for less.

In Goodyears you get the very utmost in tires for the least the best cost.

There will always be tires which cost less, but never a tire which costs less per mile.

to build new factories, equipped in modern ways.

Now we have by far the largest tire plant in the world. And we have a capacity pretty close to 8,000 motor tires daily.

To this fact is due the major part of the 11 per cent reduction.

#### No Extra Price

Now our new-type tire—No-Rim-Cut tires—cost no more than old-type tires of any standard make.

These tires which can't rim-cut cost as little as other tires which do.

These oversize tires cost no more than rim-cut tires which always run much smaller.

So all you save in rim-cutting, all you save by oversize, are clear net savings to you. Under such conditions, who can think it wise to take old-type, hooked-bead tires?

#### New Savings

Our lowered cost is partly due to lower cost of rubber. But that is somewhat offset by higher fabric, higher cost of labor.

The net saving here, in our opinion, warrants five per cent reduction. Some makers say it warrants none.

Our large saving has come about through multiplied output, due to Goodyear popularity.

To meet the demand, which has doubled over and over, we have had

#### The Demand

Last year's demand for Goodyear tires exceeded our previous 12 years put together. Yet the demand from new tires this year has increased 35 per cent. And our contracts from our makers this year call for 800,000 tires.

That shows clearly how men who know are quitting old-type tires.

Write for the Goodyear Tire Book—14th-year edition. It tells all known ways to economize on tires.

**Spokane as a Distributing Center**

By R. B. Peterson

John Jaram Arvon planned the first commercial lumber in the Spokane region over a hundred years ago. The little trading post was called Spokane House and was a branch of the Pacific Fur Company, whose headquarters were in Astoria, Oregon. Subsequently Spokane House passed to the Hudson Bay Company, which maintained for many years a traffic of exchange with Indians and the few straggling French-Canadian hunters and trappers. Even in those almost forgotten days the land, open, and fertile valleys of the Spokane was the rendezvous of the Indians and trappers, who crossed the vast stretches of mountains and plain lying between the Rockies and the Columbia. This great Indian trade, the possession of the Indians and a few adventurous pioneers until the building of the first railroad in 1872, when real settlement and development began. No one has since needed to inquire, "Why is Spokane?"

The transcontinental railroads and their war in Spokane's gate. Five thousand mountain travelers there, and almost a score of local and branch lines, both steam and electric, radiate from Spokane, serving each cluster of population throughout what is known locally as the "Inland Empire." The territory roughly bounded or lying between the main range of the Rocky Mountains and

liked them; and eventually the confederator's business became quite opposite and distinct from that of the apportionary.

Although the confederator's trade may be said to be about ten hundred years old, it was only within recent times that it became a real and extensive industry. At first sugar was heavily taxed, and the confederator's trade was passed upon very onerous levies. For a long time everything was done by hand. Implements were of the very simplest—crudely hewed or small forest saws, axes, and mortars, rolling-pans and screens, etc. The output was very small and, consequently speaking, consisted of all sorts were expensive and frequently unprofitable.

All this has been changed, and now, save the most improved machinery and implements combine to produce the most delicate and attractive sweets. Science has been employed by engineers, pattern-makers and rolling-pans, and sciences have given place to revolving pans and steam pans, and machinery for heating and blending and mixing, for rolling and slicing and grinding, for rolling and finishing, and for crushing, for crushing and freezing cream, and other processes.

While many of the best and most extensive candies are still very largely made by hand, however, the vast majority of sweetmeats is now produced by machinery.

Although sugar is the predominant element in the manufacture of sweets, the secondary commodities, such as gum, chocolate, almonds, and cream, vanilla, pistachio nuts, and other articles too numerous to mention, play an important part in the production of the sweet product of the sweet tree, which yields it in four-like drops, when melted and mixed with sugar become in the hands of the confectioner jumbles and pastilles. Confections are used in immense quantities. Almonds, the favorite fruit in the French and American countries, and vanilla, form the well-known macarons. In the Balkans and on the Riviera they knead into the flour of the almond the aromatic liqueur liqueur and sugar of the European. The groves of Italy and Spain, Florida and California provide the lemons and oranges that enter so largely into the trade. Thousands of persons in France are needed to harvest the waxes that have so popular a part of confectionery.

One of the most remarkable signs of the awakening of China is afforded by the spread of European engineering and technical knowledge. The railroad between Peking and Keiping, opened a couple of years ago, was constructed exclusively by Chinese labor under the able direction of native engineers.

The Chinese do not hesitate to construct railways and tunnels in the modern fashion. One of the most notable instances is the famous Great Wall, the demolition of which was begun a short time ago. It has been observed that while the Chinese students of engineering resort to America and Europe for instruction, as soon as they return to China they endeavor to solve their problems for themselves, they show wonderful capacity in the practical application of the theories of the Occident and are especially notable for their mathematical ability.

**The Chinese as Engineers**

One of the most remarkable signs of the awakening of China is afforded by the spread of European engineering and technical knowledge. The railroad between Peking and Keiping, opened a couple of years ago, was constructed exclusively by Chinese labor under the able direction of native engineers.

The Chinese do not hesitate to construct railways and tunnels in the modern fashion. One of the most notable instances is the famous Great Wall, the demolition of which was begun a short time ago. It has been observed that while the Chinese students of engineering resort to America and Europe for instruction, as soon as they return to China they endeavor to solve their problems for themselves, they show wonderful capacity in the practical application of the theories of the Occident and are especially notable for their mathematical ability.

**No Loafers in Switzerland**

It is rather difficult in Switzerland to try to live without working. In that commonwealth the people proceed upon the principle that every citizen, if he is left to himself, fails to become a made by being a charge and a tax upon the community. The Swiss therefore consider the problem as an economic question to be solved by the state.

The purpose is to assist the handicrafts unemployed to secure work and only for the sake of his family, but in the interests of the commonwealth. There is no relaxation of the law. Begging is prohibited by the law and vagrancy is classified almost as a crime.

And an unemployed person not making serious effort to obtain work, the authorities proceed to find it for him, and when he is unable to find it, he is sent to the workhouse, where strict discipline is maintained and every citizen is required to work to his full capacity, receiving there for his board and lodging and from five to ten cents a day in wages.

There are in Switzerland institutions where temporary employment may be had by persons out of work through no fault of their own. The matter is of such importance that it is well worth the attention of those who are in any way connected with it.

**Confectionery**

Confectionery, the making of confectionery originated in a land with the apportionary about the hundred years ago. At that time that sugar was not imported into England, and it was then that "confections" first became known. For a time they appeared only in medicinal form, the apportionary using the partly refined sugar as a means of mitigating the bitterness of their drugs. In other words, they mixed their drugs with it, and thence they the origin of many of the simple and medicated confections. The number of medicinal and medicinal confections of sugar was far too high and most people were far too poor to permit of its being eaten for its own sake alone as a mere luxury.

It was not only a couple of centuries ago that the sugar was used in medicinal form, but it was also used in medicinal form. It was not only a couple of centuries ago that the sugar was used in medicinal form, but it was also used in medicinal form.

## FINANCE

BY FRANKLIN ESCHER

## The Overrated "Tariff Influence"

THE past couple of months have seen one of those sudden and all but inexplicable changes in "sentiment" which are the bane of the American business man. For fully two months after the coming into power of the Democratic party had certain a radical reduction of the tariff, business went about as though the impending readjustment were anything but an influence to be feared. This outlook seemed to make up for the possibilities of tariff revision as a business disaster, and within a very few weeks what had been known all along but disregarded, came to be very generally considered an influence of dominating importance. As late as the middle of March, while business was still on the upturn, nobody thought anything worth about the tariff. Now that the event has been jangled and business is going off, there is no such talk about the tariff and its effects, that one might think that were the only consideration of any importance.

That readjustment of the long-established tariff schedule will necessitate a certain amount of readjustment in business is certain, but just why such a process of readjustment should result in the disturbance to business and the markets so generally feared it is hard to see. Were the whole tariff system entirely to be abandoned, the lossiness of the country, it is sure, would be faced with disastrous results. But this is not the case. In a good many directions where an unnecessarily high tariff exists the substantial rate which are going to be removed. In fact, but any idea that it is to be abandoned the protective system under which our industries have grown may at once be dismissed. Between what the administrative machinery and sole revising of existing tariff schedules and what a good many business men think ought to be done there is, without doubt, a considerable difference. While, however, it is already becoming clear that whatever changes are made will be made with due regard for their effect on business.

## 1902 and 1913

For the present looking as to tariff revision and its probable consequences the severe disturbances which followed the last substantial reduction in the tariff is very largely responsible. Back to the early thirties they put the tariff issue, it is being pointed out, and

for five years following we had the hard times the country has ever seen. Make the change proposed, you hear it argued, and the effect on business will be just what it was then.

But had the severe business depression which lasted from 1893 to 1896 resulted from the Wilson tariff, there might be some for remission as the country would be supposed to be recovering from this time. But, unfortunately for the argument of those who want to stir up sentiment against present revision of the tariff by pointing out the effects of the tariff in the past, there are no ill effects to point out. Following the tariff reduction of 1893, it is true, there were several years of business depression. But because a period of hard times followed the enactment of the Wilson tariff, by no means is it said that the hard times were caused by the Wilson tariff. On the contrary, the pretty many cases where men lived through these times, it is agreed that the depression was caused by the tariff at all, but by various emergency legislation, over-restriction of the credit position, and the building of the land boom in the West. For the purpose of showing how the pending tariff revision is going to result on business, the trouble following the tariff revision of the early thirties is being consistently brought up, but as no one familiar with the facts can it have much effect.

## Discounted

As far as the influence of tariff revision on the security markets is concerned it is no question that it has been largely discounted. It is not true, as has been widely stated, that "every schedule in the existing tariff has been removed." But it is true that a number of big corporations which have hitherto benefited the protection of the tariff will have outstanding a large amount of stock, under a reduction in rate will be less valuable than they have been. The point, speak of the word of "tariff revision," and what concrete examples present themselves first to mind? Wood, standard, and the sugar. Very far from the securities of the companies dealing in these products actually discounted the coming revision. Take, for example American Sugar products, in which which pays 7 per cent. dividends and has an authorized dividend record since the organization of the company. Its price of 94 and a time of trading in 1913, it closed at 94 and the year before that at 96, while in 1909 it was as high as 107. Take American Beet Sugar, another stock whose rating prior will be very directly affected by tariff reduction. Only last year it closed at 77. Its present price is 29 1/2.

The foregoing are merely a couple of random examples of what has been going on along the line.

## NORTH BUTTE MINING COMPANY

WITH a total production of 227,000,000 pounds of copper since the time of its organization in April, 1903, by Charles A. Hanson, L. W. Powell, and Joseph B. Cotton, of Duluth, Minn. It is capitalized for 600,000 shares, of a par value of \$1.00. Of this amount 419,000 shares have been issued.

The North Butte Mining Company was incorporated under the laws of Minnesota on April 1, 1903, by Charles A. Hanson, L. W. Powell, and Joseph B. Cotton, of Duluth, Minn. It is capitalized for 600,000 shares, of a par value of \$1.00. Of this amount 419,000 shares have been issued.

The original property was the Speculator mine, which was purchased from John A. Croghan, of Omaha, and the Lange, Idaho, of Butte. The original owners estimated \$1,000,000 worth of ore from the 1,200-foot level.

The officers of the company are: Thomas F. Cole, president; Charles A. Dutton, vice-president and treasurer; and Frederic B. Kennedy, secretary. All of Duluth, Minn. John D. Pope, Butte, Minn., general manager.

The company now owns an area of more than two hundred acres, occupying twenty-seven patented claims in one contiguous group. It includes what has been proved to be one of the richest mineral areas in the Butte district. Less than 100 feet of the ground now develops.

Mining operations are being conducted from the Speculator shaft, which by the original owners was sunk

to a depth of 1,000 feet, and by them the Speculator vein was worked out to that depth and some development done on the Edith May and Jesse veins. Now that the Speculator shaft has been sunk to a depth of 2,900 feet, and crosscuts and drifts have been extended, developing rich ore deposits on various levels.

It remained for the present owners to complete the development of Edith May and Jesse veins, which several years ago were proved to contain the richest ore deposits in the district, and which made possible the payment of dividends in 1906 in the aggregate of \$725 a share.

The principal product from the mine during the better part of 1905, 1906, and 1907 was from the Edith May and Jesse veins. Since that time these veins have been explored on lower levels, and recent developments warrant the assertion that they will prove rich. The north crosscuts have been extended on levels below the 1,000, and have intersected the Glen, Cyrus, Snowball, and Adair drift veins, which now are being developed. On the extreme lower levels the Edith May and Jesse veins are again being developed, and give promise of repeating the rich values on the lower levels. The Cyrus and Snowball veins have proved rich in silver and are giving a heavy tonnage of highly profitable ore.

Early in the history of the North Butte Company it became apparent that it would be only a question of time when expanding operations would make a second shaft a necessity. In 1907, therefore, the work of sinking the Great Edith May shaft, 820 feet north of the Speculator shaft, was commenced. As a two-compartment shaft the Granite Mountain had been sunk by the Lewisons. The North Butte Company planned to sink it with a drift, and continued sinking, and it now has a depth of 2,200 feet, and will be continued to extreme depth. Within

Other influences, of course, have been at work to depress the price of securities, but whatever the cause of the decline, the fact remains that by most of the securities which are being sold in the market are being affected by reason of tariff revision this influence has been pretty well discounted. It can be said with good probability that the rating power of a good many industrial stocks is going to be permanently lowered by tariff readjustment, and yet that at the price at which they are selling they are attractive from an investment standpoint.

## Securities That Will Benefit

There are, moreover, a great many securities whose rating power will be largely increased by the readjustment of the tariff schedule on a more reasonable basis. Take, for example, the railroads. Their product is service—that they are interested in is the freest possible movement of goods. Now, is there any question of the fact that a high tariff tends toward high prices and that high prices tend to obstruct the freest flow of merchandise? Lower the tariff, and while for a short time the inevitable liquidation in certain manufacturing industries may result in the movement of a smaller volume of freight, within a very little while freight will be moving more freely and the railroads will be making more money than ever before.

And that is only one side of it. Along with the increase in railway gross revenues bound to follow modern electric lines, and, therefore, there may reasonably be expected to occur a reduction in operating costs. How many, if any, wages will be reduced remains to be seen, but, certainly, the cost of fuel and oil will be reduced, and the railroads in operation on a more economical basis than at present. Which, after all, is the important thing—more important even than the increase in gross earnings—higher operating profit is what pays dividends.

To both business and the security markets tariff revision is more or less a disturbing influence and is likely for some little time to remain that. It is quite true. But as long as it is true that it is an influence to be feared, it is not surprising that the enactment of the new tariff, importers in many lines are going slow and manufacturers are taking every precaution against getting overworked. All that, however, while it doesn't to business any good, is not doing it any harm which cannot be quickly repaired when once the new conditions under which business is to be done are known.

a short time it will become the main working shaft of the North Butte Company, and will be equipped with the most modern electric hoist, with capacity for hoisting from a depth of 5,000 feet.

While the Granite Mountain will eventually be used as the main working shaft, the Speculator shaft will be continued in commission for lifting the ore located contiguous to it. The company will thus have two shafts for operating purposes, and will be in a position to increase its output of ore in commission for lifting the ore located contiguous to it.

The method of mining by the North Butte Company are thoroughly up to date. The equipment on the surface is modern in every respect, and the mine is now producing an average of 1,200 tons of ore a day. Slips are used in the hoisting of ore, and as it pushes the surface the ore is automatically dropped into the ore bins located on the railroad track. The underground workings are lighted by electricity, and electric hoisting is employed. As the extent of underground work it may be stated that for timbering in the steep, massive, and drifts the company uses about 800,000 feet of timber a month.

The company employs about 500 men, and its payroll amounts to about \$100,000 every month. The area in the vicinity of the company are well provided for and ripe for all of the modern conveniences. The claims owned by the company have been changed their holding before and after working in the mine, is provided with individual lockers for one hundred men. Showers are provided, with hot and cold water.

The North Butte Company ships its product to the Washoe Warehouse at Anaconda under contract. It markets 25,000,000 pounds of copper, 1,500,000 ounces of silver, and 1,300 ounces of gold a year.

# BUFFALO LITHIA SPRINGS WATER

Challenges comparison with any other known mineral water in the world on its record of results.

**Dr. Roberts Bartholow** Professor Emeritus of Materia Medica, General Therapeutics, etc., Jefferson College, Philadelphia, and in "Practical Treatise on Materia Medica and Therapeutics," 1899, that Buffalo Lithia Water "contains well-defined traces of lithia and is alkaline. It has been used with great advantage in gastric, rheumatic and other affections."

**Dr. George Ben Johnston** Richmond, Va., ex-President of the American and Gynecological Association, ex-President Medical Society of Virginia, and Professor of Gynecology and Abdominal Surgery, Medical College of Virginia, says: "When lithia is balanced, I prescribe Buffalo Lithia Water in preference to the salts of lithia, because it is therapeutically superior to laboratory preparations of lithia, lithia carbon, etc."

**Edmond M. Chagnon, M.D., Ph.D., Ch.D., Ph.D., Ch.D., Ph.D.** University of Vienna, Chicago, Ill., declares: "I have found Buffalo Lithia Water of undoubted service in the treatment of Uric Acid Gravel, Chronic Rheumatism and Gout."

**Voluminous Medical Testimony on request. For sale by the general drug and mineral water trade.**

**BUFFALO LITHIA SPRINGS WATER CO. BUFFALO LITHIA SPRINGS, VIRGINIA.**

## EVERY CAR OWNER NEEDS THIS BOOK

It makes you intimately familiar with every electrical device on your car or motor boat. Tells you how to avoid electrical trouble, how to locate it and how to correct it. Written by experts in each simple term that any one can understand it.

The only book ever written that covers every phase of electrical installation on automobiles and motor boats. Write today for a copy before the edition is exhausted. Sent post-paid for 25c.

Warren, Ohio

### The Woodpecker

The California woodpecker stores away his surplus, although he never eats them. He bores several holes, differing slightly in size, at the fall of the year, normally in a pine tree. These he fills with resin, which he adjusts to the size of the holes.

He does not, however, eat the resin, since, as a rule, he is not a vegetarian. His object in storing away the surplus is to hold his freight and a knowledge of results which would save him in the long run. The holes are always close together and are attacked by insects, and it is then that the woodpecker taps the harvest which his freight has accumulated.

Obviously it will be found that worms or ants are collected beneath the point attacked by the woodpecker for its attack and that the bird is guided in its search by the sense of hearing.

There are, however, circumstances that go to show that the woodpecker is not always in search of food or guided by sound. In the winter, when worms and ants are dormant and dead, the bird will make every hole for a long distance around by tapping on a dead, dry branch or on the hollow trunk of a tree. His object seems to be to make all the noise he can.

His mysterious habits of some interesting scientists to make of woodpecker while he was occupying a house that had large hollow pillars in front. Some scientific forest holes in them about two inches in diameter indicated what freedom the yellow-bellied bird had used and could not explain. In the next spring they began operations, and it was impossible to sleep in that house after daybreak. The birds would not have been heard for this even had it become necessary to remove the noise and put a lead on the spot.

It was plain that the noise was what they could not find, as they would have a hole within a few inches of one which was already bored and which would answer every possible purpose as well as the new one. To try them on this point a small, easily made saw-cut hole was made on a carpenter's bench in front of the house.

The yellow-bellied bird could make no progress. If their intention was to perforate the stone, but they could get out of that easily such a wonderful volume of sound. They kept work on the pillars at once, and where they had before drilled one hole they now were able to make several at a considerable distance.

# Tire Bill Payers!

You have demanded a vise-like rim grip—with no cutting or breaking above the rim—and here it is.

Cross Section Diamond (No-Clinch) Tire

In Diamond No-Clinch Tires each point of rim contact is absolutely mechanically correct—the annealed steel cable wire in the bead holds with a vise-like rim grip.

### How Opium Is Got From the Poppies

When the poppy seed grows in almost any climate, it is in the East that it is most successfully cultivated.

When the land has been plowed and harrowed, the poppy seed is sown about six pounds of seed being sufficient for an acre of one acre. Immediately upon the completion of the work, which is most laborious is about a week after sowing, the land is divided by furrows into rectangular beds about eight feet in length by four in breadth, these channels being employed for irrigation, since the plants need frequent watering, sometimes even to maturity.

About two weeks after germination the flower appears, and the four petals are gradually removed, on the third day after their expansion, to be pushed together with the leaves, destined to form the outer shell of the opium latex. There, after a period of eight or ten days, the capsules are bowed, and the juice that has exuded from the incisions is scraped off with a small scoop and transferred in a metal or earthen vessel. This process is repeated three or four times at intervals of two or three days, and the result is gummy opium. The flower petals, plant leaves, and the shells have also a considerable value for packing purposes. The thicker portions of the stalk are used by natives for firewood.

When the opium is gathered it is stored by the cultivator and carefully watched and examined from time to time to see that no ants or beetles may attack it. In due course it is ready to be made into cakes, dried, and packed in keels.

### Cats as Foster-Mothers

The cat has frequently been made to act as foster-mother to strange kittens, but have been known to rear rabbits. In one case two young rabbits dug out of their nest and abandoned for ten kittens were reared by the mother cat. In another occasion a cat suckled a young rat, for which she developed a fondness greater than that for her own offspring. Curiously enough, in an attempt to make a rat-suckling creature the difficulty arose, not with the rat, but with those intended kittens, which, although they suckled, were not fed by their foster-mother, and all succumbed from such a source.

### Fragrant Saazer Hops

Absolutely pure hops from the pick of the world's finest hops from the district of Saaz, Bohemia. It's the exclusive Saazer Hop flavor which puts their beer there.

### Budweiser

Supreme in Quality and Purity, blending with the liquid life of the Crown of America's Barley & Hops, Budweiser has won fame everywhere.

Business in 2000 B.C.

Two deciphering of the old Babylonian records of city have revealed some very interesting facts which refer to the life of man two thousand years before Christ. It shows how these records relate to trade transactions, to business disputes, to incidents in the ordinary, every-day life of the merchants, and to their troubles as to the title to property. There are even facts to show that the Babylonians and their neighbors conducted their accounting systems.

Justly four thousand years ago those people had so far progressed to "bank accounts" that it was actually found necessary to enact special laws to deal with those who were guilty of "short cuts" to wealth. The young man with "profits," like his prototypes of today, was bound to utilize these provisions in legislation with the professional money lender.

The banker of Babylon deposited regularly and issued his bank "checks" and bills of exchange, and the law intervened, as it does today, to uphold the rights of property. So, too, indeed, were the business statistics of the Babylonians that even the records were not alone a "dead" thing, as it were, in real estate. Furthermore, it appears that a vast part of the commerce of Babylon was concentrated in the temples. Great quantities of metals, cereals, and other commodities, coming either as gifts to the gods or as payments to the temples, were added to the stock, and the law rarely failed to obtain their full profit.

Most careful accounts of revenue and expenditures were kept. These were in many cases that investments in loans and purchases of land, as well as other profitable dealings, were a regular part of the local activities of the wealthy establishments.

There have been preserved the contract tablets kept in a Babylonian house and money-lenders known as "The House of Equity," established at Babylon as early as the thirteenth century before Christ. This firm was of enormous wealth and influence. It has been called by one English writer "the first bank of the ancient world." It conducted nearly every sort of financial operation. It made loans to the state, as well as to private individuals, and the services of the contract were indicated to it for several generations. It collected the land taxes, tithes, and dues for the royal courts and paid them into the royal treasury.

This firm also undertook the conduct of what are now called "agencies" for private persons, and, in addition to financial money-lending transactions, must also have been engaged in what we now term "banking" business, since it is occasionally certain that in those days there existed documents corresponding to modern checks and bills of exchange.

The transactions of this firm were noted down on clay tablets, which were found in great numbers, preserved and safely. They were translated into English, and were brought to light by scientific examinations. All these tablets bear the names of the contracting parties and witnesses, and most of them are dated. The Eight firm was not the only great trading firm in ancient Babylon. In fact, before there was discovered the records of another firm, known as Mesene, that conducted a positive line of great wealth and importance during the fifth century before Christ.

The tablets unearthed at Dilbat, near Babylon, also show an interesting list of the business methods of the people. These tablets tell in graphic manner the story of the citizens, their business transactions, disputes, and every-day life, particularly with reference to land transactions. They are the first that have been formed family archives. They relate to a very early period, being mostly dated in the reigns of the great kings, but they nearly mirror the Babylonian laws, and are evidence of the period of the first Babylonian dynasty.

The documents preserved from the ruins of Dilbat almost all concern the sale or renting of houses and lands and bills of purchase of cattle and cows. Dilbat was the center of a rich agricultural district. The great majority are devoted to all the Babylonian cities. The ground and the houses are clearly defined by the measurement of the great irrigation canals and the names of their proprietors. Frequently the buyers in a street, a canal, a house or land, or a field. Then, in case of real estate, follows a statement of value, with the names of vendor and purchaser, and at the end of the document comes the statement before the god of the village temple and also an invocation of the protective king. The Dilbat tablets also contain a clause placing the sins of an obnoxious debtor of the dead upon the "seller." For all the records concerning property, it is, it is, responsible. Fourth follows the names of the witnesses, and often also the names of the tablets, and generally several signs of the par-

# GRAFLEX CAMERAS

The GRAFLEX makes better photography possible by eliminating the uncertainties. Focusing scale and "finder" are done away with. With a GRAFLEX you see the image full size of finished picture, up to the instant of exposure right side up. You know to a certainty that the picture is in focus, without having to guess the distance between the camera and subject.

The GRAFLEX Focal Plane Shutter works at any speed from "time" to 1-1000th of a second.

Send for Illustrated Catalog.

FOLMER & SCHWING DIVISION

Eatonman Kodak Co.

ROCHESTER, N. Y.

No camera is so good as the Graflex for making pictures of children. Before or in the shade maximum may be made but enough to secure perfect photos.

You can photograph on dark days when you use a Graflex. You get the same result as in bright light, so you can take pictures in the shade.

The Graflex is best for those who wish to take pictures in a camera.

On dark days when the sun is shining, the Graflex will make pictures in a camera.

## Tenement Tommy Asks for A Square Deal

He lives in New York's stuffy tenement district, the most congested spot in America.

In his squalid three-room home there is scarcely space to sit and sleep. His playground is the blustering pavement of the ill-smelling streets, hemmed in by scorching brick walls.

Tommy's widowed mother is broken with worry; his sisters and brothers are an pallid and frail as he. The winter struggle has sapped their vitality. They are starving for air.

No medicines will help Tommy. What he, his mother and the other children need are: a chance to breathe something pure and fresh;—a taste of sunshine and outdoor freedom,—and out in the country or at the seashore.

But between Tommy and his needs stands poverty, the result of confinement. He must suffer just as if it were all his fault.

This Association every summer sends thousands of "Tenement Tommies", mothers and babies to the country and to Sea Breeze, its fresh air home at Conry Island. A dollar bill, a five dollar check, or any amount you care to contribute, will help us to answer Tommy's appeal.

Send contributions to Robert Shaw Mistry, Treasurer, Room 204, 105 East 23rd Street, New York City.

NEW YORK ASSOCIATION FOR IMPROVING THE CONDITION OF THE POOR

R. FULTON CUTTING, President.

sons concerned. The habits were a stepstone. The first was inserted and laked and rapid; then a cover of soft glass placed over or around it, and the following improvements were the result from the copy, so that it could be referred to at any time by paying the required fee at the nearest office. For an extra sum the order envelope was broken and equipped with its interior duplicating lens, and the letters were prepared to be in error in his attention that the two records were not identical and a considerable time was had an order sum was placed over the original tablet and reinserted. This procedure a modification in the Old Testament, comprising of the order and starber tablet a deed.

### How Many Stars Are There?

We think of the multitude of the stars and would in all probability holdly say that as a clear, frosty, moonless night we see millions of them. In reality on such a night, if we leave out the faintly luminous Milky Way, we see no more than three thousand distinct stars. In the whole starry sphere, of which we see only half at any given time, there are only seven of first magnitude stars, beginning with Sirius, the brightest of them, and (twice) equalling it in size, the red star Antares and left knee, Betelgeuse and Rigel, Vega and Arcturus. Of stars of the second size, there are a thousand, and of the sixth, the extreme limit visible to the naked eye, the best nights number over three thousand, making in all less than five thousand visible at any time to the naked eye; while only half, or about two thousand five hundred, can be seen at one time.

But even an optician shows a great many more, and larger and larger telescopes discover more and more stars, but they are limited in number, at least if it be true that the light entering other does not absorb and extinguish the light of the most remote. For if they were really infinite in number, and their light came so unimpeded, the night sky would be uniformly luminous, which it is not. So that a small telescope which shows stars shows a limited number, and the light of the visible to a hundred thousand stars to those visible to the unaided eye, while the largest telescopes will show stars down to about the sixteenth magnitude. The number of stars that includes between three and four hundred thousand stars counted and plotted by hand, while the modern photographic survey, in which the stars are made to map themselves, goes up to the high figure of fifteen millions. It is suggested that the best optical means which human genius can devise may show a hundred million stars. If this be, as is supposed, close to the truth, and if stars, and if we remember that the population of the earth is computed to be one thousand five hundred millions, then it follows that there is only one star for each fifty-five people, or say, a star for every three families, or more, and that the vast number so much people suppose. But, to avoid this is true only if the other does not exist, and if the light of the stars does not hide the most distant stars by absorbing their luminous energies.

### A Novel Automobile Club

BREVETEE there has been started in Paris a novel institution called the Hundred Club. Its object is the revival of the ordinary car. To realize this, the members agree to join. All are given automobiles familiar with the mode of the most famous producers and their bodies are of the most modern. It is a good "novel" club" the experience is gained for the general benefit. Thus a member who has received satisfaction in treatment in a certain town informs the club of the fact in a note that mentions the position of the road and the distance and shows it is best to get her down to the smallest details of the service. At one place, for instance, the club has a divided tablet for "more maneuvering." At a second the kitchen help are marvels of cleanliness, and so on. On the other hand, the members are making an establishment is pointed out as a warning to avoid the place as a plague spot. The five members and kept away from outsiders, these valuable clubs are free to members for their exclusive use. One result has been that the accustomed motorists have taken shape in a sort of geographical book dictionary.

## COMMENT

TRANSACTING with the issue of August 19th, Mr. NEWMAN HARPER will take direct personal charge of HARPER'S WEEKLY.

## As to the President's "Lobbying"

The real objection to the lobby investigation remains precisely what it was: it may cause unnecessary and momentous delay. On the other hand, few of us are in a position to say positively that the delay is unnecessary or momentous. On the contrary, the final shut-down on expedient amendments and on the passage of the tariff bill may prove that the President was right and that his move was the only way to hold in line enough votes to reject dangerous amendments and to get the bill into conference substantially modified and in shape to meet Democratic pledges and test the law-tariff theory.

Senator TRACY, of Michigan, Republican, has given interesting support to this view of the matter. He has declared that the President, by his statement in reference to the lobby, has held in line Democrats who might otherwise have acted against certain parts of the bill, if not against the measure as a whole. In other words, he has indicated his belief that the President's action may have saved the bill from mutilation or defeat.

Of course, at the same time, he called the President a lobbyist—the same lobbyist in Washington—and was influential at the growth and open exercise of executive influence.

That's as it may be. The President is leader of his party, and it is inevitable that he should not try to exercise much influence over it. In finally asserting his leadership, he openly attacking whatever influences there were that opposed, openly or indirectly, his and his party's policy, he was within his right, he was breaking no precedent whatever. To say that he was "lobbying" is absurd; quite as absurd as to call a British premier a lobbyist for rallying his following in Parliament or to blame a general for any measure he may think necessary to hold his men in line on the battlefield.

## For Higher Education in the South

Another million for a Southern college! And again we are quite confident that no other part of the country will react to see this fresh slice of the turning staffwheel of a reasonable part of our American generosity to colleges. This time the beneficiary is Trinity College, Durham, North Carolina. Most of the money comes from the Dixie brothers, natives of that region, and who there began their remarkable business career; but a substantial part comes from the K-B-Gebler Foundation.

## Early Good Going with the Tariff

We are no longer to be discouraged about the tariff bill. True, we should like to see it moving along faster toward final enactment. We want business to begin to see some of the actual experience of the new order which the bill will bring about. We want the country to begin as soon as possible to study the actual working of a really free tariff—something that few Americans now living have ever seen. For we are steadfastly confident that a law tariff, framed on sound principles, will, if it is given a fair opportunity, more than enough, prove the best of free-trade arrangements. We believe the Cullinan bill, if enacted soon enough to give it a safe life of four or five years, will be the next tariff revision which the WALKER bill of 1904 was to the bill of 1857, concerning which Mr. WALKER said that practically all classes, including the manufacturers, were content with it as an extension of the law-tariff principle.

We hope that feeling as to the extreme advisability of waiting no time. But we are not so unreasonable as to demand that the Senate renounce its function and pass the bill without any real consideration whatever. It is not to be expected. However, trusting the majority will, we are actually pleased with some of the intentions of the Senate Finance Committee and its sub-committees. Finally, for instance, we never could see any good reason why, if four and oatmeal and meat are to go on the free list, there should be a duty on cattle and wheat and oats. That

should not be logical; it would not be in accord with Democratic doctrine; it would not be just. As we have indicated, the protest of the millers and others against it seemed to us entirely reasonable. We are glad to believe that the protest has been made, and we are particularly glad to believe, according to the latest reports, that the remedy is to be, not a duty on flour and oatmeal and wheat, but free wheat and free oats and free cattle. That, we take it, is not only adherence to principle, but also candid acceptance of present conditions in regard to anti-growing and cattle-raising in this country. It is not a right, whether it comes from the Senate committee or the President.

We feel equally free to say that we find nothing unreasonable in the proposed Senate changes in the administrative sections; and we are certainly not displeased with the announcement that the Senate amendments, taken together, will probably yield a lower average rate of duties than the House bill. If that is true, then we will have attained not merely a new tariff bill, but a new process of tariff-making. For every tariff we remember has left the Senate higher than it came from the House, and has again been raised in conference.

We are not discouraged; and we are only too glad to praise the Democratic Senators, including NEWMAN, who, whatever their past records, seem now to be resolutely minded to keep faith with WALKER, with his party, and with the country.

## An Alien Enterprise

Senator HERRICK's amendment, proposing a graduated tax on the larger producers of smoking tobacco, and on cut and snuff, has another life. We do not understand that the Senate Finance Committee, or any of its subcommittees, has accepted it. Neither do we find up yet anything to indicate that the President is at all committed to it. So far as we can see, it merely embodies an idea of Senator HERRICK's own and a suggestion of Attorney-GENERAL TAFT. It is introduced by legislation the supposed lack of effectiveness of the Supreme Court's decree dissolving the tobacco trust.

It is a matter, therefore, for separate discussion and not for further deliberation and full consideration that we propose to entertain. It involves a question of fact to be harshly dealt with; whether, for instance, the larger of the surviving tobacco companies are actually crushing out the competition of the smaller independent companies, and by improper methods; it involves the old question of how far more vigorous is itself advisable in competitive trade; it involves a lot of things that ought not to be hurriedly decided. Above all, it involves the question, never before so squarely posed, if raised at all, whether government must yet use the taxing power—which Senator HERRICK frankly recognizes is the "power to destroy"—as an adjunct to its other legislative endeavors to regulate; it involves a "judicial" query.

Because it does raise such big issues as these, we strongly oppose any such amendment to the tariff bill. We pass no judgment on the ideas of Senator HERRICK and Mr. McHARRIS, who have it, but we think there is much sympathy with the objection that is in order. On that score we ourselves are unimpartial. But the tariff bill ought not to be complicated with or impeded by such an unnecessary addition to the troubles of the men who are fighting for it. The HERRICK amendment should take its chance as an entirely separate measure. If you then be discussed on its own merits. The announced purpose of the President and the party is power is to enact a tariff "for revenue." They ought not to be asked to pass a tariff to amend or supplement the SURVEY law, or to correct a Supreme Court decision. Their "initial bill is big enough as it is. Let us not enlarge it with other devices, however worthy.

## Not Too Sociological, Please

Some of those who had introduced an amendment to the tariff bill which would bar from entry all goods manufactured wholly or in part by child or anti-labor factories, or by child or anti-labor women who are not registered with the State, have their eyes fixed on the fact that there ought to be a tariff. It would also bar all countries made wholly or in part by some labor—Republican Democrats.

We suppose the Senator's intention is to protect American labor from the competition of foreign child labor, but there is a lot of things that ought to be done that a tariff bill ought not to undertake, and this seems to be one. Moreover, if the custom-house law to drive too far into the sociology of imports, the revenue will be cut up in investigation. *De minimis non curat lex* means tariff law, too.

Peterson and the I. W. W.

The I. W. W. at Paterson is a symptom, not a cause. Mr. GEORGE MAXWELL gathered the facts of the industrial situation in that city in an article in the *Quaker* last week. The strike in the silk mills began, he says, when, in January, the employees of the Denbury mill, caused at the installation of the four-hour system, by which each weaver's work was doubled without a corresponding increase in wages, left their places and struck." But for long before that the silk weavers had been much discontented in their minds in the silk mills here, he says, when, in January, it was a serious disturbance, for the example of the Denbury mill, under the stimulating supervision of the I. W. W., brought 25,000 silk-workers out, and they have been out ever since.

The trouble seems to be the common one of improvements in machinery and hand on operations; have large bodies and harder on operations. The story as Mr. Maxwell tells it is that twenty years ago a big business was perfected that could be run by women. Four-hour factories were opened in various cities of Pennsylvania where the men work in coal or iron, and many women are available for employment. It began in the silk-making in 1881, and in industry, but the competition of the cheap-labor mills in Pennsylvania drove the Paterson manufacturers to like expedients. "Women came into the mills of the Jersey town and wages dropped."

Now as to the four-hour system, Mr. Maxwell says that fifty years ago each weaver could make from eighteen inches wide. Gradually by improvements in machinery and possibly by developing a higher standard of energy, workers have been given two, three, and now four hours to run, and the width of the looms has been doubled. So a weaver now under the four-hour system produces as much as eight men produced fifty years ago.

That is a splendid triumph for invention and machinery, but the workers seem to be worse and worse off. The competition in silk-manufacturing is sharp. If wages are low in Pennsylvania, Paterson cannot compete successfully with Pennsylvania's great centers. If they are high in the legislature of New Jersey, what can it do? Can it regulate wages? And if it could, could it regulate the competitive wages in Pennsylvania and other states?

It will be seen that here is a situation difficult of resolution at all times. There ought to be, under our present system of government, a federal law to fix the standard of wages and hours of labor in the silk industry. If the manufacturers combined to do it the SURVEY law would probably prohibit such things.

And that is a pretty curious situation. Business ought to be able to bring that about, and go back and sit down. Along comes the I. W. W., which is not reasonable, which has an impossible industrial theory, cares nothing for state's rights or the SURVEY law, has not been led by any sacred awe of machinery, but has a very lively concern for human workers, and sympathy and sympathy for the workers in every part of the world. I. W. W. takes hold of this situation, which public law and facts argument, and does what it can. Largely it raises bids, but considerably it believes for it gets money and it gives leadership and keeps the strike together.

## Women in Industry

The element of woman's labor in this silk-mill difficulty is interesting. A very wise woman said the other day: "I do not care anything about votes for women. The great point that concerns this is industrialism, which is drawing them by the thousand away from their natural duties and vocations for which they are best fitted. How many women leave industry? What can make up in the country for the loss of their services as mothers and trainers of families?"

Who is ideal on the wholesale employment of women of the wool districts of Pennsylvania in silk-mills? Perhaps some manufacturers are the better for it, but it is not so certain that the women suffer or more profitable to the extent because of it. But see the result in Paterson, see the effect on labor, wages lowered, human life cheapened, competition intensified, men diminished in their power to support families! And since this sort of thing has been going on in all sorts of places, for a while ago and more lives of women have been worked in, and human endeavor has been stretched further and further on the industrial rack, the cost of living has mounted up, up, up, and discontent has waxed largely. Of course there are compensations. A great

many women **not** women and like them, but it is as President Wilson said in his inaugural:

We have been proud of our industrial achievements, but we have not hitherto stopped the gradual process to convert the human cost, the cost of lives sacrificed, of energies exhausted and broken, the fearful physical and spiritual cost to the men and women and children upon whom the dead weight and burden of it all have fallen pathetically the years through.

#### Women, Berlin, and Work

Last week in the French Chamber of Deputies there was a discussion about the protection and encouragement of motherhood. We read:

Deputy FÉLIXE ENRIQUEN, in proposing a measure to compel employers to continue paying the wages of workmen during part weeks in case they are absent from their employment owing to motherhood, said that France and Turkey were the only European countries in which motherhood was not protected. The death-rate among children was very high and rose as France was, and, said, sixty per cent, while among children reared by their mothers it was only twelve per cent or more.

What does four weeks amount to in a nursing mother's? To something, no doubt, but of course it is not nearly enough. Does France expect to get her population into any better condition than is created by the efforts of women who go out to work, and bear children in the brief intervals of their unrequiring labors?

Ministers! We commended to the Deputies this discourse of last week before a committee of the Missouri Senate, between Lieutenant-Governor FOSTER, of Missouri, and Mrs. ROBERTS, settlement-worker of Chicago, and president of the Woman's National Trades Union League:

Lieutenant-Governor FOSTER said that the attitude of the Trade Union League is trying girls to concentrate in the city in destroying home ties and subjecting women to conditions worse than those of the negro in slavery.

Mrs. ROBERTS said that women in industry were slaves, but she said they might be under the gentle supervision and be paid a proper minimum wage—\$12 a week or more.

Mrs. ROBERTS said that women enjoyed being among the multitude, preferring that to the home. She said her purpose was to make women who were not so well paid demand more pay and better working conditions.

Does not women's employment in the industries offend women's loyalty in this country? asked the Lieutenant-Governor.

Yes," said Mrs. ROBERTS. And are not women workers more freely in London than were the African slaves, who were valuable to their masters and properly cared for? Do not employers now know that they may not get one girl they can get another to take her place?"

Yes, that's true," said Mrs. ROBERTS. If women were at home and took care of the families, would they not be better off and would not the men then get higher wages and be better able to provide for their families?"

Every woman is entitled to work," replied Mrs. ROBERTS.

Yes, every woman is entitled to work; but to bear and raise children is work, and could not be to me so much complicated with employments that conflict with it.

#### Thought Will Still Govern

THURLOW WYEN was the grandfather of WILLIAM BARNEY. When New York proposed in 1821 to establish manhood suffrage Mr. WYEN was one of the most able opponents of the amendment. Sixty years later he frankly confessed that he had been mistaken and that some of the evils which he feared had resulted from the establishment of a generally popular government. If grandfather were now he would speak in a vivid question of voters, grandsons may be equally wrong on a question of nominations.—*The World.*

Possibly THURLOW WYEN's final conclusion was that it doesn't make much difference who votes, provided the voter is reasonable; and perhaps Grandson BARNEY's conclusion may finally be that it doesn't make much difference what voice nominates. The thought taken beforehand will doubtless produce effects in politics as heretofore, no matter what improvements may be made in the machinery of nomination.

#### False Economy with Judges

There is little or no difference of opinion to be found in the very widespread comment on the resignation of Judge WATSON, of the Second Federal District at Detroit. Those who should Judge WATSON agree that he is a very good judge indeed, and that the bench will be weakened by the loss of him. Those who know about living conditions in his district, which extends into New York, Connecticut, and Vermont, agree that his sole reason for resigning, the insufficiency of his salary—is a perfectly good reason. Everbody seems to agree

that our government is at fault in permitting such a reason to exist.

Congress is at fault in more ways than one in this matter of judicial salaries. It has failed to take due account of the increase in the cost of living. Twenty years ago that was not, for a man in Judge WATSON's position, more than half what it is today. His present salary of \$12,000 is now not nearly equivalent to the \$6,000 which circuit judges then received. Congress has also failed to take due account of the differences in the cost of living as between different parts of the country. There are high state judges in parts of the South who serve seven months with salaries of \$5,000 or less; at my rate, high-class new work and keep such judges. On the other hand, some courts are so insignificant that in New York City Supreme Court justices could have \$12,500.

But the main fault of our policy in this regard is general and continuous, and has often enough been pointed out as in contrast with English and other foreign courts. It is simply that we do not pay enough for the difficult and almost unimportant work which we demand from the bench. Our system, state and national, throws upon judges most of the responsibility for its proper working than does any other in the world. That is perhaps its most distinguishing characteristic. Yet no other great nation does so little, whether with money or in other ways, to make the bench attractive to men of the highest ability.

Some of the states are doing worse than they need to. They are signs that a general change of policy may be approaching. It cannot come too soon. Whatever may be the merits of other plans to keep the American bench what it has been and should be, and to ally what seems a growing defect of our government can be completely final that we do not make it effectively attractive to the very best men we have to get on it. Whatever else we want, we shall certainly always want the best judges we can get. We can afford whatever it may cost to get them. We cannot afford to practice any economy—or to do anything else—that may keep us from getting them.

#### Commissioner Williams

The resignation of Mr. WILLIAM WILLIAMS as Commissioner of Immigration has been accepted by the President, to take effect on June 30th. The President in a letter expresses his appreciation of Mr. WILLIAMS' "conscientious and peculiarly intelligent service in handling one of the most delicate and onerous positions in the government service."

It will be a loss to the country when Mr. WILLIAMS leaves Ellis Island. He has been the head of our establishment there for seven years in all—three by appointment of Mr. ROBERTS, and after an interval, four more by appointment of Mr. TAFT. A commissioner at Ellis Island under the immigration laws is one who has to be studied and understood. He will have to make many distressful decisions, and turn back lots of pitiable people from the door of their homes. It is a heartrending job. Mr. WILLIAMS has administered it with firmness, with kindness, with sound judgment, and entire impartiality. He has been vilified and assailed a great deal, but wherever his conduct or decisions have been investigated by competent inquiries he has been justified; and usually when his judgments have been overruled on appeal to Washington, the final result has justified his opinion.

We don't like to see Mr. WILLIAMS released from the public service. He has certainly served his time at Ellis Island, but it is doing so he has acquired an unusual knowledge of immigration, and that should continue to be available in shaping the country's immigration policies. We wish he might go to Congress. That is one place where such experts as he are needed.

#### Liquor Laws that Miss Their Mark

We read that under the present liquor law of Texas the salaried men have been known to buy German society in Dallas for selling drinks to its members, and the Attorney-General is going to sue clubs everywhere that keep "gentlemen's cellars."

To start with the Germans seem an ambitious beginning. There are a good many Germans in Texas, some localities having a large preponderance of them. We suppose they drink beer, and drink it in large quantities, and they will be glad to drink it in company. We suppose they are about as good settlers and citizens as Texas can hope to get. If the prohibition sentiment in that state harnesses them in the enjoyment of life and law according to their tastes, it will do, we should say, a mischief, and one that in the end will be likely to test the strength of the prohibitive anti-

ment in Texas. It is not enough for a liquor law that it should mean harm. It must do good or die. Moreover, it is not enough for a state law that it should do good in one county and evil in another. It must be so devised as to operate beneficially wherever it operates at all. Local option seems the likeliest way to effect that, and local option in Texas would probably avoid the harassment of the Germans.

If expert testimony is of any worth, the foremost example of a well-intentioned liquor law that has done harm is the anti-ventures law. The army struggles annually to get rid of it, making pathetic showings of its evil consequences, but it sticks.

#### Racing

There is racing again in these parts, some at Piping Rock and some at Belmont Park. The law have been modified so as to give the sport another trial, and we wonder the gambling element in it can be sufficiently suppressed to avoid damage to the public morals.

Racing seems to be amusing, and there are a good many people hereabout who have leisure to be amused, and are ready to spend money for amusement, and it would be a pity and, we think, a mistake to prevent laws between them and diversion which can be made reasonably innocent. If racing can be successfully demoralized it is no worse than baseball. It has the good quality of putting the Puritan nose out of joint. A world in which the Puritan is entirely easy is not an entirely wholesome world, not quite the world the Creator intended.

We hope the new racing will succeed. If it drops back into its former status of an institution by which a few investors made money and a big crowd was touched with the gambling mania and lost money, the new experiment with it will be short-lived. It is essential to its continuance that it shall be so profitable to the vast majority of the crowd as to be profitable to the few. Government officials squelched it. When it becomes too profitable it becomes a public nuisance.

#### Washington and New York

In the latest installment of Mr. JOHN BURTON'S memoirs he speaks of saying to Mr. SEWARD, then Secretary of State, that he had thought of choosing Washington as his winter residence. Mr. SEWARD advised him earnestly to do nothing of the kind, saying:

I would not stay here a day if it were in option. There is no society here with which you could mix. You are identified with me, and you are not a quiet office. You would be put down as a club man, or be overlooked by the officials or first-class people, and your position would be a nothing but pleasant to yourself, still less pleasant to your wife. I always held on to my country home at Auburn, because, come what might come, there I could always be sure of making with the first. I would not stay here a day if it were in option. You are a better man than I am, and you are not in the crowd, by keeping outside of the city I was always a lion in the city.

No doubt Washington has improved in the last fifty years as a place of winter residence for a citizen not in office. The city is much bigger now than it was in the days of such headquarters and more desirable; the permanent population is much larger, and includes more people of wealth and more of mental distinction, but the business of the city is still government, and active people not connected in some way with that may find difficulty in employing themselves to their satisfaction there. Mr. SEWARD might not give his day to the city, but he would not give his day to Washington; but Washington is still preferable as a place to retire to after the hard work of life rather than as a field for the unocial activities of a man with work still to do. One trouble with such a place for the aspirant is that their children, if they are ambitious, must go elsewhere to do their work in life.

It is not the trouble with New York. Mr. SEWARD's objection to being lost in the crowd of New York was proper enough for him at his age and with his competent fortune and great distinction. He went back to Auburn, and spent so much of his last years there as were not occupied by travel. But Mr. BURTON settled back eventually in New York, and he was, we believe, very happy and as long, and never became cheap as Mr. SEWARD said, and never was lost in all the crowd of Gotham.

Not every one is lost in New York. It depends. But nobody retires to New York. Mr. HAZARD lived here, and lived to be ninety-old, but he never retired. To the very end his was a life of the life of the city.

# THEY MARRIED ON SIXTY A WEEK

Were They Rich or Poor? A Genial Modern Philosopher Answers this and other Questions Relative to the State of being "A Beginning Husband" and Wife

BY LOUISE COLLIER WILLCOX

"MARRIAGE," as one of our greatest

philosophers has remarked in a still more

great beginning, as it was to Adam and Eve, who kept their

homestead in Eden, but had their first little row among the thorns and thistles of the wilderness. It is

at still the beginning of the home life, the gradual conquest of irreconcilable foes," etc.

This is not in the least the tone of the reflections of the Beginning Husband, who apparently shares with his author a gay and somewhat attitude

toward life and an uncooperable faith that the universe is mainly disposed toward well-being and well-behaved people, but that philosophy and philosophy of a grave and penetrating nature, is absent from these reflections, but it is a philosophy learnedly disguised in wit and chief of a philosophical touch, touching such that Confucius and Epicurus and Aristotle taught, is yet a little too abandoned to utter itself gravely.

It is impossible to read this book, witty and amusing as it is, without being surprised with a personality and an attitude toward life.

The Beginning Husband takes a wife brought up to like an income of twelve thousand and spend a year and persuade her to adopt herself in his income of sixty dollars a week with prospects. But by no means will he admit it as a social and depressing undertaking. For he says, as to politics and getting married: "If you wait till you're ready, you wait. It seems as if everything had to be shot on the wing."

Two passages, perhaps, give the general drift of the philosophy of the young husband and his creator. In one he says: "I love old associations and possessions of relation, and my heart is even hostile to some fifty at condition; but there is plenty to be said in favor of wearing the garments of life here—though to shed them when they get seriously in the way. One should be enough of a change artist to quit a suit he cannot wear in before the on-lookers about him out."

Again he says: "We are the standard. We laugh at ourselves, but surely it is a fine thing to have so strong a heart toward toleration of things as they are, and expectation of being pleased with them as they're going to be."

The first passage gives one the note of conversation, the attachment to the old social order, so as suitable, together with a free indifference courage and a general sense that, whatever comes, there will be some fun for the spirit that knows how to make it; and the second emphasizes that world-old philosophy of the Stoics which teaches that, if you can't get what you want, the wise man will want what he gets—and so be even with destiny.

With the married and most sensible philosophy of life, then, the young husband recounts his adventures from the moment when he re-organizes himself to the day he had relinquished an account of insignificant means remaining. "I think usually of the common state per se, but I had always rather be engaged to Cordelia than not—through contemplation of the details of living and keeping house, the relation of things in business, the first baby, a discussion of the latest woman question, contemporary politics, and the education of girls.

If this book lives, if it is treated in a number of private libraries and referred to by those who give her reflection and observation, it will not be because it is urged in a cynical way the march of events. The old order seems fairly desirable and agreeable to

Mr. Martin, and he discusses the affairs of women quite as if more than a third of them here in this very had had not already been forced into self-support, into becoming independent economic factors, responsible for themselves and often for a good many others. Even on witty details to work he congratulates himself that his wife has an "job" except that of

Edward Sanford Martin  
AUTHOR OF "A BEGINNING HUSBAND"

maintain to his comfort. "My need is for assistance in spending our money." All the choices of the young husband turn out as joyously as his own temperament. Fathers and fathers-in-law supply a dissonant of country-houses for summer, champagne, and automobiles. Cordelia sings at her work and spends her life "making calls—though she says calls are a queer employment for a lady who likes over a better shop—and she goes to see her mother, and my mother, and various girls, and goes to market, and sees a little and reads a little and does charities a good deal, and has girls in to teach and feeds them on I don't know what. She says it is not wise to break with the life you know any more than you have to."

Again, when it comes to the question of educating girls it is quite definite that the author prefers girls educated for marriage rather than for self-support. College girls, he thinks, are largely recruited from

humble whose daughters have a doubtful prospect or worse of inheriting means of support. Now his friend Mrs. Van Pelt, at the dinner-table: "The religious are anxious to get of some whose mothers I don't know, busy learning unimportant things like how to set up a factory, how to have hair attached to the scalp, how to talk to a bee, how to help a smelter, how to engage a rook, when to ask to a dinner-party. Why religious? Maria's own home in four years, forgotten by all the girls she ought to know, qualified to be a school teacher and with a large acquaintance among young ladies similarly certified, and with a strong and reasonable impulse to put her attainments to practical use either by practicing her studies or getting a situation and earning her living. I don't want her to get a situation and earn her living. I want her to get married."

This is not the tone of the modern economic situation. The author says nothing about the social in this case, but the general optimistic tone is of one who thinks well of the human experiment, and yet, if the need is to multiply indefinitely, it will probably be necessary for more and more members of the race to become producers.

However, it is not in the field of social economics that we meet Cordelia, the Beginning Husband, but in the field of human relation. The Beginning Husband has a genius for associating himself with also people. That Cordelia was thoroughly nice as well as was one seen from her reply to her husband when they were visiting wealthy contemporaries.

"No dearth, Cordelia," said I, "you might have had a set of things like this if you had asked a little timely judgment."

"Possibly," said Cordelia, "this is a nice set, but how many bath-rooms shall we need, Virginia?"

Of social status as measured by the many bath-rooms in a father's house there are many witty comments. A long island house, built to contain a lovely of three and containing twenty-five of those commodities, sets the young husband to reflecting: "Cordelia really still hangs back a bit, but we are getting pretty strong on planning, and the wilderness may find us with a bath-spa."

It is the other days Aristotle gave us the picture of the fine gentlemen of the early eighteenth century, here in a companion picture of a fine gentleman in an era of himself when fine gentlemen are perhaps rare. He has a jaunty manner still, a high heart, a tolerant regard for his messes, and a kind heart; with the philosophy of life that he offers, is no gay and luxurious style, and so makes two grave utterances that uttered in our era: "The Kingdom of Heaven is within you" and "Bless ye first the Kingdom of God and all these things shall be added unto you."

We should advise every young husband to keep the book near at hand so that he may refer to it when his failures are most apparent, laying to heart the tolerance of the young husband's friend, speaking of women, Mrs. Stare says: "We can't do anything. Perseus, but try our utmost (of course he really said 'darnedest') to make them happy, and hope that they will be good."

It has been pointed out before that the field which Mr. E. S. Martin has made particularly and happily his own is the domestic field. And one need be hot set before us with the same happy lightness of touch, the same profound wisdom as graciously offered, that we meet throughout the book and only realize afterward that we have been led along a primeval path to the underlying gravities of life.

# DULUTH'S SUCCESSFUL STORY

A Mining Town that Made Itself an Agricultural Object-Lesson

A view of Duluth's harbor

BY HERBERT STOCKTON

**T**HROUGH there was a landing-point at the head of Lake Superior a hundred years ago, and a French trading post a hundred years before that, Duluth's history began when this territory was ceded by the Indians to the United States in 1853, began a second time when the railroad entered in 1870, was broken off in 1875, and took a fresh start in 1880, when the Northern Pacific got its new lease of life and the homeseekers invaded Dakota. As the wheat began to flow from the bread-basket of the world to the port at the head of Lake Superior, Duluth took a fresh grip on the skirts of destiny.

Next iron was discovered a hundred miles north of Duluth at Vermilion Lake, and the Mesabean Tower built a railroad into the wilderness to reach it. Next the Mesabean was discovered in 1880 by the Merrill brothers, who built a railroad to the new range, paved it for funds to complete it, and went under in the hard times that followed 1893. The Mesabean Range turned out to be the biggest iron-miner in the country. Its shipments are sixty per cent. of all the iron mined in the United States. It supports a population of 75,000 in a series of thriving villages, and more earth and rock are hauled every year than at Panama. It has known deposits of a billion and a half tons, with new discoveries every season which will keep the furnace going for the next hundred years at least.

Lumbering was the great business in the early days at Duluth, but that is declining in importance, and the annual cut of this district has dwindled to half a billion feet a year or less. In fact, the lumbering business has moved out of town to Chaparral, twenty-eight miles over the hill, and to Virginia, on the Mesabean Range, where there is a mill with a capacity of a million feet every twenty-four hours. But lumbering is not dead—there is no, and the manufacture of hardwoods—larch in any imaginable quantity of spruce and tamarack and birch and poplar—is gradually taking its place.

From lumbering several indigenous industries have arisen. The lumbermen secure a head with a rubber foot—making that is a Duluth industry. The lumberjack's mackinaw is the most comfortable winter garb ever devised. Duluth has retained its native garment of fashion, the delight of the college boy and the joy of the "fan." Duluth has also become the headquarters for the manufacture of loading machinery for lumbermen all over the world.

Duluth is a natural distributing-point, and its jobbing houses, at first serving home territory only, have gradually extended their feet until their trade extends all the way to the Southwest and the Pacific coast, and some of the most important concerns in the country are located here.

But Duluth's chief boast has to do with other mines nor lumber nor jobbing nor transportation—its great achievement is in agricultural development. Duluth was almost the only town in the United States that owned to be a great city, yet was not founded in a farming community. Except the Range country, Duluth's base was three or four hundred miles away.

Every one knows to-day that the Lake Superior district is a great dairy country, that there is no sweeter cream or peas to cool the product of Northern Wisconsin, an equality to equal in richness and nutrition that of northern Minnesota, and that a country that will give thirty tons of rutabagas to the acre is not to be despised agriculturally. But only a few years ago it was the unimproved prairie, where Wisconsin was all stumps and stumps, and northern Minnesota was all rocks and stumps, and that both were agriculturally impossible. There were thousands of settlers, indeed, in the northern country, but few

of them were doing much to dispel the unfortunate impression of this region. Most of them were "subsistence" farmers, who found it more easier to get a subsistence by hunting and fishing and working a little in the woods than to subdue their land.

The first step was to employ an agricultural expert who went about among the farmers, organizing clubs and co-operative associations, showing them what was good practice and pointing out where they were falling in getting the best results, stimulating interest among those who were discouraged, finding the way to market for those who were remote, inspiring new ambition in those who had no hope of this country. That in all familiar ways and the original missionary's plan has been supplied by an agent maintained by the Federal government and the state in cooperation with the Commercial Club, and when the National Crops Improvement Association offered to help in good works of this sort its first check for a thousand dollars was sent to the Duluth Commercial Club in recognition of its primary. Duluth and St. Louis County have taken first prizes at the state fair for clover and alfalfa. For potatoes, for early and head lettuce, and for market-garden display, till it is almost a habit. In competition with the United States and Canada, Duluth showed the best basket of potatoes at Madison Square Garden in 1911, and again in the competition of the Northwesters state at St. Paul in 1912.

In line with the same purpose, the one thing Duluth has asked of the state is a demonstration farm school, to be an arm of the Agricultural College, and to have such simple equipment that the boys and girls who come from the farm shall live as nearly as may be in farm surroundings and go back

to the farm with the best results.

Next Minnesota was preparing to spend \$20,000,000 in the next few years on roads, largely in northern Minnesota, which would mean about \$4,000,000 in central and south-central Minnesota a year on roads. About the time when Duluth discovered its agricultural backwardness it came upon another symptom of arrested development. The city did not seem to be getting so much as it ought out of its situation at the head of Lake Superior. Ory, grain, and coal, the great bulk commodities, were moved by water under various appliances—appliance so efficient that their economies amounted to 40,000,000 to 125,000,000 bushels of grain, 25,000,000 to 34,000,000 tons of ore, and \$100,000 to 1,000,000 tons of coal per annum allowed little to the apparent traffic of the port. Leading a Lake vapor with 200,000 bushels of wheat takes only a few minutes and employs a handful of men. A 10,000-ton cargo of ore in libras shipped by opening a chute and letting it run. And the enormous electric converters sweep out the contents of a cargo of coal with hardly a touch of hand labor. But while bulk cargoes were so simply handled, general commodities were not coming in anything like proportion to what they ought. Investigation showed that the rates were thus drawn up in older days to favor the city where the rail-making power had its seat, or to give the railroads the best possible haul, or simply to oblige the shipper who brought the most pressure. The Commercial Club was advised, a traffic expert was employed, and a thousand errors and overcharges in the tariffs were corrected. For the railroads, like other business-providers, help those who help themselves. With their cooperation and the addition of ratings from the Interstate Commerce Commission, Duluth is establishing for itself the benefits of its position.

In recent years nearly all the railroad construction between the Rocky Mountains and the Mississippi has been for Duluth for its base, and few important routes have wheeled through a right angle to make Duluth their principal terminal instead of an interior point.

In addition to its efforts to correct railroad rates, Duluth has begun a campaign for public terminals. Duluth was converted to municipal ownership, then by a succession of typhoid fever strikes and epidemics, to raise the company that owned the water plant was not able to provide a pure supply. The city acquired it after a struggle and made a notable success of its operation. The water has been above reproach. There has never been a serious epidemic since then, rates have been reduced, and the price of gas has been cut in two. The gas, by the way, is a by-product from the cooking gases of an independent furnace which makes its fuel from an arrangement of an enormous coal shed. As a consequence domestic gas is seventy-five cents a thousand in the Duluth consumer, and the rest of the city gets it at 85 cents.

Within two miles of Duluth the St. Louis river has a fall of more than four hundred feet. This has been utilized to furnish electric energy, and a single wheel an effective head of 275 feet at the wheels three miles from the city limits—more than twice the head of Niagara. With that enormous energy, one cent of water per second delivers one horsepower at the center of the city. The power delivered in 1912 was equivalent to 400,000 tons of coal. The development furnished 40,000 horsepower so far as has been reported. Electric power runs the majority of the industrial plants, especially the smaller industries, the street-railway system of Duluth and Superior, and the electric lights of both cities.

In consequence of the improved situation as regards cost of living, the removal of the artificial settlement of the immediate country, the correction in railroad rates, and of the important influence on rates the steel plants will exercise, Duluth is growing in manufactures as well as in wholesaling.

The Central High School of Duluth

to the farm without getting out of their environment. An appropriation was obtained for land and initial buildings, to be no more elaborate than an average farmer can provide for himself, and a graduate farmer has been engaged to teach agriculture there with special reference to the problems of the out-of-country. It is all a part of the same develop-

# Building Men—Not Champions

The Remarkable System at the College of the City of New York and Some of Its Excellent Results

BY WILLIAM HEMMINGWAY

Testing the sight of a big class

**P**HYSICAL America is beginning to catch. That is to say, the amount of our national resources is no longer keeping its head with the growth of population. The resources must be husbanded, the soil must be cultivated more intensively, and the gifts of nature no longer prodigally wasted. We have been hearing a great deal of late about agriculture for the conservation of lands, of water-power, etc., but nowhere, so far as I have learned, of a systematic, sustained, all-embracing

Nach a job no this is a task to fit the ambitions of any man. I see the scheme in operation is enough to revive the hope of any citizen who may for a moment have listened to bores and legions to think that nowadays we are all going to the dogs. The boobyry is to kill men, or at least to crush out them of vitality, chiefly by

and conserve human health. Failure to respect any one of these principles will jeopardize the success of the others. No rational scheme should rely upon exercise alone for health, nor upon any other one procedure as habit. The most respect all of those several requisites in order to work under a wise policy of personal health control. The man who regulates his habits of eating and takes an exercise cannot expect health. The man who exercises properly and eats wisely will fail to secure health if his habits of sleep are bad. On the other hand, a reasonable observance of these several simple hygienic laws cannot fail to secure and conserve health for the average individual.

"Such an individual will be possessed of millions of active, healthy cellular structures working for his protection, conspiring for him a defensive armamentarium, and ready on demand to respond with supreme reaction against the invasion of disease."

How is the ideal realized? To begin with, every student at the College of the City of New York is carefully examined twice a year—or whenever else he may happen—in to the condition of heart, lungs, and other organs, skin, eyes, teeth, etc.; and if any serious defect is found he is advised to see a doctor at once. He is required to take home a written notice to this effect and to bring back a reply from his parent or guardian. The report of cases of infectious diseases by the Health Department is checked up every day. If any student is found to live in an infected home, he is at once excluded from college until he can bring a certificate from the Health Department that he is free from contagion. And, of course, if a student at any time shows symptoms of disorder he is at once examined. Whenever a student returns to college after a course of typhoid, diphtheria, or similar disease, the germs of which he unconsciously might still be carrying, he is examined to make sure that there is no danger of infection from him.

For the sake of accuracy and certainty in these and similar examinations, the college department of physical instruction and hygiene maintains an excellent laboratory, in a renovated room, by the way, that used to be a baker's pantry—quite a different source of recovering vitality. In this laboratory a daily test is made of the water in the college swimming pool. All of the ordinary bacteriological tests and chemical analyses can be made. The aim is to have the laboratory afford perfect protection against disease-carriers.

Every lay in the college is obliged to take enough exercise to keep his fit.

A "floor talk" on health by Dr. Storey

scheme for the conservation of human life and strength, which are, after all, the greatest asset of a people.

Quite by accident I happened the other day to discover a full-fledged, highly developed plant for the conservation of humanity. The scheme of its organization is at once and its results—thus far—are so excellent that they are well worth pointing out. The plant is operated, logically enough, in the College of the City of New York, the intellectual division of that vast metropolis melting-pot into which myriads of men and women of all the creeds of mankind are poured every year and from which they emerge full-fledged Americans. The director of it is Dr. Thomas A. Storey, A.M., M.D., Ph.D., a graduate of Stanford and Harvard universities; and a corps of sixteen experts aids him in the scheme of building up lifelong habits of health, strength, and efficiency among the 2,500 boys of the preparatory school and the 1,200 young men in the college proper. "If this department has been successful," says Dr. Storey, "it is the result of the loyal, efficient, uncomplaining service of the men on the staff."

The college has its regularly organized teams for track and field sports, basketball, baseball, tennis, swimming, water polo, and soccer football, just as all other educational institutions have—but the chief function of the athletic sports, as well as of all its forms of physical exercise, is to establish habits of clean living, health, and stamina as a permanent basis. No foul play is allowed to stay on any team. Instead of trying to develop, say, a world-record sprinter who can do the hundred yards in nine and three-fifths seconds while three thousand of his fellows roar with delight, the aim is to develop the three thousand fellows so that they all can run decently, swim well, climb jumps, and handle relatives with some skill, but, above all, have the habit of keeping themselves clean and in permanent good health at the highest pitch of working power and moral responsibility. The trustees and President Foley have done much to dignify and assist the work of the department, which, by the way, is now organizing the Fourth International Congress on School Hygiene, to be held at Buffalo, New York, August 25th to 30th.

crowding, dirt, and the lack of fresh air, sanitation, and exercise established by their cramped environment. So far as athletic championships and records are concerned, we find that over eleven games have been held and records kept every city athlete has been of the first quality; yet the average city man, the man in the street, has been terribly handicapped by abnormal living among ourselves. If the man in the street could be taught how to fortify himself, how to make the most of what is in him—though not to the extremes attained by the champion—he, too, can claim to be first rank in the perpetual struggle that is life. Indeed, he will feel better and live longer than most champions.

Now are school-boys and collegians to be cast into healthy development, persuaded to follow a rational plan of living? There must be an ideal in the mind of the teacher, the one who takes the mass of plastic young human material and does his share of molding it into men. Dr. Storey, so long ago as 1906, defined his ideal in a paper before the International Congress on Tuberculosis at Washington, D. C. He said:

"The health and, therefore, the immensity of the whole body depends upon the health of all its constituent parts—on the health of its cells. If the cells are all well controlled, active, and protected from extremes of pathogenic influences, their associated health will be the health of the individual whose body they in combination make. That such a healthy individual is possessed of a certain degree of immunity has been proved empirically and experimentally and it is equally well established that the preservation and conservation of the healthy body depend upon the observance of several simple hygienic procedures. These hygienic procedures are the same as those which I have already stated were essential to the body cells. Furthermore, these procedures must be the fundamental procedures in any wise and well-ordered policy of personal health control."

"The well-planned policy of personal health control teaches men to eat properly, to drink properly, to breathe properly, to take proper care of the circulation and nerves, to exercise wisely, to rest wisely, and to keep reasonably clean with reference to disease-bearing organisms. Such governing principles lead to

Carefully examined twice a year

# THE QUEEN OF THE INLAND WATERWAYS

BY JULIUS H. BARNES

Chairman of the Duluth Traffic Commission

Unloading coal at Duluth

IN 1828, the year of Oliver Cromwell's death, the first western explorer reached the far western end of Lake Superior in a birch canoe.

Where the City of Duluth now stands there was then, and for two centuries later, a dense pine forest reaching to the very waters of the lake. The first trail of the early explorers, ascending the small stream at the western end of Lake Superior, would then lead a short portage to reach the rapids that flowed west into the Mississippi, and thence Duluth became the first teaming-up point for the light supplies of explorers, missionaries and fur traders, nearly two and a half centuries ago.

Two centuries the creek on Lake Superior progressed only from light birch canoe to the flat-bottom skiff of the trader, and then began an era of transportation development. The like of which the world had never seen. As late as 1848 all the commerce of Lake Superior was transferred around the Falls of St. Mary's River between Lake Superior and Lake Huron, and one old gun barrel and a cart were sufficient to portage all the commerce of Lake Superior.

Then followed the era of development which made the figures of transportation tonnage so tremendous that they mean nothing to us or unless we have imagination to illustrate the magnitude of the government record of Saint Ste. Marie's Canal.

What does it mean to us to say that the tonnage through Saint Ste. Marie's Canal into and from Lake

Superior for the season of 1942 equals eighty million tons? What does eighty million tons express to us or begin to indicate how many old gun barrels and carts would every eighty million tons crowd these hills?

What does it mean to say that 242 million bushels of grain are on the waterway during the season of navigation of 1942, and that the average rate of freight for carrying that grain from Duluth to Buffalo was 17 cents per bushel? The rail freight for that trip would be ten times that much, even were it physically possible for the railroads to handle such a colossally great tonnage, which they certainly could not do with their present facilities.

Of that 242 million tons of coal moved westward at an average rate of thirty-five tons per ton for that long water trip, where the mill freight would have been ten times as much?

The country at the western end of Lake Superior is just beginning to be settled. Just west of Duluth there is a territory as large as New England of fertile soil, which has not been reclaimed and is growing it; which has needed roads—and Mississippian civilization—it with highways at the state expense.

It needs railroads, not the railroads are pushing their extensions into it. It has needed power, and its generation of settlers arriving in larger than in all the other North-western states combined.

The great railroad system of the Northern Pacific, Great Northern, and the Sun are to-day delivering in Minnesota more carloads of immigrant goods than in all the states combined on their western systems of North and South Dakota, Montana, Idaho, Washington, and Oregon.

We have been accustomed to think of the far West as the land of opportunity, but northern Minnesota today is a more promising field for the agriculturalist, and especially for the man with the plowman and the sawage to utilize the cut-over timber lands of that section, than any other area in the United States.

The great railroad system of the Northern Pacific, Great Northern, and the Sun are to-day delivering in Minnesota more carloads of immigrant goods than in all the states combined on their western systems of North and South Dakota, Montana, Idaho, Washington, and Oregon.

The entrance to Duluth Harbor

of the Argentine, of Australia and Russia and Manchuria. The Canadian government is having money to see this and to plan for it. Within the space of a few years there will be a road around Niagara Falls which will permit the cargo boats to cross Lake Ontario and reach the head waters of the St. Lawrence. From there in Montreal is but a cheap water-shipped route of some 150 or 175 miles.

The effect of this will be that grain will be taken from the western end of Lake Superior and delivered at the port of Montreal at a freight charge of four to five cents per bushel, and with fair ocean rates from Montreal to foreign markets, and fair railroad rates from the western end of Lake Superior to the grain fields, the grain grower of Western Canada will once more stand a chance against his great cheap competitors.

And New York State, with its great harbor canal from the Great Lakes to New York City, will be no longer a crutch and no help in its saving of transportation costs as the St. Lawrence River stands.

Each year this western country is settled more and more densely. Its needs, its requirements, its necessities. And the thousand products that supply houses and shops and factories must see that water route also.

Duluth, the far western port of Lake Superior, thirty years ago a pine boat, today a thriving city, yesterday an outpost of the pioneers, to-day sending third of its population to all the great ports of the world. Back of it a territory yet to be settled, one of a water highway not yet fully developed to its full usefulness. To tomorrow, what?

# THE WORD OF THE GRAIN EXCHANGE

BY CHARLES F. MACDONALD

THE function performed by the grain exchange is not supposed to be directly to the producer, but to the general welfare by any business agency of the day. The exchange and its members are the market for the grain, which, in the chief grain, aggregated in the year 1932 more than five and a half billion of bushels, is a matter of vital concern.

It is universally conceded that the basis of our great wealth and the welfare and progress of all nations is the agricultural prosperity of the nation, and it is a matter not merely of general concern, but also of demand, that the grower shall receive the highest possible remuneration for his product, and that he shall be enabled to market it expeditiously and at a minimum of cost. The crops which are raised by the producers of this country within a period of four or five months must find the people for export, and the accumulation of this great food supply and its distribution from the factories where it is grown to those where it is desired for consumption presents a problem which it is the mission of the grain exchange to meet in the interest of the producer. To provide a market for the grower by bringing together the representatives of both buyer and seller, and in this way to distribute the products of the soil to the consumers, is the primary purpose for which grain exchanges exist, and their usefulness to the community cannot be measured by the facilities with which they administer their business.

Economists and students of business have universally conceded the importance of the functions of the grain exchange and recognize that the exchange is a great service, but that a large number of the people do not regard them so highly and look upon them as merely agencies for speculation. It is not to be desired, Congress and legislatures of states are threatening legislation that would radically change the methods used which bring the grower to the market, and which would require much readjustment, in the process of which the chief sufferer would unquestionably be the producer.

This feeling of antagonism grows very largely out of the trading in contracts for future delivery, and it is unfortunately true that it is not the legislative basis of this very valuable and necessary business, but the marketing of grain that has provoked hostility, but the fact that it has been all proved mistaken and absurd. The exchange has been shown to be an agency for stabilizing and increasing production by severely penalizing it. It is known to every exchange that the volume of their trading is infinitesimal in comparison with that of the legit-

imate buying and speculative trading. The speculative gambling and manipulation are always exploited seasonally, and the producer is injured in that way and the exchange suffers for the sake of the few. The efforts to stamp out the undesirable trade are largely leaving, fruit, and there is much reason to believe that the day of wild gambling in grain has passed. It must always be borne in mind, however, that grain, in a commodity that is sensitive to changing conditions, and very responsive to the supply-and-demand situation, and years of short crops will always find wide and rapid fluctuations in prices.

With the manner in which grain is actually marketed the public has little familiarity. In a general way it is known that there are commission men who solicit and receive the business of grain shippers, elevators and mills which buy the grain, exporters who sell abroad, and that the grain is bought and sold through the medium of the exchange; but of the magnitude of the trade there is little realization, nor is the service rendered to the whole world properly appreciated.

From early in May, when Texas begins to harvest

its crops, until late in August, when North Dakota and the other northern states have gathered in the last of the harvest, grain is being marketed in a very high point. One of the variations at the head of Lake Superior in the fall of 1912 delivered 1,200,000 bushels of wheat into boats in ten hours' time. In the early twenties the Northern Pacific Railway's first car of grain into Duluth carried 12,000 pounds, but the great advance in railroad facilities has brought the average car to about 35,000 pounds. It is now a single car, it required 1,000 men to transport the loadings of one day from this elevator—twenty train-loads of grain to the ocean—into the waterways. In the three years ending with the outbreak of the Northwest—Minnesota, North Dakota, and South Dakota, in 1912, the average carload of wheat bushels for the entire year the product of more than 75,000 acres of land was entered in the million and a quarter bushels that went out in one elevator into boats in a single day.

The business transacted on the Duluth Board of Trade in the fall of 1912 affords an excellent illustration of the volume of the activity, and a means in receipt of wheat. It is at the head of deep-water navigation on the Great Lakes, the farthest point inland that can be reached by the great water carriers that have steadily reduced the transportation cost of carrying grain until it can be fairly said to be at the minimum. At its very doors are the great fields of the spring wheat territory of the country, the State of Minnesota, North Dakota, and South Dakota, with Montana, now jumping rapidly into the front rank and promising shortly to become one of the greatest grain-growing states of the country.

The Duluth Board of Trade

# THE NEW LAKE SUPERIOR CLOVERLAND

BY FRANK N. HARDING

**W**HEN a night's ride of Detroit, Chicago, and Milwaukee, about half a day's ride from St. Paul and Minneapolis and all the very best of food and Superior, less the Lake Superior dairy region of the north, Michigan, which has recently advanced, and with a dash of right, the name "Cloverland" thus comprises a vast agricultural territory, consisting of fifteen million acres of land, will shortly be developed, and during the next ten years, new wonderful strides toward the development of its agricultural resources. But a short time ago this territory was covered with upland forests of timber, and the popular impression, encouraged by lumbermen, the natural foe of the settler, was that the region was valueless as a result of its geographical position. With the passage of the lumbermen came the advent of the settler, and simultaneously the wonderful agricultural, fruit, and dairy possibilities of this territory became fully established.

Measurably enough, the significant position of this favored country was overlooked by agriculturists in the rush for Western lands, and here, within every striking distance of each marked corner to Detroit, Chicago, and the Twin Cities, is a vast, undeveloped, agricultural empire, located between the huge fresh-water lakes, Superior and Michigan, which temper and govern the prevalent frost conditions to an average summer crop-growing season of ninety days duration, which compares favorably with the corresponding season of the northern half of Iowa, southern Minnesota, and Nebraska. The climate is ideal for the farmer, the fruit-grower, and the dairyman. The summer days are perfect, with uniform precipitation, encompassing fifteen to twenty hours of rain, and the summer nights are cool and comfortable.

The soil of this region is deep and rich, as is evidenced by the tremendous forests of pine and mixed hard woods which formerly covered the country. It is estimated that crops grown on the far north as well as the region close to the highest quality and most rapid development. All the crops produced in the temperate regions of the United States are successfully grown in this Lake Superior Cloverland. All grains and legume crops thrive wonderfully in this region in the winter in covered with a blanket of snow, ranging from three feet upward in depth, throughout winter months, and therefore clover and legume crops are never winter-killed.

The importance of this peculiar climatic condition cannot be overestimated, and its significance to all who are engaged in normal husbandry is need pointed. All grains, whether fall sown or spring, yield abun-

dantly. Spring rye yields about 25 to 30 bushels, and spring wheat from 25 to 30, per acre. But, on these wonderful rye soils, yield seasonal crops, ranging from 40 to as high as 100 bushels of officially weighed grain. Cows, of the richest varieties, mature, not even for stags and sows, give from 100 to 150 bushels of milk, which yields from 28 to 40 bushels per acre. Barley is a good crop and runs from 35 to 50 bushels per acre. Hay, clover, timothy, alfalfa, and other feeds are abundant. Such crops, such as turnips, parsnips, rutabagas, and potatoes produce extraordinary yields. Cloverland knows no rival in the growth of potatoes, save the Apawack region in Maine, or the Western irrigated lands. Yields will run from 200 bushels per acre up to 600 bushels, and that of potatoes of the French quality.

The rapid development of the progressing industry in the northland is a most worthy of notice. Pans produce the product most of being both profitable for their crop and therefore to those who have developed lands upon which they are raised. These rich soils of the north produce such wonderful crops of peas that occasionally compared to land that some of the smaller graded varieties grow larger peas than the heavy market demands. Pea straw is as plentiful in this section as it is in the West. For raising purposes these northern grown peas are as much better than those grown farther south as they are for seed purposes. The development is more even and gradual and the ripening more graduated and perfect. This northern-grown pea seed is particularly well adapted to the Middle West being raised here.

There is but one sugarbeet factory in this north country, and it is the best in the world. It is one of the best assets of the surrounding territory. Farms produce and the best-growing industry ever known in this section, and notably so. It is further south, as the local conditions which cause the beets to grow larger and yield a higher percentage of sugar content are those prevalent in this north country. The further south you go from the equator the more daylight there is in the summer-time, and the prevailing stress of sunlight converts a load-bearing leaves into all growing crops, and usually upon the presence of sugar in beets grown here, the agricultural bulletin showing that sugar beets contain from 18 to 20 per cent of refined sugar sugar than those grown in southern latitudes.

Small fruits, such as raspberries, gooseberries, currants, etc., are raised in this section, and the quality as well as quantity equal to the finest berries, small fruits, and currants of California, and of which there is no superior in any common soil here, and of a quality and quality which bespeak

freedom from attack by worms or pests, thrive upon the dark brown banks of the river bottoms, and find prompt markets with city markets. Variety and flavor of crisp white corn, and flavor as unimpaired as to have created a demand for them in Chicago and New York markets, are raised in profitable abundance on the rich cloverland soils of this newly discovered farming country.

Lake Superior apples from the Bayfield and Kenosha provinces, as well as all the central portions of this region, have been prize-winners at state fairs and general farm shows. Plums, cherries, and crab-apples are remarkably prolific.

Many advantages are offered to farmers in this region, among which are the finest and the most perfect educational system that can be found anywhere in the United States, from the graded schools, high schools, teachers' training schools, normal schools, agricultural experimental stations, evening schools, etc., leading to the state agricultural colleges and universities. Churches of all denominations and rural schools are rapidly being erected in many communities of new settlers. People of all races find here comfortable homes. The rural telephone system is rapidly developing, and rural free mail delivery is being pushed even into remote districts. Railroad service, east, west, and south, is most satisfactory. Small towns and villages are springing up in country everywhere, and the best of this region is rapidly changing from its original condition to that of a settled farming country.

Sheep-grazing, stock raising, the feeding of hogs and dairying, follow very naturally in the wake of the clearing of the land. This northern region is most admirably suited to animal husbandry in all of its varieties. With its great fertility of soil, the bearing, ripening power of its summer corn and its freedom from insects of the West, it is an equally fitted to the development of the dairy industry. Here cattle thrive on pastures which grow under the more green manure come out green from beneath the melting masses of the spring. Here clover is never winter-killed. Here for one, lands in this Lake Superior region will produce more feed for cattle than in the corn belts of Illinois and Iowa. Pure water, ample pasture, abundant production of beets, rutabagas, etc., surrounding clover crops, corn stags, oats, peas, and in short, all the things that go to make the dairy relation point out this as the logical soil of the dairy farms for the Middle West.

In short, the Cloverland is best justified to catch up with the general march of progress, and in the near future, in the hands of the progressive, agricultural farmers of this region, it will take the dairy region for the immense markets of the Middle West.

Loading by the aid of horses

With enormous annual increase in demand for lumber products has, during the past ten years, strongly encouraged the invention and manufacture of machines to facilitate lumbering processes from woods to mill.

When the logs were formerly "skidded" great distances through the woods behind a team of oxen, hand-propelled steam skidders now run on the skid-drum logging railroad, skidding the near and far hauled them the speed and at a very considerable saving in cost.

Where the logs were formerly loaded with the aid of horses, men and sleds, skidders also, the steam log-loader now reaches down to the big logs left by the logging railroad, by the skidder's own mechanical means, and the skidder's hand is laid by a straddle throughout a two-hour day.

The steam log-loader was the first machine to come into general use after the introduction of the logging railroad.

So far as the actual loading of logs is concerned, a comparatively simple and efficient, a good logging engine will do the work satisfactorily.

The problem confronting designers and builders of log loaders, was to make a skidder of such a simple construction of the two in such form that it would be quickly and easily made and which could be brought into position to load a train of engine operating on a single track.

BY IRVING SMALL

The weight of such a machine necessitated its transportation over the railroad. Economy made the machine portable and flexible, and yet to do its work the machine had to be brought within working distance of every car in the train. Thus it was necessary that the machine should operate on a single track along which a train of engines was passing in the opposite direction at the same time.

First, by mounting the machine on the truck and dragging it back over the cars as the loading proceeded.

Second, by assisting the machine on trucks adapted to run on the main track, suitable spurs being left to follow the lower grades where the trucks and the skid loader were operating the loading mechanism to permit of the empty cars passing up inclined rail sections through the machine between the spurs and the main track, and down to the truck again on the other side on other inclined rail sections.

The third and most generally adopted method was to provide the machine with two standards, the ends of which rested on the top surface of the rails, while the trucks and propelling motion could be carried on one or the other of the standards, which passed under the machine on the main track.

Equipping this machine with a "skidding" cable which can be carried back to the rear of the train of engine, car after car can be drawn by its own power, and the machine can be used in a number of ways.

After the train has been loaded, the machine stands at the rear and the engine trucks are then moved back until they are in position to pull the loaded train out to the main spur, or proceed to

Loading by the aid of a steam loader

the next loading-point, leaving this work to a skidder.

The logs are loaded either by means of skidding booms, which resemble gigantic ice-tongs and are built on such the main principle, or with a crutch-like mechanism in two end-booms, one of which is fixed into each end of the log.

Steam skidders may be described as donkey-engines placed on rollers, having immense booms extending from the front into the log, and on one end a pair of thirty-foot-long rails.

Through booms on the tips of these booms, the skidding, outback, and pulling lines are run, while the driving lines are run through blocks suspended at a distance from the top of the boom equal to one-third of its length.

The crew required for a modern four-ton steam skidder, skidding from two rods simultaneously, consists of two engineers, one fireman, two signal men, four hook-tenders, and four whip-tenders.

The machine is self-propelling. Their capacity will actually work on the long lead skidders of the South, 25,000 feet per day for four-ton skidders, and 60,000 feet per day for two-ton skidders.

No matter how large the logs, the types described and illustrated, have already been shown to all lumber contractors of any size, many of them owning scores of such machines. Without them it has become practically impossible to compete in the lumber business on any scale.

# HARPER'S WEEKLY ADVERTISER

## A FOOD FACTORY

ONE might as well visit Cologne without seeing the great Cathedral that has made the town famous as to visit Niagara Falls without seeing the factory in which Shredded Wheat is made.

The great Cathedral is all there in Cologne. When you think of Cologne you think of the wonderful triumph of architectural genius that towers high above the ancient city. Of course there is something else in the city of Niagara Falls beside the Home of Shredded

Wheat, and he succeeded in making good his promise.

Thus we find the pilgrims from all lands. The building is located on Buffalo Avenue, on the heart of the great business district of Niagara Falls, far away from the noise and dust of factories and railroads. Thirty thousand panes of glass let in the sunlight which floods every nook and corner with its life-giving rays.

The building is entered through a program-room, on either side of which are waiting and reading rooms for guests furnished with beautiful traps and sumptuous refreshments. A handsome, well-lit staircase leads to the middle of the ceiling hangs a pendant, a great crystal ball, inside of which are brilliant electric lights. At the base of the vast columns supporting the ceiling are several elevators. Here may be found guides ready to pilot visitors through the building. The gallery around the reception-room, as well as the entire floor above, are taken up with the administration, publicity, and accounting offices of the Company.

To get an adequate and comprehensive view of the process in which the wheat is made into Shredded Wheat, it is best to follow the grain of wheat, from the point where they enter the building, through the various details of manufacture, to the final product. The guide therefore takes one of the electric elevators which rise to the top floor of the central tower, to which point the wheat is elevated and where it passes through twenty-seven cleaning-machines which remove all chaff, dust, and stones, residual seed, rye, straw, and other foreign substances, as well as broken and defective grains of wheat. Each one of these machines is a marvel of ingenuity and has some particular work to do. On this same floor is the roasting room, equipped with great steel cylinders which are filled with the wheat and the roasting-steam. The wheat, while being agitated by revolving steel paddles, is cooked for about thirty-five minutes; a process that breaks up the starch granules in the center of the wheat kernel, rendering them edible and digestible. The outer rind of the wheat berry is unbroken, and none of the nutritive elements in the wheat are lost in the process of roasting.

When the wheat is thoroughly cooked the steam is turned off, the end of the cylinder opened, and the disintegrating grains of cooked wheat roll out into a hopper which drops down the chaff into a drying, or "conditioning," machine, which removes the excess of moisture which remains after the roasting process and which must be eliminated before the wheat is ready for the shredding-machines. When a sufficient amount of the moisture is removed the cooked, steamed kernels are ready for shredding and are dropped into a large hopper in a lower floor of the building, where they enter the shredding-machines.

On the sixth floor, in the center of the wheat factory, the administration section of the building, which commands a wonderful view of Niagara River, the Rapids, Great Falls, the Three Mile Falls, and other scenic beauties of this picturesque gorge.

On the lower floor are the shredding-machines, the great ovens, and packing-plant. Here the cooked wheat is fed into the hoppers of the great shredding machine, each eighty-eight feet long and consisting of thirty-two pairs of shredders which sweep the kernels out into bins, porous shales, which are dropped upon an endless screw having a layer upon layer, until the thickness of the flake is formed, when the long band of white flakelets is brought down to a hopper which carries it into a bin below, and drops three into a pan holding fifty-two flakelets.

The pan of flakelets is then placed in the arms of a large drier in which the flakelets are dried, and then carried in an omnibus oven until the flakelets are baked, and then conveyed in large pan-trucks to the packing-tables, where they are placed in cans, and the cans are moved on an endless belt which carries them to the sealing-machine on a floor above.

Packing Tables, showing Electric Fans

These packing-machines automatically open the flaps of the canisters, cover them with waxine in a variable double-fold then together again, and then push a strip of paper over each side in such a way as to join the edges of the flaps, making a package that is perfectly unimpaired and air-tight. These packages are then carried along by means of belts between cylinders of iron and when they reach the end they are moved off by means of rollers in the wooden cars. These cars are made of quarter wood and are nailed together by sealing-machines which fasten down the top of each car.

On this floor is the spacious, beautifully lighted dining-room where the company serves to its employees at noon a delicious, wholesome meal, which may be served to guests of The Shredded Wheat Company. A separate dining-room is provided for the men and a terminal charge is made for the meals. After lunch the girls who come to do no more work in the room, but make their rest in the wooden cars. At one end of the restaurant is a room provided with hospital bed and an emergency chest.

On a lower floor are the great Transit cranes in which are baked the Company's other product known as "Treat," the Shredded Wheat Wafer. Treat is made the same way as the cereal, except that it is cooked in a water and baked by electricity in a specially devised machine so interesting and wonderful in all its operations

that it has attracted the attention of electricians from all over the world.

The Company has provided beautiful lavatories for the use of employees, at a cost of one hundred thousand dollars, which include shower, toilet, and tub baths

Dining Room for Employees

individual lockers, and other facilities for encouraging cleanliness and neatness on the part of employees.

It would require several pages of the Weekly to describe all the departments of this welfare work for which the institution is famous throughout the land.

While every piece of machinery and every danger spot is well protected, accidents are bound to happen, and in order to render prompt relief to the sick and injured the company maintains a Red Cross Emergency Corps.

The food that is purchased and served to the employees in the two dining-rooms is carefully examined, the milk is tested daily, the dishes are all sterilized, and the use of cold-storage food is prohibited.

For protection the management provides a skating-rink, tennis-court, bowling-green, baseball field, dance-and-reception halls. The Company gives an annual outing to its employees one day each summer, and every Saturday afternoon is granted as a half holiday with full pay, not only to the office employees, but to all employees of the Company.

There are numerous other features for the mental betterment of the Shredded Wheat family which could not be fully described here. There are school societies the meetings of which are held weekly, with a two-hour recess during the cool season. A drawing-class is in operation through six months of the year and all employees of both sexes are eligible to membership. Department and executive form part of the motivation. A short-hand and typewriting class is conducted for the benefit of all employees. A musical association provides the brass band and orchestra.

Miss Agnes gives a very inadequate idea of the noble program of the building. These who like figures, however, will be interested in knowing that the Shredded Wheat plant is 464 feet in length by 90 feet in depth, contains 3,000 tons of steel and 200 tons of malleable. Its capacity is greatly enhanced by the 804 windows with their 20,000 lights of glass, making it indeed a veritable "city of spires."

Nature has given us the whole-shot grain as perfectly balanced food. We believe that the shredding process (tested and patented by THE SHREDED WHEAT COMPANY) is the most perfect and most scientific process ever devised for preparing the whole wheat in a digestible form.

There is no "substitute" for Shredded Wheat flakelets. The "little boxes" are of such a size and form as to make them adaptable to all sorts of combinations with fresh or preserved fruits or creamed meats or creamed vegetables, in the case of fruits the protein foods readily absorb and neutralize the fruit acids.

In the strawberry season many thousands of persons who cannot eat the luscious fruit fresh from the vine are enabled to fully enjoy them in combination with Shredded Wheat flakelets and cream. The same is true of other fruits. The flakelets are an accurate equivalent to solid fruits, however, as the flakelets are equally nutritious and delicious in combination with fresh bananas and other fruits. The flakelets form a whole shot Shredded Wheat is made and only enables the housewife to give great variety to the daily diet of the average home by making many delicious combinations with fruit, cream, or vegetables, or creamed vegetables, but also the perfect of a great variety of breakfast dishes.

Traveling the Shredded Wheat Wafer, taken the place of the whole wheat cracker, and as a toast is used as a substitute for flour-bread baked with butter, cream, or marmalade.

The officers of the Shredded Wheat Company are: ALVAN C. HARRIS, President; GEORGE A. MITCHELL, President; FRED MASON, Vice-President and General Manager; FRANK L. MASON, Secretary-Treasurer. The directors are: HENRY H. BROWN, President; GEORGE A. MITCHELL, George A. Mitchell, Alvan C. Harris, Robert W. Patterson, Lawrence Rankine, Ophio M. Reed, Carlton M. Smith, & Co.

Employees' Choral Society

"The House of Shredded Wheat," Niagara Falls, N. Y. Wheat, but most travelers think of the famous breakfast food when the name of the town is mentioned.

This same industry—the Shredded Wheat factory—is dedicated to the promotion—now accepted by the leading physicians and dietetic authorities and affirmed by the experience of four thousand years—the whole-wheat grain contains all the elements for the perfect nutrition of man. It is also indicated to certain twentieth-century ideals of cleanliness and humanitarian treatment of employees.

It was a happy dispensation of fate that a portion of the parent granulated at the Falls should be dedicated to the health and happiness of the human family through the manufacture of the most perfect food that was ever devised for the nourishment of man.

A few years ago the residents of the pretentious avenue in the city of Niagara Falls woke up one fine morning to find that a tract of iron across the lake avenue had been cleared of its shores or moor-landings and that general was being broken for the building of a great factory for the manufacture of Shredded Wheat products.

Reception Room for Visitors

Here was a building whose builders had the daring to invade the famous residence neighborhood in the town to create an industry far away from the smoke and dust of factory and railroad. This search for cleanliness and beauty, lovable as it might seem to the hard-headed man of business, naturally necessitates one of the attractive features of the plant and gives a fine picture among the food-manufacturing concerns of the world.

The spectacle of a hundred thousand persons passing through a factory every year "to see the wheels go round" is something so unusual in this country as to call for more than passing notice. This is the number that steadily passes through the Home of Shredded Wheat. The question naturally arises, "what is there so unusual about this factory that it should attract such crowds, even drawing them away from the scenic splendors of the Cataract itself?" Surely the ordinary factory is not such an object of popular interest—indeed, the average factory does not show open its doors to the public eye.

Right here is the secret, the drawing power of this wonderful old establishment. There are factories and factories. But the Shredded Wheat factory is unique. There is nothing like it in this or any other country. It is the dream of a "dreamer" fully carried out. This "dreamer," who invented Shredded Wheat cereal, said he would build the cleanest, finest, most hygienic factory in the world in

Shredding Machines

# THE ANACONDA COPPER MINING COMPANY

## By CHARLES T. SHEARER

BACKED by the resources of an empire, the Anconada Copper Mining Company, a splendidly equipped and perfectly located business, is, year after year, demonstrating that copper mining is a business, sound and profitable. Its investment of money has been obtained in no larger an amount by any other business in the world. Its investments have been in the acquisition by the late Mr. Daniel G. Reid, of millions of dollars to the wealth of the country; it has provided health and supported towns and cities, and it has still had the important advantage of increasing the wealth of two states, one of which, the third largest in area in the Union, has natural resources that in extent and variety are not surpassed by those of any manufacturing country of America.

Based on its operations of last year the Anconada Copper Mining Company produces and distributes about \$100,000,000 daily before it makes a penny for Reid. Of that average daily expenditure \$20,000,000 is paid by the fuel; \$10,000,000 for freight; \$4,000,000 for fuel and power; \$3,000,000 for haulage and trucks; \$7,000,000 for supplies; and \$11,000,000 for taxes and other expenses. In the last five years it has distributed the amazing sum of \$28,279,325, of which \$19,838,724 was paid for labor and material, mostly in Montana, and \$18,466,584 as dividends. This in brief is the story of the Anconada Company, which while still holding some of the world's largest copper mines, leads a district that produces at Butte, Montana, within an area of less than five square miles, one-seventh of the copper output of the world. Its operations, in its relations to its employees, the position of the Anconada Copper Mining Company is unique. Labor leaders familiar with conditions here ascertained that no other large industrial concern in the United States has the liberality displayed by this Montana company. In a general covering more than one-third of a century it has never had an strike, and the employees of all its departments are paid the highest wages in the world for the kind of labor. In 1912 its 14,941 employees were paid \$18,244,284, an average of \$1,221.06 per man per year, and around were taken of the mine in coal-mines, on railroads, and elsewhere in the employ of the company and not apparently reflected in this average. These figures are remarkable. These figures are impressive. They like marvels duplicated by any other great industrial concern. The average wage of an artisan in other occupations shows by the last Federal census a little more than one-third the average paid by this company, one-half of whose operating expense approximately is represented by this sum.

It is not for the sake of liberality alone that in respect to the company's treatment of its employees. As but a hazardous occupation, mining at Butte is made as safe as possible for its employees. Almost no accidents are caused by the company to protect its underground workers. Every safety device and method known to modern mining is in use, and the equipment is inspected and maintained by the mine and on the surface. It is a fact well understood by the men themselves that more than seventy-five per cent of the accidents in this company's mines are due to carelessness in disregarding its rules governing mining operations. Working conditions in the Butte mines are as good as any in the world. The employees are given a government's pension and sick pay, and the men are given the benefit of a sliding scale so that their wages are automatically advanced in the event of higher price for copper, but they never go below the minimum fixed by the company a dividend in danger state for injuries sustained by employees in its service; in all cases of differences goes made that satisfied both the miner and the company's settlements. In short, its policy is dictated by a humane and liberal view. From miner to mine superintendent all its employees are treated as human beings.

No unmineral region on earth has more of interest than the Butte district. In some particulars its history is the story of a host of other industrial districts. The history of its last phases were dramatic. First a place where, its great quartz leads attracted Butte attention until the American deposit of copper was regarded as an exhausted resource. It was then, as if by magic, the same silver-bearing, to be followed by the ores of copper. In those former days fortunes were made and lost overnight in the way common to Western mining camps, but now the industry is controlled by men of vision and has in many years there have been in Butte neither a strike nor movement of capital concern. The district has produced more gold and silver than any other in the world, has been recognized, and additional costs incident to mining from deep shafts were more than counterbalanced by extension of production and treatment of the same. The bulk of the Butte district from discovery is placed at one billion dollars. And mining is believed to still in its infancy at Butte. The discovery of the world's largest reserves of copper has been abandoned. In Butte are the largest reserves of silver in the world, and the discovery of these reserves which would enable it to produce at its present rate for many years without extending developments. As a matter of course that would be considered in the public mind as being the same as extending its extending its reserves. It has a vast area of virgin ground yet to be prospected, in addition to the one already discovered, and may be expected to continue with greater depth.

The Anconada Copper Mining Company has just begun its \$20,000,000 program of deepening its shafts with newly by-products, in themselves constitute an important step. For last year the company's new-extended shafts in the case of a strike would have cost more than \$10,000,000. In the course of the year the company mined and reduced first and a quarter million tons of ore. The underground workings of the Butte mines of the Anconada Company average 2,000 miles. The shafts of these properties, if placed end to end, would represent a vertical hole extending two miles below the earth's surface. The mines are operated by an efficient and well-organized crew, travel for trucks underground in them without crossing its tracks or coming to the surface. From these workings more ore is being mined (100,000 tons) than in any other mine in the Anconada district, the greatest works of

this kind in the world, and to the smelter of the company at Great Falls, send a large plant and employing sixty features new to rotation plants. Eleven thousand tons of ore are sent daily to the Anconada works, and the remainder of the output is treated at Great Falls. These two smelters consume an average of 700 tons of coal and 825 tons of coke daily.

Where mining operations are on such a colossal scale the supplies required annually amount in the aggregate to an amount that exceeds the cost of a year the Anconada Company's properties use 75,000,000 feet of lumber and 2,700,000 round timbers for mine props. A forest grows in these areas every year, and the timber, once in place underground, never comes up.

The company uses 1,000,000 pounds of dynamite in its mines each year. The explosive is better known as giant powder, and employees in bearing does not take care. Other explosives are used in proportion. Under the one item of supplies the company reports last year more than \$2,000,000, this sum not including the amount paid out for fuel and timber. The Anconada Company's taxes in the state of Montana amount to almost \$2,000 a day, 365 days in the year. In several instances it pays a very large per cent. of the total cost of the local government.

The reason for the Anconada Company's leadership in the copper-mining industry is due to the fact that it is an advance of the times. It effects economies of operation that its competitors are unable to equal. It saves not a few cents, were originated by it. These savings, it may be said, are not brought about at the expense of labor and material, but, in a general way, low labor and expensive depend upon it. Its general policy is to maintain its progressive and plants at the highest possible state of efficiency. It operates on the theory that the best of everything is the best of labor, in the cheapness in the end. The company, thus, depends upon systems and improved methods of operation to effect those economies that are necessary in the successful conduct of great industrial operations.

Chief of three revenues in the case of the Anconada Copper Mining Company may be mentioned approximately.

1. The sale of its products, which is not mentioned approximately.

2. The sale of its products, which is not mentioned approximately.

3. The sale of its products, which is not mentioned approximately.

4. The sale of its products, which is not mentioned approximately.

5. The sale of its products, which is not mentioned approximately.

6. The sale of its products, which is not mentioned approximately.

7. The sale of its products, which is not mentioned approximately.

9. The sale of its products, which is not mentioned approximately.

10. The sale of its products, which is not mentioned approximately.

11. The sale of its products, which is not mentioned approximately.

12. The sale of its products, which is not mentioned approximately.

13. The sale of its products, which is not mentioned approximately.

14. The sale of its products, which is not mentioned approximately.

Company management may be cited the electrification of the railroad connecting its mines in Butte with its smelter at Great Falls. That road, at Butte, Anconada, a Parole, and built in 1901 by the Great Northern Railway, is the longest haul in the world. Its main line is 20 miles long, but with its side trails it operates 140 miles of road. No other railway in the world is so well equipped or better maintained, but when the country became concerned that it could successfully apply electricity to the line, the railway management took the case in bringing about the change. This is to go into effect as a few weeks. An equipped trolley system will be seen to the electric conversion of the line type and built especially for it will be employed to carry the passenger and freight trains between Butte and Anconada.

The line of railroad was generally an old line, for it is in possession of the master of electrification. No other line where the usual difficulties in the way of grade and excavations are encountered has been electrified throughout.

Not alone in its nature and transportation department is the Anconada Company leading. Its employees are models of their type. They attract experts from all over the world, who go to Montana to study mining and metallurgical developments. At the Great Falls plant is housed the highest work in the world. This chimney is 306 feet high, and has an inside diameter of 67½ feet. Attached to this stack are condensing fans constructed for the purpose of eliminating objectionable dust and smoke.

Type of Butte Skycraper, with a capacity 3000 feet deep. The picture represents the Diamond Hole with a steel head four 36 feet high. The left-hand tower in the picture is the Lamesa shaft, also one of the Anconada Copper Mining Company's properties. It is of steel construction, and is 118 feet high.

tion of electricity to mining and smelting. Although the company began to use electricity in its mines for power as far back as 1892, it was not until recent years that the greatest advance in this direction has been made. At present the company is purchasing of the Montana Power Company, controlling great plants on the Missouri River and Helena and Great Falls, and carrying on a total of 33,000 horse-power, all used in the operation of its mines, smelters, and land transportation lines. This means that electricity is consumed in both directions by electrical energy. As a matter of fact, the company will use much more electrical power later in the year, as the Butte, Anconada & Parole Railroad, which carries the ore from Butte to the Anconada smelter, and which conducts a general transportation business, is about to be electrified. In fact, electricity is being used in all the mining operations of the company. Electric power compresses the air with which the great hoisting engines of the district are being done with electric energy. The use of such equipment by these manufacturers, but they will in time. Electrical power indirectly drives the air-lifts which are in use in all underground workings. The tunneling in the mines is done with electric power. The ore in the mines to the Anconada smelter will be transported in train pulled by electric locomotives, several of which already are constructed. At the smelter, the concentrating work is resulted by electrical power. The concentrating machinery is operated by the same power in its electric motor, as is being used in the entire mining and smelting of the Anconada Company's ores. The application of electricity to the mines is effecting a revolution in the mining industry, and it is the opinion of those having machinery views of the opinion that none ever would be supplanted as a force for the lifting of heavy loads in the great deep. That they have long, the Anconada Company's success is a guarantee in the developing, 3,000 horsepower. They can boast with ease a good load of heavy tons from the deepest workings in the district, and they are proving as reliable as ever by the old style of engine. The deepest workings in the district are 2,900 feet, one shaft being down 3,000, and an air-lift engine is adequate there.

As further evidence of the interest of the Anconada

## Recreating the Nation's Wealth

By J. B. White

There is going to waste, on its way to the sea, water power enough in this country to harness and convert into electricity, in light and heat the houses and turn the wheels of the factories and run every street-car and railroad train in the United States. Water-power sites on the public domain should be held for the people and leased for their benefit to the general occupation at a fair rental. The state can condemn private property for public uses, under the rights of eminent domain, and allow no state waters and not now utilized should be acquired by the state for the use of the people. This water power of the rivers and streams can be used over and over again, being multiplied as many times as the water can be raised by a succession of dams. Thus, while the wheels are set a-rolling from the water that is passed, other wheels all along the stream take in turn, and then the sea pumps the water back again to its source, and the same process is readily repeated.

The people of forestry and the re-creation of our timber resources are of immense importance and of the first intrinsic value of the wood and the lumber, but also in many parts of the country for holding back the rush of water that carries at the head of the streams in the mountains, thus preventing disastrous floods in the country below.

But who shall plant timber trees? Who shall practice forestry? The planter of forest trees is a commercial business, as they mature to bear fruit in from four to twelve years. Capital is being invested in this work, and the harvest comes thousands of miles from the forest, and is sold in many places, and is not sold where the fruit is of the forest. But with timber trees there is only one crop in a generation. As we understand it, the life-cycle of a tree, with laws of taxation as they are met, are other opportunities, which long experience has proven to be profitable. The most fertile computed interest—about, say, six per cent., to make it safely attractive—out of capital invested in the setting out trees and caring for them for fifty years, annual values for fifty years before the crop is harvested, and taking account as to the value of stonage at the end of that time.

In European countries it has been found most economical that the government or state shall grow the forests, the state pays no taxes, but get income at a lower rate of interest, and can establish and maintain a uniform system of forestry under the charge of a central and trained experts. When the crop has matured to a point where one end value of product, so that it would be of a multiplier of profit and a waste for other the state to maintain carrying charges, then the trees should be harvested, the land grabbed up and the process repeated for another crop. It is surprising how much can be grown on an acre by intensive forestry, when trees of the same age are planted in rows or at proper distances from each other according to outline and nature of the ground, and are intelligently grown and nursed.

In the Pacific coast it has been ascertained that a thousand feet per acre planted trees be grown, or forty thousand feet per acre in forty years. In the Van derbilt forest near Asheville, North Carolina, I saw stands of White Pine ten inches in diameter, many of which had grown from the seed in righteously years. In the different states, such seed should be selected for future use, which is not so well adapted for annual crops of agriculture, yet well adapted for tree growth, and the work should be done by the state.

We can now make it profitable to grow trees in an age of the present, and the forests of our hundred and fifty years or more. But those old trees have obtained their growth; they have long time for the harvest; and a rapidly increasing population and the demands of other countries are calling for the marketing. Most of this arising in our logging industry, most instances, at the end it is only adding its own, through of mature trees has stopped, and trees are doing it fairly off the gain of new growth; and when trees come, the old and the new growth are both exhausted by the time. The forest service is doing most valuable and valuable work in protecting and saving the forests from destructive fires. The government appropriations for this work should be most liberal and should be supplemented and aided by appropriations and appropriations of lower field and low fire-wood areas such state.

We are far behind the older nations in the practice of conservation. But we have advanced in time. It is not now two hundred years for the present and issue for the future.

## Gay & Sturgis

Gay & Sturgis are members of the New York and Boston Stock Exchange. Complete facilities are provided for handling transactions in all mining, agricultural, and railroad stocks traded in these exchanges, had the tradition of the house and the honor of three W. W. (W. W. W.) members at the mining end of the Lake Superior copper and iron region, have long been as distinctly in the mining end of the mining end.

This firm and its direct predecessors, in which the members were partners and associates, have been members of the Boston Stock Exchange over 35 years. The members of the firm are H. H. (H. H.) Irving J. Sturgis, and B. Lester Hall.

Mr. Gay became a member of the Boston Exchange December 23, 1867, and at the present time is Vice-President of that body in 1908, at the beginning of his business career. He had entered Mr. Gay's employ and later became his partner. On March 1, 1907, the firm of Starkopf & Gay was organized. Mr. H. H. Starkopf having been a member of the Boston Exchange since 1842.

Mr. Sturgis began his business career in

Boughton, Mich., and then went to Boston and entered the employ of Starkopf & Gay, becoming a member of the firm January 1, 1880.

On January 21, 1903, Mr. Starkopf retired and the present firm was established. Mr. Sturgis is a member of the New York

Exchange.

An acronym of the name, which gives it a peculiar advantage, is given by the greater service with Duluth, Minn., Houston and Cabaret, Mich., when its western branches are maintained. The operators in these fields will be first concerned with the home office in Boston without delay.

To show the effort made to maintain the marketable conditions, Mr. Gay is to be cited that during the recent devaluation by floods in Ohio and Indiana, a note was connected with Gay & Sturgis by way of New York, Tenn., Little Rock, Ark., St. Louis, Mo., Burlington, Ia., and Chicago, Ill., through as Duluth, Minn., and other points.

Over the line the operators make these arrangements without interruption.

This service enables the western office to keep to the east continuously stay news of importance that develops there, while the local office has the news of local requirements (including transactions on the floor of the Exchange, as they take place. As the management is handled by way of Duluth, Minn., and Chicago, Ill., it is to be noted that these companies have their offices in Duluth, Houston, or Cabaret, an intimate knowledge of conditions in those regions is made possible.

## Early Brewery History

Chapter 29 of the Minnesota State Laws of 1854 provided: "An act to encourage the manufacture of pure Lager Beer, with which to discourage the use of alcoholic liquors." The words of the act imply that beer was then not regarded as an alcoholic liquor.

The act provided that no license was required for the purpose of selling such Lager Beer, if manufactured in the state. There were many other states which encouraged the manufacture of beer on similar lines, right in the teeth of the prohibition movement of that period, which movement at that time was really not intended to include Lager Beer, as witness the prominent old "Washington Society" and others. For instance, there was no Lager Beer in the State of Maine when, in 1842, it passed its famous prohibition law. Maine was even made essential to exclude other and local beer from the list of forbidden drinks, although it contained near eight or ten per cent. of alcohol. If Lager Beer had then been known in Maine, the good provision would have certainly not forbidden it, for Lager Beer was only three and one-half per cent. of alcohol.

The present agitation against Lager Beer is consequently a new move—a move which many of our best citizens hold to be in the wrong direction. It is almost too true to believe that that which held a century ago was so in a town where the drink, which to discourage the use of alcoholic liquors, should today be regarded by some as more dangerous than distilled liquor itself.

The evolution of Lager Beer in the early days of the last century has kept down the use of the heavier potter, and has now developed into a big industry, and Minnesota, and especially Duluth, now boast of more of this than any other city in the country. Minnesota ranks the best brewing barley of all the states—always highest in price, but always lowest in stock and in amount, which it is not to be wondered at that this is a small amount of the industry.

## DULUTH BOARD OF TRADE

**T**HE Minnesota legislature of 1913 subjected the grain trade of the state to a searching investigation, in the course of which the government, rules and regulations, and the methods of operation under which grain is handled on the two exchanges of the state, located at Duluth and Minneapolis, were inquired into thoroughly and persistently.

In the Northwest interests antagonistic to the organized exchanges have been prominently active for a number of years, and in their efforts to injure private grain handlers in the terminal markets have been vigorous in their attacks. It was these interests that were chiefly responsible for bringing about the legislative inquiry, and in its conduct they had a considerable voice. They went after the exchanges with a real air of a better cause. With abominable tact they supported their line of inquiry they attacked the exchanges and their methods and the business conduct of their members, and living was soon as white heat. The grain investigation became the feature of the session.

From the inception, conducted in a distinctly hostile manner, the grain exchange emerged with a complete vindication. The committee reported recommendations and suggestions in matters of administration, such as the method of disseminating offers, admission of members, etc. These suggestions not being due to any abuse, although general customs that had been found, but representing the difference in judgment of the five men on the committee and the several hundred who make the rules of the exchange.

But as to the fundamentals, that these exchanges are great market-places where buyers and sellers meet and trade in the grain grown by the producers of the Northwest, enabling them to market their products with the maximum of safety and minimum of cost, that these market-places are open and free to all, whether it be the elevator, farmer's elevator, independent shipper, or individual farmer, that competition finds full expression, that all shippers are given the protection of the rules of the exchange, and that the commission men render to their clients the best service within their power, there was no pretense. In fact, the following acknowledgment was made: "We find that the grain markets of Minneapolis and Duluth handle the bulk of the grain produced in the Northwest. The business of buying and selling grain at each of these terminals is well organized, and the commission men generally have adopted a method of operating and accurately reporting all trade made by them. There seems to be no opportunity or inclination for individual traders in these markets to engage in any practice detrimental or unfair to either the shipper or receiver of grain."

That an investigation conducted in equity should, after two months of examination and reflection, be compelled to acknowledge that their business is fairly and honestly conducted is a result in which the Minnesota exchanges find much gratification. To all exchanges it is of keen interest, for it has always been their claim that an examination of their purposes, and the conditions under which business is transacted, could produce no other verdict than the one given by the Minnesota Committee. To the entire business world it is of much concern to know that the marketing of the nation's irreplaceable production of grain is conducted safely, economically, and effectively.

The exchanges of the entire country can find an especial satisfaction in the result of this Minnesota investigation in the fact that, after rigorous inquiry into the system of trading in contracts for future delivery, the absence of exchange trading which in the respect of so much attack, from those who measure its methods by the standard that comes to those who measure it rather than by the great service it renders to the vastly larger number who employ it for the legitimate purposes for which it has been evolved, the committee found that "we believe any transaction in future is legitimate and commendable where the parties engaged have an actual purchase or sale to bridge or provide, and where by reason of expertise, business capacity, and ample means, they are fitted to engage in such business."

At the hearings of this committee there appeared a num-

Grain Elevator of the latest type, of concrete and steel construction, and absolutely fireproof

ber of representatives of farmers' elevators, who testified to the value to them not only of the grain exchange, but of the system of trading in contracts for future delivery. Practically every farmers' elevator today realizes that the great cooperative movement among the raisers of grain, about which so much has been written, and which was unquestionably born of much benefit to the producer in the marketing of his grain, had been made possible by the existence of the grain exchange and its system of trading in contracts for future delivery. The grain exchange offers to the farmers' elevator the opportunity to market his shipments to the same advantage as his competitor. The price at which to buy grain is available to him as well as to the man against whom he has to compete, and it is the same price for both. When he has bought his grain he can immediately sell it for future delivery at the terminal market. The system of trading for future delivery in his solution, for it relieves him of the necessity of speculating on his purchases. Without this the buying of grain would be in the hands of those financially able to take the heavy risk of carrying grain, the necessarily making it a fewer number, and against this competition he could not survive.

It is the commission man in the terminal market who has made the farmers' cooperative movement in the Northwest the success that it is. He is not only the medium through which the farmers' elevator can sell his grain in the terminal market on equal terms with his competitor, but in nearly every case he has financed the elevator for which he does business, providing the capital which it must have in order to be constantly in the market for grain at its local station, and often providing a considerable part of the money with which the elevator is built.

The progress of the cooperative movement, as represented in the grain-growing territory by the farmers' elevator during the past four or five years, has been so marked as to leave no room for doubt that it is effecting a change in the system of marketing grain in the country. In Minnesota in the year of 1909 there were 1,959 houses owned

by what are known as the land companies, that is, companies controlling a number of houses, generally along one railroad line, and in some instances several. In 1912 the number had dropped to 777. Farmers' houses increased from 103 to 238, and independent houses from 283 to 300. In North Dakota and South Dakota the same growth had been made.

Another very important part played by the commission man in the success of the farmers' and independent elevators is in bringing them to safe methods of doing business and eliminating speculation. The grower of grain is always a believer in higher values, and very often is willing to take a chance on his conviction. Associated collectively in the management of an elevator, they are sometimes inclined to do the same thing. The commission man in the terminal market, with his much wider experience and opportunity for observation, knows that this is an inevitable source of loss, and with money furnished to finance the buying of grain by that house, he insists that they shall be no speculation, that as long as grain is bought it shall be held by it in the terminal market. He knows that every bad failure in the grain business can be traced to speculation; that the country buyer of grain who makes a failure because he takes too small a margin and puts into business a margin. Strict measurement is made that the country elevator that gets money shall do business without incurring loss.

The grain exchange are also striving to educate not merely the farmers' elevators but every country shipper at this direction. The Duluth Board of Trade knows that every traveling man who goes to the country as a representative of a grain firm represented by membership on the Board shall be educated, and this income is granted only after a personal examination of the applicant. During the inquiry his attitude as to speculation in grain is ascertained, and he is fully informed as to its dangers and the hazard that any buyer and shipper of grain takes if he indulges in it. It is imposed upon him that to make the grain business safe and progressive speculation must be stamped out. There is a more or less general impression that grain speculation is a thing of the past, but the actual handling trade in grain, but this is wrong. Very few admit, and most of them absolutely refuse it.

The result of this policy has been a vast improvement in the manner in which the grain business is conducted. Failures are few, and the cooperatives are learning that with competent management and conservative methods their business will be successful. It is operating to the advantage of the grain exchange also, for in bringing the country shippers to see that grain must be sold at the terminal in accordance with their interest.

The value of a well-organized grain exchange is most keenly appreciated by the shipper of grain, who has been misled by some concern that attempts to operate independently. Generally it is one that attempts to get business by appealing to prejudice, claiming the exchange are a monopoly, and their members all know it. They are always successful in getting some business from those who forget that the only reason the concern that attracts has not operated as a member of a grain exchange is because it could not gain admission. It is not more than a year ago that a concern began soliciting business from shippers along business in the Duluth Board of Trade members, claiming ability to handle the business to better advantage. The Duluth man saw the grain being sold in Duluth buyers at prices no better than they themselves could have handled if far, and after poorer, for there are no more shifty elements in the world than the grain traders on exchange. One day the concern's shippers were closed, and the proprietor was meeting with about \$25,000 of money belonging to country shippers. If the board of that concern had been able to go before the Duluth Board of Trade and satisfy it of his financial responsibility and his integrity, he would never have been soliciting business as an independent. Any concern which attempts to gain business upon the reputation of the Board of its advantage is that it does not belong to an organized grain exchange, does not have the application of credit extended to it by any shipper who is in the grain business, and has been misled by some concern that attempts to operate independently. Generally it is one that attempts to get business by appealing to prejudice, claiming the exchange are a monopoly, and their members all know it. Loading lake freighter with 400,000 bushels of grain. Each of the loading spouts discharges 25,000 bushels every hour

## The Dairy Land of the North

The dairy industry demands location, climate suited to the growth of a highly prolific strain of stock, accessibility to market, pure water in abundance, and a soil and climate fit and proper to produce luscious food for cattle. The Lake Superior dairy region of Michigan and Wisconsin fits all these requirements more perfectly than that of any other region in the Middle West. With a climate uniform in temperature, free from frosts for an average crop growing season of 140 days, and naturally well soil which does not freeze so the winter-tender, and with a rainfall averaging from 36 to 36 inches, this region is unquestionably peculiarly fitted for the growth both of roughage for the dairy cow in the shape of crop roots, and for the production of cheese curd, whey, clover, alfalfa and other grasses.

The yield of clover is so luxuriant as to justify the name "CLOVERLAND," which has been recently appropriated by the dairymen of the north.

With the advent of farmers from the older settled portions of the West dairy farms with the inevitable silos have sprung up, and practical demonstration has justified earlier prediction that this north country would prove the dairymen's Paradise. In this country of pure water, cool summer temperature, abundance of food for milk cows, and freedom from insect pests, the dairy stock shows a strength of constitution which promises prolonged productivity, both in offspring and in production of milk. Calves show a rapid development seldom seen in sections farther south. Markets both for stock and for dairy products are to be found in the regions of Detroit, Chicago and Milwaukee, distant one night's ride from this region, and Minneapolis, St. Paul and Duluth, distant but a few hours.

Many dairy herds of thoroughbred cattle are already in this territory, and furnish ample supply of acclimated stock for incoming dairymen.

The thriving lumber and mining towns of this territory furnish a splendid home market for farmers. The territory is thoroughly provided with church facilities and public schools, and the road systems are becoming the dependable pride of the region. Here is a vast unexploited agricultural empire at the very back door of the teeming population of the Middle West, and waiting to give prompt response to the treatment of the skilled agriculturist.

Through the very heart of this wonderful new agricultural region, from South St. Mary and Calmar, Michigan, in the east and north to Duluth, Minnesota, in the west, runs the Duluth, South Shore & Atlantic Ry., with its headquarters at Duluth. This railway has maintained a strongly helpful and effective department which employs agriculturists to offer suggestions and advice to farmers, to construct irrigation trains, and encourages and aids in the introduction and growth of approved pure seed and pedigreed dairy stock. In short, everything is done to give the farmer the benefit of scientific research and practical knowledge without expense to them.

Here lies an opportunity for a profitable farming investment within a night's ride of Chicago, and such an investment can be made without the speculative value enjoyed by farmers of two generations ago in the Mississippi Valley.

Land in this region can be now bought for from \$10.00 to \$15.00 an acre. Comparison is invited between this region and lands, no more productive at least, located a thousand miles from their way from the great central markets.

DAIRY COW OF CLOVERLAND'S FAVORITE TYPE

## HISTORY OF CENTRAL COAL & COKE COMPANY OF KANSAS CITY, MO.

The present expansion in the development and progress of any large industrial organization is such a potent factor that it is almost inevitable that the extension and organization, as necessary, is closely interwoven with the history of the new resource. The history of the Central Coal & Coke Company is no exception. The company was finally developed into the Central Coal & Coke Company of today but its modest beginning was in 1871 when W. C. Perry, who made President in 1871 by Richard B. Keith, and through all the various manifestations of the operations since that time, has been the dominating and the guiding influence of his master mind up to the date of his death, in 1905, when he was succeeded by R. H. Keith, son of Chas. B. Keith, son of Richard B. Keith, who made Vice-President. On Mr. W. C. Perry's death, in 1905, R. H. Keith was made President and General Manager, which position he occupies at the present time.

In the year 1873 a partner was admitted, and the partnership of Mitchell & Keith was organized, and the firm was later succeeded by H. H. Keith & Company.

### THE STAGES OF AN EVOLUTION

During the formative period the style of the firm name was changed several times from Mitchell & Keith to the Central Coal & Coke Company, now chartered. In 1873 the partnership of Keith & Henry was formed, and a new lease construction was continued until 1881, when the name was changed to Keith & Perry. Prior to the last-mentioned year, Mr. Keith had secured a combine at Godfrey, in Bourbon County, Kansas, and this mine was operated until the removal of the Keith & Perry interests in 1881.

Out of these various partnerships, firms and corporations now known as the Keith & Perry Coal Company, which, in 1884, was fully chartered by and operating under the laws of Missouri.

When the change of name was made from Keith & Perry to the Keith & Perry Coal Company, the capitalization was \$100,000, and operations were carried on under the company name with this capital until 1903, when the style of operation was changed to the Keith & Perry Coal Company, an incorporated concern, chartered under the laws of Missouri with an authorized capital of \$1,000,000. The change of the capital stock, and the change in the name, were merely the only changes of importance. From the time when the company, under the name of the Keith & Perry Coal Company had been an interest in all parts of the territory which it now covers.

The growth of the company has three distinct stages. It was primarily a retail distributor of coal, and only the coal which this business had been developed until it became representative, the second stage of its career was the sale of the subsequent acquisition of the territory operated by other firms and individuals, and later of the properties of the Kansas & Texas Coal Company, an organization fully so large from its own producing field as was the Central Coal & Coke Company itself. This was found for establishing a new field of business, but has experienced a growth equalled by few companies whose sole activity has been the production of coal for the industry. This advance has been so steady and continuous, and on such a large scale, that the department of the world from an operator in the manufacture of yellow-pine lumber of the South.

Probably a better idea of the growth of the company can be gathered from the number of men employed and the extent of the operations that have any other source.

When the retail trade was opened on the West coast, only one or two men to assist him during busy seasons. After the formation of the partnership of Mitchell & Keith, this force was doubtless augmented by perhaps a half-dozen more. The firm of R. H. Keith & Company operated in the operation of its properties, and when the Keith & Perry interests realized, the value of the firm's property and the number of employees were about doubled.

### CAPITALIZATION AND COAL PROPERTIES

In 1900 the capital stock was increased from \$5,000,000 to \$7,500,000, the additional capital being used to purchase property of the New-Orleans Coal Mining Company of Rock Springs, Wyoming. The purchase of this property increased the company owned of two of the largest mines in the West, capable of producing 3,200 to 3,300 tons of coal each day, and ranging between 620 and 700 men throughout the year.

The capital stock of the company was

origin suggested in April, 1912. This increase raised it to \$7,000,000, which is the present figure.

### EXTENT OF THE COMPANY'S OPERATIONS

The Central Coal & Coke Company is interested in six different fields, producing at different points in the territory. The quality of the coal ranges from the ordinary steam coal to high-grade semi-anthracite, and the latter is used for the best coal for either domestic or steam-generating purposes suited to any part of the territory, and is used in Pennsylvania, and nearly all the way that.

The coal properties of the Central Coal & Coke Company are located in Missouri, Arkansas, Kansas, Oklahoma, and Wyoming. A total of twenty-nine mines and two substations are being made to open up new shafts and slopes at a number of places as fast as the production of the additional coal can be utilized. On an average, it requires about 9,000 men to pay the company's mines. The Central Coal & Coke Company has a total of 1,000,000 tons of coal at about 21,000 tons, of lumber, approximately 1,000,000 tons.

Under the leasehold in Texas and Louisiana embrace 175,000 acres of long and short leaf pine.

On the coal lands in Texas aggregate 40,000 acres of land, representing about 100,000 tons of unmined coal.

The territory covered by the company in its mining operations enables it to cover the entire western half of the United States, with the exception of the Mississippi River to the Pacific Coast, and from the border line on the north to the Gulf Coast on the south.

### LUMBER PRODUCTION

The development of timber and milling operations in the territory of the Central Coal & Coke Company is a very important and substantial. Entering the field with a small mill and a moderate supply of timber land, the company has since that time the first standing yellow-pine timber-lands of the South, both long-leaf and short-leaf, and handling out part of the largest and best equipped lumber-mills of the South. From a small beginning it has grown steadily, increasing its timber supply as well as its mill capacity, and has become a leading timber into commercial conditions. From the center of a small circle around near Texarkana, in the state of Arkansas, the company has an important factor in the production and marketing of long and short leaf yellow pine lumber and timber from six mills in Louisiana and Texas.

The first venture in the lumber business was made in 1881, when the Central Coal & Perry Lumber Company, of Texarkana, Arkansas, was purchased. Shortly after this time the company began to operate to improve its machinery, changing the rollers to a hand saw, and adding many other improvements, cutting and handling the product of the mill plant.

Following this, plans for the construction of a new mill, which was completed in 1903, the ground for a new sawmill plant was broken near Texarkana, and the mill construction and put into operation by the first of the year following, 1904. This is what might be fittingly termed the beginning of a new era in the history of the Central Coal & Coke Company.

That the business for turning out high-grade lumber has been steadily increased, and a new era of activity in the industry of the central place at Texarkana, a second sawmill, equipped with planer and all other necessary lumber machinery, and the product of the mill, now constructed at Keith, near known as Nemo, Louisiana. At the time this mill and land, it was the most complete in the North in every respect. Time, however, brings improvements of all kinds of equipment, and the mill has many more changes been made in any one year than in the machinery for the mill.

The plant that was once the admiration of the South, while suffering no deterioration of interest, which has been in all humanly constructed machinery, has been overshadowed by a newer lumber-mill plant which the company has been building and erecting in the heart of the short-leaf yellow-pine section of Eastern Central Texas. This is the plant of the Louisiana & Texas Lumber Company, the largest and most modernly equipped sawmill plants in the South.

The timber stay for the Texarkana mill had been exhausted in 1905, and the company secured a large tract of long-leaf pine land in Louisiana, near the town of Nemo, and the Texarkana plant was moved to that timber and reconstructed.

Another new sawmill is now being planned to develop additional Texas long-leaf pine.

This, in a brief manner, is the outline of the company's operations from inception to date.

923 Baltimore Ave., Kansas City, Mo.  
ESTABLISHED 1885

This Company was incorporated in 1903, succeeding to the business of H. P. Wright & Co., which had its beginning in 1885. H. P. Wright, President of the Company, is a native of Illinois and a graduate of Northwestern University; he is President of the Kansas Gas and Electric Company, and also interested as an officer or director in several other similar companies controlled by the Electric Bond and Share Company of New York. He is a director in the Kansas City Life Insurance Company and several other local institutions. Mr. W. B. Nickels, Vice President of the Company, was reared in Augusta, Maine, but has spent many years in Kansas City. The business of the H. P. Wright Investment Company is confined almost entirely to the handling of western municipal and public utility securities. This is the oldest house in Kansas City handling investment securities, and is the only one whose business is confined exclusively to the purchase and sale of securities.

### Broker and Client

By Franklin Kecher

A very well-timed offer of one of the big automobile companies on upper Broadway a short time ago stated that he wanted to buy a car. "I don't know the first thing about automobiles," he confided to the manager, "and I haven't any particular requirements. All I want is the best car that this amount of money will buy."

The manager talked the matter over with his prospective customer, then took him across the street to a competitor's. "We think we make pretty good cars," he remarked. "Let me show you a couple of models. These people don't think just a trim car suitable. You'd better buy one of these."

And then the customer woke up. "What kind of a place you go to depend upon what you want to buy. If you don't know what you want, an automobile you want to go to a place where they have that kind of automobile to sell. If you don't know what you want, you don't want to go to a place where they make a specialty of any particular kind, but to a place where they sell just about everything they don't care what kind they sell you. In other words, if what you are after is service, you want to go to a place where they sell service."

There are three distinct classes of firms in Wall Street. The first sell service and service only. The second sell a business of selling service, but carry a line of securities for sale on the side. The third class of firms frankly and openly merchandise securities exactly as the maker of some particular kind of automobile or piece merchandise his particular product.

It is not the object of this article to argue the superiority of one of these classes above the others, but to point out that each has its own legitimate function to perform. With which class do you as an investor want to do business? That depends entirely upon the kind of business I want to do. What do I want to buy—some particular stock or some service loan? Assuredly, in that case, it is reasonable to go to a house that makes a specialty of that class of security. On the other hand, but if I am interested in investment matters and really not capable of deciding whether my money ought to go into stocks or bonds or what? Assuredly, in that case, what I need is service—possibly distributed dividends and the like thing to do so as to go to a firm that has it to sell.

Having been handed with some fair amount of stock of the first class, which couldn't satisfy their fancy south of the old River's decision, it is quite the thing to go to a firm on "Wall Street," who, as a matter of fact, it is in the class of houses having nothing but service to sell that the great majority of these houses have to sell. With all the treasury toward the establishment of bond departments to "carry" and merchandise bonds as do the bankers, what proportion of the firms which are members of the Exchange are tied up in any particular security or kind of security? A very small proportion indeed. You come across a house here and there that has got itself interested in this proposition or that, but in the great majority of cases Stock Exchange firms are free to render their customers' undivided service. Here's the market—here we are, how ready to buy you anything you say. We're London, sure and enough. Commission's the same whether you buy in districts or outdoors, whether the cost of the shares is \$25 or \$100.

"Nothing to sell but service"—it is doubtful if there is anything like general agreement on the legitimate means to handle investment business any longer that can truly say that is in. With no one to grind, no particular securities to sell, such a house can approach with an open mind the investment problems of rich of its clients. This man is in a position where he can take more or less risk with his money—this or that particular stock is what he ought to buy. With some other firm, who sells security as the primary consideration—for him only the best bonds will do. Each case on its particular merits; suitability above anything else. That is the way a broker can handle his customers' business when his personal has financial interest in what they do. Let it mean dollars and cents to him to have them buy one thing rather than another, and—well, human nature is human nature.

Very wrong, therefore, is the idea that because a house does not engage in the business of merchandising securities its business is all speculative. On the contrary, there are a very large number of these houses which, when they know have a stake in any part of the market, that many firms which would otherwise be in this kind of business feel constrained to keep out of it. In most people's minds the term

"broker" is more closely associated with the conservative investment of money than the term "broker," and yet of these it is the broker who is usually in the better position to plan a given investment in a swift and perfectly unbiased way. His own interest does not enter into the matter at all. It is simply a question of what will be best for the client.

And very carefully indeed does the reputable brokerage house attend to the investment of its client's money. It shall take the other side under the purchase and sale of some particular stock, and the transaction will be put through, properly, suitably and honestly. It will take, on the other hand, that you have a certain sum of money to invest and you prefer to have it in a certain stock, not it, and in the majority of cases, even where the total invested is small, to maintain the position in the same house to take. That is the business, to sell service. If the service you want is simply the execution of an order in some particular stock the broker will sell you that. If the service you want involves advice and a scheme for investing the money, with full explanation of the securities proposed, the broker will sell you just that—and at no higher charge than if you merely wish to execute an order on the Exchange.

A woman investor whose experience has been with the reputation of some of the firms above advertised appears in this building with a portfolio of stock she wants to invest \$10,000. For upward of two hours two members of the firm discussed the matter with her, the final selection being five bonds of high grade. Taking out her checkbook and preparing to write a check, the client asked how much she should add for the commission. Six dollars and twenty-five cents, they told her, was the amount of the commission. "Why, if the lawyer who sent me around here had done this matter with me by the way, the margin at least would be around fifty dollars! Very much surprised indeed on this point, it turns that under the rates of the Exchange one-eighth of one per cent, was all that was charged, whether the service rendered took more or little time and whether it occurred in a stock or in a bond.

How can the broker afford to sell service at such a rate? Simply because it is a rate that makes it possible to do stock, investment and otherwise. A man comes in and buys and sells a hundred shares of stock at all times five cents. On that the one-eighth commission amounts to 25¢. The next man who comes in to make a trade of \$200,000 for the firm can give more than 25¢ worth of service without getting behind on two transactions put together. And so the day's business averages up; the reasonable commission from speculative business and the service rendered on service at a charge much lower than could otherwise be possible.

### PUT AWAY PICKLES

Mathematician Figures Out the Field Question.

If any one requires a clear head it is a teacher of mathematics. He must know in the shortest, and in the best possible manner, of truth is necessary if correct results are to be forthcoming.

An Ohio mathematician, who has been teaching for 15 years prior to five years ago, I rather took a harsh opinion of my schoolmates, and quickly ate a hot dinner.

"The result was that I went to my afternoon work, but I was not satisfied and generally out of sorts. Finally I learned about Gove's Nuts and began to use it for my morning work."

"From the first I experienced a great change for the better. The heavy, unimpaired feeling and the heavy, unimpaired feeling that had disappeared. The drowsy languor and disinclination to work soon gave way to a brightness and vigor in my attention that I had never before known."

"My brain responds promptly to the requirements put upon it, and more important, the results have been lasting and more satisfactory, the longer I have used Gove's Nuts."

"My wife had been suffering from weak stomach, accompanied by such headaches early all her life. She became so nervous and nervous when she sticks to Grape-Nuts, either eaten dry or with milk. The stomach has gradually grown stronger and she has been able to eat Grape-Nuts. There's a Reason—Name given by Popper Co., Battle Creek, Mich.—Read the booklet, 'The Food is Well-Being'—a page."

Ever read the above letter? A new one appears from time to time. It is an assurance, true, and full human interest."

**Kansas City as an Investment Center**

By Herbert P. Wright

KANSAS CITY as an investment center has not yet arrived. Every city in the process of its growth has had to contend with constantly changing conditions. The growth of Kansas City has been wonderfully rapid. Its increase in population has probably been as swift as that of any other city and its building has been remarkably substantial and comparatively expensive. Where most young cities have built of wood, Kansas City has built of stone, brick, and cement. Where most cities have built their residences in a congested way on small lots, Kansas City has built on large lots with well-kept lawns. The location of the city is exceedingly rough, being full of hills and hollows. The leveling up of this ground is at least a tremendous expense. These facts have undoubtedly tended to labor the citizens of Kansas City largely in the outside and the things that go with it. It has tended to make the most popular investments for the time being either those in improved real estate or loans on real estate owned by others.

Another popular form of investment in Kansas City has been farm loans in the western country and the ownership of farm lands. Kansas City is not yet a manufacturing city. Its business is the agricultural industry to the west, south, and southeast. Its attention is fixed much more on the condition of the crops than on the condition of the stock. It is on the wing of production on the New York Stock Exchange. It is only so why the Western man who has acquired an accumulation sufficient to enable him to be called an investor has naturally taken to the line of securities which he is most familiar. The accumulation of investable wealth in Kansas City to the last few years has been very large, but the means have naturally been limited to lend it out on real estate in the city and on farms in Missouri, Kansas, Oklahoma, and Texas, and on the outfit in those states, Indiana and Kentucky where the farmer is popular with the Eastern banks. Bond-buyers everywhere recognize that the first requisite of a new investor is to look only for safety for his investment. After he has become somewhat familiar with the operation he recognizes that the ideal investment must be convertible as well, and eventually there will be a change in the class of investments which he seeks. Communities act primarily the individual. Kansas City is just entering into that period of experience when the character of investments is changing, and in beginning to sell for high grade, long-term investments that possess the elements of immediate convertibility at all times.

There is a large amount of real investment money in Kansas City awaiting its owners' education along conservative lines. In a very few years Kansas City will be as fruitful a market for the bond-dealer as Milwaukee, Detroit, Cleveland, or Cincinnati. The familiar outlet for investment in Kansas City is becoming fewer as the money available for investment is increasing. The choice of investments is increasing. Oklahoma, and Missouri, which formerly came to this city, are now being taken up quickly by local investors. The same is the case with this kind of bond in very much smaller than it was ten years ago. The experience of Kansas City is going to be the same as that of all of the cities further East, where of the type of investment has been change in keeping with the evolution of conditions in the city itself and the tributary territory. The class of investments in Ohio and Michigan, both for banks and for individuals, has changed radically in the last twenty years—partly because the investments now popular are so lower in value and partly on account of a better understanding of the wisdom of investments which are not subject to a broader experience in handling them. There is probably no city in the country that at this time offers a better opening for a branch office of a strong modern bond-house than Kansas City. The limited resources of the houses now engaged in the business are not sufficient to carry on a campaign of education such as the market justifies. Some strong Eastern bond-houses with a high reputation will find Kansas City a very responsive place for a qualified branch office, the charge of a resident manager. Occasional visits from traveling salesmen will not answer the purpose; the result will be attained only by establishing a permanent and dignified organization equipped to carry on a campaign of education and to build up a clientele based on intimate personal and permanent acquaintance.

## To Save Our Timber

By Hartley Brandon

Your consumption of all varieties of lumber in 1906 was 18,000 million feet, and the per capita consumption was 270 feet. Since 1880, according to the government census returns of 1906, the population has increased 64 per cent., while the total annual increase in consumption has increased 42.2 per cent., resulting in a total annual increase in consumption of 112 per cent. These figures give, briefly, the principal reasons for the rapid increase in the price of lumber, while on the other hand, if we consider the timber supply in relation to the production and consumption of lumber, the results are almost startling.

The continual increase in consumption and the consequent loss of timber lands, has resulted in a steady decrease in the supply of timber. As a result of the continued decrease in forest areas and increase in the demand for the product of lumber, the value of timber and its cost to the producer, and consequently to the consumer, has rapidly increased, with prospects of its further continuation until for a long time has been manufactured into lumber.

This condition has not prevented itself to the public until within the last five or six years, and the public mind is now aroused to the fact. What is going to be the result, and what the remedy? We find that in America, certain companies have been manufacturing the timber trade for a period extending beyond two hundred years, and that every tree grown and every part of every tree manufactured into lumber. These conditions are possible only because of the far-sighted policy of the American government—not only the central government, but the provincial governments of the various sections of the country as well. The general forest policy of the American government tends toward harmony with timber owners and conservation of lumber reserves, and, generally speaking, permits:

First, Trade agreements, which are helpful and under which civil suits can be brought.

Second, They require the land to be reforested—i. e., they require trees that are cut, must be planted.

Third, Reforested land is tax-free for a period of eighty years.

Fourth, There are taxes on the output rather than on the land.

In this country the conditions are reversed. Trade agreements, in the first place, are forbidden by law, and are followed by disastrous results in our timber reserves, and the forest is depressed and overproduction the result of delving values, when the small trees and saplings, which produce the lower grades of lumber are left in the woods to rot, for the reason that under these conditions they could be substituted only at a loss. During the four years following the panic of 1907, this condition prevailed, and the waste of at least 25 per cent. to 30 per cent. of the timber harvested during that period.

Going to powers of the state governments and the policy of state rights, the federal government finds itself unable to pass any federal legislation to require reforestation, and it would be practically impossible to secure uniform state legislation, so that the producers of any one state would not be at a disadvantage when coming in competition with the producers of other states, by means of such legislation. No such legislation should be enacted in the absence of legitimized trade agreements.

It would appear that the only proper governmental policy to be pursued relative to the lumber industry is that every encouragement should be extended to reforestation of timber lands and the encouragement of the commercial of forests on the timber as cut rather than on the land; otherwise our forests will be exhausted rapidly and there will be a steady decrease in the value of timber by reason of inability to manufacture certain portions of the log as a result, causing thereby marked increases in price, which can only be overcome, as stated above, by permitting trade agreements that allow a price to be placed on the material yielding at least the cost of production. This would prevent to a certain extent the rapid depletion of the forests and ease the trend of prices to be more slowly upward than it otherwise would be. It would be interesting by the way, to note that the principal element entering into the present cost of producing lumber are due to the increased application of more reasonable laws and also the rapid increase in population, creating increased competition in every direction and depleting forests.

The remedy is limited but such as it is should be applied before entire deforestation occurs.

## Aluminum, Man's Marvelous Servant

When the history of our age is written the story of aluminum is going to occupy a prominent page. It is to be as important as the story of electricity, the all-pervading fluid that by means of wire is made to do a vast amount of work, and soft iron, and in myriads of waterfalls, until Franklin and Morse and Edison pain became and of the first use of the most metal and laparous servants of man. The giant bulk lifting machine devoted all its efforts to get only killed them in storms—until the genius of our times set up a thousand wheels, for it was with aluminum which constitutes nearly one-tenth of the earth's crust, yet by obscure and unobserved through all the centuries until Humphrey Davy, in 1808, suggested that clay and many other rocks "depended upon some metal as a base."

Very ably the scientists glibbed on the trail. Working in Germany twenty years later proved Davy's hypothesis correct. He first isolated aluminum by decomposing aluminum chloride by potassium and obtained it in the form of powder. Nearly twenty years more before he produced it in little globules. Davy, a French chemist, succeeded, in 1825, in obtaining it in thin plates. Napoleon III. paid the expense, and Davy put the metal on the market at \$100 a pound. The United States prepared to make a metal made of aluminum that this Aluminum was not impure, could not be manufactured that, though for technical uses, such as strength, and durability made it exceedingly desirable. Scientists kept on working, and in 1835 it was produced, and in 1858 it was drawn to 25 " gauge.

Hartley M. Hall, newly graduated in 1868, from Oberlin University in Ohio, had the inspiration to try electrolysis. Neither Davy nor Hall had been the first to reduce aluminum from aluminum by combining the principles of the electrolysis with the electrolytic bath. He achieved a revolution. The metal from eight dollars a pound to sixty-five cents a pound. Today, thanks to further improvement, the metal is sold at a price and malleable as gold and as light as wood, costs less than twenty-five cents a pound, and is being used for technical purposes. But for the testing and heat-treating of the parent glass, electricity, he should not side with the metal. He called it simply electric the demand, for its toughness, strength, and malleability have called it into action all over the world.

All America is familiar with aluminum in cooking utensils. Whether one heated coffee made in an aluminum percolator will never have any other: for the standard of cooking things away every trace of the old grounds, and the best in the kitchen. The metal is used for fresh aromatic steam of exquisite taste and purity. Whether you bake, stew, roast or grill, the aluminum pot or pan or grill comes new and fresh to the table and the end of the food of labor in cleaning. Every bit of aluminum prepared is in the perfection of nature's favor.

Those who have for years used iron, steel, or copper can hardly believe how much lighter and easier to handle aluminum is. Commander Perry took aluminum utensils with him to the North Pole, and the United States has won many an arctic expedition. Captain Roosevelt took them on his famed hunting trip in the African bush. With others have shown his aerial voyage of one thousand miles over the Atlantic ocean. Most of the medals of Europe are now cast in aluminum. Our war army uses some of them. In the war with Britain the Japanese used 150,000 lbs. of aluminum.

But life is not all cooking. The cheap though precious metal is rapidly becoming a general part of everybody's life. A man shall spend every moment of the day within sight or touch of aluminum. Aluminum is an essential part of almost almost as necessary as life in this century is civilized. An enormous amount of aluminum is being used in the manufacture of automobiles. Thousands of miles of wire and cables are used by interurban traction lines. The cars, lighters, and sanitary facilities of aluminum houses it is to be used in the manufacture of cars such as are now in use in the suburbs of New York and for the buildings and racks of all modern railway cars.

## What Fishes Know

That fish possess a certain power of memory is a fact which has been established. They often learn to recognize the voice of the one who feeds them, and will swim to him when they are hungry. It is habitually true to them. If a second person goes large to be swallowed, they will swim to him to divide it on a sharp stone.

## An Accurate Control of the Time of all Workers—Executive, Clerical, Productive and Non-Productive—

- Will Increase Your Capacity
- Reduce Your Time Losses
- Put You on a More Favorable Cost Basis
- Make Your Employees more Valuable to Themselves.

You can best secure this accurate control, increased capacity, and reduction of time losses with an

## International Time- and Cost-Keeping System

A more favorable cost basis will follow as a matter of course; and your employees' value to themselves will be greatly increased when such time losses cease.

Elimination of time losses operates to the benefit of both employer and employee.

We are always glad to show precisely how International equipment will bring about time-conservation in any line of business where labor is employed.

Over half million dollars worth

# Keokuk

The City  
For You to Live In  
To Build Your Factory In

THE middle west is the logical location for factories. Keokuk is the natural centre of manufacturing in the middle west, because—

1. Here is located the greatest power plant in the world, supplying constant power at the lowest cost.
2. Keokuk is situated on the Mississippi river, insuring low freight rates and the advantage of water transportation, which will in a few years be a most important consideration.
3. The city is high and dry, above any possibility of floods. A healthful and pleasant climate.
4. Keokuk has a new industrial zone set apart for factories, with special switching arrangements for prompt handling of in-coming and out-going shipments.
5. Keokuk Schools—Churches—Fire Department—Police Department—Parks—Clubs, etc., are all of the most modern in every way.

Views accompanying this advertisement show the Water-Power Plant during the construction period. By July 1, 1913, the plant will be generating power and the formal opening with appropriate celebration will be held in Keokuk, August 26, 1913.

Descriptive booklet and any special questions answered on request.

## Using Niagara's Power

BY EDWARD T. WILLIAMS

City Industrial Agent of Niagara Falls, N. Y.

Taste in the electrical era. In the past we have had the steam age, the gas age, but the electrical age is the period of the utilization of the strongest natural forces by the genius of man. In the last twenty-five years probably greater progress has been made in electrical power development than in any other sphere of human activity. This has been done solely by scientific conversion of power, represented in the flow of water, in an invisible current for almost everything that required power, light, or heat.

Naturally, the first development of electrical power was the water power, and the greatest quantity of power anywhere to be found on earth—the Falls of Niagara. We more than two centuries ago the water power had enjoyed a world-wide fame as a stupendous natural spectacle. The present-day capacity of the great outlet is estimated by the most eminent engineers at from 2,000,000 to 7,000,000 horsepower.

The potentiality of the Falls is explained by the fact that the Niagara River falls 206 feet in five miles, but in the upper rapids, 402 feet at the Falls, and 43 feet in the lower river. In its entire length of 26 miles the river falls 525 feet. The average flow of the river is 222,000

cubic feet into nearly every manufacturing industry.

According to a statement made by the Committee on Foreign Affairs of the House of Representatives by the president of the Niagara Falls Power Company, that company has expended \$24,000,000 at Niagara Falls, New York, and Niagara Falls, Ontario, in the United States, plus several other plants that in 1908 this company had made expenditures of nearly \$12,000,000, and that it is still making investments, the latter being manufacturing concerns, had expended an additional \$12,000,000.

At the same time the Hydraulic Power Company had expended nearly \$6,000,000, and its allied or dependent companies had made an investment of over \$5,000,000, an aggregate of nearly \$42,000,000 for both power companies. At that time the two power companies were using 15,000 cubic feet of water, which would make possible a cubic foot of water represented an investment of \$2,800. The investment, of course, does not include the three jenny plants at Niagara Falls, Ontario, of which one is an auxiliary of the Niagara Falls Power Company, and the investment in which is included in that company's total investment of \$24,000,000.

A view of the American and Canadian Falls 1913

feet per second. A flow of one cubic foot per second equals one square mile of water 1.16 inches deep in a thirty-day month. The flow of the Niagara River is furnished by 8,000 cubic miles of water from lower lakes having 80,000 square miles of reservoir space.

Under the so-called Burton law the Niagara Falls Power Company was allowed a maximum diversion of 6,000 cubic feet per second. The Hydraulic Power Company 6,500 cubic feet per second, the Lockport Hydraulic Company 500 cubic feet per second; the Niagara Falls Electric Transmission Company was allowed to export 60,000 electrical horsepower; the Ontario Power Company was allowed to export 60,000 electrical horsepower; the Ontario Hydro Electric Commission was allowed 1,500 electrical horsepower, making a total of 167,000 horsepower to be imported into the United States. The Burton law was enacted June 23, 1890, and expired March 3, 1913. The only law governing the matter in the British-American treaty, which permits a daily diversion of 10,000 cubic feet of water at the rate of 20,000 cubic feet per second, upon the Canadian side of the river at the rate of 20 cubic feet per second.

The electrical harnessing of the great outlets has been of general and large benefit to the people of the United States. To the city of Niagara Falls and the Niagara frontier, it has been of stupendous import. As a result of it there are now located in Niagara Falls two manufacturing concerns which are the largest power users in the world. As a matter of fact, there are several products that are made exclusively made with Niagara current at the source of the supply, and they are in general use everywhere. Through great electric lines the most distant from the great outlets has made Niagara Falls the electrical manufacturing center of the United States, and this process would be impossible without great quantities of electric current. It has made the manufacture of aluminum a great commercial success and these products are

Now, as to the question of diversion and its effects upon the scenic grandeur of Niagara Falls. The average flow of the Niagara River is 222,400 cubic feet per second. To be conservative, the United States engineers sometimes use 210,000 cubic feet per second as the amount. The maximum use allowed largely by the diversion of the wind on Lake Erie, in conditions in winter sometimes make a material difference in the flow for a few hours.

The Burton law permitted a total diversion on the American side of the river by the construction of the American and an importation from Canada of 160,000 horse power. The British-American treaty, which permits a daily diversion of 10,000 cubic feet of water at the rate of 20,000 cubic feet per second, and it is contended by those most familiar with the situation that neither the Congress of the United States nor the legislature of the state of New York should impose any restrictions less than those imposed by the international treaty which was stipulated after a careful investigation by the International Boundary Commission, a body appointed under a statute of the United States to confer with similar bodies appointed under a statute of Canada, to make recommendations with reference to the control and government of the waters of the Great Lakes and the valley of the St. Lawrence with reference to the question of the amount of water which could be withdrawn on the American and Canadian side of the Niagara River without material injury to the interests as one of the great natural beauties of the world.

When William H. Taft was Secretary of War it was his duty to deal with the matter, and he came to Niagara Falls, held a hearing at which all the parties involved were represented, and he announced that he had reported to the Senate that with a diversion of 15,000 cubic feet on the American side, and the transmission of 100,000 horse power from the Canadian side the people of the United States would not suffer substantially or perceptibly in the eye.

And the manager of the plant had estimated this conclusion.

# HOTEL OSTEND

ATLANTIC CITY, N. J.

"Where the Surf Sings You to Sleep"

Right at Chelsea's Fashionable Bathing Beach. Here you find rest in abundance. The ocean rolls and surges right up to—and under the hotel piazza, its music is grand and soothing. Distinctly, the Ostend has the finest location on the Beach. Within easy walking distance and roller chair ride to the center of life and gaiety for which Atlantic City is famous.

The Hotel is equipped with everything necessary for human comfort and enters to the best advantage.

All locks, private and public, have hot and cold running, fresh and sea water. When the temperature is highest and cities hot and grimy the Ostend is the coolest and most comfortable hotel in Atlantic City. Rooms large, airy, and 95 per cent of them overlook the ocean. Special rates to single men.

Rates are reasonable. Write for booklet and reservation

DAVID P. RAHTER

Proprietor and Manager, Hotel Ostend, Atlantic City, N. J.

## The Easy Way to Select Your Motor Boat

First, write and get our new, valuable and helpful booklet about motor engines and motor boats in our book.

Our **Big Book** "B" tells you all about what you should know before you buy a motor boat. It tells you about the different types of motor boats, their uses, their prices, and how to select the right one for your needs. It is a complete guide to the motor boat world.

Then there is our **Boat Builders' Catalog**, showing the makes of the various leading boat builders. This is the only type of boat to be obtained and described. Shows you how to select the right one for your needs.

**A Gray Motor in Your Boat Means Absolute Satisfaction**  
Over 1000 dealers will Gray Motors and give Gray engines. We have complete service stations in the large cities and leading centers throughout United States and Canada and, wherever operating, we are everywhere in the service.

**GRAY MOTOR CO.**  
632 Gray Motor Bldg. DETROIT, MICH.

Write to get what you want in the easiest, quickest and at an economical manner.

**1. "Book of Boats"** contains over 200 illustrations of boats, selected from all parts of the world. Tells you the best motor boats, their uses, their prices, and how to select the right one for your needs. It is a complete guide to the motor boat world. Price 25c, postpaid.

**2. "Boat Builders' Catalog"** shows the makes of the various leading boat builders. This is the only type of boat to be obtained and described. Shows you how to select the right one for your needs. Price 25c, postpaid.

**3. "Gray Motor in Your Boat"** shows you how to select the right Gray motor for your boat. Price 25c, postpaid.

**4. "Gray Motor in Your Boat"** shows you how to select the right Gray motor for your boat. Price 25c, postpaid.

**5. "Gray Motor in Your Boat"** shows you how to select the right Gray motor for your boat. Price 25c, postpaid.

## Niagara in Romance and in Commerce

Glimpses of the Pioneer Days and of the Twentieth Century Development of the Niagara Frontier

BY EDWARD T. WILLIAMS

City Industrial Agent, Niagara Falls, New York

THE first white man to see Niagara Falls was Father Louis Hennepin, a French missionary, in 1678. He came to this locality with Father La Salle, who built the first boat, the first vessel to sail the upper lakes, on the shore of the Niagara River just above Niagara Falls, where there is now a thrifty village bearing the name of La Salle. Thus romantically began a commerce which is now of tremendous proportions, which makes the production of the great flow more than a thousand miles through the Great Lakes, the Welland Canal, and the Lawrence River to the sea by one route, and through the Erie Canal by another route after breaking out at the foot of Lake Erie or at the Tonawanda on the Niagara River, where it flowed sixteen miles from Niagara Falls and eleven miles from the spot where La Salle built the first boat, now marked a sixth leader and leader, the largest leader ever in the world.

One of the earliest descriptions of Niagara Falls was written in English, a letter from Peter Kalm, a gentleman of Sweden, to a friend in Philadelphia, sent from Alliance under date of September 2, 1736. "When you are at the Fall and look up the river, you may see that the river above the Fall is everywhere exceeding steep, almost as the side of a hill. When all of this water comes to the very Fall, there it throws itself down perpendicular. It is beyond all belief the surprise which you see there cannot with words express how amazing it is! You cannot see it without being terrified; to behold so vast a quantity of water falling from a surprising height, it should not but that you have a desire to burn the exact height of this great Fall. Father

Niagara Falls Power Company, and thus the first steps were taken to revolutionize the region and inaugurate the electrical age.

The charter of the Niagara Falls Power Company gave it the right to develop 100,000 electrical horsepower, and it was estimated that that amount of power exceeds the theoretical power at Lawrenceville, Buffalo, Lowell, Torrington Falls, Manchester, Windsor Locks, Bellona Falls, and Colton, and exceeds the power actually developed at these places and at Andover, Fairport, and Massena.

Niagara electric power was first delivered commercially by the Niagara Falls Power Company, on August 26, 1883, the first customer being the Pillsbury Baking Company, which has since changed its name to the Aluminum Company of America and which is now the largest power user in the world, using 73,000 electric horse-power produced from the six power companies. In three great plants here which last year produced 12,000 tons of aluminum, worth about \$3,000,000. The Niagara Falls Power Company transmits considerable current to the cities of North Tonawanda, Tonawanda, and Buffalo, which operate many industrial establishments in these cities. It also furnishes the current for the International Railway Company, which operates 274 miles of electric railroad track on the Niagara frontier. On its banks on the upper river are the great chemical plants which have made Niagara Falls the chemical manufacturing center of the United States. The value of the chemical products in this city in 1930 was \$11,

A view of the American Falls, 1913

Hennepin supposed it 600 feet perpendicular; but he has passed little credit in this, the name of James Taylor has done this is the grandeur, at no far from this."

Francis Lynde Stearns, the eminent New York lawyer and vice-president of the Niagara Falls Power Company, recently said, "Since Father Hennepin, I have written my Father Baptist concerning Niagara. 'A curtain of brilliant light,' spectators by the million may have revealed something of themselves in various efforts to disclose to others the essential character of the Falls of Niagara, continuously inseparable with any other natural object. To souls sensitive to the beautiful and the sublime, the plunging torrent has appeared by the stateliness of its stream, the brilliance of its boisterous rapids, and the deep green glow of its abutment-flooding break, as well as by the drop into the seemingly infinite depths from which there comes to him who listens the note of the retreating shore, deeper than the diapason of any organ's pipe."

The state of New York, in 1862, established the State Reservation at Niagara by purchasing the land close to the Falls on the shore and the islands in the river, extending along the shore for the purpose and making this month's wonder of the world live to all mankind forever as a spectacle. The next year Assemblyman Peter A. Porter, a member of the Senate, had passed for the next year the bill which was purchased by the state, passed through

1906,720, which was 32.0 per cent of the total for the industry in the state, and which also represented 41.0 per cent of the total value of products for all manufacturing industries of the city combined.

Furthermore, Niagara Falls has not only all other cities of the United States in the manufacture of chemical substances by electrolytic process, this branch of the chemical industry having developed very rapidly as a result of the utilization of the water-power of the Falls.

The Hydraulic Power Company, which had the original water-power owned by Niagara Falls before the dawn of the electrical era, widened and deepened it and began an electrical installation soon after the Niagara Falls Power Company did. It now has an equally great plant, now manufacturing electricity in which are housed many of the city's most important industries, 6000-horse and transmit any of its current outside of the city.

When the first spadeful of dirt was formed for the excavation of the tunnel of the Niagara Falls Power Company twenty-two years ago, the present city of Niagara Falls was two villages with a population of less than 10,000. Now the city extends to the west, and the assessed valuation of the territory was about \$9,000,000. Now it is over \$34,000,000. There are now a vast number of people. The soil was a foot of snow in the territory. Now, the city has seventy-eight miles of sewer, costing \$12,500,000, and over forty-one miles of drainage, and

DINE AT THE FAMOUS OUTDOOR RESTAURANT

"New York's Most Popular and Fashionable Resort by the Sea."

At Manhattan Beach, served on the terrace, is the most appetizing and most delicious cuisine of the season. The restaurant is open from 11:30 a.m. to 11:00 p.m. For the full, see leaflet by mail.

Enjoyed Hunt Fishing, Tennis, Croquet, Ping-Pong, Hockey, Boating, Golfing.

ORIENTAL HOTEL

Opens June 15th, Five-story Hotel.

Cheerily by Nevada's Orchestra.

Also made drinks in hotel restaurant.

George and parking accommodations.

JOSEPH P. GREENE, Manager.

Brooklyn, 145 Park Ave.

11th Ave. Park 5th, Room 2014 Grand Central Terminal, New York.

## HOTEL BELLECLAIRE

Broadway and 77th Street (Subway 79th Street), New York

Situated in the most charming residential section of New York City, away from the dust noise and heat of lower Manhattan, yet within 12 minutes' ride to all best shops and theaters. Broadway cars and 77th Avenue automobile stages pass door.

This modern Broadway Hotel appeals to visitors and those seeking a refined and comfortable Hotel within the best.

Write for Illustrated Book.

NEW YORK

Special Rates for Families During the Summer Months

Rooms, also bath, at 50 c. in 12 rooms with bath, breakfast.

## COMMENT

BEGINNING with the issue of August 16th, Mr. NORMAN HANCOCK will take direct personal charge of HARPER'S WEEKLY.

### The Outlook for a Banking and Currency Bill

Despatches from Washington have been growing less and less hopeful about the prospects of getting a banking and currency bill through Congress before the end of the special session. That is not surprising. The Republicans were in power continuously for sixteen years, the need of legislation on this subject was apparent all that time to reasonably intelligent people, and yet all they did was to pass, what prodded by circumstance, the rather crude ALDRICH-VAN DUSEN emergency measure and to appoint the so-called ALDRICH commission. True, the ALDRICH commission did work which in the judgment of competent people is excellent. But it will not be in the mouths of the Democratic party's opponents to say one word about Democratic delay and dilatoriness on this particular issue.

There is the purely political aspect of the matter is negligible. And that, we are glad to believe, is the administration's view of it. President WILSON has done everything he could to secure prompt and intelligent action on this most pressing question. In his speech accepting his party's nomination he modestly deprecating enough knowledge to justify legislation, but he has ever since worked steadily and courageously to secure from Congress the radical changes in the currency system which he sees that this country needs at once.

The opposition to immediate action is easily explained. Congress wants to adjourn and get out of overheated Washington the minute it gets rid of the tariff. Most Congressmen, never having seriously studied the monetary question, do not appreciate its importance or the imminence of trouble if it is longer neglected. Other hold that the party will risk less by doing nothing than by doing what it can to reform a financial system which is confessedly without any sort of safeguards against financial disasters.

We are not ready to rebuke here that something can be accomplished before Congress adjourns. Representative GILMAN shows encouraging signs of an open mind and of a strong desire to co-operate with the President and act promptly and sensibly. There is no sign, so far as we can see, that the President himself has any notion of yielding to the forces of inertia or to any force that makes for leaving bad enough alone. He has every reason to be steadfast and determined. If he and his party pass at this one session an honest low-tariff bill and a sound and scientific banking and currency bill, then the gates of hell cannot prevail against them.

### The Minnesota Rate Case

Naturally enough, most of the talk about the Minnesota railroad-rate decision has had regard to its immediate effects, and of these the railroads and Wall Street took at first a pretty gloomy view. Wall Street's view, of course, was one of the immediate effects, and not a negligible one; less negligible than usual, perhaps, on account of the rather unexpected state of things financial both in this country and abroad. Incidentally, it was brought out clearly that the railroads and their financial backers are now much less fearful of

national than of state control. Time was when this feeling was, to say the least, by no means universal.

Indeed, such recovery of confidence as there has been—and a certain recovery did, in fact, come quite promptly—also illustrates this feeling. What was first seen in the Supreme Court's decision, and what caused the drop in railroad securities, and what is the concession of a state's present right to control rates within its own boundaries. What caused the recovery was the closest reading that discovered Mr. Justice BRIDGES' extremely important dictum which practically conceded to Congress, whenever it chooses to pass the necessary laws, at least control of intra-state commerce as it may deem necessary to make completely effective its control of interstate commerce.

There is, to be sure, a slightly different interpretation of this part of the decision, which would base it mainly on the fact, observed by the court, that the Interstate Commerce Commission had not acted on the state law in question. In other words, it is thought that the state owes its present immunity from national interference simply to the failure of the national commission actually to interfere. But there is not much difference in the outcome of the two interpretations. They both seem to concede to Congress power which, when fully asserted both in legislation and by the proper federal agency or agencies, are bound to proper control. Nobody who has studied the relations of intra-state and interstate commerce, and seen how nearly inseparable the two domains are, and how much that will happen when the law is minded to assert fully national rights as against state rights in this great matter. It is quite possible that at present Congress is not so misled; there are many state-rights menors. But in the long run the apparent triumph of the states in the Minnesota case is extremely likely to prove a Pyrrhic victory.

### Wanted—An Alexander Hamilton

To get made a point decided is, no doubt, making a certain amount of progress with the railroad question. Next October, when the Supreme Court passes on the Texas rate case—a case in which the Interstate Commerce Commission has asserted itself in a way to contravene a state's control over intra-state rates—we shall probably have clearer light on this whole matter of state and national powers concerning railroads and other public carriers. So, no doubt, we ought to feel encouraged.

But, as the other hand, it is not a bit discouraging that we should still be in need of light on a subject so obviously essential to anything like a lasting solution of the railroad question and the other questions intimately related to it? Does not the fact indicate, on the whole, rather deep progress toward a steady and permanent and thoroughly worked-out policy—a policy severely consonant with the Constitution as it is or as we may have to make it, a policy which the railroads and the public, on both the home and the overseas side of it, is immense. We have learned a lot about it, undoubtedly. We have made real progress with it—stopped bad practices, instituted reforms. But nobody claims that we have mastered it, that our policy is fixed and complete, or even that we can see the end of our wrestling with it.

Why? Granting that the problem is soluble, that there is a right and wise policy if we can find it, for the life of us we can see but one answer. It is simply that there has not appeared among us any sufficient genius in constructive statesmanship. Ability there has been, and much of it, in the White House, in Congress, on both sides of the aisle, in the commissions, in academic chairs, among the railroad bond holders. But genius—no. There has, in fact, been nothing whatever to compare with the display of that indubitable quality, made in kindred enterprises, by a single man in the first two or three years of our life under the Constitution.

Study the astounding witfulness and completeness with which HAMILTON comprehended the needs of the infant republic—particularly in finance—the energy and resource with which, molding opinion to his needs, he contrived to avert them, and it is almost enough to make one go down on one's knees and pray for his counterpart. Jefferson's was no so great, and a work of genius likewise. But that work that is just now so nearly hollow as is precisely the kind of work for HAMILTON'S kind of genius.

The Wisdom of Going Slow in Quarters

Agree we are impressed with the value of diplomatic delay. It is going to be increasingly difficult to make fun of diplomatic faces that make for delay. One is almost ready to declare that diplomacy is delay.

Japan's offer to renew her arbitration treaty with us is no doubt construed unpleasantly by bitter opponents of the idea of arbitrating the California question; but it is more generally construed as a sign of an improving good-will attitude as a good omen for the outcome of the negotiations over that troublesome matter. Unquestionably the delay occasioned by deliberate procedure has been of itself a very great help in the search for a peaceful solution.

It has enabled our government to demonstrate conviction in its relations toward Japan. It has enabled both to and the Japanese to get a better knowledge of the actual situation in California. It has, above all, revealed to the Japanese the full extent of what they would encounter by anything like a warlike insistence on their entire restoration; for it is plain—the English press has done much to make it plain—that the California question, in its racial aspect, may at any moment break out spilling into a world question, and that at least half the world will rightly or wrongly side with California. Perhaps the other, the Asiatic half, will sympathize with Japan; but what will its sympathy be practically worth!

Japan has had time to think; and Japan, how- ever high spirited and proud she is, can also, she has ample provok, be wise.

The object-lesson naturally inclines one to look there, and more fervently on such plans for keeping the world's peace as have for their main reliance provisions against hate, insistence on delays. If we can somehow arrange that nations shall always stop and think before they fight, we can get an assurance near insuring that they shall not fight at all.

The South and Immigration

In the matter of self-restricting immigration, Mr. BURNETT of Alabama, who will head the House committee on the subject, is quite keeping pace with Senator DILLON of Vermont, long chairman of the Senate committee. The fact may be significant. For many years, notwithstanding the South's failure to attract any considerable number of the immigrants we get, Southerners in Congress have pretty generally helped to vote down measures intended to reduce the number of them. The South has kept hoping and desiring to get its share of them. There is as yet not enough evidence to show that the South has changed its mind on the subject, but there are signs of a loss of eagerness.

This does not apply to immigration into the South from other parts of the country, which is still earnestly solicited. One conjectures, therefore, that whatever change has occurred is due to the character of the bulk of our recent immigration, to labor troubles in the North, and perhaps to the coming of prosperity in the Southern States notwithstanding the comparative lack of immigrants.

It is quite probable, in fact, that more and more Southerners, now that times are better than they were in the past, are reflecting, as did the late Governor Cassin, of New Orleans, North, and perhaps Georgia has its value—and that one race problem may be better than many. At the Richmond Conference on Southern education last April one speaker vigorously urged the need of fresh blood in the South and more racial studies, particularly in agriculture; on the contrary, indicating more than ever to be content with the stocks they have.

Apparently, too, this feeling is not confined to the Southern white people only. Books WASHINGTON, in a recent article, takes a hopeful view of the negro's chances in the competition for work with the white, but in his "The Man Farthest West," mainly a collection of the people's outlook in the South with that of the poorest classes in Europe, he says:

I have stated myself what would happen in our Southern States if, as some people suggested, large numbers of those foreign peoples were induced to settle there. I greatly fear that if these people should come in this fashion, in this manner, outside of the cities, where they would have comparatively few educational advantages, and where they would be better able and more ready to preserve their native customs and languages, we might have a racial problem in the South more difficult more dangerous than that which is caused by the presence of the negro.

It looks as if the complicated problem of race wars is still to be mainly the North's and the West's, as if the South will still confine itself mainly to its one great problem. There are certainly Southerners who seem increasingly content that it should be so.

#### Votes for Women in Illinois

By a vote of 83 to 58 the lower branch of the legislature of Illinois gave, last week, to women the right to vote for President. Also the right to vote for mayors and various town and county officers. It is a limited franchise, but important, if valid. The Illinois Senate, however, is now conferring it some time ago. The House has now concurred, and assurance is given that Governor DUNN will sign the bill. Under it women may vote in Illinois for all officers except those provided for in the state Constitution. For these officers they cannot vote until a constitutional amendment is passed. They cannot yet vote for state officers and legislators so the legislature ran no personal risk in its liberality.

We have not yet seen anywhere questioned the validity of the action of these Illinois legislators. The Illinois Constitution limits the franchise to male voters, and our *Evening Post* says: "One would suppose that the limitations upon the franchise would apply automatically to all officers, however created, but evidently this is a mistaken notion." Possibly the validity of this action may have to undergo the scrutiny of the courts, but if it is good law it is important and interesting.

Limited franchises for women are usually concerned with school officers or tax officers and the women voters seldom turn out strong over such matters. But the vote for President interests everybody, and in cities like Chicago, where settlement-workers and other leaders of women were who is major, the women's vote may decide elections.

The rest of the way toward complete suffrage may be slow going in Illinois. It is especially hard to amend the Constitution of that state except by constitutional convention, because the legislature can only propose one amendment in any one session, and a defeated amendment cannot be proposed again for four years.

#### Reflections

Incomplete as it is, this suffrage victory in a state this side of the Mississippi, a state that sends twenty-seven Representatives to Congress and contains a city with a population of two millions going on three, is very interesting and important. It is not small help to the great many people, not very favorable as yet to women suffrage, coming to the point where they want to see it tried, and prefer, of course, that it should be tried on other folks. They would be glad to

see it tried in Illinois much more fully than the law provides. A good many other people, suffragists, are very tired of suffrage agitation, and tired also of some of their rick-fellows, and they wish the job was done and over with, and they will rejoice in Illinois.

#### Our Lively Ex-Presidents

We have not a brace of remarkably active and efficient ex-Presidents, experienced men, in good health and in the prime of life, and disposed to be accessible. It must be a long time since we have seen one of our ex-Presidents. Mr. Tarr was in Washington the other day, and visited the President, and the papers said he got lost in the Capitol, not knowing the way about that edifice as well as his successor. And last week, when the Supreme Court passed on the Minnesota interstate rates question, Mr. T. encouraged us with his views on that matter. And lately he went to the Fairview convention in Boston and spoke there, and indeed he keeps his habit of public discourse limber with frequent practice.

So does Colonel ROOSEVELT. He gave about a week of head-lines by his exercises at Marquette, and since then has been out, the stump of Governor Fair, very direct, primary hits at the President, speaking so wearily in the *Outlook*, and in distinguishing incidents of his biography besides, in a chain of newspapers. Nobody can forget the Colonel for more than a day at a time, and he will be seen then over in mind and sight when he goes, as he intends, to the Argentine to lecture.

Our last, and highly interesting, subject. What its underlying motive is we don't know, but it is natural to infer that the Colonel thinks Buenos Ayres would be a profitable change from Oyster Bay, just as Madame SUZAN REINHARDT thinks now that it would be a profitable change from Paris. The end of sport in the Argentine, and the Colonel is a great sportsman and they are likely to be fond of him; and if they connect him with so they may warm up toward us a little as a consequence of knowing him.

We like all these ex-Præsidential activities. They stimulate our national life. We have hardly enough distinguished celebrities to talk about in this country.

And, after all, our ex-Presidents must be active unless they are rich, which both our present ones are not. Nor is either of them, so far as appears, on any pension list yet, either of Uncle Sam or Uncle Assurance.

#### We Win at Polo

The first of the polo games was a joyful surprise to the American spectators. The last one was a mighty bit preceding; in its issue not so surprising as the first because the expectations of the crowd had been raised, but a great game of polo, and one that our people were mighty glad to see on their side with the very least margin that would do the trick.

They were fine games, both of them; played with good spirit, and with entire good-will and good manners. The best team won, but was by no means a desperate effort, or series of efforts, that it seemed doubtful to the very last if they were the best team. The games made two lively play-day fireworks, and served in that a good end, for life nowadays seems very serious, and needs what refreshes it can get.

#### College and Advertisements

It is our earnest to understand why parents or other promoters of a lively young person should be so anxious to send such young person to college. It is not so easy to understand why so many of the colleges should be at so great pains to induce as many young persons as possible, likely or otherwise, to come to their doors. That colleges should try so hard for all worthy causes is precisely worthy, but the practice of their spending time and strength buying up recruits seems doubtful. For every recruit to the older endowed colleges costs at least double what he pays, and any considerable growth in the number of names on the college rolls strains the existing apparatus and necessitates new provisions of buildings and increases the funds for maintenance. A desperate state advertiser for customers to make it rich, but a university shows often nowadays a like zeal to attract customers to make it poor.

It must be that almost every university wants to be great, and assumes that one of the elements of greatness is to be big. And as the universities are not so big as they used to be, it is not surprising that they do not go far outstrip them in numbers.

Prof. DR. JOHN J. STEVENS discusses this propensity in an article in the *Popular Science Month-*

ly, especially in relation to its effect on the salaries of professors. He says in effect that the ambitions of the colleges keep the teaching forces poor; that the idea prevails increasingly that every American young man has a right to a college education, no matter how small, and that the majority of the colleges goes to meet the wish of this idea, instead of going, as some of it should, to increase the professors' salaries. Tuition fees are kept down, and the teachers' salaries stay on the same depressed level. As to all of which the *Scrupulous Republican* observes:

There is much to be said for Professor STEVENS' view. The present system of the college is a strong inducement to take a college course: "University for pupils is as much part of the college plan as the college itself, and the more the more the customers is it a wholesale business house." To accommodate the habits of new students without raising the efficiency system of the factory is involved; the hours of teaching are increased; no documents are used to provide for proof instructions for an increased number of students at cheap rates. Now this sort of popularizing is unworkable, it vulgarizes and cheapens learning instead of dignifying it; it has the effect of making the college a popular store, which though it may have been and intellectual ambitions can be helped to do their best work, whether their gift in the letters, philosophy, or science, is not so great as that of the individual, and a college is more liable for its ability to train for the few than for the many. It is not necessary that all should go to college; a large proportion of those who are there are not making their time and study to better of work. And on the other hand, as Professor STEVENS himself holds, it is well that there should be a certain amount of competition, not so strenuous intellectual competition. Whether or not they have a "right" to a few students, it is well for them to be able to give more than for its scholars. It is time to give over theanship of colleges: "There must be a return to the proper conception of a college, a return to the idea that a college is not to be trained so as to be fit for great things."

Is there not some sense in these observations? We see, and see with astonishment, odd universities of great names contriving elaborate organizations to advertise their facilities and bring their own students to college, when they will have to struggle to take care of them when they get there. With one hand they pull the bell-rope—"Ding-dong! Come! Come! Ours is the great college!"—and with the other they hold out the hat for offerings to defray the costs their advertisements bring upon them. That is not all bad. But it is not good. It is a sign of a low civilization, to true education, that is accomplished by these methods of the soap-builer and vendor of "best sellers."

#### Not a Good Machine

The reason for last week's accident and loss of life at Stamford is not clearly disclosed yet, but it will probably be settled whether it was the fault of the engine or of the engineer. The kindest engineer can hardly classify the fatal crash under "acts of God," and the mildest critic can hardly avoid the conclusion that the New Haven road lacks operating capacity.

In matters that concern the running of trains and conservation of the lives and limbs of passengers the road seems not to be at present a good machine.

There seems to have been no lack of effort or of skill on the part of the officers who operate the New Haven road to operate it safely, but few accidents in two years, costing thirty-one lives and injuring two hundred and fifty people, and all on a stretch of road twenty-two miles long, are so many to be explained on any theory of bad luck or unavoidable misfortune.

#### Very Bad

The death of Miss DUNN, who ran into the King's horse in the Derby, furnishes to the cause of the millitate its first martyr. The number can be increased in any extent wherever it occurs in the millitate to advance their cause by throwing a bomb or a brick at a fellow-traveler. Miss DUNN's exploit was virtually an attempt at suicide coupled with the largest possible advertisement. Incidentally it was an attempt to murder a jockey, but Jockey JONES got off with a broken rib.

#### Not a New Wrinkle

Mr. BUCK may set a new example—that of going to market with his basket on his arm.—*Detroit Free Press*.

It will not be a new example. It was a practice of the last great orator who filled the office of Secretary of State—DANIEL WEBSTER. So perhaps DUNN, and WILLIAM will have one habit in common to emphasize their great dissimilarities.

### BURIAL IN AIR

The last word of a materialistic age. When Nicholas Klein, standing on the ledge of the twenty-fourth story of the Union Central sky-scraper, scattered the ashes of Jacob Gross from a tin can into the air, he was carrying to its extreme expression one of the inherent principles of modern scientific thought—that life is the infinitely valuable and important thing, death an unimportant accident.

EVEN WHEN I SAID MY PRAYERS . . . I WOULD LOOK FORWARD TO THE MOMENT WHEN  
 . . . THE DOOR WOULD OPEN . . . AND MY MOTHER LOOK IN

# MY MOTHER

BY R. H. BENSON

ILLUSTRATIONS BY BLANCHE DEER

**I** WAS about seven years old when my mother died, and my father left me chiefly to the care of servants. Either I must have been a difficult child, or my nurse must have been a hard woman; for I never gave her my confidence. I had long to my mother as a saint; I sang to God; and when I lay her it nearly broke my heart. Night after night I used to lie awake, with the twilight in the room, remembering how she would look in, on her way to bed. When at last I slept, it seems to me now as if I never did anything but dream of her; and it was only to wake again to that desolate emptiness. I would torture myself by closing my eyes and fancying she was there, and then opening them and seeing the room empty. I would turn and toss and sob

hour or two of misery, half waking and half sleeping. I had been crying quietly, burying my hot face in the pillow, for fear my nurse should hear through the partly opened door. I was feeling really exhausted, listening to my own heart, and throwing myself into the half-faith that its throbs were the footsteps of my mother coming toward my room. I had raised my face, and was staring at the door at the foot of my bed, when it opened suddenly without a sound, and there, as I thought, my mother stood, with the light from the oil-lamp outside shining upon her. She was dressed, it seemed, as once before I had seen her, in London, when she came into my room to bid me good night before she went out to an evening party. Her head showed with pearls that flashed as the twilight rose and sank in the room, a dark clink showed her neck and shoulders,

one hand held the edge of the door, and a great jewel gleamed on one of her fingers. She seemed to be looking at me.

I sat up in bed in a moment, amazed, but not frightened—for was it not what I had so often fancied?—and I called out to her:

"Mother, mother!"

At the word, she turned and looked on to the landing, and gave a slight movement with her head, as if to encourage me waiting there, either of ascent or descent, and then turned to me again. The door closed silently, and I could see in the twilight, and in the faint glimmer that came through the other door, that she held out her arms to me. I threw off the bedclothes in a moment, and scrambled to the end of the bed, and she lifted me gently in her arms, but said no word. I too said nothing; but she roused the clock a little and wrapped it round me, and I lay there in bliss, my head on her shoulder and my arm round her neck. She walked anxiously and noiselessly to a rocking-chair that stood beside the fire, and sat down, and then began to rock gently to and fro. Now, it may be difficult to believe, but I tell you that I neither said anything nor desired to say anything. It was enough that she was there. After a little while I suppose I fell asleep, for I found myself in an agony of tears and trembling again; but these arms held me firmly, and I was soon at peace. Still she spoke no word, and I did not see her face.

When I woke again, she was gone, and it was morning, and I was in bed, and the nurse was dimming up the blind, and the winter sunshine lay on the wall. That day was the happiest I had known since my mother's death, for I knew she would come again.

After I was in bed that evening, I lay awake, waiting, so full of happy content and curiosity that I fell asleep. When I awoke the fire was out, and there was no light but a narrow streak that came through the open fire; my nurse's room. I lay there a minute or two, waiting, expecting every moment to see the door at the foot of my bed open, that the minister passed, and then the clock in the hall below beat three. Then I fell into a passion of tears. The night was nearly gone, and she had not come to me. Thus, as I tried to see if, trying to still my crying, through my tears came the misery flash light on the door opened, and there she stood again. Once again I was in her arms, and my face on her shoulder. And again I fell asleep there.

Now, this went on night after night, but the minister passed, and never when I awoke and cried. It seemed that if I needed her desperately she came, but only then.

"I DID I TURNED OVER TO SEE HER FACE . . . WHEN I WAS ASLEEP SHE . . . WENT AWAY."

without a sound. I suppose that I was as near the limit that divides sanity from madness as it is possible to be. During the day, I would sit on the stairs, where I could get away from my nurse, and pretend that my mother's footsteps were moving overhead—that her door opened—that I heard her dress on the carpet. Again, I would open my eyes and as if I were utterly comatose myself to understand that she was gone. Then, again, I would tell myself that it was all right; that she was away for the day, but would come back at night. In the evening I would be happy, as the time for her return drew nearer. Even when I said my prayers, I would look forward to the moment, into which I had cheated myself in believing, when the door would open, after I was in bed, and my mother look in. Then, as the time passed, my false faith would break down, and I would ask myself to sleep, dream of her, and sob myself awake again. As I look back, it appears to me as if this went on for months. I suppose, however, that in reality it could not have been more than a very few weeks, or my reason would have given way. And at last I was caught on the edge of the precipice, and dream lovingly back to misery and pain.

I used to sleep alone in the night nursery at this time, and my nurse occupied a room next door to it. The night nursery had two doors, one at the foot of my bed and one at the farther end of the room, in the corner diagonally opposite to that in which the head of my bed stood. The first opened upon the landing, and the second into my nurse's room, and this latter was generally kept a few inches open. There was a light in my room, but a night-light was kept burning in the nurse's room, so that, even without the firelight, my room was not in total darkness.

I was lying awake one night (I suppose it would be about eleven o'clock), having gone through a dreadful

(Continued on page 82)

# THE LONG TON

BY CASPER DAY

"EVERYTHING goes in the last week of May," said the big, burly, voice of Uncle Sam, leaning on the counter out on the porch. "You come on, kid, in May by the pull of half-past one, and I'll see some good ones for you. You'll do. It's his too bad about his leg. Best worse things will happen. Just now we need the drivers, and you need the money; so if your workin' party looks steady, you're old, sure of your money, you was born as you. You'll do. These child inspectors has the same gumption to get straight the coal-miners. They're a-bus' home, they're a-bus' home, they're a-bus' home, in to bring 'em as early half-ton of chestnut to put away in the cellar for their kitchies stores next fall."

Stanley by on a wide search in the living-room of his father's house, a bundle of splints and bandages above his right knee evidencing that neither boy must take his work to-morrow. Adam, aged twelve, and just through the labyrinth foundation of chickenpox, sat in a chair, swollen with pus.

"Me for it?" he announced.

"You're big for your age," Father said tartly.

Adam related himself several such. No more chickenpox, no more measles, but his! Not silly Third Reader and Contrived Pennsylvania and President's Speech. No longer would he be at the back and end of the line, and he would have an equal share to be sent on errands. He was now a man. To-morrow he was going to take Stanley's share and Stanley's dollar eighty-seven three-month job in the mine.

"Thought I'd learn him all about it, Henry," promised the disabled driver.

"How you out?" And the lone banged the door, to hurry home to both and supper.

Adam sat still, glowing inwardly somewhere in the district of his stomach, but getting no comfort and would cheerfully have broken both Stanley's legs himself for an hour like this and a marrow like to make.

"They'll eat you some, with that swollen knee you got," his brother commented from the couch. "Not's much as if they wasn't so rubbed, though. Everybody's tired out."

Adam spread his lips to say "nobody deserves a thing to him," but thought better of it. He didn't like that. "I'll be a doctor."

"Sam Tucker, my runner? I'll look out for you all, it's his business to, and some more. And all the same, he's a doctor. You'll be a doctor, too, but you'll right about, but you'll look the gate out on if you don't have next the car in doctor's place. She looks like the man in a doctor, but not a doctor, but not a doctor, when you kick 'em make one. Tom's second, and he's a pray. You won't get a cushion in his house, because he's got a ball between the ears. He's a doctor and the doctor, but not a doctor, but not a doctor, that should? May it over?"

Adam's eyes ached. Could he remember it? "An, an, an," he gasped.

"What's the first thing you'd do if you got lost in the mine?"

"What do you say the air goes?" He'd a headmaster taught Adam this when he was three. Good, Sam must think nobody but some boy his!

"What's the air for, Henry? Stanley shut at him.

"To get shut, of course. Oh, say, say."

"Now you remember it and what you, if you want to make a good runner," the older pronounced. "There's been more men killed because some fool kids left the doors open out of laziness, and out of the ventilation, then a good full a grass-ward."

And there's another thing. Unconscious, you get to stop your legs."

"Oh, my own question! I'll tell you no last!" Adam granted, much surprised.

"It was a fact that he never told any of the protesting petulant tribe in this street the truth about anything. For they got just as ready only required them to ask you, but not more serious questions. He had estimated himself as an ornament, even as he satisfied his three-year, or as he would later check definite numbers. It was a fact that he had tried—and his own."

"No, sir!" cried Stanley, hearing the side-fusion with his own eyes, and he's a good runner. You cut it out. When you go down that shaft, you got to be in thick of other boys' side of it. You can't get in there, you can't get in there. If anything happens, they're dead for you. No you got to stand by them. If you can't stand that, kid, you ain't going on my team to-morrow, that's all."

"How you going to stop me?" growled the boy. But he was deeply hurt.

"I'll send you with a note to Henry. If I told the driver how you didn't never mean to answer a straight question straight, but aimed to sit every-thing all the time for me, I guess he'd change his mind."

"You make a fellow sick."

"That you got to understand it, kid," the older replied. "You see, you're all workin' in the dark. Suppose one person asks you a fair question, like did you shut a certain door, or how'd the big pump running in the dip, or have you got his empty mine, or did you tell the company bands to read him some numbers for his head? It'll believe what you tell him. He'll think a woman's word, but he'll believe what you tell him in her hot bed, or. Who stole my milk-bottle, Adam Tolson?" He ain't a fool, nor he ain't a sucker, but he's a man. You got to make him believe just what you say. Only you wouldn't

know which of your lies might kill three-four. It was the same, just as you can't a grocery store or a bank, but you can't do the other, but the other's dirt in the mine. We wouldn't nose of no lie side, it such a custom got started."

"No!" Adam's well-thought hand.

"As right. I'll tell you straight goods."

"That's the idea. That, and stop your deers. Now, you'll be till I give you the key of the road and all."

"Supper came. But, for the first time in his life, Adam regarded the meal with interest. He was in the middle course, he was among the men who worked Stanley. They all talked together of the strike, and of losses and wonder-out, and of how much the docking loss took of young Simon Pitarog's fourteen cars this week because his road blocked, so he had to stop in the cars as he parked in the dollar were the three cars, and he had to stop for damage. Young Simon's bride of a month was going to raise hell 'til all when she saw his next check. A man said his liberty, didn't he, who he married a belle like Angelika?

Yes, and Adam, drinking in the good talk thoughtfully, as a man (Pitarog's) opinion of marriage. Marriage was evidently in blame for leading so many girls into the world; and it was because they were so many girls, and he was a man's mistress that men had to work so hard and undergo as many lectures to support 'em."

And all the adult males in the room nodded at him when he spoke. He was grown up now, and they recognized him as a man in their midst. A plebeian rising!

Later, Adam was put to school, and wrote with a piece of chalk on the black iron stove-pipe that ran to the ceiling.

"I've got twelve miners on my bench now, day shift," Stanley said. "Old man Paddock, the miner, and the best shaker, and he's a runner. He's a person like him. Bottle White and that three Simon, Simon's 124; and that's the highest number in the world."

"Bottle is 61," revised the pupil. "And they all got a right to lose except a day only if they can't get to the door. You'll be a doctor, too, but you'll right about, but you'll look the gate out on if you don't have next the car in doctor's place. She looks like the man in a doctor, but not a doctor, but not a doctor, when you kick 'em make one. Tom's second, and he's a pray. You won't get a cushion in his house, because he's got a ball between the ears. He's a doctor and the doctor, but not a doctor, but not a doctor, that should? May it over?"

Adam's eyes ached. Could he remember it? "An, an, an," he gasped.

"What's the first thing you'd do if you got lost in the mine?"

"What do you say the air goes?" He'd a headmaster taught Adam this when he was three. Good, Sam must think nobody but some boy his!

"What's the air for, Henry? Stanley shut at him.

"To get shut, of course. Oh, say, say."

"Now you remember it and what you, if you want to make a good runner," the older pronounced. "There's been more men killed because some fool kids left the doors open out of laziness, and out of the ventilation, then a good full a grass-ward."

And there's another thing. Unconscious, you get to stop your legs."

"Oh, my own question! I'll tell you no last!" Adam granted, much surprised.

"It was a fact that he never told any of the protesting petulant tribe in this street the truth about anything. For they got just as ready only required them to ask you, but not more serious questions. He had estimated himself as an ornament, even as he satisfied his three-year, or as he would later check definite numbers. It was a fact that he had tried—and his own."

"No, sir!" cried Stanley, hearing the side-fusion with his own eyes, and he's a good runner. You cut it out. When you go down that shaft, you got to be in thick of other boys' side of it. You can't get in there, you can't get in there. If anything happens, they're dead for you. No you got to stand by them. If you can't stand that, kid, you ain't going on my team to-morrow, that's all."

"How you going to stop me?" growled the boy. But he was deeply hurt.

"I'll send you with a note to Henry. If I told the driver how you didn't never mean to answer a straight question straight, but aimed to sit every-thing all the time for me, I guess he'd change his mind."

"You make a fellow sick."

"That you got to understand it, kid," the older replied. "You see, you're all workin' in the dark. Suppose one person asks you a fair question, like did you shut a certain door, or how'd the big pump running in the dip, or have you got his empty mine, or did you tell the company bands to read him some numbers for his head? It'll believe what you tell him. He'll think a woman's word, but he'll believe what you tell him in her hot bed, or. Who stole my milk-bottle, Adam Tolson?" He ain't a fool, nor he ain't a sucker, but he's a man. You got to make him believe just what you say. Only you wouldn't

know which of your lies might kill three-four. It was the same, just as you can't a grocery store or a bank, but you can't do the other, but the other's dirt in the mine. We wouldn't nose of no lie side, it such a custom got started."

"No!" Adam's well-thought hand.

"As right. I'll tell you straight goods."

"That's the idea. That, and stop your deers. Now, you'll be till I give you the key of the road and all."

"Supper came. But, for the first time in his life, Adam regarded the meal with interest. He was in the middle course, he was among the men who worked Stanley. They all talked together of the strike, and of losses and wonder-out, and of how much the docking loss took of young Simon Pitarog's fourteen cars this week because his road blocked, so he had to stop in the cars as he parked in the dollar were the three cars, and he had to stop for damage. Young Simon's bride of a month was going to raise hell 'til all when she saw his next check. A man said his liberty, didn't he, who he married a belle like Angelika?

Yes, and Adam, drinking in the good talk thoughtfully, as a man (Pitarog's) opinion of marriage. Marriage was evidently in blame for leading so many girls into the world; and it was because they were so many girls, and he was a man's mistress that men had to work so hard and undergo as many lectures to support 'em."

And all the adult males in the room nodded at him when he spoke. He was grown up now, and they recognized him as a man in their midst. A plebeian rising!

plants and dead men; the authoritative care of appetitions were really very rare. And lastly, if anything uncommon happened to happen, say in San Yurk-

II

It was dark when his mother washed Adam. He rolled over in bed and wringed his face on something hard. It was the handle of Stanley's loaded shotgun, which he had taken to bed with him, as a girl takes her doll baby.

"Folk as a first was the March morning when Adam was a little fellow, and he was on the way to work, saw the yard-level run up with instant suddenness to blot out stars and the air. The sensation of being lowered at speed, with nothing to hold on to, was disquieting to the new breakish in one's stomach; but otherwise Adam was calm.

"Me for the third year," he said, with an air.

"Henry took me out for one Stanley's place, 'cause it's the last two weeks of mining."

"I'm in the thick."

"You want to go to the barn first and hitch up. I'll show you."

"Lerd, I told I wasn't going to to-day!" panted the father and himself. "I'll be terrible glad to go on strike and get paid up from the last two months, for me! What I was Stanley, on a bed! Say, what'll you do, you'll be a doctor, too, but you'll right about, but you'll look the gate out on if you don't have next the car in doctor's place. She looks like the man in a doctor, but not a doctor, but not a doctor, when you kick 'em make one. Tom's second, and he's a pray. You won't get a cushion in his house, because he's got a ball between the ears. He's a doctor and the doctor, but not a doctor, but not a doctor, that should? May it over?"

Adam's eyes ached. Could he remember it? "An, an, an," he gasped.

"What's the first thing you'd do if you got lost in the mine?"

"What do you say the air goes?" He'd a headmaster taught Adam this when he was three. Good, Sam must think nobody but some boy his!

"What's the air for, Henry? Stanley shut at him.

"To get shut, of course. Oh, say, say."

"Now you remember it and what you, if you want to make a good runner," the older pronounced. "There's been more men killed because some fool kids left the doors open out of laziness, and out of the ventilation, then a good full a grass-ward."

And there's another thing. Unconscious, you get to stop your legs."

"Oh, my own question! I'll tell you no last!" Adam granted, much surprised.

"It was a fact that he never told any of the protesting petulant tribe in this street the truth about anything. For they got just as ready only required them to ask you, but not more serious questions. He had estimated himself as an ornament, even as he satisfied his three-year, or as he would later check definite numbers. It was a fact that he had tried—and his own."

"No, sir!" cried Stanley, hearing the side-fusion with his own eyes, and he's a good runner. You cut it out. When you go down that shaft, you got to be in thick of other boys' side of it. You can't get in there, you can't get in there. If anything happens, they're dead for you. No you got to stand by them. If you can't stand that, kid, you ain't going on my team to-morrow, that's all."

"How you going to stop me?" growled the boy. But he was deeply hurt.

"I'll send you with a note to Henry. If I told the driver how you didn't never mean to answer a straight question straight, but aimed to sit every-thing all the time for me, I guess he'd change his mind."

"You make a fellow sick."

"That you got to understand it, kid," the older replied. "You see, you're all workin' in the dark. Suppose one person asks you a fair question, like did you shut a certain door, or how'd the big pump running in the dip, or have you got his empty mine, or did you tell the company bands to read him some numbers for his head? It'll believe what you tell him. He'll think a woman's word, but he'll believe what you tell him in her hot bed, or. Who stole my milk-bottle, Adam Tolson?" He ain't a fool, nor he ain't a sucker, but he's a man. You got to make him believe just what you say. Only you wouldn't

know which of your lies might kill three-four. It was the same, just as you can't a grocery store or a bank, but you can't do the other, but the other's dirt in the mine. We wouldn't nose of no lie side, it such a custom got started."

"No!" Adam's well-thought hand.

"As right. I'll tell you straight goods."

"That's the idea. That, and stop your deers. Now, you'll be till I give you the key of the road and all."

"Supper came. But, for the first time in his life, Adam regarded the meal with interest. He was in the middle course, he was among the men who worked Stanley. They all talked together of the strike, and of losses and wonder-out, and of how much the docking loss took of young Simon Pitarog's fourteen cars this week because his road blocked, so he had to stop in the cars as he parked in the dollar were the three cars, and he had to stop for damage. Young Simon's bride of a month was going to raise hell 'til all when she saw his next check. A man said his liberty, didn't he, who he married a belle like Angelika?

Yes, and Adam, drinking in the good talk thoughtfully, as a man (Pitarog's) opinion of marriage. Marriage was evidently in blame for leading so many girls into the world; and it was because they were so many girls, and he was a man's mistress that men had to work so hard and undergo as many lectures to support 'em."

And all the adult males in the room nodded at him when he spoke. He was grown up now, and they recognized him as a man in their midst. A plebeian rising!

It was an eighteenth-mile day on their branch, nine trips of a mile and a mile back, and over the ancient out about for the heritage crew. A desperate effort was made to get the work done, and they suffered themselves. The world was clamoring for coal.

Tomard fire, Adam had lashed out the sixth car from Miss Paddock's shoulder and chucked a "4" on the short-run for the sixth time that day. And Paddock had the honor to be disgraced about the work.

"Where you been? Cryin' for your bottle? Or some of the cure?"

"I'm a doctor, too, but you'll right about, but you'll look the gate out on if you don't have next the car in doctor's place. She looks like the man in a doctor, but not a doctor, but not a doctor, when you kick 'em make one. Tom's second, and he's a pray. You won't get a cushion in his house, because he's got a ball between the ears. He's a doctor and the doctor, but not a doctor, but not a doctor, that should? May it over?"

# THE SPORT OF THE MONEY KINGS

BY  
HERBERT L. STONE

Nine multimillionaires of the New York Yacht Club are amusing themselves, this summer, racing their "one-design" 50-foot sloops in the waters of Long Island Sound. The owner, or his amateur representative, sails each race, and at the season's end prizes are awarded to the leaders in the series of some twenty-five races.

John P. Morgan, head of the great banking house, is seen sailing his own yacht, the "Grayling," at the left. The picture above represents the close finish of a race at Oyster Bay. G. M. Hecksher's "Acushla" is in the lead, Mr. Morgan's "Grayling" is second, and Harry Payne Whitney's "Barbana" is third.

The other six boats built for this series are owned and sailed by George F. Baker, Jr., of the First National Bank, W. E. Dodge, Pembroke Jones, C. C. Rumrill, Edmund Randolph, and R. N. Ellis. Most of these men are not only competent but expert managers of yachts—the present generation having been trained from boyhood to perpetuate the traditional sport of the Wall Street magnate.

It has been a long time since a yachting season has been as interesting as the present one. This is due principally to the many new boats that have made their appearance, and to the formation of some new racing classes; but, above all else, its success can be laid largely, both directly and indirectly, to the new one-design class of 50-foot sloops promoted by members of the New York Yacht Club. Not since the same club brought out the one-design 20-footers eight years ago (which incidentally produced the keenest racing of any class ever formed) has such a large class been seen, both in respect to the number and size of the boats.

Nine one-design boats in the hands of experienced sailors will always produce the best of sport, and when the boats are 72 feet long or all, as are those under discussion, it is something of a trick to handle them, and it seems that a man must be "on to his job" every minute. Incidentally, there have been but few one-design classes where the boats have been larger than these. The only ones that can be recalled are the 70-foot class, in which four boats were built in 1900, and the 57-footers, built in 1907.

There has always been some criticism of one-design classes on the ground that they do not produce as instructive or interesting sport as open-class racing, but the reason that the boats are all the product of one designer and that there is thus not the incentive for improvement in design and speed as where the boats are by different designers, each striving to outdo the other. Be that as it may, there is no doubt that, so

far as the sport goes for those that participate—and in the last analysis they are the ones most vitally concerned—the best racing is had in one-design classes, where all the boats are identical and the result hinges on the skill and ability of the helmsman. This contention has been proved repeatedly in the New York 30-foot Class, in the 57-foot Class, in the Larchmont Fairbairn Class, and other one-design classes, and it is doubtful if any one who has raced in any of these classes would give up one-design racing for the uncertainty of an open class. As far as speed goes, too, it is probable that the boats of this new class are faster than anything of their size that has been built under the Universal Rule, and Herreshoff's crews even have improved upon himself in these boats, judging by their performance alongside of other boats of approximately the same size.

The promoters of the class were wise in putting in a provision that the boats were to be sailed by their owners or by their amateur representatives, thus keeping the handling of the boats always in the hands of an amateur. This in itself is an excellent thing, and the boats are just about the limit of size on which this could be done. The 70-footers, and even the 57's, are a little too large for one man to be in complete control, much of the work of trimming sails, etc., being necessarily left to others. None of the men who own these boats are comparatively new at the racing game. Among those who may be mentioned George F. Baker, Jr., and M. G. Hecksher, neither of whom has had much experience in boats of this size, while Pem-

brooke Jones has not devoted much time to sailing since he sailed one of the old Newport 30-footers. With nine boats of this size coming down the line together, each requiring four positions, it will take quick thinking and shifty handling to keep them apart, and undoubtedly there will be many exciting and spectacular moments throughout the season just before the starting gun fires.

The coming of this class in the New York Yacht Club ought to be a great deal for the sport of sailing, which in the last ten years seems to have been on the decline in this organization. Outside of its annual cruise, the New York Yacht Club regatta have been marred by a dwindling number of starters, and their race attracted less attention than those of many other clubs on Long Island Sound; but the coming of this new class, and the continued interest in the 30-foot class, seems to indicate that the racing spirit is again coming to the front.

A brief analysis of the new boats shows a good-looking hull, with a long forward overhang and a rather short after overhang, fair displacement (about 24 tons), sharp forward section, and a tall narrow rig. The rig is of the prevailing knobhead type, with a single jib leading to the stem head and the mast and boom set all in one piece. The rig is moderate and well balanced, with the exception of the club topsail, which is an immense sail, the yard being 33 feet in length and projecting some 10 feet above the topmast head. In the light weather of the boat, however, they should be able to carry this easily.

# THE TRADERS IN WOMEN

The First Report of Mr. Rockefeller's Bureau for the Study of the Social Evil

BY GEORGE KIBBE TURNER

Copyright, 1913, by John D. Rockefeller, Jr.

JOHN D. ROCKEFELLER, JR.

THE MULTIBILLIONAIRE SCIENTIST WHO HAS ORGANIZED AND FINANCED A BUREAU FOR THE SCIENTIFIC STUDY OF THE SOCIAL EVIL.

JOHN D. ROCKEFELLER, JR., was foreman, in 1910, of the Grand Jury investigation of the so-called "white slave" trade in New York City. That body recommended the formation of a commission to study this subject, and subsequently Mr. Rockefeller brought about the formation of the Bureau of Social Hygiene, of which he is chairman.

The most thorough and careful study of the social evil in modern times is being conducted under the leadership of this body—by scientific means, and pursued in the same order and scientific spirit that has characterized the other philanthropic, educational, and medical work connected with the Rockefeller name.

First of all, a laboratory of social hygiene was established in connection with the New York State Reformatory for delinquents, for the study of individual women, and put in charge of Miss Katherine Bennett Davis, superintendent of the Reformatory, and a member of Mr. Rockefeller's Bureau.

Then, in 1912, George J. Kneveland, who was in charge of the Chicago Vice Commission's investigations, was placed at the head of a general investigation of the conditions of vice in New York during that year, and, not long after, Abraham Flexner, whose investigation of American and European medical schools had given him an international reputation, was sent to study the problems of prostitution as it exists in Europe; and Raymond B. Fendick, formerly commissioner of accounts in New York City, was later designated to study the European systems of police-including, of course, their relations to the social evil.

The first fruit of this elaborate series of investigations is seen in the publication by the Century Company of the book (Commons) "Prostitution in New York City," which gives the results of the study of Mr. Rockefeller and Miss Davis.

## The Army of 15,000 Victims Warned

THE investigation of Mr. Kneveland was confined to Manhattan alone, and describes conditions as they existed in 1912. The scope of investigations could not have been all of the victims warned that they were being investigated; but they did actually establish, largely by personal visitation, the existence of more than 1,000 persons.

"It is safe to say," the book declares, "that a total, in round numbers, of 15,000 does not overstate the number of professional prostitutes in Manhattan. This estimate does not include occasional or casual prostitutes; it includes those only who habitually offer themselves for sale to the public market. This

Prostitution is largely a state of mind. For years we have approached the social evil either in ridicule, or disgust, or hysteria.

Mr. Rockefeller's Bureau of Social Hygiene is now approaching it in the modern scientific spirit. Its first report, based on the records of 15,000 girls, is unemotional and without personal expatiation, and lays the foundation for a sane treatment of this overwhelming problem.

Mr. George Kibbe Turner, one of the recognized authorities upon the white slave question, summarizes this report below for HARTMAN'S WEEKLY readers.

assertion is founded upon an actual count of 14,026 women arrested by investigators in Manhattan between January 24 and November 13, 1912.

The first part of Mr. Kneveland's report deals with a classification of the types of matters at which this army of women offer themselves. His conclusion says: "It is worthy of emphasis to maintain that prostitution in New York City is widely and openly accepted as a business enterprise. The exploiters, the organizers of their operations, their methods, their associates, and their victims are all equally notorious."

The main places located in the first chapter are vice resorts in the strictest sense. In the second part of the book, such places as the "divorced" saloons and "places which cater to vice." There are hundreds of these. Of 745 saloons investigated out of the 1,000 saloons in Manhattan, nearly half were found to contain immoral women; of 13 dance-halls reported upon by investigators in the spring of 1912, only five were characterized as "decent." The exclusive dance-partying tens of thousands every Sunday were in many instances found to cater to vice.

But the great interest of the book actually resides in the section devoted to the exploiters; the men—but they are largely men—who are held responsible for the conditions.

New York. Center of International Exploitation

THE present investigation, says the book, has established the fact that "the business of prostitution in New York City is controlled, for the most part, controlled by men. The names and addresses of more than 500 men so engaged have been made available with personal descriptions and the records of many of them."

The manager of the head of the business are first considered, under the head of "The trader." "For several years," says Mr. Kneveland, "thirty one-dollar houses of prostitution in the Tenderloin have been operated as a 'combine' under the direct control of three or more men. These individuals have been in business for many years in New York City, as well as in other cities both in this country and abroad. They buy and sell shares in their own houses, and net the value of the shares depends upon the ability of the owners to maintain conditions in which the houses bring considerable amounts of profit. The men who profess himself capable of acting thus, through business sagacity and political pull, is called a 'King.'"

"The subjects of mass exploitation of prostitutes in New York City are foreigners by birth. Some of them have been victims of defrauds, some all their lives. The women in question did not come directly to America. Some of them drifted to other parts of Europe with young girls, whom they had secured in small towns or villages in their own countries. South Africa was a favorite destination. Their trail of abduction and corruption can be traced through Argentina, Brazil, Canada, Alaska, and the large cities of our own country—San Francisco, Portland, Seattle, Tacoma, Bette, Denver, Omaha, St. Louis, Chicago, Pittsburgh, Philadelphia. Finally, they realize their hopes in New York City. Here they have made a center, and from this center they go back over the old trail from time to time."

"If a composite photograph could be made of typical owners of vice resorts, it would show a large, well-fed man with the system of age and five feet eight inches in height. His clothes are of the latest cut in design, and exceedingly pressed. A heavy watch-chain hangs from his waist, a large diamond ring sparkles in his left hand, and his fat, chubby fingers are encircled with gold and diamond rings."

## The Minor Traffickers

THE progress—the typical "white slavers"—are shown in their operation upon abundant occasions in amusement parks and dance-halls, choosing "with almost sternly indifference the type of girl which may be pliable to their will." The error of the catch is given as he rises, through the post-parade and the

dance-hall, to his own management of a girl as a "room-keeper," the profit of the business is shown to be in the hands of the women. In the case of the "combine" as New York City they were the agents of the men who own the places. "When an effort has to be made, they are the ones who have to go to work. The large majority of these were born in foreign countries. They have had years of experience in operating houses of many cities of North and South America and South Africa."

This commercial organization of vice resorts is shared specifically for the exploitation of women. "Houses of prostitution can not exist," says the conclusion of the discussion of exploiters, "except through trafficking women. The houses are set up, an opportunity for trade is created. The proprietors give specific orders to the procurer—for young girls, for immature girls for Monday. The shares are made in this, not only a business reality, but a reality almost wholly dependent upon the existence of houses of prostitution."

## The Share of the Brood-estate Owner

INDIRECTLY, but almost as consciously as by the room-keeper, the profit of the business is obtained by the property-owner. In February, 1912, a woman investigator, visiting 122 real-estate agents for the illegal purpose of studying the appearance of immoral purposes, had only 17 outright refusals. The rest, in many cases, was simply advanced on the assumption that the place was to be put to vicious use.

The shares in houses of prostitution were found to be sold only to persons well known to the owners, but there were various lengths when transactions of this kind were not. The meeting-places for the exploiters of this trade are many and well known, and have centers of the business. Sales of third interests in houses, ranging from \$200 to \$5,000 in price, were witnessed personally by the investigators of the Bureau.

The business is, of course, highly speculative—dependent upon many doubtful factors; but, with any chance for extended operation, it is a wonderfully profitable transaction. In many cases, when transactions of the operators, and secured their conditions, reported some business revenue on the basis of more than \$100,000 in annual gross receipts. The operator of the house not only receives half of this as his share, but gets back much more by many charges against the income for clothing and food. As against such receipts, the regular operating expenses are estimated—usually—calculated at not over a quarter of the receipts, is tabulated estimates of a group of houses.

## The Illicitest Fashion Girl

MR. KNEVELAND'S investigations, as recorded in the Commons, dealt quite largely with the commercialization of vice in New York. Miss Davis' study appraised the conditions of prostitution in the district of the girl exploited. Her statistics are taken largely from interviews of her own condition at Bedford; but she says, for comparison, statistics of other girls made in other New York institutions, and of some 1,100 street girls in New York City. Her conclusions are highly illuminating—especially in the case of the Bedford girls, who, being under extended observation, furnish a body of knowledge concerning the prostitute which is most important.

Her figures show a very definite fact. In the first place, the girls come into the life very young. They are seventeen years old, on an average, when their first offer is made. They are under sixteen years and ten months old when they begin their profession. They are surprisingly uneducated. Perhaps 60 per cent. have never finished the primary grade of common school, and 20 per cent. are not even finished grammar school. About a quarter are mentally defective. They are in the case of the women morally uneducated. They are almost all ignorant.

Miss Davis' figures show most interesting light upon the theory of economic causes for prostitution now so common in the United States. Without the influence of poverty may be, it is quite clear that, directly, it does not appear to be a great contributing factor. Of all the girls who were first seen at this point, 100 per cent. were over 100 less than 100 per cent. gave poverty as the cause that led them into this life.

A great murder trial in a tragically vivid and before a nation. Romance, horror, sympathy hold its great audience—but principally the suspense over its outcome. Historic murder cases pass the usual riddle of guilt from one generation to the next.

All France was divided over the Chambige Affair. It was the subject of a widely read novel in a previous generation. It is still an unsolved doubt.

Was Chambige a genius in love, or a cruel madman? Was Madame Marlier a suicide, or the victim of the strange whim of a maniac?

Mrs. Lawrence's clear statement presents all the known facts in this historic mystery.

## THE CHAMBIGE AFFAIR

ON one of those beautiful and pleasantly warm afternoons which often visit the north of Africa in the winter, a young Frenchman named Henri Chambige hailed a cab on the grand square of the town of Constantine, the capital of Algeria. As it happened, the driver knew quite well who his fare was. This small, soft, excitable-looking youth belonged to the ruling class in the colony; he was generous and kind-hearted, and, what is French people in any class of life would seem of more consequence, Henri Chambige, in spite of his being only two-and-twenty years of age, was already a distinguished literary man.

This afternoon young Chambige told the cabman to drive out to Saïd Mahrouk, a suburb of the town, in the beautiful villa of the Marliers.

The driver also knew all about the Marliers. Monsieur Marlier, a clever, good-looking man still on the right side of forty, was the chief engineer of the African railway system; his wife, Madame, was younger

than her husband, and, in spite of the fact that her hair had turned white prematurely, she was still considered a very lovely woman. She was exceptionally kind-hearted and well-cultured, a lovely mother to her two little daughters, and a most devoted wife to her husband, to whom her marriage had been the outcome of a charming romance, for he had been poor, she rich, and they had wanted for each other almost as long as Jacob waited for Rachel.

The fact that the cab-driver knew Monsieur Marlier is worth mentioning, for his subsequent evidence proved that, even among a class ready to suspect evil, H'bow Marlier was regarded as above suspicion. To return to the fateful day when the mysterious tragedy took place which was to make the world ring with this poor lady's name. When he had arrived at his friend's villa, Henri Chambige went into the house, and after a few minutes came out again, accompanied by Madame Marlier and a woman servant to whom she remarked: "I am just going with Monsieur Chambige to his mother's villa. Please see that the children have their tea when they have done playing in the garden."

The villa in which Madame Marlier attended was in the country, two miles from her home, and some time before she had kindly offered the owner, young Chambige's mother, to keep the boys and see that the place was occasionally aired and opened.

On the way to the villa Henri Chambige behaved in rather an odd way, so, as the cab-driver thought, he began staring at the top of his vehicle, a young man known in France, the first line of which may be translated, "Good-by, but nothing of my life."

When at last they reached the empty villa, Henri Chambige helped Madame Marlier to alight from the open carriage. "You will have to walk a little while," he said to the driver, "for we shall probably stay some time here."

The two went up the steps of the villa—young Chambige, the fat of two-and-twenty, and Madame Marlier, the charming, delightful woman of three-or-four-and-thirty—and disappeared through the door. Then Chambige having, did a rather singular thing—he locked the house door behind himself and his companion.

And then began what seemed to the cabman outside an interminably long wait in the hot, still air, and as the minutes dragged on the driver's astonishment that his fare and Madame Marlier stayed so long in the house increased.

Suddenly, after two long hours had gone by, there came the terrific sound of firecrackers.

Then, more noise, deaf silence.

Jumping horribly from the carriage, the man tried to effect an entrance into the villa, but the back door fast. Again he got up to his waist, and again there came that sharp, thundering sound of shots; and a moment later two young men, frantic of thought, came up to the door. They had entered, in apparently breathless haste, and on foot, from the town of Constantine.

"Is Monsieur Chambige here?" they asked anxiously.

"Yes," said the driver. "He has been in three or four hours with Madame Marlier. A few minutes ago I heard shots being fired."

"He was stretching out his hand for the revolver. 'Let me

"We feel something terrible has happened!" they both exclaimed. "Will you help us to break our way into the villa?"

In spite of considerable difficulty, this was accomplished, and then the three men waded through the many lower rooms of the silent house. There was no one there, and with beating hearts they went to the upper floor; and there, in the principal bedroom, on the villa, a terrible sight met their eyes.

Lying on a couch near the bed was Madame Marlier, dead. Writing on a agency on the floor by her side was Henri Chambige, with blood streaming from two bullet-holes through his cheeks.

As they came in, he was stretching out his hand for the revolver with which his hands, and the wound that had killed H'bow Marlier, had evidently been inflicted.

"Let me die!" he cried wildly. "I am not castive yet! Let me die!"

Needless to say, one of his friends snatched the revolver from his hand; and then the three men made desperate, futile efforts to bring the unhappy woman to life again. But she had been shot in the temple; death must have been practically instantaneous.

With bewildered horror and pain, they left the body of the unfortunate woman alone in the villa, and transported their friend, whose wounds they thought were far more serious than they turned out to be, back to his stepfather's house in Constantine, leaving it to the way, at the Villa Marlier of the awful thing that had happened at the Villa Chambige.

II

JUDICIAL procedure in France is very different from that which obtains in any English-speaking country. In France, as in all other, the first thought of the examining magistrate is to get at the truth with out any extraordinary holding for the life of whoever may or may not have committed the crime in question. Accordingly, within an hour of young Chambige's return to Constantine, he was being proved with eager questions by the examining magistrate—who, by the way, was an intimate friend of Madame Marlier.

At first Chambige refused to say anything. Indeed, he did nothing but weep, in sallow tones of anguish, despair, revolt, and despair: "Let me die! I only wish to die! Who did I ask myself? How is it that I have satisfied here?"

At last, however, amid sobs, groans, and tears, and speaking also with very great difficulty—for the wounds in his chest, though not dangerous, were yet terribly painful—young Chambige told the magistrate an extraordinary, and to his listener an utterly incredible story.

"I loved Madame Marlier," he said dramatically, "and she loved me! Either then had led a life of death, either she could not, on such long affairs, we decided to die together."

Now, the examining magistrate was not only Monsieur Marlier's intimate friend, he was also heartily attached to his friend's wife. It seemed so long and so horrible that the woman he had known so long as a being, and as a devoted, ever-ready soldier, could have loved this youth, who was not only

"Her touch filled me with joy and anguish. 'Pity me!' I cried. 'Yes, you may indeed pity me!'"

# THE SECRET CENTER OF OUR GOVERNMENT

## A Remedy for Inefficient Legislation

Having witnessed a great upsurge of public opinion against the measures of wealth and privilege in the affairs of government. That upsurge has been characterized more by the vigor of its expression than by the care with which it has studied out the evils against which it is directed. I believe that the great need of today is thoughtful analysis of the conditions against which we are complaining, and careful study of proposed remedies. It is always more easy to denounce than it is to guide. And there will be required most responsive leadership in order that the efforts of the people should be directed into channels that will remedy these conditions and not make them worse.

There is no lack of many eyes, but few directed at our legislatures, both federal and State. Our factory men speak of their representative assemblies as the refuge of the liberties of the people; there always more that we do not seem to think of them as the refuge of the powerful special interests of business. As to our federal government, that organ has been the subject of the year by the final passage of a constitutional amendment changing the method of electing our senators. This change which has been consolidated against all the efforts of our legislatures of amendment, has apparently been suggested by popular disaffection both with the Senate itself and with the method of electing State legislatures at conducting elections to the Senate. The criticism is a good rather inspired at both levels. Simultaneously, most of our State have been changing the structures of their constitutions so as to deprive their legislatures altogether of their final voice in the choice of legislation and to place it directly in the hands of the people, through the device of the initiative and referendum.

### Limiting Our State-Makers

Even more striking than either of these two recent manifestations in the process of change which has been taking place for many years in our State constitutions throughout the country. We have been parking into these constitutions, in greater and greater quantity, matters which normally should be left to the legislature in its treatment of the statute book, and thus have been leaving the matters with which our lawmakers are deal to an increasingly greater extent, until now most of our constitutional actions and legislative government, have become a complex mass of detail.

Our factory men to demand in their constitutions that their legislatures should meet frequently. We now demand that they shall meet so often. The constitution of one of our States still contains both of these inconsistent provisions, one adopted in 1776 and the other in modern times.

Before taking up a closer consideration of the subject, I wish to express my dissent from two methods which we commonly hear suggested to deal with the trouble. In the first place, we often hear people say that the difficulty arises from the fact that we don't get good enough men to go to Congress and to our State legislatures and that the only remedy is to improve the quality of such members. I do not think that such an attitude is really helpful. When a system of government is shown to be regularly and continually producing trouble, there is little use criticizing the individuals who manage it; there is something wrong with the system. As Edmund Burke expressed it, we should not ask for a new man in the "Thoughts on the Causes of the Present Discontent."

"Where there is a regular course of operations carried on, it is the system, and not the individual person who sets it in that is to be changed."

I believe that the individuals who compose the membership of our Congress and our legislatures are, on the average, not only fairly representative of the standards and character of our American life as such, but that the chief standards which they maintain and live up to in public life are rather higher than the moral standards of the business world about them. I believe that the fact that their labors produce ineffective and bad results is not in any general infirmity of their individual characters, but to the fact that they are laboring under a stretched and impossible system—a system which handicaps efficiency and promotes inefficiency and corruption and even corruption. I should also say here that, in whatever sphere examples I may mention in this discussion, I am not making personal attacks on any individual, but merely citing instances which I believe to be typical of the results of a system.

In the second place, I wish to register my dissent from the view that we may make things better by allowing legislation out of the hands of the people's representatives and placing it in the hands of the people themselves. However useful that may or may not be in a few cases, the referendum is to be for certain classes of questions,

STIMSON, U. S. WAR

HENRY L. STIMSON

SECRETARY OF WAR IN PRESIDENT TAFT'S CABINET

We must not forget that representative government as a whole is an evolution produced to meet the problems of a more complex age than the times when the people governed directly. Although the Ages in Three or the Abolition of Man. Much of the difficulty of our present time has come from the fact that our own age is getting more and less complicated, and that the governmental system which we have is being overburdened by the pressure of new burdens. We shall not cure the difficulty by going back to the obsolete machinery of a simpler age.

I shall tell what I have to say to our federal lawmakers—to the executive and Congress of the United States; but because the evils there are more than they are in our State governments,—on the contrary, in many respects they are not so bad,—but because of the fact that I regard the evils there as representative of a bad system which prevails both jurisdictions.

### National Interests Subordinated to Local Interests

In the first place, when we come to examine the work of our houses of Congress, we find that there is a strong prevalence in both houses of what we may call the local over the national point of view. In a body which is supposed to represent the nation as a whole, we find that the interests of the nation are being constantly subordinated to local interests.

We find, for example, that our army, instead of being concentrated and maintained in the places and in the manner recommended by the military authorities as most efficient and economical, is scattered throughout the country in numerous small and highly expensive posts, and that these posts exist today simply because the officers of the town or village or locality where they are placed, in having them maintained, outweigh the interest of Congress in the discipline and welfare of the army.

We find, again, that our Navy Department is spending millions of dollars annually in the maintenance of navy yards wholly unnecessary and unneeded for our modern navy. A few years ago, when the attention of the Chairman of the Naval Committee of the Senate was called to the fact that the majority of some of these navy yards was not sufficient to harbor a modern dreadnaught, he replied that that was the reason why he believed in smaller ships, and the sincerity of his belief was evidenced by his dilatory recommendations. In other words, instead of our navy yards being fitted to our navy, our navy must be fitted to our navy yards and to the interests of the harbor around them. These examples are surely typical. If Congress will allow the special interests of a locality to take what more of the national defense, what can we hope for in matters less vital?

The needs of our public building construction in two recent and too countless to need emphasis. The Postmaster General wrote, in 1909, that more than twenty million dollars had been appropriated in that season for the construction of post-offices in small cities and towns where his department had made no recommendations for such buildings. The great work of improving our rivers and harbors has degenerated into a scramble for patch and beautify harbor has recently presented against what he calls "prevented methods," and has pointed out that

the most successful river and harbor bill, from a congressional standpoint, in the way in which districts most widely, and therefore most effectively from the standpoint of the work, the means to be expended.

Tariff legislation, instead of being the great national instrument for upbuilding the industries of the country which Alexander Hamilton proposed, has long been turned on as a systematic series of deals between various manufacturing districts, and the hostility of Congress to a reasonable method has been recently illustrated by its abolition of the Tariff Commission, which was seeking to raise tariff-making to a more national, impartial, standpoint.

It is impossible to exaggerate these local characteristics of Congress. They pervade all that it does, down to the insignificant details of a congressional session. He by someone high authority for his district. His political life is dependent on it. Under the depressed traditions of our politics, he fails to be returned in his district he can not run from any other district. He is not of public life. This depends upon a comparatively small locality, where he is in the name of constituency for votes, controlled, possibly, by a single interest, tends to make him timid and subservient. Where the interest of the nation comes into contact with the interest of his district, it must be sacrificed or he must be sacrificed. If he chooses to sacrifice the nation for the sake of his district, there is no way by which he can be punished by the nation. To the nation he is not responsible, and may be returned year after year in the face of the most flagrant disregard of national duty.

Our Congress is more local in its viewpoint even than the representative assemblies of other nations, notably England, where our rule-making is restricted to members in one district does not maintain, and where a corresponding representative of the nation as a whole can still serve his country from near other place. There is, however, in the American Congress even greater need than in the case of other nations for machinery of operation which will bring to that body the national viewpoint which it otherwise lacks. When we examine its machinery of government, we find that, in being the case, the American system of lawmaking has discarded the general national issue upon which practically all other nations rely.

### Our Executive should be the Leader of Legislation

In other nations the executive is the leader of legislation. The man or men who are to be responsible for enforcing laws and laws have a leading part in drafting and framing them. In the United States alone, the executive is shorn of all chance for effective cooperation in the process of lawmaking, and, under the influence of a stubborn political tradition, he is jealously watched to see that he does not transgress the deadline of separation. In other nations, the executive not only has the authority to propose bills, but he is authorized to frame and introduce his own bills, and to support them upon the floor as debate, either in person or through his ministers, but in some cases of legislation his right of initiative is so restricted that his proposals are carefully limited. In England and, I believe, in all the well-governing English-speaking, not only in the budget introduced by the government, but in all other bills, of course, he cut down by Parliament, so additional can be made to it on the floor without the approval of the executive. It is not our executive leadership confined to maintain where the majority are members of the Parliament, as in England. In Switzerland, for example, the executive is not a body which composes the executive are not members of either house of the legislature and can not vote there, and in many other respects have much the same relation to it as do our executive in England. In England, a constructive executive tradition points of leadership in legislation; they draft and introduce bills; they have the privilege of debate and are permitted to take advantage of the result of their bills, and when amendments are desired in the bills they are permitted to draft them. The executive is permitted to suggest to the members of the legislature the experience of men who, normally, view matters of government from the standpoint of the whole as a whole, and to present to the legislature the executive representative of the nation at large. Not only do his duties upon upon him, but he is, in this country, the only person responsible to the electorate of the whole people.

There is also a second phase of this separation which is most characteristic of Congress of executive leadership in legislation, we have it without any natural or normal leadership whatever. In such a body, leadership is not a natural thing, but is a result of the fact that it is made into that of the two Houses of Congress very. How-

LETTERS THAT SORROWY EVER WRITES

BY WILHELMINE JENKINS, R.F.D.

FROM A COVETOUS MAN TO A BILIOUS ONE, DRESSING AN ENVOYMENT

PARISH, Mass., May 27, 19—

My dear Mr. Robinson:

While I appreciate most thoroughly the kind thoughtfulness which prompted you last week to send me your certified check for one million dollars, I have, upon careful consideration, decided not to accept it, and I hereby return the same to you, as you will observe, your returned signature, which I have cut off and retained for my autograph collection. Please do not think that I scorn your gift. I do not, but you send it, to quote your own words, "to relieve me of my wants; and I feel that life would really not be worth while if I did not want anything." Shall the pleasure of life, sir, lie in the pursuit of the unobtainable; the other half in the wearing of desired objects. Most of our most blissful dreams are inspired by the hopefulness of our unattained longings. The acceptance of this million as kindly proffered would leave me with nothing to look forward to. The offer of recently which gives rest to my daily labors would be withdrawn, and I should sink into a state of lassitude inferior to the simplest joys of retirement, a state that is characteristic, and the greatest curse, of the idle rich.

Believe me, sir, with assurances of high regard,

Very truly yours,

ANNAS J. MARRICK.

TO A TENDRIL COVETOUS FROM A CONSUMER

THE BARRON, Mass., June 2, 19—

Greetings:

I send you herewith thirty cents in postage stamps to square myself with your company for a seven-cent rendered the other night. I had upon investigation, that your meter rendered the distance traveled, and that the fare, instead of being \$1.00 as indicated by the dial, should as a matter of fact have been \$1.28. Finding that you have not sustained serious losses from the sluggish action of your meters, I beg to remain,

Sincerely yours,

HENRY P. WATKINS.

FROM A NIGHTY LEASER TO HIS TAILOR

THE CHAMBERLAIN, Mass., June 1, 19—

My dear Customer:

If there is one thing under the canopy that I hate, it is a tailor's bill, and inasmuch as I intend to order a large number of suits from you during the coming summer, autumn, and winter, in order to rid myself of the annoyance of your periodical reminders of my indebtedness I hand you herewith a draft upon my bank, to be placed in my credit on your books, for \$1200. As my stock is reduced and delivered, you may deduct the price of each suit from this deposit until my credit balance has fallen to \$150, when, if you are approving me of the lot, I will make another

deposit with you of another \$1000, to be used in the same way and for the same purpose.

If this arrangement is not satisfactory to you, let me know by return mail, returning my check, and I will arrange to transfer my account to Messrs. Cutler and Childers of London.

Yours,

JOSIAH VAN DAM.

FROM ONE EX-PRESIDENT TO ANOTHER

KAMARINE HILLS, July 1, 19—

Dear old Bill:

Why not drop whatever under the canopy you are doing for a day, and swing over here to Hyder Bay, and let us have a good old-time habery and chow-bok together? The clams are running fine. If you'll please so your least to come, I'll ask Linnie and Cliff and old Pete to come and join us, and maybe Bertie Beverage can be induced to come too. What my old Billkins? Yours for clams,

Yours,

FROM A CURM TO THE AUTHORITY

BOSTON, Mass., June 26, 19—

Greetings:

If there is a Committee of Public Safety in this city, may I ask you kindly to call their attention to my case? I have just returned from looking at certain of my pictures on an exhibition here, and it has suddenly flashed across my mind that I must have been snatched, during my visit when I visited them. Naturally, if I was that way once I am likely to become so again, and I one it to myself and to my family to see that an official inquiry is made into my safety before my apparent mania takes on more dangerous aspects than the mere spoiling of good pieces of canvas. I seek a public examination only because I fear that my own family physician, or some other acting on my behalf for pay, would be prejudiced in my favor, and I could through me, I can only wish in this matter anyone to ascertain the truth, and nothing but the truth.

Trusting you will give this matter immediate attention, I beg to subscribe myself,

Yours most anxiously,

ZANIPATE DITTE.

FROM A WEARY PARISHMENT TO A CONSUMED CURIOUS

HELDON HILL, CURTISVILLE, June 8, 19—

My dear Mr. Abbeville:

I really must thank you for that wonderful postcard you gave me in your return this morning. The article was in which you humiliated me, and the scolding denunciation you included in it of me and my kind, were especially fine. As an advocate of efficiency I like to see whatever is to be done at all done well, and while, of course, you made me useless as an man has ever witnessed before, the completeness with which you did each gave me a positive thrill of pleasure. I must congratulate you also upon the great prominence the newspapers have given your advertisement. It has advertised me fully unmercifully—in fact, no advertising manager tells me we couldn't have bought an equal amount of space for \$160,000.

As a consequence of your outrage, I doubt not that the morning paper in our stretch hands will be wholly wiped out by the contributions of outsiders who will now flock to hear you if you will only keep it up. Indeed, I had no confidence of this that I now make you this offer—I will pay off the deficit amounting to \$10,000 to-morrow if you will agree to give me sixty per cent. of all contributions taken at the service of which you attack my methods. I am inclined to believe that you shall both make money, especially if it is, definitely understood that I will be in my own regularly every Sunday morning while you rub it in. It will draw crowds. That sort of thing always does.

Let me know what you think of this by return, and believe me always, dear Mr. Abbeville,

Your very warm sleep,

SILAS MEECHERY.

AN EAST JOB

"Well, Walter," said the friend of the family, "I see you are through college."

"Yes, sir."

"And are you making a living?"

"Yes, sir—on first class car, too."

"Good! What did you do?"

"Mother."

A CAPTIV'S MADDEN

"Hearst I say you, Henderson" said the fair maid on, "let me ask you—when we are married, are we to have a mistress or a horse?"

"What's that got to do with it?" he demanded.

"Why, I want to know whether I am entering you for wheel or wheel," replied the fair maiden.

NAMING THE BABY

When I thought I'd call him Conny, but my Uncle Ebenezer said that name was badly handled—wasn't Julius Caesar slain? Then I said, "I'll call him Henry"; but my second cousin, Gomer, answered: "Henry was a pig, and I don't wish his name in mine." Long I pondered, worried greatly, seeing names both sweet and stately, something grand and high and noble, such as original horses have. "I shall call him Alexander"; but an innocent bystander interposed, "Alex was a tyrant, and he splashed around in gore." Had my uncle said "Glad front us, and we'll name him Charles Augustus, which is primly and becoming, and will suit this foolish name." But my Cousin James objected. "Nothing else can be expected, if you give him such a name, but that folks will call him Jim." "Let us call the darling Reggie," said my cheerful sister Popsy, "which is short for Reginald or Richard or some other kindly name." But my Uncle Gomer protested. "Surely," said he, "you had noted: never did you think young Reggie with the shining lights of fame." Thus it was for weeks together, and I often wondered whether other parents ever suffered as I did upon the rack. All my worries and my doubts were gone from my mind, so I named the baby John Henry, and for short we call him Jack.

WALT WYATT.

THE LONG TON

(Continued from page 2)

Adam and the mixer had exchanged names and surnames earlier in the day. "Sure I had. But you'll see, if you want to get married. I had to have my own name. That looked to be good even a month or six weeks ago. I made a fair first pay on it. But she ran out on me last night, on the streets of Ohio."

"That's bad," said Adam. "By a curious coincidence, he too had been a head case. I guess he wasn't. My number hadn't been given the advent of just his twenty-five-cent three-halt knife, and I'd got some of the good stuff in my old skin! Ah, me! And the lady of the heart had had that pretty Angeline whom Simson's Pilgrimage married just before Lent!"

"Will your old woman love the devil when you take in a skin one?" Adam inquired, with careful detachment. "Simson was expected to say yes. But Simson said, 'No. Truly, with the rest of the strike and three of us to go on eating,—her old woman and Angeline and me—I either got to go off from her and make it, or she'd get to live in the skin with and support me. Oh, Lord, why didn't I keep a saloon?"

"Adam chuckled with his tongue a sold and said sweetly, 'But say, Simson, as for scabbies, I wouldn't say a word about it. If I was you, if you was to do it, you wouldn't say a word about it either!"

"Hell with hell! I wouldn't want you to support I do it. Now!"

"Hell with hell, Adam said. "And if you was to run away to a distance and go scabbies to get money for the rest of me, I wouldn't let her know where the money came from."

"Where'd she think you was gone to, the whole town?"

"Well, in the rotten thing of it! Simson explained bitterly. "For there is some spears carries a pretty girl, and in a month or so she's out of the skin and away out in Chicago or Denver or somewhere, they're up as marry another one. Now, me. I came out from the skin last night and July, and up here nobody knows me for a decent folk, and this February I got married to her. Well,—what she think, she wouldn't explain nothing, only after dark I just stood!"

"She didn't think she done what to think, Adam answered."

"No, hell. Some way, they don't. They always make out you've got tired of her, and then you're another guy. 'That's the witness of it.'"

"Gosh!" said the driver, feelingly.

"Well, I think I didn't take her, any of the time."

"Tell her she's pretty, why don't you?"

"I'll be in the werry. Pilgrimage had a short laugh for him coming from the lap of lasses."

All the same to tell her those things, and then skip out and take her out!"

Adam recognized the vicious circle of this logic. He sympathized with Simson who, if not attracted, still was being dreamed in a public by his stone-like distracted kin.

The overcast-faced old Adam had not intended to come down the shaft today at all; but in his virtuous double this sinful personality now found himself in it!

And the virtuous Adam acquired the glittering gift easily. Some after, he wrote.

"Fiddlers breaks?" prompted the old Adam.

"I'll show things were on a string, seven pipes of light brass or tin cut in an oak-log shape and stamped '174.' They're the same as the dark Simson's Pilgrimage had made for him at the company's blacksmith shop the day he got his workpiece and his mixer's number. They're identical with all the other tokens of that mine."

"Well I go back with you," the virtuous Adam asked, seeking advice. "I'm kind of tired. And if he isn't sending out no more case, now, that's the one of it! It's got plenty more."

"Arya Arya!" the experienced wheel-Adam answered, smiling. "I've got you, old Tom. We'll get a drink and go out. It's nice here. It wasn't get dark, so far, but right, too, for getting so many things to remember. And you'll be doing a nice thing by Simson and Angeline."

"I won't," said the good made driver, turning and walking lustily back to the chamber.

Simson's Pilgrimage was filling his hat with water from the shaft. The post-stuff that lay about in the water on his floor, packing it in with the desperation of a drunken boy, was up at his year made in ten minutes and I'll give you the war!" he called to the advancing runner. "If just strack me and I'll be back in ten minutes, but I'll be out for a week, and with Guido gone, I'd

just as well see it up and get the forty-five cents more to the good."

"Then, now!" said the old Adam as the circumlocution of his drink. "I shall need to eat the mixer he did eat at all. Just change them ten more dollars and let Paidik take the device?"

"No right. I'll be here to see."

The boy walked hastily down the road in his waiting mixer. The tickets were in his pocket and in his hand. He was about to be wanted to try it—wanted to very much. Should he? He got the mixture and took his ten dollars and stated last of it. That! That stood for Paidik. The animal stood alone on a line by itself. There was plenty of room to the left of it, and the foot man on the line, it stood for the front car of their eighth trip of cars, which would go for the dooking bus to the lookout in exactly the order which Adam the driver determined upon in the advance of the third run.

With a drift motion, Adam Yelenak made "174" before the 4.

"Well, how!" muttered, jerking off the ticket stamped 4, and with a bit of Simson's own string tying one of the seven pilfered ladies in three figures to the top in the side of the car. "Now I can go up with Paidik made an get his, and just this here 4 on it, and run 'Thirty-one' to let her see if that's not what they there lose to me and will acquainted with 174's coal. Now, it's too early! And so that's it."

Thus, by the decree of Providence and the impudently greedy of Adam Yelenak, his almost three years of the third coal a dooking bus had made to see was put to the account of the much-doubt Simson's Pilgrimage, Angeline's husband; and Paidik was the same as a well-known system of exchanges and written slips of sack freight spread through the mine.

III

THE fire-wheel whistles long gutting a time for Adam after a wonderful day. He was tired, but he grunted no effect of the long series, Kitty Tommy, and she took him to the machine-works, with Sam's help. They had joined the crowd of miners and boys who waited the shaft in their mine—a time of talk and mediation which which had been laid into his own, but which was in fact dedicated to what he would have to do in the mine.

When he had found the kitchen, whang-her down Simson's empty dinner can, his bed of water in the kitchen sink was laid over behind the stove, and a small splashed the gathering clouds of the sky.

"Hello, kid!" Simson called from the middle room. "How'd you make it?"

"How many rats you made out?"

"Thirty-eight, Sam, somebody put my supper out where I can see it."

"No matter, like those mules, especially."

"Good work! In your hole's broken."

"I strata," the pocketed brow grunted, wiping himself in the waist and plugging head and arms into the grating-lid water. "Me, get my drink off!"

"Understand! And work off no-hack!"

"The hell me to tell you, Sam, that they was glad you was in the air! I was tired as fast as a driver as you."

"Hell, kids, ain't he stink as himself!"

"Me, get the water, rick, while the heards' laughing.

"Which," in the moment made in my hand, he was suddenly demanded.

There was instant laughter from the kitchen and mine.

"-Did he about you a ear?"

"The sneaky old devil always claims he was tired a ear or two more's he went out, a year and a day!"

"I'm on to him, snaking Adam belly."

"-He didn't get up on you?"

"-He? You tear your money to such a guy?"

"Then that's all right," agreed Sam, and he was not a moment or two after after you was gone that I had got you into Paidik. It's lucky he didn't get you out of the mine at all. For to-morrow, you're on to him."

"I've got groups, I ain't!" pronounced the water with a dry."

There were two workpieces laid before Paidik Simson and Adam's method grew like a parasitical pestilence. It overabounded in the head case's bearings. No more old to ask, no more on the paper back to say, at steel bars and lead bolts from the shaft. It was in Paidik's hands and he turned or sportively out clothes later after dark. Instead he

had become, as far as anybody could hear, perfectly upright.

His own secret underground sin, though, Sam begged and counsel. No matter was any thing but that even here the secret of it without wishing to whisper it to Stanley. Thus after time that work he had been known on the runs of Simson's Pilgrimage and mixer Paidik's "4" and "174" on his absent-mindedly laid-up plan was in his hand, his thorough acquaintance in deception could have trained a twelve-year-old brain for such an deception, but it was the records talked with each other and the moral cat's paws on the outdoor cars.

Was any injustice from the mine's laborers by his conduct. There he stood outright a hunched man from Paidik, but it was real time as extra pay for which Paidik's work could claim the leading charge himself. Generally, though, the boy contracted himself with the exchange of one or two tickets a day to the profit of Angeline's husband.

"There'll be a dandy rumper of the pay-winner," the boy confided to Kitty while in the advance of the gangway. But Paidik's husband to be a cheat, Adam, "Hello, Henry! Take any going to tell the old man that you're broke and I will work. 'Cause that's the kind of thing a thief don't want to know—gettin'."

However, the avowal of Paidik's attitude all scores short of the pay-winner. It happened on the last day of mining. Because of the general expectation that the miners would be closed for Adam's unsummed to such amounts of dollars and cents in a whole lot of powder if his neighbor, overlooked, would not hit him two or three or ten charges for the way he had broken and it was the manner undertaken regular daily trips through the vein.

"You don't, neither, ride on my own business!" testified Adam, the driver, outstayed to the locomotive car, the engine, and the water tank. But he, Turkin! These three good mules it was done to four cars now, 'stead of five or six as you'll be to get to beat that!"

"That's the same as you, the driver, the water, and the engine, up to his own chamber."

"The water was going at a walk on a right up grade. There was no one down here for some distance, and Sam Turkin, walking at the right side of the track, was the only one who had any time to head down, stand on one foot, and examine the other shoe, which was bearing him."

Old man Paidik was at the right side of the walk, well behind the creeping train. Adam, in the ditch at the left, saw him lean forward. With a terrific start one ear, the mixer spring upon the third car and out on its side, bearing. He pulled it out.

"Get off!" Adam shrieked, exasperated.

"No, son! you call me that, neither. You can't stop me! Do you know how some the bad words I know!"

Sam Turkin, the silent, the mischief-maker, was there.

Good For Both

Parents frequently deny children the table beverage they drink themselves, because "coffee and tea aren't good for the little folks."

It's different with

INSTANT POSTUM

This new food-drink, made entirely from wheat and the juice of sugar-cane, is genuine nourishment, and has fine color and aroma.

It tastes much like high-grade Java, but is absolutely free from caffeine (the drug in coffee and tea) or any other harmful ingredient.

Instant Postum is regular Postum so processed that a level teaspoonful in an ordinary cup of hot water dissolves instantly and makes it right for most persons.

A big cup requires more, and some people who like strong things put in a heaping spoonful and temper it with a large quantity of cream.

Experiment until you know the amount that pleases your palate and have it served that way in the future.

For a summer "cooler" add cracked ice, sugar and a little lemon juice.

Instant Postum is sold by grocers. 45 to 50 cup tins, 35c. Larger tins (90 to 100 cups), 50c.

Regular Postum (must be boiled 15 to 20 minutes; large package—about 50 cups)—25c.

"There's a Reason" for

POSTUM

Sold by grocers every where.

A CITIZEN OF THE ROADS

(Continued from page 18)

Every employe should know the law through the 8 hour act that figures show how coming and check provisions that are laid for the employe as for employer

her when they continued the journey. He said the tramp took turns in pushing the little cart, and from time to time she would turn her head as to see him, always with that little smile and the slow accent of showing a joke with him. But it was manifest that her illness was heavy upon her. The rim air of the day set her rattling; she had had a shivering under her covers; and at such times her fury would take on a pallor that was like nothing living. The little woman sat strong on that road beside the cart. Just the street smart street and just the stout stare of their shop-fronts they passed their bodies, and from head to toe.

"We'll go through Workton," said the tramp. "It's time to buy some baggage, mate; you need your girl too obliging. And then—and then we'll strike into the old Pilgrims." It isn't the right weather for the Pilgrims," this said, but Leath where she is there to go?

"It goes to Rochester, anyhow," agreed James Owen.  
"You," said the tramp, "it's hard travelin', too, in the wet. But—but a man must do some mad to be mad. And, Leath, among along through these villages, I've old Pilgrims in my mind all the time.

A motorcar, headed against the rails, swayed by them, ducking them in a shower of mud. The tramp seized a bit of it from him.

"No motorcars on the Pilgrims!" he said. "You goes on your two feet there."

In Workton he had a new and a very some look; and by afternoon the best open roads were left behind them and the high, unbroken ridges of the Pilgrims. Way made to night and left. They were in familiar country now, not only to the tramp, but to James Owen also. Here the mud lifted spurs a mile, he could get away; the merry country the very nose of poplars that reversed the road side of his house. He saw them with a vision of his own infidelity. The house they had said the life it achieved several infinitely remote, scarcely to be apprehended as things affecting him. He was sudden to the skin and non-verbal; his hands were chafed and painful from pushing the cart, and his body was so unmanly. But he turned his face away from that for very quickity, and caught the woman's head, and when she turned, she would stare at him in place. He best again to the dreary task of pushing.

Her head was resting on it all, and the woman, too, needed rest. It was for the reason that they camped early, in the shadow of a little old quarry, where many looked out on all the spursous south. Through the mist that now upon the hills there showed bright red of villages and a little town. But now there was seen clearlight in their house. The fire served to light up their all. The woman, propped up beside it, stared with great bold eyes into his face; the tramp stared through it all her. And presently, with no warning, she dropped her face and began weep. The tramp, her husband, sprang to her and put his arms around her.

"Don't!" she said, "I'm crying roughly. There isn't a thing I can do, dear. There isn't a thing I can do. I know it," she panted, through tears she could not control, and clung to him pitifully. "I know it, Tom. But—but—the children!"

He looked her rather, hesitating so that she could look against him. They were framed in the light of the fire, dappled and far-off, against a background of gathering day. "I'm afraid," she was telling him, "I'm afraid I won't see them again, Tom." "Don't be afraid. You'll see 'em all right, dear. It's only only the wet and the cold, dear. You'll be better soon. Won't you?" He took her face, the face of a fighter, was looking into hers, a fighter with all the signs of a man's confidence. She smiled weakly and sighed. "Better soon," she murmured obediently, and her eyes closed. The tramp remained motionless, holding her up, and there passed moments of enduring silence. At last he had her back, following her, and he turned. He turned a troubled face to James Owen.  
"We're up against it this time," he said.  
"What's the matter?"  
"Perhaps she'll be better in the morning," suggested the other.  
"Look at 'er," answered the tramp. "If only we was at Rochester!"  
"Well," said James Owen, "we could pack on, my own girl, and start early this morning, if we pushed all night."  
The tramp stared at him with keenness. "That's what I'd have to do, my dear, my dear—nothing else for it. But what kind of a man are you to let her yourself for two pure drinks of champagne?"  
"It is a man like yourself," answered James Owen.  
"You rode on me last night, as I asked you to lead a horse," the tramp was thoughtful, in the deliberate tone of one who makes out a row. "I asked you to lead me, and you set me on the hill, and now there just've been shavin' it to kill myself." "We've had your money; you've set to the back; an' you've got shavin' all shavin' all shavin'."

"You've had your money; you've set to the back; an' you've got shavin' all shavin' all shavin'."

"Oh—out of Harry," answered James Owen, "it's nothing. Don't let the tramp rub his shavin' across his eyes."

"I'd sort thought—for a moment—that perhaps you wasn't a man at all," he said, hesitatingly. "There's talk in lookin'—an' in shavin'—"

He broke off, stupefied and a little bewildered. The woman bowed her head to a sigh, and his eyes turned toward her. "I might be wrong, but the tramp after a pause. "Things don't open like that nowadays. Ah! yet—the law's the Pilgrims! There's seven square miles of the Pilgrims! Things've been even—why not? And if ever there was a time for anything to upset, this is it. Just think! The law, hard fair, and even a great dreamy in the front. Just think! Suppose, as we've seen, the tramp and the woman, even as you said that best!" He graphic hand pointed to the place; the woman said James Owen's face and looked, and out of the dark there was to come a smile.

"It was some thought the word were a row. The sick woman had row where she lay. The map of her interior health seemed like a cry. Her thin face with all sleep eyes finished them.

"Tom!" she cried, "Tom! I want to see—the children, before I'm gone."

The tramp sprang up, wild and helpless. Before his eyes she cried again: "The children, Tom! I want—the children—before."

He seemed to be trying to look that cry across his breast, to afford a pangnancy with her strength; his head, but he could not know, call to James Owen.

"If you can—if you are one of them—rip up—the child."

James Owen in one of his pockets had a pencil. The wrappings of the food parcel, which he had carried, were in his hands with a piece of paper. He scribbled hastily.

"Here," he said to the tramp, "Take this. It's a note. Go down to the mill town and give it to Doctor Pope. I'll look after her till you get back."

"But will she look at it?" "But will she—will she—"

"He'll do all that he can do, Harry!" He went on, smiling miserably.

"There," said the tramp, "you are one of them," I know it!"

And he took sharply into the darkness the crash of his flying passage through the bushes overhead. Mr. Owen turned till he saw the tramp's face, but he did not show beside the sick woman in wait.

There were measures to keep him company a measure of strange compassion inhabiting the night, the woman, and the paroled shopkeeper in Camford, wanderer in a crowd of roads, a whole population of the road side, were looking at him. The tramp before him in view. The thoughts do not with them, not especially, now that the sick was rest, for they were left in his mind. And at the end of them, the tramp up the road, the weary figure of Mrs. Owen crossed the field of his recollection. He did not look up till he heard below the noise of a foot automobile.

The noise, with the tramp at his heels, came into the bright. He gave one keen look at Mr. Owen from under his shaven eyebrows, and then raised his eyes to the woman. After that it was as though he had forgotten Mr. Owen's existence.

### Shorter working hours and higher pay make it imperative for those employing labor to receive the full equivalent in service for every cent they expend for wages

With the constantly-advancing cost of labor, it is absolutely necessary for the employer to receive "full value" from every man to whom he pays wages.

This applies to piece workers as well as day workers. The piece worker who arrives late or leaves early and keeps his machine idle or retards the work of his department, is curtailing production, just as surely as is the day worker whose time is irregular.

Many large concerns who have used

## International Time- and Cost-Keeping Systems

for years on day workers are now using them on piece workers. They are not only saving money and increasing output, but they are increasing the efficiency of the employes themselves.

We would like to show you how International equipment will save you money on any kind of labor.

## MY MOTHER

(Continued from page 7)

But there were two curious incidents that occurred in the order in which I shall write them down.

One night, as I lay in her arms by the fire, a huge rod suddenly slipped from the grate and fell with a crash, awaking the men in the other room. I supposed she thought something was wrong, for she appeared at the door with a shroud over her shoulders, holding the night-light in one hand and shading it with the other. I was glad to speak, when my mother had her hand across my mouth. The women advanced into the room, passed close beside us, apparently without seeing us, went straight to the empty bed, looked down on the tumbled clothes, and then turned away as if satisfied, and went back to her room. The next day I managed to elicit from her the fact that she had been disturbed in the night, and had come into my room, but had found me sleeping quietly in bed.

The other incident was as follows: One night I was lying half-dressed against my mother's breast, my head against her breast, and not, as I usually lay, with my head on her shoulder. As I lay there, it seemed to me as if I heard a strange sound like the noise of the sea in a shell, but more rhythmic. It is difficult to describe, but it was like the murmuring of a far-off crowd, overlaid with musical vibrations. I trembled close to her and listened, and then I thought I could distinguish recognizable ripples of church bells pealing, as if from another world. Then I listened more intently to the other sound; these were words, but I could not distinguish them. Again and again a voice seemed to rise above the others, but I could hear no intelligible words. The voices rivied in every act of tone—pensive, content, despair, emotion. And then, as I listened, I fell asleep. As I awoke, I looked back on it, I have no doubt what voices those were that I heard.

My mother began to inquire so remarkably that those about me noticed it. I never gave way during the day, at any rate—to those who were unacquainted, and at night, when I suppose, she will partly release its control, whenever my dream reached a certain point, she was there to comfort me. But her visits grew more and more rare as I needed her less, and at last ceased. But it is of her last visit and the evening of the following year, that I wish to speak.

I had slept well all night, but had awakened in the dark, just as the dawn from some distance which I forget, but which left my nerves shaken. When, in my terror, I cried out, again the door opened, and she was there. She stood with the light in her hand, and the cloak across her shoulders, and the light from the landing lay partly on her face. I sat up, reassembled down the bed, and was lifted and carried to the chair, and presently fell asleep. When I awoke, the morning had come, and I was stirring and rousing, and a pleasant green light was in the room; and I was still in her arms. It was the first time, ever, in the instance I have noticed, that I had awakened except in bed, and it was a great joy to find her there. As I turned a little, she took my hand, and I saw—and I describe, but with increasing pattern of flowers and leaves and birds among branches.

Then I turned and came to see her face, which was so near me; it was turned away; and even as I moved she rose and carried me toward the bed. Still holding me on her left arm, she lifted and smoothed the bedclothes, and then laid me gently in bed, with my head on the pillow. As she placed, for the first time, I saw her face plainly. She bent over me, with one hand on my breast as if to prevent me from rising, and looked straight into my eyes, and— it was not my mother.

There was one moment of blinding shock and horror, and I gave a great sob, and would have risen in bed; but her hand held me down, and I wept it with both my own, and still looked neither away nor up. It was not my mother, and yet was there over such a mother's face as that? I seemed to be looking into depths of indescribable tenderness and strength, and I leaned on that strength in those moments of misery. I gave another sob or two as I looked; but I was quieter, and in fact began to breathe.

I did not, at the time, know who she was; but my little soul dimly saw that my mother, for some reason, could not see at that time more to me who needed her so sorely, and that another great Mother had taken her place. Yes, after the first moment or so, I felt no anger or jealousy. Then, I remember, I lifted my head a little, and knew that I had not dimly seen me reverently and slowly. I do not know why I did it, except that it was the natural thing to do. The hand, was strong and delicate, and delicately treated. Then it was withdrawn, and she was standing by the door, and the door was open; and then she was gone, and the door was closed.

I know who she is, and, praise God, I shall see her again; and next time, I hope, my mother will be there to see me, and I shall see it with my very eyes; and perhaps she will allow me to kiss her hand again.

# GRAFLEX CAMERAS

The GRAFLEX makes better photography possible by eliminating the uncertainties. Focusing scale and "finder" are done away with. With a GRAFLEX you see the image full size of finished picture, up to the instant of exposure right side up. You know to a certainty that the picture is in focus, without having to guess the distance between the camera and subject.

The GRAFLEX Focul Plane Shutter works at any speed from "time" to 1-1000th of a second.

Send for Illustrated Catalog.

FOLMER & SCHWING  
DIVISION

Eastman Kodak Co.

ROCHESTER, N. Y.

We restrict to no good as the Graflex for taking pictures of children. Because of its wide field of vision, the mother can be sure to get every moment perfect pictures.

You can photograph on dark days when you use a Graflex. This picture was made on a night. Slightly clouded day in December.

The Graflex is used for those who have with a camera.

On clear days when the sun is shining, the Graflex will take pictures at 1-1000th of a second.

## THE SECRET CENTER OF OUR GOVERNMENT

(Continued from page 22)

natural jealousy with which a powerful branch of the government would regard any supposed encroachments upon its jurisdiction.

From the Secret Committee Room in the Open Debate

I believe, however, that there is no sound foundation for the fear that the reform in question would at all diminish the dignity or power of Congress. On the contrary, executive cooperation in legislation would enhance the importance and opportunities of legislators. Issues on public questions would become more clearly defined when presented as the governan of an officer responsible to the public. The transfer of the real fight for and against them from the seclusion of the committee room to the open debate of the floor would necessarily evolve congressional leadership both in furthering the administration program and in calling forth an effective opposition to meet such a well defined and well exposed program of the administration. Congress would become a more truly deliberative body. It would be freed from many of the administrative burdens which its separation from the executive now tends improperly to impose upon it, and its attention and time-

would be concentrated upon the real purpose of legislation.

Fortunately also, the main obstacles to reform in our federal government are not embedded in our constitution, and to get rid of them does not require constitutional amendment. The framers of the federal constitution were not led into the position already taken by several of the States of following the theory of Montesquieu completely, and of declaring, as did Massachusetts and Maryland, "that the powers of the legislature and the executive shall be forever separate and distinct from each other. On the contrary, Mr. Madison, in "The Federalist," showed that under the English constitution, the "executive magistracy forms an integral part of the legislative authority." But they did not provide in the constitution a regular or systematic method of cooperation between the two branches, and, although, under the inspiration of Hamilton's genius, there was cooperation during the first administration of Washington, on a few occasions the two branches gradually drifted apart. Federal practice succumbed to the fallacy which had crept through the States, and the modern system of a committee government grew up. The problem now is to institute a proper practice against all of the oppo-

## THE SECRET CENTER OF OUR GOVERNMENT

(Continued from page 23)

sition and obstacles above mentioned, President Wilson, finding his strength in power in the Hall of Representatives, finally violated the theory of cooperation, and made a return to the usual precedent of Washington; but, in order to make a reform permanent and effective, there is needed the careful construction of machinery by which the executive, legislative, and judicial and national and not domestic and extraordinary. To put the matter concisely, although the following suggestions are such suggestions must be, I suggest that the following steps be taken:

First: As to fiscal legislation:

(a) The President should be given the right, by statute, to prepare and introduce into Congress budget estimates for an estimate of the expenses of the government for the coming year, as well as a proposal of the necessary new taxation, which he suggests as proper to raise revenue for the purpose.

(b) His Cabinet officers should be given, by general statute or statute, the right to present and defend on the floor of the Senate and House of Representatives the respective portions of the budget pertaining to their departments.

(c) By statute or joint resolution, both Houses should be forbidden from introducing to the respective budget any other bill, except appropriation bills, on the calendar of both Houses, and amendments to them be allowed only upon the floor of either House.

Second: As to general legislation:

(a) The President should be given the right to introduce bills, and these bills must be given precedence above all other bills, except appropriation bills, on the calendar of both Houses, and amendments to them be allowed only upon the floor of either House.

(b) The members of the President's Cabinet should be given, by statute or joint resolution, the right to appear on the floor and discuss these and other bills of general legislation so far as they affect their respective departments.

The foregoing proposals are sufficiently concrete, I believe, at least to invite discussion. No one of them would require constitutional amendment, and the possible exception of the proposal to give the President the veto power over bills in the appropriation bill; and even for the exercise of this power, though long unused, there can be made a strong argument from the constitution. Such power exists today in the State Constitution of New York.

For each of these proposals there are strong, indeed, variously supported, precedents in the practice of other nations. Even Congress itself, in the Sunday Civil Appropriation Act of June 4, 1904, partly opened the door to the entrance of the presidential budget, and President Taft made a courageous attempt to enter them. Congress has since attempted to shut the door, and rests on the old ineffective methods of estimate and appropriation.

The oldest standing order of the English Parliament, dating back to 1714, forbids members from making in the budget introduced by the Crown, and this has been called by Mr. Ford "the great principle of the English Constitution." He says it is "absolutely precluded by legislation, and in no doing does up the most complete source of legislative power."

No one who has witnessed the way in which an appropriation bill works, on its passage through Congress, like a great rolling stone, can doubt the justice of that statute which would reserve to the President the right to introduce bills for the purpose of introducing to one that has been discussed in Congress since 1864 and has been recommended to that body by one of the strongest special committees of congressional history. Bills to make the proposition effective are now pending before Congress. I believe that it would restore part of the present friction and jealousy between Congress and the executive department; that it would greatly expedite consideration of legislative business affecting those departments; and that, beyond all this, it would bring into the tangled chaos of local interests the viewpoint of officers charged with duties broadly national in their scope and character.

Taken as a whole, I believe that the adoption of a system based upon these propositions would introduce into our legislation the workable methods that have hitherto been lacking; would strike a death-blow at the power of wealth and privilege which clings around the committee rooms; and finally, by giving to the people of the country effective means by which their deliberate desires can be carried into law, would terminate most of the dangerous criticisms that are now aimed at our system of representative government.

## Do You Want Independence?

Are You Pinched for Money?

HAVE you enough pin money? Every woman knows the poignant torture of being denied the many little refinements so dear to her.

In almost every family even a little more money coming in regularly will relieve the tension. Those necessities of dress you hunger for, the little entertainments you want, the outings you need—all can be yours.

In your spare time you can earn enough money to make much of the necessities of life, and put money in bank, too.

How About Your Future?

IF your source of income was suddenly cut off, where could you earn a dollar? Are you equipped to go right ahead and make a good living—not a mere existence, but a good substantial, ever-increasing amount of money? Unless you are, you are chained to the ragged edge of uncertainty.

These occupations will pay you well. They are easy to master, and pleasant to practice. You can start in as soon as you leave your Diploma; or you can acquire the knowledge as an investment against adversity.

## Solve Your Own Problems!

Our 4 Months' Correspondence Course Gives You a Profession

## COMMENT

**BOHEMIA with the issue of August 16th. Mr. NORMAN HANSON will take charge of HARPER'S WEEKLY.**

### Gettysburg

Last week was full of commemorations. Next week has the greatest one of the year, the commencement of the second half-century after the battle of Gettysburg. Fifty thousand graduates of Gettysburg are expected and will be entertained by Uncle Sam, blue and gray without distinction—or perhaps, rather, all with like distinction.

This will be a very remarkable celebration. None quite like it ever happened before that we can recall, and this one can not be repeated. There may be future celebrations at Gettysburg, but the fifty thousand graduates will not be there again.

How great is the memory of that fight! Falls like an ever so weak in Civil War history, to whom all the other battles of it are no more than names, know Gettysburg in its details—"Culp's Hill," "Seminary Ridge," "Seminary Ridge," "Barnet Top" and "Little Round Top," the "bloody angle," and Pickett's charge. The reason is that the three days' fight at Gettysburg between great armies, well matched, settled the war. Before it the result was in doubt. After it, it never was. Union had won.

After the legends, sword and cross,  
How new a great granite globe.

Breeding through the battle field,  
And based across the tramped tent,

The death-day of a nation best!

Last! Yes, and of a nation saved!

It is the Gettysburg of the great battle, and Gettysburg of LINCOLN's immortal address. Where else in our country is there a place quite so hallowed? Where else may a leader of his country so well go to learn the lesson of devotion, to catch the inspiration of high sacrifice!

It is to rejoice in the strength and the breadth of sentiment that has made the field of Gettysburg what it is; that has made it a national possession, sacred to all who died there, marked with their monuments and the records of their valor. It is a good place to go to get the inspiration to yield in these days of change and disturbance and selflessness, of innovation, and impatience of tradition, and of all evils, and of duty itself. These are times when some of us feel a need to be reminded that our country has deep foundations, laid in true hearts, cemented by their blood. No one can mind that remembers that the thing, but no one can mind that there and some ever without a sense that what cost so much is worth keeping, nor without renewal of high conviction that it will be kept.

### For the Banking and Currency Bill

If the President needed any defense for his insistence on making a beginning with the banking and currency question, anybody with sense could find it in the tremendous interest manifested in the subject, now that the press and public have a fairly definite proposal to deal with. The notion that it is a subject people don't care about is effectively dispelled. For the thing, but it has driven more terror into the background. It reveals itself as what it has been all along—the most fundamentally important issue awaiting the action of Congress. Even politicians have

long conceded this, and that is precisely why so many administrations have shrunk from any real tackling of it. They have simply been afraid of it. Apart from any judgment of the President's views on it, he is entitled to the high credit of precisely forcing Congress and the country to stop neglecting it.

No much is perfectly consistent with his remark that the bill is offered to Congress is, in fact, "no man's bill." It was doubtless beyond his power to secure preliminary acceptance for a measure fully commensurate whatever may be his own desire and ideal. But apparently he has secured immediate consideration for a measure which, if there is sense and virtue enough in Congress and the country, may be the basis of a sound financial system and meet our most pressing need.

### What Will the Republicans Do?

There are differing accounts of the recent meeting of the executive committee of the Republican National Committee at Washington. Some indicate a strong sentiment for a national convention. Some indicate the contrary. Probably each paper's account takes its quality from the bias of the men whom that paper's correspondent happened to talk with after the meeting. Those who talked with Progressives got the idea that the party will openly renounce itself. Those who talked with stand-patters got the idea that all the party has to do, and all it probably will do, is to wait until the Democratic trifling demotes the country, and then, without change or effort, come into its own again.

We have full and wholesome respect for the power of the men who hold the stand-pater view. We ever agree with them to the extent of thinking it useless and unwise for the Republican party to take any such action as would leave it indistinguishable from the Bull Moose party. We see no reason, moral or practical, for its attempting to beat the Bull Moose aggregation at their own game. If it tries that, we bet on the Moose. But we do see reasons why the party, in order to keep alive as itself, should do and do openly, by a national convention, the things which its more progressive leaders want it to do. Moreover, we think these reasons so plain and convincing, and the opportunity still open to the party, if it is wise and candid, so great, that we expect the progressive element to prevail.

That is to say, we expect the party, in spite of the temperamental stand-paters and the interested commitment from the South, to make a reasonable response to actual conditions and to the demands of public opinion. We expect it to try and set itself right in respect of the practices which have been plainly condemned by the better people of the country, including a large part of its own membership.

### The New Order in the Agriculture Department

The new Secretary and the new Solicitor of the Agriculture Department have been in no hurry to eradicate their accession to office. In view of the ordinary behavior of politicians they seem, in fact, to have been very unimpaired of their opportunities. The country was not long ago all wrought up over the way Secretary WILSON and Solicitor McCREE endeavored, or left unendeavored, the purged land. Why on earth, therefore, did not Secretary DeSoto and Solicitor CORTIS signalize their advent by sensationally reversing all such their predecessors' policies and summoning the press to take due notice of the change?

Probably because neither of them happened to be a politician. Also because both were more intent on doing their work well and thoroughly than on making a name in the papers. They were not in office to judge their predecessors, but only to do their own duty as they saw it.

Apparently they are doing it; and one of the

results is the astounding discovery that nearly all foods, and that therefore the Pure Food and Drugs Act applies to them. The preceding administration had taken a different view, for no other discoverable reason than that there was, besides the Food and Drugs Act, a Meat Inspection Act. The new Secretary's curiosity is being assuaged—he is, we judge, not a vegetarian—the Solicitor went patiently to work to discover whether Congress, by passing two acts with the same general object, had meant to defeat that object. His result had no room for so bolding. The Solicitor-General agreed with him. There has accordingly been signed an order reversing the regulation of October 17, 1909, which practically exempted meats from the operation of the Pure Food Act, and they will be henceforth treated like other foods. That is to say, the public will have the same protection against human meat foods that it now has against other impure foods.

We doubt if the Bureau administration of the Agriculture Department ever does get around, unless involuntarily, to passing judgment on the preceding administration. Come to think of it, however, that is not its precise duty. However, by doing its present duty carefully and fearlessly, as in this instance, it will incidentally reveal to the country, in the really most effective way, how much there was the matter with the department before last March.

### The Doctors, Government, and Public Health

Various recent happenings, especially Dr. FARMAN's interesting and instructive visit to these shores, made the course of the American Medical Association, at its annual convention last week, seem decidedly timely. With the venerable Dr. ALANUS JONES in the chair, it promptly addressed itself to questions of medical ethics.

That is a decidedly live question today and in America. Medically speaking, the code of Hippocrates, which we believe to be the earliest known treatise on the subject, is a thoroughly up-to-date, complete document. Fifty or sixty years ago, probably few physicians would have admitted that this ancient statement of doctors' duties was not generally lived up to. Maybe so; but we count it a distinct gain, not a loss, that our American doctors took last week a disturbed rather than a self-satisfied tone concerning the morals of their great profession.

They naturally discussed fake cures and patent medicines. We trust they will keep going on that line; for government, if scientifically guided and if it has the courage, can do far more than it has yet done to suppress such undesirable depredations upon suffering humanity. But the association also came much nearer home. It discussed such practices as split fees, which, so far from being confined to medical and pharmaceutical outlets, can be successfully followed only by "regular" physicians. In the stamping out of such practices medical associations can probably do more than government can.

But government and the profession must cooperate, wisely and freely and thoroughly, to secure for us all that we have a right to demand from medical science. They must cooperate to get us rid of unscrupulous commercial medical schools; to get us rid of half-trained practitioners. Dr. JOSEPH A. WYER declared last week, in this journal, that our graduate students "even so this day, only one-third obtain first practice as interns in hospitals."

We have too-often in America as able physicians and as fine medical schools as there are in the world. But we have too many physicians and schools of the other sort. If both government and the medical associations do their duty—unfortunately government means both Congress and the legislature—there is no reason why we may not afford a device or so well as safe in calling a doctor anywhere or so we should be in France or Germany or Switzerland.

## Diplomatic Appointments

The administration continues to direct accomplished and capable literary gentlemen from the amelioration of society at home to the education of foreign princes. Starting with Ambassador WALTER PAER, whose qualities, we read, are so much appreciated in London, the line now includes Mr. THOMAS NELSON PAER, of Virginia, ambassador to Italy; Dr. HERMAN VAN DYKE, of Princeton, minister to Holland; Mr. MERRITT MANNING, of Indiana, minister to Portugal.

These are all appointments which we judge will be heartily approved both coming and going. The approval of Mr. PAER found an expression last week when Harvard embelished him with her "LL.D."

## For the Merit System but also for "Mere Wealth"

It was scholastic, though intimated in the Washington dispatches, that the WILSON administration was going back on the plan of promotions for merit in our foreign service. We are glad the President has promptly decided it not merely by words, but by actually promoting Minister PAER from Copenhagen to Vienna. We trust and believe he will adhere to the principle still more closely in the consular service, where it is most clearly demanded by every consideration that appears to common-sense patriots.

Still, to be honest, we must confess some contemplation with criticism of the President to send THOMAS NELSON PAER to Italy. No doubt an absolutely rigid system of promotions would have prevented that, as it would also have debarred LIVING and LOWELL, and other American men of letters from delightful diplomatic assignments, in which they did as much for home. Come to think of it, however, even in our diplomatic service it is not wholly right. If it had been, they could never have sent us BAYCE.

## "Mere Wealth"

In sending Mr. THOMAS NELSON PAER as ambassador to Rome, President WILSON has, for several reasons, shown his preference for personal distinction as against mere wealth in our diplomatic service.—*The Evening Post.*

Yes; but it is not necessary, in raising the two admirable PAERs, to disparage the secondary recommendation. We disagree neither of them looks due private ability to pierce out the inadequate provision our government makes for its ambassadors. And "mere wealth," by the way, has seldom been a true or an indispensable service. It has often been a contributory factor in appointments, but rarely the governing consideration.

## Commencement Jollification

The college have commenced again. A great deal has been said by the commencement orators, but that with the tariff bill and the currency fall and the boat-races and the ball games, a less proportion than usual if it seemed to come to general public notice.

Commencement has come to be in some of the colleges a much more highly organized festivity than formerly. At Yale and Harvard, for example, large classes that are old enough to ball and give themselves to several days of general merriment. Then there is a very prevalent and growing fashion of uniform costumes, some of them very elaborate, for the classes returning to explain another five-year period, and to play ball and long and long and long and long. Aged graduates read with wonder of the efforts of their younger brethren to have a good time, and watch their organized and costumed exertions with approval, to be sure, but not with much envy. But the current disposition is to hit the line hard in everything, and for the amount the pleasure of tranquillity are in less esteem than their merits warrant.

## The Boat Races

Poughkeepsie had the best of the boat-races. There was not clear water at the finish between any two of the five leading crews there in the fourth race. The final dispute between the two crews, New York crews—Synagogue and Cornell—was admirable racing. Conservatism may pick up heart at the victory of Brother Dyer's young men.

At New London the four-mile race was a procession after the first mile, with Harvard quite hopelessly in the lead. Yale is still in the doldrums in her boat-racing matters, and seems to be moving through a period of experiment such as Harvard went through before her. The English stroke has so far done her no more good than it did Harvard. The crews that win seem to be crews trained and taught by pedagogue narrows. There used to be and still is a sentiment that,

though men could properly be paid to teach mental things in colleges, the lesson in athletic sports could not be so readily imparted. That sentiment is not so strong as it was even among the conservative. The objections to professional paid teachers of such branches as rowing grows fainter, and the need of such teachers for crews that participate in such races as go on at New London and Poughkeepsie is obvious. Amateur crews of the requisite ability can be found every year, give the necessary time to their recreation. Some one must stay continuously on the job if rowing traditions are to survive and crews be properly taught.

## A Liberal Southern College

Trinity college, at Durham, North Carolina, which lately received a million dollars, largely from the Dixie brothers, was a fit college to receive the gift, for several reasons. One was that other large gifts, mainly from the Dixies, had provided this one; it can be used, therefore, in carrying out plans already initiated and which look toward high work not possible in a poor institution. The other reason was that Trinity already has an extremely liberal atmosphere, and has already made itself a center of the best Southern thought. The "South Atlantic Quarterly" is edited and published there, and some years ago, in the case of Professor ROBERTS, the college fought and won a great case for the liberal method. It is one of many public and practical educational factors in the South's ever-quickening renaissance. It is one of the places to which we may look hopefully for activities and influences that may possibly, while helping the South to still greater material prosperity, measurably assist it against some of the unwise concomitants of wealth prosperity which the North and West have known.

## Tantalum Is Now Good Form

In connection with the comment on the "grape jubilee" dinner at Washington, which has been criticized as hopelessly provincial, it might be said that abstemiousness in the use of alcoholic drink is not provincial in any sense. It is stated that a number of the best French and European aristocrats, among those who drink no wines of inferior vintage, are King of Spain, King FRANCISCO of Portugal, Queen Maria of Holland, and King and Queen of Sardinia.—*The Outlook.*

Another person "mentioned" as drinking no wine is Mr. BAYCE, in whose honor Mr. BAYAN gave his first grape-juice dinner.

There is nothing provincial about voluntary abstemiousness. What was criticized about Mr. BAYAN'S dinner was necessitated tautology.

## In the Philippines

Harvard gave Bishop BRYCE an LL.D., and he made a speech at the Commencement dinner at which he said:

Of this action there fall well that take to the student body of this institution is not the most common a period of tautology and dependence. But we look toward a moment when our history will be recorded in the history of the people for whom we stand sponsors; and until that day has dawned we shall continue our trial.

I have had a share, a small share, in this task for two long, unproductive, difficult years, and I stand ready, should it appear to be my duty, to give the balance of my days to what is the most glorious and noble service ever rendered by a strong to a weak people.

That is strong testimony to the merits of the work which is being done in the Philippines in the last twelve years, one happy feature of which, the Libby said, is that constructive work has always been kept above party politics. He spoke with enthusiasm of Governor Thomas, whose successor, if elected, will inherit a situation of division and inefficiency not easy to maintain.

## Disarming the Moros

General PENNINGTON'S campaign against the Moros was for the enforcement of a law of disarmament in Mindanao; very much such a law as our General Big TIM SULLIVAN provided for the city of New York. General Pennington, who is the hereditary governor of Mindanao, had laid in a very nice line of new weapons when General DENYAN thrust them in the crater of Red Dajo, and performed to get some good out of them if possible. So they fought, and they are very interesting fighters, and have convenient natural defenses. Finally, exhausted, they were left with shell. But in the end, after a season of very enjoyable fighting in which a large proportion of them are killed, they are cleared out and compelled to respect the ordinances.

It seems wonderful to kill so many Moros, and it is very troublesome, besides, but what more can you do

possibly since they are so invariably addicted to the use of weapons some of them might be used in military service, and for some others there is the example of JACK ROSE and the lecture platform. But the gentlemen on the ground should be the best judges of these expedients. Our old way with bad Indians was to round them all up and move them away from home to a convenient reservation.

## Gains?

Perhaps it was not true, as reported last week, that Senator OGDEN has urged the President to appoint ex-Governor DIX, of New York, to be Governor-General of the Philippines. We did not know that Governor DIX would care for tropical reservations, but he is not there's Gunn.

Why not Gunn, Senator!

## Timely Words

Colonel ROBERTS spent several hours in Boston on June 19th, and became implicated in various commemorative exercises of the night before Boston's Hill day. In one short speech he is quoted as saying:

"I wish I could get a square deal for every man, to put down injustice and set up high places in politics and business life, but it has to be done in the American flag, and not under the red flag of anarchy."

We welcome to this country every man who in good faith can save lives and perform his duties as an American citizen, but he is not to be against our institutions. He is not to be disloyal to this country.

Those were timely words from him. They won't do any harm, anywhere, and in some quarters they may do some good.

## Marc Henry's Condolences

Thomas had eleven or twelve affidavits of refunding bonds to sell last week, and there were no satisfactory buyers. MARC HENRY WATKINS offers his condolences:

Here we have the celebration of six or seven years of fake politics, Tennessee, the Magnificent, because of noble abstinence in the presence of wealth and noble abstinence in the presence of poverty, and noble abstinence in the presence of bankruptcy. And therefore? Because, struck by a wave of religion and morality, the people of Tennessee have allowed themselves to be carried away by the single issue of temperance into the most intemperate manifestations of the basest of government and the public integrity and credit have been contended with false schemes of moral regeneration.

Kentucky, through the same process, came perilously near the same fate. I should have no word quite over the sun, as still hang upon the edge of a fiscal whirlpool. Although we have little to brag about, still we are owed his and our-door neighbors, and therefore let us say, Kentucky mourns for Tennessee.

Since there is no provision made for receivers' claims for notes, Tennessee will have another chance to sell bonds, and may offer a new bill that will secure more desirable. Marketable bonds and social regeneration must not be incompatible.

## Japanese Pride

The Japanese feel that they are just as good as Europeans, and want to be universally accepted on that basis of valuation.

It is not to be despised and to be respected. Very likely they are quite as good as Europeans. They may be better. But they are different. They were not mixed in the same way, and nothing can make their legal border where a contract or a custom calls for Europeans.

That that is true, and it is true, implies no dishonor to the Japanese. They should not take offense because they are held to be "different." They value themselves as Japanese. They do not wish to mix their breed. We value and respect them as Japanese. But we think they are more valuable not mixed in blood with us, and that we are more valuable not mixed in blood with them.

Probably it is disagreeable to feel the same way about that, but actually they do not like not being mixed.

## Illustrious Abolition

It was Mr. Justice BRANLEY an illustrious member of the Supreme Court, who said that great tribunal, solemnly said, etc.—*The Sun.*

No matter what he said, Times have changed indeed when the Sun speaks of "ILLUSTRIUS BRANLEY" as "an illustrious member of the Supreme Court." Not that he wasn't, but it is so wonderful to see one who has read the Sun since the days of HAYES and TRUMAN to see it so stated in this paper.

IN THE HOT CHUCKERS OF THE LAST GAME

THE BASHING, BRASH, WOLPING PLAY OF THE AMERICAN TEAM CARRIED THE WISDERFUL HORSEMEN AND EXPRESS IN UNCONVENTIONAL POLLO OF THE ENGLISH TEAM OFF THEIR FEET. "NATIONAL CHAMPIONSHIP," SAYS THE LONDON "TIMES," "MADE THE DIFFERENCE BETWEEN VICTORY AND DEFEAT IN THE EVENTUALLY MATURED TEAMS IN THE GREAT INTERNATIONAL MATCH."

## THE POLO MATCHES—A REVIEW

### BY GEORGE MARVIN

"KILL it, Larry!" yelled an excited whistler, as Mr. Lawrence Watbary rose in riding down the western boundary, leading Captain Lockhart to the ball. And "Larry" killed it. A shot out of a near-side shot. Hit from a sweeping pony at full speed, straight through the middle of legs and machine chain between the goal-posts, and up went the red flag with America's second tally. Over on top of the crook stand, several hands pulled down a big white flag from the space on the score board under "America," and set up in its place a bigger, whiter number 2 over against the empty black space underneath "England." And the standard was re-raised on the field, was joined by some thirty thousand of his fellow countrymen and women in a yell, roaring cry that sounded like the taking of a city or the first touch-down in a Harvard-Yale game.

"Larry" killed it. Less than two minutes before, "Monte," equally brilliantly, had killed it. With nervous nerve that permeated white willow ball flew or rolled about the field, there was a white-shirted Cornish whorling to slash, and cut, and drive, and back it, in spite of all the horse-shirted British could do. And then, just before the big gang changed the color of that nervous nerve, and a half minute, Mr. Milburn came through with a tremendous drive which killed the ball high over the tops of the posts, had space between them, and showed that number 2 off the score-board for a still more beautiful, smiling, victorious number 3. Only one-sixth of the game gone, and America three goals ahead, all the play in British territory, and an exhibition of such dazzling polo as to hold these pumpered thousands breathlessly on their feet throughout the period.

Other things happened afterward. There was another game on Saturday. The "Big Four" became the "Big Five" when "Monte" broke his legs and Mr. Mitchell stood up to his opportunity. Qualities of patience and endurance were needed by spectators; but these were waived this way and that, but the die was cast, the answer was written, in that wonderful first period of the first game, probably the best period of championship polo ever played in this, or in any other, country. That was the international match. That is the story. All epitomized in seven and a half minutes of supreme effort by horse and man.

The London Times attributes the difference between victory and defeat, other ingredients being nearly equal, to what it calls "national characteristics." National characteristics shank right out of that first chucker. The leading captain contended, played as well as there have been. The "Big Four" string four periods at least of four glorious hours, played better than they have been. Against any other set of men now in the game, the best set of polo before that the Hartingham team would have prevailed. That in the first half of Tuesday's game they were handled out of

their true form and swept away by a pace and a degree of intuitive team play unprecedented in their entire experience. If you get four men hitting a polo-ball with the precision of billiard-players, and flow them them loose in something of the wild abandon of a Redoubt cavalry charge, no other polo can stop them. It was a careful game against rival war-military sportsmen against men called for the moment into sporting warfare.

Mrs. Elsie French Vanderbilt and Mrs. W. Goody Low under camera fire as they left the grounds at Meadow Brook

#### The Roll to the "Big Four"

PART of the thrill—particularly of Tuesday's match, but prevailing both games—came from the entire display revealed in form of Mr. Whitson's team. It is doubtful if the records of sport provide a more striking instance of "come-back." Most of an hour journeyed down to Meadow Brook that first day in a fairly helpful frame of mind—such glorious June weather would not be regarded upon as the harbinger of defeat in the old Meadow Brook long being known at the last moment to defend the eye which they had twice before won from England. But it was no longer the "Big Four" that it used to be. The Watbary brothers were away off their game, and Mr. Whitson had not been playing within several goals of his rating. Even Mr. Milburn, in the general slump, could not be depended upon as the bulwark of defense as had been in 1911. This was the talk that went stilling around long blood commiserate where these professors are generally called by their first names, and like this were the reasons that found their way into the papers and into the betting odds on Wall Street: "Let the little teach, and youth is gone"; "you must expect me forty years old to regain the simple form of thirty"; "This is simply another instance of a great past succumbing to the inevitable present; the Big Four can't come back."

The excess thing about all this kind of gossip is that it was really well founded. For several weeks before the international matches the individual members of the original Meadow Brook team had been playing so badly, or rather so far below championship level, as to weaken the confidence of the Polo Committee in them, and even to affect their confidence in themselves. Nothing is more sure than being top to a good reputation; and very probably three members of the team had gone a little while from too much responsibility and from having so much expected of them in every practice game during the long training period.

Nevertheless, about two weeks before the date set for the first international match, the Big Four was reinstated to defend the cup. Realizing that Mr. Whitson, the Watbarys, and Mr. Milburn had had comparatively little practice together in their original order during the first matches, the committee decided that, with the advantage of playing together regularly again, they would regain their old form. But, in every man's surprise, each did not press in to the team. The same men who had been before four previously seemed unable to get together as a team with every apparent condition in their favor. In the successive English challenges had agreed that, with the advantage of playing together regularly again, they would regain their old form. But, in every man's surprise, each did not press in to the team. The same men who had been before four previously seemed unable to get together as a team with every apparent condition in their favor. of team work and individual skill such beyond the form of the Harlington team which so recently raised the cup in 1911. To see these four British cavalry officers run through a well-mounted team of three, four, and five-year-old of Piping Rock or the Phigps' field in the time of seventeen posts to nothing, and then to see Mauder Brook making very hard going of it to win out against the same class of opponents, threw a good deal of consternation and doubt into what the sporting circles alludes to as "polo circles."

Unhappily, there also grew up a feeling of opposition on the part of a few players who resented the idea of accepting the championship team on its position without such regard to its record performance. This feeling culminated in a hard test match in which a team of the leading substitutes, two of whom were internationalists, clearly outplayed the chosen defenders. Through Mr. Whitney, whatever may have been his belief in the eventual successfulness of his team, out of deference to a growing opposition and the approval given before the Committee, withdrew from the field and resigned the captaincy. The two Waterburys went with him.

On the following day the Polo Committee, of which Mr. Whitney is a member, appointed a new team made up of Mr. Stoddard, No. 1; Mr. Wilson, No. 2; Mr. Kress, No. 3; and Mr. Malcolm Stephenson, back. Mr. Kress, who in 1898 had been a member of the first American international team, and who had again played against England in 1902, was appointed captain of this new defending four, which, having received, would have taken the field against Harlington on June 15. Purely as a matter of experience and individual ability, Mr. Kress richly deserved this honor. He is the only man in the country to share with the members of the Big Four the highest American handicap rating of nine goals, and he has, moreover, played consistently brilliant polo during the present season. Mr. Stoddard and Mr. Stephenson also, although officially rated of seven goals, were rising leaders and hitting men accurately those either of the Waterburys or Mr. Whitney. These matters stand, then, when this interview. Mr. Kress was chosen from his past and broke his back in the field of subsequent events, it was a fortunate accident. As certainly as Mr. Whitney's team

would have been beaten had they turned on against England the kind of polo that led to the substitution of Mr. Kress's four, just so certainly would the latter have been beaten by the beautiful team-work of Captain Wilson and his brother officers on June 10 and 11. No team of stars, without a correspondingly high degree of team-play, could have prevailed against it; and Mr. Kress and his associates had had an opportunity to develop the kind of inter-relationship which will stand the strain of a championship match.

Next, it so happened that the very difficulties encountered in making the final selection of the defending team resulted in its favor. With the same fair sportsmanship which had prompted his withdrawal, Mr. Whitney now agreed to step back into the breach; but, as any combination of his team a fifth that of Mr. Kress would have lacked even the degree of unity which was at that time accorded to the original Mauder Brook four, it was decided to put that team into the field exactly as it had defended the cup four years ago. That is, with Mr. Lawrence Waterbury at No. 1, his brother No. 2, Mr. Whitney in his regular position at 3, and Mr. Milburn at back. During the four days in which they had been relegated of their own accord to the substitute list, these gentlemen had enjoyed almost entire freedom from responsibility, and this mental and physical rest, coupled with the tractive from apparent failure to an eleven-hour change to vindicate themselves, seems to have had just the psychological effect needed to put all four of them on edge again.

To say that the Big Four came back to be understate what actually happened. Never in their long association have they reached quite the plane of individual brilliance and team-play which they struck and maintained throughout the first four periods of the Tuesday game. No one in the stands was prepared for such wild coming back, certainly not the four Englishmen who knotted hither and yon, playing their best polo and finding it not good enough. For the spectators, added to the excitement of the game as a magnificent spectacle of horse and man in intense action, came the jubilation that in the same degree was awaiting all forwards and carrying the redoubtable Englishmen off their horses' feet. This interview lasted. It lasted until the

middle of a Tuesday, and prevailed through the hot shadows of Saturday's game, which was, so far as the score-board told the tale, practically a tie.

*Crash Polo for King of Games*

AMONG the forty thousand people who saw one or both games, probably not more than five or six hundred understood the finer points of polo as thousands of fans all over the country understood inside baseball, or stadium full of almost appreciate the details of American football. It is a pity, in many ways, that polo, which is really the king of all games, is, in the present organization of society, confined almost necessarily to the exceedingly rich, only at the times of those international matches in any general public interest and enthusiasm abroad in this country. At other times this grand sport thrives only in the mother afternoon light which shrouds over smooth country-club lawns, or on some level pasture straggling near a pony-breeding ranch, or now, in recent years, across the dusty parade-grounds of cavalry posts.

Who knows how many Larry Waterburys may be lost by the banality of modern manners? Perhaps some super-Milburn is even now waiting ten-pod shanks as golf or motor-cycling! However these things may be, the intense excitement which the game never fails to arouse in every kind of spectator, irrespective of class, sex, or previous condition of ignorance, is a sufficient proof of its real character. It is a dangerous game, and if in the fastest of games; it calls for courage, dash, resourcefulness, staunchness, good qualities, those. When played with British ponies it is fifty horse-races rolled into one. The average healthy spectator recognizes and responds to these things, and any firm who has eyes to see can make out on its hockey or lacrosse, the main object and course of the contest.

Every one got the stirring spectacle at Mauder Brook greater familiarity would seem best a general appreciation of the wonderful skill shown in these international matches. For example, a great majority of the spectators admired the beautiful work made in the fifth chucker of the second game by Captain Wilson, when, in the last fraction of a second, he deflected a shot going dead between his own goal-

poets. In the final score that safety proved to be the quarter of a point margin by which his team led the match, and with it the cup, but in making his bid the English captain saved his side an otherwise certain goal, thus really gaining three quarters of a point.

*Individual Merits of the Players*

THE perfection of Captain Whitely's all-round play also probably escaped general appreciation. Never a shrewd business man or a very big hitter, he is, when up his game, absolutely reliable. To an extraordinary degree he relies upon his own strength in the general position of the team. As in the cup games two years ago, so again this year he proved the mainstay of his team. Mark of the Waterbury's brilliancy was due to their confidence in the accuracy they would be fed the ball up to them, and Mr. Milburn's great run up through the field was always adequately protected by Mr. Whitely's falling back into No. 4's position.

The two Waterburys have been playing polo together since they were old enough to sit a pony and swing a mallet. Their team-play is intuitive. In the early period of Tuesday's game Mr. "Shorty" Waterbury, in having forward he intercepted a near side shot by Captain Ritson, had the Emperor of his right hand

broken by the carry-through of the Englishman's mallet and was obliged to retire. Up to that time the play of the two American forwards had been making short of bewildering. It was like the neutrality of the right and left hands of an individual. Without any calling out, each seemed to know instinctively where the other would be and what the other would do. Naturally, the loss of such a perfect partnership in the attack might have proved disastrous—and became a substitute equally as good was not available, but because his substitution affected the other three players inevitably. Instead of a leveling of conditions and the automatic adjustments born of ten years' playing together in the same order, the other three were hurried, and their play fell off correspondingly. Mr. Stoddard, who went in at No. 1, Mr. L. Waterbury falling back in his brother's position at 2, came out into a torrid game, and, with the situation of the entire field going to him, he was very naturally nervous at first and missed near shots. It took him to the end of the match to get really going; but in Saturday's game he more than redeemed himself, making four of the five goals scored by his side, two of them back-hand shots at difficult angles.

To criticize Mr. Stoddard in another respect is, at the same time, to praise Captain Lockett, the English back. The latter, while the Waterburys were back in the game, did not shine. One wondered how he got the reputation of being the best back in India. Toward the end of the first game Captain Lockett began to justify his reputation, and in the second game his decisive play was witnessed in the extreme. On Saturday he played very deep, and as was often able to overtake the ball unobstructed and to send it up the field by off-side back-handers no less and easy that their length was astonishing.

In the corresponding position, Mr. Milburn's method in delivering goal often misunderstood was to ride up with the ball on his near side and, turning in his saddle, send it back by a profligate wallop across his middle arm. When Mr. Milburn received Captain Lockett was in his ability to move time held his own in riding off, and in his accurate two-handed hitting while making his fingers run up through the field on the offense. Mr. Milburn was fearfully accurate, especially on a big sixth day, looking more like a single-finger than a pony, which he rode in three checkers of each game. It must have been a forward-side sight to the Englishmen to see 100 pounds of Milburn borne by this run-horse cover surging down on them. As one looks back over the two games, the figure that stands out most distinctly are Mr. Milburn on this change, rounded back by his running, and Captain Ritson mounted on a gray pony which played the game as nimble and intelligently as the "Madame Vag" in Kinging's famous story.

Mr. Milburn's play was wonderfully mobile. He was all over the field, always going at top speed, and yet hitting on both sides of his pony with rapid accuracy. Like the other members of the original team, he does not play conventional polo. In fact, it is the methods of the Madras Hook team had not passed an apparently successful trial, would be declared wrong. For example, Mr. Stoddard plays No. 1 position conventionally and properly, and for that reason he belittled the English back, Captain Lockett, more than their old "Larry" Waterbury, who, instead of covering his man as he should

according to the tradition, went riding around, keeping appointments with the ball in the most summary and irregular fashion. The English players were good and modern of conventional polo, but both sides then was the absolute freedom of their opponents' play.

*Poison and Horsemanship*

IT is one thing the British were supreme. Their horsemanship was worth the entire price of admission. At the end of each checkered the British ponies must have had much more left to them than 17th-century animals which moved them up and down that with a mile of turf. They were more easily managed, spared by lighter hands and firmer seats. The Englishman had a way of getting the strongest off out of their mounts without working them when. You could see a British pony going down the field, rebounded at a tremendous pace, with his rider a motionless blue figure upright in the saddle, while his legs moved some way the delimiters, arms, legs, and body in connection almost as if he were himself standing on his own feet. This beautiful British horsemanship probably had something to do with convincing several critics that the leading ponies were handier than ours. As for short sprints, it seemed to me that we often had, at least in the second game, no great advantage.

In the matter of ponies, however, all things considered, there was no little advantage one way or the other that no just grounds remain for attributing victory or defeat as in 1911 to differences in horse-ship. After all, a contest could hardly have been closer. A difference of two and three quarters goals in the total score of two games does not spell incapacity. A very little turn of events might have altered the result. Captain Champ, who in many respects is the finest No. 1 playing the game, missed three goals by trying to smash them out from his far arm, and Mr. Frank, the famous veteran who took Captain Edwards' place at No. 2 in the second game, had two near-front chances to score in the final period. But similarly the American score might easily have been increased had not two noble tries for goal bounced the wrong side of the post after hitting it. Luckily, there have been no hard-look stories, or post-mortems. The games were fairly won and gloriously lost, and there is no end to the matter for the present.

It was very pleasant to see instances of the cordial relations which have characterized this visit of the Harlequin team. As Mr. Milburn sat on the ground after a spin, waiting for his groom to bring back his dervish pony, Captain Ritson rode off the field hand in hand with Mr. Whitely.

And surely there was enough glory on that field for all the ten men who fought there. Never was more highly concentrated championship brought to an issue. There was in the dew shirts were the pick of the British Empire, two of them all the way from India, the fittest survival of hundreds of polo tournaments.

And the men all in while riding to meet them were our best in that particular position. The world was crowded for those ponies. It was only a game, if you will; but it was a very supreme game. And where shall we draw the line, if we attempt to divide it between that which is a game and that which is art?

# THE STONE ARMADA

## A Bit of the Secret Archives of the United States Navy Department BY CHARLES FREDERICK HOLDER

**I**N the fall of 1861 there sailed from New England one of the most extraordinary armadas in the history of any country. Generally such movements are exploited in the press, and attract the attention of the world, but the Stone Armada, as it was called, was a secret movement, and a fleet of nearly fifty ships, representing the flower and dross of American shipping, was raised and despatched, in two or three squadrons, upon a secret mission. Even the crews did not learn their destination until the secret orders were read at sea.

There is at the present writing but one of the captains of the ships of the Stone Armada alive—Captain J. M. Wilks, now eighty-eight years of age. From his statements and recollections the main facts of the following account of the Stone Armada are taken. His story affords the fullest account of the enterprise yet published, so, singularly enough, there are only meagre details of the movement in reports and histories of the war, because the movement was kept a mystery. Even Duross, who was blockading Charleston and Savannah, was doubtless ignorant of the enterprise, and Don Apriste flew with post-boats pointed on and an armament described by some of the Marblehead crew as a "rock-throwing-machine" procession—referring to the fact that all they could do would be to throw rocks at the enemy.

The genius who originated the Armada idea has been lost to fame, but the plan involved such a large expenditure of money, and was so elaborate, that it is only fair to assume that the Secretary of the Navy authorized it, especially as the Department records show that the Assistant Secretary of the Navy was in charge of the details and quietly carried out the movement.

At this period England was aiding the cause of the Confederacy in every way she dared, short of recognition. Vessels even large ships, were loaded with rations, powder, muskets, blankets, and every possible article that the Confederate soldiers could use, and were sent over, consigned to various ports in South America or even in the United States, so that if overhauled by government vessels, they could not be taken. But all these vessels, and there were scores of them, carrying millions of dollars' worth of property, were loaded for Charleston, Savannah, New Orleans, Mobile, or some other Confederate port. It has sometimes been said that the War of the Rebellion would have been stopped in the bud in its inception, had it not been for the covert aid and the money supplied the Confederates through the sale of cotton by means of English blockade-runners. There were thousands of Englishmen engaged in this business, and for several years before the fall of Sumter they laughed at the government, and played a winning game.

The writer at this time was at Fort Jefferson on Garden Key, and all New Orleans vessels made the sharp turn here to run between Key West and Cuba, either through the Bahama Channel or out through some of the channels of the island. The fort was a magnificent pile for the time, but when Sumter fell the armament consisted of one shot-gun, owned by an engineer named Scott, and consequently capture was daily expected. One of our favorite diversions during the first two years (between 1860 and 1862) was to go up on the parapet and see the swift Clyde River English steamers play tag with the *Saxsefer*. She showed herself of our fleet, stationed there. The *Saxsefer* was a big New York bar upon which several guns had been placed, and she was under the command of Captain Van Syer, who had been a captain for years on the Mallory line between New York and Key West.

Captain Van Syer, a fine type of the merchant-service navigator, coaled at Fort Jefferson and made that harbor his headquarters. He was a constant guest at my father's apartments, who was the post surgeon and quartermaster officer; and several times, while I sat with us, the entry on the parapet over our heads would ring out, "Corporal of the guard, post number one." The

next entry would take it up, and the cry would go on rising over the fort, which was half a mile around. We knew that this meant that he had sighted a privateer, and we would rush for the bottom stairs, while the captain of the *Saxsefer* would run for the sail-port, jump aboard the tug, which was always ready, and strip out the mainmast channel.

Though we always ran out to watch her bold advances, we never saw the *Saxsefer* catch a privateer. Once she did chase one into the fleet off Key West. Quite

"Seventy-five hundred tons of stone were bought and dumped into the ships of the Stone Armada"

"'Nix,' he said, 'do you want a berth, short and sweet, and good pay?'"

MRS. HARRY PAYNE  
WHITNEY  
SCULPTRESS  
AND  
HER PARIS SALON  
FOUNTAIN

Mrs. Whitney's latest photograph, taken while she was watching her husband lead the American Cup defenders to victory in the final polo match at Meadow Brook

The original design of the fountain modelled by Mrs. Whitney. From this cast she worked out the completed statue at her New York studio, in the artist quarter of MacDougal Alley

A daughter of the Vanderbilts, the wife of the heir of a monumental Standard Oil, street railway, and tobacco fortune, Mrs. Whitney represents, as few other individuals do, the inheritance of the great kings of American business.

Some ten years ago she turned her attention to sculpture, working first in a studio in the New York Bohemian artist quarter in MacDougal Alley, New York, and for the past year in a magnificent studio built for her use, at a cost of a quarter of a million, on her country estate at Roslyn, Long Island.

Her fountain shown above was designed for the new Arlington Hotel in Washington, and exhibited at the Salon Artistes Français in the Grand Palais at Paris. It has just been awarded an Honorable Mention by the Société Nationale des Beaux Arts of France.

# THE PRASLIN MURDER

## A Famous French Mystery Case BY MARIE BELLOC LOWNDES

ILLUSTRATIONS BY WILLIAM BERGER

"The Duke hardly ever came home without receiving a harassing, reproachful message from the Duchess"

THE supposed murder of the beautiful, passionately loving Duchesse de Praslin by her husband the Duke is a story that might well have inspired Browning in some one of his great poems, or that might have added another set of verses to George Meredith's pungent study of married life, entitled "Modern Love." For the Duchesse de Praslin's only crime, in her husband's eyes, seems to have been that of being his too prominently, and of making him aware, partly by reproachful speech and in public letters, how badly she felt the change in his attitude since they had been for seventeen long years the most devoted of married lovers.

There was, as we shall see, another woman in the case; and not the least strange and interesting part of the story is that of the connection of the Duke and of this woman, whose no reasonable being suspected in France, where such things are rarely accepted, at least done the Duchesse any real wrong as a wife.

This story has a special interest for American readers, for the lady who was thus dragged into the awful drama ended her life in the United States as the highly respected and beloved wife of a prominent citizen of New York.

AT half past four one morning in August, 1847, a couple of workmen passing down the deserted Rue-Saint-Hippolyte, lived on the Upper-Elysées side with magnificent private dwellings, heard a piercing scream proceeding from behind the high wall of Marshal Sebastiani's splendid town house. The shriek was a peculiar Parisian—of arrival of the glorious Napoleon régime—and his only child, as all the world knew, was the beautiful Duchesse de Praslin.

Though it was August, the delicious-like season was well advanced, for the Duke and Duchesse and their numerous children had arrived the evening before to spend a couple of nights in Paris, on their way to the seaside.

These horrible, unnatural cries of agony and terror proceeded from the Duchesse's bedroom, and two of the servants—her Grace's devoted maid and the Duke's valet—roused by the noise, had risen in haste and rushed to her. To their horror and surprise, the various doors giving access to the suite of elegant apartments were locked. Behind these locked doors could be heard groans and sobs, growing weaker and weaker. Now, the Duchesse's bedroom, the principal bed-chamber of the house, was a magnificent apartment copied from Marie Antoinette's bed-chamber at Versailles. Of the four doors, one gave into the Duchesse's boudoir, the second on to a public staircase; the third into a dressing-room; and the fourth door led into a small side-chamber which opened on the bed-chamber from that of her husband. This private side-chamber could be reached by a small wood staircase from below, and it was up this staircase that the two servants finally moved bravely, to find that, above of the four doors giving on to the Duchesse's bed-chamber, this door was unlocked.

"Madame! Madame! What is the matter?" they cried. But there came no answering words of sign. Carelessly feeling their way as they went for the room was in complete darkness, they advanced into the Duchesse's sleeping apartment; and, as they advanced,

their struck on their nostrils a horrible odor—the odor of freshly spilt blood.

With awkward, trembling fingers, the faithful maid—who had never a scene of horrible confusion, heavy furniture upset, bed-curtains torn down, and splashes of blood everywhere, the Duchesse de Praslin lay dead. Clad in a blood-soaked night-gown, she was crouching against a low chair.

Neither the man nor the woman dared approach the prostrate figure; instead, they hurried out of the room, trembling as they went that all was still in the Duke's bed-chamber, and roused their fellow-servants.

Now the whole household was gathered in the great drawing-room, debating in quick whispers who should undertake to wake the Duke.

The problem was solved by their master himself. Suddenly he stood among them—a haggard, horror-stricken figure still clad in night attire. For a few moments those who crowded respectfully round him gazed upon him in amazement of the tragedy, for "What is the matter?" he cried. "What has happened to bring you all here?"

In a moment of horror, the Duke had seen the house had been broken into and murdered, doubtless with a view to recovering her jewels, which were very beautiful, and which included a wonderful set of diamonds given to her mother, the Marquise de Sabulnay, by Napoleon and Josephine.

The Duc de Praslin at once ordered the police and doctor to be sent for, gave wise orders to the distracted household, and then, as he made his way to his wife's room, he said:

"There his competitors for a few moments broke down. 'Alas! alas! My poor Fanny! What cruelty has done this thing? In an agony of grief, she threw herself on the wide empty bed, crying only: 'Alas! what my motherless children! Who is to tell them of the awful thing that has happened?'" But he did not feel his wife's dead body, and finally leaving her where she lay, he retired to his own room.

A few moments later the police arrived, and then every member of the household had to wait on to a severe examination; for when such a tragedy of this nature takes place it is the custom of the house who are first suspected, if not of having actually committed the crime, of having been accessories and accessories.

What gravely added to the horror of this particular matter was the dreadful brutality with which the Duchesse had been done to death.

The fire carried and gill bed—which stood, as in the custom in French state bed-chambers, on a platform over the floor—was in fearful confusion, the pillows deeply stained with blood, as were also the curtains. It was only too clear that there had been a terrible struggle between husband and her murderer. Not only had she received five gaping wounds, any of which would have been fatal, but her face and neck were covered with scratches.

On first being attacked, the Duchesse had evidently leaped out of bed to save her maid. And though already severely wounded, she had tried in the darkness to find the door to her boudoir, for round these sides of the great man ran thick finger-marks. The middle of the room, for on various pieces of furniture were found strands of her long, beautiful hair.

THE only clue that the police found—but they attached great importance to it—was a pistol, on the handle of which stuck several of the Duchesse's hairs and a small piece of skin.

At first it was supposed that the murderers had gained their entrance into the house by the garden going on the Champs-Élysées; but all the gates on that side were found to be securely fastened.

After every member of the household had been questioned and cross-questioned with the pitiless interest and severity usual in the French detective force, the Duc de Praslin was asked to tell what he knew of the events of the awful night.

And then came the first great surprise of the case. The Duke at once calmly revealed the fact that he had known of the murder before the servants had told him of it. Waked by his wife's screams, he had rushed into the Duchesse's room, to find her dead. Stunned by the sight, he had gone back to his own room. He also casually mentioned that the pistol which had been regarded as so important a clue to the murder was his pistol, brought into the room when he first heard the cries of his wife, and then forgotten by him in his horror and confusion.

"Madame! Madame! What is the matter?" they

# THE SCIENCE OF BREEDING KINGS

BY  
HENRY SMITH  
WILLIAMS

## THE CZAROWITZ

A DEAD PRINCE WAS CANNIBALIZED AND EVERY KIND OF SUPERSTITIONAL AID INVOKED FOR THE BIRTH OF A MALE HEIR BY THE KING AND QUEEN. CAESAR ALEXIS WAS BORN IN 1904

**F**OR the past thousand years the destiny of Europe has been largely in the hands of one kind of great stock of the human family. It is called the breed of kings. This breed has had a monopoly of calling by right of birth, somewhat as the thoroughbred horse has had a monopoly of racing by the same right.

At this moment, three political individuals rule over empires that jointly cover the world and include both the spheres, and that are populated by more than six hundred million souls—the third of the total population of the globe.

It is not correct to say that the rule of these monarchs is merely nominal. They still exercise, or refrain to will from exercising, great power, and William II, George V, or Nicholas II could personally plunge the world into war any day by a few ill-considered utterances. No the date feature of the royal stock of Europe need be of compelling interest to every one who pays the slightest attention to world politics.

But, quite aside from this, the pedigree of kings here importance for all, because they are the only comparative human pedigree that are available. A study of royal pedigrees enables one to feel the laws of heredity in a unique way, and to draw inferences for the application of genetic principles to humanity at large.

**The Seven Dukes' Beer-Soluble Part**  
**F**URTHER to introduce the subject, let me tell the story of how, through the practice of eugenics, an obscure German bishop became the father of kings. At the outset, the tale concerns several brothers who in the sixteenth century inherited a small ducal estate on the borders of the Black Forest.

The estate included the free Hanseatic city of Lüneburg, and was large enough to have some significance in German politics. It included, but the brothers realized that it each one to claim a share in the estate its divided fragments would have little importance, either politically or culturally.

So they held a family meeting, and decided that only one of their smaller should marry. The lot fell on the sixth brother, who accordingly chose a wife and in due course had a family of children. These children made a strong

A SEQUENCE OF ROYAL KINGS  
THAT OF THE FIRST FOUR CHILDREN—ALL GREATNESS—AND EMPEROR OF THE EMPIRE OF RUSSIA

themselves the same company that their father and uncle had made. The duty of transmitting the family name devolved upon one Ernest Augustus, Bishop of Osnabrück. The growing influence and success of the Bishop of Osnabrück enabled him to win for his wife a very extraordinary woman, Sophia of Palatine. And the son born of this union inherited the original estate, with scanty accretions.

But a brother of the Osnabrück bishop had broken his compact and also married, and he had a daughter, whose advent brought consideration to the family. Sophia of Palatine never forgave her niece for being born, but she advised the dilemma by marrying her own son to the offending niece, his cousin. So the family interests were again united.

What the ambitious brothers and their successors had done was to practice the art of eugenics in three important phases: (1) They had restricted the number of descendants, by preventing the birth of super-numerary children. (2) They had wisely selected able males for the procreating members of the family. (3) And they had concentrated the family estate and talents by judicious intermarriage—that is to say, by the union of cousins.

Now note the sequel of this remarkable practice of eugenic principles. The son of the erstwhile Bishop of Osnabrück and his brilliant wife became king of one country (George I of England), and their daughter became queen of another (Sophia Charlotte of Prussia). Their direct lineal descendants to-day occupy the thrones of England, Germany, Russia, Denmark, Norway, Greece, and numerous minor principalities.

Now, the great majority of other lines of the development of the royal breed have to adopt a different and less rational means of accomplishing the same end. This is the expedient of descent through primogeniture—that is to say, passing on the chief family honors and estates, undivided, to the eldest son. This

familiar plan has the obvious disadvantage that the eldest brother may not be the ablest—a fact that led to the extinction of many a dynasty. But, in general, the rule has justified itself.

## Five Hundred Years of Hohenzollerns

**K**AISER WILHELM II inherited a few years ago at Hohenzollern the status of his Hohenzollern ancestor, Frederick I, in commemoration of the five hundredth anniversary of the day when that hero first made actual entry into the territory as Margrave of Brandenburg, and thus laid the small foundations for the future greatness of that extraordinary line.

In the five hundred intervening years there has been no time when the male descendants of this first of the important Hohenzollerns have not occupied positions of almost steadily growing influence.

(Out in the Teutonic era in Berlin you may see a long double row of statues of those successful princes of the ever-waxing dynasty of Hohenzollerns. There are thirty-two of them, including such names as Albert Achilles, John Sigismund, the Great Elector, and Frederick the Great. They are an illustrious company. Nearly all were men of talent; some were men of extraordinary genius.)

But while Kaiser Wilhelm of Germany is amply justified in exulting his ancestors of the House of Hohenzollern, the student of heredity must instantly recall that, in so doing, the emperor gains an entirely distorted impression of the totality of his lineage. It is as if a geographer standing at the delta of the Mississippi were to evul the waters of some single rivulet that fell on one, in Minnesota, as the chief source and constant of the mighty current, Kaiser Wilhelm. For every other individual, in ascending the stream of a countrying line of descent that includes more than two thousand individuals within five generations—

and each one of those had, in the biological view, as direct and as potent a share as any other one in determining the personality of their common descendant who today presides in the House of Hohenzollern. Were the Kaiser to do full justice to his ancestors, he must place in the foreground, along with the statue of the great Hohenzollern, eight or more others, of William the Silent, founder of the Dutch Republic, and Frederick Henry, Prince of Orange; of Mary Queen of Scots, of the remarkable Thomas d'Ufford and the amazing Catherine II of Russia; and of the man who is perhaps his own closest prototype in personality, Peter the Great.

## Interbreeding Cousins for Germans

**I**T will be recalled that one of the important eugenic principles practiced by the founders of the seven lineages consisted in the mating of cousins. There is a popular impression that a tendency to degeneration results from this interbreeding. A study of royal pedigrees enables one to distinguish what share truth and what of fancy there is in this impression. For there is an extraordinary amount of interbreeding in the families of Europe.

Let us take as an illustration the pedigree of that most illustrious of Hohenzollerns, Frederick the Great, traced through six pairs of five generations. Here is a double interest in the selection, not only because of the greatness of the subject, but because it includes the pedigree of nearly all of the seven lineages which supplied our text and, by the same token, a main stem of the ancestral line of the chief rulers of present-day Europe.

The father and mother of Frederick the Great were cousins. Both pairs of his grandparents in born, were cousins through six pairs of five generations. Here is a double interest in the selection, not only because of the greatness of the subject, but because it includes the pedigree of nearly all of the seven lineages which supplied our text and, by the same token, a main stem of the ancestral line of the chief rulers of present-day Europe.

THE KAISER'S GRAND-CHILDREN

THEY WOULD BE GRANDSON, IN THE NEXT LINE OF INHERITANCE FOR THE THRONE

In the third generation we find also Frederick William, known as the Great Elector, the first great-grandson of Francis, and Louis Henriette of Orange, the second-granddaughter of the Great William the Silent and the only line which descended to George III. The blood of William the Silent appears in three other strains of the pedigree, and that of Mary Queen of Scots in two strains. In a word, there are not forty, but over a hundred names among the forty families which represent Frederick's ancestors within five generations; and the fact that these are not forty, but over the normal sixty-two individuals, in itself proves the extraordinary experiment in eugenics which, in the generation upon which our attention is focused, not only Frederick II, one of the small select company of all time who by common consent are sustained "The Great," but a brother Henry and a sister Anna almost equally gifted, and another sister, Sophia Ulrica, who may be said to stand fully on a par in intellectual endowment with her illustrious brother, and who as Queen of Sweden was known as "the Minerva of the North," and became the mother of the famous Gustavus III.

Here, then, is an adequate and convincing demonstration that even the closest inbreeding does not necessarily produce degeneracy; but that, on the contrary, it may be possible by such inbreeding to concentrate and bring to the surface characteristics of the highest and most desirable quality in the human breed, just as special qualities are concentrated and brought to the surface by the same method in the special breeds of domestic animals.

Inbreeding for Degeneracy

**B**UT, but not accepting a conclusion be drawn from this example of inbreeding for genius, it is desirable that we should at one time in another royal pedigree and observe the effects of inbreeding where the traits contained and retained are of a less desirable nature, as in the case of Frederick the Great, but include also those of mental aberration and physical and mental degeneracy.

Such a pedigree is supplied in the immediate ancestry of Don Carlos, the "madly depraved and cruel" son of the Spanish royal house, a man who has been characterized as the most worthless and depraved individual in modern history.

A glance at the chart showing the ancestry of Don Carlos reveals that his father, Philip IV, and his mother, Mary of Portugal, were at one first and second cousins, and that each ancestral strain leads quickly back to ancestors characterized as weak or cruel or mad. Juan, "the mad," appears twice in the third generation; and the insane Isabella four times in the fifth generation.

The inbreeding is so close and intricate that it would be difficult to characterize the relationship. In four generations there are only twenty-eight individuals instead of sixty-two. The result is that the normal stream is allowed to become overwhelmingly predominant by repetition. As Dr. F. A. Woods has said, it was as if the survivors of that time were leveling mental inequalities for the benefit of their experiment shows the eugenic principle inverted.

There is one feature of the pedigree of the depraved Don Carlos, however, that must instantly attract attention and excite surprise. This is the fact that there appear in the pedigree, along with the names of the madly insane, the madly unbalanced, and the madly depraved, the names of several famous characters, including Charles the Bold of Burgundy, Maximilian I. of the House of Austria, Ferdinand and Isabella, the Catholic, and the Emperor Charles V. What further excites surprise is that the names of Ferdinand and Isabella appear again and again in the fourth generation, and that in the case of Isabella there seems to be an alteration of generations between insanity and genius.

Guano-Fix, Grains, and Insanity

**T**HERE is a growing body of evidence to show that both views are valid. In recent years investigation has been made not only of the soil strains of rural progress but of the soil strains of insanity. It is now among people in general, and the result is that we are aware of an understanding of this hidden obscure truth. The soil factors are not only the soil factors, but the fact that the children of the mad are more of genius very commonly have no genius; yet that they sometimes seem able to transmit genius to their descendents.

No explanation of this anomaly was forthcoming until recent studies gave a clue through the soil

position that genius is a soil character which acts in inheritance as a recessive or so-called "recessive" character.

Let me illustrate in the simplest way. If a black guinea pig of pure strain is mated with a white guinea pig of pure strain in the suitable experiments of Professor William V. Castle, of Harvard, all the offspring will be black, because, in the Mendelian phrasing, the quality of blackness or pigmentation is "dominant" or positive, and the quality of whiteness or lack of pigmentation is "recessive" or negative. But the black offspring carry the potentialities of the recessive or negative character in the germ-plasm, as proved by the fact that when they interbred some of their offspring will be white like one of the grand-parents. Thus the recessive character disappears in one generation and may reappear in the next.

Making the application, if genius is in reality a "recessive" soil character, men or women of genius choosing a non-genius or average mate will produce entirely non-genius children. But if these children may, under certain conditions, produce offspring in some of whom the latent recessive character of genius will become latent and manifest. This will never happen, however, until the person in whose germ-plasm the po-

THE RIDDLE AMONG MONARCHS  
ALPHONSE DUC DE SPAIN, BRILLIANT, BAKING, EYE-TICKLING COMBINE IN HIS ANCESTRY BOTH GENIUS AND INSANITY

ney individual that can not patent in some direct ancestor.

Moreover we may fairly assume that the mass body of characteristics of any individual are manifest in some, at least, of his ancestors within at most four or five generations. Grand-folk knowledge of both maternal and paternal pedigrees is not far back, let us say, as the great-grand-grandparents, the student of eugenics may attempt with some confidence to trace the most part ancestry by means. The ancestral stock brought through the daughter of Queen Victoria a strain of neurotic habit which had manifested itself in the insanity of George III and the imbecility of two children of a sister of that monarch, mixed with the stable Habsburgian strain, in which the prodigious must be applied.

Emperor William's Brilliant Inheritance

**W**ITH these limitations in mind, let us very briefly view the more important contemporary monarchs of Europe in the light of their pedigrees.

As in Emperor William II of Germany, whose line has already been said to reveal the extraordinary character of his family history. His paternal stock is full of genius for the most part accounted by reason. The maternal stock brought through the daughter of Queen Victoria a strain of neurotic habit which had manifested itself in the insanity of George III and the imbecility of two children of a sister of that monarch, mixed with the stable Habsburgian strain, in which the prodigious must be applied.

PRINCESS MARY OF ENGLAND

VICTORIA, WHO HAS INTRODUCED MANY ENGLISH CUSTOMS INTO SPAIN, MEETS THE PRESIDENT OF A SPANISH RENT CLUB

instability is latent rather with another person having similar inherited potentialities.

Over and over again we find the descendants of the man or woman of genius manifesting no great talent until a marriage takes place that brings two such stocks of latent genius together. It is as if the quality that makes for genius were a sort of explosive which must remain inactive until a detonating spark is brought to it.

The lesson to be drawn is that a reappearance of genius may take place through the marriage of common, when otherwise genius might have an opportunity to manifest itself.

But—and here it lies the great danger—what is true of genius is equally true of the various accidents, and notably of imbecility. An analysis of the table of the ancestry of Don Carlos brings out both principles perfectly. The blood of Charles the Bold and Maximilian I, blended with the blood of Ferdinand and Isabella, produced Charles V, one of the most imposing figures of the sixteenth century. But his son, mingling two strains of the blood of the insane Isabella, was himself half a madman; and when he married his first and second cousin Mary, descended like himself from the mad Juana, the result of the union could hardly be doubted.

How to Parent Your Children

**T**HE great central lesson to be drawn here is that the child of a genius is not only a child of a genius, but the all-important thing is the family stock as a whole. Individuals must differ among themselves in the same heredity. The offspring must sometimes be in many ways different from his parents. But, rare instances of "sports" aside, no trait can appear in

THE GERMAN CROWN PRINCESS

THE LIVELY WIFE OF THE KING APPARENTLY TO THE TROUBLE OF GERMANY

tried as essentially dull. Yet it had a strain of youth and a strain of beauty, the latter revealing itself with full force in the person of George III, the grandfather of Queen Victoria.

The house of Nassau-Weilburg, from which both Victoria's mother and her royal consort sprang, is remarkable for its virtues and its least virtuous attributes, science, and art. It has little true genius but almost no degeneracy. Its seat is a little duchy in North Germany, comprising two or three tiny islands of territory the total area of which is only about six miles square. Yet for two hundred and fifty years the family has maintained most of the same traits for which Ernest the Pious was famed in the seventeenth century. The virtues of the family might be said to be hereditary genius, not without certain royal possibilities.

The Prince Consort Albert was typical of his race. His son Edward VII would have been in private life a highly successful merchant or business as professional man. But he had certain moral failings that perhaps revealed the blood of the early George, though he was quite free from outward evidence of the morbid taint of the house of Hesse III.

#### The Daughters for King George and the Czar in Russia

THE consort of Edward VII, Queen Alexandra, came of mixed Danish and German stock, is the main fairly mixed, but undistinguished. But there is one very bad spot in her pedigree, as revealed by the presence of Christian VII of Denmark, is the fourth generation. Of him Dr. F. A. Woods says: "Among all modern royalty there is scarcely a sadder specimen of the human race than this poor little, half-mad, debauched king. His type of mind was an erratic, and his self-restraint so weak, that it seems only charity to consider him among the irresponsible."

Christian VII was the son of a daughter of George II of England, and thus was first cousin to the house of George III and second cousin to the father-son of George's sister Augusta, Princess of Brunswick. He had another first cousin of the house of Hesse-Cassel, who also died insane.

This obviously introduces a very undesirable neuropathic strain into the pedigree of the Danish princess who became Queen of England. Nothing tangible would perhaps be likely to come of it, however, unless bleeding occurred with a like strain from the other side of the house. But there was obvious opportunity for this in the offspring of Alexandra and Edward VII, the great-grandson of the house of George III. What gives further significance to the matter is the fact that George V, child of this union, inherits his predominant physical traits largely from his mother, as is proved by his close similarity in personal appearance to his cousin, the Czar of Russia, who is the son of Queen Alexandra's sister.

In the case of the Czar himself, there are perhaps possibilities in the fact that his paternal strain is markedly nervous, tracing back through his grandfathers, Alexander "the poetic" in the descendant Paul I. Yet the descendant of Catherine the Great would also have the potentialities of mania. So far as can be judged, both George V and Nicholas II have escaped the worse possibilities of their heritage. Yet both have elements of instability, if not of positive insanity, that their heritage simply presupposes.

In the present, the most striking thing revealed by the pedigree of the rulers of the three great European empires is their close

similarity. If we print in parallel columns the names of the direct ancestors in the fifth generation of George V of England, William II of Germany, and Nicholas II of Russia, it will be evident at a glance that the three stocks are all but identical. All three are typically and characteristically nervous.

#### The Riddle in the King of Spain

ALPHONSO XIII of Spain doubtless presents the greatest riddle in the student of eugenics of any present-day monarch. His paternal heredity, beyond the second generation, is almost unrecognizable. His paternal grandfather has been characterized as "a degenerate little fool." He married his cousin Isabella II, a woman notoriously dissolute.

The four paternal grandparents of Alfonso were interrelated in the most curious and intricate fashion. In the case of each couple not only were the males consanguine but they also bore to each other the still more intimate relation of uncle and niece. Add that each of the four was indubitably either mentally weak or vicious and profligate, and that the ancestors of the fourth generation—who were actually only four individuals instead of eight—may be described in the same terms, and we are that we are piling up an experiment in bad breeding that compares with the efforts in this direction of the earlier monarchs of the same line.

Yet nature has revealed that, in spite of this appalling pedigree, Alfonso XII, the father of the present king, was a fairly normal man mentally, though a consumptive. The explanation usually given is that Alfonso XII was probably an illegitimate child—an explanation that accords with the known traits of Isabella II, and which might be said to be almost required by the laws of heredity to explain the fairly normal personality of Alfonso XIII. If this view is accepted, what has just been said about the official pedigree of Alfonso XIII holds only for the family of his paternal grandmother; the other half of his

paternal ancestral stream being unknown, but presumably far better than legitimate strain. Certainly it could not be worse.

But, in any event, the mother of Alfonso XIII, Queen Christina, Schastlika, was undoubtedly of bad strain of Austrian blood, traced back through the Archduchess Charles to the famous Maria Theresa. That Alfonso inherits physical traits of the mother's family is demonstrated that he has the loudest Upsburg lip, which may be traced through eight generations of Hapsburg descent from a fourteenth-century duke. This strong infusion of good blood from the Austrian side might be expected to preponderate over the bad Spanish blood, producing in the person of Alfonso XIII a fairly normal mind, with high latent possibilities of good or evil that might be realized in his offspring.

#### Royal Breeding for Stability

I HAVE not space to consider in any detail the minor principalities of Europe, nor even the great empire of Austria-Hungary and the kingdom of Italy. I can not pass the letter, however, without mention of the marriage of King Victor Emmanuel III, himself a worthy grandson of the rejuvenator of the Italian kingdom, to the rugged and hotly opposing of the male ruler of Montenegro. This constitutes a rare union, bringing in altogether new blood, and can scarcely fail to give added vigor to the strain. The results will be swayed with interest by those studies of present-day politics who look for the rejuvenation of Italian power in southeastern Europe. As to the future prospects of the chief principalities of southern Europe, whose pedigrees we have all along considered, it is obvious that their hereditary potentialities must depend in full measure upon their mothers, almost without exception, for the fathers of males here the present rulers chosen as royal consorts!

When we turn to the royal pedigrees to answer this question, the first glance seems to reveal a very favorable answer. It seems obvious that the consorts practically all the reigning monarchs have been selected with an eye to eugenic principles. The basis for selection has seemingly been the idea that what is required of the monarchs of the future is not brilliancy, but stability; not capacity for great deeds, but sound judgment and common sense.

In proof that this has been the ideal that has actuated the royal unions, it appears that the mothers of the future rulers have been selected, without exception, from the North German strains of royalty, the stable character of which has been referred to. William II married a Princess of Sleswig-Holstein; George V a Princess of the House of York; Nicholas II a Princess of Hesse; and Alfonso XIII a Princess of Battenberg.

In each case the maternal blood has the same main origin. If we print in parallel columns the names of the respective ancestors of the fourth generation of the royal consorts, no one but an expert in general eugenics would be likely to guess which set was better, but it is not even an expert could say which had a more preponderantly Germanic base. Nor would the case be greatly different were we to carry the analysis of specific pedigrees into the lines of the minor sovereigns of northern Europe.

#### "The Queen's Breed"

THE most striking single feature of our analysis is the amazing uniformity in such the direct descendants of the late Queen Victoria appear in these pedigrees. No noticeable taint that the entire strain of contemporary royalty throughout Europe has been persistently referred to as "the Queen's Breed."

It appears that more than three

# THE WONDERS OF THE THREE SIGNALS

BY SEUMAS MACMANUS

ILLUSTRATIONS BY EDMUND J. SULLIVAN

**DONALD O'NEILL**, was an able farmer's man who did a small bit of sheep-raising, a small bit of sheep-dressing, and a small bit of trading at Drogheda, and he had a few acres of bog and long miles from all neighbors, lived in the wild mountain top of Barrowmore in Downgal. No place was so wild for him, but he'd grown used to the work, and taken a night's doze in all men—which led him an unhappy life.

There was a morning in the winter time, and Donald got up before the break of day, and, gathering with him a couple of scores' load of sheep, traversed and over the hills for Broomagh Fair, to sell them. But, if he went out he didn't cross the threshold till he had some earnings on his wife's hands, and so usual with him, to be certain one and allow no stover on stover, he went out to the bog, and took a night's doze in all men—which led him an unhappy life.

Now it wasn't a good day when Donald started and his little better but worse it got as the day wore; and when he came down in the evening would drive through a dew, you'd think—it was that sharp and better, and getting so hard. And it would make the heart beat at a pace on the face of the mountain wall, but think of any poor housewife that would be alone in Barrowmore top upon an evening now.

Last of day's now (Brightly), Barrowmore was doing little better within the house, and creeping up the hearth in front of a bright fire, heard a rattle upon the door, and, going to it and opening it, she found there a poor, shivering old man with a pack on his back. And "The blessing of God be on this house and all in it," says he. "I'm a poor clerk, and I've starved myself in the trap, and I'd be obliged if you'd give me a night's lodging."

Barrowmore tried to raise all the objections in the world; but the night was so cold and the old man had such a bad heart, and the poor old parson pleaded so hard, and looked so pitiful, that she had to let the heart in her heart to what he said in the evening, she said to her son to come in and get a bed of the five into your house till you see Donald in your own house, my boy.

The old peddler thanked her, and gratefully tied to his pack, and came in, and made himself at home in the chimney-corner.

As long as the night was he till there was another firewood heater on the door; and, behold you! when Barrowmore asked, it wasn't there another old man with a pack on his back, but he was shivering and asking a shelter from the storm, and a night's lodging, for that day's work. Well, poor Barrowmore begged with his heart; but as she wasn't able to pack up with her to stow his and eatables, she had him come in and get the five into his house after Donald's time of coming. And he came in and made himself at home in the other chimney-corner.

To and he had got up and he went was this second peddler till a third night was heard on the door; and there was still another poor, shivering old man from the storm and a night's lodging for Barrowmore's sake. And, to make a long story short, Barrowmore's heart had to let him walk in also; and so she got a bed of the five into her house and Donald's house, and she was then to make the most of their time, for that her son Donald himself divided all among themselves, and the three owners of all sorts—could't bear them in his house, and would make her own arrangement of them if he found them. (Think in that case the five—the third man within himself; and there the three of them sat, with their packs at their sides, every day of their smoking, and rocking good, every day that you wouldn't have more than a smoke came from their pipes or their steeled stoves.)

By and by there came in the door another third man, but he had a pack on his back, and when Barrowmore heard it, and went and drove the bell, who should step in but Donald himself, before he was expected! The pack that came on Donald's back was he looked from one in the other of the three old peddlers, and saw what was before him, was a content.

Now he in Barrowmore, "I thought, my good woman, I warned you, before crossing the threshold this morning, to give house-room neither to stover nor stover, and to let me have my own way."

Poor Barrowmore, she pleaded that, much as she wished in any day, she had it in her heart to turn and see a dog upon any night, when a Christian, and that she had just given them leave to come in and get a bit of bed in their boxes across their backs and legs.

Then the wretched Donald but little; and he gave the three peddlers, he said, just a quarter of an hour to

"The stack was covered with little fairy men and women"

burn themselves at the fire, and do the other side, says Barrowmore.

"They thanked him; and then he pulled forward a chair to the far himself, and he lit his pipe and put speak on them; and he asked the first of them, like as the far chimney-corner, what he came for, and what was he to trade.

"Donald O'Sheary by name, sir, it please you," says the old man, replying. "And I'm a peddler to trade."

"And what's your name?" says Donald O'Donnell, says he to the old man in the other chimney-corner, and what's your business?"

"Donald O'Neary by name," says he. "And I follow peddlers for a trade."

"And your name?" says he to the man in the middle, beside himself, "and your profession?"

"Peddlers is my profession," says he straight back, and Donald O'Neary says: "I'll answer that."

"Well, well, well!" says Donald O'Donnell, says he, "if that isn't the queerest thing ever I heard tell of within my lifetime, and I'm a middling old man now. Here three peddlers of you come in, every one independent of the other, to say house in my stover, and every one of you just as good as Donald O'Neary!"

"That's not all," said the first old man, Donald O'Sheary, says he, "maybe it isn't for you'll be to go for that now."

"What do you mean?" says Donald O'Donnell, says he.

"I mean to say that I met with an queer matter—and I can't believe you," says Donald O'Sheary.

"And what will you say me if I prove you mistaken?" says Donald O'Donnell.

"The content of a supper and the content of a bed," says the man of the house.

"Good!" says Donald O'Sheary, says he. "Then I'm for my story."

### Donald O'Sheary's Story

"WHEN I was a young man of six-and-twenty, my father he was a farmer on the banks of the Fagle, in Kerry, and owned an acre and my kindly a farm as any was to be found between here and Broomagh. The farm of the Fair, it was called, by reason that there was a lovely green Fairy Ford rising up shore out of the hole in the barn's corner. My father kept and several boys and one servant girl, and on a May eve he says to me: 'Donald, says he, 'take the boy and the girl with you before

break of day to-morrow, and start off to the bog, and do a good day's looking and the kind of you.'

"That was well and good. Before break of day, just as my father directed, my wife and the servant boy and girl were out in the gray twilight and being for the bog. We had to pass by the boat of the Fairy Ford, and a short cut across the farm, and behind some of us were pressing it, down't Brigit, the girl, slip her hands and cry out: 'Oh, we're lonely now well! And there, care enough, was the loveliest little man well ever you needed your eyes on, building up great, where some an had ever known before. Says Brigit, says she, stepping down on one knee: 'I'll have a sup and of it for good luck,' and on the palm of her hand she lifted a sup of the water in drink. 'I'll have a sup for good luck, too,' says Brigit, says he, stepping down for another sup. 'Well,' says I, 'I'll not be behind either, and here goes for a good-luck sup likewise.' We were attracted 'em'd for we wanted to get the first drink. When we drank and stood up, we beheld the strangest happening that ever we saw Brigit was, her hair was all over changed into a leafy-bark-like hair, and Fairy transformed into a lively fellow, and the young woman, and I myself changed into a young man. When we looked around us, we found we were in a strange country entirely!

"Strange and queer as all this was, curiously enough, it did not seem to me strange to ourselves. I was used to the people that I found myself in, and we found my duties without an wonder in the world either to myself or to any of my companions, and all of them I knew as if I'd been born and bred among them. The young man and young woman that had been Brigit and Fairy, they fell in love with one another within a few days, and they came to see in merry times; and I married them, and they continued happy like a pair of doves of mine. A world came and went, more by the same token—and an example in the married couples under me—think, often and often, when I was preaching on a Sunday, I held the pair up for a parallel to my parishioners. They put in their happy years and had half a dozen children born to them, that they reared up decent and well—a credit to their parents and the parish. And during the same six years I had plenty of work before me, I would say, to manage a big, unruly parish—and had I might as well. I christened and married hundreds, and heard scores upon scores of sermons restoring my parishioners, to the delight of my bishop, who proclaimed that there was more than a chance of my being the best who had been called away. And he was an old man now."

"Well and good. At the end of this time, I, one day, on my way home from a sick visit, dropped into the house of the parish that had been Brigit and Brigit, to see how they were coming on—and I often used to do this. They met I was the very same in all the world they were quick to see that morning being May day, they were going to take a holiday in themselves, as they had and taken one for six years gone; and they were all well, and the wife of the Fair had taken a beautiful wood about five miles away, taking ladies' and ladies' of retail and drapery, and then in order to spend a good, beautiful, hearty day, they were and they wanted any to join them. I was invited."

"So, off we found ourselves driving at daylight, and, in my way home from a sick visit, dropped into the house of the parish that had been Brigit and Brigit, to see how they were coming on—and I often used to do this. They met I was the very same in all the world they were quick to see that morning being May day, they were going to take a holiday in themselves, as they had and taken one for six years gone; and they were all well, and the wife of the Fair had taken a beautiful wood about five miles away, taking ladies' and ladies' of retail and drapery, and then in order to spend a good, beautiful, hearty day, they were and they wanted any to join them. A skilled lady's maid demonstrating by demonstration, in one department store, the proper handling and care of lingerie

ALL the arts of the most famous theatrical producers are now ingeniously employed by New York dress-makers and milliners to sell their luxurious and fabulously expensive gowns and lingerie. Above we have reproduced scenes from some of the concerns that have gone further than any others in this new form of merchandising.

These displays in some cases take the form of a parade of models, which, to a person who happens upon them, are almost indistinguishable from the chorus on the stage of a large musical comedy show.

Scene representing a fashionable French watering-place in Algiers. Elaborate scenery is used, and attendants in native dress appear in the background

## MERCHANDISING: STORE DISPLAY

A boutique scene, designed for exhibiting negligees and cosmetics

Courtesy of J. Wainwright

One large and famous dressmaking firm has a small stage, with a curtain in front of it, which, at a given signal, is raised and fifteen or twenty models, in different designs of new dresses, pass slowly and deliberately in view of the audience.

At some of these places, where the clientele is more intimately known to the management, cocktails and cigarettes are served. The cost of this plan for persuading women to buy clothes is enormous, and it is said that as much as twenty-five per cent. is added to the cost of gowns on account of the elaborate nature of the exhibitions.

ANECDOTES THAT MIGHT HAVE BEEN

BY JOHN KENNEDY BAYSON

### DEMOTHEUS AND THE STUMP-SPEAKER

HE was a prominent dispenser of that particular kind of natural gas which flatters violently if not lamely on the political stump. Never having been convicted of anything, though suspected of much, he may be said to have been without just-  
 five convictions—a fact however, which he artfully raved beneath a thronian veilosity only equaled by the postscript, not to my keenest embarrassment of a heretical delivery. How such a one ever happened to visit Athens, dependent upon not because he himself said, "Nuffin is to record that this incoherent specimen of American but, all while wandering about the ruins of the Acropolis, one morning recently, encountered Demotheus, delivering an all-or-linear speech in the shadow of the Parthenon, whom he greeted with the enthusiasm of one brother meeting another.

"My dear colleague," he cried, raising the great statue by both his hands, and shaking them so vigorously that the pebbles in the old man's mouth rattled like a handful of shot in an old tin can, "what a joy it is to meet you—a man not only after my own heart, but after whom I have been named by a select class of admiring friends."

"Indeed," said Demotheus, rubbing his eyes and not seeing the other closely. "But Pallas! How very interesting."

"Yes," said the Stump-Speaker joyfully. "It is true. I have been called the Young Demotheus of the Sokalobanian. I, ever as now you, am given in answer, sir. Shall we a while, and I will make it ring! Give me a roared note, and I will make its sleeping trees! Give me a rock-ribbed hill, and I will cause it to echo with the reverberance, and rattle with the reverberance of my stonorian speech! Here we are, my friend, and with the brotherhood of my pebbles will I cause it to fill with burs! Lend me your ears—"

"Nay, nay, my friend," cried Demotheus. "Not that—you are long on your already, good sir. But I will give you my attention, if only for a moment. I heard about you in spirit's estate while you were speaking in the last campaign, and after hearing you I found only my way into mine, commencing to myself: 'O Ganges, where is the fact? O Niagara, where is the torrential force? O Ploeta Spring, where is thy liquid fertility? O Rome, where is thine eternal length compared to this? Compared to this bridge here, compared to this bridge—should say bridge—fertility, compared to this never-ending, limitless, infinite continuity!"

"No—did you really?" cried the Stump-Speaker, delighted with such high praise. "Frase from Demotheus in praise from Soud—er—Maid—er—well, old man, it's some praise, all right, all right, and I thank you. But, nevertheless, none of us is perfect, sir. I realize, O my Master, that I have some faults, and now that we have met, I am going to ask some advice from you. They tell me that in the nearest days you expressed the quality of your attention by putting pebbles in your mouth—"

"It is true," said Demotheus, with a pleasant smile. "EVEN my brother Plutarch has observed in his admirable volume, 'Who's Who in Athens, I did that some thing, rehearsing daily long speeches with pebbles in my mouth, plucked from the vaporous via ducts of the vicinity."

"And in my case, O Demotheus," said the Stump-Speaker, "having heard my discourse, think you, sir, that my speech would be improved were I to fill my mouth with pebbles?"

"No, my friend," said Demotheus. "I would not recommend pebbles for you, but rather—"

"Here the noble Athenian hesitated a moment.

"Go on," said the Stump-Speaker eagerly.

"Well," said Demotheus confidently. "If I were you, my friend, instead of pebbles I think I should fill my mouth with Portland Cement!"

Whereupon the great Athenian turned and walked away, leaving his chance acquaintance sitting upon the fallen, four-poked toes of a shattered Apollo Belvedere by Phidias, pondering deeply upon his "concrete" suggestion.

### A RURAL SOLOMON

"THE court has taken your case into consideration. Mr. Nibbles," said the Judge, "as Nibbles' trial for violating the motor ordinance at Cribber's Corners; and in view of what you've said, and with some growth, about the badness of my roads herabouts in your own testimony, I've decided not to let you fifty dollars, as the law permits."

"That's very square of you, Judge," said Nibbles.

"We try to be square. Mr. Nibbles," said the Judge;

"and, instead of the five-dollar fine, we've got to sentence you to work on these roads for ten days, is the hope that your superior wisdom as a road expert will make 'em corns'ibly better."

### UP IN MAINE

"In there are plain ground here where I can get my check-sharper fixed?" asked Pether, addressing the man in front of the rural garage.

"Well—I don't know, Mister," was the reply. "This here's a Prohibition State, but I may be some a hand for medicinal purposes, if you're really sufferin'."

### THE COMPLETE TIPSTER

Now that scientific authorities on tipping after due reflection have decided that the beam of the tip to a waiter in a restaurant should be ten per cent of the amount of the check, we have compiled for our own use, and for that of others who choose to avail themselves of its suggestions, the following Tipping Schedule, which we trust will add to the happiness of mankind in general.

For the Brash-boy, who has whisked the dust off a ninety-six dollar down-suit, at 10%.....	85.00
For the Drib-bley in the hotel, who has elevated your eight dollar bill back together with your wife's \$1,000 purse velvet wrap, at 10%.....	100.00
For the Porter, who has carried your wife's trunk containing \$1,000 worth of evening gown upstairs, at 10%.....	150.00
For the Chambermaid, who has put your \$5,000 note in order, at 10%.....	500.00
For the Doctor, who has shown you through the Woodward Building, costing \$50,000,000, at 10%.....	1,000,000.00
For your friend's Chauffeur, who has taken you for a ride around the Park in his \$10,000 French car, at 10%.....	1,000.00
For the Palladium Porter, who has put your trunk containing \$1,000 worth of unpaid bills aboard the train, at 10%.....	250.00
For the Barber, who has given you a freshly red shave, at 10%.....	.01
For the Postman, who has brought you a check for \$100 from your uncle, at 10%.....	10.00
For the Clergyman, who has just married you to a Lady worth \$2,000,000, at 10%.....	200,000.00
For a Taxicab Driver, who has just checked you out of \$15.00, at 10%.....	1.50

### TROUBLE AT THE GATE

"You can't come in here," said St. Peter, as the Sinner tried to shoot his way through. "Don't bring to your record as taken down by the Recording Angel!"

"I object to my exclusion on incompetent testimony," cried the Sinner. "I have not been responsible for control, and I insist upon my constitutional rights. The Recording Angel must be sworn, and submit to a cross-examination at the hands of my attorney, before a jury of my peers!"

"Sorry," said St. Peter. "But the trouble with that is that all your peers are down below in the other place, beyond the jurisdiction of this court."

## THE PRASLIN MURDER

(Continued from page 11)

"Yes."  
"But it is your own fault. It is not, that you are suffering. You took poison."  
"Praslin did not murder."  
"It is inhuman you took?"  
"No."  
"Then you took arsenic?"  
"Yes," said Frasin, lifting his head.  
"Who got you this arsenic?"  
"No one got at it. I brought it from Prasin."

There was a moment's silence. Then the Duke of Praslin spoke.  
"Now is the time, now is the moment for your own sake, for that of your family, as regards your memory, your children to speak. The fact that you poisoned yourself is tantamount to a confession. A man who is innocent does not escape the moment when his own children have been deprived of their mothers or to deprive them of their fathers. Admit that you are guilty."

Frasin remained silent.  
"At any rate, do you regret your crime? Tell me that you regret what you have done."

"The Duke, with an expression of terrible grief, repeated only: "No I regret!"

"I beg of you to admit the truth, to tell the truth. Reverse the Chancellor and make him a confessor."  
Frasin hesitated. "No," he said slowly. "I am too feeble. Perhaps I will see the Chancellor to-morrow."

"Because had he the heart to insist. And then he took down, at the other's dictation, a curious little statement, in no sense a confession."

"I WISH to say how much I regret I can not see my children before I die. I implore my family to be kind to them all. I beg not time to make any arrangements as to money. I feel that my strength is going. I am happy to leave my children in the care of my beloved old mother. I beg them not to follow her slowly the counsels of their nurses and of their grandfather's butler. I left at home a will which I make. It is an odd will. I am happy to think that my mother will be able to look

after them all. I wish my sons to remain at school where they are."  
"I wish you were more," he said, "if you are guilty of the crime of killing your wife."

"No, sir; I do not admit that I am guilty."  
"But if you are not guilty, why did you poison yourself?"

"No, sir; I am not guilty."  
"And then at last there comes in the name of the third person who unwittingly had played so great a part in the story."

"The Mills. Did you give you any advice which would have saved the woman which we find here you committed?"

"And the Duke, dying though he was, turned himself to his doctor: "No, no, no. My delay never spoke to me of such a thing!"

"Overcome I ask you, did you commit this crime?"  
"No, Chancellor. I can not tell you that I am guilty."

"I will send before the Duke of Praslin required to appear."

AND soon the only point of interest to those that remain is Milo Delroy. Under that quiet, exterior, exterior, what manner of man had he been? He was for a while indeed, for a considerable time—the French police were in his hands, he was in the hands of the Duke's accomplices. They even went so far as to think it possible that he had strangled himself in his cell. But Milo Delroy never spoke to me of such a thing!

though mark her fainter, felt it here with her. And then came the painful moment when she had to tell him of her strange and dreadful connection with the Prasin affair.

The story made no difference to the young American's generous heart. No, however, remained still satisfied in an impartial statement, and wrote to a noted French literary man, Victor Cousin, to tell her husband's address, so he might be able to write and tell her the truth.

"Do you know the whole story," she asked. "You were never present once when I was being questioned by the Prasin, but you were present at the Prasin's letters, and those of my letters that were found. I do not ask for pity—I ask you to believe, to tell the truth as a man of honor."

M. Cousin wrote to Mr. Field, and very soon afterwards the marriage took place.

Mr. and Mrs. Henry Field took their residence at Massachusetts, and the Frenchwoman became an intimate friend of Mrs. Harriet Bowler Stone.

She died in 1874, and after her death a book was published, her title "Familiar Sketches of France," which is probably known to many readers of these pages. It became very popular with American readers.

## THE SCIENCE OF BREEDING KINGS

(Continued from page 16)

had no real relatives of Queen Victoria ever living, and that more than one hundred years ago she was descended from us. We had three great descendants not only on the throne of Great Britain, Germany, and Spain; but married also in the royal houses of Prussia, Denmark, Sardinia, the Netherlands, Belgium, Greece, Denmark, Italy, and Sweden. The Queen lived everywhere.

This wide diffusion of the blood of Queen Victoria is a consideration of great importance to the study of royalty in Europe. And, indeed, it has become a fact of great importance in the study of the science of breeding kings.

For the blood of Queen Victoria, it is not to be forgotten, was half Hanoverian, and her grandfather was the tuncer George III.

Now, we have seen that the four chief monarchs of the world are descended from George V, Nicholas II, and Alfonso XIII—all have the elements of insanity in their lineage within striking distance, as it were, of the throne.

It is a fact of great importance to the study of the science of breeding kings, that the four chief monarchs of the world are descended from George V, Nicholas II, and Alfonso XIII—all have the elements of insanity in their lineage within striking distance, as it were, of the throne.

## The Shadow of George III over Europe

NO American need be told that the unscrupulous traitor of George III, which found expression in the autocratic temper of his early years and the outcast minority of his later ones, was largely responsible for the governmental evil that has plagued the American colonies and led to the overthrow of the institution of monarchy itself on the western hemisphere.

It would be a curious repetition of history if the same traitor, transmitted by George III to his descendants, should lead the world to the great principles of Europe. Yet this might readily enough come to pass, thanks to the scheming of George III's son, the Duke of Clarence, the royal match-maker. For the spirit of democracy is abroad in the world, and the crown of George III at the helm of state of a

## Sounds from a Rainbow

It seems incredible that a beam of light could be made to produce sound, but such a thing can be done. A ray of sunlight is drawn through a lens on a glass pane containing a mixture of water and alcohol, or any like substance. A disk having slits or openings cut in it is made to revolve in the stream of light, so as to "cut it up," thus causing alternate flashes of light and shadow. When one looks eye to the glass, the beam strikes one's eye as the flashing beam falls upon the vessel.

It is possible that the clatter upon it produced when the beam of sunlight is made to pass through a prism, so as to produce what is known as the spectrum of light. The disk is turned and the colored light of the rainbow is made to break through it. Now, if the light is made to pass through a series of slits or other material, as the colored lights of the spectrum fall upon it, sounds will be produced in other parts.

For example, if the vessel contains red water, the sounds of the rainbow, as the beam of light is made to pass through it, will be heard when the red and the blue are made to pass through it. Other colors produce no sounds at all.

Green silk gives out sound both in a red light. Every kind of material gives sound or low sound in different colors and no sound at all in others.

## Wonderful Dexterity

What appears to be superhuman skill has recently attained by a Frenchman in the manipulation of or special parts of the human nervous system. In this relation there is reported an amazing feat of a workman in one of the great needle-factories.

This workman took a common sewing-needle of medium size and drew eight inches in length, and drilled a hole through its entire length, from eye to point, barely large enough to allow the passing of a very fine wire. It had to be done in the presence of a more exquisite mastery of eye, muscles, and the directing hand.

## THE STONE ARMADA

(Continued from page 10)

although like the *Manfred*'s were doubtless reported at New Bedford ports. Mill tons of dollars worth of cotton went out on five English steamers, were sold in Liverpool, and with the greatest English vessels were loaded with ammunition and other munitions of war, then ran the blockade and reached the Confederates with everything it needed to carry on the war.

IN 1861 the blockade runners became so bold that the government made a desperate attempt to stop them. The effort was centered at New Bedford, and Charleston, and took the form of the famous Stone Armada, the equipping of which aroused great curiosity in New Bedford and other New England ports.

That the Armada was organized at New Bedford was due to the fact that prior cruiser had paralyzed the whaling industry, and the harbor was filled with ships of all kinds and sizes, and was well adapted to go out. Bishop if, Chappell, who had the matter in hand, bought up most of the idle vessels in New London, Philadelphia, New Bedford, and Providence.

For less than \$100,000 the government acquired a fleet of twenty-two sloops, equipped and ready for sea. Nearly all the vessels were sold just as they came from the whaling industry, and were stripped out of them, leaving everything. The work of preparing them for the voyage was in the hands of three experts, who made the ships one after another, or four or five at a time, and prepared them for the trip. All the non-essential items were removed, and the necessary stores were stowed on their long voyage with nearly all their equipment. The articles not needed, such as extra loads and anchors, were sold ashore at New Bedford and filled an entire city block. It was regarded by a going concern, and for that reason was the subject of professed curiosity and much speculation. The cutter "mountain" was later sold at auction, and many of the old anchors are still to be seen about places in New Bedford today.

The landing of this large fleet with some but indiscreetly to the eyes of the public. They severely derided those of these were bought for the purpose, and the ballast was removed, and these were dumped into ships up to the lower waterline, the citizens of New Bedford were confident that the rest of the fleet would be sent on the Southern coast, where many beaches prevailed to make forts. According to Mr. Clifford, the former mayor of the city, the chance of their lives to get rid of the general leveller that rendered their firms fit. It is even said that a war at Plymouth offered the famous rock at that place, if any one would come and get it.

The rock alone, one piece of which was done in secret, and one was about it.

## BOTH GAINED

Man and Wife Fatten on Grape-Nuts.

The notion that meat is necessary for real strength and the foundation of solid flesh is no longer as prevalent as formerly.

Excessive meat-eating is usually diagnosed a part of the taste because they are not able to fully digest their food, and the indigestible portion is changed into what is generally a kind of poison that acts upon the blood and nerves, thus getting all through the system.

"I was a heavy meat-eater," writes an Illinois man, "and up to two years ago was in very poor health. I suffered with indigestion so that I could not eat 150 pounds of meat." "Then I heard about Grape-Nuts food and decided to try it. My wife laughed at first, but when I gained 125 pounds and felt fine, she was obliged to try it. Now she and I eat Grape-Nuts ten times as fast and well and have gained 100 pounds each. I never have indigestion any more, and seldom feel the desire for meat."

A neighbor of mine, 65 years old, was troubled with indigestion for years, and was a heavy meat-eater. Now since he has been eating Grape-Nuts regularly, he says he is well and has gained 100 pounds.

I could name a host of persons who have had thousands of indigestion by changing to Grape-Nuts. Write for a free sample. "There's a Better Name given by Postum Co., Battle Creek, Mich. Read the little book, 'The Road to Well-being.'"

Ever read the above letter? A new one appears from time to time. They are genuine, true, and full of humor and interest.

FOR MEN OF BRAINS  
Cortez CIGARS  
—MADE AT KEY WEST—

and the ships were ready for sailing, so only the matter of outfitting each ship were left to be solved. This was the making of the device for working described by Mr. Clifford as follows:

"As had an oak ship was equipped alone filled for general outfitting. About two inches above the light waterline a two-inch hole was bored in the center, running completely through the side of the vessel. Into this from each side was inserted a plug, fitting in a loose fit, provided with a flange head sufficiently large to clear the opening. These two plugs were fastened together by a bolt passing through the center, held by a nut on the outside, and by a wrench on the inside. At the proper time the nuts were removed by the screws made on them, the bolt knocked out, and the two plugs were allowed to fall out and let the water go in."

The historical records of old New Bedford contain some records of the advance of the blockade runner's era of the only living member, Captain J. M. Willis, who is still an honored and venerable resident of New Bedford. On an old war map of the city, the location of the line of the channel is indicated, and Captain Willis explains the mark as follows:

"The line shows the harbor was to place the obstructions on both sides of the crest of the bar, so that the same force would be expended in the water, and upon to keep them in their places, also to place the vessels checkerwise, and at regular intervals, and in other, so as to create an artificial narrowness of bottom resembling Woods line. This would give rise to eddies, counter-currents, and other conditions, which would be extremely dangerous. The placing of the vessels in the desired positions proved a difficult undertaking, and they were all sunk by sea sickness, or were sinking."

A NEW and vivid description of the voyage of the Stone Armada is here set forth as it came from the lips of one of the crew. New Bedford, Mr. old sailor, who still lives in London.

"When the Civil War broke out," said the old sailor, who was in his thirtieth year at that time, "I was ordered to a whaling trip, and as I had been gone three or four years I had a comfortable sum of money in my pocket. I was so glad to see my ship that I took no time to spend it in New York. Those were the days when money was hard to come by, and I was in the morning with three or four years' wages, and two days later awake to find myself about a continental ship and receiving, and adding to my debt for my cargo. I was not, however, along hand; my shipmate and I were merely so while we got ashore that we did not wish anything that came along, and two days found us ashore without a dollar.

"I had then that morning when I was living, was about east-northeast from New York, so we had the course and started to sail it. But we kept too far to the southward, and after two days we ran into New London. By the end of the week we struck New Bedford, where we remained, and were taken down to Nantucket on the Cape, while I began to look for a boat to get over to Nantucket, where I had a sister."

"While I was looking around I met William Hovey, whom I had met under me as a whaling mate."

"No," he said, "do you want a berth, short and sweet, three weeks or so, and good pay?"

"I was ashamed to go home without any money, so I jumped at it, and with three other men he had in his boat, we went to an office and signed papers for a cruise on the bark *Patience*, or any vessel the owners might select. After a night at the office he went to a room where I was about an old bulk which the men were the original *Manfred*, so there were men there, and we were taken to a room where for when she had a peep so high as far forward, and she was old then. But I was not to be troubled with her, and I would hold together for a month or two, and so we were not going across the water in that time."

"When we got down the harbor, there was a fleet of five or six more vessels of all kinds: bark, brig, sloop, schooner, and all kinds made in the year one some began to rot, and were taken to a house a hundred years ago. Most of the vessels were painted in the old fashion, with square tops and masts, and were painted, and they certainly did look like a lot of new-made; but they were nothing but a lot of old wrecks, so situated with a lot of iron on could not hold them out of the water."

"When I finished the *Manfred* I sighted an old steamer and he took me up to the foreward, where five men were making a service, and a new lawyer was being held there. He had a new lawyer, they were going, and each ship was not only in

"What's the 'Holeproof' Secret, John?"

"How can they guarantee six months' wear in these fine, mercerized socks?" "That's easy, Dad! You'll find the answer and the truth in any Holeproof advertisement."

We pay an average of 74 cents per pound for our cotton yarn, for one thing. Cotton yarn can be had for 31 cents.

We do our own mercerizing. Our process adds

25% to

the

yarn's strength.

For everyday wear, travel or exercise—tennis, golf, or dancing; for business men who walk a great deal; for strenuous children; for women who want style with more than a day's wear—Holeproof is the logical choice. 1,000,000 men, women, children and infants wear Holeproof today because of its wonderful quality.

SOLE-PROOF HOSIERY CO., Milwaukee, Wisconsin

Wholesale Retailer of Socks, Hosiery, and Underwear

For long wear, fit and style, choose the finest silk thread, made in England, then cut and woven in this factory by the latest machinery that fills all sizes, and wear the name of the dealer you wish to patronize.

## Vitalized Rubber in Diamond [No-Clinch] Tires calls a halt on "Short Mileage"

All types of Diamond Tires are made of Vitalized Rubber—a new process discovered by our chemists which toughens pure rubber.

It will give you the greatest mileage—stand the friction of the road and the pull of the engine—adapt itself from one end of the thermometer to the other—from high speed to low. Under all these conditions you, at the wheel, are riding with mind comfort, free from possible tire worries.

Additional Diamond advantages—Perfect 3-Point Rim Contact, No-Pinch Safety Flap for inner tube protection—and, if you wish, the now famous Diamond Safety (Squeezee) Tread.

So this time buy Diamond Vitalized Rubber Tires—you can get them to fit your rims from

## THE STONE ARMADA

(Continued from page 25)

lullust, but looked to the clouds with such that was not worth a cent a ton. He said it looked queer—twenty-three ships headed with rock, some so rotten their bottoms might fall out, going to my daughter."

"The speech of my father had so agitated the old lawyer, whose name was Ed Colby, a comrade of mine to see the old man and ask what it all meant and where we were bound."

"Pat came back in about five minutes, and said that the skipper was ashore, and that the mate had threatened to knock his head with a marmalade; so we decided to keep quiet."

"This was the last of November in 1861. On the 21st, on 1 December it, the old man came aboard and gave orders to make sail, and we set a part of the rest of the passengers down the main. I tell you, it was a fine sight. Our skipper was Captain Brown, and we set off in the lead, three long each apart in seeing who would make out first, and in half an hour a part of the fleet was under way and headed out."

"As we sailed past, Fleet Teller fired a salute of thirty-four guns, and we replied the best we could by dropping oars and firing off whatever guns we had, as many of the whalers had been rigged up with one or two guns best of potatoes."

"You can imagine that the crews of these twenty-three vessels were fired with excitement, curiosity to see a neighbor's crew where we were going, or what our earth may one could start with all this rock. Of course, the crews were not the best, but we were sure to engage a rebel man-of-war—so prettier to engage her, and run her down. Another part of the fleet was intended to build a pier at Sandy Hook, New York, and another was that we were to build a dyke across New York harbor entrance to keep out the enemy."

"But we were all wrong. We landed on land instead of the water, and we used to see our way at sea were the secret orders issued by the commander and the truth given out. The Stone Armada was bound for Savannah, in respect to the commander of the blockade squadron, and it did not take many guesses to guess what all of this rock was to be used for. We were probably going to block up Savannah. If that was the case, we were certainly not to be before. But we certainly got up a big hull with our chests of mail and our guns loaded, and we were four miles off we looked as dangerous a fleet as ever sailed the sea. If a rebel cruiser had had the heart to attack us, we could have shot and killed, and laid out the devil. Then all we could have done would be to 'rock' them; we had plenty of that ammunition."

"Our chief mate, Commodore Beasley French, who had been selected as the chief, were to get to Savannah as quickly as possible, and to make Long Island out keep looking, as we were liable to run into a Confederate cruiser. But since the skipper decided that they knew as much about navigation as the commander, and they commanded all mail out headed for Savannah, and the next day there were but four and a half; it was each man for himself. The next day we ran into a gale and got the ship down to reefed topsails, and she was that heavy that it was sure if she got into a gale she would go down the lead. But we kept along, and the old skipper made good time, and in about ten weeks we were in the harbor of Nassau, where we had been bound, and came to anchor off Savannah."

"We did not, in our opinion, do much. December 31st, next, and with the Robert Hall of New London and the old schooner privateer, the old schooner Louisiana had gone against, and she was so heavy that nothing could be done; so they detoured."

"The day we arrived, Admiral Dupont ordered the Phoebe headed over to the troops at Tybee, and she was her orders, head out, and sailed her on a dock to land the transport boats."

"All the time and for days afterward, the fleet was under way, and in pairs, but still Commodore French on the barometer, the flag-ship, did not anchor, and for about ten days we were her by night, as it still was so old she had probably shifted her cargo, got a list on her, and the rock had hurt her."

"But one day we sighted the Godolphin, she came slowly in, with all her five flags, and retreated to the rear of the fleet and laid a gun. French was a great joker, and he had signed up a contract gun with a construction of it, and he had a small brass cannon to this. As he stepped aboard he fired this gun, and at the same time lowered his pennant, and then he said that you would have thought it was Federal times."

"The day I had a lot of work about French, the way, that he: And Commodore Dupont's flagship in it. Commodore Beasley French at the head of the fleet, and he was coming off to my in requests, and it was a party that Dupont

sent a few officers to ask who in—Commodore French was."

"I was in a shooting line, as I afterward heard, thoroughly frightened the people of Savannah. It was reported that the French had been in the Government, and that the combined fleets were going to blockade every port city. If they could only have been like the number of Federal ships, just for the fun of it, with whole brigades and liners, and few rocks at the ship's head. It was a sight and there was plenty of excitement."

"The plan was to stop blockade-running, the night a big sailing English ship came steaming in, and when the star rose she found herself facing the fleet, and tried to get off her own side the number of Federal ships. Fleet Teller caught her and captured a lot of British goods and ammunition intended for the rebels."

"If course some was passed around, as we visited from our ship to another, and all part of the fleet and felt a thrill of pride as we saw our commander looking with the real Union Jack, and the trim ship with her fine lines and polished brass looking more like a modern frigate than a man-of-war. The sight took me as that I looked up the managing officer and saw under arrangements, and I was not a great deal of news. The officer asked me what I thought of it, and I said I was not anything about it and I didn't believe the Admiral did; in fact, in some way, the rebel cruiser had been sent to the United States fleet, and Dupont didn't know anything about it, or what we were doing for the fleet, and so on, it, though I was only a sailor and not consulting."

"I had a most interesting time for a week or so, visiting ships, doing ashore, and visiting the garbans, equipped privateers. Every day the ships came in, and I was from New Bedford, that we had left behind, were coming in. They left about the 10th of December, or about two weeks or so after us."

"The service of our fleet was made up of the old schooner, and one or two others; and a few of the best, I think, were kept as equipped as possible, and sent to the blockade. About the 15th of December we had orders to make sail for Charleston, South Carolina, and I was in the ship, and the whole Armada, except the Meteor, Lotus, and Phoenix, arrived. We were all short-handed, as the crews of the Federal ships, others, all that could be spared, were distributed on our vessels, and we sailed in and anchored in a line, according to orders from the commander, and I was in the charge."

"It was a hard thing to do, make a man's old sailors, every one of which had been in the service, in many ways, to all a bank; but that's what we were there for, and it took a lot of planning and work to get every man in a line, and in a position, kind of way, the Old Man gave orders to unload mail, they were put on the boats, and every man was told to take what he wanted. Some took harpoons, some knives, so the old ship was all filled out, and everybody wanted a mattress. When everything was ready and the officer from the Federal gave the word, the anchor went back, and in half an hour she began to list. We got orders to run away, the main, and I ran the ship, and every man was told to take what he wanted, and worked her."

"It was a sight to one will ever see again. The fleet was in a line, and it was so powerful, as ships were going down all along the line, music and yards falling, and every man in a line, and every man looking up as though lines toppling. It looked as if there had been a great battle between musketry and musketry, and every ship seemed to have a row of men to go down; one rolled over on her beam ends, and every man was told to take what he wanted. When it was over, all that remained of the Stone Armada was a long line of masts and masts, parts of masts, rigging, just above the water, and a mass of masts and rigging—a sight to remember. It was sixteen or seventeen ships or more, and every man was told to take what he wanted, and every man was told to take what he wanted. It was a sight to one will ever see again. True, the ships were old, a lot of them were old, but they were so well made no effort to save a thing, even the masts, that were under at great labor, were used on the backs of the men, and a whole thing set off. But nature wanted to protect at the blockade destruction, and the old block and the old block a rocky volcano."

"The commander had arranged to send me ashore to see the fleet, and I was in the command, and after the job was closed up we were all put aboard a transport and sailed on our way. On the 15th of January I landed in Nantucket with money in my pocket and a year to tell that the Stone Armada was in the water, and I know they will tell you there about the Stone Armada."

## Your Daughter's Hair

SCANT, unhealthy hair will spoil the appearance of any child, no matter how beautiful its face. On the other hand, a healthy, luxurious growth will more than offset any irregularity of feature.

## Perpetuate Its Health

Nature starts most children right. The continuance of this condition is the mother's plain duty.

Proper care of children's heads prevents dandruff and keeps the hair growing and naturally healthy. Your girls should not use unnecessary artificial arrangements. Preventive medicine should strengthen your legs at the threshold of manhood.

## Keep It Beautiful

Our correspondence course on Hair and Scalp Treatment can be mastered easily in four months. It will show you how to keep your children's heads medically clean. It will teach you how to care, dress, and check at the various disorders that owe the seed of serious trouble. At very little cost, you can prevent, by means of the necessary treatment, your legs at the threshold of manhood.

## SPECIAL OFFER

Secures our Complete Course in

**HAIR and SCALP TREATMENT**  
**HEAD MASSAGE**  
**SHAMPOOING, etc.**

Regular Price \$7.50. Special Price for a Limited Time

**\$4.00** Payable

\$1.00 a month

The lessons are easily learned. The cost is small. You will get your money back quickly; think of what you will save in washing your hair, combs, brushes, shampoos, etc. Think of the great results the knowledge will give you. All you have to pay is \$1.00 down, and \$1.00 a month for three months; total \$4.00.

## COMMENT

Beginning with the issue of August 1913, Mr. NORMAN HARLAN will take charge of HARPER'S WEEKLY.

### Taking Our Bearings Again

The proposed tariff bill is still coming along at a slower pace than one could wish, but in other respects her progress continues reassuring. For one thing, it is still unconsciously straight for the port originally announced. There has been no loss of her true bearings, and she steers true to the compass and the mark. Better still, she has passed substantially undisturbed some of the worst framed points in her course.

Speaking plainly, it is no small thing that the bill, having got through the House committee, the House caucus, the House itself, and the Senate committee, and being at this writing in the Senate caucus, remains indistinctly what it was meant to be, a Democratic and decidedly law-true measure. It has only two stages and a half to go, and nobody can contend that its character or intent is seriously altered. Granted that there may still be danger ahead, particularly in the Senate floor, this is the main element that its present state is bound to evoke even from fair-minded opponents.

Nat that the changes have been all important; some of them have been quite important, and there are naturally two opinions about them. None of the bodies concerned has so far succeeded to exercise its rights in the matter of amendment. But one can't help feeling uneasy here that in this instance amendments may continue not to mean anything like constitutional or radical alterations.

On the part of the friends of the measure, criticism may be content to limit itself to urging a little more speed—and not to urge even that violently or angrily.

### A Big Job That We Must Start To Do It

The Park Board is strongly interested. That is a fact to be borne in mind for those of us who would like most to see its long wish come true. There is plenty of work cut out for us.

No such can be inferred by the defeat which, for the first time since his leadership began, Mr. FURNESSE met in the Democratic caucus when he presented a budget policy to keep appropriations in bounds. No matter how inferred, too, without attributing all the opposition to mere jealousy for pork. The plan presented would necessarily have somewhat curtailed the powers of the various appropriations committees, always jealously guarded. It may have seemed not the best budget plan, and there may have been gentlemen who doubt the wisdom of budgeting altogether. Members in caucus may have voted against it primarily for one or more of those reasons.

Still, their votes nevertheless indicate the difficulty of any real reform in appropriations, since it is hard to conceive of any effective plan to keep them in bounds and make them businesslike than would not be budgetary, and that would not restrain the separate committees, and it is also doubtful if any budget plan would meet fewer objections in the House than this one, which originated there and may, perhaps, be regarded as a sort of House substitute for Presidential proposal.

Perhaps Mr. FURNESSE may be more successful with some fairer caucus. The Speaker, it appears, is standing by him. Or perhaps a more acceptable plan still be worked out. In any case, the fight for reform simply cannot be abandoned. The evil is now too widely understood and condemned. It is too plain that the party in power, which almost invariably has promised economy, refers too much by a system which keeps its leaders powerless to reform its pledge against the selfishness of individual Congressmen of all parties.

### The President and the Bad "Rider"

The President signed the Sundry Civil bill with the "rider" that appropriated \$300,000 for certain specified expenses of the Department of Justice, and stipulated that none of this money should be used to prosecute labor-unions or farmers' organizations under the Sherman law. The "Times" takes this action of the President hard. It says:

Physical weakness is probable, but such moral weakness as the President exhibits in signing the Sundry Civil bill "rider" shows other failings than those of weakness. Mr. Wilson's explanation—that it was an expedient to better one thing or thought he could make that that only brightens the discredit. There is national distrust of a man who can command an act of justice, the appropriation bill with the "rider" was bad, it was wholly bad, and no plan in extension can serve as a shield against the executive's mistake.

He contends that the law shall be unapplied retroactively, he permits Congress to control his will and his act. Where there still, he tells Congress that he will about it of its intent by using other funds for the prosecution of labor-unions and farmer organizations. It was not the purpose of the lawmakers. By this enactment Congress declared a policy, and by writing his assenting signature the President becomes a party to that declaration. If the "rider" is not a "rider" it was not a "rider" at all, an avowal. Yet he accuses the country that he will make this new law which constitute him to the nation of old law, backing legislation by then blurring into a double offending. It strips himself even of the excuse of expediency, for in proclaiming his purpose to see for these provisions after fault in them, the issue specifically stated by him by rule his act of his prospective utility as a step to organized labor and the farmers.

The "Times" seems to have mislaid its faculty of discernment. To scold is the privilege of a newspaper, but to scold effectively it is necessary to see intelligently. Let us see what President Wilson said about this matter:

I have signed this bill because I can do so without in any way limiting the opportunity of the power of the Department of Justice to prosecute violators of the law, by whatsoever committed.

If I could have anticipated from the vote of the bill the item which authorized the expenditure by the Department of Justice of a special sum of \$300,000 for the prosecution of violators of the Sherman law, I should have voted that item, because it places upon the expenditure a limitation which is, in my opinion, unobjectionable in character and principle. That I could not regard it.

I do not understand that the limitation was included as either an amendment or an interpolation in the Sundry Civil law, but merely as an expression of the opinion of the Congress—a very important opinion, backed by an overwhelming majority of the House of Representatives and a large majority of the Senate. I should have voted that item, because it places upon the expenditure a limitation which is, in my opinion, unobjectionable in character and principle. That I could not regard it.

I do not understand that the limitation was included as either an amendment or an interpolation in the Sundry Civil law, but merely as an expression of the opinion of the Congress—a very important opinion, backed by an overwhelming majority of the House of Representatives and a large majority of the Senate. I should have voted that item, because it places upon the expenditure a limitation which is, in my opinion, unobjectionable in character and principle. That I could not regard it.

The "Times" and the President are agreed that the item they discuss is bad. The "Times" says the President "consents that the law shall be unapplied retroactively" and "permits Congress to control his will and act." The President answers the country that notwithstanding the "rider"

there is plenty of money to enforce the law lawfully, and that it will be so enforced. Why it is a "worse of all" for the President to tell the country that he does not intend to be governed by the "principles" of Congress in instituting prosecutions under the Anti-Trust law we do not see, but the "Times" is so bold, and it declares that by his signature the President made himself a party to a policy of Congress which, over his signature, he absolutely repudiates, and finally that he played bad politics.

Well, will. We judge that the trouble with the "Times" in this matter is that it started out with the notion that Mr. Wilson was playing politics about that "rider." We guess that is not so; and that the truth is that the "rider" at first sight did not look quite so bad to the President as it should have looked, and that, seeing that it was an unaffiliated provision, anyway, he agreed to sign the bill with it in, and felt constrained to abide by that agreement even after his opinion of the "rider" had become considerably worse.

If the trouble was that he did not begin in time to kill the "rider," that was, it seems to us, a mistake that is not inexcusable in a beginning President, new to his duties, and with a vast number of different matters to understand and decide.

And though that "rider" is something that Congress ought to be minded of, and that the President admits that he is ashamed of, for the life of us we cannot see how, under all the circumstances, it can do harm.

### Good Motive But Bad Law

Here is a contribution made by the Finance Committee of the Senate to the Un-American tariff bill so it came from the House. A paragraph of the bill is extended as follows:

No goods, wares, articles, and merchandise—except immediate products of agriculture, forests, and fisheries—manufactured wholly or in part in any foreign country by convict labor or children under fourteen years of age shall be entitled to entry at any of the ports of the United States and the impurities thereof is hereby prohibited. Any shipment consigned for entry at any of the ports of the United States of goods, wares, articles, and merchandise—except immediate products of agriculture, forests, and fisheries—manufactured in any foreign country, province, or dependency where the industrial employment of convicts or of children under fourteen years of age is not prohibited by law shall be accompanied by an affidavit of the shipper of such merchandise as his legal agent to the effect that the merchandise covered by the license has not been manufactured wholly or in part by convict labor or by children under fourteen years of age.

Why do our friends who wish to protect children from too much work at too early an age exercise such individual means to effect their humane purpose? It is quite hopeless to try by a tariff provision to force and shield labor and convict labor laws on all the rest of the world. When we can take care of our own family in the matter of child and convict labor—something we have as yet by no means succeeded in doing—it will be ample time for us to exact a like benevolence from other countries as the price of permission to trade with us. The provision above could not be carried out, and an attempt to carry it out would be quite as likely to do harm as good. And it would still leave our ports open to rubber gathered at cost of whatever mortality and torture, and to a thousand other products of unwholesome or unfelicitous methods. The way to regulate child-labor is by direct legislation. Most of the expedients that would accomplish it by indirect means are striking examples of bad law.

### The Sons of the Rich

The sons of the rich—arrogant, insolent, indolent, nervous, without self-control or self-respect—these are not only a nuisance to us, but they are a crime and a menace to the Republic. They rot out, neither do they spit, yet they rot the fat of the

lead. They are the parasites of civilization, drawing their nourishment not from the soil, but from the bodies of others. They are the propagators of communism; they are the creators of hatred between the classes and the nations.

It takes a thousand men to support every life of luxury. His house, his yard, his automobile, his table, his garden, his garden, his clothes, his wife, his chair, his diamonds, his fans, his race-horse, his golf-links—all these are supplied to him by slaves who labor only for their bread.

These slaves are not only the slaves of the poor; each one works more than a hundred families because by their extravagance they augment the cost of living, they set the strike and the lowering man both the houses.

Now Justice WHEAT, O. HOWARD, T. TOY, to the Troy High School Alumni on June 25th.

Tut, tut, Judge! Haven't you pitched it rather high! Don't you govern with somewhat too sweeping an inspiration?

Where do you find these life fellows? There are some, of course; but they speak of the sons of the rich as though they were all of a piece.

Well, who are rich sons hereabouts?

For one Mr. JOHN D. ROCKEFELLER, Jr; for another, Mr. J. P. MORAN; for another, Mr. VERNER AUSTIN; for another, Mr. HENRY H. HARRISMAN. Do you know these persons, Judge? The second, is he life, arrogant, insolent, useless? The second, is he? The third at least is trying to find duty and do it. The fourth is young yet, but was the laborious coach of the Yale crew.

Rich men's sons, Judge, vary much as poor men's sons do. What the first three do they depend on their birth and raising. Some of them are extremely valuable men; valuable enough to be worth considerable expense in upbringing. Money is a handicap in some respects, an advantage in others. There are plenty of pretty worthless rich people, and as yet who are not worth their keep, but we should say that the worst people hereabouts are not those who have money, but those who have not and will do anything to get it. One of the most dangerous disease society must cope with is money-hunger, and to that at least the rich are apt to be immune.

The talk that might be collected from Miss ELEANOR CLARE FRANK addressing strikers is much less becoming in a Supreme Court justice addressing the graduates of a high school. From a judge one expects discrimination.

**President Wilson Speaks Again**

It is still half unready to take pleasure in a President's message. These documents have been used so long as evidence tests for radiologists, lawyers, legraphers, typewriters, and readers of newspapers that one cannot be sure of what Wilson's brief discourses to Congress like a third man long used to "sifters" who is suddenly served with edible pie.

We guess everybody by this time, and especially everybody in Congress, must be pleased with Mr. Wilson's innovation of going over to the Capitol as saying that he has to try in good words with his own voice, and stopping as soon as he has said it. It is the way to do; the way, that is, for him. He is able to give the impression that what he is after is to discharge a duty and facilitate the transaction of important public business. That impression helps. Another President might be so skillful or so fortunate. He might give the impression that he had gone over to the Capitol to show off, and that would hurt. But even legislators who are ready to attribute valuable notices to Mr. Wilson's innovation must share gratefully the relief the innovation brings them, and get from it an effect of stimulation.

**Judge Chalmers**

Confession is being good for the soul, we admit difficultly in being so scandalized as seems suitable over Judge CHALMERS' case. The facts alleged against the judge correspond so precisely with the suppositions we have always entertained about the means used by the older Tammany managers to make their livings that we have to judge our consciences to make us feel a little disappointed. It was a good deal of time in the insurance investigations of years ago, when the courts were so much jockeyed up for doing what was usual and had been usual for years. When it was so, a certain conduct in this world, there is a great difference between what is generally held to be good and what can be put in a court of law. And really it is not a matter of Judge CHALMERS who is under investigation, but a little private inquiry candidate, it would seem, for a position in the system in which he is to be a prominent cog and in which he is to be a prominent

**Killing and Poisoning**

This morning, the "Times" has a story that the remark that RUFFALO'S people...

pos of President PUTNAM'S visit to England, was, whether or not he so desired it, a strong bid for a permanent stay with his administration for Mr. PUTNAM, we haven't yet quite understood why the author of "The Revolution" should be accounted only a possibility for the post, even under a Liberal ministry.

But we can't agree with the "Times" that KIRWAN has wasted his gift of "occasional" verse on a few unimportant occasions that recall far more important occasions that have evoked still better verse—even Elizabethan plays. It isn't a small thing that a President of France should come to England with such assurance of a truly national welcome as M. POINCARÉ had. Does it stand for less than HENRY the Eighth's visit to France, or for the welcome that FRANKS is on the Field of the Cloth of Gold?

We trust it stands for a better promised and more lasting friendship, anyhow. The Franco-English *entente* has lasted long enough already to prove its value to both countries and to Europe. It will not be lightly abandoned. And it is surely a pleasant thing to say, good these few days, or still better, as anybody can write about it. Consider, as KIRWAN does, the centuries of bloody hate it seeks to obliterate. According to Lord ALTON, when NANCY, with bowed head, was retreating from Waterloo, he was heard to say: "It has always been my duty to say, for the most remarkable fact of recent decades in Europe; for the stability of the Third Republic; for a real democracy in France—a democracy that goes deeper than institutions, into the people's thought and ideals, and which thus makes of the French, long the most military of peoples, continuous supporters of the cause of peace.

**An Instance**

Here is a little story from the news columns of the "Evening Post" of June 24: Two Italian school-boys, fifteen and sixteen years old, left their home on June 1st, to look for vacation work. They did not return. Their friends and relatives searched for them, and the police were asked to help.

It was not till June 24th that a friend of the family caught a glimpse of the younger girl at a window of the Thirtieth Street house. The police broke in and found her caked. Her captors had taken away the girl's clothing to prevent her from coming back. It was said that he had been held for a few days after their capture. She also explained that they had been hired to the place and that the man was the same man who had been seen, a year after, is supposed to be in the same plight at some other address, possibly out of the State.

**The Very Lizard was Arrested**

What will happen to GINSENG? When will it happen? Will the other girl be found? What will be the result of that, when such a paper as the "Post," stimulates interest very much in such articles as that of Mr. TUNNICLIFFE, in the WEEKLY of June 21st, on the ROCKEFELLER report.

There seems to be a good many extremely bad people about this town and this country nowadays, who will do anything for money, and who will not be hunted down and cut like hideous rats.

**Flying Boats**

There is a new wonder in the world—our world of wonders—the flying boat, that skims above the surface of the water, rising at its driver's will hundreds of feet in the air, and then swooping down again and on. It was told last week here one of these wonderful toys jumped over a Sound strait. Mr. OSCAR STRAT has been taken out in one of them, and had his picture in the paper. "Wonderful," he cried, "absolutely wonderful! Too fine to express in words. It is undoubtedly the sport of the future. I can tell you how secure the sport of the future we see out."

Very advanced world this is even now; and it is still moving at a good gallop. It is thirty-odd years since STEPHENSON said, "There is always a new horizon for onward-looking men." "Onward-looking" it was then; but "forward-looking" Mr. STRAT is. It has the horizon, but it has the character, too, of these flying boats against it now!

**With Decent**

SEVENSON, discoursing about admirals, speaks of all-time handships and narrow space on ship-board, and quotes from "Roderick Random" about the cruise, inclusive, six feet square, in which downy souls slip and submerge, and his

pipe, sang his Welsh songs, and swore his queer Welsh imprecations."

Weld is to be seen. MORAN is a sure-enough Welsh name, and presumably our late Mr. MORAN was of Welsh descent, though in all the pieces about him we don't remember to have seen it noted. But it was worth remarking, for the Welsh are Celts, and a mighty interesting species of that level, and have imagination, and are everywhere in the world, and in the States, and in the Cities are Roman Catholics, but the Welsh are mostly Protestants. The combination of Welshman and Conqueror Yankee, of which Mr. MORAN was an instance, is one in which vision and practical efficiency are well entitled to be joined.

Mr. MORAN was more attentive to his countrymen than to his country. He was a man who appears from the rising steps of Hartford to prospective impression as an art critic.

Mr. FRANK SANWYD said the other day in a letter to the Springfield "Republican":

At Hartford a week ago I examined the galleries and art collections of that city, which are increasing at a rapid rate, and I feel the most curious of Hartford know—and not all of them. Some of the best paintings of TITIAN, have long been in the Wadsworth collection. One of the most interesting of our colonial painters, is represented there (by the gift of FRANCIS SIMON) in his full-length portrait by LAWRENCE, one of Wren's own cathedral paintings—"The Kissing of Lazarus," which long hung in Wadsworth cathedral, for which it seems to have been painted. Mr. SIMON is expected at Hartford, and a fine marble memorial building is nearly ready for receiving them.

**After the Kiss of Good Feeling**

Of a truth these are strange times. The papers are full of thoughts and musings; SEAMAN and MORPHY, Mr. NIX and Mr. RICHMOND, LOREY pinching up LAURENCE, CHAMBERLAIN and CHILMAN, and all with tall headlines and endless exhortations of print. All this in June when the weather has been moderate! What will it be in the day-days!

**The South for the Japanese?**

A land agent, representing some of the California agents, recently inquired of Governor BROWN, of Georgia, whether that State's laws prohibited the ownership of land by its clients. Some of the Japanese themselves, not unreasonably, wanted to know also whether their coming would be checked by the laws of the Georgia. The Governor found there was no legal obstacle. He was silent on the other point. But the Charlotte "Observer," rightly remarking that it is quite as important as the matter of the law, is more outspoken. It is kinder to say, for it is experience. Southern people should dislike having Japanese colonies among them, they would be quickly forthcoming. Moreover, if it should be announced that a large part of the country, with cheaper good lands than the West, welcomed the Japanese, it would probably get them in considerable numbers. The "Observer" goes on, still very sensibly indeed:

What is the best? We would ask. They are too industrious, too frugal, too efficient as competitors. They would inspire us with new zeal for the Afro-American. . . . They are aside from their probable success, it would fit into our social scheme of things. Their position between the white and the black would not be pleasant for them, and it would be a troublesome problem to all concerned.

Elsewhere, the "Observer" dissolves for Southerners any dislike of the Japanese, but there can be little doubt that its understanding of the South's "social scheme of things" is entirely correct. To maintain a contrary view would be doing a service to anybody concerned, least of all to the Japanese themselves.

**On the Side Lines**

It must seem almost incredible to our Mayor that there could be so likely an exchange as that between STUBBS and MURPHY, and be not in it.

**The End of a Good Beginning**

ERICK GUSTAFSON MARTIN, who died the other day, was a man of pleasantness, hardly defensible, but very real and effective, with which other Southern names than his will be more widely associated. It was the movement, following Reconstruction, to make a long stricken land a full partaker of the last there is in modern life. He fought for it in the pulpit, then on the platform and with the pen, and ten years ago he will have been . . . . However, came a long illness, and the favorite gradual being held. But he will remain our citizen by his fellow-workers and perhaps also a few of the millions to whom the strength of his young method was, as the world goes, too . . . . surely depicted.

## Are We What We Think?

It is an old maxim of the philosophers that a man is what he thinks also. Even his world is shaped in by his capacity to conceive it.

"As what he sees is  
So have his thoughts been."

In the recent repetition by AVONDA of the truth older than Seneca's proverb.

Yet is a man what he thinks? Is his whole life and his value to the world what his thoughts also are? There is a modern tendency not so much to belittle the mere thinking process as to lay the chief stress on what a man feels, what he comes to by his feelings; by his intuitions; by his unreasoned, but not unreasoned, habit, post-training, and tradition. A man is a complex atom, and if he is what he thinks, he is a good deal more. This helps to account for the startling difference between a man's thoughts and his conduct. And what vast divergences there are between theory and conduct! Often they contradict each other with a life-and-death rudeness fairly astounding. One sees the great reformer, the friend of the downtrodden and the poor, merciless to his own writers. There is the man who despises this world and the things of the world, carefully hoarding his fortune. And who has not seen the fragile, sheltered daughter of the rich and confident dominion and the capable, independent officer of the sea who believes the chief obligation of a girl should be in-keeping and the pleasing of a husband? It is a shocking gap that lies between theoretic principles and actual practical application.

A man is not just philosophy to the contrary—after all, not what he thinks. Have we not known men who eagerly and defiantly denied an intelligent Creator of the world, an upholder of an ethical standard in life, who felt moved reverently among the fables, gods and reprobates, as if the all-wise Elys were never out of their consciousness? And do we not know leaders of the world with the same of will and duty even as their lips barely utter the words as soon as the words are spoken, who feel in silence? The theory may be accepted, but it does not compel action. It is a mere dead thought, unproductive of anything but words. The girl believes that a man thinks and what he thinks is what he does, and she looks to the observer. If a given theory of life results in no complaint, conflict, why take note of the theory? The most convincing thing in the world is a self-fulfilling word; hence being who says what he says and what he does. After all, the only test of a theory or a system of thought after the pragmatic method—how does it connect with conduct and with thought?

There are in fact to face with a new difficulty, for the same theory results in totally different standards of conduct. The real test that a man is not necessarily what he thinks, but that behind what he thinks lie the compelling power of the habits of his ancestors, the quality of his mind, the value of the words and looks, the gestures and vestments, of his whole environment; the tone of mind of his acquaintances, and the quality of heart of his friends. He is not only what he thinks; he is not even only what his environment thinks; he is what he has done in the past and all the present, and occasionally or otherwise, not the least little spark of living anywhere but after his growth and reaction upon life. It is this old story of old and noble thrown in the track but the stress must be made.

"Identity," thought LEXIE, "is just your chain of activities." But a man is more than that, and he is as much made of what he does not know as what he does. Just as an oak may be made up of seeds handed down to him from generations he has never seen or thought of, so his identity and mode of reaction are given him from lives of which he has an conscious knowledge.

Indeed, even as we look as we see, we largely, we think as we must. There are all these in the world, fewer than ever, but still too many, to whom any change of method or new idea remains a personal injury. They are might as well be a mountain beyond past. There are those who look unthinkingly toward any and every future, provided only it furnish change, because the remembered past has been intolerable. And so we have the comfortable conservatism and the suffering radicalism of the man at release. The extent and power of our thought is conditioned by everything that has happened since the world began. And in despite of this we believe each man to be responsible for creating a new creature in an open universe. In each of us there is some the deposit of the *divine mind* which may escape improving conditions and go forth to twist and curl and mold the incipient matter of life into an art.

It is when a man comes to a very adequate consciousness of his chains of where and how they lie, that he can loosen the fetters and begin to think more freely. Then he takes his birthright in hand and forces from it more consciousness than the dead past allowed.

That freedom entails first is understanding as well as one can what the twilight is, and what its powers and defects. It is a freedom of identity and consciousness only with things. To do this, one must speak a deeper and profounder vision of being than that of mere conscious thought. He must track his relations further than conscious thought will carry.

Just as his past brings him more than he can ever give account of, so does his freedom stretch beyond his grasp. In a dark, agonizing, hidden region he must seek to find true power. Out of the depths he becomes a new creature. Having gathered and arranged and indubitably all the possible data of his consciousness, he must plunge beneath to find all the words of his speaking, even beyond his vision. Thus the spirit inherits its own and becomes a free, romantic adventurer, making new worlds from the material at hand.

The further that toward the body are at last loosened and destructive. Only the stretch and the earth and the beauty of the inward landscape can give man peace. And this landscape is not all composed of thought. There goes to its making, feeling and the objects of its thought. The outlook into the infinite is half blind intuition.

There has been published recently a pretty tale—fictions or otherwise of the greatest financier of these times, slipping away from his office to an empty chapel to rest and sing alone. He had all the materials that life could give, and, finding them insufficient, he sought a treasure elsewhere.

Whatever life offers, it is he who stands through the half-hour of thought, his feet at the end of the horizon, and his hand at the end of his creation.

To the end of time men will roll up out of the depths to find the answer greater than their own thought. L. C. W.

## SCHOOLS AND READING

WASHINGTON, D. C.

To the Editor of Harper's Weekly:

ST. LOUIS.—"Children's Reading," an article appearing in HARPER'S WEEKLY for Saturday, May 1st, has several interesting points which are unique in opinion since from my own experience, having been in the business of the *Book Store*. This age is so near an age of low reading than any other preceding one. The children in the past who loved to read, and who in the childhood of the present have ample opportunity to do so. It is in the early years of my schooling that I see all the pleasure I have had in reading the old books of the old world. I had not been made to read aloud in class one or two of the best books I could not have known what it would be like to read.

The child has only to desire for more knowledge and it will be given him. Each school that I attended had a splendid library, and every Friday books were given out to those who wanted them. As we received a great deal, we could not carry away many books with us; so it was the school library that furnished the best reading and many a young child, who had been given the taste for good literature and wanted none.

I am, sir,

NANCY GORDON JONES.

## THE HARBEST BATTLE OF ALL

To the Editor of Harper's Weekly:

ST. LOUIS.—I have read the battle of Antietam in your paper.

It is quite popular to abuse McClellan for Lee's escape. But what are the facts?

By a captured report of Lee's few days before the battle it showed Lee had about 50,000 men. (See McClellan's report.)

It is ridiculous to say that the rebels had only 10,000 engaged at the moment—McClellan's 70,000.

If he had only 10,000 men, how could he have lost 43,000 men—If so many—to invade Maryland and Pennsylvania when he started?

McClellan did wonder in a short time.

He took the worn and defeated troops of the Army of the Potomac and sent them to the front on the march between Washington and Frederick, Maryland, created a new army, not well fed, not well drilled, not well shod. There was not time between Pope's defeat and McClellan's advance to properly feed, clothe and shoe the Union army. They needed rest, food, and could not get it. In fact, McClellan had a great deal of ammunition at the battle field at the Burnside bridge a heavy battery was firing dead cartridges instead of shell and shot, having run out of the latter.

Lee's army at Antietam was the strongest and best army he ever had, and he had plenty of men on every part of the field; and in the afternoon of the 17th he had the very best of Jackson's army at Harper's Ferry; and further, Lee's advance and retreat in the First Maryland campaign was the most wonderful of any he has accomplished except in the last days of the war, thanks to McClellan.

McClellan advanced in the open field, while Lee was in the woods and he took the men to the front and discharge one in hand many times each circumstance. Lee made blunders, too. He had blown up the bridge over his front and delayed the march by sending a strong force to the front. McClellan had taken days for McClellan to cross Antietam Creek, which he did, with Lee opposing, in one day after the latter.

Any one knows that Lee would have been an awful fool to start an aggressive campaign into an enemy's

country with an army of 70,000 or 80,000 opposing him, with 40,000 men; and every one knows Lee was not Lee.

The writer was in Antietam fight from eight o'clock the night before, all day of the 17th, all of the 18th, and all of the 19th, and he saw the whole of the battle on the firing line. Without a cup of coffee or anything else, until the morning of the 18th, he was brought up to the Antietam; and his regiment has never done in the Antietam National Cemetery than any regiment engaged in that fight. It lost thirty-one men. An illustrated paper published at the time that the boys of the Antietam charge were on every line were lost.

I am, sir,

JAMES BEAVER,  
A printer of the Ninth New York Regiment (Regulars Army).

BRUCE

SACRAMENTO, CA.

To the Editor of Harper's Weekly:

ST. LOUIS.—In an editorial in HARPER'S WEEKLY on May 31 I noticed your reference to "that unwarlike homophile commonwealth" (meaning California). I am also where you say Roosevelt says "the need of moving tranquility with tranquility" in dealing with California.

The editorial is full of misapprehension, misjudgments, and misstatements concerning the Japanese problem in California.

Do you not think the indignation is rather with you and not with the Japanese, who are treated not as though California is a mighty god and that you are the god?

We in California do not consider that we understand your New York problems as you do. And we are content to let you make your own way for your own good, although several of them are intruded in their course.

Had you New York with a disposition and a healthy of sympathy that might be irritating are it not as intensely fallacious—before us like a high school exercise repeating his lies.

Take a friendly tip: Either come to us in California and see for yourself that of which you show you are deeply ignorant, or else counsel that ignorance from your own desk. You are not to be discussing the Japanese problem in California.

For every editorial you publish upon the subject you are the dealer of you are the dealer of a river boat southward exposing the mud banks of the Sacramento.

I am, sir,

CHARLES McCLARNEY.

## MONEY AND MARRIAGE

MINNESOTA.

To the Editor of Harper's Weekly:

ST. LOUIS.—A genuine church publication gives up a half-page of its valuable space to the recumbent of American girls trading their ribbons for poverty-stricken foreign girls, forgetting entirely that there is far more marrying for money both by men and women, but more especially by women, than by men; to better their condition than sell themselves and their fortunes for the glittering baubles of society. Indeed, it is doubtful if the girl who marries for money is not in the more deplorable condition of the two; to marry for money is a crime anywhere; to marry for money in this country, it is a crime, and it is a crime, and it is worse than a crime; it is sissy. It is literally only two generations from shirt-sleeves to shirt-sleeves.

The man who is poor today may be rich to-morrow; and the man who is rich today is pretty sure to be poor to-morrow, especially if he has inherited the money. It is hardly the match to which a marrying a girl may have her choice between whether she will be poor and wear home-made frocks and rub the streets with her own sweat and tears, or be rich and clothed in imported fancy and ride in automobiles in middle life, or whether she will have inherited a fortune, money for her own use, and be pined for the price of groceries in middle life.

It takes the poor and industrious young man, with a determination to get there and some talent, about thirty years to accumulate sufficient money to be regarded as well-to-do, and a splendidly inherited but idle young man, with a considerable fortune, and three or four wives, and their life is also. At the time they were married neither Mr. Rockefeller nor Mr. Morgan was getting old, and each had only \$10,000 a year income; neither would the most prosperous men of your immediate acquaintance, but many of them who are getting old, and each has a fortune. This also is to be said against writing for a man to have as income sufficient to support an establishment before marrying him. It is very hard to make a fortune, money for her own use, and her own who eats herself off from being her husband's clerk the latter has missed the most interesting experience that life offers.

I am, sir,

M. L. F.

## INFORMATION

PASADENA, MEX.

To the Editor of Harper's Weekly:

ST. LOUIS.—In your issue of June 7th you refer to the "Iron Ore" as a trade paper, in the reference being that it is not in the business industry.

This is not so. It is a general news paper published over a year. It is called the "Iron Ore" because it is published in Lakewood, a town in which there are a few iron mines.

I am, sir,

AUSTIN DOBSON

*From a Sonnet*  
 In after days when grasses high  
 O'erstep the moor where I shall  
 lie,  
 Though ill or well the world  
 adjust  
 My slender claim to honour'd  
 dust,  
 I shall not question nor reply.  
 Austin Dobson

*Comes from "The Ship"*

JOHN MASEFIELD

*From "The Ship"*  
 They are grander things than all the art  
 of towns,  
 Their tests are tempests and the sea that  
 drowns.  
 They are my country's line, her great art  
 done  
 By strong brains labouring on the thought  
 of men.  
 They mark our passage as a race of men.  
 Earth will not see such ships as those  
 again.

John Masefield

THOMAS HARDY

*From "The Poet"*  
 I towered far, and lo! I stood within  
 The presence of the Lord Most High,  
 Sent thither by the sun of earth, to win  
 Some answer to their cry.

"The Earth, say'st thou? The Human race?  
 By me created? And its lot?  
 Nay: I have no remembrance of such place,  
 Such world I fashioned not."

Thomas Hardy

## POETS WHO ARE FOR THE ENGLISH

WILLIAM WATSON

*From the "Old to New"*  
 Let me go forth, and see  
 The overflowing sun  
 With one wise friend, or one  
 More than wise, being fair.  
 William Watson

ALICE MEYNELL

From "The Lady of the Lake"  
 She walks—the lady of my delight—  
 A shepherdess of sheep.  
 Her flocks are thoughts. She keeps them  
 white;

She guards them from the steep.  
 She feeds them on the fragrant height,  
 And folds them in for sleep.

Alice Meynell

STEPHEN PHILLIPS

From "Clare in Fife"  
 Give me again great life! To  
 dare, to enjoy,  
 To explore, never to tire, to be  
 alive,

And full of blood, and young,  
 to risk, to love!  
 The bright glory of after-battle  
 wine,

The flushed recounting faces, the  
 stern hum  
 Of hurished armies, thrill of  
 unknown men!

Stephen Phillips

RUDYARD KIPLING

From the "Barraband"  
 God of our fathers, known of old—  
 Lord of our far-flung battle line—  
 Beneath whose awful hand we hold  
 Dominion over palm and pine—  
 Lord God of Hosts, be with us yet,  
 Lest we forget, lest we forget!

The tumult and the shouting dies—  
 The captains and the kings depart—  
 Still stands Thine ancient sentinel,  
 An humble and a contrite heart.  
 Lord God of Hosts, be with us yet,  
 Lest we forget, lest we forget!

Rudyard Kipling

## TALKED OF LAUREATESHIP

# THE INITIATIVE AND THE REFERENDUM

## From the Standpoint of Political Science

BY HENRY JONES FORD

Professor of Politics, Princeton University

"The world's best & broadest field is in the  
New England."  
You can't get an eye on the lot.  
And play it in the  
"For the People of the United States,  
of the County of Albany, and of the State  
of New York, do hereby certify that  
this is true to the best of my knowledge and  
belief."  
From the "History of the State" by Wendell Phillips

THE idea in a suggestion of the fitness of things which we must have in mind to see if their proper setting the new instruments of rule to which the people are resorting. Kipling shows and holds that, abstractly considered, the basis is superior to the plan, the folk, or the organ, but only that it is handy when they are unavailable. If this distinction is grasped, readers will disagree with Wendell Phillips on a university president discharged the initiative and the referendum, while as a statesman he now recommends them. In the case even he had in mind general values in the abstract, particular needs. These two points of view will serve to clarify opinion. Those who approach the subject from the historical standpoint are apt to regard the initiative and referendum as dangerous tools of factious; while those who approach the subject from the standpoint of practical conservatism in existing circumstances are apt to regard them as useful appliances for present use. In the current nomenclature of politics, the one side is usually conservative, the other is progressive. Much may be said upon both sides.

### The Conservative View

AN argument advanced on the conservative side is that the means to which the people are now resorting would have wrecked the future. The idea of the fathers was formed in the period of ancient democracies whose experience of direct legislation exhibited it as the road to ruin. Democratic government through means since developed, opponent of the nineteenth century, and the type was unknown to the fathers. Hence a brand and deep suspicion was made before the initiative and referendum could be proposed—a distinction still occasionally visible in judicial opinion. The reasons explained are that the means to be used—a government in which the scheme of representation takes place. Therefore the new government was to be regarded as a thing quite alien to the ideas with the ancient democracies in which the government was subject to the immediate direction of the people. Such democracies have ever since experienced instability and confusion, but have never been forced incompatible with personal severity or the rights of property and, in general, have as about in their lives as they have ever known in their history. He declared that "the true distinction between these and the American governments lies in the total exclusion of the people of the collective capacity from any share in the latter."

Thus it appears that the distrust of democracy that permeates the writings of the fathers was based on ancient and medieval experience. Nowhere was there any system of democratic competitors. Switzerland—some a striking example of the economy and efficiency of democratic government and the great source of inspiration to the direct legislative movement in this country—figured in the "Federalist" as a divided territory.

At that period De Laune's "Constitution of England" ranked as a book authority. The author—a lawyer and publicist of Geneva, and the individual trouble of his own country led him to write his treatise advocating the superiority of the English system of representative government to the latter. The citizens of Geneva had been "stripped of all their political rights, and had little more left to them than the pleasure of their own consciences, and the assembly they met." At the same time, he concludes them with having "governed their liberty more than the laws have ever been able to do in the other commonwealths of Switzerland."

The new view of Swiss political institutions is adopted in John Adams' "The American State Constitutions," published in 1787. The attitude of popular sentiment at this period is indicated by Schiller in his youthful dramatic production, "The Robbers," in which one of the characters refers to the Gracian as "an Athens of Switzerland."

The notion that Swiss politics were corrupt continued to prevail, and it was not until the Gracian in which the referendum was compulsory on all acts and engagements of the government. Cuvier's "Switzerland," the standard history of the country in the middle of the nineteenth century, speaks of the extraordinary prevalence of bribery and corruption in the Gracian. His Gracian, however, is the Gracian published in 1842, taking a similar view of Swiss politics. The apparent failure of Swiss democratic institutions was the subject of a book by the one country of a noted writer of the best of English critics of American "New System" which ended his "History of the Continent" with the

declaration that he should visit America for light upon the problem whether the faults of the Swiss form of government could be remedied. In his volumes, "History in America," in six volumes, the publication of which began in 1829.

The political institutions of Switzerland for good government has been established since the adoption of the federal constitution of 1848, introducing representative government of a peculiarly high and refined character.

Although the reputation of Switzerland in now somewhat in our political institutions, the day of her institutions, the earliest approach is not yet filled from the apparatus of direct legislation which Switzerland has retained and systematized as adjuncts of her system of representative government. Instead of attributing to them the excellence of Swiss government, some students of political institutions are inclined to regard them as the drops of poison which, whose virtues qualify has been nearly all extracted, but which are a hindrance rather than a help to the system.

President Lowell, in his "Government and Parties in Continental Europe," makes a detailed survey of the history of the initiative and referendum in Switzerland, and he concludes that "the idea of the right of everybody to take part in public affairs by proposing laws for the good of the country has it has not proved of value."

Professor Wilson, in his standard manual of political science, "The State," remarks:

"The initiative has been very little used, having given place in practice, for the most part to the referendum, which has been employed and not proposed either progress or enlightenment, leading rather to doubtful experiments and to reactionary dispositions of reaction than to really sound legislation."

As for the referendum, he says:

"The vote upon such measures submitted in the United States is not so high, there is not much popular discussion, and the referendum by no means creates that quick interest in affairs that its originators had hoped to see it excite. It has failed the sense of responsibility among the people, and in fact quickening the people to the exercise of any real control of affairs."

These quotations are not agreed as to the value of these institutions, and it is noticeable that those who approve them do so not so much on the basis of their own political theory as on their actual operation. It is manifest that they are a break rather than a driving wheel, or, using the illustration of American politics, they are stand-pat rather than progressive agencies.

It is to be expected that any kind of the referendum, which characterizes the initiative and the Liberal party opposes it as a hindrance to popular rule expressed through representative institutions. It is not the other way about in this country. The issue of progress or democracy for the institution, and conservative opposes it. This striking difference is due to the fact that we do not have responsible government in this country.

Woodrow Wilson put the case exactly in his speech at Kansas City, May 5, when he said:

"If we had that we had genuine representative government in our State legislatures no one would propose the initiative and referendum in America. It is proposed in this country because of the defective features of direct legislation, and of the defects in Swiss we do it, and yet favor it in this country as a political agency for present use."

### The Progressive View

TO view a right the new political forms now being introduced is aid of democratic progress, they are not to be regarded as a thing quite alien to the ideas with the ancient democracies in which the government was subject to the immediate direction of the people. We have to do with a political situation favorable to defects in our constitutional organization, which the initiative and referendum are proposed to remedy. The American state was corrupt and impugned from the start, and this was the principal cause of the rapid progress of the federal movement that is the characteristic of our constitutional history.

Such an achievement as setting up a workable national constitution by agreement is no act of the most ordinary kind, but it has been accomplished and the mirror disappears when the actual situation is surveyed, and the fathers are now working like obedient slaves to repair the defects, guard their values, and set the crew under control.

The debates of the constitutional convention give evidence of the fact that they were not the obedient slaves under such as the breakdown of discipline, as shown in the behavior of the States. Mercey of Maryland in the Federal Convention of 1787, in the words when he remarked that they had to protect the people "against these speculative legislators which are now prevailing throughout the United States."

The progress of the convention leaders to apply the oath was very marked. Hamilton's motion was adopted, and the convention was dissolved. Madison's motion was that the federal government should have "a negative in all cases"

whatever, on the legislative acts of the States, as the King of Great Britain before him, and the inability of the laws was such an immense evil that "it would be well to provide as your constitution that three shall sit on the bench between the executing a bill and passing it."

But as the convention went on with its work, the federal leaders found that the king did not get what they wanted, but had to take what they could get, and what was attained, did not receive recognition in State action.

Madison took his failure rather hard. Even in the midst of the campaign to carry New York for the constitution, he had occasion to declare that the people "will never be satisfied till some remedy be applied to the vices and inconveniences which characterize the State administrations."

Madison was not alone in this view. The people have tried various remedies in vain, and have concluded that the political institutions which affect them are unworkable, and that the only hope of relief lies in taking the extreme of authority in their own hands.

In their search for an off-land remedy for the ills of their State administrations, the American people, from 1789 down to 1902, explored 217 distinct State constitutions. It is difficult to keep count of constitutional amendments, their being so general official record; but it appears that in the decade 1890-1900, there were 100 amendments. In 1902, were proposed, of which 217 were accepted. In California alone 17 constitutional amendments were adopted between 1892 and 1902.

It is to be expected that any kind of the referendum, which characterizes the initiative and the Liberal party opposes it as a hindrance to popular rule expressed through representative institutions. It is not the other way about in this country. The issue of progress or democracy for the institution, and conservative opposes it. This striking difference is due to the fact that we do not have responsible government in this country.

The progressive contention is that the initiative and referendum are to be valued, not upon their own merits, but upon the ground of the improvement of the present unworkable. Talking about the superior advantages of representative government in an abstract way, the corrupt nature of the system is unnoticed. Even a critic so friendly in his attitude and so moderate in his opinions as Ambassador James Bryce is found to use terms as "Swiss pool" and a "Wicked" method of juggling, shoring, and prostitution of political power" in discussing the initiative and referendum. In the latest edition of "The American Commonwealth," he says that he finds no reason for any marked change in judgment, but that the corrupt nature of the system first made public more than twenty years ago. The general situation is much the same, "the fathers working for good and evil having not greatly changed."

The progressive contention is that the initiative and referendum are to be valued, not upon their own merits, but upon the ground of the improvement of the present unworkable. Talking about the superior advantages of representative government in an abstract way, the corrupt nature of the system is unnoticed. Even a critic so friendly in his attitude and so moderate in his opinions as Ambassador James Bryce is found to use terms as "Swiss pool" and a "Wicked" method of juggling, shoring, and prostitution of political power" in discussing the initiative and referendum. In the latest edition of "The American Commonwealth," he says that he finds no reason for any marked change in judgment, but that the corrupt nature of the system first made public more than twenty years ago. The general situation is much the same, "the fathers working for good and evil having not greatly changed."

1. They avoid inequalities of legislative apportionment.

2. They escape legislative abstraction to constitutional amendments.

3. They provide means of political action apart from those controlled by special interests and free from the worst entanglements of the legislative committee system.

4. They provide for more careful legislation.

5. They clear the way for a reorganization of public authority.

6. They clear the way for a reorganization of public authority.

THE English view of the actual tendencies of our State politics from representative government that not one of those points could be used in Canada, Switzerland, and America. It is to be expected that any kind of the referendum, which characterizes the initiative and the Liberal party opposes it as a hindrance to popular rule expressed through representative institutions. It is not the other way about in this country. The issue of progress or democracy for the institution, and conservative opposes it. This striking difference is due to the fact that we do not have responsible government in this country.

Such an achievement as setting up a workable national constitution by agreement is no act of the most ordinary kind, but it has been accomplished and the mirror disappears when the actual situation is surveyed, and the fathers are now working like obedient slaves to repair the defects, guard their values, and set the crew under control.

The debates of the constitutional convention give evidence of the fact that they were not the obedient slaves under such as the breakdown of discipline, as shown in the behavior of the States. Mercey of Maryland in the Federal Convention of 1787, in the words when he remarked that they had to protect the people "against these speculative legislators which are now prevailing throughout the United States."

The progress of the convention leaders to apply the oath was very marked. Hamilton's motion was adopted, and the convention was dissolved. Madison's motion was that the federal government should have "a negative in all cases"

**I**NTO the stagnant heat of the "Bald Eagle," right at the door's edge—heat that roared beyond even the fevered probability of the poker-players and fattened the leverage to incursive liquid—fell the mangled stranger. Like a bolt from the blue.

Just how he came, or whence, he could tell! A groan, a gasp, a flapping shingle, a creak of the swinging back door, and there he was. A skeleton of a man, bronch-battered, overhung with rags, powdered with dust which had oozed on here and there and stopped his bloodshot eyes—eyes that lagged and blinked, half blind, whitey terrible. Into his matted hair he thrust his fingers; he sweated a moment, then, "On an empty gassy-stomach, flattened into a chair, fell he down across a table, gasped, "Water!" and thereafter grew very still.

One moment, no response. Two chairs scraped, seats craned, men crowded toward him; and, over all, rose the voice of Buck Dawson:

"Water—hell! Hey, Bo, a slug of Fire-X! Jump!"

But, as Bo Squires, behind the bar, stood rooted, Buck's own jaw snapped up a long-sworded, sloped four fingers into a V-shaped plane, and (just a second later, as Chato Andrew's pulled back the stranger's head) erupted if down the bloodshot throat. Some of the stuff trickled through the man's beard and dripped off upon his neck, long about.

Gripping, lapping beads wide and wide of sweat, the devil's rated again. Two or three in the crowd tried to hold him up, but Chato interposed:

"As, drop him, you first-hand pistol!" he belted angrily. "Kain! you all see as how his phant' wined! Let him rest, you, of he 'erts ho. Why—back at 'em!"

Starting, he pointed with a nerve-like leverage at the floor beside the stranger's right foot. There, slowly oozing, spread a trickle of black ink blood. They saw that the man's head was all sudden and awry, with a bullet-hole obliquely through the middle. His fingers-knives were torn as if from crawling far, far, over rocks and mud. His hands were just four most articulated riveness—nails were down to the quick, fingers stripped of their skin.

"Sore-bless! her water, where 'lar wa'n't none!" squeaked the voice of old Pop Haddock. "What in Tophet has he went 'g'n'?"

Chato whipped out a seven-inch blade and slit the cloth, exposing the lip of a ghastly tear in the flesh of his high up on the calf—a wound cleanly squared with a hand of slicing that had slipped just off.

"Something like a committal oath of consecration—snapped the gag.

"'In he ain't bind to death yit!" narrowed Dexter, of Tree Fren. "Well, darned if he ain't got 'y-tality! Reminds me of a certain fellow."

"Here, but 'em 'er 'em 'er 'em!" Chato interrupted. A moment later he was kneeling to bind the gap. "Check another gargo into him, some an'!" he commanded.

Shorty McGroth tried to avenge, but the stranger, getting a grip on the table-edge, shook his ghastly head. They heard his breath rattle. "I owe his law, while 'er a clem's under his mouth of dirt.

Still blood-sweating, he leaned around. Then a swirl of smoke cracked his prominent lips, and he held up one hand as if for silence.

Shaking, it fell again and with it the hand.

"What—what do—?" he whispered. "It was hardly even a whisper; yet not a prancer in his

Bald Eagle but heard his every syllable. "Heys, what day is—this?"

Black answered; then Chato answered:

"Friday, May."

The stranger shook his head again.

"There where days are—I left him," they heard his mutter. Then, louder:

"Where am I?"

"Bald Eagle, at Howell's."

"Howell's? Then I must be—went north. Didn't ought—?"

His voice tailed off to nothing, though his lips still moved.

McGroth brought his glass to the numbling mouth. The stranger blinked.

"No, no!" he objected. "Water—that's all!"

"Not him some—of you-all but and may!" cried Chato. "As will—grace the devil's granted the luke-warm slip that Squires shoved across the bar to McGroth."

"No more!" he repeated, as he continued haltingly.

"A—? What fert?"

"Why, to string—me!"

Dexter's voice was the only one that audibly gave vent to the universal stupefaction.

"Big show!" judged Dawson, behind his palm, to Shorty.

The stranger, blinking, trying to lick his lips with a longer all swollen and cracked, squeaked:

"A card? Yes, that's what—I said. Broken that's what I—lived 't' git here—fer!"

It must have been a full minute by the tin abstract clock back of the bar before anybody seemed to find to speak. Down dropped the stranger's head again. He lay there motionless, wheezing slowly, his hands still gripping the table.

Round him the crew now ranged themselves, staring blankly. Chato rapped the blindest note that had given him his Grover machine. Pop Haddock belched his long, masculine. Shorty leaned an elbow on the table, and, his left hand on his vertebrae-battered hip, stared at the man point-blank with wide eyes.

The other, such in his own way, tried to digest that astonishing phenomenon. Then out of the stillness rose Squires' judgment:

"I've and 'em took 'most every way, by Judge Priest! but this sort o' bug has got me skum!"

And on his hand, close-cropped skull his knuckles tapped out his opinion:

"The stranger moved again. Into his forehead he thrust his fingers and whirled a little life.

"No, not buggy," he thought again. "It was hardly even a whisper; yet not a prancer in his

lim miles. Know what I'm a-sayin'. It's right, too. Strang I'd ought to be, an' mind to be—what's left o' me to string. Huh? Don't you git me 'sral? With a bone-rubber phant' strumme beside a me? Listen!"

**T**HEY listened, hushed into tension. But for a time the stranger brought no words to utterance. He just sat there at the table, swinging a little from side to side, hands baling fast, eyes blearing. The blood-pool at his feet started and creaked. His face, beneath the beard and dirt, had gone the color of soggy pie-crust.

Pop Haddock made as if to stir him in the ribs, but Chato stayed the old man's hand.

"Cut that!" he warned. "Kain! you-all let him tell it the way he 'erts ho! We'll git it soon enough! Ah—"

Breaking the silence where no head only the deep breathing of the punchers and the tick-tack of the impertinent clock, the stranger blurted in a raw, hoarse, inhuman voice:

"There was him an' me. Just as two—sawry? Jackson. That was him, I'm Hyerson. Sam Hyerson—yes, an' Sam K."

A sort of wailing murmur hummed into audibility. Two or three of the men glanced at one another. And Buck Dawson, peering into the stranger's face, let his hat drop upon the table with a indifferent impatience.

"Sam K. Hyerson, the wounded man went on.

"An' I ain't a-goin' to let nobody tie my bag up, nobody, hell! What 'd be the use, when I'm done through with her? Sam K, I reckon you-all have heard o' me, down here south of the Gila. Mobbe some of you 'erts even see me, though you wouldn't recognize 'em no more. No matter."

He leaped.

"He ain't!" growled Buck.

"Huh?"

"How is hell 'd you ever git here, hey?"

"Oh, that? Hey, I dropped the bar a spell back."

"I goes fer to hit Tomaso, an' hits my own self. Ain't that a joke, hey?"

(Continued on page 22)

### THREE BUILDINGS—THREE CENTURIES

**P**ROBABLY nowhere else in the United States is there such an interesting juxtaposition of buildings as that of St. Paul's Chapel, the Post Office, and the Woolworth Building in New York City. The scene reproduced herewith is familiar enough to thousands of New-Yorkers and visitors to the metropolis, but few many have considered that there are three unusual relations not only shared by the Church, the State, and Business, but also represent, respectively, the past three centuries in the history of the city and the nation.

St. Paul's Chapel, the oldest church building in the metropolis, fittingly represents the eighteenth century. Completed during the Siting Act settlement of 1743-44, it has been a place of calm in the midst of turbulent ever since. President Washington and Governor Clinton, marshaling within its walls, enjoyed temporary respite from affairs of state, while, in all the years since, countless thousands of busier

persons, retiring momentarily from the rush and roar of the great city without, have been rested and sustained by a few minutes spent in this quiet sanctuary or among the historic graves in its churchyard.

The Post Office—or Federal Building—stands for the nineteenth century, in that it was completed in 1811; but many would not regard it as really typical of the architecture of that period. New-Yorkers are not particularly proud of this \$10,000,000 pile of mixed Doric and Ionic architecture, and it need be admitted that it is not, strictly speaking, a work of art. It occupies what used to be the southern point of the once beautiful City Hall Park, its massive bulk cutting off what formerly was a fine vista up lower Broadway to the splendid old City Hall. But there is talk of tearing down the "big, costly, and conspicuous" Post Office, and restoring the park to a measure of its pristine beauty as a civic center. Then the City Hall, which is considered an architectural gem, would be the more suitable repre-

sentative of the nineteenth century in this interesting group.

The Woolworth Building, just completed this year, will represent the present burgeoning century. Towering 106 feet above the street, it is the highest structure ever reared by the hand of man, save only the Eiffel Tower in Paris. Twenty-eight high-speed elevators are required to handle the traffic of its fifty-two stories. The owner of this \$11,000,000 property, Mr. F. W. Woolworth, began his business career as a clerk in a small up-State city a little over thirty years ago. To-day he is at the head of a company controlling a chain of about one hundred department stores, which prosper because they help the masses to buy economically in these times of the high cost of living.

Thus the Woolworth Building may be regarded as a vast monument to Thrift and to the opportunity which is another name for America in this glorious twentieth century.

# NOT PROVEN

## A Famous Scotch Criminal Case

BY  
MARIE BELLOC LOWNDES

ILLUSTRATED WITH DRAWINGS BY WILLIAM BERGER

**I**n the long roll of murder mysteries, the case of Madeleine Smith need always take a conspicuous place on account of its intense romantic interest. Some features of the story would seem absolutely incredible if we did not know there is no doubt. But to what purpose does all the evidence converge? Was Madeleine guilty, or not guilty, of poisoning her lover? Or must we, as the jury themselves did, give up the riddle and return a verdict of "not proven?"

Small wonder that for long weeks nothing aroused such interest throughout the British Empire as the fate of this lovely and accomplished girl. If guilty, she had proved herself capable of planning and of carrying out one of the coolest, most deliberate, and fiercest murders ever accomplished, while her victim had ever been the object of her devoted love.

Details of the story might well have made it difficult of discussion in an ordinary literary circle, especially in the pros and Victorian age. Yet it burst through the conventionalities of eyes that pruned. All over Scotland, in particular, gently nurtured girls heart and pruned each night, in an agony of anticipation, that Madeleine Smith might be acquitted of the awful charge brought against her.

The greatest legal authority of that day declared that "never in a criminal case were the chances of condemnation and acquittal more evenly balanced." Yet so great was the dominant fascination and charm of the youthful prisoner that during her trial she received no fewer than seventeen genuine offers of marriage!

And when at last, after a most careful trial, the elderly humane Scottish verdict of "Not proven" was returned it was received with a mad outbreak of cheering all in the courtroom, while outside, among the tens of thousands who had assembled to hear it, hundreds burst into rapturous cries of joy, beyond the confines of the city in which she dwelt.

"He spoke to her, only to be spurned with proper dignity"

for her exceptional beauty, her vivacity, and her charm of manner. His was of moderate height and especially graceful; he was large, deep blue eyes were shaded by long lashes and her whole being emanated an air of aristocratic instinct with health and the joy of life.

The mother's eyes rested very tenderly on her child, for Madeleine was about to leave the home nest—in fact, the date of her wedding had been fixed the day before.

Her parents were delighted at the marriage, for their prospective son-in-law, William Minnoch, was not only prosperous in business, but he was also a man of character to whom they could with confidence intrust their beloved child.

The whole household was in a joyful happy state, and that perhaps was why Mr. James Smith came in and out of the drawing-room so often that day, addressing kindly words to his wife and giving fondly to the young daughter who was so soon to leave him.

As her parents' glances rested on Madeleine, they could not but have noted an unusual side look-alike with a young foreigner named L'Angelier. Madeleine had shown herself a good, dutiful daughter on that occasion, for she had certainly been more or less in love—in so far as a child of seventeen can be in love—with Leslie L'Angelier. Mr. Smith ever recalled the words of the letter which Madeleine had written to the not very nice woman—a certain Miss Perry—who had acted as go-between and confidante in that unresolvable love-affair:

"My men will not give me consent and I am to stay here in this house. Can you do anything for me? I had hoped to go to have been happy with him, but she was not to be disappointed. I hope and want to see her sooner. I am going to leave the country, if it would have seemed, that my men to have met her. They are not to be disappointed. My father to study, and a kind letter too."

Yes, in the eyes of her fond parents Madeleine had behaved very well ever that matter-of-fact, in a way that might serve as an example to every rebellious daughter, and while they were thinking of this, the door bell rang.

"A visitor, my dear," said Mr. Smith, and, next-like, hastily left the room. A moment later Miss Perry, the very woman who played her questionable part in Madeleine's love-affair, was shown in.

Mother and daughter glanced at each other. They could well have spoken with a voice this afternoon, and particularly with this visitor. Madeleine, indeed, looked a little troubled.

"Through the empty lamp-lit streets she crept quietly:"

They were but slightly acquainted with Miss Perry, and their only association with her was not pleasant; but they provided her easily.

After a few moments of aimless talk, the visitor (continued):

"Mrs. Smith, I had a serious reason for coming here this afternoon, or I would not have troubled you with a call. I feel that you and Madeleine ought to know that Leslie L'Angelier is dead. He died last night, very suddenly, having sent me a message to say he was ill and desired for me to see him. But when I reached his lodgings he had already passed away."

There was a moment's pause. Then Mrs. Smith expressed her regret at the news. Madeleine flushed deeply, but did not seem very deeply affected. And Miss Perry, in some confusion, rose and stiffly took her leave.

The news was characteristic. All three ladies in the painful circumstance showed a true Scotch reserve, and as a word was spoken of past events, she let us look into their hearts. Mrs. Smith, though rather shocked at her own feeling, could not help being glad that L'Angelier was dead. The episode of his love-affair with her daughter had caused the only rash that had ever passed between herself and her elder daughter.

And Madeleine? What were her feelings on learning the bad news? Whatever secret was hidden behind these lovely, downcast blue eyes, we may suppose that she was only remembering that L'Angelier had truly loved her.

As for Miss Perry—well, she, it is clear, was seized with her more sinister feelings of pain and distress, and her stiff behavior showed us clearly as the pharisaical speech how indignant she was at the outbreak of both.

It is to be noted that Miss Perry lingered for a moment in the entrance-hall of Mr. James Smith's comfortable house, wondering whether Madeleine would rise out after her to learn something more of the pitiful end of her erstwhile lover. And so she thus lingered. Miss Perry wondered indifferently whether she ought to tell the girl that certain letters had been found among the dead man's belongings. But Madeleine Smith remained upstairs with her mother, and on at last the door of No. 7 Blythswood Square closed behind the unwelcome guest.

THE rest of the afternoon whiffed itself away in lonely meetings. The family—consisting of five heavy men and daughters—met at the evening meal, attended family prayers, read by Mr. James Smith, and later had one another good night and went to bed. Madeleine, and the little sister who slept with her, retired to the various half-bathrooms room where, by the young girl's own wish, she had always slept since the Smiths moved into their new house.

Next morning, at the eight o'clock when still dark, Madeleine got up, indignantly dressed herself, and slipped out of the house, talking with her only a

# DANGEROUS DILEMMAS OF

# WILD ANIMAL TRAINERS

BY ELLEN VELVIN

One of the foremost experts in this country on the handling of wild animals in captivity is a woman, Ellen Velvin. Miss Velvin has visited and studied all the celebrated collections of wild animals in North and South America and in Europe. She has known the leading animal trainers of the world, and has experimented under them and observed their methods. In a highly specialized branch of animal psychology—the psychology of wild creatures in captivity and under taming—she has an equal.

In this issue of HUNTER'S WEEKLY, Miss Velvin gives a new series of articles, dealing with some of the most critical wild animal problems that have come within her experience.

AMONG the many varied and peculiar occupations of man to earn a living, that of a wild animal trainer is perhaps one of the most unique. He works in a field that is very other on the face of the earth; his hours are long and tedious; he lives in a constant state of excitement and nerve strain; and if he has the interests of his animals at heart—and in man ever makes a success of this peculiar calling unless his animals are never fatigued.

After a day of incessant activity—for trainers sometimes begin their rehearsals as early as four in the morning—he generally retires at about twelve o'clock at night, tired and weary. But at the slightest signal of an animal among his animals—and night is the restless time for the wild beasts of the forest—who is up and among them, with a light in his hand quelling them and making sure that everything is all right.

The majority of wild animal trainers take such keen interest in their animals that they search for them with delight the progress of each animal; and when, after weeks of incessant labor, the success of an "act" is secured, they are as proud as a man taking his degree at college.

Had a man such possess unusual qualities to succeed in this calling. The loss of a wild animal costs him, of course; but this is only a small item among the many other essentials. In the wild days it used to be considered that an animal trainer, or "handler" as they were then so erroneously called—for no wild animal is ever tamed—must be a rough, strong, and somewhat brutal individual, in order to obtain any sort of control over the wild beasts.

## Quiet Men Make the Best Trainers

**B**IT at the present time this idea has been discarded entirely. It has been proved that those who have the greatest power and control over wild animals are the quiet, reserved, and good-tempered people. A man first, in the first place, have capacity to control over himself, and must possess a placid disposition. A man who gets excited is worthless as a trainer. Nervous commentators think it wild animals in a most remarkable manner, and one of the great factors in training is to calm, not excite.

Physical agility is also absolutely necessary—not a quick, nervous agility, for this the animal would not understand, but an agility that consists in quick,

quiet movements and a lightning-like appreciation of the animals' varied moods and movements. Strength and good health, patience and plenty of nerve, are other essential qualities.

There are, of course, certain rules and methods of training wild animals; but, generally speaking, each trainer has his own peculiar ways and tricks of breaking them. What will succeed with some animals will not succeed with others. Each man must go his own way and do as he thinks best; and this is why it is sometimes so puzzling to the general public to realize all that the greatest men.

As lions always played a prominent part in the exhibitions of the ancients, so at the present time they are, perhaps, among the most interesting of all the performing wild animals. The largest group of lions ever trained to perform together were the twenty-seven trained by Captain Benarria, which were exhibited in all parts of the world. Captain Benarria is one of the greatest trainers I have ever seen. Calm, placid, self-possessed, he would walk about among this herd of lions, speaking to one, touching up another who perhaps did not seem inclined to do as he was told, compelling a third by quiet insistence to mount his pedestal, making a fourth more sure by to show a good pose, etc.

## Benarria Disciplines a Refractory Lion

**H**E lives in Richmond, Virginia, one day, teaching his lions a new trick. He thought he would give them one hour that morning, and another the next day, and so on. But, for some reason or other, one lion absolutely refused to do anything he was told. It is not always nice to force a lion when it is in this mood; but, having to do this, Benarria made him all get into certain positions, and then gave him attention to the disobedient animal.

For two solid hours the man and the lion did each other. The lion would refuse, with a snarl, growl a little, make a rush forward, and then stop suddenly before the solid figure of the trainer. Then he would walk round and round the arena in a dashing, shifty manner, with the trainer turned round and round him, making him until he must have been quite dizzy. After this, the lion would sit down on his haunches for a while. The same thing would happen again and again. But he would not get up on the pedestal, which was the only empty one in the arena.

Meanwhile, the other lions became tired of sitting on the pedestals. Some of them yawned, some began to get down. And now came the great danger. Any trainer is supreme master while he keeps on his feet, but once down he has no chance whatever. It is the signal for an immediate attack, and the trainer was now likely to be knocked down at any moment. When one lion gets down, all the others follow, and, moreover, it is impossible to touch one stubborn animal while twenty-six others are pawing round.

To give in now would have been fatal. So a signal was given, the arena doors were opened, and all the other lions were sent back to their different cages. Benarria himself going with them, leaving the lion alone in the arena. It was assumed to see the lion, as soon as he was alone, go up to the very pedestal which he had so obstinately refused to mount, and smile it carefully. As he smiled he growled. Then he walked round the arena, went up a second time to the pedestal, and smiled it again. After this he sat down, settled his head comfortably on his huge paws, and was half asleep when the trainer returned.

The same thing was repeated with the same results. The lion began to get excited and angry—he had not been punished in any way, but he was evidently tired of it; while the trainer was white and trembling. At last the lion lay down again, and then suddenly, without the least sign of relaxation, got slowly up, stretched himself, walked over to the pedestal and mounted it! There was no more trouble after this. He went to his cage like a lamb, and the next day, when told to mount, got up instantly, looking for a way into the distance in that indifferent manner, as if all lions have.

## The End of the Dark with Frightened Lions

**T**HE man was with this very lion—Merriman—that I once had such a terrible experience not long ago. While putting his lion back, after a performance, the electric lights suddenly went out.

I was then in the narrow passage in total darkness—no lions. He was at the extreme end where there was no exit. As the other performers were still going on, the noise and confusion among the audience can be imagined. It was quite useless. Therefore, to call or shout for help, as no one would have heard him. This was one of the most terrible moments I ever had—called and had no one

A dangerous act—putting a lioness where she can spring. This is one of the least showy and most dreaded parts of the performance.

was Mervine in the very act of springing! But the sudden brilliance of light, another crack of the club on his nose, and a peremptory order from his trainer, so realized the lion that he turned round and went into his cage like a tame dog. With a supreme effort, Bonavita put the other lions in their cages, but was felled soon afterward by a trainer at the entrance of the ring, in a swoon. The strain and effort had been too much even for him. It was considered by all the other trainers that he owed his life entirely to his wonderful power of mind and his cool, quiet behavior.

*Terror—versus Lions*  
*Fight at rehearsal*

AT another time Bonavita had been smiling all his lions through a rehearsal, when one of the lions suddenly appeared to discover that a strange lion had been

CAPTAIN. I whipped at it afterward.

Leopards are always unwilling performers, but their agility and intelligence enable them to achieve remarkable results.

heard his cries, I doubt whether any man could have been found brave or hardy enough to venture in a dark passage with a number of frightened wild beasts.

Fortunately, Bonavita had his club with him, and this he kept swinging in a circle in front of him. He could hear, even in the midst of the confusion outside, the heavy breathing of the lions, and knew instinctively that one was moving toward him. When the club suddenly came in contact with something and a roar followed, he knew that he had hit a lion, and that the lion meant here been very close.

He dared not stop swinging the club for a moment, although his arms ached and he was getting exhausted. But when he struck the lion a second time, and actually felt himself knocked by a paw, he determined to keep at it until he dropped. The danger was, however, that the lion would spring upon him. In this case nothing could have saved him, for the weight of the lion would have thrown him down. When he had become dizzy from the strain and the constant swinging of the club, the lights suddenly came on again, and there

**CAPTAIN BONAVITA, THE "QUIET" TRAINER**

Bonavita's specialty is the handling of large groups of lions—he has exhibited as many as twenty across in one act. Although he lost his right hand in one encounter with a lion, he is still one of the most skilled trainers in the world, owing his success to his extraordinary tact with animals.

in the arena just before, (All lions are heartily jealous, especially of a newcomer.) The lion stopped his performance, got off his pedestal, went over to the corner, and snarled suspiciously. He ordered another lion to go over and see what he was snarling at.

The first lion promptly turned round and hit the second. Next lion in line, lion number five, retreated just as promptly, and before any one could realize what was happening, the whole lot had pined in and were fighting as fiercely and viciously as if they were in their native state. The trainer was in danger of his life every moment. He was likely to be knocked down and trampled upon; he was just as likely to be bitten and clawed as any of the lions, not to mention being lashed across the face with the hard, rough tails of the animals, which give terrific blows.

Without a moment's hesitation, he began to climb and jump over the backs of the animals. More than once he nearly lost his footing; but he knew it was a matter of life and death, and, as so many times before, he saved his life by his quiet self-possession and pluck. He managed to reach the top of the back of the lion, and once safely on the edge of the ring there was nothing to do but to hit the lion right in the center of his forehead.

And right it out they did, and a most sorry-looking sight they presented the next day, with swelling skins and torn heads and noses, many of them had blinded from the swellings of their eyes. But they had relieved their feelings, and after that quieted down, and as soon as their wounds healed they became as good performers as before. It is a curious fact that lions generally have a good fight among themselves after an excess of rage, and no matter how much they may have been, they always appear to become more comfortable and contented afterward.

A curious incident in Bonavita's training of lions is that of J. Lion, a trainer who performed with seven lions at the New York Hippodrome a short time ago. The lions belonged to the family of Lincoln, and were big, well-developed animals. But all through

he set the trainer lashed his heavy whip, making it crack harshly, pulled the lions about (not hitting them, however), and generally made an excellent performance.

*A Lady Who Feeds Her Lions by Hand*

MRS. CLAIR BELLOT, although handsome and graceful as still to her lions, always attended at them. Never did she in any performance treat them gently. She had a high, pleasant voice, but to keep up these somewhat shrill notes all through her performance, as it were, she had a great strain on her. She explained it to me by saying that they could not hear her otherwise, while the band was playing.

And yet, downstairs, when she was talking to them, she spoke in the softest of tones, and patted them continually. She never allowed any one to feed them, but herself, and let them actually take the meat out of her hands. It was a most dangerous and risky thing to do, and she gave it to them in very small pieces, and sweetening that it had been warmed by just the right temperature—the sometimes grew very be-

One of the most difficult feats is to teach an elephant to stand on its head.

It took Mile. Albany three years to train the only trick donkey in the world.

# BROADVIEW—A BOYS' COMMONWEALTH

BY

ELIZABETH HUNTER AND ARTHUR E. McFARLANE

The new school-boys

IN the autumn of 1910 Sir Wilfrid Laurier, Premier of Canada, received a deputation from a commonwealth of which he had never heard before; and although that deputation consisted of a Governor, in a Cabinet Minister, a Comptroller, and two distinguished private citizens, only the Governor was more than seventeen years old. Nevertheless, Sir Wilfrid, being a Frenchman and a statesman, betrayed an surprise. As his visitors were introduced in turn, he received them with all the deference that the great State owes to the small one.

Here is the dialogue:  
"Albert Jod, Comptroller."  
"Mr. Jod, this is indeed a privilege!"  
"Harold Stroh, Minister of Finance."  
"Your visit, Mr. Stroh, places Ottawa under an immense obligation."  
"Minister of Athletics! In this hour I learn what the newspapers have been endeavoring to truth for the last twenty years. What the Canadian, what every modern country, needs in a Minister of Athletics!"

"And were more the Premier of Canada congratulated the Governor of Broadview upon being the head of a commonwealth so progressive, so truly representative, so manfully inspired."  
For its beginning, all this goes back ten years to the day when a certain big, beaming Canadian master printer, Christopher Joseph Allison by name, battered himself with nineteen thousand dollar mortgage, and gained possession of a small estate in a thickly populated quarter of Toronto known as Broadview, with Broadview Avenue for the main thoroughfare. Riverside, according to the Inspector of Public Schools, had more boys in the area than any district in the city, and a great deal more than its share of juvenile delinquency. Well, Allison had an instant for boys. For twenty-five years he had been working there in printing-office and Y. M. C. A. classes, in steam school and Provincial Reformatory. He had organized three hundred of them into a Boys' Brigade. He had studied theories in practice and in theory; and he had come at last to feel that he had hit upon a big and basic idea for getting hold of them, for keeping hold of them through the danger years in a boy's life, the years from twelve to eighteen—and for giving them in the mean time a kind of education which will fit his own life experience. Had taught him ought to be exceedingly good work. But a stern condition was the assumption of that thirteen-thousand-dollar mortgage. He assumed it. He finished told him that he was simply "a great big fool." He answered that it would be a satisfaction, anyway, to be big in something. And with gratefulness, a native and unswerving helpfulness, and a capital that people laughed at, he went ahead and started the "Broadview Boys' Institute."

The property covered by the mortgage consisted of a large house and five and a half acres of land. More than half of the land he turned into an athletic field. He made it a good one, for he wanted it to be a magnet for every sport-loving boy in the district. It very soon became so. But the athletic may be allowed to go in a short while. His accompanying motto was to make the house itself a second magnet by offering it as a meeting-place for all boys who had hobbies—books, birds, pigeons, garden, or games; boys who collect shells or coins, insects, curiosities, "specimens," naturally buttons or post-cards. The hall was arranged to be a "club" for all sorts, and to get them all. Then he divided it into four themselves into "hobby clubs," and made it appropriate name. A twelfth-century man-of-war he

covered everything—and, where it was necessary, an opportunity was given to wear this.

## Learning to Do by Doing

THE motto he had given his Institute was *Learn to do a thing, and be taught to make it a habit in the world in which the boy should, during his Institute hours—after work or school and in the evening—live the life of a boy in such a manner as to prepare him for the life of a man. The master printer believed that such hours could be made more absorbing, more engaging, for both mind and body than the hours of gang or street-work. And how far this "new way with boys," as he called it, was to be carried should not with the boys themselves. Meanwhile he went to work to leave these boys about in a whole series of "hobby frames."*

He still had an acre and a half or more of vacant land. He divided this into seventy-five ten-by-fifty-foot "farms." Every boy who leased a "farm"—actual horse farms were used—might plant and grow what he chose, and have the free disposal of all the produce raised. Of course, only seventy-two boys could be accommodated. "If you want to get boys into farming," he said, "make it hard for them to get in. Try to keep them out. Always have a waiting list." (It was not long since, by so doing, he had increased his Boys' Brigade membership from seventy to three hundred.) And those farms were taken immediately. When they were gone under way, he went back to organizing the Institute proper.

He had already been arranging for evening classes. Equipment called for more money. He still had a little of his, and his printing, continued by day-work continued, too, for the next five years—would always give him more, but not enough. "I had to begin to go around with the lot," he said; "I had to borrow."

And the master printer proceeded to borrow in the hard-earned way. He had to learn to beg was the hardest thing he ever had to do. But in that Broadview district there were a lot of wise people, and the boys who were getting to know him through their boys; and, joining to them regard to chess or chess, they provided the Institute with barometers. Fathers took hold of a child, and he had a good opportunity and planning and wiring. Wherever it was in any way possible, the boys were made to do the work themselves, and in some of these classes the boys did their own work. It was a great thing to see the boys at work, and the day when from the work of a twenty, book manual-training plan.

With this installed, teachers volunteered, and one by one these classes grew up. The first manual training training then was practical. That was something Allison had

well could teach; there were designing and lettering; typewriting and business correspondence; music; free-hand and mechanical drawing; wood-working and book-binding; domestic science, even cooking. In addition drawn in by hobby club and athletic field, more than three hundred boys met on a sign, and founder and leaders set themselves to make their classes interesting.

The printers to be were allowed to print score-cards and badges and team certificates. Music was made to turn the formation of a Broadview Band and Orchestra. There were also great prizes for the first wild flowers. At the manual training benches were gathered boys, games, book racks, specimen cabinets—all of which helped indirectly to their makers. "In our way," says the master printer, "a boy is as bad as a man. It's just about useless to try to get him to work for nothing."

## Cooking—by Lord Strathcona and Jimmy Fink

THE cooking classes, regarded at first by most of the boys as practically *infra dig*, were given their grip by a succession of irrepressibly desirable "Tuesday teas." They were prepared and served by the boys themselves, although under the direction of two women teachers from a big school of domestic science direction. And from talk-setting to public conversation, all was done as things are done in high society. In other words, every Tuesday tea was given a second value as a school of manners. When, a little later, Allison had occasion to talk at his Institute to Lord Strathcona, High Commissioner for Canada in London, president of the Hudson Bay Company, and a great many other things, the Broadview crew invited to speak of these cooking classes. But they were exactly what caught the

The boys set out of doors under a big tent. Most of them know how to cook when the domestic science course was opened, three hundred boys put on caps

Every year a stream of boys from the manual-training class flows into Toronto's big printing and engraving plants, its machine and carpenter shops and piano factories

(Continued on page 21)

the men had been previously convicted. But it was also proved that this man was serving in the army at the time. A week later, however, fingerprints were identified. It was found that he had been in and about the grounds of service of another, and that he had never been in the army.

This was something like a recent case in America, where for certain years a man gave himself out as a doctor. Upon our army and was sent to a Western United States penitentiary. His fingerprints were taken and he was found to be a deserter. There it was found that he had never been a United States soldier. Fingerprints revealed this man of fortune when he fell from a high window. The system has time and again proved itself so infallible that a writer of detective fiction, in a recent story, had no way in which to make a man appear to have the clever criminal out of his fingers and grow new ones by the ultra-modern methods of the new surgery.

**A Historic Finger-Print Case in India**

AMONG the historic finger-print cases in India was that of the manager of a brickyard in the Dabhoi district. He was found lying in bed, his throat cut, his despatch-box and rifle, and several hundred rupees had been carried away. The Indian police at once rounded up a number of suspects and they were taken to the brickyard, where it was thought that perhaps some of the coolies on the ground had murdered him. But, in looking over the ground, the police found suspicious blood-spots on the bricks.

Not to let any possibility escape, the relatives of a woman with whom the murdered man had had a liaison were arrested. She was taken to the brickyard, where he had been imprisoned for theft. Kingal Cusam, besides her, a wandering band of native musicians accompanied her. The woman, however, was eliminated the band of natives, the woman's relatives, and the coolies. Inquiry showed that the woman had been released recently and she had never been in the neighborhood. The coolies were interrogated, but the stains were of pigeon's blood from a hole that he had made.

As it happened that among the papers in the despatch-box was a calendar in lock form printed in London, it had a finger-hole cover, and on the cover two latent blood smudges appeared. Under the glass they were seen to be impressions of fingers, and the chemical examiner of the government demonstrated that they were of the same man who had murdered or an associate had placed his bloody thumb on the lock while hunting for the key to the safe. The murdered man's own blood the murderer signed the warrant for his own arrest. But who was the murderer, the cook or the servant?

The latter proved to be the murderer. He appealed to, and they looked through their classified finger-print records. The latent finger-prints corresponded with a record of the man who had been arrested on the basis of a chemical analysis made that the spots on the cook's clothes were really of pigeon's blood. Kingal was arrested because he was found to be a deserter in Calcutta. There his fingerprints were again taken. The prints on the book, in the police records, and those on the article were compared. It was found that there was a striking resemblance—established by Sir Edward Henry at over one million to one against him. The judges ordered Kingal to be kept in custody, but he properly, but held it unsafe to commit him to a prison, and he had seen the deed committed. To-day there would be no such likelihood.

**The Carpet in the Billiard-Room**

THE first case in Great Britain in which the evidence of finger-prints was solely relied on to convict a man occurred in 1902. A billiard-room in a house in Downside Hill had been broken into and robbed, and the thief had used part of a dust cover in which to carry off the stolen property. There was no clue, apparently, to the offender. But the dust was going to be sifted over the billiard-room, for that was the work of the window-fitters had been quite recently painted and was not yet dry. On this airy painted carpet they detected the marks of a man's feet. Sergeant Collins, one of the officers in charge of the records of fingerprints kept at Notland Yard, who had the special training in this matter, recognized and notified, and he immediately photographed the single print a slender thread, it would seem. Here were the fingerprints, and he was sure that he could identify the thief in a day, and he was.

Four nights later a burglary was perpetrated in Hever Hill, and there the dust-cover that had been taken from Downside Hill was left behind. It was not the same man, but the prints were of the same individual amounting to six hundred dollars were taken.

He had taken a long time to go through all the records on file, laboriously comparing the left thumb-print with those filed. Fortunately, it proved to be unnecessary. The police knew the kind of man who would have been likely to do such a job, and among those whom they investigated was a man named Harry Jackson. His prints were already on file. The moment he saw them he knew he had the right man. But Jackson could not be found in any of his regular haunts.

He was taken to the city morning, a noise was heard on the roof of a public house in Brighton. The constables were called, and a man was seen on the roof. He gave evidence that he had been on the roof of food that showed him to be a house-breaker. Other constables, and finally into a garden, he was followed by a policeman. He said that he had been on the roof.

So far the case had been ordinary enough. But it was novel in this respect—the single finger-print on a billiard-room carpet connected the man with two previous robberies. The man was taken to the police station with the fingerprint of the prisoner himself and the record on file. The three agreed absolutely.

But would the court accept such evidence? Would it go even as far as in the Kanglei case? There was evidence to establish identity of a kind never before made before a jury in an English criminal case. The man was a deserter, and he was a deserter. Nevertheless, the authorities went ahead and presented their evidence, photographs, and explanation of the case. The court did not seem to be at all surprised about a month later, in spite of the man's plea for leniency, he was sentenced to seven years' penal servitude. The man was a deserter, and he was a deserter. The first man had been convicted in England by means of finger-prints alone.

Other remarkable cases have occurred where fingerprints have identified and convicted criminals—impressions on plated ware, drinking-glasses, but the most famous was the case of a man who was charged in Birmingham was found to bear a finger print on a note left in London. Within a few minutes a burglary impression was found on the file, and the burglar was arrested the same day.

In another case two finger-prints on a wine glass identified a notorious criminal of a robbery at a West End house where he had passed long enough to help himself to a drink. A man who bearing a resemblance to the criminal was found in the cell, and his side arrested in Deptford. Two brothers suspected of the crime were arrested, and the fingerprints of the man who had been arrested were taken on the box. A curious case was that of a finger which it claimed a two-foot gate, but in attempting to do this he was arrested. The man was arrested, and he had been holding the splint on the top with his right hand. The ring on his little finger was so full that the finger from his hand. The ring and finger were found by the police, an impression was made which revealed a duplicate record, an life, and he was arrested.

**The "Candle Bagging"**

CHARING CROSS the mystery of the "candle bagging" was so called because he always had with him a tallow dip. This case involved the robbery of a house in Washington Square, New York, and the solution of the mystery rested on the fingerprints of the thief who stole a soap-bath. Captain Farrer, who has a memory for fingerprints better than most people have, was called in to identify the prints. He was arrested, and he was arrested. He was arrested, and he was arrested.

While John H. Milburn, Jr., son of the noted corporation attorney, and his family were in Europe one day, a man came to their door and offered them a large sum of money. The man was arrested, and he was arrested. He was arrested, and he was arrested.

One of the many cases with a queer little hand-manipulated found in that which involves about a cat and glass case-bank. Three years ago a house in Flat-bush, New York City, was robbed, and most of the contents were the dining-room were taken. A money-lift, freed from the cage, was flying about the room but found the things left behind was the bowl on the table. The man was arrested, and he was arrested.

"Why did you release the manny in that other case?" Farrer asked, who had been arrested and would see with the evidence against him. "Well," he replied slowly, realizing that the game was not to be played on the river itself, and I had to be very careful about it." So far, fingerprints had secured indictments and convictions after the criminal had confessed or confessed after the fact. In the case of a man who was arrested in New York, who offered in open court before a jury that he had been in the room on the night of a burglary on Waverley Street was not a glass print was removed from the dust in the room. The man was arrested, and he was arrested.

He had taken out the petty and looted the glass case on the wall, so as not to break it and attract attention. He was arrested, and he was arrested. He was arrested, and he was arrested.

returned, and Crisp had gone to bed. The accused man fought vigorously, but he was not so strong as he was produced to court. But Captain Farrer's testimony was a sensational feature. Still the jury's verdict was a foregone conclusion. The man was arrested, and he was arrested. He was arrested, and he was arrested.

**Finger-Prints on Objects Not Fide**

AT a rate fingerprinting objects are valuable, however, after a few days, and after hours. For instance, in one case the New York police found finger-prints on a safe that had been broken into. They found that the prints were of a man who had been arrested for a police record. At the trial his lawyer admitted the fingerprints for the sake of argument, but contended that the prints were not his, and he was arrested.

In one case an express package containing six thousand dollars was stolen. The thief had been arrested, and he was arrested. He was arrested, and he was arrested.

The man was arrested, and he was arrested. He was arrested, and he was arrested. He was arrested, and he was arrested.

**The Wide Use of Finger-Prints**

NEW YORK is probably the first city to use fingerprints in the case of minor charges. In that city they are now used in the night court for women. The man was arrested, and he was arrested. He was arrested, and he was arrested.

The man was arrested, and he was arrested. He was arrested, and he was arrested. He was arrested, and he was arrested.

The man was arrested, and he was arrested. He was arrested, and he was arrested. He was arrested, and he was arrested.

"Hey, there! you feller in th' air-ship! Shit that cloud over my farm. I need rain"

## INTERLUDES

### FROM A JESTER'S NOTE-BOOK

It is hardly yet time to vex ourselves over Dr. Hillis' prophecy that a hundred and fifty years hence our children will all be bald as a hilliard-bill, but we no reason why in this moment of calm we should not suggest as a measure of relief that when the time comes the manifest thing to do will be to get them a cure. As the editor of London "Punch" will probably say when he hears of the forecast, there will be the deuce to pay if something isn't done.

A Boston newspaper has for some time now been engaged in a commendable effort to ascertain "what is the moment job in the world." Frankly, we have no decided convictions on the subject, but we should say offhand that next to trying to live in New York on a Scholastic income, the moment job in the world would be trying to write an acceptable account of a baseball game with the style of a Henry James.

A German scientist tries to remark that a particle of water before evaporation has been in the ocean for 2,400 years. This may be an interesting item of general information, but the only perfection it inspires in us is the thought that if it is true it is no longer strange that sea-water should not be fresh.

A glance at certain modern sciences is convincing evidence that, however successful a scythes may be in imparting spiritual beauty to a homely face, all the graces from Pallas to Harpocrates have utterly unable to placify what some residents of the Hub still call "peasants." It is doubtful if Helen herself, with her elbow and a block of marble of the finest texture, could enter a mile of trousers that even a Cubist would regard as a thing of beauty and a joy forever.

It is said that King George of England and the Cur of Lincoln look so much alike that they can only be told apart by their uniforms. If this be true, King George will do well to devise all institutions from his imperial cousin to join him in a plunge in one of the old swimmer-baths of the latter's domain. It is possible even for a king to be higher!

The average cost of an A.R. at one of our leading Eastern universities has recently been shown by an authoritative figure to be \$4,720. This is some cost! King George is said to receive only a dollar a word for his writings, but here is an invention that costs in \$2,162 a letter!

### PLEASANTLY PUT

"Yes," said Senator Grapher, with a deep sigh, "I often years deeply for the joys of private life."  
"Well, by George, Senator," said one of his father-in-law's relatives, "Nobody deserves to be returned to them more than you do!"

### DOMESTIC ADVENTURES

"If I had known I was to marry you what finally," said Flinke ruefully, "I'd have wanted seven dollars on an engagement ring for you."  
"No!" said Mrs. Flinke coldly.  
"No," said Flinke, "I'd have bought a seventy-five cent belt big enough to circumnavigate the whole world."

### CONSISTENT

"Now, this car is so constructed," said the agent, "that it can't possibly fare turtle."  
"Well, I should say not!" said Flinke. "At the price you ask for it, it couldn't turn anything short of diamond-backed ferris-wool."

### HARD TIMES

"It's pretty hard making a living these days," sighed Haddock.  
"You bet it is," said Hithers. "Why, even the life-insurance people are getting to be careful. A fellow can't get more than thirty thousand dollars' insurance on a carpet-bag full of pennies and nickels!"

### A MARVEL

"I TELL you, that woman is a wonder," said the druggist, as Mr. Shoppage left the pharmacy.  
"How does she show it?" asked Silliers.  
"Why, she just bought a five-cent stamp, and asked me to be sure to deliver it at her house before twelve o'clock!" said the druggist.

### QUITE APPROPRIATE

"Have you heard my chauffeur during the summer?" asked the visitor of the rural husband. "Per-haps I ought to explain that he is a negro."  
"Was?" said the husband, reflectively. "I ain't never look reared people yit, but I guess—I suppose, 'cuz' in the death o' my brother Jim last spring, a few black boarders wouldn't be outta't?"

### CEPID À L'ANGLAISE

"Why, Capid," said Psyche, "what have you done with your bow and arrow?"  
"Thrown 'em away," said Capid. "I've joined the Suffragettes."  
"Oh, now!" protested Psyche. "Suffragettes are just as susceptible to love as any other women."  
"I know that," smiled Capid, "but they don't use bows and arrows—they use bricks."

### UNCLE SILAS' WISH

"I wish for goodness they'd hurry up an' settle this low question about whether I'm to keep the post-masterly or not," said Uncle Silas. "Hallelu! out this way as long as they live, how am I for know whether th' administration's gait' 'r be successful or not?"

### THE RECKONING

"How do you reckon these great profits in your vrenamery?" asked Digbes. "In the value of your plant?"  
"No," said the manager, with a grin. "We don't plant. We calculate our percentages on our gross savings."

### UNCONSCIOUS CONTENT

"The way of the transgressor is hard," said the Justice as he filed Haddock for exceeding the speed limit.  
"Not around here it ain't," protested Haddock. "I never saw such monkey roads in all my life."  
"Ten dollars extra for contempt o' court," said the Justice.  
"Why, I haven't said anything about you, Judge," protested Haddock.  
"Yes, yo' hev'," retorted the Justice. "The Road Commissioner here as well as Justice o' the Panes."

### CUMULATIVE WOE

"But I haven't got fifteen dollars," protested the victim of the law.  
"Oh, all right," said the Judge. "That hev' the case, we'll have to attach your car for fifty dollars now."  
"Fifty dollars more?" demanded the victim.  
"What's the authority for that?"  
"That's the penalty in this State for bringing short loaders to market," replied the Judge, with a sly wink at the Sheriff.

THE TOSS-UP

(Continued from page 20)

All ahead in—Jackman. His no' me-  
mories as 'em took up an' remembered  
that he' had bread, cooked, fried!  
An' starved! An' no water! Only them  
damn things—you savvy—blows an  
etch, here an' there an' elsewhere. An'  
tucker-tanachs, little specks of 'em,  
nites high jolt a-waitin', waitin'.

"Done an' his knees—savvy? 'Twas  
an' the hard bod' of the dry creek, ripplin'  
his milk off. 'Twas he'llin' like a load  
of wind against one land, an' he' tried  
to grab one of these little brown  
lizards out from behind a rock, 'cause,  
you see, we hadn't had one damn fly for  
nigh for weeks, I reckon.

"O you! Come here, you little  
sawd-gum! I need your' licks! Jack-  
man, awake! That lie, she ain't  
there. There!—"

DAWSON held a hand on the bowed  
shoulders.

"No here, pard," said he, "bees like  
there's a gap in your memory. But you  
thought in some stupor. Bimeby you  
tip, now, an' let's have it straight!"

"On a regular pent, a moment's ab-  
sence, 'em thinking in some stupor, an' led  
into a dumb grin. Then, at last—"

"Prospectin' with 'Jackman,'  
he whinnied. "See, where was I?"

"Headin' water," prompted McGrook.  
"Cut that out. Cut out 'heads an'  
water. We kin't do that. What's your  
pointed. How you got that last night?"

He pointed at the wadded log. "'An'  
Jackman, where he' jumped the wreck."  
Then silence again.

"Must he' erowed here, I reckon," he  
said, "regardless. This tangible rock  
lies cleared an' strolled him. "Why,  
yes, sure!" he affirmed. "I sure did  
mean that that must be been after I  
went for to shoot Tansie an' hit myself.  
'Cause, you see—"

"Which should kin' impudently, de-  
spite that's growin' prohibition."  
"See, now! You took it, pard!" he  
quoted, peevishly. "Here—take this?"

"An' you're the glass. This time the gambler accepted it  
eagerly.

"Why, I am skippin' to it," he pro-  
tested. "You see, that's the burro, see?  
Well, after an' an' her bones—Jackman—  
broken his neck in the end, you see  
savvy—an' strikes out—'cause, you see,  
Tansie can't carry no load—"

"We gitt load, 'Tansie an' no dead,"  
he went on, after a pause. "Load me,  
Tansie. Pretty soon I ain't stand it no  
longer. I think, an' pull up you."

"No, 'Tansie," says he, "you got load  
in you, an' I'm a-goin' to have some.  
It's wet, anyhow."

"No! I should. But things is ripen-  
in, an' you'd no' mind like that—  
dumb me if I don't play my own will  
through the hole in the sky. An' that's  
a joke, hey?" he chuckled into a laugh.

"I was for to hit Tansie, an' hit my  
own."

"Well," he went on in a dead voice,  
with slapping intentions, "well, after  
that, I povers away some considerable.  
Next thing, there's that abandoned of a  
burro ripin' away at my legs with her  
tailer teeth, an' she's no' dead. I kin  
shoot her five times—five, that's all—  
before I drops her. Now, ain't that good?"

"What happened?" insisted McGrook,  
looking at the man's expression. "I gitt  
you savvy—your' his bones—well—  
an' ain't pinto for no new black burro—  
no, not loads no' skin. It's you 'n'  
me, an' you kin't do it. You kin't do it  
at all. Savvy that? How come you to  
get the critter, an' not me?"

THEY looked around to think for a  
moment, holding himself silent.  
"Well," he replied at last, "I said  
flesh sound through his party skin."  
"No, ain't I told you that yet?" Well,  
say! "An' that's what I come for!"  
"—"

The assembled partners allowed cheer.  
"There was Jackman down on his  
knees, an' rememberin' that I had  
here was a little brown lizard, back of a  
stone, no-fashion. Well—now, say, I don't  
think that I ever had any of 'em. I  
see, pard. After that, 'er see, Jackman  
was in, me, says he—"

"—"

"—"

"—"

"—"

"—"

"—"

IS the maker solid? You  
need to know that, now,  
before you buy a car. For  
the day of reckoning in the  
automobile industry is  
here. Witness the sudden  
changes in plans, methods,  
models, and prices—heavy  
stock offerings—reorgani-  
zations—big loans—fail-  
ures, more than 25 in the  
past year. Excessive over-  
heads and super-expanded  
plants, extravagances, and  
mushroom methods are

coming home to roost. Already several well-known  
makers have failed, and cars of good reputation have  
disappeared from the market.

Review of Reviews says automobile stocks are  
not a good investment. Neither is an automobile  
unless its maker is sure to continue in business,  
making good on his guarantee, giving service to  
car owners, and sustaining the commercial value  
and public standing of his car.

Find Out About the Maker

Find out where the maker stands before you  
buy. Know that the Winton Company has always  
followed sound and enduring policies. No water  
in its stock, no bonds, notes, or mortgages to be  
charged for in its price, no frantic and frequent  
changes in models that prematurely age and de-  
preciate prior models, no juggling with quality,  
no marketing of experiments, no grasping after  
quantity, no exaggerated price.

A Car of Beauty and Excellence

You can safely buy a Winton Six, for it is now  
in its seventh year of success—a thing impossible if  
it hadn't been right; made by the company that

The Winton Motor Car Co., 118 Berea Road, Cleveland, Ohio

The Fashion Plate of American Automobiles—\$3250 Fully Equipped

"Well, then, which one is it, an' ap-  
pear to be? Had better the question."

"You go, 'Savvy,' says he to me.  
"You're younger 'n' what I be. You your  
outside sense. Take the devil an' sell  
your freight," says he. "I'll stay."

"No, Winton's not," says he. "Winton's not  
it that's-way. This year has got to be  
done proper an' all—down—down right."  
I bet, all that, then, says he, "well,  
well, well. You see why I act for that  
these rigs. Listen!"

"We're a-listenin'!"  
"Keep right on." This year has got  
to be done right, says he. "I takes a  
quarter out of my pocket. A quarter,  
you savvy? One what I'd had a long,  
long time. You bet I had!"

"Flop for R?" says he.  
"Jackman, he nods."  
"First got no two out of three?"  
"Two out of three," says he.

"He's lookin' mighty bad, Jackman,  
an' he's troublein' when he says that."  
"You too an' I'll hold my eye, I an'  
bonds him the quarter. He dips her like  
his hand, G. K."

"I've the 'n' Slicker's to the end,  
an' she done she spoke into the wind."  
"Heads, says I, an' so it was. Jack-  
man, he smiles back, an' pishes up."

"Tally!" I calls her, an' I mean, (O,  
you, I look real time, an' sure enough,  
well—"

"W. I sorry, this time you kin't do  
no—"

and everything that was  
there. She sent money  
and those were

## Read Carefully.

### Consider what's happening right now among the makers of AUTOMOBILES

Founded the industry, and the first in the world to  
concentrate upon six-cylinder cars exclusively. The  
newest model is one of remarkable beauty and ex-  
cellence—the automobile fashion plate.

Finest of Car Equipment

Has the finest of everything—gracefully low  
body with yacht-like lines, long stroke motor, left  
drive, center control, electric lights, self-starter,  
first quality mohair top, easily handled curtains,  
rain-vision glass front, best Warner speedometer,  
Waltham eight-day clock, Klaxon electric horn,  
tire carriers, demountable nuts, full set of  
tools, German silver radiator, metal parts nickel  
finished, four-cylinder tire pump. Price \$3250,  
fully equipped.

What Every Buyer Ought to Know

Find out about it. Find out about the company  
that makes it. Compare point for point with what  
you can find out about other cars and other com-  
panies. Get our book that tells what every buyer  
ought to know about what's happening in the auto-  
mobile industry: sent only to car owners and those  
intending to buy. Ask for Book No. 15.

## WINTON SIX

only barely make no sound of all, but  
some power! Well, then—"

THEY view of the narrator died down  
in smiling. "That and Pop Hadlock  
spilled another drink into his, surreis-  
ing, and after a little while he went  
along."

"There was a little brown lizard, you  
savvy. Both of us tried for 'er look him,  
but—"

"But the old man interrupted with  
"See, now, that varmint, you, an' give  
us the third one-up, kin't you?"

"Oh, say, I told you that already,  
didn't I, 'bout that there prolessioner  
pinto? Evens so, says he. Where was  
it? 'Tansie' says—that's it. Well, then,  
Jackman spins her the third time, an'  
down she comes."

"The stronger stopped short. All went  
kin, the horse became lethal.  
"Squires' turned out." An' it was?"

"Why, for sure? Why wouldn't it be?  
Heads it was, all right, all right. So then  
me an' Tansie holded. Jackman, he set  
it over."

A long pause. Then spoke McGrook:  
"Well, says, that was sure rough-  
handed it was, but I told you kin't always  
be helped in these ver-ports. Our friend  
was sure to be a-sufferin' from a case of  
infamous constipation. I think he'd done  
acted plain justifiable, an' I sure used  
well exercises his. Ay, body differe?"

As he looked the wounded man. By the  
table he stood, his lips whitened into a  
sordid laugh, his eyes glazed and wild.

"Tucker-bugs," he croaked. "Tiber-  
an'—an'—pickin' away. An'—her's a whack  
—down—!"

Into his pocket he fumbled a pulsed  
head, arranging the white. Out he lobbed  
a coin.

"Look, you all!" he shouted, an' it  
with a last gasp of breath, and down  
the coin so high that it clicked against  
the ceiling-panels.

THEN he fell, knocking the table over.  
The glass spanged into shivers. In  
the hallway, some one slipped a foot  
down on the ground, and fell, an' sprang  
over the floor. And, ever before Mc-  
Grook and Chain had lifted the body, a  
fly went up.

"Gawd's sake! Look! Look a  
year!"

On to the bar, close beside where they  
had laid the organist, Hadlock slipped  
the counter.

"Heads!" queried Squires. He turned it  
over.

"Heads again! Heads! Both sides!"  
Then, through the sudden hush, Chain  
gave indirectly.

"Bos," said he, laying his ear against  
the dentist's clock and holding up a  
significant card. "There, I reckon an'  
how this year do—down he saved me a  
piece of hard proposition, fifty-eight."

# COMMENT

**HERMANN** with the issue of August 12th, Mr. Newman HAROLD will take charge of HARPER'S WEEKLY.

## At Gettysburg

The nucleus at Gettysburg was a barefooted, very remarkable, very non-warlike. The veterans truly had, as school-girls say, a wonderful time. They got together wonderfully; they were well looked after; there was an immense fraternization, and, not as it was, there were hardly any fights. The tone of all the proceedings, as one reads of them, was patriotic and affectionate. Disrespect was very free, too. Everything seems to have been talked about. There was no need to keep anything back.

The veterans who sat fifty years after an experience of a country that had thirty million inhabitants, and a very large proportion of them native born. They are doubtless more of a kind, more closely related in descent and inherited traits of mind, than an average fifty thousand men that would be gathered from all over this country now. But the veterans of the South are probably more nearly representative of the present population of the States they came from than the veterans of the North. As to that, the letter of Mr. MANN on page 3 is interesting. He points out that while the South in the last fifty years has increased in population at a faster percentage than the North, the South has had the more increase, whereas the increase in the North has been very considerably an increase by immigration.

Maybe that is one reason why the South is advancing so fast just now toward political control of the country. Its white population is almost all of the old American stock, stimulated by the ideals, traditions, and institutions, and usually interested in politics.

And that makes the attitude of the Confederate Civil War veterans the more important. We have seen them to be very mindful of past history, but manifestly reverential to its verdicts; fraternal, affectionate, better united with the rest of the country than men of the South have been for a century. That letter was written for our country, and all the better because we may assure ourselves that the younger men behind these veterans of the South are like them, of the same stock and habits of mind, and inspired, we doubt not, with the same acceptance of accomplished history, and the same good-will.

## President Wilson's Speech

When the transformation has opened with the Lord's Prayer, the brother who is called to follow first in oral supplication is entitled to feel that the standard has been set pretty high. So Mr. Wilson, following LINCOLN in an address at Gettysburg.

Yet there has not been since LINCOLN a President so likely as Mr. Wilson to speak high-water mark again in a Gettysburg address. And so there was a special interest and expectation to see what he would say.

His speech is full of distinction; a beautiful address which to speak we think of could have belonged. Mr. Wilson followed LINCOLN in speaking what was in his own mind rather than what

he might have been expected to say. It was his own message he carried, and so much to his insouciant hearers as to all of us who read him; a lofty message; an inspiring summons to a difficult task.

## Marine Hero Contributions

Colonel WATSON contributed last week (July 4th) a delightful discourse to the literature of Gettysburg—two double columns of the "Courage-Journal" but not a word too much. More than any other writer was aware to the edification of his readers that he does now; nor ever wrote, perhaps, out of so wise and kind and philosophical a spirit.

One thing he said in his Fourth-of-July piece was that we are a wonderfully homogeneous as well as an overwhelmingly united people, and that the old tradition that peopled the South with Cavaliers and the North with Roundheads had mighty little real basis. The Americans, he says, were pretty thoroughly mixed, and he cites examples, to wit:

WATSON had all the votes supposed to have signaled the Cavalier, and CALDWELL all the votes claimed for the Puritan. During twenty years three attempts were made to change the name of the leaders of Cavalier Mississippi: ROBERT J. WALLACE was named in Pennsylvania; JOHN A. SPURMAN, born and reared in New York; and SAMUEL S. PAVENY, born and reared in the good old State of Maine. They tried Florida, JOHN MURPHY, never saw Louisiana and he was old enough to vote and to fight; a native New Yorker sprung from New England ancestors. ALBERT HENRY JEFFERSON, the most prominent of modern Cavaliers—from try to tie a type of the old Virginia Cavalier, General Sherman liked in his time; Yankee on both sides of the house, though born in Kentucky a little while after his father and mother arrived from New Connecticut.

ALBERT STREET JEFFERSON, a Connecticut Yankee ever renewed! Well, that is worth reading, though it will not surprise any one who knows much about the quality of Connecticut Yankees, and the people they have produced. General JAMES S. WADSWORTH, of Genesee and Gettysburg, was one. His biography has just been published. Mr. J. P. MANN was another. A son of Southern birth, he says: "I didn't know how much aristocratic matter I had behind me until I had occasion to compare some of the old villages near Hartford and discovered the old houses in which some of our Connecticut forebears used to live. I had always thought of them before as very plain people."

The same word, MARSH HENRY! JEFFERSON HENRY might easily have derived from Vermont (where they used to raise very, very hard-shell Democrats) and General DEWEES from the Aroostook.

## General Meade's Fatigue

JAMES was deeply disappointed at Meade's failure to push in and push Lee away after Gettysburg. Meade rested and LEE retreated at his convenience. Whether Meade was at fault, and if so how much, has always been much discussed. Perhaps the true answer is that given in a letter to the "Times" by Mr. ARTHUR H. WALTON, who quotes Mr. HUNTER, an intimate friend of General Meade, who once asked the General why he did not pursue General LEE after Gettysburg. Mr. WALKER says:

Mr. HUNTER told me that General Meade was justified in this regard in saying that, at the close of the battle of Gettysburg, he was practically exhausted of mental power that he could not think, and was temporarily deprived of the use of his mental faculties; and being conscious of this, did not dare to take the responsibility of immediately ordering a new battle, which would have resulted from a pursuit of LEE's army.

That sounds very likely, and the army was tired out as well as the General. Still, it may be, as Mr. WALKER says, that

If nature had happened to give to General Meade the same power of indubitably continuous, unceasing intellectual activity which nature gave to General

GAZE, the rebellion would have been finally subdued in 1862, instead of in 1865.

But General Meade, as it was, did a great work that will keep his name always in an honorable and distinguished place in history.

## The Fourth in London

The London "Times," in a grand-natural discourse, comments upon the significance of the Anglo-American Fourth-of-July festivity, which has become, it says, "one of the established functions of British life," and in which Englishmen cheerfully participate.

It means in the first instance that they are celebrating the tragic disaster of British slavery; and in the second that they are paying tribute to the memory of the men who brought Britain to her lowest depth of material impoverishment. It has come to be a sort of annual prayer. Year after year this "old and hoary custom" does the white work, and through the mouths of some of the most eminent Congress men congratulated for her share in the American Revolution. If that motto was great, we have at least many, sincerely, and repeatedly admitted it.

The "Times" is reconciled to the annual festivity, even as interpreted, and speaks gracefully about it; but its interpretation seems to need amendment. Englishmen and Americans celebrate the Fourth of July in London in just the same spirit that "Boys" and "Yanks" have been celebrating the anniversary at Gettysburg. They do so not so much celebrate victory as reconciliation and reunion. What is celebrated in London on the Fourth is not the distress of a mother, but the birth of a child; of a child born, not without tribulation, of British parents.

## The Tariff—Changes and Riders

As the tariff bill goes at last to the floor of the Senate, two things stand out as unusual in its history so far.

One is the comparative importance of the trouble due to changes and attempted changes in the schedules of duties. There is, of course, need of emphasizing "conservatism." There was a short fight over the very important items of sugar and wool, and plenty of other items were attacked. Of these others, however, not many were of any great importance, and not many were changed. Let us see: There was a change in the direction of free grain and free live animals in accord with free meats and free wheat—a good change; finally for wine-making it is to pay duty; wool already to be free; insurance to pay a less duty; unhappy works of art below a certain age are not to be free, as the House bill promised; mutual life-insurance companies are to have some exemption from the income tax, and the tax is to favor married men.

Really that is about all one finds worth noting in the way of direct change in the bill considered as a revenue measure.

What one can't help noting, however—and this is the other striking thing about—the bill's history—is the amount of effort expended in the direction, not of changing it exactly, but of enlarging it, of grafting on it features, but slightly if at all germane to its proper purpose.

This may be said, indeed, to have begun in the original draft of the bill: the anti-dumping clause and the clause favoring imports brought in American bottoms. Both could be argued for as permissible in a tariff bill, since they took the form of raising or lowering tariff duties. But the plain object of the anti-dumping clause was not revenue, but protection, and that of the other was not aid, practically to the manufacturers, but merely to give

The latter proposals have had still less chance for seeing incorporation in the bill, whatever their merits when considered apart. The plan to tax down the output of big tobacco companies does not belong here. It belongs with the trust question, with the internal revenue question, perhaps with the question of our jurisdiction. See issue, p. 316.

to regulate child-labor abroad, and to take all dealings in cotton futures out of the only one of these enterprises which the bill actually has on board. They were not pertinent.

These things are really tricks. They are attempts to overload the bill with extraneous matter. Its sponsors have therefore done well to reject them, as they did, with one exception, without consideration of their merits. The job was too big to be any further complicated. We shall hear more, no doubt, in the Senate debate, both of these and other additions in the shape of amendments, but they should be left for separate action. They might not be permitted to delay or impede what is essentially the administration's design to meet the country's demand.

#### Putting Back the Tax on Art

Now as to the tax on art, the PUNE-ALBANY bill did one thing commendable. It took the tariff tax off works of art, now that twenty years old. Largely in consequence of that partly enlightened legislation, America is to-day far richer in great works of art than it was forty years ago. The original Interoceanic bill went further and set us Americans free to acquire without taxation all the works of art, ancient or contemporary, that we can buy. The Senate committee and means here for some reason decided to tax the importation of all works of art less than fifty years old.

That is to say, we suppose there is a reason. But the only reason we can think of is revenge, and if that was the reason, then a tax on the later acquisitions of art, now that they are so plentiful, would be more logical. They are very costly; only wealthy men and institutions can afford to import them. Contemporary works of art are the only ones that moderately well-to-do people can buy. Protection, even if it could be considered in this bill at all, is out of the question. Of us all, none so unjudicious as the idea of it as our American artists.

On the contrary, they deplore a policy which deprives American art students of opportunities to observe and compare which other countries jealously preserve for their youth of artistic inclinations. But that is as nothing to the state appeal of millions of Americans, remote from our great cities, for the chance to see good pictures and statues which practically every French and Italian peasant, and many others, enjoy. If our statesmen think our people still unconscious of such enlightenment and high pleasure, then they are simply mistaken.

We trust Senator TILMAN, of South Carolina, will repeat in the Senate debate the simple and admirable speech he made four years ago after Europe had in his old age taught him what art holds forever in store even for the life-long consumers of his offerings. If he does, and falls, then may Mr. FURNES and his House be wise as in a conference on the question of this particular amendment.

#### Mississippians

President WILSON will hardly know his New Freedom as described last week by Colonel ROBERTS of the Progressive club at Newport. The Colonel said:

"The New Freedom" is nothing whatever but the right of the strong to prey on the weak, of the big man to crush the little man, and to shield their rapacity beneath the cry of the "New Freedom." "The New Freedom" means nothing whatever but the old device translated into terms of pleasant rhetoric.

It lacks a little, so though Mr. ROBERTS had depicted a conviction that Dr. Wilson was a fraud. If so, it is a conviction that has no set to great voice among the Progressives. Most of them are able to detect in the ideas and purposes of "the New Freedom" something quite different from the freedom of the strong to prey on the weak.

#### States and Rates Again

North Carolina's rather remarkable effort to secure by State action, changes in inter-State railroad rates affecting her interests, continues unabated. It promises to keep on till somebody learns something that will prove worth while.

As yet the legislature hasn't met and the threatened retaliation on the railroads haven't been tried; but there was never before in the State such organizing for any purpose. The matter remains, as far as results, the foremost topic in a sweep and at public meetings; and the debates, with interesting proposals.

One comes from Mr. A. J. MAXWELL, clerk of the State's corporation commission, who in a comprehensive study of the problem finds little hope in mere retaliation. If one State can sue that, he remarks, so can all; and where is the State that thinks it gets the rates it ought to have? Neither would he appeal to the long-and-short-haul principle. That would not give North Carolina citizens any advantage over certain of their competitors, particularly to Norfolk. It would simply give more business to the short lines near these cities, taking it away from the longer lines, passing through North Carolina, which are now permitted to bid low for it, on account of water competition.

It is now Mr. MAXWELL thinks the Virginia cities are their low rates—perhaps the lowest in the country—to a real advantage of position, mainly due to the very extensive coastwise shipping of the Norfolk-Portsmouth group. He asks, therefore, why North Carolina cannot go to work and give her cities the same advantage by building up her own Wilmington to be a real rival to Norfolk. He proposes State aid to steamship lines and to any necessary railroads from Wilmington inland.

That is not a new idea, but it looks decidedly pertinent to other cases besides North Carolina's, and we should not be surprised to see it taken hold of in some way that will be new. There is the case of pretty nearly all New England, for instance—one can't help recalling what happened to the Harvard and Fall some years ago, and what has happened to various other merely private attempts to give New England the full benefit of her opportunities in commerce and industry. Could the idea of a new way that will be new. There is the case of pretty nearly all New England, for instance—one can't help recalling what happened to the Harvard and Fall some years ago, and what has happened to various other merely private attempts to give New England the full benefit of her opportunities in commerce and industry. Could the idea of a new way that will be new.

And of course it will take a lot of thinking over. We have had unhappy experience with State aid and State ownership applied to transportation. All one feels like saying now is that the present state of our transportation problem, and the present popular mood, naturally evoke suggestions as this one and may quite naturally lead to serious experiments with them.

#### Not the Only Powerful Appointees

The point seems well taken that power conferred on the Federal Reserve Board of seven members appointed by the President is not necessarily more liable to abuse than power conferred on a larger board of nine members appointed by the President.

#### The British Laissez and Home Rule

Most of us admit that in important respects the English government beats ours. A general election over there much more promptly and completely puts in power the party favored by the people. Since the latest curtailing of the Lords' prerogatives—a revolution far bigger than most of us quite understand—the successful party is only to hold together to do almost anything it wills. With us, on the other hand, a successful party's leaders can not even get a budget respected, much less their followers may control both Houses of our Congress.

The present Liberal government, though a somewhat unstable coalition at best, can and probably will get its Home Rule bill through, the Lords and filter to the contrary notwithstanding—the country itself. It is possible, now, to the contrary notwithstanding. The probability, indeed, is that it is impossible to doubt that there has been a big anti-Liberal reaction, but there is still nothing to force an appeal to the country, and the London "Times" rightly remarks that ministerial "manages," however discouraged, have lost the habit of disappearing until they are forced to go to the country. That really means that a general election yields not only more power, but a longer lease of it than with us.

Of course, with our regular and more frequent elections, we Americans may question (if this is best); we may hold that the people ought to be better consulted. In this matter of Home Rule, however, Mr. Asquith and his colleagues are unusually good grounds for holding to their purpose—and therefore holding to office. Home Rule was most plainly in issue at the last general elections, and the policy was sustained. There is no real evidence that the present apparent reaction is due to that issue. On the contrary, there are good reasons to believe, as most observers seem to

believe, that it is due mainly to other things, such as the failed insurance and the Maxwell scandals. When the Unionists send Sir EDWARD CARSON, later's champion, to Scotland to speak for a dissolution, the Liberals accordingly do well to send Mr. RAMSAY, rather than others, hard upon his heels.

The Liberals will be excusable if they hang on to their grip. Home Rule is a trial, even if they have to bear as many riles of "Reign of Heaviness" as Mr. BALFOUR heard before the last Unionist government went forth to overachieving defeat.

#### A Stylish Embellishment for Amherst

It is proposed to erect an equestrian statue of Lord AMHERST on the campus of Amherst College, and the very handsome model has been offered. Mr. EDWIN D. MEAD says No; that Lord AMHERST had nothing to do with Amherst College, which got its name from the town of Amherst, which, to be sure, was named after Lord AMHERST. So Mr. MEAD would have the statue on the village green, and not on the college campus.

He argues, possibly about pointing out that Lord AMHERST was an interesting historical figure, and that as military adviser to George Third he wrought, along with General Wolfe, to conceive that New England should be New England, and not New France. But put the statue on the campus, and the Amherst alumni to have it so done.

Lord AMHERST, as he appears on a horse, in the model, is a mighty stylish man. Amherst needs him and ought to have him somewhere. For if there is any good thing that Amherst College lacks it is style. Merit she has aplenty.

#### The New Haven's Boon

Along the New Haven Railroad, west of Stamford, the company, fed by we know not what inspiration, has planted the sides of the road, especially the edge of the cuts, with pink and red geraniums. There are miles of them, a beautiful decoration and restful to the eye, who are not much used to provision of beauty by railroad corporations. These flowers, much more than all the embellishments of the Pullman cars, give the traveler a sense of being in a civilized country.

#### A New Laureate, Maybe

There are a good many emplacements, including some literary ones, in which a competent discretion is much more desired than outrageous talent. Perhaps that explains the report that Mr. ASQUITH has offered the British laureateship to Mr. EDWARD BISHOP. Mr. BISHOP is an experienced poet of mature years, and, we presume, of a discretion that inspires confidence that he will do his full duty by the royal family, without heaving out in any way to EDMUND PASKYHEAST on the side.

The papers say he will accept the appointment, which attests his courage. It takes almost as much courageous concentration to accept the laureateship as to run for Vice-President of these States.

#### Syndicalism

Here is an idea about syndicalism, from a discourse by Mr. ALVIN CRAPANZ, of Boston, at the seventh annual sociological conference at Sumner Beach, Massachusetts, last week:

In a state of nature, a struggle for existence is a struggle for efficiency. Our modern industrialism has removed from man the incentives for efficiency, and life is reduced to a mere struggle for existence. When man put into the product of his labor his own thought, inspiration and made the economic value of that product was the result of his individual efficiency. The individual efficiency, so to speak, of the individual. The individual system leaves man in a position to either degenerate to a mere machine, or revolt. No other moral standard gives us any assurance that man has no interest in degeneration. We may, therefore, view syndicalism and other revolutionary movements as forerunners of efficiency.

Syndicalism seems to be a sort of industrial gunpowder. Gunpowder is destructive, as, apparently, is syndicalism. But gunpowder has done a work in civilization. On the whole it has been a provoker.

#### Don't Skip

Ten thousand dollars a year is not salary enough for members of a Federal Reserve Board. It is not necessary that they should match responsibility, but it may well indicate it. The man who is wanted most is willing to forego half of his income, but not the credit of it.

The Harvard crew, just after winning from Yale by ten lengths at New London

# WHY THE ENGLISH STROKE FAILS IN AMERICAN ROWING

BY GEORGE MARVIN

A Member of the Harvard Varsity Eight in 1898 and 1899

**E**NGLISH rowing, or rather rowing in England, has one advantage as a sport over rowing in this country. The men in the boats are allowed, by general consent, to win or to lose their own races. In this country, according to the reports, rowing races are rarely decided by the efforts of the crews on any day. The annual regattas of Frogheepsaw and New London in prize to deal with these two regattas not so much as a sport as an exposition of exact science, ascribing victory or defeat to the merits or defects of a given "stroke." In the theories and personality of a given coach, or to the mechanical appliances of oars and rigging by means of which racing shells are made to move smoothly over the face of the water.

## A National Standard in England

**T**HE reason for this difference is simple enough. In England every one rows, or tries to row, in the

same way, according to the rules generally accepted principles. Differing theories may prevail at Oxford and Cambridge as to training, table diet, or the exact width of oar-blades; but among Englishmen the game of rowing is standardized. By the same token, you will read the annual accounts of the Varsity race from Putney to Mortlake or of Henley Regatta in vain for expostulations on the theory and practice of rowing. All that is taken for granted, and the story consists only in the naming of the victors between crews of picked oarsmen, all hands endeavoring to do the same thing with varying degrees of success, and victory going to those fittest survivors who most highly combine the qualities of skill, courage, and endurance. Thus it was in the beginning, if we remember rightly; for in that first recorded boat race, faithfully reported by Virgil in his *Æneid*, the winning trireme crossed the line several galleys length ahead because the crew most desperately "struggled against" their oars. Although the competing ships were pulled, and

hailed, and lauded, and submerged by various superstitious sea deities, it is written that the victorious heroes "were able because they themselves thought (believed) they were able."

## The Magic of the "System"

**N**OT such simplicity or leaning down to tradition in these waters of the free. Yale used to win year after year because of the "Bub Cook stroke," a magical term in the early nineties; Cornell victories at Frogheepsaw are generally foregone conclusions because of the "Carruthers stroke"; when Syracuse wins, it is the triumph of Ira Ryan; and Harvard's series of triumphal processions during the past six years are in large part rightly ascribed to "Jim" Wray. Each system has its partisans, unconvinced by the success of other systems; but, as a matter of fact, four-mile races are still won very often by the united and

The Yale victory in the middle of the English stroke. The extra effort required by this stroke is not only unproductive of extra speed, but it can not possibly be maintained for four miles

and everything that man  
can, the rest may  
be, and there were  
no terms.

The spirited finish of the Harvard-Yale contest showing the Elis hopelessly outclassed

sustained efforts of eight strong backed, stand-bored men.

#### Reveries of Harvard and Yale Crews Compared

CONSIDERING rowing purely as a sport, it is scarcely doubtful to have boat races solely primarily of the competitors themselves. Nevertheless, the Harvard-Yale race at New London on June 20 ranks a considerable list of methods particularly appropriate because, this year, the race provided a complete contrast in boats, rigging, men, and stroke. No matter how much the various schools of American seamanship may differ among themselves, as a whole they offer a lively distinct contrast to English seamanship, which is, as has been stated, much more thoroughly standardized. This year an especially new Harvard rowed according to American ideas. Yale after having lost to Harvard five years in succession, having discarded one professional coach, and obtained no better results in a return to alumni coaching, adopted this year English rowing methods in their entirety.

#### Yale Discards Harvard's English Experience

SIXTEEN years ago, Harvard, after a long series of humiliating defeats at New London, did precisely what Yale has done this year. Mr. Rudolf C. Lehmann, at that time the most famous rowing coach in England, took charge of the Harvard crew and entirely Anglicized rowing at Cambridge. That year at Pound-Brook, and the year following at New London, Harvard in English boats, with English men settling around in English thos-pies, rowed as crews in England now. And back years they were conclusively beaten by Cornell and by Yale. In those two years English methods were given a thorough trial at Cambridge, were found ineffective as means of winning boat races in this country, and were abandoned. To the writer, who was a member of the Harvard crew during those two years, the lessons of that experiment are almost as vivid now as they were then. It seems extraordinary that Harvard's experience should have been, as it seems, entirely lost to Yale, particularly since the resemblance as to the naturalization of English rowing, rowed at Cam-

bridge fifteen years ago, were heartily shared by Harvard's opponents, who then assisted in the June demonstration.

#### Learn Efficiency of the English Method

THE chief defect in English rowing, so exemplified in this country, is that it seeks to achieve results in spite of lost motion and by a maximum of effort. The stroke that Harvard rowed in 1907 and '08, and that Yale rowed this year, is the most exhausting of strokes. Were the extra effort compensated by extra speed, the stroke might nevertheless be practiced for a set of men who could maintain it over four miles. But such has been proved again and again not to be the justifying fact. No demonstration could have been clearer than that provided at New London this year. All men without previous knowledge of seamanship could see a distinct difference in the rowing of the two sights as they struggled at first side by side, and later singly, down the course. Those sitting bodies in the Yale shell described an arc much wider than the rhythmic figure in the standing boat. The Yale crew reached out until their backs were almost parallel with the gunwales of their shell, and then coming over backward until they lay in a semi-reclined position.

And yet, that irritably and devastating haste did not send their boat on its own stroke, even in the first half mile of the race, as the unerring and more elastic drive sent the other boat. The Harvard crew, sliding easily forward to the same point that Yale attained by strained reaching, applied back and legs together as they drew their men through, finishing each stroke in a position from which they could pull easily back on the oar, without the useless extra effort of lifting themselves up by their abandoned oars.

#### Exhausting Effects of the Body Swing

THAT extreme body swing means that the English tradition believes in slow accomplishing what men American rowing authorities believe can more economically be accomplished by a more equal combination of back and legs. Thirty-two times every minute, during twenty-two strenuous minutes, the

devised men in the Yale boat were crumpling their backs and straining their muscles to a degree noticeably beyond the corresponding efforts by the Harvard crew. No wonder they fell steadily behind from the start, and finished twelve lengths in the rear of a not particularly fast Crimson eight.

#### Yale's Loyalty to the Classics

YALE'S defeat can not be ascribed to failure in carrying out their coaches' ideas. Mr. Harcourt Gold and Mr. Kirby, the two English coaches, admit this. Yale rowed the race out as they had been taught, and finished, generally, every man sitting up. It was a singularly fair test of method as well as of material. In addition to the extreme swing fore and aft, the Yale crew were rigged alternately across the boat in the English manner, a method which is supposed to give greater leverage in managing the longer, smaller-bowed oars of English make, but which, unless habitual, is apt to make men swing across the boat instead of straight up and down the boat. English thos-pies, with which the Yale shell was rigged, were discarded by Harvard in 1898 with good effect. They do not hold the leather "bottom" of the oars as neatly and firmly as do American row-boats, and no corresponding advantage has been advanced for them to offset their lost motion and extra friction.

#### Ability and Unison the Prime Factors

IT was the opinion of many good judges at New London that this same Yale crew would have finished half a minute better, rowing a less punishing stroke and rigged in the American way. That need require a matter of opinion. But it is confusing such opinion to remember that a English crew has twice won the Grand Challenge at Henley, where the course is so short—only a few yards over a mile and a quarter—that "strokes" are of slight significance compared to spryship ability and unison. Moreover, the Oxford-Cambridge records are made with a curved and side-way oar rather than the stream at Pound-Brook, and those races are rowed over a course so winding that position is a distinct factor in the result and violent ranging bursts of speed are of about equal value as sustained pace.

The Syracuse freshman eight, rowing in striking contrast to the awkward, erratic English style. These pupils of the veteran "Jim" Ten Eyck used the deliberate but steady and rhythmic American stroke

"Let me tell you, Hoff, they can convict grafters like you!"

# "FOR FAILURE TO PROVIDE"

BY P. C. MACFARLANE

ILLUSTRATIONS BY F. B. MARTEAU

**B**ETTER lay up a few judges for a rainy day, Hoff. That's my advice," said Larkin, the State Boss.

They were in a small committee-room just off the floor of the State Convention of the reigning political party.

"Why?" asked Hoff, the City Boss, a portland Hebrew, who set blinking culture like as he pandered. His present mind was to demand, he was next after in the pie and Larkin was rattling up together, the chief of State Proctor, for there was large graft there. The judges offered, he took possession, have a sense of doubt flared over his shrewd eyes, and he asked again, as Larkin resumed staid and thoughtful, "Why?"

"Because," said Larkin, reaching suddenly one of the cash-purse state in which he had been chewing his cigar since the last month, "because, in the end, Hoff, they always get grafters like you."

Hoff dashed and straightened up with a start. "No offense, you understand," apologized Larkin, seeing the movement, "but I mean it. Some day there'll be a new boss in the town. I don't want, you know, that you'll just fall down, lose your grip, and hit the cobble. You'll have a straight criminal case; and they'll get you—get you dead. And you ain't got a friend on the Appellate Bench. Let me tell you."

Larkin bowed over close, his cigar in his fingers, and the knob of the hand that held it tapping for emphasis upon the little table between them.

"They can convict grafters like you, Hoff. Folk down in St. Louis—stark, 'em big and stark, 'em little, but the Appellate courts turned 'em all loose. Skinned one of them only the other day because the lawyers lost a 'the' out of the plaintiff. Larkin needed the Appellate conviction sufficient, but the Appellate Court set it to a whipper and come down 'em again! Larkin to fall for disorderly conduct."

"Same everywhere? They'll get you. They'll get you a case that twelve men locked up together can't get away from, no matter how much they want to. Hoff with the upper courts it's different. They get time and lawyers to figure a way out for 'em and write the decision and put it in their hands, and all the courts here to do 'em in case it isn't stand. Take it from me, Hoff,—and apply Larkin your conviction!—the Appellate courts of this State has crumpled nose down and windows clean all the cases in both years. You're going to need 'em; and my advice to you now is to let the Public Printer job, and the Surveyor-General's, too, go to me, and put a few friends of yours on the Appellate Bench. It's a mighty good investment, you'll find."

Hoff listened till Larkin had finished, and reflected solemnly. He quite agreed with Larkin as to the courts, but he did not agree for a moment that the power was in the great city which he held in his hand could ever wane. Why, he was absolute master there. He killed and made alive; he plowed and sowed and reaped and gathered in every department of the city government; he made judges, there, and jurists, too. From all he got what results he would; and was it possible that things could ever be different—that a grand jury would indict him or a police judge condemn him—or a jury convict him, a court condemn him—his jurist and his courts? No, it was impossible. Success was his fetish. He would hold it, and it could never depart from him. Some of it he had in Larkin himself, and he was not so much hooked in to the mill and because State Boss Larkin's plan. There he would make his way to

governance and himself United States senator. So his imagination ran on before. Meanwhile he fanned his hands with graft, for it takes money to be a United States senator. And—

"BETTER hire an anchor to windward, Hoff," urged Larkin.

"No," Hoff said decisively, contemptuously, after a moment. "I don't need you. Give me the State Printer, or I can collect off the School Book Trust—and one judgment, just to take care of my broad Missouri."

"Short term do long," asked Larkin.

"Yes," said Hoff carelessly.

"All right," said Larkin. "Who's your man for Public Printer?"

"Denny," answered Hoff through the smoke.

"Denny?" declared Larkin, making a mental note. "And was here we saw the District Courts of Appeals—Hargren and Myers, long term; Case and Fitzhugh, shorts. Do you get 'em?"

"Yes," answered Hoff.

"By the way," asked Larkin, shouting over a shawl, protruding glasses, "are you sure you can deliver on this judgment?"

"Deliver?" asked Hoff in amazement. "Haven't I been delivering all the week?"

"Yes; but Marinetti—I hope he has promised his district to Plude, who is running against my man Harrigan. That's why I work and tied it up with the farmers on the Surveyor-General—no I could have something coming on the judgment—if I needed it."

Hoff flushed. He recognized in this both a snarl and a threat—a snarl in the suggestion that his power was not absolute in the city, and a threat that a combination was laid against him in the State. The snarl stilled his vanity and hurt him some, but the threat frightened him. He never could understand those grafters. He never could do business with them successfully—political business. It was his weakness. In the city he was king. Get him off the ribbon and, to use his own expression, he was "lamed." He knew it. With Larkin, now, it was different. He could cut bait with those lawyer-whippers all day long while they fished, and at night put all the fish on his string.

Rudolf, Marinetti was always a possible snag in Hoff's pathway. He had taken orders liberally, but, perhaps without intending it, had managed to cause Hoff the vague feeling that some day he would block. So Larkin's threat frightened him. But he bluffed.

"Marinetti?" he queried composedly. "Marinetti's rating at my crib, isn't he?"

"Aw—yes, of course," answered Larkin.

"Well, then, what's ratin' you?" asked Hoff insolently.

That bit of language seemed to win the day, for Larkin, appearing satisfied, arose and went out on the floor of the convention, where they were buying themselves with the final clean-up of the convention's work.

Hoff stayed behind in the little committee-room to meet his district leaders and pass the question to the politicians. They came singly.

Last of all came Marinetti—amiable, aggressive, loyal. "Hullo! Biggest eye in Hoff's machine, and therefore distrust of him; absolute master of the Sixty-second Assembly District, Superintendent of Public Works in the administration cabinet, and the most popular man in the city government. He was a native of Switzerland, big as a Holoetin, with a large, hammy face and a half's complexion. Small blue eyes set in the upper corners of the face kept laughing watch over the Alpine jumble of features below, prominent among which was a nose-stem and upspring like one of his native crags, and under the nose a long, snipe-cleft that was a sparkling valley or a forbidding chasma, according as the Boss of the Sixty-second called or showed a fang.

"'S all right," said Marinetti. "'S all right, er—Harrigan. He's distrust you for Blako."

Hoff's eyes showed white.

"What?" he screamed. "Your district? When is time did it get to be your district?"

"I don't own another thing, er—got to be yours," retorted Marinetti coolly. "I give you the Sixty-second sometime when it suits me. You don't give it to me—never." The politician's great face hardened.

Through narrow slits his beady eyes looked out, and his mouth had become a mere seam upon his face in the tactile comparison of his determined lips.

Hoff next tried to reason with him. "We all stand together, don't you see?" he began. "Sit to do so indignantly. They is only a credit ask for the trustee, Marinetti.—Hoff drew close and confiding—

"If the Sixty-second should vote for Blako we should have to have a new Superintendent of Public Works."

Marinetti started as though he had been stabbed.

"So?" he breathed deeply. "So? I was the Superintendent of Public Works."

"Yes, but we can't fire you."

"No," said Marinetti, with a dangerous chuckle.

"You did not appoint me. Ernest appointed me be-

# QUEEN VICTORIA AS I KNEW HER

BY XAVIER PAOLI

Former Special Commissioner of the Sûreté Générale, Detailed to Accompany Royal Visitors to France

For twenty-five years M. Xavier Paoli held one of the most difficult and dangerous posts under the French government—that of guarding the European sovereigns who visited France and of mastering for their personal safety. No man in France had better opportunity for observing and judging the rulers of nations of close range. His tact and judgment won the confidence of the visiting princes whom he guarded, and he was admitted to their friendships and to the freedom of their households. Among the many foreign sovereigns with whom Paoli was associated was Queen Victoria of England, who asked the French government that an man she should watch over her during her visits to France and to the French Riviera. Paoli's reminiscences throw new light on the character of the great English Queen.

My duties as special commissioner placed me in attendance on Queen Victoria during each of her later visits to France. I therefore had the opportunity of living beside her, as it were, of leading about the same life as her Majesty, very nearly every year, for a varying period of time. I will not speak at length of the Queen's first holidays in the South of France. These were really but so many trials of the climate, and I should not have anything very striking or sensational to tell about them.

I lighted on the news that the Queen had become a landowner in that part of the country. Fortunately, one of those small and petty differences which are always apt to arise where a question of property is involved, and which are generally settled in a friendly way, was exaggerated and cultivated by local rivalries, with the result that the whole thing was spoilt. When her Majesty was preparing to lay the first stone of her French home, she asked the local authorities to make an alteration in the roads, for which she offered to pay liberally. Objections were raised; an attempt was made to turn the situation to account by imposing onerous conditions upon the royal landowners; and this need to seek brought the Queen along by abandoning her project, selling her property, and taking leave for good of Aix-les-Bains.

At that time the Queen of England had not yet quite lost the use of her limbs, and could still move about a little, with the help of a stick. This slow and painful method of progress soon tired her. She took long carriage drives, but what she really needed was a means of locomotion suited to easy and moderate use and requiring no great preparation. One day, as she was driving, with her suite, along the edge of the Lac de Stangnet, she met a peasant approaching slowly in a little cart drawn by a donkey. The animal was still young, but so thin and so ill looked that he was nothing to look at. The Queen stopped her carriage and beckoned in the fellow.

"Would you care to sell me your donkey, my good man?" she asked.

"Not knowing to whom he was speaking, the peasant replied, with the usual distrust that country people instinctively entertain for those who come from the towns.

"It all depends, madame."

"How much did you pay for him?" asked the Queen.

"A hundred francs—and he was cheap at the price."

"I will give you two hundred. Will you take it?"

"The peasant pretended to hesitate. I said, in my turn:

"You can buy two donkeys with that."

All but he made up his mind; the bargain was struck; and the donkey became the Queen's property, and was duly washed, crumpled, groomed, and generally made up. Above all, he was better fed.

Now after, he was put to draw the Queen along the little roads and narrow paths which the carriage could not enter. Thereafter, indeed, as he was christened, had an easy, painless, and agreeable life.

When the Queen next took to the sea, in 1890, it was decided that Anglet should be taken with her on the journey.

On the day of his return to Aix, the sky Queen proved that he had a good memory. He broke loose from the wagon in which he was carried, sniffed the air of his native land with delight, took his bearings, and disappeared away before any one could lay a hand upon him, walking straight for the stable where he had been so well cared for

THE QUEEN'S "LITTLE FRIEND."

Portrait of Angèle Goutard, the French peasant child, which was pointed at Queen Victoria's order on one of her last visits to the Riviera

It seems that the Queen took a great liking to Aix-les-Bains from the start. She was to stay there, and there was every reason to believe that, thanks to the "Alpine gardens of Stangnet," which Victor Hugo sang, she would never see a moment of being in another part of France with so good a better springtime resort. She bought a piece of land not far from Aix, and proposed to build a country house upon it. The whole district was de-

The Queen taking tea in the highroad. Beside her is the Princess Victoria

in the previous year. One of the Queen's apartments, on the story, contained, quite richly, — "See you?" Will have to change your French manner which says "Nilly as a donkey?"

**AFTER** Aix-les-Bains, Queen Victoria went southwards in Provence, Biarritz, Gijón, and Lisbon, and ended by selecting Nice as her holiday resort. She was faithful to the Riviera for five years, and death alone prevented her from returning there, but shortly before existing, in one of those dreams of hope that light up so many death-beds, she exclaimed:

"Oh, I shall never get well except at Nice! If I were only at Union, how soon I should recover!"

An old Xavese scholar of my acquaintance, who had made a far-reaching study of the archeology of the place, said to me one day:

"I suppose you think that this is the first time that an empress has been in stay at Union; but there was one before the Empress of India, who also came here in search of peace and health. I desire to say that I am not speaking of the day before yesterday. The Empress I here allude to was the Empress Satalonia, the wife of Gallimor, who lived and reigned in the third century of our era."

The Grand Hotel at

Casino still exists as it was at the time of the Queen's stay. It is a very plain building. The Queen's empress had hired the whole hotel for a period of some five weeks, at a price of about fifty thousand francs. The hotel was furnished with all speed, for the accommodation of the illustrious guest, and the Union municipality gave orders for regular road-making operations in the country-side. The neighboring landlords cheerfully offered to throw open their parks and gardens, and even to give benches made in their woods, so that the Queen might have a place wherever she went. In short, a general spirit of veneration prevailed.

Everything was done to make the royal guest comfortable, attractive, and agreeable. A great number of hatteries were sent over from England, and especially a number of little commodes, such as which the Queen liked to see about her. The sovereign's apartments occupied the right wing of the hotel. The bedrooms were quickly furnished with a few chairs in thick velvet, a very fine Venetian mirror, and a mahogany bedstead.

The dressing-room was more sumptuously furnished, in a rich mahogany, artistically carved; and the walls were upholstered with flowered hangings. Rich and thick curtains barred off the doors and windows. In the middle of the room stood the Queen's little wash-table, covered with papers and lining photographs.

The dining-room looked neat, and was very large indeed, so much so that, for private meals, the size had to be reduced by means of an enormous and very handsome screen. On the left were the apartments of furniture, tapestries, objects of art, and vases with flowers; and water-colors, etchings, and paintings by master hands.

The Queen's two daughters, Princess Ilveta of Badenberg and Princess Christine of Schleswig-Holstein, and the belle-in-law, Lady Southdown, and Miss Harriet Popham, had their apartments in the left wing.

In the ground floor, on the right, two rooms were used as reception-places. On the left were the apartments of Sir Arthur Rippe, the Queen's private secretary; of Colonel (afterwards Sir William) Carrington, her equerry; and of Sir James Hall, physician-in-ordinary to her Majesty. The remainder of the hotel was allotted to the different members of the staff.

This hotel formed Queen Victoria's first residence at Nice in the spring of 1855. The second was the Hotel Excelsior-Horizon, comprising altogether eighty large rooms and dressing-rooms, which was let for the respectable figure of eighty thousand francs for the length of the visit.

The Queen's Indian Body-Guard

THE Queen's household comprised, in addition to the household members of her suite, a fairly numerous staff of servants, including a first assistant, assisted in her service by several others; a French chef, M. Ferry, who had three or four Frenchmen; and a whole regiment of soldiers under his orders; a coachman, an outrider, and a dozen grooms, besides the small band of Indian servants who, to a certain extent, formed a set apart.

I think that my readers may be interested in a few details concerning these last. They were a fine-looking body of men, Mohammedans from Agra and Lahore, clad in big turbans and cashmere garments of dazzling colors. They wore a trifle fierce and shy, but were very impressive in their demeanour, and quite taken up with the almost religious importance of their duties. They acted as a sort of private body-guard to the Queen. They enjoyed certain privileges, practiced all the rites of their creed without restriction, were thoroughly accustomed to discipline, and were faithful and devoted in their service in life and death. The Queen also brought with her a French gillie, who wore the picturesque costume of his native land.

allowed herself the time to read everything that was submitted to her for her signature. She sent many telegrams, both official and private, and these were nearly always couched in either an English or a French agreed upon with the recipients. The Queen's correspondence was really enormous, and I think it will be interesting and amusing to know that she gave to a variety of communications which her Majesty received in abundance. The more powerful you are, the more you are troubled with communications of every description of every unexpected sort and kind.

These letters, I assure you, were very curious reading. They arrived from every point of the compass. They were obsequious or arrogant by turns, fresh or cringing, clever or silly, and in general, the supplicants laid upon a thousand ingenious methods of calling attention to themselves. Sometimes they took the most finishing pains to write a beautiful hand; sometimes they finished their petitions with decorative devices. There were those who had their appeals written by children, hoping thereby to produce a more sympathetic effect in the recipient. There were others who were so modest themselves on the strength of great precedents, that they invited the most complete confidence in the success of their enterprise. Some of the petitions were signed by an old man of eighty, who was writing:

"How painful and repulsive it would be to me, but as you were the first to have to alter my high opinion of the value of my youth, maturity, and benevolence!"

"Others made a display of penmanship:

"If your Majesty does not include me in my country, I shall be obliged to be left to me not to put an end to my life."

A correspondent at Bordeaux, who was as busy as a pining fiddler, had cherished the hope that the Queen's return would consent to pay his son a visit at the Bordeaux Normal School. A young man from Lyons Lorraine had written her to send him a bicycle.

Requests for postage, stamps and autographs were not infrequently made. Not a day passed but the Queen received some of these petitions, which were often very important—such as that of a person named Nastes who had carefully drawn up an extract list of the things that were missing from his collection. The list filled many pages. There were also numerous petitions for objects of every-day use, for clothes and linen.

Other correspondents offered to sell various knock-knives, and, of course, piled themselves on affording the Queen the opportunity of having "a real bargain." Some of these had sold and some were an acceptance or refusal.

The Inventions

SPECIAL mention must be made of the inventions. Among the latter was one who asked her assistance and patronage in introducing a machine that would automatically stop a ship in motion and thus avoid those terrible collisions at sea which result in so many catastrophes." Another man modestly devoted solely to manufacturing an artificial hair which he had long had the idea in his head. A third wished to sell a new improved sort of his invention, that is to say, a sort of "large winged sparrow" (1) used in the Kingdom of England, for use at different colors, endlessly varied and impossible of imitation."

The Queen was ever ready with the men, and they seized every opportunity, every fleeting actuality, to improve the agency of their enterprises.

No one will be astonished to learn that parts figured largely among the Queen's habitual correspondents. I have instructions before me in which particular frequency is singled with absurdity and even sometimes

Queen Victoria in her donkey-cart, drawn by Jaquet, the donkey bought by the Queen from a French peasant on one of her drives. Jaquet became the favorite of the royal stable, and the Queen took him about with her on her travels through France.

All these servants had a great deal to do, especially on the arrival and departure of the royal party, for the Queen always carried nearly all of the furniture of her bedroom with her, including the bed and bedding, together with her own linen and plate and articles and knock-knives of every sort.

The Queen usually rose at nine o'clock, proceeded in dress at once, and then took breakfast, which was laid on a small sitting-room adjoining her bedroom, and consisted of chocolate, coffee, tea, and various kinds of rolls. A dish of eggs was also served prepared in a different manner every day: a dish of fried fish, grilled bacon; and Cambridge omelette. Let me hasten to add, after saying this substantial list, that the Queen ate very little, and selected one of those dishes at random, without showing preference for any in particular.

Victoria's Enormous Correspondence

NEXT came the turn of the mailing and the daily correspondence. As the Queen made it a rule to answer every letter of ours that was worth answering at all her two secretaries were kept very busy. She had to sign a number of papers, and

# SURGICAL OPERATIONS ON WILD ANIMALS

ON  
WILD  
ANIMALS  
BY  
ELLEN VELVIN

A convalescent monkey. The wooden necking in to prevent it from tearing off the bandages and splints

THIS is an age for operations—especially surgical operations. In many cases, as it is said, these surgical operations are not really necessary. But there is now an increasing operation on wild animals—some may not accord on that point. There are too many and too great difficulties in the way, not to speak of the expense and the danger to the operator, as well as to the patient.

In every case where an operation is performed on a wild animal, it means a chase between operator and patient. The animal, and, generally speaking, wild animals are extremely elusive. No, in case of broken limbs, torn flesh, ulcers, tooth, ingrowing claws, etc., the animal is first of all given a little chloroform, then tied down securely, and the operation takes place.

All this needs very sharp and keen. But to those who have ever studied or had anything to do with wild animals the difficulties and dangers are only too well known. In the first place, it is extremely difficult to drug animals of any kind, especially wild ones.

Animals are often tied down without being chloroformed before a minor operation; but, in the case of a being obligatory to chloroform a wild animal, it is found better to put him in a traveling cage, which is closed so narrow that he can not move about in it. It is then possible, even when he constantly moves his head about, to keep a cloth saturated with chloroform in contact with the animal securely, and then the animal surgeon does his business as quickly as possible.

When the animal is once chloroformed, no time is lost—and a moment. For drugs do not act equally in different men and different ways, and it is no telling at what interval the patient will wake up again. So the men rush forward with their ropes and hooked sticks, fasten the animal securely, and then the animal surgeon does his business as quickly as possible.

It is never a minute too quick; for very often, almost before the ropes have been loosened, the animal is beginning consciousness; and many an animal has had to be left with the ropes still being round him, in order that attendants might get out alive. In some cases the animals are ferocious with rage; in others, so dazed and stupid that they scarcely wake up for the rest of the day.

## Curing a Fever Near of Improving Toe-Nails

It was observed some time ago, in the Zoological Gardens of Copenhagen, that a particularly fine polar bear was suffering from improving toe-nails on his hind feet. This is a very common complaint with polar bears in captivity. If it is well known, to people who have watched these bears, that, in turning round, they twist themselves right about on their hind quarters, and that in this and in nearly all other movements, except that of walking, they rarely use their hind feet at all. Being to this, the nails, not having anything to rest them down, grow so long that they turn over and grow right into the soft pads of the feet, which is extremely painful.

In this case it was found that the claws had not only grown into the soft part of the feet, but had bored right through to the other side. The poor bear must have been in extraordinary pain. A large transport cage was built, the dimensions being four feet six inches high, seven feet long, and only one inch six inches wide. The front of the cage was covered only with iron bars. The object of this was to get the bear where the operators could see hold of his hind paws without having him in a struggle to tie him down.

The bear was very willing to go into this narrow cage, but a trapping piece of fresh fish did the trick, and he was found in the dimensions being four feet six inches high, seven feet long, and only one inch six inches wide. The front of the cage was covered only with iron bars. The object of this was to get the bear where the operators could see hold of his hind paws without having him in a struggle to tie him down.

After this the animal was put into a

box of wood was lined with straw about a foot high. The bear was filled with cold water, and in this the bear was made to stand all day. Fresh water was supplied occasionally, and— I believe—the cage was drained in the evening to give the animal dry quarters for the night. In a few weeks the bear was quite himself again, and appeared to have forgotten everything in connection with the incident. I mention the matter here because in some cases animals not only recover but are lauded like this, but do not forget it, as in the case of a lion quite recently in Mr. Frank Bostwick's case in London, England.

The lion had been suffering from an abscessed tooth for some days, and it was hoped that by giving it soft food, like baked mackerel in milk, etc., it would get over it. But when it was found that the animal was getting worse, that one side of the jaw was terribly swollen, and that the poor animal was starved for want of food, it was decided to extract the tooth. It was a fine specimen, and the owners did not wish to risk dragging it, so it was decided to extract the tooth without any anæsthetic.

Accordingly, all the men in the show were told off to help the men the lion with ropes to get it ready for the operation.

## Pulling the Ulcerated Tooth of a Lion

AFTER tremendous difficulty—it was found impossible to get him into a small cage—when the men had attracted his attention in another direction by means of poking him with sticks, one leg was fixed securely and then all the men set to work, entered the cage cautiously, and, keeping clear of his head and front—to speak of his roars that—might his other set in business of pulling; and he was finally on his back and ready for the operator.

No time was lost, and, in spite of thirsty, ferocious growls and heavy breathing, the piece of buckram round the tooth, a mighty pull was given, and, simultaneously with a roar from the lion, the tooth was pulled out. For a moment the lion seemed quite surprised—probably at the sudden cessation of agonies, for his mouth was fearfully ulcerated—and then he tried to get up. He again seemed puzzled. He gave a very low moan, his ears were lowered, he sprang on his feet again, but, beyond a heavy groan as the ropes drawn out of the cage, he made no more noise.

He was given a pillow of hot bread and milk, which he took greedily, although he snarled at the trainer who brought the milk as directed, as he was the man who always fed him. Some one suggested that it was because the trainer had been the one to hold off his hind legs, and that another laughed at the idea, and said it was probably because his mouth was still sore and a faked stick while the tooth was drawn out. That another laughed at the idea, and said it was probably because his mouth was still sore and a faked stick while the tooth was drawn out.

Though the lion quickly recovered, and was in the best condition for his cage, as directed, as he was the man who always fed him. Some one suggested that it was because the trainer had been the one to hold off his hind legs, and that another laughed at the idea, and said it was probably because his mouth was still sore and a faked stick while the tooth was drawn out.

If it is curious in all animal shows for the trainers to go very early in the morning into the cages to see them all. Accordingly, about five o'clock one morning, the keeper went in to clean out the cage of this lion before having his breakfast. It happened to be a particularly dark and dismal morning, and on all the electric lights were turned on.

The lion seemed perfectly quiet when the trainer went in—grinned a little when the man made him a bow, and otherwise seemed in a fairly good humor. And then, suddenly, without the least warning, all the electric lights went out! And in a moment, with a ferocious roar, the lion sprang at the keeper, his head in his mouth, and began to maul his ears. He was shrieked and tried to fast of the animal, but when the trainer saw that he was getting on his feet, he struck and the lion's ear attracted the attention of the other trainer, who put the light on, and the lion was in a state of great excitement, striking, thus causing the lion to jump on the other to drag out the trainer, who was now in a condition and bleeding terribly.

A doctor was sent for, and he found that the man's arm was badly torn, and that three digits of his hand had been completely bitten off. He was sent to the hospital, and was there many weeks. He finally recovered and returned to the show. But, as every time he went near that particular lion the animal showed great resentment, it was thought wiser to put him at other work. So he and the lion had been the best of friends until the tooth-drawing operation. There can be no doubt that this was the cause of the animal's change of feeling. This episode almost proved a critical operation for the trainer.

## A Young Lion Was Operated on Himself

IN the Forepawm Brothers' show, at one time, it was noticed that a fine young lion kept his mouth a little yaw open and appeared to be in pain. After much difficulty, it was found that in some way a piece of sharp bone had got between the lion's teeth, and was firmly wedged there, a pointed splinter of a protruding outside his mouth. Brags were out of the question when it came to an animal; and when it was found that the lion was himself in pain, and that it was starting to death, prompt measures were taken to be taken. The young lion was to be kept, and the piece of bone extracted.

But the animal was extremely nervous, and when one man was tied, it was found that he was shivering like a leaf, and that he was not at all steady in his keeping, being very fond of the young animal, and he was afraid, thinking in quiet and gently him; but, need not worry, the lion was himself in pain, and was raising three feet and attacked the keeper's carriage. The keeper was so surprised and of his guard that it would have been badly with him had it not been for another keeper, who rushed forward with an iron bar to protect him.

But by this time the lion had worked himself up into a perfect frenzy, and, as the lion bar was put in front of him, he bit at it so savagely and violently that he snapped the piece of bone in his mouth. This caused the pressure, the remaining gear fell out, and there was now no need of an operation. The lion seemed just as much surprised as any one else, and lifted his nose and snarled, as a thoughtless, unsteady manner. Soon after, a lion of warm blood and with was given to him, and, after lapping up every drop of milk, he was given a little more, and was utterly exhausted from want of food and sleep, but when he was recovered, and grew into one of the finest lions in the show.

When the well-known evangelist Dobson, in the New York Zoological Park, was in his last sickness, he was thought that he was coming from an operation caused by some foreign substance he had swallowed, for some-one would swallow anything that he could not swallow, and was very much interested in getting them things when they think of as looking.

As after the most careful watching, it was found that he could not swallow anything, something was being done. It was decided to try something in the hope that it might save his life, so he was a great favorite with the public and all the keepers. And with every day, and just as his preparation as well to be taken for a human being, with several doctors present, he was given ether, which he took with rather a puzzled air, but quite placidly. The operation was performed, but there was no obstruction. It was found, however, that he had double pneumonia, and that he was coming from an operation caused by some foreign substance he had swallowed, for some-one would swallow anything that he could not swallow, and was very much interested in getting them things when they think of as looking.

It was found, however, that he had double pneumonia, and that he was coming from an operation caused by some foreign substance he had swallowed, for some-one would swallow anything that he could not swallow, and was very much interested in getting them things when they think of as looking.

low night after night, and he had as much attention as any right man, for his keepers were both devoted to him. When he died on the 24th of February, 1897, everybody in the Park was sorry, but Dr. Hornaday and the keepers were more than sorry; they were deeply grieved. It is wonderful how those big eyes gain the affection of those who have anything to do with them. They are so intelligent, so affectionate, and so appreciative of any kindness that it is not to be wondered at. Few children have so much care and attention as some of those andropod apes.

*A Struggle with a VICIOUS LLAMA*

**A** VERY recent operation which took place in Mr. Frank Hootick's show was that performed on a llama. The circumstances were interesting and peculiar. This llama had conceived a great friendship for a mired white donkey in the same show, and the two were therefore put together. The old friendship was kept up for more than three years, and then, one night, those two respectable friends had a most terrific fight between themselves. When they were separated, after much difficulty, it was found that the poor llama had had one eye completely destroyed, and that its head and eye-socket were in a bad condition.

A first-class veterinary surgeon was sent for, and the wound was thoroughly cleaned and disinfected, and the llama's head bandaged up snugly. All this sounds very easy, but some experts think when you can realize the amount of trouble and difficulty it meant. In the first place the llama, in being so disfigured and mangled, was exhibiting a strong tendency to attack his own eye, and when any attempt was made to get near him, he struck out viciously with his fore feet and tried to bite—and llamas can give terrible licks. It took nearly all the men in the show and some outside men in the White City at Shepherd's Bush to keep him still while the veterinary did his work. Even then, one or two received kicks, and one was bitten slightly.

The poor head presented a pitiful sight when it was finished, but as soon as it was over to be given—so it is called—by the head application, for he must have suffered greatly; and after a few weeks, when the lambs were returned, the neck had healed. But it was found that his love for the white donkey had changed to hatred, and each time he caught sight of his former friend he became terribly enraged. Now he is always kept with his blind eye carefully covered the donkey.

A very common operation among snakes is to take out their loose teeth, or to feed them by artificial means. Nearly all snakes in captivity suffer from new mouths, and it becomes necessary at times not only to take out the loose teeth, but to snub out the mouths with some disinfectant, and also to wash of the pieces of loose skin round the lips. That this is a very critical and dangerous operation, not only to the snake but to those in attendance, need not be said.

*Erasing the Tusk of a Python*

**A** BOUT eight pythons, for instance, which is about twenty feet in length and weighs two hundred and seventy pounds, is not only a cumbersome and heavy article to manage, but also a very dangerous one. It takes twelve or fourteen men to handle him and take him out of his cage. This is done by one man taking a large piece of coarse matting and, after the door of the python's cage is opened, throwing it without one moment's hesitation over the python's head, and then rapidly quickly securing the snake by the back of his neck. And now here should be the best hold of just the right place on the neck—the front instead of the back of the neck,

for instance—he is as good as a dead man.

But, supposing that the man has caught the python in the right place, in the apex of the neck, with a quick movement he draws the snake's body forward; and, so he draws it, the other men come forward and catch hold of the snake's back at intervals of about a couple of feet, and hold on for dear life. Then, while the men are holding him, another man takes to time, but with a pair of pliers takes out the loose teeth—they come out very easily—snubs out the snake's mouth with some cotton wool steeped in disinfectant, and then puts in another lot of cotton wool saturated with iodine. And here, unconsciously, the snake helps in the operation: for he holds on the cotton wool in the most vicious manner, which is the very best thing he could do. After he has done this several times, the wood is taken out of his mouth with a pair of pliers, his lips are washed off and dried by means of some cotton wool inserted on the end of a wooden pole, and the operation is over.

I witnessed this operation myself on one time, and I can safely say that no one was more delighted at the ending than the men who were holding the python. They were all exceptionally strong and energetic men; but it needed great strength, great nerve, and cool presence of mind. For occasionally the python would present long fangs in this manner, and with a fearful and most powerful wriggle would send the men nearly of their lives. If they had loosened their hold, it would, in all probability, have meant the death of the whole lot of us. For what could any human being do in a comparatively small room with a twenty-foot-long python loose? The men kept their heads and the python; but when he was more sure of his grip, and had slipped into his tank of water like an oiled rat, each man was streaming with perspiration and panting for breath.

*Manicuring the Elephant's Paws*

**O**PERATIONS have been performed on nearly all wild animals in captivity at one time or another—hippopotamuses, rhinoceroses, river elephants. There is one operation on elephants which is always performed at least once a year and sometimes much oftener in all zoological gardens, wild animal shows, and circuses. That is the simple operation of manicuring their tusks. In captivity, the elephant does not get enough exercise to keep his tusks worn down or the skin of his feet in good order; so it becomes necessary to cut and trim the tusks and cut off the superfluous skin that collects round his legs feet.

This is a very simple operation, and, yet not, of course, least the animal in the end, and most elephants stand quite still until it is over. But, in other cases—small elephants being extremely nervous creatures, in spite of their enormous size—the greatest difficulties are encountered because of the animal's timidity. One large elephant in a Kansas show had always been considered one of the most gentle and amiable of his species, and not the slightest trouble was anticipated when the time came to cut his snags and trim his feet. But, at the very first

Making an examination of a sick elephant's mouth. Elephants display almost human resignation in allowing the doctor to relieve their sufferings.

sight of the knife, the big creature uttered a shrill shriek, trumpeted at the top of his voice, and, with his big body swaying from side to side, tore off and was not only run out of the circus grounds, but all the way down the village street!

After such time and trouble, he was persuaded to come back, and soon became as quiet and gentle as before. The circus people visited a while, and then, thinking he had forgotten the incident, and wishing to get his feet into good condition, tried again. But just as soon as the elephant saw the implements, he uttered another shriek, at this time an angry one. He took up one of his men in his trunk and tossed him away as if he had been a rubber ball; and this he did to each man in turn. And when the unfortunate men jerked themselves up, terribly bruised and cut, they refused ever to attempt the operation again, simple as it was.

But in course of time the elephant's feet became very sore and the overgrowing nails caused him much suffering. So it was finally decided to try just once more to get his feet in good order. And, curiously enough, this time the elephant allowed them to do just what they liked, and stood perfectly still until the whole business was concluded. After that he always submitted most willingly in this operation, even lifting up his huge foot as if to help the operation.

But, among all the wild animals, there is one who can not be operated on. That is the giraffe. This curious creature, the tallest of all earthly inhabitants, is so timid and nervous that anything the least unusual frightens it. At one time, in the Zoological Gardens in London, it was noticed that a young giraffe seemed to be in pain, and it was decided to give it some medicine. Several keepers were called in to help, but, as they came in, the giraffe looked at them nervously with its beautiful eyes, trembled all over as if with rage, and greatly distressed on the floor of the stable, and died on the spot! So no one had touched it; no one had hurt it in any way. It simply died from sheer fright.

"Brutus," a fourteen-month-old lion, being made ready to have an ulcerated tooth drawn. Not an instant is lost after the animal has inhaled the anesthetic, for he may wake up at any moment.

"For the Calmed lady and Judy O'Geady are sisters, under their skins"

## INTERLUDES

FROM A JESTER'S NOTE-BOOK

The man who invented cold storage is eighty-five years old. This fact is itself should be a sufficient refutation of the fable that a majority of the fresh eggs now consumed were laid in days prior to the War of 1862.

Since a recent very pertinent pronouncement from the White House, a good many citizens at Washington who are desirous of obtaining well in the eyes of the Administration here have anxiously seeking suitable names without any failure to the front door.

A German Militant Suffragette advises her British sisters to burn their husbands' diaries and breakfasts. This is not half so effective as the American plan under the operation of which a good many really fine women burn their husbands' money.

The authorities up at Newport are said to have placed two police-men in charge of affairs on the Newport beach. We do not recall the rumor that this concession to the ladies is shortly to be followed by an order requiring that all the waves that break on the beach shall be married.

Ex-Speaker Cannon will be heard from again, having been captured only recently. This time he announces that, now that Illinois has granted the suffrage for women, it is a fine time for good-looking men to run for office. This is really the first complete act of co-operation on Mr. Cannon's part that has ever come in our notice. Let the good work go on!

An interesting item in the newspaper informs us that out of seven hundred members of the San Francisco Birth-Women's Union one hundred are college graduates; and another item in the same journal asserts that a college education is worth \$25,000 in increased earning capacity. If both these items are true, they must be some extra-odd in San Francisco to require an investment of \$2,500,000 on the disbanding account alone!

A correspondent wants to know the correct pronunciation of the word *Parallal* in Faneuil Hall. Frankly, we do not care to commit ourselves definitely on so important a matter; but we can say positively in our retrospective that upon a recent visit to Boston we heard the word pronounced by natives in such a way that a newspaper report would be justified in using it as a rhyme either for "bassal" or "bassal"; so we presume that is about the way it really should be spoken. But why refer to it at all in days like these, when everybody seems to have forgotten it altogether?

In a list of the twenty greatest women in history recently published, we find such names as Marie Antoinette, Madame de Maintenon, and Cleopatra; but no reference whatever is made either to the lamented

Currier Nation, whose art was quite so famous and much more effective than George Washington's halibut; or to the late Casser I'badwick, who as a "dove" of the 19th, if not devoid, has had an rival since the days of Tolstok.

In laying our belated wreath at the feet of the Kaiser, who has recently completed his twenty-fifth year of service as a German leader, we have only to say that a man that holds fair to be just one thousandth larger than another has turned out to be nothing more than a refreshing shower, for which the whole world has reason to be profoundly grateful.

### SUPERFLUOUS

"I see," said little Blanka, "that the Lieutenant-Governor of Illinois wants to have newspaper reporters hanged."

"Nonsense!" said the Gentle Philosopher. "Seems to me the general run of 'em takes too much license on it."

### ON ELECTION DAY

"In this the polling-place" asked Mrs. Silibers, over the telephone to Tampa's Barber Shop, where the voting was going on.

"Yes, madam," replied the inspector. "Well, I'm Mrs. Silibers, of number ninety-seven Greenway Street. I just wanted to tell you that it is raining so hard just now that I can't think of going out, so will you please cast one straight ticket for the Progressive Party for me? And, while you are about it, ask Mr. Higgs to send me up four pounds of liver, two pounds of chops, a dozen fresh eggs, and—"

"But—would you believe it—last night politician actually hang up the receiver, with a bang!"

### AS TO BACHELORS OF ARTS

A YOUNG man has just been denied his Bachelor's degree by Columbia College because he had not passed his ordaining examination, as required by the rules of the faculty of that institution of light and leading. In all other respects he had proved himself a capable student; but, after four years of abiding hesitation on the brink of the swimming-pool, he had not felt himself wholly prepared at all times to propel himself from one end of the tank to the other, and in consequence he flunked at the emergent moment. We notice a disposition in some quarters in Pad Mall to give the college authorities for withholding the young man's degree as any such score; but the more we think of it the more are we convinced that the faculty are not only wise in making his requirement, but would be wiser still if they carried the principle still further. It is their job to fit the young man committed to their care to fight the battles of life in the larger world, and it is clear to any man of ordinary common sense that a youngster who can't swim eighty-six feet in real water would have no chance whatsoever as Wall Street, or in the Social Forum, or in a new consolidated, and to induce him as fit for the struggles of existence would be most improper under all the circumstances of modern life.

### But why swimming alone?

With New York's gamblers in considerable numbers shooting real bullets at real people out of real guns, and Muffragette bullets hurling bricks with an unenviable accuracy in many quarters of the world, why not have a course in judging, or skill, or in swimming? In view of the sudden changes of base required of men in modern politics, why should a student who can not learn a complete sonnet-craft at a woman's nod be considered as a capable person, fit for treason, stratagem, and spoils? In view of the swift pace of modern life, why should the ability to swim, eighty-six feet be regarded as a sole test of a man's capacity to keep up with the procession, with an requirement that be able to mix a hundred yards in fifty seconds? Considering conditions in the subway during the rush hours, why should more swimming, when everybody knows that the only thing under the canopy that saves a man from suffocating is a rough and wool in a complete mastery of the arts of hating, abusing, and poisoning?

Truly it is all right to hold that a man be able to swim before certifying him to the world as a Bachelor of Arts; but the idea that anybody can get along in the world as it is constituted to day without judging, writing, judging, writing, and being judged, writing, judging, writing, and being judged, is quite preposterous.

If the Butler does not believe this, let him talk it over with the Mahook Conference, and with his friend the Kaiser, on his next annual visit to both these institutions. We give our guess if they don't both tell him there's something in it.

### THE MORGAN OF MARGUS OPTUTY

TRAVEL, my son, may broaden your intellect, as many wise sages have said; but take it from me, who have wandered much, that it is not likely to increase the circumference of your pants.

Nothing the constitutionally, friend Nostin, is as unprofitable; therefore never contented with a swim for the last word. She will have it, even if it requires a V. S. to get it in.

I, who have been twice married, and speak therefore from experience, my dear Cassius, do hereby solemnly flow that the one thing under a woman's hand will first make inquiry as to the cost of gloves.

When you find your nose rising higher and higher in the days of your youth, O Senegambian, do all that lies within thee to keep it down, but in your later years you shall bend beneath the strain of keeping it up.

Kiss-kisses, Bostonian, are dangerous adornments for ambassadors whose lips are bowed, since they afford his adversary ample opportunity to see through him, and not infrequently serve to place his unadvisable in an undesirable light.

As I have gone through life, Beatrix Quintus, I have observed that a gassy tongue is a more indication of a light mind, which sheds no illumination whatsoever, save that which brings into better relief the own emptiness of thought.

# AMANDA

BY  
KATHARINE BAKER

ILLUSTRATED WITH DRAWINGS BY JAMES W. FREYTON

**T**HIS Duchess of Alabachon has left her soul's capital, and is now at Berkeley, Cal. She has lately been troubled with a slight rheumatic ailment, which, it is hoped, may disappear before the date set for the marriage festivities of the Duke and his son. The preparations are said to be beyond—

At this point the cabbage boiled over and overflowed, whereas Amanda, tactlessly laying aside her newspaper, went to the rescue of the dinner.

"By George!" said Mr. Wood enthusiastically, as he ate, "Amanda certainly is the boss cook. This sausage-and-cabbage combination beats the world. We must have some when Bartholomew comes to dine."

Amanda frowned. She was waiting at table—there was nobody else to wait. Mrs. Wood looked discomfited. Her American husband often amazed her by exhibiting phibetic tastes. She was too young to know that all husbands have phibetic tastes.

"Do let us give him something thoroughly vulgar and coarse," she commented. "No American!"

"It was always the favorite dish of my father," says Amanda indignantly, then, checking herself, she left the room.

"No," retorted Mr. Wood to his wife's remark; "let us send around to Burnard's for a plum-cake, serve it with tea, and imagine we have given a new something to eat. That would be the English way."

Amanda is really intolerable, with her impertinent habit of looking in upon the conversation at table, regarding the lady, changing her point of attack. "I can't think why you ever married her."

"Best to be had at the price," he answered eloquently. "As far as that goes, can't you see that she has any faults. But at two pounds ten a month some might reasonably be expected. If you can do any better—"

**S**HE could not, and not so well, wherever Mr. Wood had some weeks earlier spent an arduous day examining applicants, until Amanda presented her ruddy countenance. Mrs. Wood was not much of a housekeeper. Her chief claim to distinction, after her pretensions, was that she was third cousin to an earl. This fact was of no interest to the earl; indeed, he did not know it; but it was the pride and glory of Mrs. Wood's life. In the daughter of a rosy city merchant, and later in the wife of an energetic young American striving to introduce a California champagne to an indifferent world, this hardly connected had served only to excite desire and respect.

"Have you noticed how all the journals are filled with the marriage of the Duke of Alabachon," she inquired over the coffee. "Hush! me those newspapers, Amanda, Lieben. The Danziger Duchess of Alabachon is indisposed, it is said that the Duchess is more troubled than ill, and that the same is to be found in the approaching marriage of her son, the reigning Duke Leopold, with the Princess—"

"You're not interesting," she broke off. "I'd like to marry a winning duke myself."

"I wish I knew a few to impress Bartholomew with," remarked her husband, who pursued his business meditations everywhere, in the American style; "here is a long list of one or two, if you like. You call it. Yes, take the cap, Amanda; I'm through," likewise turning away, that before. But he an introducer who handed into every decent hotel in London, if he takes it up. If I can get him to dine here next week, will it cost days? I must go up to Berkeley first to see what it says, but we can do it when I get back."

"So you are going to Scotland!" said Mrs. Wood pleasantly. "I wish I were going somewhere! Men can always call it business."

He rose and touched her shoulder with logical embarrassment.

"Why, girls!" he said, "I'd love to have you, but honest, I haven't got the money to do it. It's right way and you wouldn't like any other way, would you, now? But when we put this deal through—"

"He shook off his hand.

"Oh, we can't afford anything, of course. A Distinguished but and one arrest, and the Crystal Palace for diversion—I suppose that's your idea of fitting circumstances for me. I never see a soul. If it weren't for Horrie Robinson—"

"If being a Jewish man having a motor and giving dinner at the Carlton, then I wish all the men I know were Jewish," said the spirited Mrs. Wood; and Mr. Wood retired into his room, there he went daily. "He wanted to buy me a fan-chain at Street's to-day," she continued testily, "the sweetest thing in baroque pearls. It was lovely, and I didn't like any other way, would you, now? But when we put this deal through—"

"I do prefer to buy my wife's jewelry myself," remarked Mr. Wood grandly oblivious of the fact that he had not bought and could not buy any. She forbore to trouble him of this. Perhaps a gilt-wood chair with a Bible upon it, he has ever more inspired her annual magnificence.

Amanda loved. "Poor boy," said she to herself, as she sat at the dining-room table. "Amanda loved her husband. Yet he can't ever buy them."

Amanda had a great fondness for Mr. Wood. He resembled a young lieutenant of hussars whom he recalled very well. He loved her, and on account of the difference in their station, vainly.

**A**MANDAN'S room was in the angle of the lower court, and the building adjoining it was of no pretension. The apartments therein were not only small, but more comfortable in every way. Amanda looked from her window. A pretty, tidy girl's head emerged from the one opposite.

"I suppose," announced the calling head, "Thanks ever so, my Mrs. never thank you. You know everything."

"How goes it with the invalid?" inquired Amanda.

"I haven't heard yet," admitted the girl. "But I expect some very day. This is the longest time he has ever left me, and I have been with him two years now. Amanda's disappointment was evident.

"He will come soon," persisted the girl.

"I suppose so," granted the cook. "But a month is too long for a girl to stay home. He doesn't do right."

"He won't."

"Then? Well, you have some enough to take care of yourself. What have you for dinner?"

The girl laughed softly. Amanda was certainly surprised.

"Jan," she confessed, "and tea."

Amanda frowned. Then produced a plate of cabbage elaborately ornamented with sausage links.

"Eat this," she commanded.

"I'm not hungry."

"Mrs. Wood might not like it."

"I dislike it."

"In tell the truth," said the girl. "I can't bear cabbage."

"All my Mr. leg I have been annoyed," said Amanda, "by people who would not say what they mean. And she let the table slide."

"You're no dictator!" murmured the girl, unafraid. "You are the kind of cook one reads about, that makes everything miserable. You don't like the Duchess in 'Alice in Wonderland.' Oh, have you read the Queen about the Hobbies of Alabachon? Her son is going to marry a German princess, and the ladies German princess, and she's going off to Vienna and Germany and she's water for humpste. It says she always loved to go about in white, but her husband never liked it, so she read it. It says she's a splendid cook, too. Here it is. The woman next me on the bus left it when she got it."

Amanda took the Queen from her neighbor, and read the article with interest.

"Now was Amanda alone, and for some min. with the sense of anti-climax possessed her."

"Through her paternal grandmother, the Duchess is a great-granddaughter of the eccentric Count Paul of Bavia, who was murdered for his liberal tendencies by the reactionary nobility. She inherited vast domains in the province district near Baku on the Caspian Sea, and is immensely wealthy in her own right. The Duke will be short of much of his inheritance if the count's adverse counselors drive the matter to hidden her proceedings. . . . An incident in the Duchess' family which . . . She reads Karl Marx, an admirer of Henry Bismarck, and holds it in mind, startling socialist views—views which her husband during his lifetime repressed with difficulty, driving her to turn her overflowing energies into the American channel. . . . She has with pride offered to the Car and the Kaiser bond made by her own hands—"

**BOND STREET** was crowded. A stout, homely, middle-aged woman, who had the air of regretting her husband, entered Street's. She was evidently unused to shopping. The haughty clerks gave very perfunctory attention to her demands.

"These are rather cheap," said one, with many incidents, when she asked for pearl fan-chains. The woman eyed him with an ask look, drew from her shabby bag two handfuls of coin, and pushed them toward him. The abashed salesman produced the chains. She chose one. Too fashionably dressed women, passing, stared curiously.

"My dear," said the elder in a clear undertone, "these, if you please, is the missing Duchess of Alabachon."

"But she's at Peverel, because the Car writes so on her address. The Times this morning says so. And there is an official announcement that the Duke's marriage is off, and she will go back so soon as the Car is a King!"

"Did you notice all that American gold on the counter? Here's for her husband's belongings."

"She's no parcel at once," said the stout woman authoritatively.

The salesman clerk obeyed.

As she stood on the curb waiting for an omnibus, a cab containing two men passed. A brown, black face turned out, fastened with interest, and was withdrawn.

"There stands the Duchess of Alabachon—the alabachon," said a short, balding man to his companion.

"Looks like a wash-woman," said Dr. Watson, distrustfully.

"Friend number one, my dear fellow," answered Holmes. "But did you not remark her left boot-heel, as the wind exposed it? Only one man in the world puts on a boot like that, and he is the court bootmaker of Alabachonshire. I bet a pair of his boots is evidence, I remember, in the strange case of the Lithuanian Margravine's lover. You must hear that some day."

Long before the end of those garrulous remarks the cab was out of sight, but the first words had been quite audible, and much discomfort, the woman hastened to Oxford Street, and by that thoughtless of farting horse and slipshod freaks made her safe way to Tottenham Court Road.

**A**MANDA, returning home after an airing, found a message from Mr. Wood awaiting her. He knew better than to expect her to take a real bit interest in the census.

"Most important has champagne left right Bartholomew dinner tonight," read the message. Mrs. Wood stood beside her mirror, eyeing a nail

"He tore the covering from a parcel. It was a case from Street's!"

**The Bouquet of Age**

**Old Overholt Rye**  
"Same for 100 Years"

"Mellow as old recollections; fragrant as the rose of yesterday." The whiskey that has retained its reputation for over a century. Aged in wood and bottled in bond.

## QUEEN VICTORIA AS I KNEW HER

(Continued from page 12)

with genius—that is to say, commercial genius. One set of letters was placed in the following order, to address to the Queen's private secretary:

I shall be truly grateful if you could present my best love to her Majesty and say that I send you a small order for my \$200-tube cigar.

The Red-White-and-Blue Club

FROM the poets to the creatives in art, I got a stop. It was taken by the writer of the following, which did not absolutely genuine letter, in which I have changed nothing except the signature:

August 3, April, 1867

About a year ago I was told that you give a card of one of these, red, white, and blue, for her Majesty the Queen of England would receive a million thanks as a return. I have occasioned many disappointments in the intervening hours of time, but I refused to let a card that will meet your wishes. If it gave your Majesty, as you are at New York, I propose to bring the card myself. That would give the pleasure of making your acquaintance, and I should be able to thank you from the bottom of my heart.

Should it be possible, would your Majesty be so good as to let me know if this means of carriage for your services, and the card will be quite effective during the crossing, and I do not ask this to the charge of any one but myself.

Amating your Majesty's reply, I beg to remain,  
Your obedient servant,  
Wm. F. G.

Real madmen who possessed the Queen. A certain Count de C— invited her to order her government to replace him in possession of the Egyptian scepter. Another fanatic believed himself to be the son of the Queen of England, and naturally took it into his head to assert his rights. I am bound to say, in very respectful terms.

Madam and Dear Madam:

I fear that you are in France at present, and I therefore hesitate to write you in a state which would do you more harm than good. I am sure I am not on British soil, where I could do you more harm than good. I am sure I am not on British soil, where I could do you more harm than good. I am sure I am not on British soil, where I could do you more harm than good.

Yours truly, Wm. F. G.

Thank, &amp;c., &amp;c.

These few examples, which I could here merely mention, will give you a general idea of the importance, the diversity, and the eccentricity of the requests of her Majesty's official correspondents. It is a miracle to our country. There was no replying to all these letters; it was really impossible.

FOR CURE OF BRUISES  
**Cortez CIGARS**  
MADE AT KEY WEST

## The Queen's Routine

I RETURN to the daily employment of her Majesty's time. The Queen had breakfast at eleven o'clock, when she went for her quiet drive, without pomp or circumstance, in the little donkey-springs, round about the royal residence in the beautiful gardens of Combe, or, more often, in the delightful grounds of the Villa Lancelotti.

The Queen seldom went back to her hotel before six o'clock. Lunch was served in the kitchen at twelve o'clock. This was the old Queen's chief meal during the day. The bill of fare generally consisted of fish, poultry, game, vegetables, and fruit. From six to nine the French cooking was served with national dishes. The Queen received five or six visits after tea, usually for she was eager to start on her afternoon drive. Tea was taken in the carriage, which stopped for the purpose of six o'clock. The Queen returned to the hotel at about six o'clock in the evening in March, and at about seven in April; that is to say, just before dawn.

After a short rest the Queen sat down to dinner, which she usually finished for half past eight, was seldom served before nine o'clock. Her favorite soup was a cream of cauliflower. Every day specially for her every day. Her Indian cook also sent up a dish of his own preparing. Apart, apart from this, in addition to the queen's appetites. At the royal table was invariably French. As a hotel diet, I must add that, in addition to the queen's appetites. At the royal table was invariably French. As a hotel diet, I must add that, in addition to the queen's appetites. At the royal table was invariably French. As a hotel diet, I must add that, in addition to the queen's appetites.

Her Majesty usually left the dining-room at ten o'clock, stayed for a little while at reading in the library, and then returned to the Queen's private apartments. She usually took a walk in the park, or to the lake, and then returned to the Queen's private apartments. She usually took a walk in the park, or to the lake, and then returned to the Queen's private apartments. She usually took a walk in the park, or to the lake, and then returned to the Queen's private apartments.

After this, she usually took a walk in the park, or to the lake, and then returned to the Queen's private apartments. ## Bernhardt Plays for Queen

QUEEN VICTORIA always interested herself in the pursuit of art. In the spring of 1871, Mrs. Bernhardt, who was then in the height of her fame, was asked to give a performance at the Albert Exhibition. She took place in the large reception-hall, and was so successful that she has been invited to give a performance at the Albert Exhibition. She took place in the large reception-hall, and was so successful that she has been invited to give a performance at the Albert Exhibition. She took place in the large reception-hall, and was so successful that she has been invited to give a performance at the Albert Exhibition.

Never had I seen a more unanimously loved and admired actress. Her performance was so successful that she has been invited to give a performance at the Albert Exhibition. She took place in the large reception-hall, and was so successful that she has been invited to give a performance at the Albert Exhibition. She took place in the large reception-hall, and was so successful that she has been invited to give a performance at the Albert Exhibition.

quite as eager to cheer the Queen. The Queen, however, did not like cheers or noisy manifestations. The public respected her wishes, and contented themselves with waving their hands and the royal carriage drove between the rows of sight-seers amid a soft shower of friendly wishes.

## Palming the Donkey-Cart

I MUST admit that I felt a certain anxiety each time that we went out for a drive. The Queen's carriage was always in the good feeling of the inhabitants of New. On the other hand, I knew that the Queen's carriage was always in the good feeling of the inhabitants of New. On the other hand, I knew that the Queen's carriage was always in the good feeling of the inhabitants of New. On the other hand, I knew that the Queen's carriage was always in the good feeling of the inhabitants of New.

The Queen certainly did not see the main, but she was not afraid of it. More than once she refused to get into the carriage, and she was not afraid of it. More than once she refused to get into the carriage, and she was not afraid of it. More than once she refused to get into the carriage, and she was not afraid of it.

Although the Queen displayed a marked preference for excursions to lonely places, she was not afraid of it. More than once she refused to get into the carriage, and she was not afraid of it. More than once she refused to get into the carriage, and she was not afraid of it. More than once she refused to get into the carriage, and she was not afraid of it.

FOR FAILURE TO PROVIDE

(Continued from page 9)

So the Mayor, by Hoff's order, took a hearty trip to the Atlantic. It was a part of the scheme to get Mariavetti without embarrassing the Mayor. Hoff's plans were laid, and he was at the station that night to see his boss off and wish him a pleasant journey. He could not tell that Mariavetti came running up Boardwalk out of breath, holding a wet copy of the latest edition of the evening paper in his hand. He could not help at first to comprehend Mariavetti's unaimed pleading voice, hoarse with excitement and haste and nervousness, regarding his duty. He read a heavy thump on the name of Sullivan, who had that day, by the Mayor's act as Hoff's order, been appointed acting Mayor, and would have the power of official life and death over all executive appointments.

"He'll do me? He'll do me?" Mariavetti was saying.

"Don't you worry about that! Don't worry. You, Mayor assured him. "You'll live you all right."

"You bet he'll find him," said Hoff to himself, feeling the surge of anticipated vengeance.

THE next morning, in his office, Hoff was checking over the knowledge that Mariavetti's head was rubbing in the political gutter.

In the midst of one of his earlier chuckles, the door burst open unceremoniously, and Mariavetti himself strode in. Ordinarily Hoff did not have a word of color in his face. Now he was white to ghostliness. His small eyes were close shut, and he only a glimmer of light appeared, and awful angles of intensity converged round them. A faint hair line marked the terrible expression of bloodless lips. His cheeks, white and prominent, now looked about knitting lumps of muscle that told how terrible was the constriction of his jaws in their set Emperor of unrelaxable resolution.

Hoff looked at him calmly yet anxiously. The plant lowered down upon him, his face shaking with the fury of the storm of anger that swept over him and which he was striving to control.

"Hoff," he said at last, trying hard to be calm. "Look Ernest here at me, this will come home with me. I will get you some good kick, and together will put you where you belong."

"Ernest!" roared Hoff, snarling derisively. "What Ernest! Why, Mariavetti! Ernest was in the deal. He went away as I could kick you out?"

FOR a moment Mariavetti stood bolt upright, his head drawn back and down at the base, and his arms quivered from top to toe like a man who had been dealt a death-blow. Hoff looked intently at the expression on his face. He was confident: then for a moment was gray and smothering like a fire. After that the expression was:

"You lie!" he roared, with all the pent-up violence of his soul, and, purely as an incident of his emotion, his great feet, which, when he walked, had struck about his head, downward, sliding, also as an incident, a perfectly unobtrusive, slip.

Hoff drew back quickly. A lead about the eye of darkness in his desk was cut. Hoff saw that it was coming in with a crash that echoed like an explosion.

He retreated completely out of the play-area now that he strove to maintain Hoff's opening up to share.

"What, man! Am you crazy?" he asked.

Mariavetti looked surprised at his own violence.

"I would be," he confessed boldly, "to catch you like an egg-salt on a night, and came near to doing, when—when there was no other and better way. Oh, I'll crack you, all right. There'll be a new boss in the Sixty-second, did you see? No, but there's a new boss in the city, Hoff, for I'll put you out of here, and I'll put you in somewhere else. Oh, I'll crack you, Hoff, here! here! here! here! Good stuff, Hoff, and stone walls, and tarries, and gangs, and Winkler. Oh, if it'll be left, Hoff, but you'll get it. You'll get it."

Mariavetti was bowling at the mouth as he ran out of the door, with his trousers hanging his great feet heavily. The touch of eggs and salt was resting there, feeling upon his skin. He hurried about into a ship in a storm, started to feel the door, and then strove out.

Hoff, who had arisen, sat down weakly, white and nervous. He was in the control of himself when Larkin stood in to see about a new-back franchise he was interested in getting through the street.

"Well, Larkin," Hoff said, their faces flushed. "You find the man that lived up down at the convention—Mariavetti. You know, he was really to blame for it all."

"You've got to send him," said Larkin in disgust. "You're up to Hoff."

"Up!" queried Hoff. "I'm just getting loose head."

"Nothing to do. You've done you. You got some money out of the game, a few hundred dollars all right, and a hell of a lot of revenge; but that's all, except a few more years in the pen. They're coming all over you all around. Mariavetti will be the end. When the play gets strong enough, Ernest will step you, and you can't get a friend where you need him. You're a damned fool. You got an amazing enemy in Mariavetti; you can't get no friend in me unless I get mighty positive orders from above, and I don't think I'll get 'em; and even Blake, the man you elected to the District Court of Appeals, is the only man that couldn't be bought or beaten into doing a thing for you. You've short-circuited yourself, Hoff. I smell your sides already."

A suspicious sneered Hoff's crafty mind.

"Larkin," he said, "see you in the fight against me? Your own actions were bound to feel themselves biting over every feature of Larkin's face."

"No," responded Larkin frankly. "It's 'heads off' with you. If you win out, I do business with you. If you don't, I do business with the man that does."

Hoff's eyes had dimmed still. Cold sweat stood on his brow. The thought of the threat Larkin had made the week before at the convention. The Mayor frowned his thoughts.

"Oh, I did say I'd take your sparks' play; but I can't keep it for a while yet—for so long as—you can, be drawn, rising to go."

There was a paralyzing tremor in Larkin's manner that was menacing, and that forgot his lips in anger, as anger that was childish in its boastfulness and lack of direction.

"Look here, Larkin," he blazed. "You needn't crew. I'll win this fight here in town, and then I'll go into the State and put you over my head. Talk of sparking plays, I'll take yours—and when you want to see it, you'll come to me for it."

Hoff's manner was laconic, but Larkin's phlegmatic nod looked at the words, his phlegm, simple language did not betray it.

"So long, Hoff," he murmured smoothly. "We'll get your personal company for each other this morning; don't mess and wade away, leaving the little few unprofessionally agitated."

Hoff's agitation grew with the days. The total wave of reform, rising higher and higher, and rolling inland unceasingly, threatened everything. The waters were up to Hoff's neck. Presently they were gurgling about his ears. He heard a left-one of his own, his first child (what treachery!)—pronounce him guilty of extortion; and one of his own judges, innocent as he did, yet spent the initial words that marked out for the erstwhile savior of the city a staid prison cell.

The flood waters were rising higher. They rained about Hoff's eyes, and an unending sea of mud and rollers came rolling over him. Hoff's face, the full moon, glowing in yellow fire, derived, the great circle face of Mariavetti's. Hoff's head! He was staring for a moment at the bottom of all this. He felt that really opened the floodgates to that incoming wave of reform. It was as if the bloodhounds of the prosecution on a trail that was hot enough to lead someone.

But the waves surged higher and engulfed the Mayor; swept higher still, and the flow of reform, steadily changed from purity to gravitas, they took apprehension, and with sudden attack, Mariavetti felt something pulling at his bottom, and he lay disappearing beneath the eddy currents—all because of a little reversal in having voted for his candidate. Since, in his district, the Sixty-second, a man who had been dead since the spring before.

"THREE years," the judge said to Mariavetti.

The Mayor had two coming to him, and more. He had felt the shabby up against him, and a perfect storm of indignations. But he was absorbed in the wave of reform, and he appealed, and he confidently expected a new trial. This was denied, so that his complaint. But the Mayor got a new trial, and Mariavetti. Each walked the streets

## COMMENT

HERNANDO with the issue of August 19th. Mr. NORMAN HAYDON will take charge of HURPER'S WEEKLY.

### A Report on New Haven

The Interstate Commerce Commission, having examined into the conditions and present proceedings of the New Haven road, has made a long report which contains these passages:

The present management started out with the purpose of controlling the transportation facilities of New England; in the accomplishment of this purpose it sought what must be had and paid what must be paid. Any betterment of railroad conditions in New England must begin with the assurance that the New Haven management will act not only privately, but, above all, within the letter and spirit of the law.

That is to say the New Haven must give up trying to be a monopoly (and be content to be a railroad).

It is a step to that direction that Mr. MELLER has resigned the presidency of the Boston & Maine Railroad, though that road is still a part of the New Haven system and may continue to be so. A government suit to undo some things that have been done by the New Haven is likely to be another step. But the way out is not at all clear yet. There has been cruel wastes in the pursuit of monopoly, but there has also been good work done. There is an enormous property, heavily leveraged but not overvalued, with obligations. The commission finds that the physical plant of the New Haven has been very well maintained; that its passenger service is the best, barring accidents, that comes into New York; that passenger fares are lower in New England than elsewhere in the United States; that its freight service is almost as good as that of the Pennsylvania and equal to that of the Baltimore & Ohio; that the passenger service of the Boston & Maine has improved under New Haven's management.

The commission thinks the New Haven should get rid of its trolley lines, but it does not recommend the separation of New Haven and Boston & Maine. Its general conclusion is in these words:

It would seem to be perfectly apparent that, if this road is suffered to exist, there must be some, where a power of regulation which is co-extensive with the monopoly. In other words, the federal government must assume jurisdiction over the maintenance and operation of these railroads, so far as they may be necessary to secure to the public a proper service.

### Judge Cochran

A legislative committee has heard evidence about Judge COTTELL and his dealings with Mr. COOKLEY, and found favorably to Judge COTTELL. The proceedings, on the whole, seem overmuch directed to the disparagement of the claims of Mr. COOKLEY to be a righteous man. That is well enough, but his public is more interested in the Judge than in his success.

### Farmers' Loans and Government

The visit of our Agricultural Commission to Europe is an incident thoroughly representative of the time. Coming at last to recognize that our resources of arable land are limited, though still far from being fully used, or even fully occupied, nothing is more natural than that we

should inquire of other people how they make the most of lands that have been cultivated for ages. We are simply fulfilling, in this and other ways, the prophecies of MARYLANN and THORPEVILLE and HAYNE and others who have understood how much the frontier has had to do with our prosperity.

Our commissioners should learn much, particularly about the proper care of land. In Ireland, SIR HENRY PRYDETT alone should prove so because he has been over here and looked into our own agricultural ways.

As we understand it, however, this commission, a government affair, wanted especially to learn about the devices of European farmers for borrowing money cheaply by combining to secure credit. Something may, no doubt, be learned about that also. Some of the European loan associations have had considerable experience, which may well be worth studying.

We shall, however, learn something better left unlearned if, because our commission is governmental, we make much, by far, of the governments, we get the notion that financing agriculture is a proper government enterprise. It is not so considered in Europe. There is no reason on earth why it should be so considered here—any more than that government should finance any other form of private enterprise. There is every reason why our farmers should, like those of various European countries, combine and cooperate to get lower rates on the money they need to borrow. The rates many of them pay are still, for various reasons, too high. There is no reason, either, why government should not cooperate, and we doubt that government, State and national, will readily enact any legislation needed to facilitate such combination and cooperation. The principle of it is already successfully exhibited in our building and loan associations. We are not even without examples of it among the farmers themselves. But it would be anything but a service to farmers to spread the notion that this is something for government itself to do. Financially probably one can not do it. Certainly ought not to do it. It will do more harm than good if it ever seems to attempt anything more than to procure information and offer plans which will aid farmers to do it for themselves.

### Don't Look Qualified

Governor NILES's nomination of CHARLES J. CHASE, of Uxton, and WALTER E. LEFFENWELL, of Watkin, to be members of the U.S. Public Service Commission has not been received with favor. Mr. CHASE is a locomotive engineer; Mr. LEFFENWELL is a hotel-keeper and an energetic Democrat. Both are worthy men, so far as appears, but there is a severity of fact on which to base belief that either of them is qualified for the fifteen-thousand-dollar job he has landed.

### A Fight Between the Ems

The Balkan fighters do not advertise. The newspapers, as a rule, are disgusted with them, and inclined to let them proceed, unheeded, the way gone by the cuts of Kilkenny. That is all the papers can do, for the Balkan brethren seem to have little more concern for the hopes of correspondents than the Japanese had in their war with Russia. Accordingly, up to the time of this writing very little has got out about the fight between Bulgaria and the Greeks and Servians. But it seems to be a very earnest fight, directed to the enforcement of a joint resolution of the Greeks and Servians that Bulgaria shall not have all the best of the best (distilled) from Turkey.

It must be admitted that the late allies do wisely to minimize publication of their differences. If they can fight them out behind the bars of Europe and reappear with a settlement, it is the best way. To appeal to arbitrators would be to

risk the loss of the whole disputed spoil. They can trust no one, not even one another. It would be a great missionary work to send a company of experienced arbitrators to the Balkans to help those impulsive and afflicted people divide their winnings. It could be done. Our own great country has the necessary men. For, after all, where is there such a company of practical arbitrators as our millions of householders? It is wonderful to think how much good a few of them could do in pacifying the Balkans if the Balkans would only submit to their judgment.

Meanwhile we know very little about what has happened. What is much more unusual, hardly anybody pretends to know. The editors in the papers, though from habit content, are from necessity not only vague, but brief. Our writers only that there has been some fighting, probably on a big scale, among the allies of yesterday—Bulgaria alone on one side, Greece and Serbia, with little Montenegro sympathizing, on the other—over their spoils. Bulgaria seems to have been getting the worst of it, and finally Rumania has cut in, declaring war on Bulgaria, and sending her banker. So it looks like success for the effort to make Bulgaria listen to some reason.

And that is very necessary, for permanent peace for such a region as the Balkans can hardly be attained without the utmost attention to the claims of race in any partitioning of soil, difficult as that may be. Religion, too, must not be neglected. Their collisions have filled each other's breasts. But nothing is quite like blood for stirring men up to pride and ambition and combatsiveness.

### The Underworld of National Politics

Although averse to anticipating the outcome of judicial inquiries, we make bold to do so in the matter of the lobby investigation. We confidently predict that the Senate committee will find that there is and has always been a lobby—a lot of lobbies—at work on national legislation. We predict that the House committee, if there is one, will arrive at the same astounding and horrifying conclusion. President WILSON will necessarily not be impeached for calling attention to something that exists not merely in connection with our national legislation, but with every other legislation in the country, if not in the world. We are almost, in fact, tempted to predict that no minority report will try to define "lobby" in such a way as to exclude, say, the representatives of the sugar people or of the National Manufacturers' Association.

Really the most surprising thing about the whole business so far is the apparent surprise occasioned by it. Were there any among us who actually doubted if there was such a thing as lobbying? If there were, then let us all follow in the way the Senators' example. As they solemnly reported to what extent they had individually been lobbied, let us all ask ourselves whether or not we have ever attempted any lobbying. A lot of us will be surprised to have to admit the extent of our own lobbies in that line.

This is not meant as unkind light of the inquiry or of the specific disclosures before the Senate committee; of course, when we speak of lobbying as well-known universal, we make the term over-generally all forms of private inducements upon legislators, no matter to what ends directed.

Some of the revelations have indeed been surprising. Mr. LAMAR's telephonic impersonations especially, and many of MARYLANN's still unconfessed confessions. But are they not surprising mainly because we haven't thought much about the matter? Ought we not to have remembered that every conspicuous man and every important event in politics is hourly watched by shoppers and adventures, obscurely trained, like common thieves or pickpockets, to get their living from them? Do we not know, from mere knowledge of human nature, that politics always has an ample

underworld of its own? Surely we do not need to go to Washington to find that out; one's own city or town or village is quite sufficient, if one keeps one's eyes open, to prove it.

Investigating underworlds is troublesome business, and seldom more than moderately successful. But it is often best, and sometimes necessary, to undertake it, notwithstanding. One study at the Senate's original idea of covering in two weeks the entire underworld of national politics. But the investigation is started, and it will find no logical place to stop until it is, humanly speaking, complete. To be that, it must examine every form of influence on the government that is not entirely public.

#### At Keokuk, Iowa

Doubtless the spectacle at present stands for the future to more minds than anything else does. It came superbly heralded and imagined. There was probably never a time since men began to have visions at all when they did not imagine the ultimate future of this world or the next, or any of us at a period when men should die.

Think of comparing the realization of that dream with a mere promise done—a thing that men and beavers have patched up immemorially!

But think of the Keokuk dam, across the Mississippi—and then think again. Think of the enormous power, which is also heat and light, which by long lines of its industry, and kindred, and will, has been thus forever captured and tamed to the use of millions. Think of what the "white coal" of little Switzerland always does for her, and of the immense river flows of the two Americas, as yet hardly challenged—and of many other dams the Mississippi itself can leap without the slightest impairment of its energy. Remember our vanishing forests, our recklessly increasing coal consumption. See if it does not look reasonable to conjecture that the rivers may yet yield us, in the long run, more of power and achievement than the air can—more than anything else, indeed, until such time as we harness the tides.

#### The Mayor and the "Mooves"

Mayor GAYDON'S defense of the "mooves" before the owners and exhibitors thereof had a decidedly favorable reception. Even when he paid his respects to the elegancies and others, "who are much better than the rest of us," and who sell some of the "mooves" for lead, that broad-minded audience remained admirably complacent. The first thing we know the Mayor will be telling the labors to their faces that bakers' bread is all right, or the undertakers that, say what they please, there's nothing like a real handsome funeral.

Nevertheless, and notwithstanding, the Mayor was, in the main, and the whole, dead right about the "mooves." Of course, there may have been and may still be some bad ones. The creators of them are artists after their kind, and all kinds of artists occasionally offend people's moral senses and present things that children would be better for not seeing. There is need of some supervision, no doubt, particularly in this country, where children see pretty nearly everything their fathers do. But "mooves" offend far less and less often than other kinds of shows. As the Mayor remarks, parents and mothers take children to them much oftener than to other shows, and the managers of the "mooves" know it. They are not eager to risk half their patronage from decisions to peddle as they find, and any of the other things that come over-erecting passages in books or questionable scenes on the stage.

To tell the truth, "mooves" are at present as simple and cheap and enjoyable that we should hate to see their higher possibilities studied. We almost hate to hear that a "moovey" opera has been written. We are almost bound to see this new movement of the people, now led by fashion and high art. We can't help recalling what the regular stage was when it was simple and popular, and what fashion and cosmetics art did to it when they got hold of it.

#### Are We Americans Impatient?

Phony among ourselves, and most foreigners, seem to think so. We are certainly often in a hurry; go fast, out fast, (most of us), make quick decisions, in many ways show our love of speed, of expedition. While a few visitors have lately descended to the stage, most visitors have found our cities in a perpetual state of rush.

But is that quite being impatient? Do we not, on the contrary, actually show extraordinary patience in what we often submit to in order to save expenditure on it? Some foreigners have even found us especially patient with overcrowded trains and street-cars, for instance.

Herein we also show a good deal of patience—we're patient, perhaps, but patience toward the law is not a whole virtue! Maybe California will be cited to the contrary but did the rest of us show many signs of restlessness? Maybe the abrogation of the Russian treaty is mentioned, but it is only fair to recall that that treaty was pretty old, and that the dissent with it was fairly old, too, and among some of us very acute.

Anyhow, Mexico is enough to rest against these instances. We repeat, patience has probably been lost, but we repeat certainly shown it. Two administrations, though both seriously troubled by Mexico's state, have waited and hoped steadfastly. Texans of the border have complained, and without reason, but the country has not seen get really excited, the land of government has not been forced. It has been, in truth, a remarkable patience, and a reasonable.

#### Eugenic Marriages

A news item from Lynn, Massachusetts, notes that a clergyman there who announced in May that he would marry no one who could not bring a health-certificate from a doctor has since had no applications for his services as a minister.

The same clergyman. People about as good as not going to bother to get certificates of health because this of that clergyman thinks it suitable. If this detail of eugenics is to work at all, it must be part of a license system, enforced by the civil authorities.

#### The New Heave in California

Miss HELEN YOUNG, of the California Civic League (formerly State Factory Inspector in Illinois), has been in these parts on business connected with a Federal suffrage amendment, and makes interesting assertions about the effect of woman suffrage in California. She says:

The right to vote has positively given the women of this new lease of life. Her husband is now beginning to reap the rewards of industry. He is sought to serve on committees and the school board. The wife's work is over-abundant has advanced to do it well. Her children are away at school or at work. Suddenly an entirely new field of usefulness has opened to her. She is getting a new husband and at the same time, she is helping, by her own vote and saving activities and at home after dinner.

Among the laws which women have caused to be passed in California are "a subcommittee was constituted with power to investigate banks of any business and appoint a trade board for each industry." Also a law for pensions for widowed mothers. Of another law, she says:

The health certificate law, which the women advised the almost unanimous enactment of the women and also before enactment, but as it was passed by the Legislature it applies only to men.

She tells of other laws, and goes on to say:

The men are still back of the women in achievement, but the women are doing the hard work. At the best elections we could not harness enough women speakers. They were wanted at every gathering, and voters could not be attracted to meetings without them.

California is going to be—in already—a very interesting subject of study for Eastern people. Travel should set straight toward "the coast" this coming year. There is much to see there and much to discuss.

#### Every Man to His Trade

Report says Mr. HAYAN will start out this week on a six weeks' lecture tour in the West, leaving the helm of State in the competent hands of Professor JOHN BRYCEOTT MOORE.

It is a heavy load, but probably no one will object. Mr. HAYAN is a very unusual Secretary of State.

#### Useless Army Posts and Navy-Yards

Secretary of War HANCOCK starts this week on a six weeks' tour to inspect army posts. This is a Washington dispatch. It is preliminary to a plan for the discontinuation of the nameless army posts and the concentration of the army in well-situated units upon a military instead of a political and "pork barrel" basis.

People who read the papers know about these useless posts, most of them survivors of frontier conditions, which are now rated as the greatest waste of money and life-money in the army. Not only does it cost much to maintain them, but our little army is spread all over the country, in hanches too small to be advanced military instruction, in order that there may be soldiers and heads in all these places. It is to give entertainment to the neighbors, and help local trade.

It is hard to get rid of them and save this expense, leaving behind every one there in a Congressman who objects to anything prejudicial to the interests of his district. Mr. GANNON knows this difficulty, but he has hopes. He will go as far as the powers of his office permit to cut off these suckers and distribute the army on a military basis. And what he can not do himself, he hopes Congress can be induced to order done. And though Congress is probably before now, he is getting tired of waiting and trying.

We wish that Secretary DANIELS showed as much zeal in getting rid of the useless navy-yards as Mr. GANNON does about the useless army posts. Heavier DANIELS thinks more in terms of voters than Mr. GANNON does. He seems disposed to close to the useless navy-yards that cost so much and do so little, and to secure by funds Congressional support for that disposition.

#### Rumania and Czarism

RUMANIA, having crossed the Danube in flow, it believes us prepared to know her better. She has washed into Bulgaria, it seems, to possess herself of twenty-five hundred square miles of territory which, held, were awaiting to her American agreement with Bulgaria as a reward for remaining neutral during the Russo-Balkan war.

Which looks as though Rumania was fairly keen at a bargain.

We have a diplomatic acquaintance with her and read a minister—at present Mr. JACKSON, of New Jersey—has been in these parts for some time, dollars a year to be polite in our name. Mr. KAZEMSKY, of Delaware, who now represents us in Berlin, was Mr. JACKSON'S predecessor in that post, and it is at his suggestion, the papers say, that Secretary HANCOCK and Fish Commissioner SMITH are about to stork the Delaware River with their hands in Rumanian straggle. As we all know, straggle is produce certain, which is now pretty dear, so that you pay a dollar at a restaurant for just a little. That is one reason why there are no stragglers left in the Delaware River, nor yet in the Hudson. They have been sold out, and largely for their own.

If Mr. JOHN BUCKNER were still alive he would remind us of the Rumanian straggle, and perhaps that the Hudson River was a clean river. But now it isn't, and very likely the Delaware isn't, either, and perhaps the Rumanian straggle may not like it. But, anyhow, it is creditable to Mr. HANCOCK to make this effort to bring order and the simple life to the choppy waters, and perhaps the imported straggle do furnish it may help Congress to see that ministers and ambassadors are seen good and to vote them more liberal allowances.

#### The Tall Gray Hat

The gray hat tall was a popular thing in this country in the 70's, and every reader will remember—*Maryland Republicans*.

Alas! not "many a reader."

Some readers.

To be sure, there were 50,000 veterans at Gettysburg, and they remembered the attire, let alone the scarlet. But the country was scraped to get it again. Only a few, mostly New Jersey, and the tall gray hats—gray plaid, if the Republicans will excuse us of the scarlet. But they were few hats, and if, as our neighbor hears, they have returned to earth this year in London, it is a good thing, and makes for peace and settled order, and we hope they have cause for a long stay.

The tall gray hats, and the tall gray plaid, need to live and move to such a hat. So did all the college boys who could raise the necessary money. The gray top-hat is the lawful descendant of the old and beautiful bell-crowned army beavers of the days of the great-grandfathers of such of us as had them. The never-should have looked. It is a good sign if they are back in London, this year, and, coming to us, New York next year, and in Philadelphia and Chicago, maybe, in 1912. Any establishment that man can get forth he should get forth now. He never was so on trial. There never was so much doubt, among persons competent to enforce their doubts, whether it is either necessary or desirable. If he can attain to it, it is a good thing. New York next year, and in Philadelphia and Chicago, maybe, in 1912. Any establishment that man can get forth he should get forth now. He never was so on trial. There never was so much doubt, among persons competent to enforce their doubts, whether it is either necessary or desirable. If he can attain to it, it is a good thing. New York next year, and in Philadelphia and Chicago, maybe, in 1912.

"He herded them like sheep toward things he saw"

"All or nothing!"

All work and heavy jaw, Donnelly did not look the orator. Not so much, as you, the best of speech was on him. Then the vein of his throat swelled to thick cords, and the voice, ringing stern challenge, thrilled those who heard it.

Their pulses throbbed hard and their Celtic blood ran hot—these miners of Lead Creek were a sympathetic audience, sympathetic because they revered this modest organizer who spoke of principles as dear to them as religion. A rough-hewn crowd in the parlors of their tall, hard-furred, the faces lit with earnestness, they packed the lower-level hall. They cheered him eagerly.

"All or nothing! We make no compromise, boys!"

His full face flamed. It was a well-fed face, a face grown stern with purpose, masterful, indomitable. His head went back; he squared his big, thick shoulders like the fighter that he was. His eyes swept the sea of eyes that turned up to him from the seats below. His very look compelled. He drove them to it, and his whole frame shook with the conviction that he drove them thus was right. He herded them like sheep toward things he saw—such things they could not see—for purposes they knew not. To him they were in their entirety—meat to be handled for his cause.

They listened to the hot words as they fell. Their hot indolence, fed by long years of idleness with the company and fattened by these months of open battle for the wage they sought, became white-hot. He ridiculed the compromise that had been offered them; they laughed with him derisively. Congressmen! Their hard heads cracked; their heated feet stamped the floor; their big throats tightened as they growled that they would strike first.

In his way Donnelly, the great organizer, drove that Lead Creek union toward the vote, and paved the road toward better things. Thus he made possible the next step which he had planned for his faction as the body of organized labor. This vote must come, that other things might follow—all incidents to shape a campaign's end. Like a pool

general, he saw these large things clearly, unmistakably. First upon the platform, he looked down over those many faces, and beheld them as a crowd—a giant ready to obey him.

The great orator with the scorned emotions of individuals, fanatic in their cause. Suddenly they sank to silence as the organizer raised his hand. Team-faced, they waited now to give their vote.

NONE of them felt the anxiety to assess his convictions more keenly than Deane Foley. His thin form had swung before Donnelly's champion like a live before a wind. His union card was in the pocket above his heart. He gripped the bench seat he sat on. He was in the crowd's thick, his hair back bent, his leg arms rigid at his sides. His thin face was alive with eagerness; his eyes hung on Donnelly.

He had a quick face, mobile, with a long upper lip, and a pair of eyes that cried the heart's deep feelings from their depths. This was his first strike. He had been a steady man; had done well married; bought a cottage upon his wife; and was going to wait for children. When the walk-out came, they too had not and better; level, and other interests; and she had been as glad—more and she was—so he to take war's fortunes. Even now, sitting here, he thought how grandly he would tell her of the speech of Donnelly and of his vote. A moment later he shouted "No!" yelled upward to the diapason that shook the rafters.

They left the hall slowly, Donnelly the organizer, and his audience, the expelled. The latter spread, scattered in groups, in pairs and individuals. The men talked of many things, of long months yet ahead, of wild heads to come, of hard, lean days. And some whispered of ugly deeds. For these Colorado miners, an interval in their vision of principle as old Deane Clevelanders, were men of action, and saw but a little way ahead.

Deane Foley went home to his unopposed board cottage, where his wife met by the silent organ. He held her of the vote; praised Donnelly as only loyalty can praise. And she agreed that it was right.

Donnelly went to his hotel, lighted a thick cigar, and pined. He knew what must come next. Foley

demanded it. That multitude became intolerant of foolish capital, martyrs must be made. Pulling his black eyes, seeing beauty in masses, he took no thought of individuals like Deane Foley.

Two weeks later the inevitable arrived. The thing took place one sultry afternoon—a trading fair, a building torn to fragments, a crowd of brutes bled skyward, a fog of dust above a rubbish-heap, and ground all buried men. Those who had watched the strike had expected rioting. This dynamite paralyzed them all. But the arrival of State troops hard on his heels was a climax which none of the crowd doubted when the taking of that vote. Donnelly saw it with the satisfaction of a man who watches his machinery working. The soldiers came in two block-lined companies; they swept the streets of Lead Creek clean. They piled the awnings—Donnelly's awnings—into one place, and held them there, stockaded, guarded by a ring of bayonets.

THE strike was over, lost, a dead cause gone for ever. And now began the sowing of the seeds for future crops of radicals in Labor's world, the creation of the martyrs.

For many days the miners of Lead Creek walked in the packed indoor where the soldiers held them. During many nights they tried to sleep upon the tramped and rocking earth. Among them, Deane Foley ate his hard-baked shivers, and inhaled polluted air, and wondered how his wife might live. He observed secretly his union card.

At length the strikers were deported, under martial law. The soldiers packed the prisoners in battens and shipped them to the boundary line loads of slaughter-house sheep. At the depot, standing in the loaded racks of his fellow, Deane Foley glimpsed his wife outside the line of barracks. She smiled at him—smile of hope and love and encouragement. He could not kiss him, for the soldiers stood between; but he took with him the cross of her worn eyes.

It was a harder journey. The jolting out-cars heaved cruelly, and the human freight curved the machinery of man-made law for many weary miles. From mountain grades the train plunged down to

"He rested and sank upon the dripping pavement"

the hot-100's. Then swept out to the broad country of the prairie. And over, as it went, there came through its iron rear into the moving wind a stifling murmur of sentences that never rested. At her wider reaches of the flat-lands had shown for some time between the wooden stiles, the cars stopped with a whine of brakeshoes on heated wheels. With layabouts fixed, the soldiers lined up by the track side; the doors slid open; the miners emerged.

Brown-ranched, the regiments stood on Oxbow's boundary. The engine strikers went before them across the grassy prairie toward the coal. They went slowly, for most of them were weary and many were sick, retreating to a country which they did not know. Dennis Foley, standing as he walked, felt through his stomach and the surge of a great pride for his principle. Like others in that rugged company, he was his own end as a badge upon his hat.

ONE night, two years later, when rain was whipping through a lawley, red-haired highway at a

head turned toward him hesitantly. She waited for the fit to pass, that she might give him opportunity to say what she anticipated from all men who came there. Thus she stood until the second wave to minister, and he still bent before the cough's evil weight, supporting himself by one hand upon the wall. Then her look changed and she dropped the book.

"Man," she cried, "you're sick!" She seized him by the shoulder and half pushed, half dragged him within her door. There he retired somewhat, and sat huddled in a chair close to the stove while she brought him a glass of liquor. She watched him drink it, saw the flush come to his wan, tight cheeks, and some of the hard lines of his face began to relax a little.

"Where are you from, brother?" she asked at last.

"What's the matter with you, anyhow?"

"Lead Creek," he answered huskily. "But I've been all over pretty much of late, washed away by

the wind. Behind the headstones she sought the peculiar trifle of his voice, the best one common to the track underground. Like all the West, she knew

quartz camps, high ways, and wanted men. The companion laid their luggage out. They parked the miners carefully, with caution; they knew who worked for them. Since that winter evening when the brown-headed address had watched the forms of the strikers income dots against the prairie's skyline, he had wandered far and asked for work in many places, seeking the steady job, the chance to make again his home, he had answered questions put by many farmers, had showed each of them his usual card. Always the same; they had told him to go on.

Full camps and waiting men—he came to one after another. Carl Inquiries, brown when they read the name "Lead Creek" upon the little postcard. The Four of Alices, Enoch, Butte's posted hill-side, Idaho, and Washington—were gone but satisfactory from Grand Norovity that followed at his heels.

"I'll have an agitator here," they said when unions came but ruled. The greatest copper camp of the West he saw filled with idle men, who turned in long lines every morning to get tickets permitting

"She was looking gravely into his face. It was as white as hers where the rain had washed away the rouge."

another town, Dennis Foley plucked the sleeve of a belated workman, home-bound to his fire.

"Please, Mister," he began, and ended with a hard, dry cough. Then advanced from his berth in his lower shelter, he observed at the clammy hand. He looked eagerly into the face of the man whom he held; but the other stood himself hunched and hunched on; and Dennis Foley shook back into the shelter of the car's where he had emerged, a minute splash among the shadows.

Hecker then saw the shadow in his sight. The heavy rain had drenched the eave of the red shingle house. Beneath its eave, patches of gravelly rock had become still holes; it whipped the bitter underfoot he felt; the very air was colder with it. Nowhere seemed a thumping pain; through the darkness came the wailing cry of a woman's mouthless laugh. Otherwise the place was silent, save for the splash of the falling water.

A third-time woman crossed the roadway to the wall when Dennis Foley again, and opened a door close beside him. In the flood of yellow light that came now from within, her garments showed clinging to her. The rain had struck the eave upon her sunken cheeks. She was one of that dreary company who live in place and noise by night; but the street, she had now but everything except her loneliness. Dennis Foley coughed by the wall's edge. She turned her head—the movement was as quick and stiff as that of a prowling cat—and she saw him standing there as one who waits.

"Hello," said she—and her tone hardened as she asked an acknowledgment.

It did not answer, for the cough was on him; it gripped and shook him to the bones.

She stood fast, her hand upon the doorknob, her

the history of Lead Creek. "Ah, yes," with understanding.

He added, "I've been on the team two years."

She was looking gravely into his face. It was as white as hers where the rain had washed away the rouge. Something in the man's eyes appealed to her, and she said decisively: "You've got to stay at dry work."

He retransferred weakly, giving his reasons. She laughed—it was as hard and dry as his cough. "It don't make an difference," she answered. "There's law out with this rain, and God knows you're not one. How come you here?"

"I thought," said he, "there might be some work where I'd be able to get a few dollars' worth of money. I got a chance to stop out for some hard rock work, so anyway; but I saw the rule of a dollar for the employed other people, I've not." He left to coughing again. "I'm from here," he explained, "I can't get a job anywhere else. My wife is different now than they was before the strike."

SHE drew up her chair so that she sat on the other side of the stove from him. The world-fellowship between those whom the world has helped made him so glad to tell his story as he was glad to listen. First of all he showed her his union card, strewn with big blundering, couched from wear, his eyes lit upon it with a faint pride and beneath the pride a half-smiled expression. Holding the card in both his hands while he talked on, he glanced at it occasionally with that same old look, as one who worries over something he would like to understand.

It was not like the old days, the days of roaring

them to ask for work. Most of these, he learned, had been killed by the labor trouble.

ONE he got a job at a smaller, housing one. The other was working and prisoner and lack of work—most had now combined against his lungs. He saw an hour of the same he had been. Years in underground passages whose damp air had come thousands of feet from compressor valves had sooted the soot of "miner's consumption," which usually means quick consumption. Now the malady came on.

It weakened him as he sought deeply for the tool which he was used to stand. Mopping behind behind's complex, with the fire shifter against the night wind, heaped the disease. For he'd worked now with traps. At first—at the outset of his journey—he had made card had got him many rides at the hands of friendly brethren. As time went on, such made become numerous. Benefits from leaders later troubles, discouraged workers, and professional vegetarians and those for begging debts.

"When I showed mine, they kicked me off." He laid his hand on mine upon the postcard in his hands. A number of that sad story of homeless wanderers who speak the country's wails, he shared their treatment. In his West-iron city he was arrested and served time in a jail cell. Making his way across the mountains, he reached the Pacific coast, then in the grip of a wet, slump winter. The police again found him an idler upon the streets. This time he got a chain-gang sentence. He left, one day, beside the rockpile, and finished his term on a jail hospital bed.

Weak and great, he turned his face toward the South. It was now a rare against sickness, a plot

### "LE BAISER," BY RODIN

**M**OLDED of snow-white marble, her arm draws down his head.  
Over them both hath genius a mystic stillness spread.  
Curved of the purest beauty, her face and her bosom rise.  
Tender his touch upon her, reverent, strong, and wise.  
And their kiss creates a rapture wherein all discord dims,  
Miraculous with harmonies as the music of their limbs;  
Poignant as utmost anguish, of utmost bliss the flower;  
Immaculate and immortal in love's most tremulous hour!

WILLIAM ROSE BENÉT

# FROM THE JUNGLE TO THE ZOO

BY ELLEN VELVIN

Author of "Dangerous Dilemmas of Wild Animal Trainers," "Surgical Operations on Wild Animals," etc.

**I**t is extremely difficult to realize, when watching wild animals living quietly in their cages in the Zoological Gardens or in some wild animal show, the many and various troubles—the frightful dangers, even—which not only the animals, but those who have had the labor and expense of bringing them to their present condition, have been through.

It may perhaps be mentioned that invariably, when a wild animal show or a zoological garden gives an order for the purchase of wild animals, the order is made subject to an agreement that the animals purchased shall be delivered in "good condition." As a matter of fact, wild animals on their first arrival are scarcely ever in a good condition, and it is a most difficult thing to prevent them in even fair condition. They always suffer from extreme fear and terror during the first months of captivity. In addition to this, they are confronted with an absolutely new method of living, a new method of feeding, a new environment—an animal new to the animals accustomed to perpetual

freedom. They suffer from the discomforts of travel, from the close confinement, from the change of climate. Everything is entirely different in every way from what they have always been accustomed to.

To begin at the beginning—a lion is born in the thick of the jungle. Great care is taken by the parents that the cubs they choose for their issue is large and sturdy, and that it is close to water. The lioness is able to spy on the deer, antelope, gazelle, etc. that come down to drink at creeks, and the damppan caused by the close

keeps away the innumerable insects, rats, grubs, and flies that are so terribly trying to hot creatures.

These cubs are most cleverly hidden—so cleverly that it is almost impossible, in some cases, to tell that there is any cub at all. In some instances the thick interlocking branches of the wild olive and similar trees form such a thick arch in front of the cub, that hunters pass the opening again and again, without seeing it. This delicate arch keeps the lion's den beautifully cool and shady. It also affords him privacy, and the advantage of being able to see his enemies without their seeing him.

In this luxurious retreat the lion and lioness, with their cubs, make their home. They sleep nearly all day long. But at night, when the "dew" rays of the sun have died down and the cool evening shadows begin to appear, they wander forth in search of food, which they generally have little difficulty in finding. And then, into the jungle, one day, come some hunters of wild animals. They know there are certain lions in the vicinity, and also know there are young

cubs. It is difficult enough to hunt wild animals for what is called "sport"; but that is more child's play compared to capturing wild animals alive, and not only alive but practically unharmed. For an injured animal is practically valueless. Such an animal it is almost impossible to deliver in good condition.

## Taking a Lioness with Cubs Alive

To capture lions alive, the best way is first to take the cubs. It is needless to say that this is one of the most difficult jobs of all. Hunters are sent out in various directions to find signs of a lioness with cubs. Should they find these signs, they call to one another by peculiar cries, each cry having a certain significance. They then meet at a chosen place, and follow up the trail until they come to the den. They do all this care to retire the mother and cubs outside, the next move is to capture the lioness. But a lioness with cubs is a dangerous beast, and many a man has lost his life in trying to do this.

There is a story of some hunters who, trying to capture a lioness outside, told one man to go to the back of the cub and fire off a gun at a given signal. But the lioness crept quietly out at another entrance, and while the unfortunate man was waiting for the signal, she sprang on him and killed him. Those in front, having no knowledge of this, wondered why he did not fire, and two men went right round to see. They were met by a ferocious animal, and had not their cries brought the others quickly, there is no doubt that they also would have fared badly. As it was, the "hunters

Young female elephants called "hookies," are trained to enter wild elephants into the stockade. Using all their tricks and blood-courting, the hookies lead the strange elephants into the enclosure. They then trumpet as a signal, and the natives come and close up the entrance.

was killed, and they got the cub alive.

But capturing rats is no easy matter. Young lion cubs, especially forest-born animals, are so strong, brave, and savage that great care has to be taken. They bite, scratch, and tear with their sharp claws in such a vindictive manner that they can in five terrible minutes. All lions have curved claws, and their claws, which are driven straight, are always claws out curved. Terrible shakes in the flesh are the result. Moreover, all mammals from wild animals are extremely shy, and take a long time to lead.

The best way is to throw nets or sackings over the heads of the cubs. In dragging, they get themselves rather glad, and after they have lifted themselves out, the nets are loosened, and they are

mental difficulties of transporting wild animals across the desert are the laborious and the great scarcity of water. Extreme precautions have to be taken to guard against such losses.

With a large contingent of wild animals, the larger animals are generally driven first, each attached to several men. An elephant will sometimes have as many as four or five attendants, and it is to be his own disposition, a guide three or four; sometimes, a veterinarian, and others all have their keepers or caretakers, while his driver of slaves and attendants with this unique provision. The cubs are sometimes used as food for both men and animals, while the larger goats supply the milk for the young animals. This is a most important item, for many of the

Great difficulty was experienced in getting this elephant to enter a freight-car. After the men had spent several hours trying to walk up the inclined plane, he pushed it away and climbed into the car without help.

An antelope caught in a net—one of the most common devices for catching an animal without injuring it. An injured animal rarely survives transportation.

Goats and dogs are used as foster-mothers for young lion cubs while they are being carried into captivity. This dog brought up two lion cubs, but seemed relieved when its task was completed.

put into a strong cage specially provided. They are allowed to get very hungry, and are then taken to some goats in full milk, which have been prepared in readiness; and the little cubs are fed by those foster-mothers until they are old enough to eat a bill-meat.

*Goats and Dogs as Foster-Mothers of Young Lions*

SOMETIMES when goats are not procurable, and also when wetters are provided who act as foster-mothers. But although in these cases, and in many artificial gardens and wild animal shows, dogs have been used for this purpose, and although in a few cases they appear to be attached to their foster-children, they generally show a marked aversion, and it always appears to be a great relief to the dog when the mothering business is over.

In capturing full-grown lions, of course different tactics have to be used. As a rule, large traps are placed in the trail of the lion, when his space has been found. A very costly mole trap that is often used in quite square, one side lifting up on a spring, just like our old-fashioned mouse-trap. A piece of fresh bullock's or antelope's flesh is put in as a bait, and this will often tempt a lion inside—when down goes the door, and the animal finds that he is a prisoner.

But lions, like all the rest of the cat, are very crafty and cunning. They are, however, terribly suspicious. And after watching the lion patiently for hours at a time, thinking from his actions that he is just about to enter the trap, many a hunter has felt sick with disgust and disappointment. A piece of lion's skin, with hoofs and claws, will often save the lion, after thinking it over, walk bravely away.

Tigers are caught in various ways. One plan is to enclose the leaves of the plain and enclose or any broad leaves with some sticky substance.

The second the tiger puts his foot on these leaves, his feet is settled. Like all the cat tribe, he at once puts his jaws over his head to get the sticky substance off. Not being able to do this, he rolls on the ground, then covering himself all over with the leaves, and getting more and more angry and furious as the leaves get into his eyes and ears, and then partially blind him. The natives then come forward and cover him with cow dung, and drag him into a cage, and leave

him until he has quieted a little. There are many other effective means of catching wild animals. In some cases, inclosures are built, formed of bamboo and covered with netting, into which all kinds of wild animals are driven by the natives, who form in a ring, with beating sticks, there in the animals can not get out. The bamboo is not sufficiently strong for lions to climb over; it holds with their weight; and they are then thrown back again. The net is too high to reach, and so sharp the animals stay still, hungry and thirsty, they are driven into cages and taken away by trained elephants.

Trained elephants also render their own kind into these inclosures. Young female elephants are specially used for this purpose. The elephants, which are called "kumbhis," are used and led to the forests, and when they meet a strange elephant they see all their tricks and misbehaviors upon him. As soon as he is interested, the kumbhis lead the way toward the inclosure, and the dog elephant follows quickly and sleepily. As soon as the fore-runner leads the kumbhis has caught a prisoner, the inclosure is lifted, and the natives come and close up the inclosure.

Other wild animals are caught in different ways. The most modern being by hunting. The first polar bear ever caught by a lion (by Mr. Paul Hadow) is now in the New York Zoological Park. Some excellent moving pictures are being shown in London at the present time by Mr. Paul Hadow and Mr. Cherry Kearton. In these pictures we see all sorts of wild animals being caught by the lion—the lioness I have just spoken of, a large thicket, a wild bear, a tiger, a giraffe, and others. The giraffe picture is very funny. The poor animal seemed so surprised and puzzled that he stood quite still, only occasionally giving his little wisp of a tail a sharp twist.

When a dealer in wild animals has caught a number of animals of all kinds, he next turns his attention to the consideration of their transport. And this is one of the most serious things in the whole business, from the financial point of view.

*The Journey Across the Desert.*

THE traveling is generally done at night, for the fierce sunlight of the tropics makes traveling at most impossible in the daytime. The two great func-

tionary animals are entirely dependent on this little alone.

Most of the camels travel together in pairs, with the smaller animals, like lions and tigers, leopards, panthers, cheetahs, etc., are carried in rough-made, but strong wooden boxes. These boxes are placed on the backs of camels, and here, again, is one of the great trials of a young or newly captured wild animal. For the awkward gait of a camel causes a most uncomfortable motion, and the continual shaking, the outside jolts when the camels kneel down and rise up again, are most trying to those wild creatures, who have never in their lives known any other movement than their own natural walking and leaping.

The start is made early in the evening, and about midnight a halt is made while the animals are fed and watered. Some of the drinking-places are free of charge, and animal as if it were the most rarely champagne. All the animals are attended in most carefully, some being rubbed down, others being cooled, while those in the cages are made as clean and comfortable as possible.

*Lions and Balloons Suffer Most from the Heat*

IT is very often, in spite of the greatest care, a large number of the poor animals die before reaching their destination. Although all the animals come from a tropical climate, the lions and tigers, many of their natural state the animals know how to take care of themselves, and during the heat of the day even to die from the heat more often than from any other cause. The poor lion, coming from a cool, damp area, where he has been accustomed to lie freely on his back and sleep all day long, and even crawl, by his own simple, cramped leaping, and his limbs get weak and stiff, he puts an excessive weight on his back, and he is in strange surroundings which he is not used to. The intolerable heat prevents him from getting any rest or sleep during the day. And at night the fearful noise of the camp disturbs his rest. No wonder, then, that even if he survives the terrible journey over the desert he is in a most feeble condition on arriving at the ship's side. The embarking of these wild animals on board ship is a trying, and

# RICH MEN OF JAPAN

BY  
ALLAN L. BENSON

Denzoro Fujita, who looks like Lincoln and acts like Schwab. He takes contracts from the government and is the Emperor's political adviser.

藤田 傳之 郎 茂

"MR. ROCKEFELLER," said a Japanese banker, "has been liberal in my stomach. Whether he takes it in digestion and has most important articles are usually not visible to outsiders."

The remark was made in connection with a great Japanese capitalist, Mr. Yasuda.

"Mr. Yasuda and Mr. Rockefeller are much alike," continued the banker. "Mr. Yasuda also works like a stomach. His early history, too, is not unlike that of Mr. Rockefeller. But there the resemblance ends. Mr. Rockefeller is broader-minded — that my countryman. Mr. Rockefeller has surrounded himself with an able staff, some of whom are so well known to the public as to be almost, Mr. Yasuda has no such staff. His own brain is the only great brain that is working for him. What he himself can not think of, he'll thought of."

Morgan, Rockefeller, and Russell Sage in One

AMERICA never heard of Mr. Yasuda. An America-speaking head-bow never heard of any of the enormously rich men of Japan. Yet America's lack of knowledge is not the fault of Mr. Yasuda or of his fellows. Mr. Yasuda began, as early as did Mr. Rockefeller, to practice some of the principles that have made Mr. Rockefeller world-known. They have not traveled in parallel paths because they have not lived in parallel countries. Mr. Yasuda has reaped part of the crop of power that Mr. Rockefeller has reaped, without being so great as Mr. Rockefeller. Perhaps that is because Mr. Yasuda, in some respects, is the greater of the two.

But so greater is the sense that he has never sided. Rockefeller is Rockefeller, and so were. Yasuda is Rockefeller, Morgan, and Russell Sage at his prime, rolled into one. At the age more than seventy, he is the most powerful banker in Japan, and the only man who can raise \$50,000,000 upon a day's notice.

安田 善次 郎 茂

Emryo Yasuda, who is Rockefeller, Morgan, and Russell Sage at his prime, rolled into one. At the age more than seventy, he is the most powerful banker in Japan, and the only man who can raise \$50,000,000 upon a day's notice.

Emryo Yasuda, in more each, ranked below Mr. Rockefeller. But Yasuda, like Mr. Morgan, has a genius for controlling the money of others. His personal fortune is only \$11,000,000. The wealth that he controls runs into the hundreds of millions. He controls the greatest chain of banks in Japan. He is the man in whom all Japanese go when they want to finance a big undertaking. And he is the only one in Japan who, upon a day's notice, can raise \$50,000,000 in cash.

The father of this great Japanese man the sort of a fabled hero. Yasuda, as a boy, struggled as the boy Rockefeller never thought of struggling. And, now that he is old and rich, he has the Rockefeller fondness for selling stories of the time when he was young and poor. He has written the story of his life, and the facts that follow are from his own account.

### Copying Books of 1-2 Cents a Hundred Pages

YASUDA was born in 1818 in Toyama. He was the only son among five children. His father belonged to the military class. He appears to have had ideals. Though he was not the sort of a fabled hero, he was ambitious for his son. He taught his son that merely to live was not enough, that animals and birds live, but a man who really lives must achieve something, and that industry and thrift were necessary to achievement. Yasuda's father was both industrious and thrifty, but he could save nothing. His income from his fabled land was too small and his family was too large.

The elder Yasuda gained permission from the feudal lord to cultivate a little garden on his own account. The boy Yasuda, who was then ten years old, was pressed into service on the ancestral garden. He worked cheerfully, but not contentedly.

"I was 'began to work," he says, "that I might find some of the good things of the world. I followed the lord's command and did not mind him about it."

安田 善次 郎 茂

one day. The job was copying books. For every third page that he copied he received half a cent. He was, indeed, was an exception. There was a great demand among the Japanese people for books containing accounts of the lives of ancient warriors. The art of printing was very little practiced in Japan, and being expensive at less than a cent a day required a special investment that buying printing presses. Yasuda like the work, and grew a student of it. He kept himself supplied with parchment, and divided the rest among his sisters.

Yasuda's first step up the stairs of success came when he transcribed the life of Tai Koo, the Japanese conqueror of Korea. He received the work's inscription from the work by copying that he saw in himself the possibilities of another kind of Tai Koo. Tai Koo, like himself, had been the son of a poor farmer. For seven years he fought in the army, under the orders of others. Then he moved up to the top, and made others take the credit of his success. "I was tremendously impressed," said Yasuda, "by the exploits of this great man. The rise of a mere farmer's boy to the rank of the greatest general of Japan, and of, more, due to his extraordinary genius, but I did not fail to note that, instead of going upward at a single bound, his advancement came as the result of a slow, orderly process of achievement."

Yasuda's next lesson came when he was sixteen years old. He saw a banker visit his father's master. Arriving to the custom of the time when a person of inferior rank had to kneel to a person of higher rank, the inferior person removed his sandals and, calm or alone, stepped in the street to salute his superior. The lord, of course, contacted his lord, but little Mr. Yasuda was shrewd enough to notice that the lord accompanied the banker a little way on his return journey, removed his sandals, stepped in the street, and saluted him. Yasuda quickly reached the conclusion that the lord need the banker money.

"This incident," said Yasuda, "gave me some conception of the power of money. It also created in me my first great desire to be wealthy. I resolved, at all costs, to become rich—to have a thousand dollars a week, at that time, was regarded as great wealth."

He looked about him for means to reform his desire, but he saw an opportunity for more intensive employment as a wage-worker.

"I drafted the conclusion," said he, "that I would gain wealth only by becoming a merchant. I therefore determined to give my life to business."

### Yasuda's Rules for Growing Rich

THERE was no business around Toyama. All the business was done at Osaka, a traveler must pass through several provinces. Upon entering each province, he must have a passport. Yasuda could get no such passport from his father, and he was so sure that his father would not give his consent that he never took the trouble to ask his father. Instead, he determined to run away, going to Osaka to seek his fortune, by traveling through the mountains.

"One morning in October," he says, "I left my home. In order to become rich, I knew I must have great determination. No, of the outset, I made the following resolution:

"To abstain from drinking for five years.

"To be extremely thrifty, even after I had become rich."

"Never to depend upon others; never to lie; never to wrong others."

But Mr. Yasuda's "great determination" was coupled with a great philosophy and a great philosophy. Knowing nothing about mountain trails, he was soon lost.

"And realizing," he says, "that without life I cannot achieve, I returned home on the second day. My father, confessed to my father what I had done, and asked his permission to go to Toyama. The old man had been angry about his fall. The old man would not give his permission to go to Toyama. The boy waited three years, and then ran away again. In his solitude, he had a great time of it, and the people of his country were happy from the time he started, he trudged

late Tokyo, with more than half of the twenty-three cars which he had left home.

Yasuda's first employment in Tokyo was as an apprentice for a wholesale dry shop. His work was to deliver goods, carrying them in large baskets on his head. He chose this occupation because he believed that his future success as a merchant would depend upon his knowledge of the city and the people. He retained the position for three years. By that time he was ready for a larger field.

*Starting on \$2.50 Wages a Year*

YASUDA found a larger field in a store that came into the selling of groceries and the buying and selling of foreign coins. His wages were \$2.50 a year. His master supplied him with food and a place to sleep, but the boy had to pay for taxes, hair-dressing, and clothing.

When the money of Tai Ko again yielded Yasuda to wonderful success. He recalled what Tai Ko did when his master, according to veritable Japanese custom, removed his sandals upon entering a building, and left them outside the door. Faithful little Tai Ko always put the sandals in his bosom to keep them warm.

Outside the toy shop and the grocery there were many sandals. The sight of so many foot-wear irked Yasuda. He was averse to the sight of the sandals. There were too many sandals for Yasuda to put in his bosom; but he did the best he could, and arranged them neatly, pair by pair, in rows.

"Other boys had been punished," said Yasuda, "but had gained. I did it on my own without getting caught without being noted. In all other small matters I worked with the greatest fidelity. So pleased was my master that when, at the end of my third year, I wanted to leave his service, he offered to increase my wages to six dollars a year."

Yasuda remained another year. Then the desire to go into business for himself became too strong to resist. The four second apprentices, Tai Ko had arrived seven years ago as an apprentice in the store. They took command. Yasuda had served seven years as an apprentice in Tokyo.

Yasuda left him in the grocery, and sold all of his clothing that he could spare. With his savings, the sum amounted to \$27. He rented a store for a year and set a market. His former master gave him credit for a stock of groceries and foreign coins. Also, he hired an office-boy and a woman to cook.

Every morning Yasuda got up at four o'clock, and swept and sprinkled the street, and only in front of his own store, but in front of the stores of immediate neighbors on both sides of the street. Then he built a fire in the kitchen, and awakened the cook and the office-boy. As I worked in the same faithful way in all things, I soon became well liked. People came from quite a distance to buy at my shop."

*A Wife Was Where Nothing But Cash*

YASUDA opened his store in March. At the end of the year his business showed a net profit of 90%. His success was the subject of general comment. Friends and neighbors began to enquire. He refused to tell them. Yet he did not immediately act upon it. Yasuda, like he was cautious in this matter, as in all other matters. Little by little, money troubles him—money made the things that make and save money. The Yasuda wife must be no more beautiful but she had looked pink, died in smiling skin. She must work hard and live cheaply.

"As I tried continue to work," he declares, "I despatched for one thing, that the woman whom I married to carry must take the work, and in my absence, look after the store to the satisfaction of the customers. Also, for the time being, she must do all the house-keeping. I married my present wife when she accepted these conditions."

Such is the story of Yasuda's early life as he tells it himself. The rest of his story is a part of the financial and commercial history of Japan. From a grocer and a money-lender, he became exclusively a banker. From the owner of the bank, he became the owner of the bank and three and four and more. From a mere owner of banks, he became the controller of banks that he did not own. By the time he was fifty, he had a million-dollar bank under his spot. His four banks had grown to fifty, with a combined capitalization of 25,000,000 yen in yen equal to \$100,000,000 and more. He had made great deposits of his business. He had loans in the old capital of Edo. From Japan, banks in the new capital of Tokyo, banks in all the big cities of Japan, and banks in Korea. Yasuda, the banker, had become too big for his country. He had become too big for two countries. He needed a larger field in which to put his work. His rapidly increasing herd of money.

Yasuda did what Rothschild did, what Morgan did, what Roca did, when such of these men were called upon to save a similar situation. Yasuda "spread out." He spread the money all the money that he made in banking, and invested it in other lines of business. He had Morgan and Lyons. He put money in the capital of the United States, in the companies. In a little while he controlled the life-insurance business of Japan. Then he controlled fire and marine insur-

ance. Yasuda's life, five, and more. He had a company now have a capital of 12,300,000 yen and a reserve of 10,000,000 yen.

But the success of Yasuda's investments, in yen, only increased his wealth. Previously by looking into bank profits that he could realize in banks, insurance had yielded him a more profitable investment. He could realize in insurance companies. But the business of manufacturing here seemed to hold the surplus of both genius and money. The lines industry of Japan was in the same condition that the steel industry of the United States was in before Mr. Morgan struck it into shape. Unorganized competitors were warring on the competitors. Yasuda combined the principal companies into a corporation capitalized at 6,000,000 yen, and put the industry on its feet.

*A Japanese Real-Estate Success*

YASUDA next turned to the north bank as a promising field. In this line of investment he was observed. He invested heavily in Tokyo real estate, and organized the Tokyo Building Company. The building company which he formed to be an enormous financial success. Yasuda built no skyscrapers, but he dotted the hillside with working-men's cottages. He never ran short of business; but, in the course of time, the Tokyo Building Company fell behind Yasuda's ability in real estate. Yet Yasuda did not stop building. He extended his operations to include Taiwan, China.

Taiwan has a large foreign population that is not content with either Chinese architecture or Chinese construction. Yasuda, while visiting Taiwan, had noted the opportunity for Japanese architecture and Japanese construction. At the time when he was there he was not known to have an opportunity to make money. Thus it came about that when he was looking for an undertaking in which to invest his banking, insurance, and loan profits, he remembered the real estate possibilities of Taiwan.

Now, Yasuda the banker had much use for his skills. He bought from competing manufacturers at the best prices he could get. But the best prices he could get were not good enough for him. Somebody seemed to be making a profit from him. To keep this profit, Yasuda built a mill factory. And, while he was about it, he built a factory large enough to supply and sell his own demands, but part of the demands of others.

Of course, such widespread operations raised Yasuda's name as a banker to the first rank in Japan. He had not the most money, but he worked the hardest with his money. He was not the greatest banker, as far as mere dollars were concerned; but he was by far the greatest banker as far as activity, enterprise, and power were concerned. Men soon learned that if there were heads to fund, a railroad to build in Manchuria, or any other great business venture afoot, it was always best to see Yasuda. He was the strong, energetic, progressive factor in Japanese financial affairs. He was capable and daring—and fearless, but daring. He would take a chance.

An incident that occurred ten years ago illustrates the manner in which he sometimes backs his own judgment against the judgment of others. Certain men who associated themselves under the name of the United Realty Trust had obtained a franchise to build an electric line from Osaka to Kobe, a distance of twenty miles. After they got the franchise, they were unable to raise the money. They had no banker could get up an amount of money as they wanted. No banker had such faith in the project. Every banker knew a bit about jurisdiction. He has learned that the electric line had no banker except Yasuda, and he was too busy with other affairs to give the subject attention.

Things drifted along for a year or two, and the men were in danger of losing their franchise. Yasuda heard of their plight and sent for them; told them the story, and which he would furnish the money; drove a hard bargain; furnished the money—something like a million; built the road—and made money.

Yasuda always drives a hard bargain, whether he is buying a railroad for a railroad ticket. A Japanese banker who has traveled with him in Japan told me the following incident. One day Yasuda had but little time in which to catch a train. At the station, an employee of Yasuda had bought the tickets. He handed the tickets to Yasuda with some change. There was not much change, because the tickets were for only a short distance, and cost but fifty cents each, and Yasuda had not given the correct exact money. But when the change was handed to the great banker, he counted every piece; moreover, he handed the change short. The banker, who was anxious to be the first to offer, but failed to present a certificate which would have entitled Yasuda, as stockholder in the road, to a dividend from the regular rate. The loss was not much—perhaps ten or six cents—but Yasuda held it over the employee with good, vigorous Japanese language, which, he explained to his fellow banker, was easy to touch the employee's pocket. But the banker says he smiled because he left the loss.

*Yasuda Gives a Banquet for Sixty Cents*

FARTHER along on the trip, they came to the capital of a province, and Yasuda invited the governor to dinner. When a governor is invited to dinner by a traveler, the agreed is usually given in the banquet-room of the best restaurant in the town. Waitresses and girls are hired, at an expense of six cents out.

There was no gossip at Yasuda's dinner to the governor. Nor was the dinner given in the banquet-room of a restaurant, but in a room at a hotel. Yasuda's room was approximately twelve feet long by five feet wide. The furniture was all new and very beautiful, and the bill for the three men was between sixty and seventy cents. The cost of entertaining the governor in the banquet-room of a restaurant, with approval waitresses, girls, and wine, would have been perhaps fifty dollars.

Called every month calls together the members of his own family and all of his employees who are in Tokyo, and gives them advice. Some of his employees evidently say that he never gives them anything else. He has furnished also for the guidance of his family and his employees. Upon his family he urges harmony and thrift. Upon his employees he urges industry and thrift. To his employees he pays the lowest wages that can be paid for similar services in Tokyo. Other bankers hire many graduates of business colleges. Yasuda, for the most part, retained men and women, who had no college education.

Like most men who have become rich, Yasuda has a great temptation to tell others how to amass fortunes. A few years ago he wrote the following advice to "Young Men":

"I want to give some words to young men, based upon the experience of fifty years. Those who want to go into business should first get careful attention to the business in which they will be most likely to succeed. It is not a man's business trying to do something that he can't do, while believing in do something that he could do."

住友吉左衛門氏

Baron Kichisaburo Sumitomo, the Japanese copper king, who is considered a "progressive" in that he has introduced many advanced European customs into Japan. He likes to be referred to as a social reorganizer and reorganizer for the Russo-Japanese war.

岩崎久彌氏

## THE PLAYGROUND OR THE SCHOOL?

BY WOODS HUTCHINSON, A.M., M.D.

IT is natural to have a high opinion of the work of our own hands. The children of our towns are as ungrudgingly fair and as boundlessly promising as the children of our bodies. That which comes of itself through the beauty of nature we have

little opinion of, partly because, through aberrant inertia, we think nothing about it, and partly because it cost us nothing. There is a world of wisdom in the quiet saying of that rural philosopher, Josh Billings, "What people gets for a thing they generally values at about what they give for it." And yet, the most precious things are those that cost us nothing, like air, sunshine, and water, and we never value them until, by our senseless worship of the things of our own creation, like houses and streets, we are in danger of being deprived of them.

Even so it is in our estimate of the playground as compared with the school-room, or the school as play or against that of books and blackboards. The one is our natural heritage, and we take it as a matter of course, holding it at best in a sort of scornful deference, never dreaming of its precious value. The other we have made ourselves at much pains and with its facile stupidity. Moreover, it has cost us money, that most precious of all readily things, and, like Aara's golden calf, we have made it into a fetish, and here ideas and worship before it. The work of our own making are those we most devoutly worship.

### Grass and Geraniums Instead of Children

THE popular idea of a playground is simply an open space surrounding a school building and repaired to set off its proportions to advantage. If there happens to be a spare corner of this that can be utilized

for the children to play on, well and good; if not, they must be satisfied with the street. Worse yet, in our school systems of the debris instead of the merits of our educational systems, such portions of it as might have been valuable for play purposes, if they happen to be gently toward the street, are weeded down in grass or disfigured with flower-beds. Grass and geraniums are very pretty in their place, but to see them growing as a substitute for children makes one's fingers itch to get at them with a grub hoe. Grass growing in a school yard is no savor; a reflection upon the intelligence of the community as its appearance to the outside of the main street would be upon its commercial prosperity.

In short, we are worshipping and exalting to the very heavens the little ten or fifteen per cent. of finishing and training of body, mind, and character which we have invested ourselves, and ignoring or deprecating the eight or ninety per cent. which the great edifying forces of nature carry out without our help.

I have no hesitation in declaring that, under modern conditions, the playground is far more important than the school-room, and that, if I had to choose for my child between a school-house without any playground and a playground without any school-house, I should unhesitatingly select the latter.

The chief trouble is that we attach far too narrow a meaning to the term education. To "get an education" is to go to school, and so peremptorily have we conventionalized our attitudes upon this small percentage of the whole that we have come to regard nothing as education except what is got in the school-room. The education of a child begins with his first cry and continues until he is thirty or forty years of age. His school life, however, on an average, only lasts ten

years of this period, and, counting vacations, only about one third of his waking hours during this ten years.

The problem of the old education was how to make the training of this one third of ten years, or our ninth of the total period of education, as different as possible from the remaining eight ninths. The problem of the new education is to make it as completely in harmony as possible. Stripped of its externalities, this is the battle between the classical and the modern view of education—between the classic and the sciences.

### The Battle Between the Classics and the Sciences

FROM the point of view of the scientist, the aim of the old classical education, which we have slavishly followed until within the past quarter of a century, was to make, not a worker, but a scholar and a gentleman. There is truth in the general complaint that the old education spoiled men for manual labor—it was meant for. Its definite aim was the creation of a class that should be marked by its superiority to the rest of humanity, and the chief value of its interesting product was that it was "different." It accordingly laid great stress upon those subjects which were not only of no use,—perish the very thought of such production,—but of no interest except after prolonged training in studying them. Hence the classics really won first place in the curriculum. It had no intention of increasing either the happiness or the efficiency of the street man.

The battle between the classic and the sciences is one between two totally different ideals. The ideal of the classic is *culture, superiority*. The ideal of

"Here in the playground the chief credit is given to initiative, vigor, and individual aggressiveness. The picture on the left shows the boys playing in their garden, a necessarily studying the ever-changing processes of nature. The single-rope swing in the center teaches some of the primary principles of physics. While the girls on the right are exercising their initiative reasoning in garden-making."

"The tendency of the entire mass system, with its large classes, its drill, its discipline, is to make puppets out of children instead of free men and women. It crushes individuality, promotes uniformity, and dwarfs the reasoning powers."

the sciences to service, brotherhood. As one of the means to the unimpaired development of human powers, the scientist has no quarrel with the classes. As an aid to be nurtured or a shield to be set up, he has nothing but a single banner, and never will have as long as two fragments of the flag hang together.

The first step toward making this one truth of our education harmonious with the other eight axioms is that the school-room should recognize its limitations. This is precisely what it is most unwilling to do. There are few dissenting voices among those who have made a careful study of both the physical and the mental aspects of the problem of education, that a large share of the wasted triumphs of the school-room have been achieved without its aid—in fact, some of them is quite ill.

But the blind council of the school-room is something almost incredible. It insists upon full credit for the whole mental and moral development of the child, and the almost that it can be brought to do as regards his physical development is to gradually grind on him at least two or three days per year to be "waxed" in play. It regards itself as broad-minded and even generous when it reserves certain little shaped-out hours, called recesses, for the gratification of the play instinct. And it usually fights vigorously against every attempt at reducing the form of the child's daily imprisonment of hard labor, and of relinquishing the methods of study and the curriculum. The child was made for the school-room, and wherever the interests of the two appear to clash it is so much the worse for the child.

Worse than this, the spirit of the school-room—which is, of course, a direct inheritance of the monk and the priest, who were the earliest formal teachers—not only refuses to harmonize with the natural instincts and tendencies of the child, but regards him as so suspicious and so to be controlled at every possible point.

The child takes in play, therefore, he can acquire nearly both mental and moral, by being shut up indoors five hours out of his available eight. The child lives in his constant anxiety, therefore, it is unnecessary to add perfectly still, on most nights as possible, without even the slightest privilege of wriggling. The child sees through a thing like a hawk, then finds it and wants to go on to something else. The average governing thinks that the child is just as slow and stupid as he is, and insists that it is for his good to be compelled to stick to a subject at least ten or fifteen minutes after he has tired of it.

#### School Hours Might be Cut Down Fifty Per Cent.

THIS superiority of the playground over the school-room for the physical development of the child is so obvious to all except the teaching force that it needs no support or even illustration. The chief function of the school-room in the physical development of the child is a negative one—to keep out of his way as much as possible, to perform the proper and necessary share in education, with as little interference

once with its natural life in the open air as can reasonably be planned.

Nearly all intelligent students of the problem, whether from the hygienic or the pedagogic point of view, are now unanimously agreed that the present school hours are unconsciously and criminally long—that they might be cut down from thirty to fifty per cent., not merely with benefit to the health of the child, but with an actual increase in the rapidity of his mental progress. Children who are kept out of school altogether until nine or ten years of age, or who, on account of health, are allowed to attend only half time, one session a day, are almost invariably not only up with children of their age by their third or fourth year, but usually a little ahead of them; and I have never known a "ball-tower" of this sort who failed to keep up with his or her class.

The most stubborn objection to the shortening of school hours comes, not from the teachers, but from the intelligent tax-payer who wants to get the value of his money, and from busy mothers who want the children taken off their hands. The school of play would meet both these objections.

Part of the money a school of play would cost is playgrounds it would save in school-buses, as these could be used for two, even three, releases of children each day.

We are trying to teach altogether too much in the school-room now-a-days, crowding the child's mind with an overmass of superficial information upon an absurd variety of subjects—as if it were a case of new or never, and so were prohibiting him for a

careless journey through an intellectual desert at the root of his life.

#### The New Idea in Education

THE idea of the new education is exactly the reverse—to teach the child the use of the tools of his mind, and make their use so interesting to him that he will go on and learn new trades and new accomplishments of his own accord. Instead of improving him with the ridiculous man-milliner's idea that his education is finished when he graduates, it teaches him that his education began long before he entered the school-room and will continue for decades after he leaves it. Here to give education its carrying power, so that the boy or girl will not only be in harmony with it, but will go on with it after our mechanical school ever feeling the break, is the vital pedagogic problem of the day.

Nowadays the admission that a given method is physically superior carries with it at least a presumption of its favoring mental development also. Whatever attitude we may take in the old-fashioned world squibbles about the superiority of mind over matter or matter over mind, it is universally admitted that mind has a broad and most necessary material or physical basis. The tools of the mind—the eye, the ear, the hand, the memory, the brain, and the nervous system—must be supplied by and made of matter; and to keep them is the best possible condition, both of vigor and of longevity, is only common prudence. But the relation between the two goes much further and deeper than this, and when a child is developing his body in vigorous muscular play or healthful and reasonable amounts of bodily labor, he is developing his mind also.

The very first thing that is done with defective children, in our intelligently devised modern schools for their care, is to try to teach them the proper and purposeful use of their hands and limbs. The moment that one of them begins to handle a ball or a pair of scissors a new in some purpose, or even to dance gracefully, his mind is beginning to improve.

#### Muscular Training is Mental Training

IT is astonishing how long and completely we have managed to shut our eyes to the fact that a large part of so-called muscular training, whether in the shop or in the playground, is really mental training. Give a boy, for instance, two or three pieces of board, and tell him to make a box of certain dimensions out of them. Instantly he takes out his rule, and proceeds first to calculate with his eye which of the pieces would be best suited to make the bottom, which the sides, which the top. These vital estimates are verified by actual measurement.

Then begins the problem of getting them together. First, they must be used to provide the right dimensions and at the right angles in order to make them fit together. For this so-called "true eye" is required, and comes only by repeated experience. Then, when they see to be placed and trimmed down, the direc-

"The moment the children begin to use their hands to some purpose, even if it is only to dig holes in the sand or to make mud-pies, their minds are beginning to improve"

## INTERLUDES

### LITERARY NOTES

Messrs. TIMBER, BELL AND COMPANY announce for publication this fall a volume of poems entitled "Chirpings of a Jail-Bird," by Thomas Maginnis, late of Williamsburg Prison. Mr. Maginnis was recently pardoned while serving a fifteen-year sentence at Williamsburg for second-story work by the Gracey Gang, who was named to citizenship by the author's account. "The Eternity of Beans," which appeared in *Wasp's Magazine* last May. Mr. Maginnis's verses were all written lachrymatically at Williamsburg with the aid of a burnt match on the walls of his cell, and had to be set to rest with considerable power the atmosphere of his incarceration.

"Great Mugs I Have Lathered" is the title of a volume of reminiscences of Washington life shortly to be published by the Dulles Publishing Corporation of Washington, written by G. Endow Dousherry, the octogenarian brother of the New Squillard at the Capital. The reminiscences are said to be very rare, and give intimate portraits of eminent statesmen. Mr. Dousherry has abated during the past forty years, the chapter on "China, Past and Present," in which Mr. Dousherry contrasts the motive power of modern orders like Bryan, Salter, and James Hamilton Lewis with those of Webster, Stephen A. Douglas, and other famous spellbinders, is said to be most striking.

The popular series of papers entitled "The Confessions of a Cop," written by Officer Number 100,000 of the New York Strong Arm Squad, presumably a new de power, which have been running for the past two years in the *Brook Magazine*, will be published this autumn in a fresh and larger edition by Messrs. Mack, Kalk, and Company, of West Philadelphia. Seven editions of this interesting work have already been bought up on line by certain individuals mentioned in the chapter on "Great Grifts at Home," presumably for private distribution.

Professor Dobbie's *Sketches*, at the University of Journalism at Cornell, New Hampshire, will issue his original lectures on "How To Make Fresh Human Out of Antique Jaws" in both forms next month through the Jay Press of Watkins Glen. Those who heard Professor Sketches' infernal talk before the Hackensack Institute of Human last winter on "Originality Through Invention" will be delighted to hear that this lecture, revised and improved, is included in this little volume, which is to be the first in a series of sketches to be published under the auspices of the distinguished Professor of Parasitic Literature.

Henry Washington Bell, until recently a contributor on the Broadway surface cars, has written the *Brooklyn Publishing Company* are at it to publish "The Padded Nickel—A History of the nickel that is said by those who have read it to be a valuable addition to American literature, if not to the

looked-for American Novel. The story is, in fact, a chapter out of the author's own life, and tells most vividly of his own courtship and marriage of Mrs. Templeton Soudge, the widow of the millionaire California Junk Contractor, whom Mr. Bell met for the first time on the car he was conducting at the corner of Thirty-fourth Street and Broadway, permitting her to pay for fare with a padded nickel contrary to the rules of the company, whence the title of the novel. The readers of the Brooklyn Publishing Company say that Mr. Bell's style flows limply along, easily suggesting a New York trolley-car in the easy rhythm of its movement.

### IN MERRIE ENGLAND

"I like you, my boy," said the Cautious Father, "but when you ask me for my daughter's hand I want to see the style in which she is accoutred!"  
"Well," said the young man, gazing thoughtfully at his toes, "if she will go off on a bumper strike car in a while I think I can manage it."

### FROM A DEXTERIAN NOTE-BOOK

We started to write a Sonnet on the extraordinary phenomenon of a Butterfly Seen on Broadway the other day, but when we came to think the thought over it didn't seem so much of a phenomenon, after all, Broadway and Greenwich Street, in the last analysis, aren't so very far apart!

Our idea of the most futile proceeding in the world is that of an Indian trying to be held seen through the dense and stormy underbrush of the forest, up steep hills, through deep valleys, across parching deserts, and over raging torrents, in order to show the legible's scalp to his collection.

Billed says that "if you want to pull the leg of a man with a cork limb read before you agree with a corker." We mention this observation of his merely to show the depth of idiocy to which an ordinary intelligent citizen will descend under the influence of a prolonged spell of bad weather.

A Chicago lady says that every human soul has a free affinity, and that the trees themselves have their hills and dingles. We do not know just how true this little bit of philosophy may be; but, for comparative, we must confess that, while we try to do it in the world of honor, and to convert only with lofty spirits, when it comes to trees in the summer-time we have a distinct preference for those of stately bearing.

A Newport late-dresser is said to have announced that she will shampoos her customers down with a

vacuum-cleaner. There is a more or less subtle implication here that we really prefer not to dwell upon; but, just the same, we wish the same instrument would come into use in the barber-shops of some of our State capitals!

Women's clothes have always been more or less sympathetic of the condition of the money market, so it is with some apprehension that people who live on borrowed capital loans that need year the ladies' skirts will be lighter than ever. This would seem to indicate the imminence of some panic!

A New Jersey Historical Society has erected a marker on the site of Monmouth where General Washington overrode so effectively as General Lee. It is good to mark these historic spots, but in these militaristic days how much more appropriate it would have been had these good people built a dam in the Delaware that could have been turned to some real account!

The Post-office Department has substituted the head of Jefferson for that of McKinley on the postal cards, which is perfectly proper. The Democratic party has a perfect right to spread the fame of its own bright particular stars, but, after all, what good did the Democratic postmaster try to do in concealing the noble features of Jefferson? Truly, it would have surprised some men in the subordinate staff had they not the likeness of Rutherford B. Hayes thereon.

It has just come out that there is only twenty-three cents' worth of copper and nickel in four dollars and fifty-five cents worth of five-cent pieces—almost the precise proportion of the relative amount of War-surger and fresh in the average glass that needs fifty-seven fusions.

"It is all right to say 'see America first,' but, after all, it didn't seem to do Columbus much good. A dozen or more active-minded individuals who came along considerably later seem to have got all the cream in that particular coconut.

### AT THE CAUCUS

"MARRAGE FORTUNATE," said Miss Mattie Bettle-fare, rising and addressing the chair, at the caucus of the United Brotherhood of Suffragette Progressives. "I mean you that, in the interest of economy, this can-us phre in nomination the same ticket we had last year."

"I don't see exactly where the economy comes in, Miss Bettle-fare," said the Chairman.  
"Why," said Miss Bettle-fare, "I understand from the secretary that we still have on hand five thousand unused ballots left over from the last election, and by nominating the same ticket we shall save printing a lot of new ones."

## COMMENT

Beginning with the issue of August 10th, Mr. NORMAN HADSON will take charge of **HARRIS'S WEEKLY**.

### Mexico

Nothing dignifies that Mexico is in a bad case. The chief question is: How much worse must she be before she is better? Her railroads ran unacceptably or not at all. Her business is pretty much at a standstill. The HUERTA government seems not only unable to keep order, but unable with increasing weakness. There is talk that Mexico if left to itself will soon split into three parts, with separate governments and separate alliances.

Appeal is made to Washington to do something. It is expressed that the failure hitherto of our government to recognize the government of General HUERTA has restricted the power of the HUERTA government to borrow money enough to put down the other revolutionists. It will be recalled that President WILSON has this Mexican problem handed to him warm off the fire by his predecessor, and that his decision was not to recognize the HUERTA government until it had been indicated by a vote of the Mexican people. That decision was well regarded by the country when it was made last spring, and still has ample support in public opinion. Whether recognition by our government now would be HUERTA's only good line in question, whether immediate recognition of HUERTA would do Mexico good is another question. President WILSON wants more information before taking further action. At this writing Ambassador WILSON is on the way to Washington to tell the President what he knows. Until he makes his report there is not much to say. The problem is big, difficult, and growing. It is the problem of helping to provide the best obtainable government for people who are not able to provide good government for themselves, and who seem able to agree on nothing except opposition to interference from outside.

### Mr. Bryan Lectures

MR. BRYAN says Mr. BRYAN will start out this week on a six weeks' lecture tour in the West, leaving the helm of State in the competent hands of Professor JOHN HANCOCK MERRILL.

It seems unusual, but probably no one will object, —HARRIS'S WEEKLY last week.

We guessed wrong about nobody objecting. There has been a good deal of objection. There are those who think objection is the best, leaving the helm of the business of the Secretary of State Mr. BRYAN is content to leave to Dr. MOORE the lecture. But there it is. The papers disposed of the habit of finding fault with Mr. BRYAN are at it hard, and the papers that want to support him are mostly respectful and apologetic. It does not seem to impress very deeply so suitable for the Secretary of State to be out lecturing for money during his term of office. There has been so much sniggering that Mr. BRYAN has explained that his salary as Secretary does not cover his living expenses, and that he is unwilling to draw on his savings, and must just give a few lectures, while his colleagues are on their vacations to keep himself in funds.

It is true that even on a grape-juice basis he can't live in Washington as a Secretary of State is expected to live, on \$12,000 a year. The salary of his office should be about double what it is. A great many people in the country do not know and

will not believe that that is true. They have no experience of life that qualifies them to appreciate how the Secretary of State ought to live, and what it costs to do it. But Congress likes to know. The members of Congress live in Washington, and can discover by observation and comparison what manner of housing, housekeeping, and hospitality the Secretary of State is in for, and how much salary he should have to meet it. If any one thinks it undignified for the Secretary of State to be out on the lecture platform, let him speak to Congress about making a proper provision for his official needs. Mr. BRYAN on the Chautauque circuit will be a good object lesson on the inadequacy of the present provision by Congress for some of the high officers of government. The Justices of the Supreme Court, the Vice-President, most of the Cabinet officers, the ambassadors, and some of the foreign ministers are all out-of-pocket.

It is not only to say the word Mr. BRYAN ought not to have as plausible an excuse for lecturing. It is not really a good reason. Mr. BRYAN knew what the Secretary's salary was when he took the place. It is a matter of taste, opinion, and custom whether a Secretary of State should lecture for money. The sentiment that he shouldn't seems to be gaining with the country. But Mr. BRYAN's own bebout as a politician to justify his course it is and whether it is worth lecturing. In all matters of taste he is apt to follow his own judgment, and no doubt he can continue to do so as long as he is sustained by a sufficient popular backing. But it may be with the oratorical art as it is with the sword, that they who live by it shall perish by it.

### Keep Them, for the Present

For our part we do not expect to discharge Mr. BRYAN for this exercise of his judgment. It is better to give all the members of the present Cabinet ample time to find themselves and their constituents. Some of the usefulness, however, to give notice to most of the members of Mr. WILSON's official family. The *World*, for instance, thought Mr. McBRIDE ought to get out because of the CUMMERTON case, and take with him Mr. Secretary WILSON. The *San*, on July 13th, had three columns about Secretary DIVISION and what hob he is raising with the Navy; they forget what was saying the other day that Secretary McALAN ought to have the decency to resign because of something he had done wrong. But it is too soon to set about making a new Cabinet to suit critics. There is too much else to be done and the President needs help too much to spare any one who can help him.

Mr. BRYAN is entirely disposed to help him, but it is doubtless very much easier to Mr. BRYAN's taste to help him on the lecture platform than in the State Department. Any man would rather do something he knows how to do than something in which he has less skill. The complaints about the condition of business in the State Department would be terrific if it were not that there were few men, very like them in the last administration when Mr. KNOT used to spend his summers at Valley Forge.

### Good Work All Round for Arbitration

It is hard to find fault, and few indeed even seem to find any, with the way the threatened strike on all the Eastern railroads has apparently been averted. On the contrary, there is praise on all hands for SETH LOW and the Civic Federation, for President WILSON, for both Houses of Congress; commendation, too, for the railroad presidents and the union heads who took part in the White House conference; and Secretary WILSON, by his ready acceptance of the legislation he had opposed has indignantly stood for any mistake he can find there, have made.

To avert the strike and secure arbitration in this instance alone was ample worth the exertion of all these co-operators to that end. The public, the

railroads, and the men who strike have all learned what ill and suffering every big railroad strike entails; and this promised to be the biggest yet. But more than that was accomplished. We can hardly double, more railroads, unions, and the Civic Federation agree on the point, that the newly passed amendment to the EMERSON law decidedly improves it. If it greatly renders it more acceptable to both the usual parties in such disputes, that of itself is a very big gain.

We are glad to believe there were still other gains. Every conspicuous instance of choosing the peaceful instead of the destructive way of settlement strengthens the habit and makes both sides so much less ready to force the fighting. One gain, too, the interest of the public, the right of the public to be considered and heard, is emphasized.

At this writing, only two things seem in any way to be in the prospect of a peaceful settlement. One is the refusal of the Erie Railroad to go into any arbitration or to be bound by its results. The other is the demand of the managers for the railroads that certain grievances of their own, and not merely those of the conductors and trainmen, shall be considered.

We can not say that Erie will reconsider, —or that mediation and arbitration as to the other roads will proceed notwithstanding. As to the managers' unexpected move, while we should all deplore it in any way obstructing a prompt settlement, may there not be in it something the future will profit by? It certainly seems to indicate a fuller acceptance of the arbitration principle than railroads have made in the past. It would certainly be a gain if, committed to the principle, the rivals should bend over, whenever they want to leave wages or to restrict privileges, first seek impartial arbitration, instead of acting first on their own judgment and then waiting to see whether the men will accept, strike, or ask for mediation.

### The Tariff—Feared and Hoped for Changes

Public opinion, if we may judge from the papers, has got pretty clear as to those features of the tariff bill as it now stands which are still open to what may be called practical controversy; that is to say, as to those provisions which one may reasonably hope to see changed without any general or radical changing of the character of the bill.

From the very start, of course, those of us who keep the post in mind have understood that the chief danger to the bill's fundamental aim and enterprise lay in Senate amendments, accomplished in the old log-rolling fashion. Those of us who read the bill moved and made in the House, that enterprise accomplished, have accordingly been gratified to note how kindly mindful of this danger the bill's managers have been, and how wisely, on the whole, they have striven to avert it. They were wise, we think, to try and commit Democratic Senators not only to the whole bill on the final vote, but to certain amendments not accepted by the Finance Committee. They were equally wise not to insist on too hard-and-fast a form of commitment. It was good and loyal management, and Senator SUTTON and his colleagues deserve to be praised for it.

Assuming, however, that their plan succeeds, it will plainly make rather difficult the few changes which friends of the bill would like to see, for there seem only two ways to accomplish them—by the action of the Committee of Finance or, later, by the action of the Committee of Conference. Clearly, then, the provisions of this character which stand the best chance of getting changed are those which are themselves changes from the original House bill.

It is fortunate, all in all, that the two provisions of the bill as it stands which have provoked the most opposition from Democratic law-tariff sources, are, in fact, amendments to the House bill, and there are therefore two chances to get rid of

# THE INDIAN FIGHTERS OF THE ARICKAREE

BY ARTHUR CHAPMAN

ILLUSTRATION BY MAYNARD DIXON

IN western Colorado there is a mountain, inconspicuously white in the vast expanse of brown plain, that marks the scene of the most desperate Indian fight in frontier history. The place is remote from railroads, and when one comes upon it after a long and hazy driving drive over a mountainous prairie and the glimpse of the white shaft rising from the shallow valley of the Arickaree Fork of the Republican River gives one all the thrill of a fresh message. It was here, beneath the cotton-woods that flank the meadow, that Major George A. Forsyth and his fifty scouts defended themselves against the charge of at least a thousand warriors under the great Cheyenne chief, Roman Nose. There are four tablets near the main shaft, telling of the best fighting days of those of the command who were killed outright by the Indians; and, if one happens to visit the spot while an anniversary reunion of surviving scouts is in progress, one may hear thrilling stories from the lips of men who bear the marks of desperate wounds, for hardly half of the command escaped from Deesler Island with whole skins.

It was due to the fact that the scouts were able to make a stand on slightly depressed ground, instead of on a hill, that Forsyth's command was not annihilated. His command of Currier and Fetterman, the same topographical conditions restricted to the Fetterman massacre, in the Powder River country, in Wyoming, when a detachment of eighty men from old Fort Phil Kearney was surprised by Red Cloud in 1866, and killed on what is now known as Massacre Hill. Had Forsyth been caught on any of the high cliffs overlooking the Arickaree valley, his defense, to use the words in which the Indians described Currier's fight, would have lasted "about as long as it takes a hungry man to eat his breakfast."

Forsyth's scouts were attacked by the war party of Roman Nose at dawn, September 17, 1868. The Cheyenne and Arapaho had grown very bold in victory Kanam and Forsyth, who had been on the staff of General Sheridan in the Civil War, had been directed to gather an independent command and stop the wholesale murdering. The scouts were not regular men, but they signed a personal agreement with their commander, and were paid from emergency funds in the quartermaster's department. They were chosen from the scouting service because of their

skill with the rifle, and most of them had seen service in Indian campaigns. Forsyth's men had been on the trail of a large war party for several days, and were receiving the utmost caution. He had, someone had protested that the command was going into a death-trap, and this led to a little incident that showed Forsyth's splendid courage.

Forsyth called a consultation, and "Tom" Banahan, one of the scouts who traveled all the way from Idaho to attend the fortieth anniversary of the fight, "He explained the protest that had been made, and then said: 'Now, boys, when you signed this agreement, didn't you understand that you were going out to fight Indians?'"

"We all saw the point," added Banahan, "and there wasn't another kick made, though a good many of us thought our scalps might be lifted any minute."

WHEN the Indians made their attack, the estimate that there were at least a thousand warriors and a large number of squaws and children in the war party proved to be correct. The hills leading down on the steep stream toward Hiramly lake with Indians. At the first onslaught, many of the horses, and the mules bearing the provisions, were carried off, and the whole carrying part of the ammunition was swept only by desperate efforts. The scouts who are living to-day seem to agree that an elaborate order was given to fall back on the steep island directly opposite the camp, but the scouts, moved by a common impulse, sought shelter on the strip of sand that proved to be their salvation. This island was not more than a hundred yards in length, and perhaps half as many yards in width at its widest point. At its head, where the scouts sought shelter, two or three cottonwoods. Except for these, and a clump of bushes in the center, the island was barren. The stream was barely knee-deep, and the narrow bank fortunately was not high and afforded no protection to the Indians.

The retreat to the island was made under steady fire, but Forsyth and his men kept their heads well. Work was instantly begun, rifle-pits were scooped in the sand, and several horses were shot, to make additional breast-works. The Indians were so intent on annihilating the little band that they rode to the edge of the stream and concentrated a deadly fire

on the island. Forsyth, who had been standing, to divert his men in digging pits, sank to the ground with a terrible wound in his thigh. A few minutes later he was struck again, and the bones between his knee and ankle was shattered. Raising his head to observe the movements of the enemy, Forsyth received a third wound, the bullet striking him a glowing blow in the forehead. Dr. Mosser, surgeon of the little command, was struck in the forehead, and died three days later. Several of the scouts were desperately wounded, and, to add to the misery of the defenders at the island, it became apparent that the Indians were going to charge.

Roman Nose, who was an Indian of splendid physique and fearless courage, withdrew with fully five hundred of his warriors, and formed in battle array behind a bend in the river. Then the Indians came charging down the riverbed. Roman Nose was in the lead. The scouts waited until the yelling horde were close at hand, and then they fired several volleys with telling effect. At the critical moment the Indians broke under the withering fire, and swept around the island, leaving Roman Nose with the slain in the shallow river. The squaws and children, who had assembled on a hill several hundred yards up the river, and who had expected to see their warriors ride over the whole sea, burst into prolonged wailing when they saw the chief fall and the line of Indians water and break.

This remarkable charge is one of the few instances known of Indians directly assaulting a fortified position, and it was disastrous to the whole man as well as to the rest men. Lieutenant Fred K. Beecher crawled over to Forsyth and said:

"I have my death wound. I am shot in the side, and dying."

Then, after lifting his commanding officer "good-night," and whispering a message to his mother, this young knight of the frontier breathed his last. Young Beecher was claimed by his command, though he had been little Indian service. He had made a good record in the Civil War, and was an admirable type of the young, ambitious, courageous army officer. In his memory, the battle-field has been called Beecher Island, and the headstone that bears his name has been located upon the spot where the scouts are certain they buried their friend.

# IMMIGRATION AND DEGREE

BY HENRY SMITH WILLIAMS, M.D., LL.D.

RECORDS of the shift of our population in the past three generations will show, I think, that the bulk of American population is being substituted; that we have virtually ceased to be an Anglo-Saxon race; and that the entire composition of our civilization is being rapidly metamorphosed. The facts will at least raise a doubt, I believe, as to whether our civilization is being benefited as well as metamorphosed. They will also, I hope, to raise a question in a good many minds as to whether it is wise to continue such large-scale or characteristic American policy of letting all kinds of alien

## The Native Stock of America

AT the outset, we must recall that the American colonization of the early days dealt with what now seem almost insignificant numbers. Accurate figures are not a matter of record, but we learn that the famous fleet of eleven vessels that sailed from England and landed at the port of Salem, Massachusetts, in June, 1620, conveyed 1,200 passengers. The Massachusetts Bay Company sent a fleet of sixteen ships, presumably carrying a somewhat larger cargo, the same year. Meanwhile we are told that the colony of Virginia by about 1620 had acquired a population of 4,000 souls.

These were the two chief colonial nuclei from which what we now speak of as the "native American stock" sprang. Between 1620 and 1640 about 2,000 persons came to New England, and from 1640 to 1660 were discouraged and possibly even barred. The colony of Pennsylvania received about 6,000 immigrants between 1640 and 1660, but there were few other immigration reversals of corresponding magnitude.

It is estimated that the total immigration throughout the colonial period was not over 170,000 souls, and that the population of the United States, when the first authoritative census was made in 1790, had reached about 4,000,000. A very large proportion of these it will be obvious, were of "active" stock, in the sense that their ancestors had been in America for only a few years—let us say, for from three to five generations. In the course of the ensuing thirty years the population a good deal increased. In 1800 it numbered 5,700,000. And substantially all of this was "active" immigrant, inasmuch as the total immigration of the period from 1790 to 1800 was 100,000. In other words, for every 1,000 additional inhabitants in the period 1790-1820, 167 more were born in this country and only 43 came from abroad.

Here, then, we find the United States populated in the year 1820 with a tolerably homogeneous company of 6,800,000 people, of whom 1,000,000 were of "active" themselves American, inasmuch as all but a very small percentage of them were born in America and represented a stock generally ten generations old. We may fairly enough speak of this as the native stock—the present or actual blood—of America.

## The Assimilation of the Native

THIS is a well-understood, even if obviously paradoxical, sociological doctrine, according to which an immigration such as that to which the United States has thus been subjected does not increase the population. The claim is made that the coming of the hordes of alien alters the conditions of life and so increases the stress of living that the birth-rate among the native rapidly decreases.

As illustrating this, we are pointed out that before the day of the great migration the population increased with astounding rapidity. In 1790 the native population numbered 4,000,000. In 1800 it was almost 5,000,000—an increase of 25 per cent. And the native population continued to increase at the same rate, when the census of 1810 showed an even of 5,000,000 by the end of the century, even as had no immigrant come to us.

Yet, in recent years, by subtracting the count of nearly 20,000,000 aliens in the period 1820-1900, the population at the close of the century was only 7,000,000.

Thus it is quite within possibility that the population of the United States to-day is not larger than it would have been had we had no immigration in the past century. There is a high authority for this paradoxical doctrine; but, whether or not it be accepted, at least there is no doubt that the immigration has had a marked effect on the character of the population from what it would have had its increase been dependent solely upon the normal growth of the native stock.

Fully to appreciate this, we must consider the factor of foreignness from another standpoint. True, for we have been concerned with mere numbers. We must now give heed not only to numbers, but to nationalities and classes.

When this is done, it will be apparent not merely that the native stock is being supplanted by foreign stock, but that the Anglo-Saxon race from which the native stock has heretofore sprung is being supplanted by races of widely different character. As to this, the statistics speak in unmistakable terms.

The recent investigation of the subject are agreed in dividing the great foreign body into three periods, one of which is spoken of as the old immigration, the other as the new immigration—the terminology being about the only one of these words, the

old immigration comprised the immigrants of all generations except the most recent; whereas the new immigration is the most recent immigration of our race (therefore the one that ultimately concerns us most directly).

The chief point of the matter is that the immigrants of the old period—that is to say, those of the colonial time and all the succeeding generations in about the year 1820—came primarily from England, Ireland, Scotland, Germany, Denmark, France, Germany, the Netherlands, Norway, Sweden, and Switzerland. These countries furnished about 90 per cent. of the total number of immigrants of that long period.

But since 1842 the entire racial aspect of the immigration problem has been changed, inasmuch as more than 80 per cent. of the total number of European immigrants have come from Austria-Hungary, Belgium, Greece, Italy, Macedonia, Poland, Portugal, Rumania, Russia, Serbia, Spain, Syria, and Turkey.

## The Invasion of the East

IT appears, then, to be beyond dispute that the old colonial stock of America is being pretty rapidly displaced by a population of totally different racial strains.

But, when we come to the interpretation of the facts in their bearing on the future civilization of the United States, we are met by a variety of divergent views. It is very difficult, in dealing with the subject, to get entirely away from the bias of our own day. From the earliest times, the cultivated nations have been disposed to look upon other nations as pertaining to a lower order—the very application of the term "barbarians" which originally meant only foreigner, is sufficient proof of this.

But, in the present case, it would seem as if the most candid and unbiased observer must be convinced that the major part of the great mass of the immigrants that have been coming into this country in recent years do belong to a lower intellectual order and must tend to lower the level of our civilization. As, for example, the average of immigrants that came from a ship at Ellis Island would in itself suffice, I suppose, to counter most practical objections.

If evidence of another character were required, it might be found in the tables of illiterate among immigrants, compiled by the United States immigration commission. These tables show that in the fiscal years 1903-1906 the total number of immigrants over fourteen years of age was 1,000,000. Of these, 1,000,000 were of the old immigration, and the new of the old immigration type; that is to say, more than half of the immigrants of the total number only 27 per cent. were able to read or write.

But, of the adult representatives of races that we may call the "new immigration," no more than 35.6 per cent. were illiterate. When the individual races are considered, the contrast is still more striking. Thus, 12.13 per cent. among Scandinavians number only 4 per cent. among the North 3 per cent. among the English 1.1 per cent. among the French 4.4 per cent. among the Welsh 5 per cent. among the Irish 27 per cent. among the Dutch and Flemish 47 per cent. Contrast this with the illiterate among the old immigration: for Rumanians 34.7 per cent. of illiteracy, for Russians and Norwegians 36.4 per cent., for Russians 39.5 per cent., for Belgians 41.8 per cent., for Lithuanians 48.9 per cent., for Rumanians 51.0 per cent., for Poles 54.4 per cent., for South Italians 54.2 per cent., for Portuguese 65.2 per cent.

Of course, illiteracy is not an absolute test of intelligence, but it was hardly to be disputed that illiteracy is a sure sign of a low mental and moral level. It is a good gauge of the level of society and phase of civilization from which the class springs. Accordingly, then, the immigrants of the new immigration make up the highly cultured colonial stock and the relatively illiterate average colonials of the old immigration. The chief difference of the new immigration concerns is found in the fact that illiteracy is much more prevalent among the recent immigrants than among the old. The statistics of the Census Bureau of the City of New York recently published statistics showing that of the patients under treatment in insane asylums in the city of New York, 10.5 per cent. of foreign-born patients had increased, since the federal census of 1892, by 13.4 per cent. In the State of Massachusetts the percentage of illiterate among the inmates of the insane asylums of 1900 showed that the percentage of aliens in the total population in the State is only 29.5 per cent.

It is computed that the State of New York alone spends \$3,250,750 for the care of its foreign-born inmates in the city of New York.

Doubtless the proportion of aliens to the total foreigner population is not at the New York rate throughout the country, but it is certain that it is not enough to cause apprehension, and it had students of the subject to marred at the combination with the present rapid assimilation and the coming of hordes of unfortunates. As Professor Charles F. Johnson puts it: "A new plague that rendered 40 per cent. of our population, chiefly at the most productive time of their lives, incapable of doing more than 8100,000,000 yearly to support, would indicate at least universal affliction. But we have become so used to crime, disease, and degeneration, that we take

them as necessary evils. That they were on in the will of the gods is granted. That they must remain so is denied."

## The Immigrant and the Labor Problem

IT can hardly be doubted, then, that the physical station of the American race is suffering from the new immigration. Scarcely less in question is it that in the quality of the native stock is being lowered by the influx of this alien horde is making itself felt disadvantageously. The art, literature, public morals, and national character are being lowered.

Natural accomplishment is largely conditioned (1) by general intelligence and (2) by parental inheritance. The aliens who came to us during the first great period of immigration, 1820-1860, were intelligent north-western Europeans, who sought homes where they and their children could find a larger measure of personal liberty and better social and intellectual opportunities.

But the aliens of the new immigration, for the most part, seek America for no reason other than because it is the land of the dollar. If you work hard and save, you will have money. It is not so hard to get and therefore a little better than your neighbor. You may even acquire a competency that will enable you to return to your Mother European home to spend your well-earned days in comfort. That is the thought of a large majority of the millions of immigrants that have come to us in recent decades. In such a case, the immigrant is not supposed to have traditions, history, art, literature, or ideals, except those of the money-bag.

Such an aim may lead to money-getting rather than the making of homes, the immigrants of the new era do not go to the most desirable of the middle and lower West, but to the cities, where they can get and come under some American influence. They cluster about—St. Louis, "Little Italy," "Little Bohemia," "Little Poland," "Little Denmark," and "Little Ireland"—and give opportunity for the development of the system of business that has made the government of the United States a struggle between the masses and laborers, introducing an element of competition that is destructive to the interests of the American citizen.

Commenting on this aspect of the subject, Professor E. A. Ross says: "The most momentous consideration in the new immigration policy is the fact that free land is gone, and immigration is confined to the cities. The result is that the immigrants are settling the public domain, not becoming a competitive force in the West. There is a deep significance in the fact that during the past few years the population of Minnesota grew 10 per cent., of Kansas 10 per cent., of Wisconsin 13 per cent., of Nebraska 15 per cent., of Colorado 15 per cent., of Pennsylvania 20 per cent., of Connecticut 21 per cent., of Rhode Island 21 per cent., of Massachusetts 22 per cent., of New Jersey 23 per cent."

Thirty or forty years ago, Germany, Poland, France, Italy, and other countries, furnished a large number of immigrants, landing at Castle Garden, journeyed straight through to the frontier with a railroad ticket paid for by the government, and they went to the west and yoked the loom of the incipient future. This new immigration, which has Constantinople as its geographic center, is the product of the North with its immigrants, who have no intention whatever of seeking the remaining fragments of the frontier—Idaho, the short-gone country, the Texas Panhandle, or the empty lands of the West.

The report of the United States Immigration Commission is summarized by Professors Josiah and Helen H. Henshaw in their book, "Immigration and Nationalities where Belgians, Russians, Rumanian Magyars, and Armenians live by themselves, with their own languages, customs, and habits, and with their own social life from any American influence." The report adds further that there is everywhere a feeling that the immigrants are a burden on the American citizen or approach attitudes in working with the native aliens or in the same occupations. This is the situation in the United States. The Commission declares, in the psychological in its nature, and arises from race prejudice or ignorance, but is nevertheless not a natural or effective force in racial segregation and displacement.

"Perhaps the most significant feature of the entire situation," the Commission concludes, "is the fact that the immigrants are a burden on the American population (in general) in the recent local galleries and in their condition."

The situation is indeed becoming serious. The one thing that the American public has been taught to hate is the competition of every European laborer. We hold it a crime to let a foreigner take the place of our laborer, but we do not get over our "detest our infant industries." But the immigration ports are holes in the dam that let a steady stream of laborers come to our shores. Thus the American manufacturer is protected from foreign competition, while cheap foreign labor side him is piling up a colossal fortune.

## Cosmopolitanism versus Americanism

IT has been urged that immigration is now leading us to fall off and so that the worst is over. There is nothing to justify the latter belief. The 1911 population is an economic phenomenon varying 25

## THE TENTH INNING

This picture, taken at an amateur baseball game between two rival boys' teams, shows the interest and excitement that can attach to the national sport even though the professional element be absent

A history class studying the epoch of the cave-dwellers. The pupils enact scenes from the life of the cave men, making as faithful as possible a representation of their customs and occupations

## OUTDOOR SCHOOLS

BY THOMAS S. CARRINGTON, M.D.

**A** NEW theory of primary education has spontaneously revealed itself to us in America. It is a theory based on the belief that good health is more to be chosen than great knowledge, and that neither knowledge nor health need be acquired at the expense of the other. A still further conviction is that this theory may be readily turned to the advantage of any community that elects to embrace it. It is the opinion of the writer that has turned these convictions upon us.

When the first open-air school was established in Germany, in 1901, and when later the idea was adopted in England, and still later in the United States, its primary aim was exclusively to benefit the sick. We are now beginning to see that what is good for a sick child can certainly do no harm to a well one; and, still further, that there are other advantages in the idea than that of the improvement of the pupil's health, and that well children should not be deprived of these advantages merely because they have the good fortune to be strong and healthy.

### The Open-Air School Good for Well Children and Country Children

THE open-air school was started as a city movement, and remained such until very recently. But the absolutely plain discovery of the advantages for the strong as well as for the weak has now developed an other obvious fact, which is that if the institution is good for city children it must have some benefits for country children. And it has. Arrived that there are more sick school boys and girls in the cities than in the towns and villages, it does not follow that all country children are beyond the possibility of acquiring still stronger constitutions, or that the new methods of learning and discipline would fall utterly in small communities, when they succeed so wonderfully in large ones.

No, there has come to be almost a universal interest in this new theory of instruction, and many are seeking to learn just what an open-air school is, how it is conducted, what it costs to conduct it, what special equipment is required, and how the methods of instruction differ from those of other schools, and why. The substance of such an investigation is a foregoing commonplace. Business and city living conditions are in no degree essential to the success of the school, in the country, if they can accomplish what may be said for better children in the city. The only condition is that there must be healthful children in the country, and when these are few and strong alike, it is not that they

get close to nature—the closer the better. There must be due provision for protection from inclement weather, and there must be no fragmentary disregard of the fundamental rules of health, but otherwise the success of the school is in direct proportion to the degree of freedom that it attains from roofs and walls.

### The Open-Air School Need Not Cost a Dollar for Special Equipment

THE aim of the open-air school is twofold—to improve the child's health and to provide more effective methods of education. In the first respect, its aim is that good fresh air is a most effective counter-agent for disease. In the second respect, it rests on the principle that actual association with the things that are studied is more inspiring and instructive to pupils than the abstract lessons acquired from books only. The open-air school, therefore, helps in

two ways to secure—the closer the better. There must be due provision for protection from inclement weather, and there must be no fragmentary disregard of the fundamental rules of health, but otherwise the success of the school is in direct proportion to the degree of freedom that it attains from roofs and walls.

The building problem is one wholly of convenience or local conditions, and is settled only by the needs of each individual case. In its simplest and most effective form, the open-air school is conducted in a garden or field or under the trees. Here it can be carried on only in fair weather, but with the school-house close at hand, as it usually will be, there is shelter near by in time of need.

### Simple Ways of Constructing an Open-Air School-Room

IF some simple form of shelter other than the school-house itself seems desirable, there may be an open

ly as much for their practical working upon nature and the great out-of-doors, which the country of years provides at its best, while the city has to fight for every breath of country atmosphere if you go—and even then often gets but the artificial likeness of the thing and not the thing itself.

To accomplish these aims, the equipment of the open-air school may be practically whatever its teachers wish to make it. There may even be an effective open-air school without the expenditure of a single dollar for special equipment. The main thing is to

The children learn geography from maps of sand which they make themselves, planting ferns with sprigs of vegetation natural to the region they are representing and adding tiny hours, laden with articles of the country's actual commerce, up and down the play watercourses

and with only a roof and one inclined side, and with the grotto for the floor, or perhaps a simple board platform. A still more elaborate plan would be to build a somewhat more pretentious shelter with all sides inclined about three feet up from the ground, and with rolling canvas curtains to be let down to keep out the wind and rain or snow when there is a storm. Tents have sometimes been used in place of these wooden shelters and are fairly satisfactory when placed over board floors.

Of course, there are days throughout the year, and sometimes weeks at a time, when some of these devices would afford adequate protection from sun, snow, or wind. At such times there is again the old school-house; but if the school is occasionally directed indoors by the owner of the shelter, the operation is entirely abandoned in out-of-door aspect. Even if nothing else were done, the open-air theory could still be practised by the simple use of the open-air shelter of the shelter; or, if a new building is to be constructed with the open-air idea in view, its rooms should be so arranged that all sides can be opened or closed. There is thus perfect protection from sun, snow, or storm, from whatever quarter it comes, but still with two sides of the rooms open to the fresh air. Starting and revolutionary as the idea may seem, it has been found that cold weather does not harm children if they are properly dressed and protected, even though they sit for an hour or more at a time at their desks.

The alteration of an old school-house to adopt the new idea may be easily accomplished by removing the entire wall on one side or on two, and replacing the walls with long windows, so long that they may be wide open from top to bottom. In some instances these alterations have been carried to the extent of removing a portion of the roof and replacing it with canvas curtains on storm days; but this is hardly necessary, since the open sides will provide all the required circulation.

#### Giving Children Rest Instead of Inactivity

FULL looks the open-air school has no special requirements. The same desks may be used as in school; and there need be no radical changes in the course of study, nor do the teachers require special training for the work. If the classes are to be conducted in the open air, there will perhaps be the necessity for portable blackboards, chairs, and desks; and if in the old school-house the chairs and desks are fastened to the floor, it may be necessary to acquire a new outfit of furniture of the portable type. But even this possibility of expense disappears if the school committee, the parents, and the children will be satisfied with a modified form of the out-of-door installation, whereby as much of the work and study as is possible is done out doors, while the building is used for such parts of the daily routine as require desks and blackboards. In any case, the lack of chairs, desks, and blackboards should not be allowed to check the open-air campaign. The fresh air is the main thing. Not merely the child's health, but also his capacity for learning is increased and his mental faculties stimulated by permitting him to learn and study under the most favorable conditions that nature can provide, and by supplying the almost imaginary problems of the text-book with the concrete, visible demonstration of the same problems in the fields and among the trees.

There are various accessories required for the city open-air school for sick children, some of which could be rendered useful in any school of the type, but most of which can be dispensed with if necessary and their absence not felt. But the one absolute essential is the good, fresh open air itself. All else is secondary and has a merely auxiliary value in securing the best possible supply possible of the parent or substitute. And as this all-important particular the smaller town and village have an advantage over the big cities that no human agency or power of dollars can counterbalance.

#### What Sick Children Need in the Open-Air School

IN the city classes where none but bedridden children are admitted, and in the poorer sections where the parents are unable to provide the clothing and food

needed for effective treatment, the schools provide beds. Frequent baths are secured; there are reclining-chairs, sitting-out bags, bolsters, and foot resters. Special medical attention is also provided, and there is apparatus for recording the child's condition and progress toward recovery. But the country school may easily dispense with these accessories.

If there are sickly children who would have to stay at home at least the school made special provision for them, their parents should be more than willing to provide the reclining-chairs and sitting-out bags, since this would prevent interruption in the child's school course. While the old-fashioned school at home, with its management and its maintenance, is still making against a fair chance for improved health, was the last place in the world to which to send a sickly child, the new out-of-door school provides precisely the methods of cure and restoration that make for increased strength of mind and body. The parents provide their child's food and clothing as usual, and would hardly expect the school to do that.

Out-of-door treatment would also be far more effective some times, and doubtless far less expensive all the time; but no complaints need be entertained from the parents on these scores. The sitting-out bag may be easily and cheaply made at home if the school committee's appropriation is not large enough to provide it. It is made of cloth, or of some sturdy material, and is closed or opened by means of a cord or strap, and is so constructed that extra clothing will be required, whether the climate are hot or cold, or whether by drifting storms as the chief indicator of the locality, or as the best course of the curriculum.

To sharpen the child's powers of observation; to increase his capacity for knowledge; to make the acquisition of knowledge attractive and interesting; and to rub it in of his drudgery and reading lessons; to associate study and learning closely with the child's natural interests and identify them intimately with the things about which he knows something already; to teach him how to discover for himself the "secrets in stones" and "hacks in the running brooks" that are so ready at hand to be discovered on all sides; these are the aims of the open-air school's educational theory.

#### Geography Out-of-Doors with Maps of Sand

THE geography class needs hardly a small book where a "map" has been worked out on the ground in the clay and sand. Rivers are represented by strings laid in slight depressions, mountains and hills are raised up near by with piles of sand. Little groups of toy buildings are placed to indicate towns and cities, and softeners, iron founders, cotton mills, and other industrial plants, including coal and iron mines, are suggested by bits of the manufactured material placed here and there. Sun routes from the various points, and railroad lines by the rods of all materials. Somewhat more understandable and easy to comprehend than the old style map is the geography, with like symbolizing made of many colors and materials of interest.

History is taught by taking one period at a time and by enacting some of the principal events in the period, in costume, in costume, as of course, taking all the time. The knowledge of the historical periods in this period is not confined to the study of the past, but is also applied to the present, as well as military events, which are especially interesting to the boys. For the sitting-out bags, there are tape-measures and yard-

Studying physical geography from actual surroundings instead of from a text-book. The class members bend a brook to learn some of the laws governing watercourses.

sticks, and measurements are taken of the distance of trees, the distance between the trees, the surface of buildings, and so on, and the examples based on these measurements. The advantages of this method over the old system of theoretical classes is easy to appreciate.

There is much of the manual training system worked into the European open-air schools and in some of those in the larger American cities. One striking feature is the use of the boys and girls in a study course of the local plants. There are sewing classes, and for boys and girls alike, and it seems that the small firm and English boys experience no improvement of pride when they are asked to join the sewing circle and do the things that young America of the nineteenth century would be sure to consider with contempt as girls' work. Other forms of household industry are taught in some of the schools, such as the care of babies, and bandaging.

But, of all the forms of instruction that the children like, gardening comes first. We in this country already know much about school gardens. They are, in reality, one form of the open-air school. Like the open-air schools, they were first devised for city children; but, since then, they are ideal for the country, where there is more likely to be found a large number of practical one for gardening knowledge than in the city.

Out-of-door life is not so much of a novelty for country children as for those who live in cities, and to the extent it might seem that the disadvantages of this type of school would be less intense for the boys and girls of the villages. But the variety of instruction provided and the novelty of its method have their special appeal to the country children, in teaching them how to apply their book learning to the things with which they are familiar by daily contact. The country lad whose interest is attracted to the vegetable garden by knowledge that first came to him in school in the form of nature study, is much more likely to be a helpful and effective worker among the plants when he grows up than one whose first introduction to farm work is the command to go out and go to work without results accomplished by one's own hands. This is a very natural question for any community to ask before it joins in the movement.

First of all, the most remarkable improvement in the children's health. At the end of the first three months in the first open-air school, twenty-three per cent. of the children had been completely cured of various ailments, and forty-six per cent. greater improvement. Other reports of the first open-air school are most extravagant in their enthusiasm, but not more so than subsequent developments have actually warranted. The earliest reports stated that the children showed a marked improvement in attention, mental alertness, and behavior; that passively, cleanliness, and orderliness were developed; that the introduction of the greater freedom allowed the children, there was no difficulty in maintaining discipline; that a close personal relationship was established between pupil and teacher; that many of the children carried into their homes a new health, wholesome atmosphere—and so on through a long list of advantages.

Working in clay, bow-making, and basket-making. The work is all done out-of-doors. Results show that not only well children but sick children, not only city children but country children, do better work and improve physically in out-of-door schools.

# The Love-Making OF THE Newfoundland Caribou

BY

A. RADCLYFFE  
DUGMORE, F. R. C. S.

The big fellow let him rise, and then the fight began for the mastery of the doe

If any one would form a satisfactory opinion of the caribou's stage, one must see the animal at least—see him when nature has provided that he shall be in his fullest power; and that is only during the brief period of the mating season. Then, and then only, can it be said that the caribou displays himself to advantage. For of longer, born of eye, impatient of interference, arrogant yet supple, filled with a passionate desire to display himself to his kind, he is rarely as gay as usual in his battle to secure his superiority over all comers, especially those smaller than himself. For he is an animal of great discretion, an animal too much to realize that, in his battle with success, it is important that he should not be inferior in point of size to his antagonist.

For months nature has been at work preparing the stag for this task of power, for months the life of the animal has been sacrificed to the one real perfection of power. As the athletic train for weeks or even months that his condition may be as nearly as possible perfect, so does the stag give almost half of his life to preparation—immensely perhaps, but nevertheless the sacrifice is made in order that when the crucial test comes he will be found ready and in all ways worthy to be the father of future generations fit for the open world as nature, it must be clean of flesh and sound of body, exhibiting nothing but what will help it in the great battle of life in the winter country, where the battle is fought against almost overwhelming odds, where weakness, inherited or contracted, means death, where only the few who are hardened and who can hope to survive the rigors of climate and be clever enough to outwit the numerous enemies that are ever on the watch, ready at all times to destroy the weakling.

## The Stag's Preparation for His Love-Making

PERHAPS you are already asking, in what way does the caribou stag prepare himself for the season of love-making? Let me answer your question by taking you back to the days of early spring. Nearly has the winter's accumulation of ice and snow begun to melt than the northern stag, alone and in great straggling herds, leave their winter quarters, and seek their way southward in their summer haunts. It is a hard journey, for the country in all its very worst; streams are converted into roaring rivers by the melting of the snow, ponds become lakes, and shallow streams are under water, and the water is as cold as ever, even the water deep under water, and slushy snow are almost impossible. Yet through such obstacles the caribou, by force of habit or reason, must make his way to his fair-weather home.

At this time the doe, heavy in fawn, is also coming northward, seeking the sweet of the husband stag, latest only on finding a suitable place where she may bring forth her young safe from the hands of man.

The stag is not now an object of beauty. Mottled in color—for his winter coat is dropping—he is thin from scarcity of food, he is harden, and his eye lacks fire. If we examine him, we shall see that the horns, pedicels are slightly swollen, and covered with soft, velvet-like substance. The horns are beginning to drop. At first they are a little or no matter, but as the summer advances they grow with surprising speed. A great part of the animal's food must go toward something these horns, structures of bone which are imposed in the soft velvet coat that they will not become dry until development is completed. During this period the horns are covered with velvet, and some can readily imagine how great an obstruction they must be to the animal's freedom of action. Throughout the entire summer the stag is handicapped in this way; and when we remember that the greater part of the summer is spent in the close woods in order to avoid the sharp eyes of the hunter, it is not surprising that the strenuousness of Deane's saying, "By the way, they would make an excellent horse, whereas in the present-day world the available horse need be a constant source of trouble."

## The Caribou's Transformation

WITH the approach of autumn conditions change for the better, and when the caribou display their wonderful winter clothing, and the horns become

masses of shimmering gold, so bright that my eyes are dazzled by the lustrous color, the stag's horns have attained their full growth, they have hardened, the velvet, no longer needed for protection, is peeling off by being rubbed against the rough branches of scrubby trees, and the animal comes forth in all his glory—the glory of newly hardened horns, his prominent possession. His eye, too, is full of fire. The glint of his neck shew itself to conspicuous size, and from his ears to his shoulder he is clothed in a heavy white mantle.

What a transformation has been effected—from the dull gray, graceful, hairless creature, that seemed to lack all qualities in this particular, heavy-antlered, perfectly animal as contrasted to his wedding garb.

This is no fanciful picture of imagination, made up for the purpose of trying to interest the reader. It is merely a statement of actual facts that any one may see for himself if he but takes the trouble to visit the country where the caribou lives. Unfortunately, only too few of those who are interested in these animals ever see them during this most interesting season. For of this time must be absent, the government of Newfoundland having wisely decided that shooting shall not be allowed during the mating season.

It is a great pity that more people are not sufficiently interested in animals to enjoy watching them in their native haunts, being possessed of the single idea of hunting them with intent to kill. It is evidently the survival of the fittest in us that makes the joy of the chase so dependent on death as the end of each object. The chase of wild creatures, when conducted on sportsmanlike lines, has much to recommend it. It teaches us many things that might not otherwise be learned, and leads, of course, to vigorous, healthy exercise. But when we see pictures published showing the so-called sportsmen actually photographed standing in a veritable sea of caribou, the wretched animals that have been so ruthlessly sacrificed to satisfy man's fit, we feel almost ashamed of being called sportsmen.

Perhaps the man who has done a reasonable amount of shooting, and has been educated in a proper knowledge of the animals' ways, so that careful stalking has become an unconscious part of the hunt, may enjoy to the very fullest extent the art of hunting with the camera.

## Camera-Hunting Has Erasing this Rifle-Hunting

If I may speak from my own experience, I should say, without the slightest hesitation, that the camera has, directly and indirectly, given me unusual pleasure and actual excitement than I had ever found in using the rifle, and very few creatures have paid off greater gratitude to me than the caribou of Newfoundland. Not accurately correct, I visited the country before venturing in obtaining even reasonably good photographs of the autumn migration; and on each visit I always hoped that I might have the good fortune to catch the stag during the mating season, and so perhaps secure a photograph of that most interesting event, the fighting of the stags.

At every suggestion of such a desire, disappointment was offered most freely by guides and others, and it was almost hard to believe that such a quest was an impossible one. But, last autumn, peculiar conditions gave me reason to hope, for an early snow drizzle had given the caribou herds of caribou down in the lower plains immediately before the mating season. This good fortune and unexpected occurrence gave me the opportunity for which I had so long worked in vain.

On the morning of October 10, the sun rose on a cloudless hill that were well covered with freshly fallen snow. It was unusually early for snow, and at first I scarcely realized what it meant for me. At the time I was working an heaver, with scarcely a thought for caribou. During the many autumn days in the country, I had never seen them before the 20th of the month, though I had always hoped that they would winter.

The mating season, which lasts about two months, begins about the end of the first week in October, and it is very probable that the animals are in the best of health when they begin to migrate. The first week of snow would bring the animals down to

the lowlands before the season begins. Allowing three days for the herds to reach the Sandy River region, which is in the path of the autumn migration, I went out to a large barren about five miles north of Grand Lake, and there, to my great delight, found that a almost constant stream of caribou were appearing from the north—small herds and large ones, all traveling in a very leisurely way. On reaching the large herds, they rested, and the silver-colored coats could be seen scattered in every direction.

## Stalking the Caribou in Clear Range

THERE was an air of excitement among them, the old and the young stags intermingled with the does without being noticed. It was quite evident that, unless they continued on their southerly route earlier than they had ever been known to do, I was practically certain to have an opportunity of being with them throughout part, if not all, of the mating season. The caribou was entirely correct, and though during the three weeks that followed there was a steady but very slow southerly movement, there was scarcely a day that I did not see some caribou. By October 21st the southing herd had ended, and practically all the herds had passed.

A caribou stag looking for a mate. With the approach of autumn the stag's horns have attained their full growth, and the animal comes forth in all his glory.

For a good many years there had not been such an early migration; in fact, for several seasons I had had to wait until well into November before the animals appeared, and one year it was as late as December. Most of my previous experience with caribou had been during the autumn migrations, so that I had never really seen the stags at their best. But this year fortune was kind to me, and I had abundant opportunity for watching the animals and studying their habits.

#### Caribou Are Not Monogamous

LITTLE or nothing has ever been written on this subject. Let me begin by saying that the caribou are not believers in monogamy; at least, this is true of the Newfoundland species, for they will take as many wives as they can get possession of. Judging by

what anything like reasonable photographs range, I might add that my experience was not with one or two stags, but with nearly a hundred, and headed throughout the entire breeding season. Perhaps I was unusually unlucky—or lucky, according to the point of view—but I would have given a great deal to have found even one stag tractable enough to come within close range, so that really satisfactory photographs could have been obtained.

The most interesting day I have ever spent with caribou was when I was for five hours with a large herd that numbered over a hundred does and stags. Then it was that there was opportunity for watching them at very close quarters, so that their behavior could be carefully observed. This herd, when I first saw it, contained about forty, among which were several fairly good stags. They were joined during the day by another herd, until there were nearly a

hundred, of course, have been fatal. The slightest word of man will arouse their suspicions, and soon that occurs there is no chance of doing anything with them. As it was, they were absolutely oblivious of my existence, and were as peaceful as a herd of domestic cattle on a warm summer day.

Not more than a few yards away from me, a pair of ungrazed antlers showed above the bushes. A post-stag stag was lying down near a couple of does. In front of me was a very old stag with long, spindly horns. He stood perfectly still for over an hour, with his head lowered almost to the ground. It is difficult to understand the meaning of this curious habit, which exists only during the breeding season. Sometimes a stag may be seen in the middle of a barren, standing in this absurd manner for hours at a time, apparently oblivious to all the world. The animal near me was almost white, and had the very

A caribou stag driving his "harem" of does northward to their summer home

During the mating season, when the woods are deep in water and slushy snow, the fawns are often separated from their mothers, but they take to the water like ducks

all the accounts that had ever come to my knowledge, either by reading or hearing, I imagined that each herd contained only one stag, and that the stag would always fight if he met a possible rival.

There appears to be absolutely no foundation for either of these ideas. The stags do fight, but only on rather exceptional occasions; and herds may have quite a number of full-grown stags, who behave on a whole in a most amicable way. These stags even go from one herd to another, with only occasional interference.

I had also heard that the croonings were so all-trouped that on the approach of a man they would throw aside all discretion and attack him, without the least provocation—so that attempts to photograph them at this season would be attended with considerable risk.

This is not at all in accordance with my own experience. Not only did the stags not attack me, but I had the greatest difficulty in approaching them to

hundred and fifty altogether, and one poorly fit stag.

#### Following One Hundred and Fifty Caribou through Swamp and Woods

FOR hours I scrouled about through swamps and woods, now-and-then not daring to make a move, until I felt as if I should frown to the ground—for it was a bitterly cold day. Frequently the animals would be within a few feet of me; some even slept so close that I could almost have touched them. This, unfortunately, was in a swathed thicket of dwarf spruce and scrubby birch, so that the camera could not be used; but, even if it had been entirely clear, it would not have been wise to attempt to get photographs, since the sound of the shutter would have revealed my presence and the herd would instantly have vanished.

So it was that I watched patiently, keeping a careful lookout that no straying doe went down wind,

long nose that is characteristic of old stags. It was impossible to obtain a good photograph of him, for there was a lot of intervening brush, and I severely scared many a doe, for fear of disturbing the many creatures that were within sight. At last a doe came along, and the old fellow moved. This seemed to offer a fairly good opportunity, so I gradually raised the camera and secured the photograph shown on page 16 without attracting attention.

During the hours of waiting, the stags could frequently be heard crooning. They were, however, in the thick scrub, and being entirely surrounded by does, there was no possible chance of approaching them—the only hope was that they might come toward me.

#### A Battle Among the Caribou

LATER in the afternoon a stranger doe appeared on the scene. Evidently he was unknown to the

small thumping travesty as melody, until it all but drowned the deep low voices of the men. Beneath the arched lamps that hang from the low board ceiling, many of the men's heavy faces were red with fresh blood, others were ashy, some of which wore the rugged marks of exultation like the recent one, while others, dead by loading powder, had been revived in the crowd, surrounding warriors about the leavers waged against the living rest of the mountains.

SUDDENLY the roar was hushed. A woman's scream ran along it. The men turned toward the bar. Jerry Morley stood facing them. His big throat was swollen with passion, the great veins standing out on it like ropes. His red-tinted eyes were half closed. Eight lines between them drew his brow deeply. Near his feet lay a half-drowned form. He kicked it as they looked.

"Get up, you—!" he said hoarsely. The bundle stirred slowly; the roar of voices went on. The piano turned to his instrument. The rattle of tin began again at the crystalline. Jerry Morley walked the length of the bar. He

"Ye can't stand for what ye robbers!" he growled, and raised his empty fist.

The man's hand flew toward his hip. Jerry Morley leaped the wrist, wrenching it; there was a sharp cry of pain. The arm hung limp when the guest loosed his grasp, and a revolver fell to the board floor. "Ye will!" cried Jerry Morley. "I'll learn ye!" And he struck the man down, and kicked him as he lay on the floor. Some in the crowd laughed, others yelped encouragement.

THE woman in red—who was leaning on the bar—saw—raised her head from her arms, then dropped it again wearily. The door opened slowly.

Jerry Morley sprang to it with upraised hand—and came to a halt with his hand stiff on high. A black-robed man entered.

For a moment she stood, dazzled by the glare of the arched lamps. Beside her, Jerry Morley covered about her front form, his hand still raised. The piano had come to a stop. The men in the room stared, silent. On the floor, motionless, a growing patch of dirt red beside him, the bartender lay huddled, his arms still before his face. Near him stood the woman

The man answered his question as calmly as if there were nothing unusual in the things about them.

"Could you show me the right path? I must hurry."

She asked it with the simple assurance she would have used in making the request of an altar-boy on a street corner.

Jerry Morley threw open the door. Before them lifted the black wall of the mountain-side, and against the blackness, high up, a yellow ray was moving swiftly. As he looked, it vanished suddenly.

He grasped her arm. "We must make a run for it. Niels," he said briefly. "The train's in the cut now at the end of the second leg."

They ran together out of the place and over the snow gateway to the short cut. There a path straight across it.

"We must try this steep cut. There's no time for the regular trail." His bare nose beamed on the still night air.

Behind them a low glow of saloons threw lines and patches of yellow light on the snow. The night sky was clearing, and a few stars showed above the black outlines of the mountain ahead.

"The Ruby saloon was living up to its bad repute this night"

lifted his bass voice until it rose above the noise of the room.

"Billy Cassidy," he called—"Billy Cassidy, come here."

A square-shouldered man with high cheek-bones and slanting gray eyes passed his way through the crowd. Jerry Morley advanced into his ear, and the other smiled evilly. Together they moved to the closed door and stood beside it. From their places in the crowd, the other side watched these two.

The door swung open. Morley's great hairy paw fell on the shoulder of the man who entered. From the other side, Cassidy seized the newcomer. Together they dragged him to the bar, with the crowd in the low room stood looking at them without a word. The victim had fought for a moment; but now he stood cowering in their united grasp. Morley nodded. The two giants reversed their hold, one man in with a ban when they tip it along end over end, and grasped the man by the legs, lifted him on high in this position, and shook him. There was a sound of jangling, and they threw the headless man to one side like an old sack. Cassidy bent to pick up the money.

A roar of laughter went up from all sides of the room. The stock-barred, hoarse-eyed man behind the bar did not laugh. This thing had gone too far even for him. He ran from his place to where Jerry Morley stood, now holding in one clutched fist the money, which Cassidy had given him.

"Jerry Morley, I can't stand for this!" he cried. The giant's eyes straightened and he half closed his gray-green eyes. The bartender was close to him now,

in the red wrapper, her black locks hanging in a loose tangle, a vital mark upon her cheek.

Gradually the eyes of the man included three things, and as they did they dilated. Yet her white face remained absolutely calm. There was an almost imperceptible shivering of her slight figure, and she half raised one hand to her head. All that moment Jerry Morley, with his great hand of a hand, mechanically took off his misshapen snow-white hat. For perhaps a second he stood, holding the alkalin head covering beside him. The green square of the bartender stirred and he moaned faintly. The movement and the sound awakened Jerry to speech.

"Niels," he said, "did ye want anything?" His heavy voice sounded dead, though he spoke low. The man turned toward him, her small oval face looking upward into his. It was a rare face, even with the setting of snuff-buff and the white borders. And from beneath the front of her hood peeped a lock of auburn hair whose soft sheen and curl no convent's discipline had ever completely subdued. Yet the impossible features and the large, quiet eyes possessed complete spirituality.

JERRY MORLEY felt all these things as he looked down into the quiet face. He did the others in the room, peering at the black-robed little figure. None of them stirred—except the woman by the bar, who raised her head, then lowered it, bring her eyes on the form of the man's garment.

"I missed my way to the depot; and the train is coming now."

"Niels Corvella is at the depot, waiting for me," she said. "I came alone, and I took the wrong path."

"Ye were mistaken, Niels," he asked, a mixture of disbelief and deep respect in his hoarse voice.

"For the Paul Leavenworth Orphanage," she told him. "Do you think we can get there in time?"

THE yellow eye was in sight again, far lower on the black wall, crawling softly toward them now. They could see little dots of light marking the rough windows. Suddenly a flare of red sprang through, then vanished in smouldering darkness. As they looked, the train swept up above them and a faint humming came to their ears.

He suddenly realized that he held his left hand clamped. Noting, he felt the money that he and Cassidy had shaken from their last victim. He had held it instinctively all this time. He was about to thrust it into his pocket, when the man caught her foot in his cumbersome black shirt and stumbled. Morley reached out and grasped her; then stammered her awkwardly, with his hand on her elbow.

He quickened his pace, taking long strides, and she stumbled as she tried to keep up with him. As they crossed the dump, the train was nearing the end of the last leg. It had almost reached the cotton bed.

The path turned now, making a detour to the right to reach a little bridge across the stream. Ahead of them the side of the dump dropped sheer to the creek, now making full-banked from the flow of the day before. Across it, twenty feet above the water, cutting the loop of the trail, stretched a tree-trunk. The

Addressing the ball

## INTERLUDES

HOW HE DID IT

They were seated in the smoking compartment of the Pullman car, and, as men will do under such circumstances, they began discussing the high road of living. One middle-aged individual who sat in the corner smiled deeply as the discussion ran on, and finally blurted out his feelings.

"It's a perfect outrage, the way everything has gone up," he said, "and there it's all going to end suddenly under the canopy known. The worst part of it all is that thousands of worthy young people don't dare get married for fear of being swamped by the ever-increasing expense required."

"Oh, I don't know about that," said the mirror of fashion and mold of form over by the window. "I get married last year on ten dollars a week—"

"What?" cried the middle-aged man, with the manner of a doubting Thomas. "You mean to say that as these times you got married on ten dollars a week, and make it go?"

"I sure do," said the young man, taking a solid gold cigarette-case from his pocket and passing it around. "That's all I had, and I only got twelve now."

"Well, by George!" said the other. "I'm blast if I see how you do it. I get forty dollars a week, and life's a Chinese puzzle for my wife and myself all the time."

"Why, of course it takes some management," said the young man, "but by snatching things carefully, and reducing my expenditure to a system, I make it go all right."

The middle-aged man laughed a mirthless laugh. "Well," he said, "that stumps me. I wish to thunder you'd give me a sort of general lay-out of your expenditure. It might help—"

"Sure," said the young man, smiling pleasantly. "I'm always delighted to help another chap along with the benefits of my experience. The married life I workly expose amount of mine is my lead for so long now that I really know it by heart. I can recite it backward and forward, and let it slip at the top, bottom, or in the middle without the aid of a pencil or a cash register. Here is the detailed statement—take it down if you want to:

2 packs cigarettes per day, at 20 cents, or . . . . . \$2.00  
 14 packs per week . . . . . \$2.80  
 I travel, at 20 cents a day, with 10-cent tip for leader and baggage . . . . . \$2.00  
 16 dollars per week at two for a quarter . . . . . 1.75"

"Excuse me for interrupting," said the middle-aged man, "but do you really live fourteen now dollars every week?"

"Oh, no!" laughed the young man. "That's one of the ways I economize. It saves a lot on my laundry bill. Wearing two collars a day, as a gentleman should, your head's job would amount up some if you had my wash-day."

"Oh, no!" cried the middle-aged man dejectedly. "What else? How many dress suits do you have per week? Seven?"

"Oh, no!" laughed the youth. "I had one last spring well through the winter, even after I lay in three pairs of trousers, six white waistcoats, and a dinner jacket to go with it at the start. But, let's see—where did we leave off?"

"You had just accounted for your weekly cargo of collars," said the middle-aged man grumpy.

"Oh, yes," said the youngster, "I remember—well, that totted up to \$6.00, which, with two new hatted ties per week at \$1.50 apiece, brings the total for what I may call the necessities up to \$9.00, leaving, on the ten-dollar basis, thirty-five cents for lavatory, or, on the twelve-dollar basis, \$2.25. This goes for such things as an occasional hat, or a visit to the theater or to the club, or perhaps for a bunch of sweet-peas or a lot of candy for my wife. I find that it isn't the cost of the thing so much as the thought of the thing that pleases a woman, and my wife doesn't care what I bring home to her, even if it is only a pocket card with a picture of the Grand Opera Building on the back of it, as long as she knows I've thought of her during the day. But, somehow, I always hang these expenditures under the general head of trifles, which finishes the account—"

"But see here," cried the middle-aged man, "you haven't accounted for house-rent, wages, food, clothing, light, fuel, shoes, doctor's bills—"

"Oh, those?" said the young man. "No—I don't account for things of that sort. You see, I don't have 'em."

"Don't have 'em?" echoed the middle-aged man. "Under what gloriously inspired delirium do you live that you don't have to consider the narrow, whetted shall we be fed, and what you shall put on?"

"No, sir," replied the young man. "I'm strictly unknown to humanity."

Here he lit his thirteenth cigarette with an automatic silver pocket-knife studded with rubies.

"I'm an idiot, but, you see, when my wife and I got married last year, we went home to live with some," he said.

**THE MESSAGES OF MARCUS OTTUM**  
 A POWERSOME man is not necessarily a sign of political undergrowth.

"In Union Is Strength" is a motto that is seldom heard at home.

Contentment is better than riches, but the two together are better than either.

A girl may be a perfect pharisee and yet fit a man with one by giving him the agoutie.

Many a prospector looking for quarts of gold succeeds only in finding a rock or two in the end.

If it is the time of your prosperity you will give every man his share, in your adversity you will find more men taking your part.

Love may make the world go round, as both have said; but there are times when it fails to do the same thing with man's income.

A poltroon is a fine possession, but we have nevertheless known many a man made of common clay to turn out a perfect hero.

often delight in catch him napping in his criticism thereof.

The man who thinks twice before he speaks never may be reckoned among the wise, but he will never make a reputation for himself as a master of verb first and adjective.

The Wheel of Fortune is a very smooth running affair, even so we get it going; but when on the Road of Extravagance be careful not you joust the tire.

It is to be feared that when some women get to heaven they will be found putting the feathers out of the wings of the cherubim to decorate their backs.

By the proper use of cosmetics, a clever woman who is physically a trifle "out of drawing" may yet make a first-class composition of herself.

**FOR CONSCIENTIOUS SAKE**  
 "Will you Mr. Meaton be going to abolish the Title of Collector of the Port at Mr. Bryan's request?" said Jimpson.

"What's the idea?" asked Whimper.  
 "It is to be Collector of the Grape Juice hereafter," said Jimpson.

**CHEAPER AT HOME**  
 "I see," said Bill-headache, "that over in Tartary you can buy a first-class wife for \$125."

"That's nothing," said Yincicus. "Here in Anurolo almost any man can catch a Tartar for the same."

**A WISE CHOICE**  
 "If you could choose, Billings," said Waggles, "which would you take—a wife or a motor-car?"

"A motor-car every time," said Billings. "Because, you see, if I had a motor-car, the chances are I could get a wife; but if I had a wife I'd be less to me I'd never be able to afford the car."

**A CHARITABLE SOUL**  
 "Can't you give me nothing to eat, man?" said the tramp. "I'm out of a job, and I haven't had nothing to eat for a week."

"Maybe I can give you a job," said the farmer's wife. "What do you want to do?"

"I was the Glass Eater in a Dime Show, man," said the wanderer.

"Poor man!" said the lady. "Come right in and eat down. I've got a half store of patent medicine bottles just waiting for you. Would you like 'em hot or cold?"

**A USEFUL OCCUPATION**  
 "I see," said Mr. Bizzled, "that your son John has been made a B.A. and a B.S. and a C.F. and an M.C. all at once at Spurgeon's."

"Yes," said the proud father. "John has pretty nearly the whole alphabet tacked in his name."

"What's he going to be, now that he's graduated?" asked Mr. Bizzled.  
 "Why, I don't know. With all those degrees, he ought to make a good letter-carrier," said the proud father.

# THE BATTERY

BY DONAL HAMILTON HAINES

A GROUP of unshaven, bearded men sat around a door-shutter supported by two men-horses. The light from two oil lanterns washed each side and center of the shed, and fell upon the many-colored surface of a big map spread out on the floor. The men looked at their chins in their beards, and looked at the map and colors of color with light, unwavering eyes. All over the surface of the map were little pegs, some of some color, and with some of them were small pieces of paper, so that it could be stuck into the heavy paper and leave only a small hole. A tall man on one end of the improvised table upright, lighting a single black peg up and down in his hand.

"We've got to show our battery close to the line," he said after a long pause during which he stared fixedly at the map.

The chief of artillery, sitting at the speaker's left, gripped his thin hands tightly about his face and scowled. He had an earnest, eloquent objection to breaking divisional artillery into smaller units than three-battery battalions.

"A lateral move of three miles would bring three batteries into action there if the occasion came," he asserted.

The tall man shook his head soberly and forced the black peg into the map with an air of decision, then looked at his chief of artillery for support. The latter bowed forward with a slightly stony, arbitrary glare of the last of his batteries.

"It's thinking out the line too much," he said to himself, as he stretched out a leg forward to the map.

The black peg had been stuck near one of the wriggling contour lines marked "500" in gray figures. Both sides of the line were marked "100," thus pulling the battery on the top of a hundred-foot rise.

"It's a tidy little place for a battery, it cuts away these three thousand feet that stand against the general, seeing that the chief's forces are divided."

The chief stared steadily at the map. The general had the black peg stuck on the edge of the map; he had had several other of the colored paper for hours, and he was tired.

"Inconvenient," he announced. "I think that divides our positions."

He passed, but the chief kept silent, each was intent upon some portion of the map. The general sat down and began to give an order, and shortly, motionless face of a messenger debiting to his stomach. The circle of four men stared silently as the general spoke, and then the chief of artillery, who had the heavy musk drawn on, with an occasional hiccup; then the circle broke up, the batteries came down from their pegs, and horses' heads nodded behind in the night.

A few minutes later, all orders were pushed their horses through the darkness in every direction, and they lighted trails here and there, where the men of the field-telegraph were going over their instruments that nothing might slip in the morning.

CAPTAIN HAYE made it a rule never to sleep on the right before a battle, as he made it a rule never to do anything else that he could not do honorably responsible. It was a matter of instinct to the surgeon and artificers of his battery, that he looked at specific incidents during battle marches (and even forced marches) and had them never to every act and not—but HAYE's gun was never losing wheels at critical moments, or coming barely into "action line."

So HAYE was sitting wide awake by a tiny fire, smoking his pipe and reading a newspaper three months out of date, when the first of his men and horses brought his instructions at three o'clock in the morning. Left alone, HAYE shifted his pipe into one hand and the newspaper in the other, and went the other side to himself.

"Open being joined by your orders at five o'clock, you will march west, receiving your final instructions by telegraph."

HAYE scratched his head thoughtfully.

"Detached service of some sort," he said, fiddling the thread, it into his pocket, and resumed his newspaper.

The night-lighting process was already over, and the four lieutenants, in the darkness, had a suspicion of guns and caissons, when ten sleep troops of cavalry, who were to act as escort, made their appearance. The battery got into the road with the usual accuracy, but there had always been asked, the cavalry escort split its flanks, advance, and re-arranged of the main body, and the little column took the road.

With what his subordinates privately considered almost servile following of the regulations, HAYE rode carefully in the middle of the column, at the left. The narrowness of the road prevented his position being exactly fifteen yards from the hub of the wheel and others in the column, but he kept his eyes neither to right nor to left until the column passed a fence guarding the wayward side of the field-telegraph, then HAYE centered ahead and probed his instructions.

"The battery will occupy square 101," he read, and will act under the orders of the divisional commander unless directly ordered to the contrary."

HAYE looked up the order and conferred with the captain of the leading troop of cavalry. In the light of the moon's pocket, the other three lieutenants, and HAYE's steady forwarder pricked out their own position and located "square 101." The column joined

on its way, while HAYE began debating in his own mind as to whether he should use Russian or French gun-pits, should arrange fire his time for their construction.

The line of their march cut the patch of the ad-joining body at right angles, and the little column, which had been several times when drawn away of leading infantry, charged troops of cavalry, and long, winding lines of horse and foot-artillery would appear about the same time and place.

From time to time HAYE consulted his map and conferred with his lieutenants. His caution was met by that of a sudden lawyer that a final man; he seldom changed his mind, but he seemed to require that each part of his mental processes should have without a gap when he might call into his own view. Now viewed the passage through the advancing army without concern or apparent interest, but his lieutenants were not so minded. Despite no Wainwright's order, the main body of the battery would decrease the interval between them unattended and converse in low tones.

"They're shoving us clean out to the fringe of things. We've gone through the corps artillery and a good bit of the divisional artillery. We'll be out in the cold—and this is going to be something of a fight, too."

"Probably we'll swing on to the flank of the divisional artillery," announced Wainwright, "but we'll take the old man out of things altogether. He's too well-sided!"

The coming column became thinner and frayer, and each of the men on either side were running into the reverse communication lines, when the column turned a corner and swung to the right. HAYE's head swiveled again, and presently the non-commissioned officers of the battery went ahead to reconnoiter, while the cavalry, dismounted, scrubbed themselves of artillery on the left and the infantry gathered in a knot behind HAYE. Presently the sergeants came strutting through the gloom, and talked excitedly to HAYE, who clicked in his horse and looked at them.

"Now," complained Drake, "we'll waste HAYE's good intentions. He's,"

"Well," admitted McCord, "he is a job, with all his pretensions!"

THE minutes passed. Finally HAYE rode back, and the four lieutenants, and the four lieutenants looked at one another and then laughed.

"Well," admitted McCord, "he is a job, with all his pretensions!"

THE minutes passed. Finally HAYE rode back, and the four lieutenants, and the four lieutenants looked at one another and then laughed.

"Well," admitted McCord, "he is a job, with all his pretensions!"

THE minutes passed. Finally HAYE rode back, and the four lieutenants, and the four lieutenants looked at one another and then laughed.

THE minutes passed. Finally HAYE rode back, and the four lieutenants, and the four lieutenants looked at one another and then laughed.

The other three shook their heads.

"There ain't a better judge of gun positions in seven kingdoms," Drake went on, "and he's stuck on square 101. He's a real expert, and the reason is that the guns will stick out of sight in the mud!"

"They leveled their glasses at the night, snapped shut, and looked at the map, and finally looked at which probably thinned into woods, as their flanks.

"It's crazy as well as be a million miles away," admitted Wainwright.

"It's HAYE's!" was Wainwright's opinion.

Wainwright, whose forehead had been furrowed with perplexed thought, shook his head vigorously as he put his binoculars away with a snap.

"You know better than that," he corrected. "I'll admit that it's the craziest thing I ever heard of—but he thinks he's doing the right thing."

"But that ridge up there was drawn for me!" wailed McCord. "And he puts it as thick as lead into this mud-hole with his eyes open!"

"And we've got two weary troops of cavalry for support," Wainwright put in. "One infantry regiment can't get up in five minutes."

"I know, I know," admitted Wainwright. "He's all wrong, but there's something back of it. HAYE has blundered. I am convinced of his wronging—almost lost out of his making a mistake."

THEY waited, dumbly, while the sound of firing grew louder for a time, and then drifted away on the outskirts of the two forces drew out of fourth and watched each other like cautious hunters after the deep blue of a fall-gate; a strained interval then another and another.

"That's the ending the range," whispered Drake. "Half an hour, and there'll be three hundred guns going—and we'll have a fog-pond!"

As the firing of the distant batteries sounded, he knotted the ash from his pipe, straightened himself in the saddle, and then went on to study the landscape, which was clearly a few moments he held the posture; then for the third time he pulled out the map, studied it with painful care, nodded, got away the map, and looked at the sky.

"He's worried," muttered McCord; "he keeps looking out at us in five minutes."

"It's the snapper they'll grill," persisted the loyal Wainwright, to which the others said "snapper" in chorus.

THE volume of gunfire increased until the air and earth seemed to tremble with the reverberations. The men listened with pale, set faces, their heads twisting and playing with the hills of their men and the battle of their reserves. At the noise of the guns swelled, they looked at one another like men in physical pain. Only HAYE and the horses seemed to be unaffected. HAYE, with a definite shake which square his shoulders.

"Lord will shepherds!" he announced solemnly.

The sun jumped as if they had been pricked. The order—was nothing as stout as had a dreary march, empty of everything save a few freezing, howling blackbirds—sounded like martial blasphemy. But the men hoped to cry it out. There was relief in the action, and they stood about the leading up of the charges, the opening and closing of the breech-blocks, and every detail of the operation with a precision that was almost a study in itself.

Once again his glass and studied the surface of the earth, the distant skyline, the woods, and the noise of the sun passed yards for a long minute, then he spoke again.

"Fight for seven hundred yards," he ordered. "Cut the lines so the charges will burst in air at that distance."

Again the warring powers executed the order with dead movements, then leaped into inactivity, leaving only the artillery dead dotted out every other second.

THE order which hurrying pencils had transferred to note-books from the lips of the man general on the preceding evening had set forty thousand men and one hundred and sixty guns in motion. Through the very center of the line, the first of the ranks had rolled. Ten miles to the north of the shed, the railroad crossed a river and ran into a flourishing city, where were the first of the great masses of rolling stock. It was this city that the iron passed and his heart thousand were endeavoring to take—was the first of the great masses of rolling stock. It was this city that the iron passed and his heart thousand were endeavoring to take—was the first of the great masses of rolling stock. It was this city that the iron passed and his heart thousand were endeavoring to take—was the first of the great masses of rolling stock.

the Indians from attempting any more direct assaults, for there was no other lighter of the great war chief's order in the city.

The Indians soon found out the exact range of our carbines, and Kananah, at the head, position of Beech Island carried a rifle. "They would come leisurely down the slopes from the hills that overlook the valley, and when just within range they would lob their points and gully like a shot right up to the river-bank, where they would fall long enough to give a man of bullets and arrows in our direction. Then they would be out of range again in an instant. I never saw such magnificent marksmanship as those Indians displayed."

In the meantime, the scouts kept dropping their trenches, and by daylight were fairly well reconnected.

"Some of us didn't have much protection at the outset," said E. A. Gilbey, who enlisted in Forceth's company under the name of Louis M. Langrish, and was shot through one lung early in the engagement. "There was a reloaded clip near me who had been very busy fighting in the much fighting. Finally when the Indians were standing on the opposite bank, pouring bullets and arrows into us, this fellow lay on his face to fill the clip was over. Part of his back was struck, and some of the Indians got his range in five days. Any way, they would pump bullets at the edge of his scalp, and every one of them would scrape the hair off his head before he could get up. I had enough to break the skin, but except to make him yell and cower. That clip was wounded fifteen times, in just that way, before he could borrow me enough to find absolute protection. You get an idea from that of some absolute no-were at the mercy of the Indians. If I had not lost track to the island, I could not

have been too excited to shoot well, but I would have been all over in the first round."

As night fell, it was seen that the Indians had determined to starve out the little band on the island. The cries of the howlers could be heard from all sides, and it was evident that a cordon was tightly drawn about the place.

Water was found only at a depth of two or three feet, but Forceth knew that the question of food would soon become a matter of life and death. The scouts had about a few days on the carcasses of dead mules and horses, but there would be no more of that. Forceth determined to call for volunteers to penetrate the Indian lines and get out from Fort Wallace, the nearest army post, eighty-five miles away. From the men who came forward for this hazardous service, Forceth selected Jack Wallace, a youth and Peter Treason, an experienced plainsman and trapper. Hiding nearby to their comrades, these men started down the bed of the stream, and as nothing more was heard from them, it was supposed that they had penetrated the Indian line. Through the chances for making their way through a hostile country were very slender.

The second night, E. A. Gilbey and another scout were chosen. Pilley, on receiving the battle-field for the first time after forty years, insisted that he should where he and his companion tried to break through.

"I had who went with you was plucky enough," said Mr. Treason, "but he was too hot for such a long and tiring trip across the plains, and I think he gave up at the outset. He was killed on going so we made the trip. We reached down the river about midnight, in the middle of the night, and found we were playing along the bank, and suddenly there came an extra light flash. By the light, I saw a bunch of Indians directly in our path, evidently waiting for us. The three boys and Major Forceth lurked away more at length that night. Next day my companions were finally persuaded that he was not cut out for such work, and the choice of his successor fell on Jack Dawson—fortunately for all of us.

Dawson and Pilley, who were sent out on the third night, reached Fort Wallace only an hour behind Wallace and Treason, but they have received much attention at the hands of his comrades. They have been almost completely ignored, in spite of the fact that, but for the heroic Dawson, who guided the relief party, there is no telling what would have resulted the starving and disheartened garrison of Beecher Island.

Forceth was beginning to suffer before from his wounds, and I have been told by his sons that a good part of the time he was delirious and did not know what was going on about him. Hence, Dawson was selected in the commander's account of the fight, and it is only within recent years that he has been given the credit that is his due—credit that seems little better than mockery, if it came after the severe soldier's death.

"I missed with Jack Dawson—God bless him!" said Kananah, "and a better type of fighting man would be hard to find. He was the lightest-hearted man I ever saw. He could not down at the extreme end sleep songs at his evening, and never sing the same song twice. He never drank anything but water. Every man was wild to get him, because such a type of fighting man would be hard to find. He was given his shot of coffee whether he drank it or not, and what he didn't use went to the great ones. When Dawson and Pilley were on the march that had been taken to the dead Indians,

and said goodbye to us, we never thought we'd see them again, but we were wrong. We thought we'd see Dawson and Treason, who had gone a night before."

Crawling in and out, as silently as leopards, Dawson and Pilley made their way down the north side of the island. Fortunately, the night was dark, and they managed to get past the Indian pickets. But a scout was on the island, they crawled up on the bank and made their way up a draw to the top of the bluff overlooking the valley of the Arkansas. The scouts decided to trust only at night, for the country was alive with Indians, and at attempt to travel they would have met certain capture. They had put on moccasins instead of boots, in order to deceive any Indians who might observe them, and they shaped their course by the North Star. The two men had not gone a mile, however, before they found that every step was torture. The moccasins, being wet, afforded little protection against the spines of the cactus and prickly pear, with which the desert was covered.

Dawson and Pilley agreed that the best plan was to make their way up the Shucky Hill stage line, which then ran as far as Denver. If they could find wild meat and take the cross-country stage, they would reach Fort Wallace more quickly than if they tried to do the whole journey on foot.

"The first night's walk took us not quite across the divide," said Pilley, in recounting his adventures in a buffalo saddle, and by three all day at the hot sun without water, our only food was a little of the horse-meat, we had taken with us. The next morning we were on the island. About three o'clock in the afternoon we spotted a fair party of twenty-five Indians coming from the south. They were headed directly toward us, and we thought they knew our whereabouts, in fact they had followed their course, they would ride over us. We got our cartridges where we could see them, and after a moment's hesitation we fired. But when the Indians were within a quarter of a mile of us they halted, and after a moment's hesitation they turned and passed by without seeing us. Dawson, always light-hearted, was simply too excited to say a word 'til, for a thousand longings!"

"After dark we took up our weary way, but our feet were so sore that we might have, they were doubly painful now. Every step was agony. We had to use all our strength to keep from giving up and lying down to die on the prairie. About midnight, though, we reached the South Fork of the Republican River, and spent the night on a small island and looking our men and women folk. When we drew our moccasins, we simply had to discard them, because they had worn down to the point that they would be of no use. Still we kept on, and after a moment's hesitation, we were in the valley, as before, but sighted no more Indians."

We had planned to strike the Shucky Hill stage near Cherryville, a station near the present Colorado-Kansas line, but the condition of the river drove us back in the morning, we struck the road at a much lower three miles east of Cherryville. Our feet were swollen to twice their size, with blisters protruding from them like plas from a gun. The men were so weak that they could not get up, and we had to carry them down to where they could be put in a wagon and taken to the station.

"The next day, the Indians being disappointed by the condition of the abandoned men, a detachment of about the wounded to defend themselves, as but the soldiers at the station, the low hills in the south, exclaimed:

"There are moving objects on this hill!" They tried to be Colonel Carpenter's ambulance, with Jack Dawson riding in it. The ambulance was so full of wounded that the scene of the fight. Nobody being guided him up the Arkansas River, he was given his shot of coffee whether he would have been carried for and the heavy fee.

It is agreed that a delay of another day would have been fatal to some of the scouts. Kananah had set in, Forceth's son, and twenty-four hours more would have been enough to have killed him. If it was, the scouts arrived the assistance of his shattered leg, but Forceth was so weak that he could not be allowed to have his own way and create all the link was sunk, though the command was given to the ambulance. It was two years after the engagement.

## COMMENT

### Public Opinion and the Railroad Controversy

The controversy between the Eastern railroads and their conductors and trainmen ought to result in something for we are getting an uncommonly good chance to study it. No doubt, there have been and will be things done more or less behind the scenes, influence exerted, for instance, in quiet ways that we shall not know about. Personality will count, and the Associated Press reports, though often well-written, are not the work of BALDWIN and THUNDERBOLT. But we can hardly recall another great labor-and-capital controversy put before the public as well as this one so far has been.

We have seen the metamorphosing of position, the swift transfer of action to Washington and back to New York, Erie's stand and revision, the railroads' disconcerting demand about their own grievance, which at this writing looks like a fairly successful effort to score a point rather than the taking of a position meant to be adhered to. If the general present expectation of an arbitration is fulfilled, then we shall be equally well served concerning the merits of the case; and we might in study it.

For it looks more and more as if, in the long run, we, the people, were going to decide about these things—not the specific cases, perhaps, but the way cases shall be decided. We have not, so doubt for good, letting the railroads decide and the men do what they can. It is hardly proposed to let the men decide and the railroads go hang. When President CHAMBERS, of the new mediation board, said the other day that public opinion was already the strongest factor in the situation, he was not far wrong, and the future will set him completely right. Public opinion will continue to set through legislatures and commissions, through both the unions and the railroads themselves, and finally, crystallized, through the courts. But this matter of justice as between public-utility corporations and their men is in public opinion's proper province—and now in its grasp. It is a kind of justice which we believe that public opinion really has the virtue, in the long run and after errors, to determine aright.

### Some Obvious Arguments for Protecting Nicaragua

It is not at all surprising that our provisional treaty with Nicaragua should have instantly arrested public attention. It could not for a moment be mistaken for anything less than an extremely important departure in our diplomacy. In consequence, as with Cuba and the Philippines after the Spanish War, we have taken steps more or less like this; but this, taken deliberately, has the earmarks of a policy whose result is not determinable. Neither is it surprising, reversing the objection, as they say in the House, that the administration's proposal, fully concurred in by the Nicaraguan government, should have instantly found favor in the Senate and other strong quarters; it aims at things too plainly desirable.

As to securing the Nicaraguan canal rights and a new naval base, these are things which stand apart and for which we had already made offers. As two administrations have not thought three millions too much to pay for them, that valuation is doubtless all right. Of course, we don't want to build a second canal, only to keep others from

doing it. The late Senator MORAN, of Alabama, the tireless and learned advocate of the Nicaraguan route, is in a way vindicated by our thus continuing to guard it.

But it is the new parts of the proposal we are all thinking most about, and these, too, aim at things desired, which may as well be given first. They aim at peace and settled government in Nicaragua, from the lack of which we ourselves have recently suffered in men and money; at a sound financial system for that perpetually embarrassed state; at a sensible management of her foreign relations, to keep her out of broils with her neighbors and the world. It seems only true to add that the proposal would readily have been extended to embrace Nicaragua's independent neighbors if they had wished, but that for them also those of its aims are desirable. On the other hand, we believe one can say honestly that no territorial aggression or absorption is set one of its ends. There are a few filibustering Americans, no doubt, most of them in Latin America, but the great mass of us have no such designs in our direction, and our politicians know it.

### Some Sources of Hesitation

No such is good; perhaps that is enough, and it is good enough, to overcome all fears and objections that rashly or hastily advocate treating these otherwise than very carefully.

There are the promptly declared objections of Nicaragua's neighbors. Not only have Honduras, Salvador, and Costa Rica declined their assent to any such arrangement for themselves, but they regard Nicaragua's net as something like treason to the old dream of a federated Central America, no doubt, most of them in Latin America, but the great mass of us have no such designs in our direction, and our politicians know it. There are the promptly declared objections of Nicaragua's neighbors. ### The Whole Bill

After so many weeks of talk about amendments to the tariff bill, it may be as well to have some discussion of the bill as a whole. After so much of detail and application, it seems wholesome to emerge awhile into an atmosphere which permits broad principles to be considered, here, constructions watched and analyzed. The Senate debates

will not continue like that, but we are glad they started off that way.

For one thing, it serves to show both sides how real and unavoidable this conflict is, and that is something only too easy to forget when tariff-makers are absorbed in specific schedules and items. Thus the fight really comes to seem merely an affair

"Of slowly calculated loss and gain,"—and it is hard to keep in mind that "more"—though it be such by only a cent or two in the pound or yard—is one thing, and that "less" is a different, a positively irreconcilable thing. That, indeed, must be a chief reason why so many tariff bills go wrong in the making; they vary detail makes it so hard to keep any principle dominant.

Yet one can not read the opening outgoings of Senators SWAN and CROMBIE and BATES without again perceiving, as clearly as ever, the old conflict of political principles and economic theories that has surely, by this time, proved itself irreconcilable even if it does now-and-then wear for a little while a respectable, if hardly hardly have strengthened the demonstration if, wicker years ago, we had had a war with the Nullifiers about it. For it is not plain that these Republican speeches, in which we readily grant sincerity, express a view, not merely of our American conditions and our trade, but of all trade and of the sense of all national prosperity, which is different from that which the COLUMBIAN bill attempts to work out!

For these gentlemen do the Democrats the justice to perceive that they are entirely in earnest, and on that ground, not because of any slight inconsistencies, attack the measure. Senators CROMBIE and BATES, in their efforts for freeing our trade, not for falling to Senator SWAN was too earnest to be at all content when he asked the Senate just to look how much we are already buying from foreigners and think of getting us any more! In this philosophy there is simply no place for such considerations as that two-sided deal between nations may be best for both; that America may be either over-producing or under-producing.

It is not, therefore, also plain that it would be a coincidence in any case to have the bill tampered with, to have it become anything less than what it now is—no least experiment, so reviewed by friends and foes of tariff-reforming taxation? We believe that any such tampering would have that feeling. As to tariff boards and other plans for gradual modification, meritorious as they may be, this is no longer a time for them. This is not modification, it is change—change to a different basis and principle. If, as we saw before, that basis and principle shall yield us to economic stability, we may quite possibly find under it a use for devices of correction and of energy, amending modification.

### All Quiet Along the Pacific

There is something interesting about the still very recent Union-Pacific-Southern-Pacific settlement. One hears so little about it!

Of course there were LAWRENCE and LATHROP, but really, if it isn't speaking disrespectfully of a newspaper sensation, that episode didn't amount to much, either in business or politics. It was a mere extraordinary piece of knavery, with little or nothing behind it. What we mean is that the arrangement accepted by the Attorney-General as opponent of the Powers was so far from having provoked little heated animosities, as we need less to add, we shall all be delighted if we find this news that the deal was about the best way out of a big mess that was far from new.

For the California railroad situation was nasty and political long before the New Haven road, or New England, dreamed of monopoly. There was a BRYANIAN lag before there was a NEEDLES, and HANFORD, after all, was a visible

"It's no little for me, an' I've got two real strykin hats, howdy? but I ain't goin' to feign that you want 'em!"

"What makes 'em call you 'Hindoo'?" the youthful inquirer demanded. "That's a funny name."

"My real name's Hindoo, but I don't think that's got any 'go' to it, do you?"

"Go," repeated Abelson vaguely. "Go where?"

"Well, just 'go—anywhere—anywhere!"

"Blessed foolish to me," Abelson had the small boy's seven of pit amuses. "I'd rather call you Mazy—'t wouldn't be my fault."

"Well, I guess so. I want to sound like an aunt." They looked at each other for a moment; in the passageway they could hear the footstep of Mr. Baldwin returning from the "break." "Yes, I guess I do"—and she stooped to kiss him; but Abelson, who had a very young gentleman's dislike of such demonstrations, evaded the kiss and, reaching his little finger in hers,—that infatigable creature of friendship the world over,—said: "Partners?"

The little ceremony was over before the group returned, headed by Mr. Balch, bearing a slice of stale Swiss cheese as a treat for Abelson; it was the most generous thing that the bar afforded. "Mr. Balch was incoherently hospitable. The young guest did not for the taste of his treat, and was glad it had so many holes that it fell less to be eaten for 'measures.'"

In the little, moss-walled, solid edifice was telling for the wholesome tones of his own voice.

"Now, this here Last Shoonster, if he ever was found, he wore a mighty eye and velvet coat of mine. In the old days, every prospector that comes into the country had the Last Shoonster leaver—and it was, too. There were those saggies some of 'em got up as a walaak, that old chief Hain in the face had up to the eyebrows, and the old prospector would look out to you—let you get plumb drunk in the eyes looking at 'em. Then he'd tell you the mine they come from leaping to his people a long way back, and let on that he knowed where it was—and you'd give a drink—maybe, if you was soft, a doze. It was all the same, a barrel couldn't make him tell where the Last Shoonster was hiding itself."

"And were the saggies, pros'ers?"

"Oh, weren't they just?"

Martin passed a shaking hand across his forehead. "I had no idea of the tremendous distances here, or that to hunt this mine I should have to travel over so much territory. I'm an old man, sir, but I'm going to have my try for it. I don't care about it for myself, but that little boy of mine, he ought to have his chance. He's bright, and I don't doubt he'll make a good thing out of mining; that was my rise, sir, but I don't mind admitting to you, it don't satisfy a father's ambition."

"You don't mean you're going to waste time hunting for the Last Shoonster after what I've told you? It might be anywhere—might be nowhere; there's nothing beyond the word of a bunch of drunken louts that it ever existed."

"But the saggies"—the old man repeated.

"Firsting you the saggies, but in all probability they came from a long way off, from the Pacific slope to the North. The best country's been pretty well run-tooth combed for the Last Shoonster and she ain't showed up yet."

TOWN was the beginning of that mad quest which, in its time, went on, kept the old man away from his can for longer and longer periods. He bought a horse and a prospector's outfit, and the hills saw more of him than Town. When the outfit and mining industries in the neighborhood failed, the Hindoo had left the town to its fate and had betaken themselves to more profitable pastures, and the outfit chug with the beauty of failure, waiting for something better to turn up. In its day, Town had heaped of many things, but a boy as an actual resident was a hard-earned experience, and it was a miracle that in his parental enthusiasm Abelson was not lured by the lures, blown up by the outrigger, and stampeded by the bonuses which he was hourly given to "play" with.

But Abelson was an alert Town, with hosts of friends and a following that would have insured an election, was one thing, and Abelson aged six, crying

"The boy backed off. This wild creature here no resemblance to his dear Mary!"

in the dark, afraid to go to bed when his father had failed to return from his greatest quest, was quite another. It was that that his "paddies" found him one evening, weeping desolately at the foot of the stairs, too weakened to touch the stick of "Biederich" the clerk of the general store had given him.

Now didn't say a word; only, gathering him into her arms, hurried up the rickety steps. She could not have told why she ran, nor put into words her dread that those inviolate powers that secured respectability to his name to thwart her should attend the simple pleasure of putting the child to bed. But as care came to question her right, and she put him down and lighted the lamp.

Abelson's preparations for the night were as simple as those of a young robin; he removed an old L.D.F.E. badge with which he had been ungenerously honoring himself for the last few days, and washed his coat.

"Where's your nightgown?" Biddle demanded, rummaging through an abundance of empty barrels.

"Oh, it's all wore out a long time ago. I must always take off my outside shirt to save it—don't sleep in all the rest."

"Would you like to have me make you a little nightgown with a pocket in it?"

"Thank you, Aunt Charley, want to make 'em for me; but she did, and papa sold the farm and came out here to hold the mine. I say my partners now." Abelson's suppositions were the faintly personal de-

ments of childhood; he prayed for his father, the prospector, for a partner who had been kind to him on the trail; he prayed for a miner to share his hardships, and he prayed for Mary (he desired to call her Biddle); and lastly he prayed for himself.

THIS place in the dance-hall below looked into mine and across preparatory to the burst of sound that ushered in the evening's entertainment. A little while, and the girl would be dancing in the smoky atmosphere, drinking an occasional stiff shot behind the back and smell of salt, but accepting it all graily as part of the day's work. But now the four walls that sat, and she deviated over the unusual experience of putting the child to bed, making believe to herself that she did this thing every night and that she was "like other women." Even when the boy was fast asleep she could not persuade herself to go, but lingered on, watching him. She stooped and kissed the hand of the sleeping child with an impulse womanly and good as gentle of the world of her month; then she descended to the glare of the lights and the din of the piano and the mystic heat of feet.

There was none the more but a little generous mis- understanding on the part of the stranger. Instead of seeing it in all its dreary, emphatic, vicious, brutal, cheap,—Martin Trow's simple old eye saw only growth, prosperity, and thriving industries. The yellow-haired Indian, with the vivid complexion that he characteristically in his bush years, were less in search of health, or because they enjoyed traveling—no reason was too absurd to be accepted. But Martin, so fertile in everything else, was granite when it came to his mine. For the character of the mine had become real to him already in imagination. As he roiled through the hills, he was spending the phantom gold that later he and his partner—Abelson should have his share. Seeing that he knew no more of the trick of getting gold from the ground "than a rooster," sometimes, if they left available or had small hope of their own at home, fellow prospectors would tell him certain fundamental truths of the great power of silver and rock. The other man would listen with a far away look in his eyes, and perhaps a week later the outfit that had entertained him with food and was general disintegration would be then passing allah! dust with sugar, quavering hands.

SINCE that first evening when Biddle had found Abelson crying on the stairs, she had put him to bed, with song and story, every night but his father was away. She had made his little nightgown with the pocket—was two of them so that he might have a change, like a schooler and a gentleman. Town regarded her general absorption in the boy with amazement, though no one dared put with her on the subject of her foster-motherhood after the day when Mr. Balch—prospecting on his position of professed admirer and willing donor, if he could ever save the mine of the larder—ventured an unenthusiastic ally in that direction. "I declare, Biddle, you've gone plumb to the good sense town," he struck Town; "you damn well ain't got no more spirit in it than you was ten a day's washin'."

"The day washin' I'd enjoy, Jimmy Balch, would be washin' my hands of you and your dear-old and the bested gang that's got soft'n' hole but their general manner of paying compliments. I just wish by the

"Are you a lady?" Abelson asked the one they called "Biddle."

SIR JOHNSTON FORBES-ROBERTSON  
AS HAMLET

MISS GERTRUDE ELLIOTT AS OPHELIA

## "HAMLET" IN MOVING PICTURES

SCENES from Sir Johnston Forbes-Robertson's remarkable production of "Hamlet" for moving pictures, which took place at Lulworth Cove on the Dorsetshire coast, where a medieval castle was especially built for the purpose. The out-of-door scenes were acted on the rocky coast beside the sea. The film, which was three miles long, was the largest ever made in England. Forbes-Robertson and his wife, Gertrude Elliott, are announced to open an engagement in America in October.

"The white tern is hatched on bare twigs, and seems to enjoy it"

# THE BIRDS OF LAYSAN

BY ERNEST H. BAYNES

**I**N the Oceania there are a number of bird communities situated on tiny atolls, rocks, and reefs, which straggle off southward from the main Hawaiian group in the direction of Japan. However important these may seem from the standpoint of man, they are nevertheless centers of great activity among the island population of the ocean. Each year, throughout the nesting season, which includes every month in the calendar, vast herds of sea fowl sail of remote corners of the southern sea to flock together to rear their offspring free from fear of molestation or injury. Every rock and reef has its community of many species, which return year after year, not all together, but in an orderly and definite succession, so that, even while some kinds are leaving with their young for the ocean, which will henceforth be their home, others come flocking in to fill their place, and to undertake the strenuous care of nesting.

Nothing more wonderful exists, among the manifold mysteries of nature, than the regularity and precision with which these creatures journey from distant parts of the Pacific and seek their homes, with no other guide than the fact that they have been there before. Whatever may be the faculty that enables them, after a flight of often many thousand miles, to pick up with certainty a speck of an island peopled scarcely three leagues at sea, it is certainly true that the voyage is now little more arduous than in earlier times when men first gave thought to such matters.

Intending as are all these islands because of the exclusive character of their inhabitants, one stands prominently as a singular center for the bird life of that region of the globe. I refer to the islet of Laysan, lying some eight hundred miles northwest by wind from Honolulu, and about four hundred in the opposite direction from Midway Island. It is really only the smallest of this on the chart—scarcely three

miles long—and in a slightly elevated shell with a lagoon in the center. The white coral sand is clothed in rich bushes and coarse grass, and, were it not for the birds, Laysan would be the loveliest spot on the globe. There are probably few other islands so far from continental shores.

## *The Home of Millions*

**M**YRIADS of sea-fowl fill the air and cover the ground. As far as the eye can see, the island is dotted with lonely albatrosses, the snowy whiteness of their heads and lower parts gleaming in the semi-tropical sun. Thousands of sea-swallows or terns of several species, dart back and forth through the air, and keep up a noise-making enough to drive one to madness. Splendid tropic birds, in glossy plumage of pale rose pink, flutter by in nervous haste, their two red tail plumes, fully eighteen inches in length, trail

Interviewing the chief of Laysan. "Two very striking facts at once impress the visitor: the vast numbers of birds and their surprising tameness"

ing out behind them. Men-of-war birds, boobies, and shearwaters join the throng and add to our bewilderment till we scarcely know which way to turn.

Landing Laysan, we had difficulty, if we wished to cross the island, to avoid crushing the eggs of terns, and as we proceeded we were constantly breaking through the roofs of petrel burrows, which everywhere brood upon the soil. We floundered along as if walking in deep snow, thereby disturbing the spaciousness of many of the best residences by our awkwardness.

This reminds me that the bird population is so extensive that all do not nest on the surface, but hidden in brown-rot bushes. Some, like the petrels and shearwaters, make dens below the sand and rear their young in darkness. Others occupy the ground floor, and among these are the albatrosses, terns, and tropic birds. Still others, like the land birds, dwell half-way up in the bushes, the topmost branches being occupied by many of our birds, boobies, and sooty terns.

Two very striking facts at once impress the visitor: the countless numbers of birds and their surprising tameness. They seem little put out by our presence, and permit of ordinary action as if we were a part of the community.

#### Dance of the Albatrosses

Of all the birds that make Laysan their home, none possess more striking personalities, or exhibit greater peculiarities of habit, than the white albatross. There are literally a million nesting on this tiny island, and they dominate all the other birds as rulers of the domain. They dwell in large colonies, forming rookeries over elevated areas in the interior of the island. There seems scarcely a touch of grass but has in its shadow an eagerly young one, ready to snap at the visitor with an enthusiasm show of ferocity. In these rookeries, deathless swarms to strike terror in the heart of the visitor, really live, for, after the first paroxysm of rage is over, one can stroke them with little danger of scratched hands. When undisturbed, they sit for hours with their feet lifted awkwardly in air, gazing gravely at their beaks. They have few amusements to vary the monotony of the long day; for, in this lagoon land, it is the growing pit, like play, while the young are at and demand.

We were struck with the quite different reception accorded us by the old birds. They did not once squawk for our arrival, and continued their domestic occupations and amusements as if they had known us always. They have a half-dabbling inquisitiveness, and if we sat among them they would sooner or later walk up to observe us. One became greatly interested in the light aluminum top of my tripod, which it curiously examined from all sides. Finally it led the way with its beak, and we were pleased with the fragrant sound, repeating the operation until satisfied.

The old birds have an insatiable objection to insects, and so for their diversion they spend much time in a certain dance, or perhaps more appropriately a "cake-walk."

First, two birds approach each other, bowing feebly and stopping heavily. They swagger about each other, nodding and courtesying solemnly, then suddenly begin to fence a little, crossing bills and whetting them together, sometimes with a whistling sound, unchangeable necking and drooping little bows. All at once one lifts its closed wing and flutters at the others' breast, or, rarely, if in a hurry, quickly turns its back. The partner, during this short performance, assumes a stammering pose, and either bows mechanically from side to side, or swings its bill loudly a few times. Then the first bird bows more, and points its head and beak straight upward, then, in its next gesticulation, it leans and utters a prolonged nasal "Ah-h-h," the companion snapping its bill loudly and rapidly at the same time.

When both birds see their heads in air and either one or both will have the nodding with the rhythmic and bell-shaped gait. When they have finished, they go through a series of bows again, repeat and alternately, and presently repeat the performance, the birds often reversing the order in the game. Sometimes three of them will dance, one dividing the attention between two. They are always executed with vigor, and never lose their vigor in any way.

Occasionally, while "cake-walking," one will lightly pick up a straw or twig and present it to the other, who does not accept the gift, however, but increases rather the compliment, when always are promptly dropped, and all hands begin bowing and nodding about as if their lives depended upon it.

Several times, at this stage of affairs, I have walked quietly among a group of the old rookeries and have begun to bow very low, imitating as nearly as possible the manner of the game. They would all stop and gaze at me in astonishment, but, reverting to their usual equanimity at once, would gravely nod my bows and walk around me in a puzzled manner, as if wondering what sort of bird I might be. Unaware as we may appear, it accomplishes in a striking way what extraordinary birds albatrosses are.

The albatross "cake-walk." "All at once one bird lifts its closed wing and snatches at the feathers beneath."

"Then the first bird utters a prolonged nasal 'Ah-h-h,' the companion snapping its bill loudly and rapidly at the same time."

"They swagger about each other, nodding and courtesying solemnly, then begin to fence a little, crossing bills and whetting them together."

The finale of the dance. "When they have finished, they go through a series of bows again, rapidly and alternately."

#### Six Hundred Tons of Squids for Breakfast

EASILY in the morning they hit themselves off to sea and across the water for the century squid, which is a staple article of diet for the larger members of the vast bird population. There, about sunrise, the whole community begins to return, and for several hours they straggle in, tired but full, and seek their sleepy children, who see soon very much to eat.

Breakfast may be ready about any time during the early morning, for the mother does not invariably feed the baby immediately upon returning. However, when all is ready she alights near the impatient and greedy child, and, to immediately arouse the initiative by waddling up and pecking or biting gently at her beak. This pecking always takes place at some strategic moment, for in a few minutes she stands up, and, with head lowered and wings held loosely at the sides, regurgitates a load of squid and ash. Just as she opens her beak, the young inserts its own rostrum, and skillfully catches every morsel, which it feeds with evident relish.

At this single meal each young albatross consumes from a pound to a pound and a half of squid, and, as there are several million birds, old and young, the daily aggregate would surpass six hundred tons. All the other birds come in for their share, greatly increasing the total amount of animal life gleaned from the surrounding waters every twenty-four hours.

#### Punishing the Robbers

AFTER the landing process is repeated at intervals of a few minutes over eight or ten lines, the aerial is over; but the young bird is not at all content in its dominion, and keeps asking for more. The mother soon picks back in an annoyed manner, and, if the baby still insists, she walks off and vents her anger by snapping at some neighboring young. Often I have seen her dash over to an inoffensive and unprovoked "goat," and give it a most unmerciful beating, mauling and "woolof" it in a pitiful manner. The poor little thing never knows what she is to be taken to task for, but is so wounded, and cries in a plaintive wail for relief. After a while the ill-treated creature returns to its own nesting affairs, sometimes in food it again, or only to start off for another strange day.

One day an especially vicious gony was making the rounds of a large circle of nesting young, but came at last to one which sat up as if piping. Its mother, who was expectedly sent, fell upon the intruder with disastrous effect, and in the ensuing scrimmage fell her completely to rest. In this case, at least, the "victim" was not and the "innocent victim" asked, but the story does not always end so pleasantly, for sometimes the babies overtake in their behavior. I am at a loss to suggest an explanation for this persistent and heartless explosion.

A spirit of inquiry sometimes leads the young gony into trouble. We found one buried in its nest in a collapsed petrel burrow, yet still living. From the condition of the surrounding soil, the creature had been in this predicament for some time, and had now faithfully tended by its parents. Not did it feel being dug out but objected most vigorously to our interest. When finally released in a normal position, it took a favorable view of matters, and began to preen its feathers.

Albatrosses are impulsive creatures, especially on the ocean. One day our dory, rather overcrowded, was making for the beach through a choppy sea. Suddenly a wave curled ahead, and then the bird, rearing its back over the waves, began pecking for a tender morsel. It walked over the plumped member of the party, and began about a little bear of inspection. The look of anticipation in the creature's face was an unmistakable fact that the creature, at such a rare moment, and exclaimed: "Can't you wait till I cook?"

The albatross lives on Laysan fully nine months of the year. During the last days of October, before the winter storms set in, the migrant of the mighty earth appears, and for days they continue to look in from all points of the compass. In exposed places the number of birds that many are obliged to be content with rather unobtainable spots, while late-comers must leave the overcrowded ones. Leaving couples defend their rights against the tardy ones, and in several days before all have settled their respective claims. The young are not hatched until February, and then many months of hard work to feed the hungry babies. They grow slowly, for birds, and it is not until the last of July that the most fortunate some follow their parents on short flights to sea. By early August all are to the west, with the old birds, they scatter far and wide over the Pacific. Thereafter will the next nesting season they become less abundant, but not less.

Mr. Elwood Haynes  
Inventor of  
America's First Car

The above shows America's first gasoline car—the beginning of the motor automobile industry in America—which was invented by Elwood Haynes, president of The Haynes Automobile Company, and was exhibited at the Smithsonian Institution, Washington, D. C. The official placard in front of the car reads: "Steamlike Automobile built by Elwood Haynes, in Kokomo, Indiana, Chicago, November 19th, 1895, at a speed of six or seven miles an hour, July 6, 1896. Used by Elwood Haynes, 1895. No. 200-12."

# HAYNES America's First Car Adopted Electric Gear Shift as Standard

## America's First Car

America's first car—made by Elwood Haynes, president of the Haynes Automobile Company, is today an exhibit belonging to the United States government in the Smithsonian Institution at Washington, D. C.

Not only is the Haynes America's First Car, but its part in the development of the automobile is shown by the way it has been first in the fundamental development of the motor car.

The Haynes was the first gasoline-driven car made in America and commercially successful.

It was the first two-cylinder-opposed car built in the world.

It was the first to use aluminum in cast parts. This use of aluminum is universal today.

It was the first to use nickel steel in axles.

It was the first side-door car.

It was the first to have the floating carburetor.

It was the first to use the make-and-break spark and the first to use the jump spark.

It was the first to use electric ignition.

It was the first to use a magneto of any type; its magneto was the first American-made magneto.

It was the first to use the double independent system of ignition through two sets of spark plugs.

In other words, the geological tree of the American-made automobile has its root in Kokomo, in the Haynes factory.

The Haynes—America's first car—was the pioneer. It set only led the way, but it made the way.

When you have a Haynes you are buying more than the automobile which naturally attaches to America's First Car.

You are buying an automobile which embodies every advanced development—and which has introduced practically every fundamental betterment of the automobile. You get every tested, proven advantage—and more. You get the benefit of the creative knowledge and scientific accuracy which inspired Elwood Haynes to make America's First Car.

The Haynes policy is to put nothing on in the car for the sake of novelty or to meet a passing whim—but to put everything on and in which the Haynes experts know will make for efficiency in operation and economy and normal in service.

Twenty years ago Elwood Haynes built the first American gasoline car. Since then, the Haynes has constantly been first in developing and perfecting the Automobile. And now the Haynes is again first in the use of the most wonderful of all automobile improvements—the Electric Gear Shift.

## Simply Press Push Buttons and Electricity Shifts the Gears

The wonderful Vulcan Electric Gear Shift, standard equipment for all new Haynes cars, removes ninety per cent of the bother of learning to run a car and eliminates all the bother of driving. In a convenient dial on the steering wheel is a group of push buttons. You simply press the button and electricity does the rest—does it without the grinding and crashing which has been one of the annoyances of motoring in the past—does it instantly and with automatic surety. No chance of a wrong selection, no possibility of stripping a gear.

Any member of the family can drive the new Haynes. The slightest woman is the complete master of the powerful car. No lever pulling, nothing complicated. Makes driving so safe and simple that even the person afflicted with nerves enjoys it.

You must see the Haynes with the Electric Gear Shift to appreciate this new improvement in all its remarkableness. The apparatus is almost automatic. You never have to take your hands from the steering wheel. The starting, lighting and gear shifting buttons are under your finger tips as handy as a set of desk call buttons.

Model 26, 6-cylinder, 2-passenger roadster, 4-passenger straight line or 5-passenger touring car, \$2700. Coupe, \$3200

Model 27, 6-cylinder, 6-passenger straight line or 7-passenger touring car, \$2785. Limousine, \$3850.

Model 28, 4-cylinder, 2-passenger roadster, 4-passenger straight line or 5-passenger touring car, \$1985. Coupe, \$2700.

Hand levers are optional at \$200 reduction

# You Can See the New **HAYNES** at Your Dealer's NOW!

## Haynes Specifications

**Engine**— $1\frac{1}{2}$ -inch bore,  $5\frac{1}{2}$ -inch stroke, L-head Haynes design, cylinders cut in pairs. Enclosed valves.

**Ignition**—Centrifugal pump and pressed steel fan.

**Wheel Base**—Model 26, 159 in.; M. 27, 154; M. 28, 118.

**Intakes**—American Super magneto, with patent pole shoe, producing hot sparks at full speed. Perfect synchronization, greater horse power and more perfect running motor.

**Lubrication**—Splash and gravity feed to main bearings and side gear; also constant feed to oil lines in lower beam.

**Control**—Left-hand drive, Valves electric gear shift, dispensing with hand lever and clushing device to shift gears electrically.

**Transmission**—Selector type, three speeds forward, one reverse. Tinker roller bearings.

**Steering Column**—Worm-and-worm gear. Tinker bearings.

**Clutch**—Haynes contracting steel band. Adjustable with single set screw. Applies power gradually.

**Rear Axle**—Tinker full floating on Models 26 and 27. McCar design on 28 with Gurney bearings.

**Front Axle**—I-beam, single piece, O. H. steel best treated.  $1\frac{1}{2}$ -inch spindles of chrome nickel.

**Wheels**—Artillery type with Fink demountable rims.

**Tires**—Model 26 and 27, 34 $\frac{1}{2}$  inch, Model 28, 34 $\frac{1}{2}$  in.

**Brakes**—Front, semi-elliptic, 195 in. long; 2 in. wide; rear, 18 in. long, 2 in. wide.

**Trunks**—Diameter, 11 $\frac{1}{2}$  external and 11 internal on Models 26 and 27, 12 and 14 on Model 28, both external.

**Finish**—Body Indiana dark blue or Pacific Tom gray (optional) with black gear and wheels.

**Gasoline Feed**—Pressure feed. Storage tank holds 20 gallons of gasoline. An one of cut when needed.

**Battery**—Model 26 and 27 had buffer battery, model 28 has tubular battery.

**Starting and Lighting**—Lever-Neutral electrical system. A separate set system obtaining a generator to charging battery and motor for starting engine. Each efficient under all conditions.

**Dashboard Equipment**—Electric lights, night oil feed, motor carport for lights, dash lights, necessary air pressure pump, lights in and out of door, mud chock.

**Other Standard Equipment**—Top, top cover of silk plush, overhauled front and rear axle, "springing" steel shaft, two loose electric headlights, electric side lights, electric bell horn, full size standard equipment, electric starting, generator, battery, spare battery, spare lamp, spare and four 1000, six 1000, full size equipment, six every demountable rim, Gurney tires.

This is an electric gear shift year. This wonderful feature is far greater than the self-starter and a more important improvement. Only a Philadelphia car of small output preceded us in adoption. The Vulcan Electric Gear Shifter. Our orders naturally will be given preference over later ones. You are sure of getting a car with the new feature when you order the Haynes.

## Everything Else Desirable in Design, Equipment, Comfort and Performance

### Electric Starting and Lighting

You press a button and the motor starts. You turn a switch and the electric lights are on. You press another button and the warning sounds. Your tires are pumped automatically.

### Beautiful, Comfortable

The cumulative refinements of two decades are clearly reflected in the Haynes. It has a perfected look. Long, graceful, sweeping lines, superb finish and masterful workmanship, make the Haynes a car you'll be proud to own.

### Powerful, Economical, Durable

Under the handsome body of the Haynes lies a frame, an engine, a transmission, a complete motive mechanism

that's the result of 20 years perfecting The motor—built in the Haynes shops —is L-Head type, famous for its economy and efficiency.

### Long Service Insured

The new Haynes is entirely built in our own plant or under our supervision. It is Haynes quality and Haynes tested in every detail—plus beauty, up-to-date-ness, and economy of upkeep, meriting the consideration of everyone in the market for a car.

### Write Today for Our Book, "The Complete Motorist"

Written by Elwood Haynes, creator of the American Automobile. A valuable education on the subject of selecting and running an automobile. Points out the pitfalls to avoid. Puts you on familiar terms with mechanics, transmission and cooling systems. Gives full information concerning the latest models of the Haynes, with a complete description of the wonderful Vulcan Electric Gear Shift.

# A LOST QUIXOTE

BY  
EARL DERR BIGGERS

ILLUSTRATIONS BY MAYNARD DIXON

**L**ANDLORD "Bossy" Sharp of the Crystal Palace Hotel leaped in an apple chair and repeated loudly three friends of his on the shelf behind the bar. These three were trendy, rum, and gin, all so respectable and time-worn as to look that Sharp alone knew one from the others.

Turning from an inspection of his three enemies to that portion of Kansas Junction visible from the window, Mr. Sharp was confronted with a lean, snappy partner. In the meretricious light of the Arizona sun, the woman seemed to crinkle and turn up round the edges. The false fronts of the sharks assembly referred to as "business" looked dropped as if weary of the pretense they preserved; the equal red station resembled close, seemingly for protection, to the outer water-tank. The scattered adult loaves lay blistering in the heat.

Inevitably this scene of pained desolation drove Mr. Sharp back to his liquid friends on the shelf. Fighting heavily, he peered himself from the chair and huddled behind the bar.

"I say, it's hot," he muttered, pouring out that which would make his better.

"Doo" Haywood, during his unaccustomed career, displayed his unusual animation at the sound of smoking glass.

"Hot?" he sympathized. "It's hotter than Topper." And then, his diverting eye noting no second glass on the bar, he dropped back into a slumber.

Thus fortified, Landlord Sharp returned to his chair and stared again the prospect from his window. From time to time his thick lips moved in whispered protest against the heat.

**MR. SHARP** was a sight at which the gods might weep. Berlinches, fang from heaven, could have fallen in further. His face was that deep shade of red that emotion readily converts to purple. The fire through which he had passed had singed a very big eye, leaving mercilessly desolator before the world a pair of watery eyes long ago washed destitute of color. It is that hollow, vacant gaze blossomed the year round, regardless of the season. No testimony of his avarice shone, his hands remained thin and girlish, with long, slender fingers, at the sudden sight of which men sought to play the fero right in the corner had been banks to restore their money to their pockets and take away.

As Mr. Sharp gazed dully out at the sea-struck town, a habited train crawled into view and passed sleekly at the station. From this a lanky young man alighted, and, after a word with the station agent, alighted the burning street toward the Crystal Palace Hotel.

Mr. Sharp made no move to rise and, in his capacity of landlord, welcome a possible guest. Instead, as the young man assumed the steps, he staid out to indicate a berth, and, before the stranger had taken the hallway, past the kitchen "ladies' room," and into the main dining room, Mr. Sharp then inquired:

"How young man make into a chair, Bossy Sharp noted that he was big and good to look at, with the manner of the one who has spent his days in the open fields of 'God's country.'"

"Nothing," he answered. "You can do nothing. I take the 2:10 train back East."

"It don't stop here," granted Mr. Sharp, pronounced of the fact.

"They'll Sag it to slow down, and I can grab it, I guess. Yes—'E's gone' back—back home."

The laws of hospitality seemed to demand of Mr. Sharp some slight interest.

"Where's that?" he inquired languidly.

"Indiana," returned the boy with feeling. "Boy, don't you ever get to longing for a mountain out in the farmer? Don't you looker for a chilly morning, when the wagon wheels crack and your breath's white with the frost?"

It was a disconcerting picture Mr. Sharp ran his fingers through his hair—so dirty gray in color.

"Now and then," he admitted. "No you're from Indiana, boy? I've known a good many from there in my day."

The boy leaned forward quickly.

"Maybe you can help me," he said hopefully. "You're my last chance!"

"Maybe you can help me," he said hopefully. "You're my last chance. I came out here to find a man who left Indiana fifteen years ago. I've tracked him from South down here, and now the trail leads up to Arizona, and my money's gone. So I got to go back—without him. I got to go to her—alone."

He sat gazing unhelpfully out, past the huddled sharks of the Junction in the silent desert beyond. Regularly from the corner came the noise of the sleeping Haywood. In sympathy with this melancholy, Mr. Sharp yawned.

"What's the fellow's name?" he inquired.

"Hubbs," was the answer. "Heary Statins, of Greenburg, Indiana."

**MR. SHARP** crossed his fat legs, and then, as if he had done it merely to prove that the trick was still in his repertoire, crossed them again.

"Seems to me I wouldn't go very far," he remarked facetiously. "To find a man with a name like Statins."

"The boy's eyes flashed.

"You would if you was me!" he cried. "I'd go through hell for to come face to face with Statins, too. I'm lookin' for Statins, all right. I want to talk to him. I want to say: 'There's a little woman back in Indiana I'd like mighty well to see you, Heary Statins. There's a little woman who's been waitin'—waitin' all these long years, with never a word to ever her, or a dollar to lighten the burden of raising that orsawly, played-out farm.'"

He stood up. His cheeks were aflame.

"Yes, I reckon I'm lookin' for Statins. I'm lookin' for him to tell his law, every night for fifteen years, when the six-thirty-five train from the West has whizzed round the bend, she's gone to the door and shaded her eyes with her hand—her hand, that's okay and ugly, slavin' for the kids he left behind. And I don't need to tell him, I guess, how every night for fifteen years, she's gone back to her work with a sigh, settin' her hopes twenty-five hours ahead to the next night's train. You, sir! I want to see Statins. I want to ask him where he's been these fifteen years."

Mr. Sharp blinked in awe under the face of the silent outcast.

"What's Statins to you?" he inquired, with his first display of interest.

"He's my father," said the boy, in a hoarse tone. He sat down again. "I'm Bill—'s the oldest boy. Five years old, I was when he come out here on a grub-pitch gambler, and since that day, almost, I've had to take his place on the farm. They preach about honorin' your father, but when I think about the land on that woman's heart these fifteen years, I could strangle him on sight."

"Oh, no," said Mr. Sharp peacefully. "Oh, no, now."

"But I wouldn't," the boy went on—"for her sake. She wants him. Married the farm, she did, and set me out here to find him. She's waitin'. And now the man's gone, and I got to go back—without him. I know how I'll be. The train from the West'll whistle, and she'll wait in the door—for me. And I'll come down the old Miller road and up the bank and the crooked ledge. I'll come—alone."

"All I've got—about sixteen hundred," he gasped—"gone down on the red!"

through hell for to come face to face with Statins, too. I'm lookin' for Statins, all right. I want to talk to him. I want to say: 'There's a little woman back in Indiana I'd like mighty well to see you, Heary Statins. "But I wouldn't," the boy went on—"for her sake. She wants him. Married the farm, she did, and set me out here to find him. She's waitin'. And now the man's gone, and I got to go back—without him. I know how I'll be. The train from the West'll whistle, and she'll wait in the door—for me. And I'll come down the old Miller road and up the bank and the crooked ledge. I'll come—alone."

Mr. Sharp blinked out a very dirty

handkerchief and passed it lightly over his forehead.

"Stubbs," he stated thoughtfully, "Stubbs, at Indiana, I don't recall the name."

"It wouldn't be by some year's remembrance him," the boy said. "He'd change that. Trust him. Always good on his word, that name did. No name for a driver, anyhow."

"Driver?" queried Mr. Sharp. "Driver?" repeated the boy bitterly. "That's what Henry Stubbs was. That was what went into the driver's clear out here, away from a woman's million times too good for him. Good looks, he did. His hair was too white for his farm—his soul was too high-toned."

"His nose rose in scorn. "Started his nose when he was a boy. They talk about it yet in town; brag about it. And, whether he rose back of me, I wanted her to have a little Henry, and some credit, these last years of her life. He'd come on long—she looks so tired—I wanted her to put on a dress and sit and down in a chair with a lady at it, and rest—just rest—to the end of her days. And now—"

"The boy sat, his mouth twisted into bitter lines, "It is," he said to the boy. "And there's the mortgage to be paid—(old) knows how that's to be done. And, whether he rose back of me, I wanted her to have a little Henry, and some credit, these last years of her life. He'd come on long—she looks so tired—I wanted her to put on a dress and sit and down in a chair with a lady at it, and rest—just rest—to the end of her days. And now—"

"A lady had, sort of," he commented. "A lady," answered the boy. "Followed his nose, as you call it here. Wife, children, home—they didn't count with him. Said he was coming out here to make a fortune. How could he make a fortune? Said his nose back with a thousand dollars—that's a fortune in town;—or he wouldn't come at all."

"And he never came?"

"No."

"You never heard from him?"

"At first," said the boy, "he wrote in my mother regular, but he was doing well—costing timber in Oregon with a man named Harding. A few months later he wrote that Harding had gone to Portland to sell their lumber, and that when he got out his account was a hundred dollars—he was coming home."

"What?"

"The next letter was the last she ever got. It was severely discouraged—set in a week, just in a way. You see, this Harding turned out a cunning, mean, contemptible cur. He sold the timber and skipped out with the money. Never heard that seemed to be in my old Henry Stubbs—all up."

"And he was gone to try again, but there was no heart in his words. He never wrote again, and then these people from home would send word that they'd run across him out here. Name and his name—nothing more."

He stamped, and his breath came heavily as he gazed out at the drooping trees. In his favorite corner, the boy would still snored listlessly. With difficulty the landlord of the Crystal Palace, striving to get well from his chair and shuffled toward his friends on the wall. He returned smacking his lips. "You can't believe all you hear," he remarked cheerfully. "If I wasn't sure, I wouldn't add any on in Henry Stubbs' case."

"I don't intend to," remarked the boy. "She says" his voice softened—"he was a good man. Keeps says that right along through it all. Says he was a man who lost his home and his family. She blames it all on the West."

He turned sharply on the landlord of the Crystal Palace.

"What sort of a country is this out here," he cried, "that makes a coward of an honest man? You say about you and your friends, and how they drive a man closer to his God. What about their crime? You say they're a hell of a ways from his wife?"

Mr. Sharp did not answer. He was content to see the defense of his ruined West. Instead, he carefully studied the distant staid agent, making in the shadow of the doorway a copy of a man's face who gave a week old. Then he passed his hand tenderly over his gray hair, and through his wrinkles.

"It isn't recalled," he said, "that any number of Quakers ever strayed across my path and here. But then, you haven't described Henry Stubbs very clear."

"I've just seen his picture myself, to remember," answered the boy. "She showed it to me the day."

There in the old parlor, there in her old chair, seated black with the house of my gaze—she showed me his picture and behind of him. He was handsome enough, I guess, but—again, she said—and curly black hair. Handsome, but the chin was weak.

"She told me he talked like the books he read—always about queer people and places he'd got out of there. Nobody in town; nobody could make him out. And every now and then," she says, "he'd pass his hand quick before his eyes, like a man brushing strange dresses away. I'd know him in a million by that," she says, "if he was a good man, your father would be sure, and I don't believe, anyhow, that the years have changed him. It he'd died I want to know it, and if he's alive—I want him back. I love him in spite of all, and I want him back!"

Mr. Sharp took out a vile-looking cigar, and lighted it.

"Heard luck," he remarked. "No you got to go back without him—without even news of him. That's tough."

"It is," he said to the boy. "And there's the mortgage to be paid—(old) knows how that's to be done. And, whether he rose back of me, I wanted her to have a little Henry, and some credit, these last years of her life. He'd come on long—she looks so tired—I wanted her to put on a dress and sit and down in a chair with a lady at it, and rest—just rest—to the end of her days. And now—"

The boy sat, his mouth twisted into bitter lines,

"Want to try the wheel?" he asked suddenly, a bit startled at the sound of his own voice echoing through the stillness.

The boy laughed heartily.

"Not so," he said. "I don't care to buy a gold brick, either."

Mr. Sharp assumed a bearing of offended dignity.

"You think the wheel's bad," he said in a hurt tone.

There was no reply.

"They say that some of 'em," went on the head look. "It's a lie. They lose, and then they go away and lie. Your chance is as good as mine."

"Forget it," answered the boy. "I've got my ticket and all of eleven dollars beside. I've got the wheel, and I've got the wheel."

Mr. Sharp's eyes became whirling. A scolding smile crept evilly out from his hid-eyes in the watery eyes.

"I don't want your money," he argued softly. "It's just to pass the time—nothing to be made of it. The excitement I'm after. Always start something. Always have something doing. That's my motto."

Mr. Sharp's eyes became whirling. A scolding smile crept evilly out from his hid-eyes in the watery eyes.

"Don't stare at me like that. Go back to her. Stubbs is dead!"

his eyes fixed on the shabby lying in hot despair on the bosom of the dead. No sound broke the stillness, for the Haywood's name was uttered, and he slept peacefully, his feet far forward on his breast. Mr. Sharp, looking at him, evaded him his obligations to the land and to the tragic confidante of the youth from Indiana.

IN a spirit of broad hospitality, Mr. Sharp suggested a drink. His offer was begrudgingly refused—so abruptly, in fact, that he postponed his own visit to the table. He had recourse to his dirty handkerchief to cover his disappointment.

Then they sat, silent as the desert. Mr. Sharp smugly as he sat, while minute after minute ticked by, and the hands of the scratched and mottled clock, back of the gambling table's empty chair, crept on toward the hour that need start the boy on his long, subversive pilgrimage back to Indiana—where no sign of life was visible in the picture before them. In the shade of the station agent was kneeling, as usually asleep as the Haywood, over his work of old years.

Finally Mr. Sharp rose, and, walking over to the bare, cold, cushioned car, the little boy, of the latter, made an sign. Heavily Mr. Sharp glided on to the toilet, and over which he had passed with the soft rustle of a liver.

the minutes passed it became startlingly evident that the thing called luck was on his side. Only at rare intervals did he lose, and then at such times when one more risked was usually small. The hands of the dirty clock crept toward midnight, yet the pile of chips before him showed no signs of diminishing.

It was now to him suddenly, that the game was, for some reason, clearly against him, and the silent Sharp played at gambling, with a new-found wheel on a ivory ball, and make-believe chips for bets. Sharp's eyes, and there it was, when one more risked was usually small. The hands of the dirty clock crept toward midnight, yet the pile of chips before him showed no signs of diminishing.

The warden, the "truncies," and the mascots at one of the "ranches"

# A COLORADO PRISON REFORMER: "TOM" TYNAN AND HIS CONVICT "BOYS"

BY ARTHUR CHAPMAN

THE Colorado State Penitentiary sits grimly at the mouth of the cañon of the Arkansas River, that a few miles farther on narrows into the awe-inspiring Royal Gorge. Less than two years ago the penitentiary was the scene of disaster, but today, owing to the work of its new warden, Thomas J. Tynan, whose achievements have attracted the attention of statesmen dignitaries in all parts of the world, new wings is and out of the iron gates with songs on their lips and hope in their hearts.

"Tom" Tynan, without any previous experience in such work—and who would not rather to read a book on criminology, even if he could "saw" Lombroso and his associates—what came nearer than any other man to a practical solution of the problem of the criminal. He has established penitentiary schools and workshops, and, from a practical standpoint, has shown that such institutions need not be a drag on the purse of the taxpayer; but, better than all else, he has demonstrated that it is possible to save the criminal and send him forth from the penitentiary with self-respect regained, and with a desire to be the friend of society instead of its enemy.

Looking for the first time at "Tom" Tynan, with his fresh, ruddy cheeks, his merry blue eyes, his laurel hair, and his general air of worldly sophistication, one is inclined to be astonished. Here is not a type of the student, but rather that of the traveling salesman. And that guess is exactly right, for Warden Tynan was what the young reporter in the small town before he called a "knight of the grip," before he received his appointment from Governor Shafer, in 1908, as warden of the Colorado Penitentiary.

## A Traveling Salesman Turns Prison Reformer

TYNAN knew nothing of prisons and penitentiaries before assuming his post. He had been a busy and successful traveler for a Denver wholesale firm. His home was in Pueblo. He had "sold a little" in politics there, as he puts it, and as a result he was selected by Governor Shafer as a good man to fill that place in the Pacific states. The post was proffered somewhat apologetically, because it paid only \$200 a month.

"Tom" Tynan was making a good deal more than \$200 a month; but, on thinking the matter over and taking a look at the forbidding cañons and Cofran City and the human devils gathered therein, he decided to take the job.

"It was a matter of pride with me," said Tynan. "It sort of got on my nerves—all the advertising" message that that was in evidence. I saw new ones landed life me, so I was willing to save this a sure of life

wasn't, and, true to my business training, I got to figuring up what could be done with all that wasted energy. I couldn't stop thinking it over, and figures marched in my head in a long procession. I saw there wasn't any need of keeping those fellows fed up in that prison yard and in those narrow cells. I knew I could figure out work for them that would not interfere with free labor, and that would make the prisoners healthier and better men in every way. I had visions of road gangs making big highways—the kind it is said they have in Europe—and then I saw convict farms worked by big gangs of tractors. I took the job, and what I have done since then is merely a working out of those dreams. It was a practical idea from start to finish. As to the other side—well, I guess I have a faculty of separating the sheep from the goats, and that's about all there is to it. I give the promising ones a chance, and if they make good they don't regret it. If they throw me down I don't bear a personal grudge, but I see to it that they don't have a chance to repeat."

The warden's merry blue eyes and smiling mouth looked as he spoke, and he told regrettably of the only attempted prison break during his term of office. Several of the most desperate convicts attempted to get away by shooting down their keepers and dynamiting the prison walls. Probably the attempt would have been successful had not Warden

Tynan, who had been hastily summoned from his home, headed a rush into the prison yard, where he faced a convict named Williams about to blow up the wall with dynamite. Headless of the explosion, and of a gas with which he was threatened, Tynan dashed at his man, and, with a well-directed shot, brought Williams down with a bullet in his leg.

"When I went to get Bradley, another one of the men who tried to escape," said Tynan, "all the men in both tiers of the cell-house begged me to stay away; they cried out that Bradley had a gun and would kill me. That showed that the sympathy of the prisoners was with me, and it did me more good than any praise that has ever come my way."

As it happened, Bradley had been wounded by one of the guards, and we had no difficulty in capturing him. He and the three others conspired in the outbreak I never could do anything with, I never could get under their skins, and could find no source of honor or decency in appeal to.

"They were furnished with dynamite and a revolver by a paroled prisoner who has since been recaptured and made a confession. Three men of them made a break here, with which he returned the cells of the others, after he had leaped from his own cell and wounded the keeper. The boys laughed their work off every time, but it was safe owing to their bad luck. I did not lose some of my best men. It was the first and only attempt at escape. The prisoners scrawled words and signs I had traveled. If one of my road gangs or some of the men at the prison ranch had thrown me down, I should have felt bad about it."

## Putting Convicts on Their Honor

IT is a fact, however, that, out of the hundreds of convicts "Tom" Tynan has sent into the fresh air and sunlight, receiving their word of honor that they would not attempt to escape, only two have proved unfaithful. One was the convict Norton, who furnished the dynamite and firearms to the desperate man who had been recaptured. The other was a paroled prisoner who deserted from one of the road camps, but who, however, could not stand the strain, and who returned to the prison of his own accord.

That fellow whose conscience brought him back to me in the picture you took of those tractors on the ranch park," said Warden Tynan to the writer of a printed picture of the penitentiary ranches, where the men had been for a group photograph.

"He hit the high places not long ago, and I was making beds on him for a week. I had a hunch that he was coming back, so he hadn't needed his

Warden Tynan and some of his convict laborers at Ranch No. 4, where one of the section gangs is quartered. One of the men in the group ran away, but came back on his own accord. Good work on the road-building enables a convict to reduce his sentence by fully one sixth

the sort of chap who would throw me down. It says he got into Kansas, and could have made a complete hell out of it, but his conscience got to hurting him so that he couldn't stand it any longer.

"I turned back to Colorado, and one day came into my office in the penitentiary and told me the circum- stances of his return. I told him to go out and get to work. He expected some punishment for his offense; but I let it go, and he has not had me say a word to him since, and is going right along with the traffic as usual."

#### Solving the Nation's Road Problem

THE convict road camps are the pride of "Tom" Tynan's heart. He believes that convict labor is going to solve the road problem of the nation. Furthermore, he is proving his theories in practice. Union City contains five built camps of the finest highway in the world, including the celebrated "sky-line drive" extending along a "hogback" north toward the foot of the Arkansas Valley and offering a superb view on both sides. It gives a big road gang of inmates in putting the finishing touches to a magnificent mountain highway near Tynan. Another gang has just completed a perfect boulevard connecting Union City and Colorado Springs. It was

constructed from Independence, Missouri, through Steam City, Hartsburg, and Garden City, Kansas, and Pueblo, Colorado, along the old trail followed by pioneers in the early days of the West.

Let it not be supposed, however, that all this work is being accomplished by means of the laborious pick-and-shovel of the hard-day villain clad in the striped garments of shame, hampered with leg-irons and watched by eagle-eyed guards armed with rifles. That is usually the way sporadic road work is done from reluctant and desperate convicts in the South; but things are different in "Tom" Tynan's road camps. Picture several white leads meeting among the pines in an ideal camping spot in the high foothills of the Rockies. Cooks are busy preparing the noon meal. Around a bend in a half-finished highway above the camp, some swinging the numbers of the "road gang." The morning shovels have been "planted" and there will be no more work until after dinner. At the tipping point of exploding dynamite descends the silhouette of the mountains, one takes a look at the bathhouse of the highway. Here is no prison jailer, neither does one consider the wretch the body that denotes the man who has fallen into the habit of the lock-step. Instead and, finally, the convict is leaning at the rear and his arms, like open arms at the throat, and street-lamp bulb offered by the

building is particularly difficult. Three hundred miles of road a year would soon cover the State with a web of perfect highways.

I am not taking any of the effect on the men, but am advancing a business proposition for my state to consider. The quality of work done by convicts on roads is as good as that done by the average free labor, provided the road gangs have the right kind of overseer. As in the case, it is only twenty per cent. that of free labor—a saving of eighty per cent. to the taxpayer.

"So great is the demand for convict road labor from counties that are willing to defray the expense that I am at a loss to pick the required number of men. We give the road men better food than they get in the prison, on account of the nature of their work, and they are also provided with better clothes. It costs thirty cents a day to keep a man in a road camp. The extra expense above the twenty cents a day necessary to maintain a man in the prison is borne by the county in which the work is done. This summer I was working a gang of men on the small highway between Canon City and Colorado Springs. The county was out of funds, but public-spirited citizens at Colorado Springs made up the amount and enabled me to complete the work."

Each man who works in one of Tynan's road camps

The famous "Skyline Drive" at Canon City, Colorado. This road was built by convicts from the Colorado State Penitentiary, and it is one of the most remarkable scenic highways in the world.

opened with impressive ceremony by the Governor and other eminent citizens of Colorado.

At present many convicts are employed on a scenic highway from Union City to the top of the Royal Gorge. Nearly every mile of this road is a magnificent road being blasted out of solid rock. The road sweeps in majestic curves around the eternal hills, and every one of the countless curves are all hairpin-looking in character, but bank full and dangerous in the spring—is bridged with a wide-arched culvert of stone. The highway winds upward in a series of easy grades, most of which can be taken by an automobile on a "high gear," and when the road is completed the eight-mile run from Canon City to the very brink of the four-thousand-foot gorge will be a matter of ease.

The Royal Gorge road enters the hills at the foot of Mount Manitou, two miles from Canon City, but its wonders begin when one enters Grand Canon. From that point on, the road rises in a graceful succession of curves, each turn affording a beautiful view of mountains and plains. Pike's Peak, Mount Pisgah, the Greenhorns, and the Sangre de Cristo range can be seen at various points on the drive. The climb is reached when the traveler reaches the end of the road, at the top of the Royal Gorge, almost directly above the world-famed "Hanging Bridge." Twenty-five hundred feet below, the Arkansas River flows and seems always about to engulf the trains that share its narrow passageway between the boiling cliffs. It is proposed to build a suspension bridge across the top of the gorge, but the chief feature will always be the convict-built road, which has been made part of the new "Santa Fe speedway"—an automobile high-

way—no matter thing that "Tom" Tynan will not tolerate in the atmosphere "prison bar-out."

#### The Prisoner's Ward of Honor

SURELY those bhakti-ist men, who meet your gaze so often, and who talk and laugh among themselves in their own way, are convicts. They troop the camp, where they work with pick and shovel and splintering. Meanwhile, you sit by the window, you come so frequently at the rear and who passes for a convict with the warden, in the forenoon. There is no rifle at his shoulder. In fact, he is entirely unarmed. There is no argument until twilight, when two armed guards patrol the camp, more as a matter of form than as a precaution; for the men who are sleeping so peacefully in the camp have given their word of honor to the warden that they will not try to escape—and honor is the thing that rules the camp here. "Tom" Tynan's "best" hold forth.

"I have about fifty per cent. of my men working on the road," says Warden Tynan. "Let's see—there were just seven hundred and six prisoners in our charge this morning, according to the prison register. That means that there are about three hundred and fifty men doing work for Colorado, which is other class of men will do for free or money. It is getting more and more difficult to find free labor for road work. Men get more money in rock lands of employ- ment, and that is what makes the good roads problem in this country so hard to solve. But I figure that, when things are running as they should, I can build a mile of good road every day with convict. That means a lot to a State like Colorado, where road-

has ten days a month taken off his sentence, in addition to the usual time off for good behavior. This incentive does much to make the road work popular, so, by "hooking" paid, with the road gang and also getting the customary time off for good behavior, it is possible for a convict to reduce his sentence by fully, one sixth—which means more to the man.

#### Selecting the "Trusties"

THE real test of Tynan's manhood comes in select- ing the men to work as trustees. The Colorado State Penitentiary, like other Western penal institutions, has a large number of "hardy fellows"—men who have been sentenced to long terms for murder, swindles, those criminals, there is the usual motley array of rogues, lawyers, confidence men, etc., which makes up the majority of prisoners in Eastern institutions, where the gang-fighter is not quite so prominent.

To "pick the sheep from the goats" is such a collection of humanity requires a shrewd judge of human nature. The warden keeps in personal touch with the men in prison, so far as that is possible, is always continually moving about the prison or the various outside camps and ranches. He speaks to a group of men at work in the stone quarry, under the towering cliff that overhangs the back of the post penitentiary; he goes in at some other camp who is undergoing punishment in a dark cell, and what he sees, is never made known, but privately it is con- sidered helpful, for he chances to see the convict prisoner is seen applying for work at a farm. Every Sunday morning Tynan steps into his car

## RENO-VATED

# INTERLUDES

FROM A JESTER'S NOTEBOOK

### STRATEGY

I SUCKED myself between the deep sea and the devil, but soon as when I tried to down him—the devil, I got a hose and squirted the deep sea all around him. And ere I was diverted I'd taken the D. and drowned him!

Our idea of the serious-minded man is the chap who reads the new tariff bill aloud in his front yard, bringing in a hammock on a soft summer afternoon, with a string orchestra playing Wagner in the distance.

New Jersey now has a law making it a penal offense to "steal ice from any one's pond." Is it to be inferred that if you can slip it out of a refrigerator, or off the last end of an ice wagon, ice may be stolen with impunity?

Mr. Stuenkel has written a story about Panama that makes mighty interesting reading; but, all the same, we can not help wishing that when the author was making a name for himself he had not chosen one that sounded like an official linguist at state dinners to the Diplomatic Corps.

Why a man should throw himself at a woman's feet when he really is aching at her heart is beyond me, unless it is because his own heart is in his hands at the time and he concludes that that is his natural anatomical position.

Some prominent bills now pending before the senate seem to a correspondent to be as follows:

Career Bill.....	Bill McAllen
Prohibition Bill.....	Bill Bryan
Municipal Bill.....	Bill Gaynor
Treaty Bill.....	Bill Raymond
Patrol Bill.....	Bill Vard
Non-6-Cleaning Bill.....	Bill Edwards

Mr. Walter Scott once wrote to Shelley, "Call that, then, sir, your taste for poetry and heliobolites as an elegant and novel interesting amusement, but combine it with studies of a more serious and solid cast, such as are now interestingly connected with your prospects in future life, whatever those may be." After that it would seem that nobody in the world should consider himself too humble to knock his grand mother to his own eggs.

With a historian as President of the United States, two officers in the cabinet, and the Authors' Club spread all around the continent of Europe, an ambassadorial duty bent, the Ellimanian period has nothing on this as the golden age of letters. Even the President's landing up in New Hampshire is a lit-

erary letter. How different would have been the rule of Mr. Justice Hughes, had he been chosen President after his war on the bookmakers!

While no man can properly justify the use of white-wash on public offenders, it is at least to be said of it that it makes it easier to see them in the dark, which, considering all things, is a commendation devoutly to be wished.

### OPEN POSTALS TO THE FAMOUS

(To a distinguished Cabinet Official)

New York, July 21, 19—

Dear William:

A little carbonic water mixed in with it will make it fit more like the real thing. Try it on the Diplomatic Corps at your next strawberry festival.

Yours ever,

PAO BONA PANAMA.

(To a Famous College Professor, Ex Officio)

New York, July 21, 19—

Dear Mr. Ex-President:

In a judge, would you find the Republican party guilty of venality on the ground that it has no visible means of support? R. N. V. P.

Respectfully,

ONE OF THE FEW.

(To a Generous-Minded Secretary of the Treasury)

New York, July 21, 19—

Dear Sir:

Why can't you tell the fall to distribute that \$100,000,000? As one of the 100,000,000 citizens of the United States, I'm ready for my five now. Wire it collect, if you wish.

Ever mine,

DRURY ROANER, KING OF THE HONORS.

(To a Distinguished Ex-President)

New York, July 21, 19—

Dear Teddy:

What's the use of trying to convert the Argentine, with Tammany Hall and the I. W. W. right at your door? There's plenty of free-pape space waiting for you if you don't wait the wind dies normally.

Minutely,

PANAMA.

(To a Sympathetic Agitator)

New York, July 21, 19—

Dear Bill:

When you promised those Paterson strikers Morris chairs to work in, why did you omit all reference to the valve you are going to provide them with to do the work itself? You lost a trick that time.

Respectfully,

CAPTAINMORRIS.

(To the Jailer of a British Staff Sergeant)

New York, July 21, 19—

Dear Sir:

Don't try forcible feeding. Put a broiled lobster and a coffee perked before the lady. It is a combination no man has ever yet been able to resist.

Yours confidentially,

THE WISE KNOWS.

(To a Famous Irish Patriot)

New York, July 21, 19—

Dear Brendan:

I am told you are looking around for a new and startling pose. Why not try answering just for a flyer? It would make a lot of talk if you tried it just once.

Yours devotedly,

CONSTANT READER.

(To a Leading Cabinet Minister)

New York, July 21, 19—

Dear Old Boy:

As a friend, let me advise you never to waste your money on lotteries. You know yourself that you never could draw anything, not even a pain.

Unwittingly mine,

PANAMA.

### ADREPT IN THE BUSINESS

"I am situated here in the Guano that a former tax-collector is quite prominent in politics out in Oklahoma," said Little Binks.

"Well, what of it?" said the fiscal philosopher. "Fishing up railroads is an essential part of the duties of the modern statesman. This chap has had practical experience, where most of the others bungle along on mere theory."

### HIS COLLECTION

"I wouldn't mind marrying in haste and repeating at leisure," said Hallowberry. "The thing that gets me so like time is marrying in haste and repeating at hard labor."

### AN EXTREME CASE

"Do you remember that Mrs. Giggibody a first-class" asked Hallowberry.

"First" cried Binks. "Well, I guess she is a first. Why, Hallow, that woman would first with her own husband if there wasn't anybody else around to first with."

### THE TEST

"Do you think your Knollies really love you, do you?" said papa.

"He says he'd die for me," said Mattie contentedly.

"All right," said papa. "That makes the test simple and easy. You tell him for me, to go out and die for you, and the day he is buried I'll give you a cent."

way or another they have been losing it constantly.

Their latest downfall was just like the others—something anybody could have foreseen. Filkins and Wittens, the two Wilson candidates for Governor, were killing each other off. Former Senator Smith's name was sure to be nominated, and after that it didn't matter who was elected. The Wilson "machine" would be smashed, anyhow. The President, of course, couldn't interfere. Either of the candidates would be sure to resent any of his dictation.

So then you were told the astonishing Wittens actually "resigned" his office to the President for advice. The President advised him to come down, and he did it. That bit of correspondence, of course, assured Governor Filkins the united support of the Wilson men all over the State, which has several times proved amply controlling in the party, and meanwhile, as a by-election the other day showed, the opposition has remained as helplessly divided as ever. So there are probably plenty more downfalls still in store for the President and his friends in his own State.

The truth seems to be, however, that New Jersey is not so very exceptional, after all, in the way it strikes to the political conditions revealed last autumn, and which, while they continue, give the President and his party such a free hand. The Republicans have been the same sort of party together in certain States. But the schism of 1912 is practically unhealed. It is hard to see any powerful single opposition aligning itself for 1914; and on the whole the party in power has done pretty well in the matter of holding together and following its leader. The country is not worrying to witness a change of power. It is giving the Democrats a real chance, and that, they must candidly acknowledge, means no excuse for failure.

#### Dutch with Ditions

Mr. PAUL in a speech said that of all the Presidents from Washington to Wilson, not one of the Presidents of Colored Race, there has not been a man whose main strain of blood did not come from the British Isles—London, of course.

VAN BRUN of Kinderhook, for instance, is a genuine of the British Isles as man and place pedigree.—"The Sun."

For that matter, the Colored isn't so very Dutch. His mother was a BRILLIANT of Georgia, and his grandfather a BARRELL of New Jersey, another of whose names is Dutch. Still his main strain did come from Holland.

#### Sounding "America"

That was an amusing assault which was made the other day by the Roman Catholic Weekly "Monitor" of Newark, New Jersey, upon the venerable patriotic hymn "America." About a fortnight ago the "Monitor" came out, it seems, with this:

It will not be out of place to insert a note of warning against the singing of "America" by the pupils of Catholic educational institutions. The degraded lines so long the boasts of all Anglo-Americans should never be heard within the walls of a Catholic school or a Catholic college. Unlike the "Star-Spangled Banner," they do not generate a racial spirit. "America," in essence, is the "National Anthem of God Save the King," it helps perpetuate the fiction that we are a mixture of "Anglo-Saxons." From the viewpoint of broad outlook, equal these are the reasons why a national song, as a Yankee Protestant minister who wrote it for a Yankee Protestant Sunday-school picnic, is objectionable. It has not been so long as it is to be present on an occasion when this offense shall be repeated we advise them to bias, and his vigils, usually. No matter what the date, but for the sake of the proceedings. Their doing so will help to bring out the true character of "America," which should never be sung at a Catholic gathering.

Hymns are matters of taste. No one should wish to force on the "Monitor" any hymn it objects to. But this objection to "America" does not seem to be well taken. Dr. SUTHER of Harvard's famous class of '38, was not yet a Protestant minister when he wrote it in 1822, but only a divinity student at Andover. He got the time out of a German hymn-book and did not know it was the time to which the English sing "God Save the King." But it looked to him like a good tune for a hymn of patriotism, and he was words to it, not for a national picnic, but for Lowell's Bay, publisher of verse. His hymn is not great poetry, but it has answered its purpose for nearly three generations, and has patriotic associations in the minds of millions of Americans. There is nothing in it that should give offense to anybody.

So the line "Land of the Pilgrims' pride" may be the one that divides our New-Englanders. But why should it? We believe that Irish-Roman Catholics are now in the majority

in Boston, and are likely to constitute a majority of the population of Massachusetts. Certainly, then, they are the heirs of the Pilgrims, and should, and probably do, share their pride in the land of which Pilgrims and Puritans were by far the most numerous and important early settlers. "America" is a hymn of liberty; of religious liberty as well as other kinds; of religious liberty by which no group of our American population has profited more conspicuously than the Irish Roman Catholics. There is nothing in the hymn for Irish Catholics to object to, nothing in it that is out of place in their gatherings; nothing in it so much as to suggest to us that a score of every million of them will ever make complaint.

#### Mrs. Young Resigns

The resignation of Mrs. ELLA FLAGG YOUNG as superintendent of public schools in Chicago, anticipated the close of her term of office by only about three months. She asked to be released in January, but her resignation was not allowed to take charge in the middle of the school year. She resigned, it seems, because of a hard fight on text-book lobbyists, in which she has been covered, and which has divided the Board of Education and deprived her of the power of selecting text-books. She would have to fight, she says, to hold her place in the position in December, and she says that she thinks herself too old to fight for any personal advantage, and besides, she says, "I have always talked peace and harmony."

We are not informed about the details of the dispute in which Mrs. Flagg is involved, but it is to admit the dignity of her position. She is a very distinguished woman, a teacher-a married woman—who has done some of the best work of her profession since she was seventeen years old; fifty-one years and over. There seems to be a pretty strong sentiment in Chicago against her retirement, and it seems likely at this writing that her resignation will be withdrawn.

#### Mr. Adams at Oxford

For English people who tell you of America, and who's more, I beg you frankly, set my eyes to look anything of it. Students at Oxford were surprised to hear the announcement that the distinguished AMERICAN LAWYER who had something to do with a Civil War in the United States. They have heard of STANWELL JAMES and his son but he was not known to them. They knew very well that he was a man of a high character. Whether they were in the rightness or the wrongness of their view, they are by no means wrong.

The laws of the English are set toward the East. The British situation has been their permanent to view. Their own Best War means more to them than does America history. America and the story of our Western transatlantic committee are little to them. We see they looked upon as a profitable field of study.

So Mr. CHARLES FRANKLIN ADAMS is quoted by Mr. KING in the Boston "Transcript."

Mr. ADAMS went over last spring to lecture at Oxford on his Civil War. Mr. KING, he says, broke it to him gently that he would not find Oxford interested in that topic, and intimated that the English had forgotten all about it, and that it would be of no great fundamental importance, and that the programme he figured in it would divide in the lapse of time. Mr. ADAMS disagreed with him and thought the issues, historically, very big and likely to look bigger as time went on. He noted out there; the shaping up of a world power of the first class, the question of chattel humanity, and the world movement toward democracy. Mr. ADAMS went, and lectured. But he says: "The Oxford, I freely confess, was one I should not care to be called upon again to face."

"Pioneer work," Mr. KING calls it. We have a vague memory of reading that one of Mr. ADAMS' lectures fell on the day of the Oxford-Cambridge races. If Oxford on that day was not interested in American Civil War there was a reason. But there is no one about better qualified than Mr. ADAMS to do admirably what he undertook to do at Oxford, and if Oxford neglected to profit by his ministrations it was Oxford's fault and Oxford's loss.

#### The Immigrant Food

The papers of July 14th had this notice: SEATED PROPOSALS will be received at this office, at 100 Nassau Street, N. Y. C., until 10 o'clock P. M. Thereafter, for the entire period of immediately thereafter, for the entire period of furnishing food to immigrants and their families at the restaurants at the Ellis Island immigration station for a period beginning from date of notice and continuing to June 30, 1914. For specifications apply to the COMMISSIONER OF IMMIGRATION, Ellis Island, N. Y. C.

The job of furnishing food to immigrants at

Ellis Island is very attractive to persons who aspire to furnish improper food at luncheon prices.

Mr. WILKINSON, the late commissioner, had the reputation of being extremely vigilant about the immigrants' food, and successful in seeing that it was good, and sold at a fair price.

Will the next man do as well? There is something to watch.

#### Must Paris Beat Itself?

What is this! In three parallel columns in the same New York newspaper, whose foreign service is excellent, are read these three head lines:

1. London 'Crowded After the Season, Hotels Are Filled and the Stores are Kept Busy by the Americans. The Disappointment is Real.

2. American Tourists Still Crowd Berlin. German Health Resorts Also Welcome Them in the Unfinished Numbers.

3. Disastrous Season in Paris at an End. Managers of Shops, Restaurants, and Open-air Theaters Complain of Heavy Losses.

Really, here is something of almost as much concern to Americans as to Parisians. If it's true, and if it should continue, then it is not a sign that Paris has been charged, quite as likely as that Paris has changed. There is something, no doubt, in the dull and drizzly weather Paris has been having. London has had it, too, but sunshine is not a London specialty, anyhow. It can stand the loss of it better. So for this we make allowance. Still, those head-lines remain disturbing.

We must, therefore, make allowance for another fact which is that London and Berlin have been changing prodigiously of late, whether Paris has or not, and with the American tourist very much in mind. London's transformation has been really extraordinary. In streets, shops, and hotels particularly, it does ten times what it used to do to attract and hold the traveler. It keeps its unquenchable dignity, yet it has grown palpably more cheerful. Berlin's self-improvement has been even more studied. No wonder American respond.

Maybe there is another thing. Maybe Paris has at last over-reached herself as the arbiter of fashions, particularly in female apparel. Maybe she has made too many of her royalties bow down to rivals in the field and think ridiculous, and changed them too much for it. Hence her temporary loss.

For we doubt its permanence—almost as we would doubt a prophecy of Rome's own downfall. We cannot conceive that Americans will continue long to go and lose to Paris, wherever they may go. Her charm is too great and perpetual to be so easily lost. She has shown us rather, to see what she will do, now that she perhaps feels she must more actively rival Berlin and London. We can no more believe she will bow humbly to their rivalry than we could believe the like of a woman wove all her life to non-ambitions than her sisters.

#### Our British Civilization

Mrs. RITA SUTTER says in the paper that "the continued destruction of birds has assumed the proportions of a vulgar crime against our boasted civilization."

Well, so it has, but does any one nowadays boast of our civilization?

The anti-suffragists say it out, but say that maybe they could better do it if they had the vote. The anti-suffragists aver that what with feminists, militants, and the disruption of the home, it is all to the bad, but they may save the pieces if they can only head off votes for women. The I. W. W. and the socialists deny my standing to a capitalist society; the capitalists are successful in a social system in which such showmen as the I. W. W. can exist. The radicals generally declare our civilization can only be saved by radical measures, and the conservatives generally feel that standards have already been so upset that salvation is a foregone hope.

Who is boasting nowadays of our civilization?

We guess the phrase Mrs. SUTTER has used was left of a social system in which such showmen as the anti-suffragists were better pleased with their achievements.

Nevertheless, rather than here our civilization lack a voice to praise it, we will raise ours. It is full of faults, but full of hope. Our world was never so full of people at work to better it. The oceans to that end were never so abundant. The soil yielded there never so free, not so bountiful, nor more intelligently devoted.

Michelangelo's "Night" and "Day"

## COLUMBIA INSPIRES SCULPTURE ANEW

BY JOHN WALKER HARRINGTON

**M**ICHELANGELO, sculptor, has had a rebirth in New York. A group of American disciples of the plastic art, some young, others veterans of the atelier, have adapted his methods of studying anatomy by actual dissection. They begin work this autumn in the College of Physicians and Surgeons, with the sanction of the trustees of Columbia University. For the last year, however, under the direction of a demonstrator from the school, they have been pursuing their studies in their several studios and sometimes in the dissecting room.

With Columbia in the same relation to them as the great prior of the monastery of St. Spirito here to Michelangelo, the pupils of a great master hope to achieve yet more of his inspiration. His influence upon their work is apparent in a virile and a sure touch, in a vitality that seems to radiate even through their close with life. George de Forest Heath, seeing his son studying under the old order that has become new again, exclaimed: "At last we have something!"

Many fine works have been produced by American sculptors, and some are being modeled by men with the true impulse of the artist; yet this vintage of the school of Bessarotti now revived is indeed well arrived. It comes at a time when conventionalism is rampant on one hand, and the cult, with undisciplined indifference to the things that are, are reaching their rampage.

The country is emerging from the gossamer Renaissance Movement period into a world of reality. It is well that Michelangelo has been invoked by us. Who knows whether this movement gains impetus, but that, instead of statues brought up by pedagogue and painting-manicure, we shall see sculptors working the solid marble themselves, as did the illustrious Florentine when the fine lady of his art was upon him!

Michelangelo Bessarotti was in his early years led to the study of anatomy by dissection, even in an age in which the dismemberment of the human body was practically under the ban. The ancient Greeks, who were under much the same prohibition, probably dissected little. The Renaissance, reviving the Helianthion of anatomy, copied the statues of antiquity, and often sculpture fitted into grooves of cold and classic imitation.

Michelangelo, who began modeling at the age of sixteen years, was soon under the patronage of Lorenzo de' Medici, and became a resident of the Medici palace. The prior of St. Spirito was the first to call his attention to the value of anatomy to his art, and despite the attitude of the authorities toward the examination of the dead, obtained bodies for him to dissect. The sculptor, against his natural inclination, applied himself with energy and enthusiasm to his studies. The effect of those hours of intense application may be seen in works that the world has long since hailed as immortal.

In later years Michelangelo planned to leave the result of his labors in a treatise on anatomy for the use of sculptors. He had consulted with his friend, the noted Italian surgeon, Realdo Colombo, and the sculptor entered upon his task, and made voluminous notes. The work, however, was never completed, and finally was lost. The records of similar labors, however, remain in a molten mass containing these volumes in such masterpieces as the "Moses," the "David" in the wonderfully muscular anatomy on the torso of the Medici, and the torso of "The Last Judgment."

The sculptors of this modern day who are following the method of him whom they have chosen for their master have gone back to the same principles that guided him. They do not know and do not understand the human structure. Michelangelo, as his biographers record, did not concern himself with all that the surgeon needed to know, but he sought to learn how the human frame was built and moved. The sculptors of today have vision in their studios a rickety fashioned structure to support the mass

of clay that they would impose upon it, some spend months in modeling an arm or a leg, putting down the damp plaster and rasping it up and leaving it down with tiny tools until it conforms to their ideal.

And here is the mighty artist hewing his "David" from a block of stone scarcely ten feet high.

—A fine one, Master Michelangelo, what you do.

"Toll," by Victor D. Salvatore

for you have only a small wax model," said they of his art.

How the great few, how the great hordes of marble went hurrying to the ground, as the mallet smote the chisel. No stone did he come in his rough work to the outline for which he strove that it seemed as if he must ruin the work at last. His touch was so sure because he knew. For how there was an uncertainty as to where the bones should come in the surface, and where the muscles were attached. Such knowledge as this is what the little group is seeking to gain by its first-hand studies.

Some critics have said that Michelangelo bestowed too much attention to his anatomy, and that symmetry and beauty would have fared better at his hands had he had less stress upon anatomy. The "David" of Michelangelo, as is received, it was an athlete. The popular conception of the slayer of

"The Young Girl at the Pool," by Frances Grimes

Gelatin in a slender striping such as Donatello has given to us in bronze. In later years the sculptor felt that he might have given more attention to representing the soft loquacity of the feminine form.

Micheleangelo was the sculptor of force and vigor and life. The quality that his studies in anatomy especially gave was a virility, elasticity. One can well imagine his figures straining and working. Their poses even as only those of the moment. The bodies give the impression of substance, the feeling that they exist beneath their clothes. His human forms were not mere scaffolding for the holding up of classic attitudes. Where an arm came to the edge of drapery, it was evident that it there right places were not mere scaffolding for the holding up of classic attitudes. Where an arm came to the edge of drapery, it was evident that it there right places were not mere scaffolding for the holding up of classic attitudes. Where an arm came to the edge of drapery, it was evident that it there right places were not mere scaffolding for the holding up of classic attitudes.

This is the effect, then, for which we are working the grasp of sculpture over whom, at the recommendation of Professor George S. Huntington, the College of Physicians and Surgeons has extended its friendly arms. First of all they made a careful study of the human skeleton, under the direction of Martin Perleson, who for many years has been anatomical dissections of the institution. They learned the nature of every bone, and what its function was in sustaining the fabric. They found where the muscles began and where they ended. It became known to them through actual dissection, or by witnessing the taking apart of the tissues, just what the later play

of muscles would be when the frame was put in motion. They learned where the articulated framework beneath was snaked, and where it receded under the impulse of muscles and tendons.

A glance at the works of Daniel Chester French, of A. Phimister Proctor, of Herbert D. Adams, of Adolph A. Weissenberg, who signed the application to Columbia, and of the younger members of this circle, such as Barry Faulkner, Victor H. Balster, Jerome Brush, Max Francis Grimes, and Miss Melville Hoffman, show the influence of the new spirit that has come from our old master.

The records of this work are of unusual interest. Victor H. Balster, the young Italian sculptor, modeled an arm in clay as a result of his studies of the cadaver. Miss Melville Hoffman, another of this class, made a sketch of a right arm that is of unusual power.

A recent work of Mr. Balster, representing "Toll" after the day is done, is a fine example of the influence of his recent studies. A stubborn figure of a man bent over and with muscle relaxed, it commands attention at once for its lifelike quality. It is as if the worker had just come home, that he had stopped to rest only for the moment; that, if he rose, he would be ready to go on full possession of muscle and practical force.

Do you remember that remarkable little group, "The Russian Emigrants," by Miss Hoffman, that was

exhibited and hung since at the National Academy of Design? The agile forms, heavily resting upon their support, represent the new inspiration in terms of beauty. The anatomy is true and exact, the pose forced. Here is the art that is first seen in the principles and then gives free rein to fancy—the art that was not stray from truth.

Of the new school of anatomy none is more sure in his method than Mr. Proctor, sculptor of Bass and lions and mountains above. His attempts are nervous in the field with the best—indeed, for he is an enthusiastic big-game sportsman—have always made him a good artist. It is one of Micheleangelo that his dissections of animals were very extensive, and that he was especially proficient in demonstrating the muscles of the horse. The animal sculptor, above all, needs the expert knowledge of the tissues and nerves beneath the shaggy exterior.

The class that was begun in the quiet of the studio, and has now extended its work to the directing room, has few little children and gone out to struggle with the dynamo of a movement that may electify American art. It may mean an effective protest against the imitation of the prime masters of the antique, and the servile copying of a degenerate art of hands beyond the sea.

Above all, it may point the way to the preservation of the principles that will inspire American sculpture with a new and better life.

"The Tiger," by A. Phimister Proctor

## A MOTHER OF REVOLUTIONISTS

BY NINA LAWTON

*The following story is not fiction. "Mother" really lived, and lives now in the hearts of those who knew her. Characters like hers are not rare in Russia. She is only one of those numerous "fighters for freedom" whose life is a complete self-renouncement, a*

EVERY house-owner who had to mortgage his property at the Territorial Bank of Chicago—and this is what nearly every proprietor in those times of financial crisis in Russia had to do—knew that first of all he had to address a plan of his property to the Bank, and he submitted himself to Mrs. Barbara Ivanoff, who, as an architect, furnished such plans.

When they came to her to speak about their business, they invariably found her at work as her study,—if that there could be called a "study"—in which stood several chairs with somewhat-out-thrust straw seats, a big black stool filled with books, papers, on the floor near the walls hung of sketch-books and glass watercolor and diffused in great disorder. In the middle of the room an enormous table—four boards joined together and hid on two trestles at each end, covered with ink-stands, pencils, rulers, and paper; the windows without any curtains, with panes on which rain and dust had left their traces—this was the furniture of the "study."

Mrs. Barbara Ivanoff had such quiet with a manly shape of the head. And in general she gave the first glance the impression of a man rather than that of a woman. She was about forty, tall, of a somewhat rugged constitution and large features, with light-colored hair smoothly combed and arranged in a small ball at the back of the head. Her gray eyes looked at one directly.

But she had only to smile, and her jawless smile showed blindingly white teeth, the gray eyes became soft and tender, a deep, all-understanding love shone in them—the whole face transformed itself, as if illuminated and became truly womanly. This same came to see her on business rarely saw this wonderful smile; they saw only the hard-working woman in her,

energetic and clever, in whom they could intrust very serious business. Therefore, Mrs. Barbara Ivanoff's social position in the business world was quite definite: she was the architect, the designer, a clever and honest laborer.

MRS. BARBARA IVANOFF'S personal life was one of luxury to those business men who consulted her. But all the thinking young people of southern Russia knew it. Every student, boy and girl, knew her by name—"Mother," though they might not know her by name. They knew that "Mother" was a member of the Central Committee of Russian Revolutionists; that she held in her hands all the threads of the secret revolutionary work of a whole district. They knew that she was greatly appreciated in the "Party" as an old, experienced worker, and that she was famous for her extraordinary ability to escape from the most dangerous political affairs under the very nose of police and gendarmes—and not only to escape herself, but also to help others to escape and hide. Traditions grew up about her, and everybody, even those least acquainted with the delivering movement in Russia, knew about them.

But for those young people Mrs. Barbara Ivanoff was not only the member of the Party of Russian Revolutionists; she was their mother—the woman with the all-understanding, all-sacrificing, loving heart, who loved them, not sentimentally, for herself, but who loved in them all humanity. They knew that they could come to her at any time of the day or night, and always find not only a cup of tea and, in case of want, a night's lodging or a ruble, but also a sympathetic or encouraging word. They knew that she was always ready to help them not only in their studies, but also in solving complicated moral or social problems that tortured their young minds.

(Continued on page 56)

And they could tell her their joys and sorrows. She enjoyed and suffered with them.

It was known that long before she had left her husband, a despicable creature; that she had taken her few little children and gone out to struggle with life; that she had seen much sorrow, suffered starvation, had worked very hard; and that, putting her personal life aside, she had devoted her life to the cause of others, and had found time and energy to devote herself to the of the poor Russian youth, passionate and excited, for whom self-sacrifice is the highest of ideals, could not but adore such a woman.

ONE day I received a big package by post. When I opened it I saw thousands and thousands of proclamations, of pamphlets, of collections of so-called "illegal literature." I was known to one of those who did not belong to the Party, but who sympathized with its aims and who helped it as best they could. The names of such "sympathizers," as they were called in those times, were known to the Party, and their addresses were often used by the Party for transmitting letters, illegal literature, etc. "Sympathizers" were not under surveillance of the police, and so these packages and letters usually arrived at the destined address. Therefore, I was not much surprised, and went immediately to see Mother to tell her about the package.

When I arrived, she was sitting on a bed in the room that served her and her two little girls as a bedroom. On chairs and on the other two beds sat her son, a university student, some other students, and her grown-up daughter, also a student. Mother had probably just come from some handling that was under her direction, for her hand-covered boots stood before the oven, and her jacket, soaked with

# GENIUS

## A World-Old Problem Viewed in the Light of Modern Psychology

BY H. ADDINGTON BRUCE

**T**HE theory of genius that it is my purpose here to present and defend has little in common with the views held by most students of this world-old problem. (Especially does it differ from the well-known and at present dominant doctrine of the *Motiv-Lexikon*—the work of investigators by whom the man of genius is regarded as an abnormal, even depressive type of humanist, closely allied to the insane, and hence by implication deserving to be repressed rather than encouraged.) Nor am I at one with those who, justly protesting against the depressive theory, themselves contend that genius is an anomaly in the scheme of nature, and that the man of genius, biologically speaking, is a "varietal" dependent on an unknown, perhaps unobtainable, line of heredity.

On the contrary, following the lead of the late Frederic W. H. Myers—the first, in my opinion, to glimpse the true significance and fundamental characteristics of genius—I shall endeavor to show that in the man of genius there is, at bottom, no real departure from normality, and that he differs from the "average man" only in being the fortunate possessor of a power far utilizing more freely than other men heretofore common to all. More than this, going beyond Myers, I venture to affirm that genius is to an appreciable extent susceptible of cultivation, so as to become a far more frequent phenomenon than it is today.

In other words, I maintain that God, or Nature, as you choose to put it, is giving to the world its DuRoi, Newtons, and Einsteins, but not withholding from any mere scraps of admiration and admiration, but no indications of possibilities open to the generality of mankind.

Such a view, it may at once be conceded, could not reasonably have been advanced many years ago. It rests mainly on facts then unknown or misunderstood, and even now little appreciated outside of a narrow circle of scientific investigators. Foremost is important in the discovery that, in addition to the ordinary realm of conscious thought, there exists in all of us a second realm—that of the so-called subconscious—in which, quite without any will-directed effort of our own, the most varied mental processes are carried on.

The subconscious, in fact, is a kind of vast

storehouse, wherein are preserved, seemingly without time limit and in the most perfect detail, memory-images of everything we have seen, heard, or otherwise experienced through our sense-organs. It is also a kind of workshop for the basic manipulation of ideas, including even the elaboration of complicated trains of thought. Manifestly, the more freely and habitually one can draw on its resources, the more one ought to be able to accomplish with regard to any set task or chosen field of work. And in this, I am persuaded, we have the clue to the true explanation of the brilliant achievements of the man of genius.

It does what he does so well, not because he is of an abnormal type of mentality, as the *Lexikon* men seek us to believe, nor yet because he is born with gifts transcending those of other men, but simply because he has found a way more readily, more frequently, and more probably than others to avail themselves of the subconscious powers that are the common heritage of the race.

### *Solving Problems in Our Dreams*

**T**HAT the "inspirations" of genius are really nothing more than spontaneous pourings from the depths of the subconscious is indeed demonstrable from the recorded statements of men of genius themselves. To the modern psychologist, one of the most impressive proofs of the activity of subconscious mental processes is the occasional solution in dreams of problems that have long baffled the waking consciousness. In this way obscure mathematical problems have sometimes been worked out after all hope of solving them had been abandoned; and troublesome clerical errors, the perpetual dread of bookkeepers, have been cleared away during sleep, on the following typical instance, reported by a successful business man:

"I had been bothered since September with an error in my cash account for that month, and, despite many hours' examination, it defied all my efforts, and I had almost given it up on a hopeless case. It had been the subject of my waking thoughts for many nights, and had occupied a large portion of my leisure hours. Matters remained thus until the December 11. On this night I had not, to my knowledge, once thought of the subject; but I had not

been long in bed, and asleep, when my brain was on leave with the books as if I had been at my desk. The cash-book, banker's pass-book, etc. appeared before me, and without any apparent trouble I almost immediately discovered the cause of the mistake, which had arisen out of a complicated conundrum.

"I perfectly recalled having taken a slip of paper in my dream and making such a memorandum as would enable me to correct the error at some leisure time; having done this, the whole of the circumstances had passed from my mind. When I awoke in the morning I had not the slightest recollection of my dream, nor did it even occur to me throughout the day, although I had the very books before me on which I had apparently been engaged in my sleep. When I returned home in the afternoon, as I did daily for the purpose of drawing, and proceeded to draw, I took up a piece of paper from my dressing-table to wipe my eyes; and you may imagine my surprise at finding therein the very memorandum I fancied had been made during the night.

"The effect on me was such that I returned to our office next day to the cash-book, when I found that I had really, while asleep, detected the error which I could not detect in my waking hours, and had actually jotted it down at the time."

The modern psychological explanation of all this would be that in his many hours of searching through the books he had, though without being in the best aware of it, probably brought together the data necessary to correct the solution of his problem; and that in this case this happened to be first definitely formulated in his mind while he slept, thus giving rise to the dream that caused him such astonishment, or he might have the correct law unconsciously known the cause of his error, but without being able to profit from the knowledge until a favoring condition of sleep permitted its emergence above the threshold of his consciousness.

Now suppose that instead of being a business man he had been a novelist, artist, or musician, and had been preoccupied with some special or general problem peculiar to his art. If in that event, he had had a dream in which was presented in his sleeping consciousness a plot or subject or theme, which, being afterward given permanent form on paper or canvas, proved to have the qualities of a "work of genius."

# CHILDREN'S COURTS

BY

ERNEST K. COULTER

**A** CENTURY ago they were hanging children on Tyburn Hill for robbery. Some one protested, and it was ruled sentimentally. But in time the hangings ceased. Sentimentality has always been the cry set up in opposition to legislation for human betterment. The proposition to create children's courts was denied as the "foolishness of a lot of women and other long-haired cranks." Children, being the weakest members of the community, have been the last to come into anything of their own. Jurists and "leading citizens" clamored against the Children's Court plan in Illinois in 1898, where the first separate tribunal for children was created by authority of legislative enactment, and later in Colorado, where Judge Lindsey first came into being.

The introduction at Albany in 1901 of a bill drafted by Joseph M. Dewal, then a police magistrate, prevailing for a separate court in New York City for the hearing and trial of the cases of children under the age of sixteen also came into conflict with the law, expelled the District Attorney and a cohort of defectors to fly in Albany to amend the State constitution and the courts thereafter against this proposed invasion of their sacred rights. These police courts are of their jurisdiction, and what difficulties have not attempts to improve their arduous procedure! Had the sentimentality of women who protested against the further arraignment of children—many of them merely the victims of environmental and parental cruelty or neglect—in company with the city's thugs and drunkards, prevailed.

## Women Responsible for Next Humanitarian Progress

**WOMEN**, indeed, have forced most of our steps of humanitarian progress. Frankly it is because the men are so busy with the bread winning that they do not have time to think of these things. Until a good woman created a Hell's Kitchen tenement thirty-eight years ago, and decreed to light a naked, half-dead little creature whose body was covered with the marks of the shears her guardians had used in torturing her, the dog and the horse reeked higher in the law's eyes than did the child. The dog and the horse had a property value, the child had none. The rescue of the child Mary Ellen by Mrs. E. A. Wheeler inspired Henry Bergh, then the head of a society to pro-

tect animals from cruelty, and Elbridge T. Gerry to organize the first society for the prevention of cruelty to children. The movement which began with that sentimental act by Mrs. Wheeler has spread until there are now some such societies for the protection of children.

The awakening consciousness of a new duty to the child which led to the establishment of juvenile courts came much later. Now that the majority of States have children's courts and they are proving great life-saving stations, various communities are vying with one another in their claims for credit for their first establishment. There are several New England towns whose magistrates, backed by no law other than their own common sense and spirit of humanity, have for more than twenty years been holding the trial of children's cases separate from those of adult offenders. In Providence, Rhode Island, for instance, the Grand Jury in 1831, after the summary review of court, found that a boy who had robbed a bakery had been in jail for many weeks with hard-core cranks while waiting for the uncertainty of justice to move. The recommitment in a preventative against their further incarceration with grown criminals, and for the quick and separate trial of children, has since been followed.

The injustice of the arraignment of children at the same bar with New York's thieves and thugs led Judge Dewal, in 1903, to hold separate hearings in his police court for the children brought before him. Had it not been for such splendid unsentimental jurisdictional obstacles, had it not been for the untiring efforts of the late Mrs. Josephine Shaw Lowell and the woman's clubs she headed, the bill he drafted later could not have had the effective moral support back of it that finally served it on the statute books.

There are communities today that are still jailing children in company with depraved criminals. The writer, on a visit to Charleston, North Carolina, not many months ago, was asked to inspect the jail, and found a boy of thirteen years locked in the same cell room and mingling freely with a vicious lot of tramps and thieves. Through the barred windows of the cell room was seen the wretched structure of the gallows. This occurred close to Tyburn Hill.

The writer, in his official experience of almost ten years in the Children's Court of New York County, the largest children's tribunal in the world, and a

court that he helped to organize, saw at close range a great pathetic procession of innocent children pass before it, creating those who were there on one or more occasions—children charged with all sorts of offenses, from larceny to homicide.

Mark that in procedure, mark that in fact, has been written about our children's courts. None of our juvenile courts have been bitterly criticized, usually because of political motives; others have been held up by some theoretical sociologists as being ideal. Perhaps the writer's experience may give him the right to set down with some authority a few observations about the work of our children's courts and the subject of delinquency.

## Children's Courts Not Yet Perfect

**A**T the outset it would say that there is no "ideal" children's court" in existence today. They are too young to have attained to any such degree of perfection. Fifty years from now, perhaps, we may properly talk of such a thing. But we have gone far enough to prove that they are great life-saving stations, and that they are developing a new value as great social chairs. For in dealing with children we deal with fundamental, and under the X-rays of judicial investigation in these courts for children, we are being shown in a manner most startling not only the delinquencies of the child but the more serious delinquencies of the parent and the community.

When any one holds up any one children's court as a model for the world, whether it be in Indianapolis, Denver, Chicago, or New York, it is proof that he does not know what he is talking about. There are widely different State constitutions, conditions, and problems to be met in dealing with the children's case of different cities, and it would be impossible to attain the best results and have the procedure in any two cities exactly alike. The great advance that has been made in all of them, however, has been the saving of the plastic material of future citizenship that comes to them from the inextinguishable mold of criminality, the placing of his material in the hands of a judge who, in those common-sense instances, give wide disciplinary powers, and who usually is a wise father in time of greatest need to the boys and girls who come before him.

A recent study of the cases covering a period of six years showed that less than one per cent of the

A scene in the Richmond County Children's Court on Staten Island, where a case of neglect is being heard from six children, who accuse their parents

Photograph by Ernest K. Coulter

children who had been arraigned in the court of New York County returned a second time. If all the thousands of children who had been found guilty of juvenile delinquency, to have been without proper guardianship, to have been unmanageable or disorderly, and who had been released on probation, only eleven per cent had failed to make such good progress that their commitment to institutions was necessary. In the old days, a vast majority of these same children would have been returned off into the gaping maws of barracks-like institutions, there, perhaps, coming into contact with children no truer worse than themselves, and suffering the great risk of being turned out confirmed criminals.

The great effort in the Children's Court of New York County is to save the children in their homes if it is at all possible. The feeling is that a home must be sought not to be better than the best institution ever created—and the institution may have catalogs of male and male lunatics. This is not any rebellion on the institutions; it is necessary to have them; but, save for unusual conditions, the home is the best place for the child. So it is that of the army of approximately 11,000 children arraigned at the bar of the Children's Court in New York County each year, only about one fifth go to institutions, and one half of that fifth are committed, not

hospitally of the old Department of Charities and Corrections. That report in countless thousands the city's cradled grown-ups to beg its grudging charity. But today the constant presence of the negligent and delinquent children who pass between the doors are being saved from the army of pauperism and crime.

### The Forces that Make for Juvenile Delinquency

Of all children's courts, we are opening our eyes to the forces that make for delinquency. They are forcing us to see that our great city of the past has been social irresponsibility. We have not saved particularly what has happened in our neighbor or his child, so long as nothing unpleasant has happened to us. Since they have been committed we have been brought to a realization of the enormity, the injustice of treating children as thieves, burglars, and felons. The Court of Appeals in New York only last week gave the case of the man of the People's Park, decided that a child under sixteen, who had been convicted of a felony was disqualified to be sworn as a testify in any proceeding, civil or criminal.

Most of the States that now have children's courts are no longer convicting children of crime, but, where they have offended against the law, are finding them to have been guilty of juvenile delinquency only. Formerly, children that had been convicted were barred from civil service examinations. Now they are being disqualified from any of the civic privileges of citizens. Our children's courts are teaching us, too, that seventy per cent of juvenile delinquency is due to parental delinquency, and that most of the parental delinquency is due to the delinquency of the community. They have shown to what an alarming extent had grown the practice of parents tramping up charges against their own children in an effort to have them committed to institutions and thus shift to the State the burden of their support until they had reached a bread-winning age. If the children's courts have done nothing else to justify their establishment, they have made it possible to put a check on this practice. For now many of the States have laws that permit the judge who has committed a child to an institution to place the father under a court order to pay in the State, in whole or in part, and, if unable to maintain that child while it is in the institution.

Formerly there were some parents in the congested districts who were so proud of the fact that their boys had been sent to an institution, reformatory or otherwise, as we would be that our son had gone to Harvard or Yale. In fact, in many of our newly settled Italian immigrants these institutions were known as *colleges*. But where the parents know that, unless they pay at least a part of the tuition of the college, the father stands a good chance of going to jail, they are not so anxious to get rid of their children in this way. They have reasoned, in the past, that if the State insisted that the child go to school, and would not permit him to help in the bread-winning world he had reached a certain age, then the State should pay for his support and education until that age.

There are parents of this class who even try to get rid of the support of their infants. A mother with a seven-month-old baby in her arms appeared at the Children's Bureau one day, and told a pitiful story of a husband at home dying of consumption. They were out of food, fuel, clothing, and had pawned everything for medicine. The mother said that if the city would relieve her of the support of the child for a few months she would go to work. An examiner was sent hurrying down into Oliver Street. He climbed four flights of basement stairs, and there, in a room that had been stripped of everything except the bed and a wooden box that lay conspicuously beside it, was the consumptive. Surely enough, he was in the last stages of the disease.

The woman, who questioned, stepped her walking

More than half the children brought in the courts in New York each year are there because of the thwarted desire for play

long enough to explain that her husband had met with a blasting accident before the consumptive had developed, and had had a leg. The realization of misfortune made the examiner suspicious. He lifted the covers at the foot of the bed, and two legs were revealed by as good a date as legs on a consumptive in that stage of the disease could be. The services of the consumptive who lived in the next block had been hired for the day in an effort to defraud the city. The woman boy had been borrowed from a professional mendicant who lived a few doors away, and who had no particular use for it on this day, so he was sitting on a corner not many blocks away with his stamp and a hat rebound, enjoying the presence of the sympathetic passer-by. The husband and father was at work earning ten dollars a week. This was all a plot to get rid, for a number of years at least, of the support of the infant.

There was recently been coming to light, too, another heartless but ingenious scheme of parents for unloading the care of their offspring on the public—practically family desertion. This evil has grown to alarming proportions. In addition to the ten thousand children arraigned in the Children's Court of New York County each year, the commissioner of another ten thousand is proposed in the Children's Bureau of the Department of Charities of that one county because of institution and dependency. One-fourth of this number have been deserted by one or both parents. In many of these cases, it has been proved before the parents that the father will disappear, and will locate in or out of the city under an assumed name, and that after the supposedly stranded mother has succeeded in having the city relieve her of the care of her children, they will reappear. Sometimes it takes weeks and sometimes months until the mother has included the children on the authorities, but in the end she plus usually works, and she disappears too, to rejoin her husband and start life and child-bearing all over again. All this is brutal and criminal, but how much of it is due to the State's care delinquency?

Photograph by James Van Der Zee

These boys may be primary pupils of an East Side "Fagan," but their fathers are helpless to prevent it

because of any offense, but because their own homes are not fit for them. Our children's courts have proved beyond any future question that there is no safe even in the child of the most wretched surroundings—and he may be the child of criminal parents—a case of decency and right, and that he can be saved to good citizenship if the community will but take him as he is in time. If frequently call the dirty old building in which the Children's Court of New York County still has its home, and which stands on the lot in the Bowery, the great Gray Way of the Metropolitan, the Palace of Ignominy, because of the hopeful, helpful work that goes on there. In the old days, before children's courts were thought of, it was the Temple of Sorrows; for then it was the

# TOM SAWYER'S TOWN

MARK TWAIN AND THE HEROINE OF "TOM SAWYER"  
Mrs. Laura Hawkins Fraser (Becky Thatcher) was a guest of Mr. Clemens at "Stonfield," Connecticut, in 1908

BY  
KEENE  
ABBOTT

THE thousand of today, with its thriving factories, steel mills, and brick pavements, is a very different place from the languid, yawning hamlet of Mark Twain's boyhood. In the abandoned era of the Illinois the levee was nearly always crowded with big side-whippers; there were five packed lines on the upper river, whereas there is now but a single line. In those pioneer days pork, beef, and lumber were the exports; now they are cement, steels, and cars, and there are five lines of railway to transport them.

But the mile-wide Mississippi is still picturesque with life along the levee. In summer-time four steam-boats a week come in and depart, plying up and down the river between St. Paul and St. Louis; there are daring little skiffs, gayly festooned riverboats,

floats, port launches, delicate yachts, heavy tugs, houseboats, winks; and there is always a jostling dredging machine, with a pair of tall stacks (tumbling forth black and heavy plumes of smoke, towering the town on the bank, the river crackles and splashes and gleams, and at evening gloriates with the reflected sunset. All day long the sycamore green blanches down and down, out there in the slow and tranquil current.

### The Cadets of Temperance

THE river, in short, has not changed, and without the river Samuel Clemens could scarcely have been Mark Twain. Yet perhaps it had no more influence upon him than had the picturesque old town of his boyhood. It is still the same cotton, yellow, soil-gorged stream, with its mud-bars growing with willows and out-towndocks; still the refuge of fraud, school-boys,

filchily known as Polaris, says that withdrawal from such an organization is a gift that comes natural to boys. He modestly declares that he himself was one of the most gifted. "I got expelled," he says.

Mr. McDaniel is a cigar-maker in Hannibal; he is now in his seventy-sixth year, and still works at his trade. I found him "looking" cigar-binders in the factory where he has long been employed.

"How did it happen," I ventured, "that the Cadets of Temperance thought they could go along without you?"

"Combing his fingers through his gray beard, he smiled quizzically as he replied:

"You see, we weren't allowed to smoke any, and maybe I smoked a little; we weren't allowed to chew, and maybe I chewed a little; we weren't allowed to drink any cider or wine or beer or whiskey, and maybe I—well, I reckon they sort of lost confidence in me."

"Was told that his predicament was shared by several others, he solemnly added:

"Yes, sir; I believe the boys were pretty much of a strain on the confidence of that order—all except Tom Blankship. You never struck any one else."

"How was that?"

### The Original Hackberry Finn

"WHY, he could never get in. He was too harem-strange even to try to stir a row of society. Tom—old Tom ago—Tom was the original Hack Finn. Sam Clemens says so in his autobiography; and Tom has no wiles up as the most cowardly boy in town, after Tom Blankship. Says the boys never saw me ending early. Though my father was a rowdier; and he says, too, that the boys always supposed that really was my ordinary diet."

"You were well acquainted with Blankship?"

"How I? Well, I reckon so. Co boys, with Tom and Sam Clemens, used to go fishing together away and away a time, down at Hannock Island. Another place we liked to go to was Turtle Island. It lies up the river above the bridge. That's where we went to get turtle eggs."

After tentative interest the Mr. McDaniel said deliberately:

"I remember all about the Blankships. The main family—father, mother, two boys, and a girl—was down the river in a dugout. Know what a dugout? Well, it's a boat or canoe made of a big tree hollowed out. They came from up river some place, and they landed at the foot of North Street. I was three at the time. Ben was the name of the other boy, and he was older than Tom, but what the girl's name was I don't remember."

"As for the name of Finn, which Sam Clemens gave to Tom Blankship, I'll tell you about that. When we were boys together, the town drunkard used to be Jim Finn. Now, I never have read any of Sam's books, but from what I hear I reckon that his description of that Finn's old pig of a father was pretty much on the order of old Jim Finn. One morning he was found dead in Jim Finn's barnyard, that used to be up there at Main and North streets, but it's gone long ago. It was in the same place where the carriage and wagon shop is now."

This information was corroborated by Mr. John A. Fry, a distinguished citizen of Hannibal whose very special distinction is that he neither withdrew nor was expelled from the Cadets of Temperance. When this fact was mentioned to him, he blandly inquired:

"What, they didn't put me out? Well, then, I reckon I was overlooked. Must have been that, so the secretary got worn out with scribbling off the names of so many boys. Still, it's a solemn fact; I have kept the ledger."

As he sat in the sunshine on his front porch, he drew deliberately at his ash pipe, letting little blue wisplets of vapor eddy up through his gray mustache,

The house in which "Hackberry Finn," whose real name was Tom Blankship, used to live. It was in the same block with Mark Twain's old home

The old schoolhouse, now used as a cheap dwelling, where Mark Twain and Becky Thatcher started to school

# HIS LITTLE TAN SHOES

BY ZOE ANDERSON NORRIS

ILLUSTRATION BY H. M. OLCOTT

It was Saturday, a beautiful day, a first-pat-twelve. The sun shone straight down on the peak of my eucalyptus of a hundred windows, which were now compassately empty after the usual Saturday morning bustle of cleaning, sweeping out the curtains on the cross lines, of beating and sweeping the rugs, the lathie having resigned itself to the fate, where the preparation for the Saturday afternoon outing of those people, for whom Saturday and Sunday are the only holidays, was going on.

Usually the couple in the windows of the fourth-floor flat sat and quarreled all afternoon; but, to my intense amazement and delight, all was lathie these two.

There, where they quarreled once a day and twice or three times on Saturdays and Sundays, something was happening. They were going to France or Brighton Beach, at any rate, they were not going to quarrel that Saturday afternoon of the terrible heat in their cramped and badly impured flat—in their flat of the wall-paper. They were going to spend it on the beach where the sands were white, and the skies were blue, and there was no fery, quarrelsome nod to egg them on to battle, unless perhaps a dash or so here and there in the oasis of the children, too widely diverse and separated to hurt.

I don't know! The account of the child! That past year, I had pitiful child a boy of five or six, who spent all the days of his unhappy life in the vain endeavor to separate his father and mother as these piteous battles, brought on by his own hands, unless by the wisdom and lathie of his mother, the crowd—all to be so different from his usual Saturday afternoon with his quarreling parents, those departing, heart-breaking afternoon that were robbing him of health and strength, and snatching his growth.

There was the mother, harrying about in her lathie way, getting, mending, the lathie along, perhaps, in another room of the flat that I couldn't see, but which, in all probability, was paged the same bright, fiery red, for he frequently came from it in a violent and unmanageable temper that was only assuaged by the breath of fresh air and the view of a scrap of sky that he got from the window-blind.

I sat by the window of my den, watching the boy polishing his shoes, glad that this Saturday afternoon was to be different.

Now and then the mother would come by, in her process of getting ready, and look over the work of polishing the shoes, telling him to hurry or to work a little more in time, and he would always make a dash at the throat of leaving him lathie in the heat of the afternoon.

The mother was pretty, very pretty, young, and would have been wonderful except for the wall-paper and the heat. Sometimes, when she put on the light green gingham with the little checks, and did up her hair she was wonderfully pretty. All day long she went about her work, chatting with a woman friend, laughing at her children on the roof, and laughing a little fat laugh that I rather liked to hear, good-natured rough and sweet when she was out in the open on the roof under the sky—she was good to the boy, and she hardly ever slapped him and then not so very hard.

Once the father came in the window with one hat of his late slaved and the other lathie, and looked at the shoes.

The part of his face that was slaved had a piteous look of content. He was rather good-looking on a Saturday afternoon a boy he first came home, before he had not a couple of hours with the wall paper and his remaining glass of beer on the window-sill, she at the other window with her glass of beer, sometimes a friend at that window with his glass of beer, and the little waving between the two, laughing at each other.

—It's the third pint," would cry my neighbor, who

watched the court courtmen, too, from her window seat to come along the street.

"It's always the third pint!"

"That and the wall-paper," said I. "Don't forget the wall-paper!"

Then the run—the row! The man who called each other! Terrible, terrible! A disgrace to the court. After, in spite of my shouting, I closed in the afternoon of the light, I had to shut my windows down, but all went so well this Saturday afternoon, on account of the boy. Now all must go well. What a day he would have on the beach! How different from the cramped heat of the fire-escape!

The boy had almost finished one shoe. He had set it down, with a smile of self-satisfaction, to look at it, and see what else it needed, when—

What was it again? The wall-paper, for there had been no beer.

A word, a look, a fashing glance of impertinence, and the war was on.

I gave a loud cry as I looked at the boy.

For a brief period he kept on shining his shoes, kept on valorously, in a determined way. He must go! Every Saturday afternoon of his life he spent trying to separate those two. He must have some afternoon of play, he must!

But, as the light progressed, he lost heart. He stood there for a time, he stood as if he were designing into the room, and I could hear his piping, childish voice, trying to make peace between them, trying to separate those two.

The two swung past the window in their circuit, she running, he following. I saw the child follow them, clinging wildly to the skirts of his mother.

I heard him give a cry of terror as the father suddenly snatched his nurse in mid-air, threatening his wife.

I think he had no real idea of killing her, or even beating her. He never did, though he often threatened it. She was so many. If she had ever seriously suffered punishment she would have been afraid, I guessed myself!

There she stood by the window, where I could see her, the boy clinging wildly to her skirt and sobbing his small face white and drawn with fear. But she was not afraid. She barked frightened words, as she stood there, at the man with her eyes.

I sprang to my feet and had the thought of calling for the police. In my heart was the fear that she should be the child—the fear of Maudslott, of a tragedy, but it was not in her.

Perhaps he had waded the race at her many times before in that beach room. Perhaps the boy had not been a witness of these scenes, or maybe he had, and yet the red terror of it entered his little and each time as it had done on the first.

The mother turned, and I could hear the sob of the boy as he flung himself prone upon the floor in his childish despair.

I could see there flat on the floor, sobbing. Toward the middle of that terrible afternoon which I had hoped he would spend on the white and beautiful sands of the beach, the quarrel came to a close as a little. He and by some one reached the ground.

For another hour the two quarreled, but apart, one at each window, with a glass of beer on the sill of each, and the other with a glass of beer on the sill of each, and the two quarreled so long and loudly that I was fain at one time to put the window down, and would have except for the intensity of the heat.

The quarrel increased as usual, at the third pint, but thought better of it and quieted down considerably, at the fourth, as much as that was and the boy's feet began to sound merrily.

Finally she drew up her chair, saw that drink was beginning and the shadows deepened upon the wall-paper and set quite close in him.

And then?

Well toward dusk of that bright day, which should have been a happy for the first white boy, as the sun—be he first came home, before he had not a couple of hours with the wall paper and his remaining glass of beer on the window-sill, she at the other window with her glass of beer, sometimes a friend at that window with his glass of beer, and the little waving between the two, laughing at each other.

—It's the third pint," would cry my neighbor, who

"There, where they quarreled once a day and twice or three times on Saturdays and Sundays, something was happening"

NORMAN HAPGOOD

THE next issue of this WEEKLY will be the first one edited by Norman Hapgood.

Mr. Hapgood has had a varied career in literature, daily journalism, and magazine work. Like a good many others who are interested in writing, he went through the law school at Harvard, but, after practising a year, left that profession and went on the *Chicago Evening Post* at \$5 a week. From there he went to the *Milwaukee Sentinel*, where he dealt mostly with politics and the drama. From there to the *New York Evening Post*, where he did general reporting, especially on educational matters; and from there to the *Commercial Advertiser*, where he began by writing editorials and building up various departments, but ultimately settled on the drama and made that his specialty for four years. At the same time he conducted a dramatic department in the *Bookman*. While doing this work in journalism he found time to write the following books: "Literary Statesmen," biographies of Webster, Lincoln, and Washington, and "The Stage in America."

Since then there has been added to the list "Industry and Progress." He became the editor of *Collier's Weekly* in 1903, and remained there until last fall.

Taking charge of HARPER'S WEEKLY will give him a full opportunity to make exactly the kind of publication he believes in. It will seek to be a combination of popularity with a special appeal to the intelligent class throughout the United States, both women and men. The WEEKLY has a great past. In the days of Nast and Curtis it was, without any question, the foremost publication in the country. It remains to be seen whether the new management can recapture the leadership.

Public affairs will occupy a considerable part of the paper. The attempt will be to have them treated authoritatively, much of the time by men who are taking leading parts in them; but they will be treated in a modern, energetic manner, rather than in an academic spirit. There will be three pages of editorials. Those aspects of public affairs which are not so much political as social and economic will be carefully covered, and a very special attempt will be made to have the paper the spokesman of the new Feminist Movement in its broader and deeper aspects—those that have to do with real changes in morals, traditions, and industrial conditions, and relations of the sexes.

Humor will be looked upon as very closely related to intelligence, and the central idea of the WEEKLY will be that the life of intelligence is a very agreeable and even amusing one. This idea will be carried out in serious and humorous treatment of current affairs, both in text and pictures, more and more as the paper develops into its intended nature.

Mr. Hapgood looks upon the drama as one of the most interesting as well as one of the most popular expressions of human nature and human ideals, and he will make an attempt to build up a dramatic department that is really notable.

Sports, books, finance, and various other features will be emphasized, and some idea about what may be expected of the WEEKLY can be obtained from next week's number, both from the nature of that number itself and from the announcements made in it.

gins of their hearts and thought to their "little sisters".

"As we look back at the story of boys and girls whose good fortune has dated from the day they were brought to the children's Court and who have developed into strong men and women who are taking a useful part in life, we can not but say, surely the profits of our work run big to the children, but biggest to the State.

The establishment of our children's courts on the foundation of a new attitude on the part of the community. We are experiencing these strange conditions of a unique new situation. We have made some progress, so far as the child is concerned, in the last hundred years than in all of the world's previous history.

How difficult it has been to get away from the dollar mark and the supremacy of money "rights" properly children's courts are helping to awaken the conscience to the truth that religion means relationship, social service. This knowledge is coming, but at least we are getting away from a period of empty resolutions and discussions and non-achievement in getting down to direct attempts. The sowing of seeds and seeds must go hand in hand. The sowing of seeds in the real story is a kindling of new hope in the heart, the children's courts, too, are teaching us that the best education lies in the heart and that the child only had the solution. Unless we give the parent enough return for his help in support of his child, we have done little more, in regulating the legal support father, than to say that it is bad for the child to be under the shadow, so it is better that he should starve.

When we go down and look at the children destined on the streets and at their elders with the lines of care necessarily lighted on their faces, we can not but realize what even a fragment of a chance means to our neighbors and his child.

At last our thoughts are turning to the thousands that are being sacrificed in social irresponsibility and the great movement of liberty which Ellen Keys says, "shall bring their degradation of rights and make an end of the spiritual and bodily ill-treatment of children" as surely begins.

**A MASTERY METHOD**

(Continued from page 10)

an anxiety. "It is connected with our mission. We are thinking steadily of finishing."

**POSITIVE** with a soft and green was the Patterson, home on Christmas morning. The star pointed in at the windows of the dining room, where the family dinner, cheerfully busy. Lois was tying red ribbons around a white paper package and humming to herself. Mrs. Patterson was driving Tom as he sat up a step-back and was talking about being a body worn at every angle but the right one. Only Mollie stood idly looking out of the window. Mollie was getting rather into the habit of idly looking out of windows. Tom from his left eye had an interested expression as he looked at Lois. "Tom will do, Tom," said his mother, but Tom still did.

"He never decided what to give Gregory for Christmas, did he?" he said, solemnly.

"He has the Bismarck's will come tonight," said Mollie, with fervent haste.

"No," said Tom. "But, as I was saying, we have not yet decided what to give Gregory for Christmas. It is the only one. I looked over the lists in my morning papers. They are always helpful, but there was nothing there except 'What to Give Grandpa' and 'Cocoa for the Cousin.' He had one name in his pocket as he descended from the ladder and joined Mollie at the window. There he stroked away again, and he placed back of the shiffling slight-of-hand man. Lois sat there by package in his mother's chair. Mrs. Patterson had gone to the kitchen.

"What? What?" broke out Mollie.

"What's up?" asked Tom, coming from his appreciative and proprietary contemplation of his precious sister.

"It's a horse!" said Mollie. "And— and Gregory!"

"Right on line!" murmured Tom. Two steps took him to the side porch, where he looked behind a horse, a beautiful bay, leaving a lady's smile and led by Mr. Campbell. Without ceremony Gregory dropped the lead on the man's hand and ran up the steps. Mollie heard the door open behind her, but she did not turn. It was quite half an hour before Gregory spoke.

"Do you like it, Mollie?" he said.

"Do I like it?" she asked. "Is it really

to me, Greg?" She loved him with radiant eyes, that were after all unconsciously shy for Mollie's eyes. "I'm going out to see it."

"Well, fine, Mollie," Gregory spoke cheerfully. "It's something planned to your blouse."

Mollie flew in the mirror. Across the shoulders of the mirror she started a broad red ribbon. On it in bold black letters—no black and hold that even the broadest reflection in the mirror was easy to read—stood the inscription, Gregory's Christmas Present.

As the red of the ribbon burned Mollie.

"Tom did it," she muttered.

"Yes, and Gregory," but may I have it?"

"You may have the ribbon," said Mollie.

**GENIUS**

(Continued from page 6)

another. Moreover, all the forty-five super-genius ones, and a few were doubtfully absorbed even then in their own lines of mental activity—for example, Whiston, Byron, and Lander. And, as regards the health of men of genius in childhood, more than two hundred were found to have been of an unusually feeble constitution; a number that involved by no means represented the full proportion of the total population. Even the writers of the biographical dictionary made an analysis of the physical conditions of their subjects during infancy and youth.

These figures—which are corroborated by the findings of other investigators—of air of interest and significance, but they are serious. They tend to bear out the growing belief among psychologists that the creative and energetic use of the mental faculties in childhood, provided this results from the awaking of a lively interest in the things thought of, is beneficial rather than harmful—for the men of genius who in childhood were found here, on the whole, remarkably well-lived. And, secondly, the figures unmistakably suggest that weakness in infancy has a direct bearing on the production of genius by forcing the development of interest in things of the mind. If only because through ill health the child is to a great extent deprived from participating in the physical interests and activities of other children.

**Can Genius be Developed by Education?**

**B**UT is the awaking of a lively interest—an interest so intense that it spurs to increased endeavor in some special field—enough to account for achievements of the men of genius? Granting that the men of genius depends for its results, as I have tried to show, on the extent to which he sustains and stimulates his subconscious powers by continuous absorption and thought, may we not assume that he possesses, to begin with, an exceptional mental capacity? Or is the average normal mind, by environment—the occurrence of events that make so profound an impression on his mind as to arouse a great longing for accomplishment—sufficient to rapture him? In short, would it be possible, by certain education and the wise adjustment of circumstances, to foster, and to develop any individual of normal mentality that he might achieve in his chosen life-work, results usually regarded as leaving the stamp of genius?

"Nark, decidedly, is my belief. I saw it pretty on the repeated failure of inventors to demonstrate the operation of heredity in the making of the most notable men of genius who, by the history of mankind, have sprung from all sorts and conditions of ancestors, rich and poor, and of various bloods and languages. Partly I base it on the many instances in which men of genius have known little or nothing of the circumstances of their activities to facilitate beginnings in early life. But most of all I base it on the many experiments in education by parents, entirely unaware of the interrelationship between conscious thinking and subconscious "inspiration," yet which have shown that the more a child is habituated to using his mind to good purpose the more he will accomplish in his life.

"Without exception, the outcome of these experiments has been the production of men of extraordinary attainments. In one case, a German country physician named Witte, taking in hand his infant son whom he had known as congenitally defective, began a process of formal education as soon as the child showed a first sign of awakening intelligence. Treating the boy from the start to learn through and simply by memory, led by the activities of his senses, gradually he came to become more and more interested in the great work of Nature as well as in the contents of his school books. Con-

## Greyfriars Bobby

By ELEANOR ATKINSON

"A bonny, spirited bit dog is Bobby of Greyfriars kirkyard, an loyal, loyal a little animal as ever graced the pages of fiction."—*Daily News*. "The book is, indeed, not unworthy of a place beside 'Black Beauty.'"—*V. J. Tribune*.

With Frontispiece.  
Post 8vo, Cloth, \$1.20 net.

## The Red Lane

By HOLMAN DAY

"A LONG SERVICE," "THE ASSASSIN," ETC.  
Love, daring, and romantic adventure all figure in this thrilling tale of the Canadian border. The scenes are dramatic, the setting picturesque, and the theme is of striking force, giving this author of humor and philosophy new opportunity for virile life pictures.

None other than a writer who has journeyed among these simple-hearted and cheam-faithful folk, could so sympathetically portray their nobleness and their failings, their reverence for authority, and their loves and hates and passions.

Illustrated. Post 8vo, Cloth, \$1.25 net.

## Tangles

By MARGARET CAMERON

"THE PROFESSOR PERSON," "THE INDISTINGUISHABLE," ETC.  
The tangles in this collection deal with humorous situations so complicated that there seems no possible way out. Amnity, however, is the sword which cuts the Gordian knot in all of them.

The author is one of the few born story-tellers with a unique talent for inventing the most laughable plots, and every tale accurately reflects her own irresistible humor.

Illustrated. Post 8vo, Cloth, \$1.20 net.

## As Caesar's Wife

By MARGARET SPALDING GERRY

"A TRUE WOMAN COMES HOME AT FOUR O'CLOCK IN THE MORNING IN AN automobile with her former lover, and explains her all-night absence by saying the car broke down.

The waiting husband does not believe her, but, because of his passion for prostitution, yields his eyes to what he believes to be her unfaithfulness. What effect would this have upon a man, upon his every-day life, upon his character?

Illustrations by James Montgomery Flagg. Post 8vo, Cloth, \$1.20 net.

## The Honorable Miss Moonlight

By ONOTO WATANNA

"A JAPANESE VERITABLE," "YAKA," ETC.  
Only Japan could be the scene of this daintily picturesque yet vitally human story, with its charming quaintness of costume and manners, its note of high heroism, and its curious, thrilling drama of birth and death, of life and love. The appealing figure of the fragile Geisha girl when the gods at last blessed with a son forms a most touching picture of blended paths and shy love.

Frontispiece. Post 8vo, Cloth, \$1.00 net.

## The Financier

By THEODORE DREISER

AUTHOR OF "JENNIE GERHART" AND "NOTICE TO LEAVE"

Once in every four years a big book, an unusual book, comes to the surface. We believe Mr. Dreiser's story of "The Financier" is such a book.

Broad in its scope, sweeping in its power, it is only fair to add that it is almost brutal in its sated picturing of the lust for wealth and the hunger for love.

It is not for those who fear the fighting force of a strong man use it the unfolding of a lovely life.  
It is a story first and always, perhaps a great lesson, too, but taken all in all—its bigness, its insight into larger phases of our life—it seems designed to rank as one of the great examples of modern fiction.

Post 8vo, Cloth, \$1.50 net.

## Mark Twain—A Biography

The Personal and Literary Life of Samuel Langhorne Clemens

By ALBERT BIGELOW PAINE

More fascinating than fiction, this true story of a strange and untried life is like no other biography the world has known. It is as full of fun and humor and rollicking anecdote as the writings of Mark Twain himself, and as diversified—for this Great Author and Philosopher was ever the plaything of a whimsical Fate that mingled tragedy and adventure and laughter and failure and success in swift-following sequence.

The very preparation for the writing of the work was a romance. Six years the author gave to the work, traveling half-way round the world to follow in the footsteps of his subject, to visit every haunt in Europe or America; and four years of the time the two—his biography was to be written and he who was to write it—lived in close daily association.

What intimate suggestion, what wise and frivolous comment, what charm of living quality this has given to the work, only he who reads may say. A few chapters published in *Harper's Magazine* gave some hint of this delightful quality.

And above all—this picture of a life is no eulogy; there is no false hero-worship. In his dedication Mr. Paine makes clear his fixed purpose "to write history rather than eulogy."

The result is one of the great biographies of all time.

## The Street Called Straight

By the Author of "THE INNER SHRINE"

"The novelist is skilful in depicting contrasts of character that lend vitality to the successive scenes."—*North American* (Philadelphia).  
"The story is ingeniously and cleverly written, and it will furnish most delightful reading."—*Public Ledger* (Philadelphia).  
"The story is one of tense emotional situations, treated with good taste and deep psychological insight."—*Times* (New York).

"We certainly do not exaggerate when we describe this book as a profoundly religious novel, human, kindly, and vital. It is a story that puts a keener edge on a jaded appetite for novels, and we should like very much to 'interview' the author."—*Christian Cosmopolitan* (London).

Illustrations by Green Lozell. Post 8vo, Cloth, \$1.25 net.

## The Moth

By WILLIAM DANA ORWITT

AUTHOR OF "THE SPILL," "THE LEVING," ETC.  
A vitally human plot in which a young Boston matron attempts to defy the conventions.

As a study of a flighty young fool of a woman who denys her two best friends down into the morass of a world seeming scandal Mr. Orwitt has drawn a fine sketch.

Post 8vo, Cloth, \$1.20 net.

## The Olympian

A Tale of the City

By JAMES OPPENHEIM

AUTHOR OF "THE SPECTATOR"

Primarily the story of a great career, this new novel is what might be called the American fairy-tale; the young man goes forth upon his lonely adventures; his years of obscurity; his struggle between his love for a woman of social position and power, and then the marvelous transformations of American life, the skyrocket rise to success—the clerk becomes the magnate, the drudge becomes an Olympian. A story that quickens the pulse.

Illustrated. Post 8vo, Cloth, \$1.25 net.

## May Iverson Tackles Life

By ELIZABETH JORDAN

AUTHOR OF "MAY IVERSON—THE BOOK," "SMOKE ELEGANCE," ETC.

The sparkling humor of these tales of school life are irresistible. There are amusing adventures and never-ending fun in the story of the young lady and her gay-hearted companions whose school-days are portrayed. In fact, every youthful character in the story is brimming over with the joy of living, and the author has been eminently successful in her effort to impart to the reader the same spirit of light-hearted mirth.

Illustrated. Post 8vo, Cloth, \$1.25 net.

## The Woman Of It

By MARK LEE LUTHER

Here is a genuinely clever story which has for a background the social life of Washington—not the brilliant pageantry of official functions, but the real everyday social life of the capital with its fussy formalities and glaring incongruities. A crisp readable dialogue helps to tell a story that takes strong hold on the sympathies and is really typical of American life.

Post 8vo, Cloth, \$1.20 net.

## Home Place

By G. W. OGDEN

Unique in plot, fascinating in humor, dramatic in development, this new novel is delightfully refreshing in its departure from the ordinary type of current fiction.

Mr. Ogden shows the interrelations of rich and poor. His graphic story pictures a cross-section of life—the workman, the financier, the politician, the artist, contentment and intrigue, humor and tragedy, developing an outcome uncertain until the last.

It is a broad, rich, thoroughly American novel, revealing a sense of life a realization of character, an appreciation of the dramatic that will inevitably place it in the ranks of worth-while fiction.

Post 8vo, Cloth, \$1.20 net.

EDITED BY GEORGE HARVEY

# New-York Life Insurance Co.

346 BROADWAY, NEW YORK

## SIXTY-EIGHTH YEAR OF BUSINESS

### TO THE POLICY-HOLDERS:

Your Directors assume that, when you think of your contract with this Company, you never question the Company's soundness, but that you are deeply interested in its progress, and in the efficiency and economy of its management.

We submit, therefore, the following summary from the transactions of the year:

During 1912 the Company received in premiums .....	\$85,941,784.05
In Interest, Rents, etc .....	33,301,582.53
<b>Total Income .....</b>	<b>\$119,243,366.58</b>

### INVESTMENTS MADE DURING YEAR

Real Estate Mortgage Loans (first liens) made in 46 Cities located in 25 States and Countries (to yield 5.32%) .....	\$34,916,046.00
State, County and Municipal Bonds (domestic, including Canada) issued by 49 Counties and Municipalities located in 20 States (to yield 4.47%) .....	7,463,101.77
Domestic Railroad Bonds (to yield 4.56%) .....	3,820,791.17
Foreign R. R., Gov't and Municipal Bonds (to yield 4.21%) .....	8,234,223.13
Miscellaneous Bonds (to yield 4.73%) .....	266,777.50
Loaned to policy-holders on security of their policies (to yield 5%) .....	27,763,909.00

### DURING 1912 THE INSURED OR THEIR BENEFICIARIES RECEIVED FOR

Death Claims .....	\$25,788,714.50
Matured Endowments .....	6,167,076.79
Surrendered Policies .....	12,989,576.80
Dividends .....	11,436,686.36
Annuities .....	1,570,502.77
Added to the reserve funds for insurances, to meet the standard adopted by the Company, in accordance with the law, and to the reserve funds for future dividends .....	\$31,019,826.00

The increase in the earning power of the Company's assets during the last seven years is equal to 0.29%. Translated into dollars this means an increase in earning power, over 1905, of more than TWO MILLION DOLLARS.

The increased earning power developed in 1912 is notable. It is represented by 9/100 of 1%, and, if maintained, will increase the income of the Company in 1913 by comparison with what it would have been had the earning power remained as at the close of 1911, by the sum of .....

**\$647,000**

Of the amount which the law allowed us to spend in 1912 for new business, we actually spent .....	91%
Of the amount which the law allowed us to spend for all purposes, we spent approximately .....	63%
Of the amount of new business which the law allowed us to issue in 1912, we issued .....	100%

# THE TERMINAL CITY

THE GREATEST CIVIC DEVELOPMENT EVER UNDERTAKEN—INCIDENT TO THE  
NEW GRAND CENTRAL TERMINAL IN NEW YORK CITY, WHICH WILL BE

OPENED FEBRUARY, 1913

This vast undertaking comprehends the erection of a great Terminal City, a city within a city, occupying an area of thirty blocks, in New York City.

It will embrace hotels and modern apartment houses, convention and exhibition halls, clubs and restaurants, and department stores and specialty shops. In short, practically every sort of structure or enterprise incident to the modern city.

These features are all in addition to post office, express buildings and other natural adjuncts of the up-to-date terminal—to expeditiously handle diverse traffic.

All these structures will be erected over the tracks about the terminal itself, while a plaza will surround the Terminal building, reached on the North and South by a new Boulevard, hiding all trace of the railroad yard.

## THE NEWLY COMPLETED GRAND CENTRAL TERMINAL

Will provide every detail of comfort and convenience of its patrons. The Terminal itself is the physical embodiment of the latest and the highest ideal of service. Its adequate description is impossible here. It must be seen to be fully appreciated—or indeed to be completely comprehended.

The Main Terminal alone is 722 feet long and 301 feet wide on the surface, and half again as wide below the street level. It will accommodate comfortably 30,000 people at one time.

Through and suburban service occupy different levels approached by inclines, avoiding stairways, so that each level may be reached without confusion. Incoming and outgoing traffic is segregated and the two elements of travel separated. Every facility is progressively arranged so that no step need be retraced, no time lost.

There are 42 tracks for through travel and 27 tracks for local trains, 33 miles of track within the Terminal, accommodating over 1000 cars at one time. Dedicated to the Public Service, February, 1913.

HARPER & BROTHERS, PUBLISHERS

# Your United States

By ARNOLD BENNETT

Author of "Old Wives' Tales," etc.

NO English writer since Thackeray has been welcomed to the United States with such spontaneous enthusiasm as Arnold Bennett. All doors were opened to him. He saw more in a comparatively brief visit than most of us see in a lifetime.

Gifted with a keen sense of humor, Mr. Bennett approaches his subject in a brilliantly unconventional way—and with a full consciousness of the bigness of his undertaking. Our daily life, our society, our sports, our theaters, our schools and colleges, East and West, all come in for their share of his sane and graceful appreciation.

Few indeed are the works of fiction that can even begin to compare in charm and fascination with this masterly series of impressions.

The many beautiful illustrations by Frank Craig, the English artist who accompanied Mr. Bennett, tell their story pictorially as brilliantly as Mr. Bennett does in his text.

# The Most Enjoyable Smoke In the World

EVERY man knows that pipe smoking is the ideal form in which to use tobacco.

Only by smoking a pipe can you get the full benefit and enjoyment from tobacco.

And yet - thousands of men reluctantly deny themselves the pleasure of the pipe - because fancy "mixtures" and ordinary tobaccos bite the tongue, dry the throat and upset the nerves.

It is not necessary to longer forego the pleasure a pipe can give you.

## Tuxedo The Perfect Pipe Tobacco

Tuxedo cannot bite the tongue or irritate the throat.

The reason for this is that Tuxedo is made of only the mildest, choicest leaves of the highest grade, perfectly aged, Burley tobacco, by the famous "Tuxedo process."

The "Tuxedo process" is a secret, known only to its manufacturers.

It was discovered by Dr. R. A. Patterson, the founder of the R. A. Patterson Tobacco Co., after many years of experiment. Its popularity has never been artificially forced by sensational advertising. The demand has grown naturally and steadily, until now nearly eighty million packages are sold yearly.

You can smoke Tuxedo in the office, on the street, and at home. Its aroma is delightful.

### YOU CAN BUY TUXEDO EVERYWHERE

*A New Novel by*  
**MAY SINCLAIR**

Author of "The Divine Fire"

**The  
Combined Maze**

With broad, clear strokes, Miss Sinclair has drawn the characters in this story of love, disillusion, and fate in a London suburb. We know them all; love and hate and sympathize with them as we do with the people of Bennett's Five Towns. There is the hero, with the passion of a Greek athlete for physical development, and his girl friend at the gymnasium. The springlike freshness of their love is destroyed by a woman of a more sensuous type, who makes him ashamed of what he now looks upon as the undeveloped sentiment of a boy. Her marriage to him brings out the contrast between her selfishness and the other woman's lovable nature; and when she elopes with another man, divorce is impossible for the want of money. The sum is accumulated penny by penny; then Fate interferes again.

## HARPER'S MAGAZINE *for* APRIL

### A VENETIAN PLAYGROUND—THE LIDO

Upon the stretch of sands which keeps the sea back from Venice has grown up a veritable Atlantic City, gay with hotels and villas and populous with half the nations of Europe. HARRISON RHODES has written delightfully of this cosmopolitan pleasure-ground, and André Castaigne has pictured its people and their diversions.

### SUMMER IN THE ARCTIC

Few people realize that in summer within the Arctic Circle flies and mosquitoes abound, sunburn is inevitable, and the thermometer soars to the nineties. Mr. STEFANSSON continues his interesting experiences among the Blond Eskimos, and describes the important geographical discoveries which he made along the unknown Horton River.

### A NEGLECTED PORTION OF THE BIBLE

Between the Old and New Testaments of our grandfathers' Bibles we may recall never once printed the Apocryphal Books, which are no longer a part of the Sacred Canon. Rev. JAMES T. BEVY, Ph.D., tells the story of these fourteen books, many of which are of a literary excellence rivaling Job and Isaiah, and are of extraordinary interest.

### EXPLORING AN ANCIENT INCA CAPITAL

Professor HIRAM BINGHAM, of the Yale University Expedition to Peru, tells of his visit to Machu Picchu—a ruined city of granite and marble, which has recently been discovered. Professor BINGHAM describes the strange grandeur and isolation of the country, and pictures the great civilization that once reigned there. Illustrated with photographs.

### ROADS THAT WIND AND VANISH

RICHARD LE GALLIENNE contributes a delightful essay upon "Vanishing Roads," finding in this text much that will arrest and charm the thoughtful lover of nature and books. Illustrated with a remarkable series of roadside photographs.

### WHEREIN THE COLLEGE PROFESSOR IS HUMAN

As a companion-piece to the study of "The Undergraduate," in the current HARPER'S, Professor HENRY S. CANNY, of Yale, here portrays, as he really is, the much-misunderstood American college professor.

## SEVEN SHORT STORIES

AMONG them is a wonderfully impressive tale of deep spiritual significance, "Fishes of Silver," by a new writer, CLARENCE B. KELLAND. WILLIAM GILMORE BURNETT contributes a dramatic romance of black-and-white days in the Civil War. Other stories are by JAMES OPPENHEIM, VICTOR ROUSSEAU, LOUISE CLOSSER HALE, KATHARINE PYLANTON GREGG, and ELIZABETH JORDAN.

## NEW LEAF MILLS

By  
William Dean Howells

This new novel by Mr. Howells, depicting, as he knows so well how to do, the simple conditions of the Middle West, is a story of American country life shortly after the Mexican War, when huskings, barn-raising, quiltings, spelling-matches, coon-hunts, candy-pulls, and revivals were the amusements of a homogeneous, self-sufficing community.

There is, of course, no need to dwell upon Mr. Howells's art; but it may be doubted whether in any of his books he has drawn a more sympathetic character than that of this unsuccessful idealist, the Swedenborgian bookseller, who left the city to turn over a new leaf in the country.

# No-Rim-Cut Tires—10% Oversize

## Putting Young Men on Their Mettle

Here is one reason for the greatest success ever made in Tiredom.

We assumed that existing types were wrong, when 23 per cent became rim-cut.

We found that tires just rated-size were overloaded, fully nine times in ten.

And cost of replacement, under standard warrant, a few years ago ran up to 18 per cent. We knew that cost was wrong.

### What They Did

First they built in our factory a tire testing machine. Hundreds of tires were there worn out under actual road conditions.

They tested 40 formulas for treads—200 separate fabrics. They compared scores of new methods with old ones—all by actual mileage test.

They learned what rubber wore best—the costliest Up-River Para. They brought out our "rivet fabric" which forms our breaker strip.

A machine was devised—now controlled by our patents—which gives every inch of the layer exactly equal tension.

In the course of years they brought our cost of replacement down to eight-tenths of one per cent.

### Cost Per Mile

These men stood, during trying days, for the lowest cost per mile.

Others undersold us. Tires were sold at half our prices, which cost less than half to make.

But all felt that some day men would measure cost per mile.

And we built a tire which men would come to then.

### Two Innovations

Then came the invention of No-Rim-Cut tires, which we still control.

That, at one sweep, did away with a trouble which wrecked 23 per cent of the old-type tires.

From that day to this, a No-Rim-Cut tire has never been known to rim-cut.

At the same time came our 10 per cent oversize, which added 25 per cent to the average tire mileage.

These two innovations gave overwhelming advantage to the Goodyear No-Rim-Cut tire.

We knew that ancient methods had to be improved. And we felt that young men, with the proper foundation, were the men to do it.

So we went to the greatest of technical schools. Year after year we picked the best of their graduates. And we set those men—scores of them—at research and experiment.

The tires which now rule Tiredom, after 14 years, are those young men's creation.

### Then Came Success

Then came the vogue of odometers. Men began to see, by mileage figures, what these tires were saving.

Every year since the demand for Goodyears has doubled at the least. It has grown and grown until last year's sales exceeded our previous 12 years put together.

And now, after two million Goodyears have been sold, these tires command, by long odds, the largest sale in the world.

### These Young Men Succeeded Too

Now comes the best part of our story.

One of these young men became superintendent. At 36, he is now in charge of 7,000 Goodyear men.

Others came to share in our profits. There are in our factory 46 men who are stockholders in our concern. There are 33 more in our offices, whom we helped acquire their stock. There are 56 in charge of our branches.

And still the improvement goes on. Half a hundred men—mostly technical graduates—still devote their whole time to research and experiment.

This department still costs us—despite all our perfections—\$100,000 per year.

This is all done to better the best tires men have yet created. To reduce still further the cost per mile, which we have cut so low. And to hold forever the top place in Tiredom.

This season we ask you to prove these tires out, as hundreds of thousands have done. After all our records, the demand from users is now twice as large as last year. It is time for you, if you pay tire bills, to find out why this is.

Write for the Goodyear Tire Book—14th-year edition. It tells all known ways to economize on tires.

## THE BEND IN THE ROAD

By Truman A. DeWeese

THE story of how a tired city man found rest, diversion and renewed bodily vigor through a return to pleasant pastoral pursuits on a neglected farm. There in the daily pottering with the soil amid the peace of the hills and in the companionship of "growing things" the owner was filled with strength and inspiration for his work in the city. Every chapter is redolent of blossoms. And through it all there runs the

boyish ecstasy of a man who has discovered a hobby that holds him. It is not a manual on agriculture or horticulture, and yet it abounds in suggestions that testify to the author's practical experience in "making things grow."

*Illustrated. Post 8vo, \$1.00 net.*

HARPER & BROTHERS, NEW YORK

## THE SOJOURNER

By  
ROBERT D.  
ELDER

A STORY of the West, with realistic descriptions of adventure and life that recall Bret Harte, and a tender love story. The hero, a popular senior at Princeton and son of a multi-millionaire, had apparently a smooth way of life ahead of him. Yet fate and his own idealism led him into rough roads. After an unfortunate experience at Princeton he went West and became a cowboy, and among the Colorado mountains experienced hardships, adventures, and loyal comradeships which made a man of him. The girl who had done so much to harm him in the East again nearly wrecked his life. All through the story the presence of the Sojourner, appearing at critical moments, is a mystical influence for good.

## A NEW NOVEL

By the Author of  
"Riders of the Purple Sage,"  
"The Heritage of the Desert," etc.

# DESERT GOLD

"But it is melodrama pure and undefiled," said one reader of "Desert Gold."

"What's melodrama?" he was asked.

"I mean it is a glorified dime novel written with splendid distinction, with charming grace, with red vigor, but still it is a sort of dime novel. There's the same galloping succession of events, the same tense situations—only it is all presented with such delicacy, such literary charm, one almost forgets the plot."

That's the story, after all.

Illustrated by Douglas Duer. Post 80c, \$1.30 net

HARPER & BROTHERS, NEW YORK

# THE BEND IN THE ROAD

By Truman A. DeWeese

THE story of how a tired city man found rest, diversion and renewed bodily vigor through a return to pleasant pastoral pursuits on a neglected farm. There in the daily pottering with the soil amid the peace of the hills and in the companionship of "growing things" the owner was filled with strength and inspiration for his work in the city. Every chapter is replete with blossoms. And through it all there runs the

boyish ecstasy of a man who has discovered a hobby that holds him. It is not a manual on agriculture or horticulture, and yet it abounds in suggestions that testify to the author's practical experience in "making things grow."

Illustrated. Post 80c, \$1.00 net.

HARPER & BROTHERS, NEW YORK

# THE SOJOURNER

By  
ROBERT D.  
ELDER

A STORY of the West, with realistic descriptions of adventure and life that recall Bret Harte, and a tender love story. The hero, a popular senior at Princeton and son of a multi-millionaire, had apparently a smooth way of life ahead of him. Yet fate

and his own idealism led him into rough roads. After an unfortunate experience at Princeton he went West and became a cowboy, and among the Colorado mountains experienced hardships, adventures, and loyal comradeships which made a man of him. The girl who had done so much to harm him in the East again nearly wrecked his life. All through the story the presence of the Sojourner, appearing at critical moments, is a mystical influence for good.

V. STEFANON

V. Stefanon, the famous explorer, who has recently discovered a tribe of blood Esquimaux in the arctic regions of Northwestern Canada, says: "Tuxedo is mild, cool and soothing—just the sort of tobacco I need. Tuxedo goes with me wherever I go."

*V. Stefanon*

## Tuxedo—the Most Enjoyable, Most Healthful Smoke, and the Most Economical

THE most enjoyable smoke is a pipe. But many men refuse this method because they have had unhappy experiences with pipe tobaccos.

Likely you have paid 35c to 50c for a tin of fancy "mixture," and it burned your mouth or throat, or was unpleasantly strong.

Too bad—but you got the wrong tobacco. The hundreds of thousands of men who have tried

Lieut. WILLIAM H. SANTELMANN

Lieutenant William H. Santelmann, leader of the U.S. Marine Band, says:

"I have used Tuxedo tobacco and found it to be a great luxury. It is a cool, sweet, fragrant smoke and I take pleasure in recommending it to all smokers."

*W. Santelmann*

SAM BERNARD

Sam Bernard, well-known star in many musical comedy successes, now appearing in "All For the Ladies," says:

"A tin of Tuxedo is my constant companion. I like it especially because it has never given me a bit of throat trouble. The smoothest smoke ever."

*Sam Bernard*

# Tuxedo

The Perfect Pipe Tobacco

have found the answer to their smoke problems. Tuxedo is the mildest tobacco made. It cannot bite the tongue or dry the throat.

And it's economical. There are 40 pipefuls in a ten-cent tin. You can't get any better tobacco because nothing better grows than the mellow, perfectly aged Burley leaf used in Tuxedo.

If you try Tuxedo for a month and cut out other smokes, you will not only have had the best month of smoking you ever had in your life, but you will have made a mighty big saving in your pocket-money!

WILLIAM F. SHERIDAN

William F. Sheridan, one of the most famous detectives in the country, says:

"Tuxedo is so mighty fine, so imperative in its quality, its mildness and combined richness, that it seems the ultimate and only tobacco for the connoisseur. I can recommend it unqualifiedly."

*William F. Sheridan*

YOU CAN BUY TUXEDO EVERYWHERE

Famous green tin, with gold lettering, curved to fit pocket 10c Convenient pouch, inner-lined with moisture-proof paper 5c

SAMPLE TUXEDO FREE—Send us 5c in stamps for postage and we will mail you prepaid a generous tin of TUXEDO tobacco to any point in the United States.

Address: TUXEDO DEPARTMENT Division 5, Jersey City, N. J.

GARRETT P. SERVISS

Garrett P. Serviss, prominent scientist and writer, author of "The Second Deluge," etc., etc., says:

"I have tried many brands of tobacco, good, bad and indifferent, before alighting upon Tuxedo, the ideal smoke."

*Garrett Serviss*

WM. STUART REYBURN

Wm. Stuart Reyburn, Congressman from Pennsylvania, says:

"I take pleasure in recommending Tuxedo tobacco to all smokers. It is a most refreshing smoke."

*Wm. Stuart Reyburn*

# HARPER'S WEEKLY

EDITED BY GEORGE HARVEY

THE PIONEERS

INDUSTRIAL SERIES:  
OREGON

# Oregon

*the haven of the Homeseeker*

¶ The Northern Pacific Railway and its numerous affiliated lines have more than 530 miles of railway in Oregon. Much of this is comprised in the new Oregon Trunk Railway through the Deschutes River Valley from Fallbridge, on the Columbia River, into Central Oregon—that great virgin field for the Homeseeker, of vast extent and wonderful fertility. The remainder is in the rich valleys of the Columbia and Willamette rivers, well served by the lines of the Spokane, Portland & Seattle Ry., the United Railways and the Oregon Electric Railway.

¶ Oregon may aptly be termed the land of PRESENT OPPORTUNITIES. Central Oregon has millions of acres of homestead lands awaiting the homeseeker, while Western Oregon, more closely settled, has abundant opportunities on every hand for dairymen, poultry raisers, fruit growers and farmers.

¶ Send for free copy of "Central Oregon" and "Oregon for the Homeseeker" books, fully descriptive and containing names of Secretaries of Commercial Clubs, who will gladly help you in any way to get located.

¶ The Willamette Valley in Western Oregon, 150 miles long and one of the most beautiful of valleys, contains about 5,000,000 acres of very fertile land. It is well watered, thickly settled, embraces many fine farms, has much water power, and is the oldest settled part of the state. The Willamette River is navigable for 150 miles.

¶ The Hood River Section along the Columbia River has made itself famous with prize winning fruits. Here orcharding is reduced to a science.

¶ In Southern Oregon along the foothills and slopes of the Umpqua and Rogue rivers are some of the most prolific fruit lands in the west. The valley lands are valuable for grazing, poultry raising, and dairying. This region produces bountifully of Spitzenberg and Newtown Pippin apples, and the pears grown here are of superior excellence. There are large timber areas on the mountains, and extensive mineral deposits, including coal. There is much good water power and the climate is ideal.

¶ Eastern and Central Oregon embrace millions of acres undeveloped and now inviting settlement. Here, general farming is largely practiced, grains, grapes, vegetables and fruit all doing well, stock raising being an important industry. The mountains abound in fine timber and magnificent water power. Numerous irrigation projects are in operation and a great change is under way in this section, owing to the construction of the Oregon Trunk Ry. So-called "dry farming," where necessary, produces satisfactory results. The rainfall ranges from eight to fifteen inches annually.

¶ Oregon is said to have the best school laws of any state in the Union. Her State University, Agricultural College, Normal and public schools, and several denominational colleges, etc., provide educational facilities of the highest type. Write for free booklets about Oregon and details of low Homesteads, Summer Tourist and Convention Farms. Address:

## OPPORTUNITIES

in

### A "NEW LAND"

reached via

### THE "NEW LINE"

for both

## FARMER and INVESTOR

The "New Line"—The Chicago, Milwaukee & St. Paul Railway—has opened and is rapidly developing in

**SOUTH DAKOTA NORTH DAKOTA MONTANA IDAHO WASHINGTON**

The greatest agricultural sections in America. Wonderful opportunities await the new farmer and investor.

**W**EST of the Missouri River, along the "new line" of the Chicago, Milwaukee & St. Paul Railway, in the states of North and South Dakota, Montana, Idaho, and Washington, there lie millions of acres of fertile land awaiting only the developing energy of its future citizens. Nowhere else at this late date are better opportunities being held out to the prospective settler. When this land has finally found ownership no future time will hold forth the rich reward and independence as the opportunity which is presented today in this wonderful country.

A few years hence and the settlement of this fertile region will be a matter of history, and the home-seeker or investor who has failed to take advantage of the opportunity now offered will surely regret it, for certainly home-seekers looking for ideal conditions under which to live a life of prosperity and contentment, or the investor seeking the largest possible returns on his investment, need look no further.

### THE DAKOTAS

Special stress is laid on the advantages of these states as a wheat-producing country, but at the same time it is not intended in any way to belittle the value of its diversified products. In the Dakotas are to be found hundreds of thousands of acres of the finest prairie land, some of which can be bought at very low prices and on very easy terms, while there still remain thousands of excellent homesteads to be had practically without cost.

### MONTANA

The state of Montana contains 146,572 square miles and is as large as the combined area of New York, Pennsylvania, Indiana, Maryland, and Connecticut, while the population of the entire state is less than half a million and will support in comfort thirty times its present population. All it needs to make it one of the greatest states is more capital and more people of the right kind. Wealth awaits those who, properly equipped, will join fortunes with the "Treasure State," and now is the time. Montana's average wheat yield during the past ten years has been 26.5 bushels. Where can you beat it?

The farm land of Montana is located principally in broad valleys, among the most noted of which are the Yellowstone, Musselshell, Judith Basin, Smith River, Gallatin, Jefferson,

Deer Lodge, Missoula, Blackfoot, Bitter Root, and Flathead, all of which are reached via the "new line" of the Chicago, Milwaukee & St. Paul Railway.

### IDAHO

Along the "new line" in the state of Idaho is to be found some of the most fertile farm land in the country. The soil in the valleys is a deep, rich alluvial deposit, while on the highlands it is a volcanic ash, deep, rich, and very productive. The lands of Idaho will produce abundantly any crop common to the temperate zones. The climate is equable and the winters are at all times tempered by the Chinook winds. This state offers wonderful opportunities for farming in all branches, and the investor can hardly fail to secure unusual returns.

### WASHINGTON

This state is divided by the Cascade Range of mountains into two nearly equal parts, commonly known as Eastern and Western Washington. Western Washington is primarily best fitted for intensive cultivation, although general or diversified farming can be had and is being carried on very successfully. The soil, climate, and market facilities, however, are so favorable for the growing of strawberries, blackberries, cherries, and garden truck that this branch of farming is being carried on to a very large degree.

In Eastern Washington the principal crops are grains, hay, apples, and potatoes, although there is no known crop grown in the temperate zone which cannot be successfully grown in this state.

The principal agricultural districts of Western Washington are the Nookwich, Snohomish, Cherry, White River, and Puyallup valleys, and the Grays Harbor country, Puget Sound country, and Enumerate District, while in Eastern Washington the principal agricultural sections are the Island Empire, Kittitas Valley, Moses Lake country, Inland District, and Palouse country—all reached via the "new line" of the Chicago, Milwaukee & St. Paul Railway.

Here, as elsewhere along the "new line," await untold opportunities for the farmer and investor.

For further information, literature, etc., regarding this wonderful section, write to the Immigration Bureau of the Chicago, Milwaukee & St. Paul Railway at either Seattle or Chicago.
