My Dear Editor,—I do not know whether the subject to which I wish to call your attention for an instant will appear to you to merit notice in the columns of the *Pharmaceutical Journal*, as in point of fact it is not a pharmaceutical or a chemical question, but because of its importance it appears to me that it is one worthy of a place in any publication occupied with the interests of humanity, and I hope that specially the journals of pharmacy, medicine, and hygiene will spare a corner for the discussion of a question which has hitherto been unfortunately too much localized. I refer to the toxic action of copper and the use of copper salts in bread-making.

It is some considerable time since experiments on this subject were commenced in Germany, and during the last three or four years they have continued with almost a feverish activity in France, but the opinions based upon them have not been at all concordant. On the one hand, Galippe and his school maintain that the compounds of copper are not poisons; on the other, their antagonists, Feltz, Ritter, and others maintain that these same compounds are not without danger, and that animals have been killed by administering to them salts of copper.

In a discussion which has recently taken place at a meeting of the Medical Society of Ghent two of the members expressed diametrically opposite opinions. A memoir "Sur les falsifications du Pain," had been presented to the Society by Dr. De Ridder, in which the author had insisted specially upon the employment by our bakers of sulphate of copper.

A propos of this, Dr. Dumoulin, resting on a host of results obtained by different experimenters, ranged himself upon the side of Galippe, and alleged that the use of sulphate of copper in bread-making is completely inoffensive, and that the time had come for the modification of the law respecting the adulteration of alimentary substances. Not only, said he, is sulphate of copper when introduced into bread incapable of doing injury to human health, but it allows of the production of a bread which is finer, better, and more agreeable to the consumer, whilst effecting an important economy. He considered that the introduction of a suitable quantity of this salt constituted a progress in the art of bread-making, which affected political and domestic economy in the highest degree, and which in the interests of these two sciences should be realized, because sulphate of copper rendered possible the making of good bread from inferior flour.

Dr. Morel refuted these assertions of Dr. Dumoulin at some length. He argued that supposing even sulphate of copper is not a poison, it is nevertheless true that this salt when introduced into the economy in doses of twenty centigrams, causes nausea, vomiting, colic, and diarrhœa, though these pass away in about twenty-four hours, and are followed by a return to health. Dr. Dumoulin did not deny this action of sulphate of copper in such doses. Dr. Morel therefore considered it more than probable that doses of one-half or one-fourth of this quantity would produce symptoms of which the intensity would be equal to one-half or one-fourth the intensity of those produced by the dose of twenty centigrams. Not only did this appear to him evident *à priori*, but he also raised in the discussion one of the most important chapters in therapeutics, that which relates to idiosyncrasies. Dr. Morel even borrowed some of his facts from the professorial course delivered by Dr. Dumoulin himself in the University of Ghent; such, for instance, as the small quantities of camphor which frequently induce syncope, the occasional emetic action of manna, and the different action which mercury and chloroform have upon different persons.

These examples seem more than sufficient to prove that too much prudence cannot be exercised in the ingestion of substances that do not form a constituent part of the body; at any rate it has not yet been proved that copper is indispensable to the human economy. During the discussion in Ghent mention was made of the experiments of Kuhlmann, which showed that sulphate of copper added to bread in the proportion of fifteen to thirty-three milligrams per kilogram, gives to the product —especially if the flour be of inferior quality—a much finer appearance, and augments its apparent value. If the proportion of fifteen to thirty-three milligrams per kilogram be exceeded the bread loses instead of gains in its physical properties. These proportions, according to the partisans of the innocuousness of the salts of copper, are to be recommended on every ground, since in some maladies they are even beneficial as a medicine.

As will be seen the question is one of capital importance. As was argued by Dr. Morel, supposing even that idiosyncrasies do not exist, that chemical poisoning by copper had never taken place, that the salts of copper were not toxic, and might be introduced into the body with impunity, nevertheless the introduction of sulphate of copper into bread is reprehensible. In fact, since good flour never requires such an addition in order to yield good bread, and since the use of such an agent can only be favourable to the use of inferior flours, having a low nutritive power, it follows that the addition of sulphate of copper to bread ought to be considered an adulteration.

The greater part of the inferior flours are characterized by a low proportion of the essential nitrogenous constituent known under the name of gluten. Bread made with the addition of a little sulphate of copper also contains more water, experiments having shown that this excess amounts to 6 per cent. It is not therefore without reason that Dr. Morel maintains with Millon, that "the degree of the hydration of bread should be the first point regulated by the legislator." A baker who gives a weight of water in the place of a weight of bread always strikes at the purse of the consumer, and when the consumer is poor and does not eat bread in proportion to his appetite, he strikes at both his purse and his health. Five per cent. of water in the bread every day represents at the end of a year a deficiency of eighteen days' food, and converts for the unhappy workman a year of abundance into a year of privation. According to Dr. Morel the addition of sulphate of copper constitutes a triple fraud:—(1) because the sulphate of copper is not a harmless substance; (2) because this salt augments the proportion of water in the bread; (3) because it is employed in the utilization of low class flours inferior in nutritive power to those of good quality.

My dear Editor, you have here a faithful *résumé* of a debate which is of considerable importance in its relation to the public health, and I hope the readers of the Journal will be pleased to have the subject brought before them, for I think it is one that should interest them. In my eyes its importance is so great that too much publicity could not be given to the facts. I look upon it even as a duty for all those who occupy themselves with hygiene to take part in the debate, and they will, in my opinion, render a great service to humanity by availing themselves of the columns of the scientific journals to make known the opinions they hold upon the subject under discussion.

Yours very truly, GHENT.

The Pharmaceutical Journal.

SATURDAY, APRIL 27, 1878.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W.*

Envelopes indorsed "Pharm. Journ."

LIGHTING BY ELECTRICITY.

MANY years have now passed away since FARADAY'S experiments revealed the possibility of electricity becoming at some time applicable as a source of light. Whether this could be economically and usefully done was, however, for a long time, and indeed is still, a moot point. Thus it has been contended that the elaborate and expensive machinery necessary in the production of the electric light placed it at a disadvantage as compared with the more easily produced light from coal gas or oil. Moreover, when the electric light was produced it was not without its disadvantages, one being its intermittent character, and another, the dazzling brightness of the beam, which is very disagreeable in its effect upon the eyes. Some of these difficulties have been more or less overcome by persevering and ingenious workers, notably by M. GRAMME, and dwellers in the metropolis have now abundant opportunity of admiring the beauty of the light given by his machine from the Clock Tower at Westminster during the time Parliament is sitting. The electric light has also been used advantageously in the carrying on of various out-door operations in this country and on the continent. In Paris, amongst other places, it is used in lighting the Exposition Buildings as well as the Chapelle-Paris goods depôt, the Place de l'Opéra, and the courtyard of the Hôtel de Louvre, whilst in the celebrated chocolate factories of M. MENIER, we are told that no less than fourteen machines are now employed, and these are so arranged that the electric light can be supplied also to the drawing and dining rooms, conservatories, and gardens of the residence.

An interesting contribution to the history of the subject of electric lighting has been made by Dr. PAGET HIGGS, in a paper recently read before the Chemical Section of the Society of Arts, which we hope to reproduce in an early number of this Journal. It consisted principally of a description of a modification of the SIEMEN'S magneto-electric machine, which is at present employed by Messrs. SIEMENS Brothers in one of the departments of their telegraph works. This machine is said to do there the work before only imperfectly done by one hundred and twenty gas lights, and at a cost calculated at one half. Dr. HIGGS'S figures, however, did not pass unchallenged, and certainly they appear to have been favourably put. For instance, although it was stated that one and a half or two horse-power at least was necessary in order to drive one machine, only a sum for coals was charged, on the ground that in Messrs. SIEMENS'S establishment there is always such an excess of steam power that it was not practically noticeable whether the machine was connected with the shafting or not. This may be the case, but it cannot be assumed to be a normal state of affairs in every establishment. Nevertheless, Dr. HIGGS'S sharpest critic willingly acknowledged the enormous advance that has been made, since the machine for producing a light equal to one thousand candles can now be obtained for about £35, whilst a short time ago it would have cost ten times as much.

During the discussion that followed the reading of the paper, several interesting points were touched upon. In answer to an objection that whereas in the gas manufacture the operation of storing gas went on in the day time, whilst it was assumed that in the case of the electric light it would be necessary to have machinery equal to the current production of the maximum quantity of light required at any particular time, Dr. HIGGS said that though at the present time it was not the practice to store up force for electricity, there was no reason why it should not be done, or why engines working a certain number of hours per day should not store up force just as it was done in hydraulic machines. In order to overcome the unpleasant glare of the electric light opal and milk-glass globes have been used, and it has been found that even in shaded lamps electricity gives a light six times more intense than that of gas, though the effect of looking at the lamp is still unpleasant. It has also been proposed to place the electric focus in a reflector and to project the rays upon a whitened ceiling or another reflector placed so as to diffuse and soften the light. One great advantage that the electric light possesses is that it allows of a discrimination between colours that is not practicable by the aid of gas, and this has been turned to good account in silk mills, making it possible to distinguish readily between a bluish green and a greenish blue by artificial light. When the electric light was introduced into these establishments the workmen during the first two or three hours always wasted time in looking at the light and thus got dazzled, but after the novelty had worn off it was found that not only could the task of examining the silk be better performed with the aid of the stronger light, but that the work did not fatigue the eyes so much.

It would thus appear that although much yet remains to be done before the electric light can replace gas and oil lamps in the household, if indeed it ever does, it is already in a fair way of receiving an extensive application in our large manufacturing establishments.

ALLEGED POISONOUS VIOLET POWDER.

In the *Lancet* for the 20th inst. there appeared a letter bearing the signature of a firm of "analysts," which contains one of those unsatisfactory charges that ought either to be supported by fuller details or not to be made at all. After some preliminary remarks about a "sad epidemic" among young children in the neighbourhood of London, in which the disease presents the appearance of erysipelas and ends sometimes with the death of the child, the letter goes on to state that in a case where a child was similarly attacked some violet powder was suspected to be the cause. A packet was therefore sent for analysis to the writers of the letter, who returned a certificate that it contained 25 *per cent. of white arsenic*, and communicated this result to the *Lancet*, with the remark that "These poor children, then, have suffered and died from arsenical poisoning." Not the slightest indication is given, however, as to the seller or manufacturer of the violet powder.

Incredible as such a statement appears to be, we should not be justified in challenging its correctness in the absence of fuller information, and we notice that in the editorial column it is stated that the subject is under "official investigation." It is to be hoped that the result of the investigation will be speedily published; indeed it is not quite clear why, if the facts are as stated, sufficient has not been elicited since the 12th inst., the date of the letter, to warrant a prosecution under the Arsenic Act, if not on the graver charge of manslaughter. But we do protest against such an accusation being hurled indefinitely against a large body of tradesmen, with the almost diabolical insinuation that because white arsenic is cheaper than starch it is used by them, reckless of consequences, as a substitute in the preparation of violet powder. As our contemporary the *Lancet* has allowed itself to become the mouthpiece for making this sweeping charge, we think that it is bound at the earliest possible moment to withdraw it within the limits circumscribed by facts, if indeed it does not prove necessary to withdraw it altogether.

NOTE ON A NEW RHUBARB.

From a note by Professor Baillon in the Monthly Bulletin of the Linnean Society of Paris, we learn that M. Colin, pharmaceutical chemist at Verdun, the author of a creditable "Thèse" on Rhubarbs, received some time since (as stated by Professor Baillon in the 'Dict. Encyclop.,' 3, iv., 428), from Mgr. Chauveau, the plant which the latter considered to be the source of true Chinese rhubarb. This plant has now flowered, and from an examination of a specimen forwarded by M. Colin, Baillon is of opinion that the species is *R. hybridum*, of which, however, it must be considered a variety characterized by more elongated leaves that are also more acute at the apex and more irregularly cut at the margin. The flowers are small and white, often male, and constructed nearly as those of *R. hybridum.* A piece of the root presents the characters of a very good rhubarb, analogous to that of *R. officinale.* The author proposes to call the plant *R. hybridum*, var. *Colinianum.*

This further tends to corroborate the opinion already expressed by the author that the origin of the good kinds of Chinese rhubarb is multiple. Thus we have *R. hybridum Colinianum* and *R. officinale*, from the latter of which he has seen rhubarb of very good quality in Parisian commerce, whilst Prejevalsky states that *R. palmatum* undoubtedly affords the excellent rhubarb of Thibet. The author insists on the influence exercised on the quality of the drug by the method of collection, the season when this is made, probably also the process of drying, etc. He adds that it is also necessary to take into consideration the part of the plant which constitutes the drug, as this determines its histological characters. A rhubarb furnished by the stem or a part very close to the stem will differ from one obtained from the root. In *R. officinale*, for instance, where the aerial stem and its subterranean portion takes on a great development relatively to the root, he has found that the latter part may also acquire a considerable development, and that portions taken from it, and which would be naturally employed in commerce, present very considerable differences from those shown in the stem, and indeed have scarcely any of the characters there found, and considered essential in a rhubarb of the best quality.

THE PARIS EXHIBITION.

Since our last report on the condition of the Paris International Exposition considerable progress has been made in some of the departments, but though the time at which the Exposition was to be opened is now only a few days off, even the building, the grounds, and the arrangement of the objects exhibited are so far from being complete that in spite of the rapid advance in the work from day to day it seems scarcely possible that the Exposition can be thrown open to the public for some weeks. In many cases exhibitors have delayed sending in their goods until the last moment, and then the number of packages to be dealt with has become so large as to cause serious inconvenience. So backward are some of the courts that a rumour was current that the building would only be formally opened on the 1st of May, and that then it would be closed for some weeks until completed. If this be true it would be matter for great regret, as it would doubtless be productive of much inconvenience.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A General Meeting of this Association will be held on Wednesday, May 1, at the Quebec Institute, 28, Baker Street, W., at 8·30 p.m. The Annual Report will be submitted, new members enrolled and the Council for the ensuing session elected.

Transactions of the Pharmaceutical Society.

PHARMACEUTICAL MEETING.

Wednesday, April 17, 1878.

MR. JOHN WILLIAMS, PRESIDENT, IN THE CHAIR.

A Special Evening Meeting of the Society was held, when a lecture was delivered by Professor BENTLEY on "Eucalyptus Globulus."

At the close of the lecture a cordial vote of thanks to the Lecturer was passed.

It is proposed to publish a report of the lecture in the next number of the Journal.

NORTH BRITISH BRANCH.

The sixth and last meeting of the present session was held in the Society's Rooms, 119A, George Street, Edinburgh, on the evening of the 19th instant. Mr. J. B. Stephenson, President of the Branch, in the chair.

The first paper read was by Mr. J. Falconer King, city analyst, on "The Disposal of Refuse from Certain Manufactories, in Relation to River Pollution." This paper will be printed in a future number.

Dr. William Craig followed with a paper on "Prescribing," which also will be printed in a future number.

The President then delivered the following Valedictory Address:—

Gentlemen,—In accordance with a time-honoured custom, I have now to go back over the subjects which have been brought before us at our varions meetings this session, but I purpose really little more than a bare enumeration of them. On the first evening, we had Dr. Stevenson Macadam, who gave us a highly interesting paper on the "Action of Paraffin Oils on Metals," as experienced in the storing of the oil for the lighthouses. Next evening, Dr. Andrew Wilson, favoured us with a capital address, in his own fine breezy manner, on the "Origin and Conditions of the Nervous System," and the same evening Mr. Howie kindly explained the working of the telephone, with practical illustrations. Our third meeting was held, through the kindness of Professor Archer, in the Industrial Museum, when he explained a new system of arranging the Vegetable Materia Medica of the British Pharmacopœia which he had just introduced there. At our next meeting Dr. Moinet read a valuable paper on the "Therapeutical Actions of Quinine," and on the last occasion on which we met Mr. Baildon, junior, gave us a singularly beautiful and able paper on "Botany in Relation of Modern Thought," being a continuation of a paper on the same subject which we had from him last session, and that same evening Mr. Ivison Macadam favoured us with some remarks of a very interesting character on Californian Wines. This evening our friends Mr. Falconer King and Dr. Craig have increased the obligation under which we already lay to them; the former by giving us the interesting paper to which we have just listened on the Disposal of Refuse from certain Manufactories, and the latter by his practical and suggestive remarks on Prescribing. In addition to all these, we have had various material contributions, books and specimens, etc., among which I cannot omit mentioning a stuffed musk deer, from Mr. Howden, of London, and a variety of quite unique specimens from our old friend Mr. Jamie, of Singapore. I am sure that at the last meeting of the session, you will authorize me to express our hearty appreciation of the kindness of each and all of our contributors and our lively gratitude for past favours as well as for favours to come. For obvious reasons, I cannot refer particularly to any of the contributions, but there is one paper which appears to me to occupy a place so peculiarly its own, that I think these objections do not apply to it. I mean the one by Mr. Baildon. And I feel that as the representative of the Society, I may be allowed on this occasion to compliment him on the rare ability displayed in it, as well as in his previous communications, and to thank him specially for them; and at the same to congratulate ourselves that such papers have emanated from one of our own members. And this brings me to the old grievance, the backwardness of our members in taking an active part in the proceedings on these occasions, for excepting Mr. Howie and Mr. Baildon all our contributors have been from without our own body. I do not think this is entirely creditable to us, and it is the less excusable that there is really no sufficient reason for it, for there are surely many of ourselves well competent both to interest and instruct us; and besides, however highly we may value papers on scientific subjects generally, (and I would be the last to undervalue them), it must never be forgotten that the communications most valuable to us, and therefore the most desirable, are those bearing directly on our own profession, either in some of its practical details, or its scientific aspects, or as co-related both to Art and Science, and that the requisite qualifications for doing full justice to such communications consist not so much in scientific attainments, as in practical observation and experience, which are obviously within reach of us all. Holding this view you will understand how I must continue to cherish the hope of better things in the future. Looking back on the session as a whole, you will see that we have had a goodly amount and variety of intellectual pabulum set before us, and the attendance on all occasions has been, I am gratified to say, very good. Our scientific meetings are designed and calculated to assist in effecting a most desirable object, viz., the diffusion of useful and scientific knowledge, and generally to raise the status as to culture and intelligence of the whole body, and in this respect they constitute a most important agency, gradual and imperceptible in operation yet not the less assured in results. It is from this point of view that I would urge their claims on our continued and increased countenance and support. And there is another consideration which is, I think, fitted to strengthen this appeal. I mean the privilege we enjoy of listening to the lectures *vivâ voce*, and the advantage we thereby possess over our brethren who can only read them in the Journal. And now, gentlemen, in conclusion, it is my pleasing duty again to thank you for the great honour you did me in placing me in this chair, and for the unvarying support and kindness I have received while occupying it, and you will all readily understand how my acknowledgments are specially due to our valued, or rather our invaluable Secretary, Mr. Mackay, and his indefatigable, ever obliging, never failing assistant, Mr. Stenhouse.

The Honorary Secretary announced the following donations:—

To the Museum.—Portrait of T. N. R. Morson, presented by his son; Working Model for preparing specimen cases for museum purposes, presented by Professor Archer; Bromide of Potassium, in fine crystals, by Geo. Atkinson and Co., London; Copper Precipitate, from the Tharsis Copper Company, by Mr. Kinninmont, Glasgow.

To the Library.—'Proceedings of the American Pharmaceutical Association,' for 1877, from the Association; 'Year-Book of Pharmacy,' for 1877, from the British Pharmaceutical Conference; 'The Pharmaceutical Register of Victoria,' from the Pharmacy Board of Victoria.

At the close of Mr. King's and Dr. Craig's papers, a short discussion took place, in which a few remarks were made by the President, Messrs. Young, Napier, and Mackay, and votes of thanks to the Lecturers were heartily responded to. The business of the session was brought to a close by a special vote of thanks to Mr. Stephenson, as President, for his able services during the session.

EXAMINATIONS IN EDINBURGH.

April 16, 1878.

Present—Messrs. Ainslie, Borland, Gilmour, Kemp, Kinninmont, Noble, Stephenson and Young.

Professor Maclagan was also present on behalf of the Privy Council.

MAJOR EXAMINATION.

One candidate was examined and declared qualified to be registered as a Pharmaceutical Chemist, viz.:—

Rohan, Robert Aldor ....Mauritius.

MINOR EXAMINATION.

Fourteen candidates were examined. *Six* failed. The following *eight* passed, and were declared qualified to be registered as Chemists and Druggists :—

Drummond, George ....Edinburgh.
Duckett, John James ....Preston.
Hutton, William ....Portobello.
Mair, Alexander ....Edinburgh.
Newsam, William Henry.........Otley.
Newton, George Robert ....Heckington.
Pryer, Henry.........................Chipping Norton.
Riddle, James Pearson............South Shields.

PRELIMINARY EXAMINATION.

The undermentioned certificate was received in lieu of the Society's Examination :—

Certificate of the Faculty of Physicians and Surgeons of Glasgow.

Houston, James ....Glasgow.

Provincial Transactions.

GLASGOW CHEMISTS AND DRUGGISTS' ASSOCIATION.

The concluding meeting of the session was held in Anderson's College, on Wednesday evening, April 17. In the unavoidable absence of Mr. Daniel Frazer, President, Mr. J. M. Fairlie, Vice-President, occupied the chair. The minutes of the last meeting having been read and approved, James Christie, Esq., A.M., M.D., etc., was called upon and delivered a lecture on "Laws Regulating the Geographical Distribution of Epidemic Diseases."

The lecturer started by observing that epidemics may to some extent be likened to plants found in certain localities, and which when transplanted to another locality die a natural death or survive only under special circumstances. He next went on to notice the geographical limits of various epidemics, proving that these rarely extend beyond certain zones. He next dwelt on the cause of epidemics, and criticized very severely Dr. Lawson's "Pandemic Wave" and Dr. Byden's "Atmospheric Wave" theories. To illustrate his point Dr. Christie took up the East Africa cholera epidemics from 1821 till 1872, and came to the conclusion that such went directly against the two theories mentioned, especially Dr. Bryden's "Southern Aerial Epidemic Highway," and that the disease moved solely along the highways of human intercourse and in certain definite relations to that intercourse, and from facts stated, came to the following conclusions regarding the movements of epidemic cholera:—

(1) The generative agent of cholera is contained in the alimentary canal of a person suffering from the disease.

(2) The discharges (dejecta and ejecta) of a person suffering from the disease may produce, when swallowed, the same disease in others.

(3) The generative agent of cholera may find a fixed local focus of dissemination which may exist in activity for an indefinite length of time.

(4) The generative agent of cholera may be conveyed for short distances by currents of water, contaminated with discharges introduced in a fresh or dry state, or by currents of air.

(5) The generative agent of cholera may be conveyed for considerable distances by persons affected with the disease, during the period of incubation, and by articles to which discharges in the dried state may be attached, as tainted linen.

It follows from these conclusions that the progress of an epidemic may be arrested by the absence of local circumstances necessary to its propagation, and, in such a case, the disease would be said to have died out; it also follows that the disease may be arrested by sanitary and such other measures as may secure the absence of these local circumstances. Presuming that these conclusions be correct, the lecturer contended that a community can secure immunity by sanitary measures alone, and that these are simply such as ought to be adopted by every civilized community, and the adoption of such measures ought to be compulsory. From a tainted water supply and an impure atmosphere the health of the general population is deteriorated and organic diseases are produced, and this is the case not only in large centres of populations but also in country districts and even in detached houses. The lecturer concluded by observing that instead of regarding the outbreak of epidemics as special dispensations of Providence for the punishment of national sins, they are now coming to be regarded in their true light—*as but the inevitable results of living in a state of semi-barbarism;* and that epidemics, disastrous as they have been, have been productive of much good, and will continue to be so, for they have been effective monitors in regard to measures affecting public health.

After a few observations by Mr. Kinninmont and others, a very hearty vote of thanks was accorded the lecturer, who, on replying, presented the library with a copy of his work on 'Cholera Epidemics in East Africa.'

The annual general meeting was announced for Wednesday, May 1.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

The annual meeting of the members of the Aberdeen Society of Chemists and Druggists was held in the rooms, St. Nicholas Lane, on Monday, April 15, Mr. G. P. Cruickshank (President) in the chair. The minutes of the former meeting were read and confirmed.

The Treasurer presented his annual report which showed that the sum of £16 3*s.* 3½*d.* stood to the credit of the Society. The income during the past year has been greater than for a number of years, except when special efforts had to be made to meet any extra expenditure for the support of classes, etc.

The following members were then elected office-bearers for the ensuing year :—President, Mr. David Ritchie; Vice-President, Mr. William Giles; Treasurer, Mr. James Paterson; Librarian, Mr. C. Coutts; Secretary, Mr. A. Strachan.

Mr. Mackay proposed that £5 sterling should be spent on books for the library. It was agreed that the young men should be asked to select suitable books and a committee elected to revise and report.

The 'Calendar of the Pharmaceutical Society' and the 'Year-Book of Pharmacy' have been received since last meeting, and on the motion of the Secretary a vote of thanks was passed and ordered to be transmitted to the various bodies.

The usual monthly lecture under the auspices of the Joint Association was delivered on Thursday, April 4, by Dr. James Moir, on "Phrenology." The chair was occupied by Mr. W. Giles (Librarian) who in a few sentences complimented the Joint Association on the success it had attained.

Dr. Moir then proceeded with his lecture, in which he gave a thorough exposition of the laws of phrenology, contrasting the various opinions of those skilled in the science of craniology. The lecture was amply illustrated with real specimens and casts of the human and lower species.

After a rather severe cross-examination by Mr. D. Ritchie, a hearty vote of thanks was accorded to the lecturer and the chairman.

The next lecture will be delivered on May 2 by Mr. A. Strachan, the subject being, "The Rise and Progress of Pharmacy and the Pharmaceutical Society."

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, April 18th. W. Crookes, F.R.S., Vice-President, in the chair. After the announcement of visitors, confirmation of minutes, etc., the following certificates were read for the first time: H. R. Smith and J. H. Wilson.

The first paper read was on—

"*Terpin and Terpinol.*" By W. A. Tilden, D.Sc. Terpinol is the name given by List to the liquid obtained by the action of dilute acids upon terpin hydrate. Conflicting statements as to its composition and properties have been given by Wiggers, List, and Oppenheim. The author's experiments lead him to conclusions which differ materially from those made by the above chemists, and he has brought this preliminary account before the Society, although the subject is by no means complete.

Crystallized Terpin, $C_{10}H_{20}O_2$, OH_2. —This compound was prepared by the process suggested by Wiggers. A mixture of one volume of nitric acid, one volume of methylated spirit, and two-and-a-half volumes of rectified turpentine oil, is allowed to stand about two days; it is then poured into a dish, after the addition of a small quantity of methylated spirit. Terpin is deposited in successive crops of crystals. No crystalline compound is obtained from the terpenes of the orange group; but the same compound is obtained whether American or French turpentine oil be used.

Action of dilute Hydrochloric Acid on Terpin.—To 53·5 grm. terpin, boiled up with 7–800 c.c. water, twelve drops of hydrochloric acid are added and the liquid distilled. An oily product, trepinol, distilled over between 205° and 215° unchanged. It has the formula $C_{10}H_{18}O$, and probable composition $C_{10}H_{18}\left\langle\begin{matrix}O\\O\end{matrix}\right\rangle C_{10}H_{18}$. It is a colourless, somewhat viscid liquid, sp. gr. at 16° ·9274; it has no action on polarized light. When dry hydrochloric acid gas is passed into it, its colour becomes purple, and ultimately a mass of crystals is formed, which by pressure can be obtained perfectly white. This new body has the composition $C_{10}H_{18}\left\{\begin{matrix}Cl\\Cl\end{matrix}\right.$ and is therefore the dihydrochloride. If an alcoholic solution of terpinol be acidified with nitric acid, and the mixture placed in a dish, crystals of terpin are deposited. From this and other considerations the author concludes that in the preparation of terpin by the ordinary process, terpinol is formed at a certain stage of the reaction. By the action of dilute sulphuric acid, 1 in 8, on terpin, and subsequent distillation in a current of steam, an oily product was obtained which analysis indicated as a mixture of a hydrocarbon $C_{10}H_{16}$ with terpinol. The crude product was therefore boiled for two or three hours with dilute sulphuric, 1 in 2, and distilled, finally from sodium; a liquid was thus obtained boiling at 176°-178°, vapour density 68·8, with the formula $C_{10}H_{16}$, sp. gr. at 15° ·8526. It is optically inactive, gives no crystalline deposit with hydrochloric acid, and no crystalline nitroso-compound. A dibromide was prepared. The author suggests the name "terpinylene" for this hydrocarbon, which resembles in many respects the hydrocarbon characteristic of Russian turpentine oil. The author has made a preliminary examination of the oxidation products of terpinol and terpinylene.

After some remarks by Dr. Armstrong, the thanks of the Society were given to Dr. Tilden for his valuable paper.

Dr. Armstrong then read a paper entitled—

The Poisonous Principle of Urechites suberecta. By J. J. Bowrey. The *Urechites suberecta* is a common wild plant in Jamaica, where it is called nightshade from its well-known deadly properties. Its dark green leaves and large bright yellow flowers render it a conspicuous object. It is believed to have been frequently used as a poison by the negroes in former times, and occasionally its employment has been suspected at the present time. It is stated that by suitable doses it can be administered so as to produce death immediately or after the lapse of some weeks. Experiments by the author prove that this statement has some foundation. Three active substances have been obtained in a pure form, urechitin, urechitoxin, and amorphous urechitoxin. They are extracted from the leaves, which are, physiologically, more active than the other parts of the plant. The fresh leaves contain rather more than half a per cent. of the active principle. *Urechitin* is prepared from the air-dried leaves by extracting with alcohol; by using this solvent in various states of dilution the pure substance was obtained in long four-sided prisms, transparent and colourless, containing 6 per cent. of water of crystallization readily expelled at 100° C. Urechitin is practically insoluble in water and dilute alcohol; more soluble in ether, benzol, amylic alcohol, and strong spirit, and very soluble in hot alcohol, chloroform, and glacial acetic acid. Strong mineral acids decompose it. The reaction with hydrochloric acid proves the substance to be a glucoside. With strong sulphuric acid it gives a characteristic colour reaction. If 0·01 milligramme be treated with a drop or two of strong sulphuric acid, a yellow solution is formed which becomes successively orange, red, mauve, and finally purple. These changes of colour are much hastened by heat or the addition of a trace of some oxidizing substances (nitrates, nitrites, chlorates, bleaching powder, bromine and iodine). The author prefers a trace of a solution made by adding one drop of nitric acid to 100 c.c. of sulphuric acid. The results of several analyses of different samples indicated the formula $C_{28}H_{42}O_8$. It is intensely poisonous and bitter, a solution of 1 in 40,000, having a distinctly bitter taste; its solutions are also very acrid. *Urechitoxin* is prepared by a process somewhat similar to that used for obtaining urechitin, but the leaves are first dried completely at 100° C. Basic lead acetate is also used to precipitate the substance in question. It differs from urechitin in being much more prone to undergo change and become amorphous; it is more soluble in water, spirit, amylic alcohol and chloroform, but less soluble in ether and benzol. It also crystallizes less readily with sulphuric acid. It gives a colour reaction almost the same as that yielded by urechitin, and with hydrochloric acid splits up into an inert substance, and a body which readily reduces alkaline cupric solution. Like urechitin it is bitter, acrid and exceedingly poisonous, one one-hundredth of a grain injected subcutaneously being sufficient to kill a cat within sixteen hours. From several concordant analyses the author deduces the formula $C_{13}H_{20}O_5$. Amorphous urechitoxin was procured as a residue in preparing urechitoxin, but has not been obtained in a pure state. In its toxic and general chemical properties it closely resembles the crystalline substance. Other substances have been obtained by the author, but to avoid confusion he has not named them as their composition was not absolutely certain. In conclusion he states that the poisonous properties of *Urechites suberecta* are mainly due to urechitin, which he obtained by the use of water, alcohol and a temperature never exceeding 38° C., and that urechitoxin is a product of chemical change from urechitin. The author gives full details of the preparation, solubilities, chemical properties, etc., of the above substances. Specimens of the three bodies were exhibited and the colour reaction shown at the meeting.

After the thanks of the Society had been given to the author for his interesting communication, a paper by A. Wynter Blyth, entitled—

The Temperature at which some of the Alkaloids, etc., Sublime, as determined by an Improved Method, was read by Dr. Armstrong. Helwig was the first who systematically employed sublimation as a means of recognizing the alkaloids, etc. Afterwards Dr. Guy greatly improved the process. Very wide statements are, however, still made as to subliming points, *e.g.*, theine, which really sublimes below 100° C. is said by Strauch to sublime at 177° and by Mulder at 184·7° C. The author investigated the subject and found these discrepancies to arise (1) from defects in the apparatus used; (2) the want of a definition of the term "sublimate;" (3) the want of uniformity in general procedure. The method recommended by the author is as follows:—A porcelain crucible about 3 inches in diameter is nearly filled with mercury for low, or fusible metal for high temperatures; a very small quantity of the substance is then placed on a thin microscopical cover-glass and floated on the fluid metal; the substance is then surrounded by a glass ring (cut from a tube), one-eighth to two-thirds of an inch thick and covered by a second thin cover-glass. The crucible is supported on a brass plate fixed to a retort stand and covered by a flask, from which the bottom has been removed. In the neck of the flask is a cork, through which a thermometer passes which has its bulb immersed in the liquid bath of metal. A first rough determination is made in which the bath is heated rapidly and the upper cover-glass changed at every 10°. In a second experiment the disk is changed every 4--5°. In the final determination the disk is renewed every half degree, the temperature being raised with great caution. The author defines a sublimate as the most minute films, dots or crystals which can be observed by a quarter-inch objective and which are obtained by keeping the subliming cell at a definite temperature for sixty seconds. The author has used the same apparatus without the upper cover-glass for determining melting points accurately, the specimen being observed microscopically in order to determine when the first melted drops are formed. The active principles of plants can be classed, in regard to their behaviour to heat, for practical purposes into (1) those which give a decided crystalline sublimate *a*, below 100° C., *e.g.*, theine, thebaine, cantharidin; *b*, between 100 and 150°; *c*, 150-200°, pilocarpine, strychnine, morphine, etc.; (2) those which melt but give no crystalline sublimate, *a*, below 100°, hyoscyamine, atropine, etc.; *b*, 100-150°, papaverine, etc.; *c*, 150-200°, salicin, etc.; *d*, above 200°, solanine, etc.; (3) those which neither melt nor give a crystalline sublimate, saponin, etc. In addition to the above substances the author has examined narceine, narcotine, delphinine, theobromine, picrotoxin and quinidine, and gives details as to their behaviour when heated.

The chairman suggested that more accurate results might be obtained by subliming *in vacuo*; he had found that oxalic acid sublimed without decomposition below 100° *in vacuo*.

The thanks of the meeting were given to Mr. Blyth, and the Society adjourned to May 2, when a lecture "On the Chemical Aspect of Vegetable Physiology" will be delivered by Mr. Sidney H. Vines.

CHEMISTS' ASSISTANTS' ASSOCIATION.

At a meeting of the above Association, held at their room, 29, Brewer Street, Regent Street, on Wednesday, April 3, Mr. O. Wallis, Vice-President, in the chair, Mr. E. S. Bull read a paper on "Pill Coating."

The paper contained a full and practical description of the various modes of coating pills, including silvering, varnishing, gelatine, pearl and sugar coating, the author giving his experience of each method, with examples of the products, some of which reflected great credit on the manipulator. One of the methods spoken of as giving good results was also one of the simplest, consisting merely in moistening the pills with dilute mucilage, and rolling in French chalk. The author, however, insisted on the importance of skill and perseverance in carrying out the process, and said that with patience and care many of the published formulæ for pill-coating could, although at first seeming impracticable, be made to give an uniform and attractive appearance which is so much desired by the pharmacist.

After the paper, which created much interest on account of the practical way in which it was treated, several members confirmed Mr. Bull's statements in many particulars.

Mr. Wallis then, in answer to a query laid before the members some time previously, read a note on 'Methylated Chloroform and its Impurities.'

Parliamentary and Law Proceedings.

The Sale of Driffield Oils.

In the Chancery Division of the High Court of Justice, an action was tried before Mr. Justice Fry, at Lincoln's Inn, on Wednesday and Thursday, the 3rd and 4th April, in which the plaintiffs were Messrs. Tomlinson and Hayward, and Mr. Thomas Luddington, of Lincoln, and the defendants were Messrs. Lofthouse and Saltmer, wholesale chemists, of Hull. The action was brought to restrain the defendants from manufacturing and selling a specific known as "Luddington's Driffield Oils," or "Luddington's celebrated Horse and Cattle Medicine," by that designation or by any title or name differing only colourably therefrom, so as to lead purchasers to suppose that they were buying the preparation manufactured by the plaintiffs or their predecessors in business, and from representing that the defendants were the successors in business of James Luddington, deceased, or were the sole proprietors of the specific. It appeared that the preparation, which was stated to be of great value in various diseases of horses, sheep, and cattle, was originally invented by one William Luddington, who lived at Driffield, and was sold by him as "Luddington's Driffield Oils." Some time before his death he went to Hull to live with his son James, to whom he communicated the secret of the manufacture. After his father's death, James, being then the sole proprietor, found the business more than he could manage, and accordingly in 1850 he imparted the secret to his brother John, who lived at Market Rasen, and they arranged that they should divide England between them, James taking the north of the Humber, and John the south. John Luddington died in 1870, and by virtue of the provisions of his will and an arrangement made with the widow and the executors, his business devolved upon his son Thomas, one of the plaintiffs. James Luddington died in 1875, and by his will gave his residuary estate, which included the cattle medicine business, to his trustees and executors, Jonathan Duncan and James Simpson, upon trust as to one moiety for the daughter, and as to the other, for the benefit of the son, Jno. Wm. Luddington, or his wife and children, in the absolute discretion of the trustees; but in such a way that the son should have no power to dispose of any part of it. After James Luddington's death, his executors continued the business and supplied the oils to his customers, and amongst others to the defendants. Jno. Wm. Luddington, pretended to sell to Messrs. Lofthouse and Saltmer for a small sum of money, the business of his father, James Luddington, to which he said he was entitled as his father's son. The defendants set up this sale, and contended that by virtue of it they were entitled to manufacture and sell the oils, representing themselves to be the successors of James Luddington, and they further alleged that the sale was made with the privity of Mr. Duncan, one of the executors. This, however, Mr. Duncan emphatically denied. On the 3rd February, 1877, James Luddington's executors sold his business to the plaintiff, Thomas Luddington, and by an arrangement between him and Messrs. Tomlinson and Hayward, they are now the proprietors of the businesses of both James and John Luddington, the two original proprietors, and they now applied for an injunction against the defendants.

Mr. Justice Fry said that upon the evidence before him he was satisfied that Mr. Duncan, the executor, had not concurred in the sale by John William Luddington, and that, even if he had, it would not be binding, because it was necessary that both the trustees should concur in any bargain for the sale of the property. After an exhaustive review of the whole case, he said that he should grant an injunction in the terms asked for by the plaintiffs, which were as follows:—That the defendants, their servants, and agents, be restrained by the order and injunction of the Court from selling or exposing for sale any specific or other medicinal preparation, under the designation of or purporting to be "Luddington's Driffield Oils," or "Luddington's celebrated Horse and Cattle Medicine," or otherwise described by any title or name differing only colourably therefrom, so as to hold out that the preparation so sold or offered for sale was or is manufactured by the plaintiffs or any of their predecessors in business, or that the defendants are carrying on the manufacture or sale thereof, or of any medicinal or other preparation in continuation of or in succession to the business formerly carried on by James Luddington, deceased, and from representing that they are the sole or exclusive owners or proprietors of any such preparation.—His Lordship also ordered the defendants to account for and pay over to the plaintiffs all profits made by them by the sale of the oils since June, 1876, and to pay the costs of the action. —*Lincoln Gazette.*

Obituary.

Notice has been received of the death of the following:—

On the 5th of January, 1878, Mr. David Soulter, Chemist and Druggist, West Grimsby. Aged 30 years.

On the 16th of February, 1878, Mr. William Henry Foster, Chemist and Druggist, Great Crosley, Aged 47 years.

On the 20th of March, 1878, Mr. Thomas Lee, Chemist and Druggist, Wem, Salop. Aged 66 years.

On the 26th of March, 1878, Mr. William Glynn, Pharmaceutical Chemist, Torquay. Aged 57 years. Mr. Glynn had been a Member of the Pharmaceutical Society since 1846.

On the 26th of March, 1878, Mr. Thomas Slann, Chemist and Druggist, Birmingham. Aged 39 years.

On the 2nd of April, 1878, Mr. John Hunter Leighton, Pharmaceutical Chemist, Durham. Aged 54 years. Mr. Leighton had been a Member of the Pharmaceutical Society since 1853.

On the 6th of April, 1678, Mr. Bartlett Hooper, Pharmaceutical Chemist, King William Street, London Bridge. Aged 65 years. Mr. Hooper was one of the Founders of the Pharmaceutical Society and showed a lively interest in it during the earlier years of its history.

Dispensing Memoranda.

We are constantly in receipt of requests for aid in overcoming difficulties met with at the dispensing counter, and so far as lies in our power such assistance is always rendered. But it has been suggested that instead of a reply being given among the Answers to Correspondents, where frequently it stands as an individual opinion, intelligible to only one person, it would be more widely advantageous were such questions published, with an invitation for suggestions as to their solution. We therefore propose as an experiment, to devote a certain amount of space every week specially to these and other "Dispensing Memoranda." In order to assist our younger brethren as much as possible, considerable latitude will be given to the definition of what may be considered to be a difficulty, but it is evident some discretion will have to be exercised in excluding trivial matter. Each note will bear a number, which it is requested may be quoted in all correspondence respecting it. Opportunity will be taken every month of calling attention to the more important points brought out in the various discussions.

[54]. Creasote Dispensing.—Is it not somewhat strange that Mr. Martindale, who writes as a "Pharmaceutical Examiner in Dispensing," should state in the "Dispensing Memoranda," of the 20th inst., that in his "large experience" he never remembers having dispensed creasote in a liquid form for internal administration? I cannot boast of such a "large experience," and yet I have before me the copies of seven prescriptions, all written for different patients, and not all by the same physician, which I have dispensed (some of them many times) within the last two or three years, in which creasote is prescribed for internal administration in the liquid form, and in four of the mixtures carbonate of magnesia is also ordered. I find there is a form in the B.P., and also in the Pharmacopœias of three London hospitals, for "mist. creasoti." I shall be glad to know whether my experience is singular in this matter.

I may just add that in February last I dispensed at the Square, and under Mr. Martindale's supervision, a gargle in which creasote and liq. potassæ were ordered. Would not creasote as a gargle be as obnoxious to the patient as creasote in a mixture?

W. P. Hoare.

[94]. In reply to "Dispenser," for making Carbolic Acid Pills (no other ingredient mentioned in his query), I send the following, obtained from the 'Year-Book of Pharmacy,' 1871, the author recommending it as a good and convenient form for administering carbolic acid:—

℞	Carbolic Acid	1 part.
	Powdered Elm Bark . . .	2 parts.
	Gum Arabic	1 part.
	Tragacanth Paste	q.s.

Mix and make pills of the required size, which may be coated with tolu or silver leaf.

J. W. Barnes.

[94]. Wheaten flour and simple syrup together with carbolic hydrate afford a plastic mass if soft enough. The pills may be varnished.

J. B. L. M.

[95]. Tr. Sap. Virid. Co. is Tinct. Saponis Co. (made with soft soap). Sap. Virid. is Sapo Virid., or in French Savon Vert or Savon Noir, synonym for soft soap.

W.

[95]. In America Sapo Mollis is also called Sapo Niger and Sapo Viridis. The Tr. Sap. Virid. Co. is in all probability a spirituous compound of this soap, somewhat similar to our soap liniment.

M. H. T.

[97]. In answer to "Euryowie's" query, I believe Succ. Taraxaci, B.P., is meant by Sol. Taraxaci. I have dispensed several prescriptions like the above for a well known medical gentleman here, and fully believe his intentions were carried out by the course indicated. As for the direction to "shake the bottle," it is very likely the prescriber's intention to insure to his patient the full dose of Potass. Bicarb. in each dose of the medicine.

Glasgow. J. KITCHEN.

---

[102]. Will some of your correspondents favour me with a description of the reaction that occurs on mixing the following?—

℞ Acid. Sulph. dil. . . . . . ʒiss.
Magnes. Sulph.,
Liq. Bismuthi . . . . āā ℥j.
Inf. Calumbæ . . . . ad ℥vj.
M. ℥ss ter die.

J. KITCHEN.

---

[103]. Can the following be dispensed without a separation taking place?

℞ Tinct. Benzoin. Co.,
„ Conii . . . . āā ℥j
Misce. ʒj to be used for an inhalation as directed.

My customer first received it from the medical man who gave the prescription, and it was perfectly clear; it was also dispensed in the North of England with the same result. I have tried it with both B.P. and P.L. tinctures of conium, and with each get a thick gummy precipitate which adheres to the bottom and sides of the bottle. Can it be prepared without this? If not I presume it must have been filtered before sending out.

H. M. H.

---

[104]. Will you kindly inform me through the Journal, what would be the right thing to give when "Palma Christi" is asked for? A doctor sent for a bottle for his nurse, and we sent Castor Oil as ordered in Gray's Supplement, and he returned it.

N. K.

---

[105]. When Syr. Ferri Superphosph. Co. is ordered in a prescription, would Syr. Ferri Phosph. Co. (Parrish's Food) be meant. Would anyone give me the composition of the Superphosphate.

B. P. BURN.

Durham.

---

[106]. When Sodæ Carb. is ordered in a prescription would it be correct to use sodæ bicarb. ($NaHCO_3$)? If the physician meant (Na_2CO_3) sodæ subcarb. would he not put sub. before the carb. in the prescription?

Westminster. G. F. W

---

[107]. LIQUOR HOFFMANI.—Will some reader kindly inform me what should be dispensed as Liquor Hoffmani? Squire mentions spiritus ætheris, B.P., while Beasley and Neligan give a preparation containing ethereal oil.

Belfast. S. L.

Notes and Queries.

[585]. BALSAM OF ANISEED.—In answer to query 585 in last week's issue, I forward enclosed formula for Balsam of Aniseed, a preparation that is extensively sold in this neighbourhood at 2*d.* per ounce.

Balsam. Anisi.

℞ Succ. Solazzi . . . . lbj.
Aq. Bullient. . . . . lbiv.
Theriacæ. . . . . lbiv.

Boil the juice with the water until dissolved, make up the lost weight with water, then add the treacle; gently simmer until it is mixed with the juice.

℞ Morph. Acet. . . . . . . ʒss.
Acid. Acet. Fort . . . . . ʒiij.
Mix.

℞ Ol. Anisi. . . . . ʒss.
Sp. Vini Rect. . . . . ℥iv.
Dissolve the oil in the spirit, then add—
Boiling Water . . . . ℥iij.
Tr. Camph. Co. . . . . . . ℥xvi.
Mix all together and strain.

Dose.—Adults, one teaspoonful; fourteen years and upwards, half a teaspoonful; seven years, thirty drops; four years, twenty-five drops; three years, twenty drops; two years, fifteen drops; one year, ten drops.

F. W. HALLER, *Boston.*

---

[588]. SKELETON LEAVES.—Could you inform me through the Journal of any way for making skeleton leaves quickly? R. S. P.

---

[589]. SYR. SODÆ HYPOPHOS.—Will some reader kindly give me the form for Syr. Sodæ Hypophos.; also one for Syr. Ferri Superphos. et Calcis?

JOHN C. B. MORRIS.

---

[590]. BROWN SMELLING SALTS.—Can any reader refer me to a really good formula for Brown Smelling Salts?

A. E. J.

---

[591]. BLACK WRITING INK.—Can any correspondent kindly inform me of a method of making ink that will both write black almost as soon as made and keep well? The chrome ink is uncertain, while that made from galls does not write black until kept some weeks.

ALPHA.

BOOKS, PAMPHLETS, ETC., RECEIVED.

INDUSTRIAL CHEMISTRY. A Manual for use in Technical Colleges or Schools, and for Manufacturers. Based upon a Translation of Stohmann and Engler's German Edition of Payen's 'Précis de Chimie Industrielle.' Edited by B. H. PAUL, Ph.D. London: Longmans, Green and Co. 1878. From the Publishers.

A KEY TO ORGANIC MATERIA MEDICA. By Dr. JOHN MUTER, M.A., F.C.S. Second Edition. London: W. Baxter. 1878. From the Publisher.

MÉMOIRE SUR LA LIQUÉFACTION DE L'OXYGÈNE, LA LIQUÉFACTION ET LA SOLIDIFICATION DE L'HYDROGÈNE, ET SUR LES THEORIES DES CHANGEMENTS DES CORPS. Par M. RAOUL PICTET. London: Asher and Co. 1878. From the Publishers.

Correspondence.

"NOT ONLY PATENT MEDICINES, BUT ALSO GENERAL PHARMACY IS GOING TO GRIEF."

Sir,—The above is the heading of a letter in this week's Journal, and the statement is only too true. But I deprecate the fretting and fuming and "kicking against the pricks" exhibited week after week in your valuable periodical; for if the writers can do nothing else, it is simply ridiculous, because utterly futile, and consequently a waste of pen, ink, and time on the part of the fretters, fumers, and kickers, as well as a waste of your valuable space. That a revolution in the retail drug trade is in progress is too true, and like revolutions in general it is utterly impossible to forecast the ultimate result.

"Sussex," query "Senex," in the letter referred to, lets us know that he has been considerably over 50 years in the drug trade. Surely in that time he should have made a fortune, and should at least now leave the field to younger blood, to battle through the great trials that are evidently darkly looming on the horizon. For however indifferent the trade may already have become, and however much worse it may be fated to be in the future, the drug trade during the last 50 years has certainly been as good as any other for the middle class to gain a livelihood and a competency by. If "Sussex" or "Senex" will search the files of the *London Gazette* he will find that the chemists and druggists figure as proportionately infrequently in the list of bankrupts and insolvents as any tradesmen.

S. intimates that between 40 and 50 years ago, when he first went to London, C.s and D.s were springing up like mushrooms; very good evidence of the excellency of the business. I observe by some statistics before me that 100 years ago the marriages in London averaged annually 6000, now they reach 100,000. S. surely must see reason why the C.s and D.s of the metropolis should rapidly increase during this century of time. It strikes me he went to London at an excellent time, but made a mistake in not casting his lot in among the "mushroom" number. Had he done so, probably long ere this he might have "thrown physic to the dogs," have galloped, an' he listed, over Brighton Downs or lounged in its Aquarium, instead of having yet apparently to stand behind a counter, fretting at his neighbour selling "patents" at cutting prices. He and half a score more who have "piped" to the same tune in your columns can get no one to "dance;" they want something to be done for them, and like drowning men they catch at straws. They seem to have a vague idea that the Council can prevent this cutting down of prices. S. says he has received a circular from one who is a candidate for a seat in it, who promises to "use his best endeavours to promote the interests of the retail trade," and that he is the man for his money. He says, "he has read that once upon a time a mouse could release a lion from his snare." He pictures himself the ensnared lion, and thinks he has found his "mouse," and very much "a mouse" no doubt he will find him. He thinks the lion and mouse story an o'er true tale, and not a fable, and sees no reason why such a wonder shouldn't happen again.

S. has a singular notion of the meaning of the word "monopoly." He says that we should "agitate" (forgetful of the homely proverb, "the more you stir, etc."), "petition and strive together against the cruel monopoly of village grocers, drapers, advertising tailors, dabblers in medicine, and pharmaceutical chemists by examination calling themselves co-operative drug companies, clipping our respectable business into shreds" (!). If an "enterprising" trader should open a shop in S.'s near neighbourhood and advertise the primest joints of Herefordshire beef and Southdown mutton at 2*d.* per lb. less than S. pays his butcher, would S. be too "respectable" to patronize him? If the "respectable" butchers of the locality were to propose to "agitate and petition against the cruel monopoly," wouldn't S. laugh consumedly? Does S. not know that for a score or two of years the druggists have sold packed tea, coffee, and cocoa, not to mention many other articles which "legitimately" only grocers can sell? Perhaps S. himself is not guiltless of this "illegitimate" sin. Did he ever hear of the grocers threatening "to agitate and petition against" it? If they had, I guess S. would have thought it "no end of a joke!" Grocers in selling "patents" are clearly but retaliating. Then druggists sell chest protectors and Cash's towels, drapers' or hosiers' articles, and pickles, sauces, combs, and hair-brushes, and a host of other articles not "legitimately" their trade.

Now with regard to the special question of "patents." What feasible reason can S. assign for the legislature permitting only druggists to vend them? They may be made by anybody, by any ignorant old quean, surely then they may be sold by anybody. What greater risk does the public run by my neighbour the grocer or draper vending them, than by my doing so? If a customer applied to me for chlorodyne, I deem it no part of my duty to warn him that it is a patent medicine and enumerate the half dozen "poisons" it is reputed to contain. All I do is to sell him the largest bottle and the greatest number of bottles he may be disposed to purchase.

The trade of a retail druggist has hitherto been one of large profits and small returns, that of a grocer smaller profits and larger returns. Can S. assign any abstract reason why such a state of things should of necessity be? Possibly the time will come when the profits of a druggist's business will be much smaller than heretofore, and his returns be increased in proportion. But as physic in a very great measure is an exception to the rule of lower prices creating larger demands, if such a state of things is to ensue, the number of druggists must be reduced, and the evil days which appear to be coming upon us will have to be borne and the furnace passed through. In the town from which I write, the drug trade had, until recently, from time immemorial been conducted in a fairly "respectable" manner. I employ a qualification. About a quarter of a century since, one black sheep, in order, if possible, to aggrandize himself at his neighbours' expense, tried to make a "leading article" of seidlitz powders, and dropped them from 1*s.* 6*d.* to 1*s.* and also charged a little less for putting up prescriptions than he knew his competitors did. Barring this we were "respectable," and though half the druggists sold tea, no grocer had retaliated. Recently a new man (a druggist) dawned upon us, who carried on "respectably" for a while, but without eminent success, probably because where his tent was pitched druggists were thick enough without him. Be that as it may, he has ceased to be "respectable," is now an advertizing cutter, and is selling at such prices that he must do four times the trade he did to better his position sufficiently to enable him to hold on. It remains to be seen if he will. If he should it will only be by so seriously affecting the trade of the rest of the druggists, that general retaliation will ensue, and one half of us will assuredly go to the wall. There is no help for this sort of thing. S. and the whole host of fretters and kickers had better try to look "the accursed thing" heroically in the face, and cease to badger and abuse the Council which is powerless to help them.

HAMPSHIRE.

The Sale of Patent Medicines.

Sir,—Permit me space for a few remarks in reply to "Tento," "Benevolent," and "Treu und Fest," in the Journal of the 13th inst.

"Tento" says he "doubts not the eight registered chemists I mentioned in over seventy villages, besides hamlets, will be fully competent to supply them with all the medicines and patents they require without the interference of unqualified persons." No doubt they would, but will he say because a resident of any of these villages lives ten or more miles away from any registered chemist, and that is the case with quite one-third of them, he must lose a day's work to get a pennyworth of laudanum, a dose of spirit of nitre, or any other drug or patent medicine that may be required in an emergency, and emergencies will arise even in the best regulated villages, where there are no qualified chemists, as well as where such reside. Over a third of these villages are quite this distance, and why should they not be able to get simple remedies at home. I would ask "Tento" what these people have done amiss that they should be thus taxed and inconvenienced. No chemist could live in these villages, even if no other shopkeeper sold an ounce of medicine or single patent; every one who understands and knows the country is aware of this

The reasoning of these gentlemen is this: We cannot serve them; it will not pay us to do so; and they say in effect, no one else shall. This is what I call the "dog in the manger policy," though I think at the same time they do not intentionally mean so, but the effect is the same.

One correspondent suggests an application to the surgeon in an emergency; here is another tax and injustice to the village poor. Benevolent suggestions are made that the emergency could easily be met by going by rail, which means that more than a third of the village residents would have to traverse ten miles to a station, and nearly this average to the nearest surgeon, who might when sought be as many miles in another direction.

I quite agree with your correspondent that some remedy is needful to check the evil of underselling and sale by unregistered persons, and I feel sure we should all feel indebted to any one who may suggest a practical remedy for these and other grievances from which the trade suffers; but be assured that in any legislation on this subject, the public must be taken into account; the days of monopoly of any kind are ended unless the public requirements are fairly met.

One correspondent suggests that in these cases people should keep a stock of simple medicines by them. Possibly even in this case the emergency that has arisen might not be anticipated, and hence not provided for; but supposing all emergencies could be foreseen, it would only be the wealthy members of the community could keep such stock, and they would either have to sell them to their poorer neighbours, or act the part of the "Lady Bountiful." Neither positions are desirable.

I am aware the course I recommend is exceptional, so are the circumstances, and require exceptional treatment. My opinion is still that the wisest policy for legislation would be to register some person in every village for the sale of both poisons and patents where there are no chemists. Before registering see if they have a fair knowledge of drugs, and no other person should be allowed to sell either patents or medicines of any kind except those registered. This would end, I think, in villages proximate to each other, forming a centre, where such a trade might be cultivated as would make it worth while for a qualified chemist to settle, which I, in common with every well-wisher to the trade, would be glad to see.

When we as chemists have duly considered the wants of the public and their requirements, we shall then be able to take a high standpoint for our rights and privileges in any future legislation, which in my opinion cannot be far off.

A. G.

Chesterfield, April 16, 1878.

The Patent Medicine Question.

Sir,—Allow me to state that I am heartily glad to see that some of our kith are beginning to take an interest in the above important question. Some of your correspondents seem to be labouring under delusions, others again appear to understand the question in all its bearings, and a few seem to have nothing else in their heads than to garble and snarl at each other. We must fling all petty quarrels to the wind. If we expect success, we must stick together as one and lay our petition boldly and firmly.

John Mudie.

Opium Eating.

Sir,—In corroboration of your extract from the *Bradford Observer*, under the heading "Parliamentary and Law Proceedings," in a recent impression, I can well remember when I was an apprentice at Newark, over thirty years ago, that a man one day came into the shop and asked for three drachms of opium, which he said he took at one dose, and was "all right" for the rest of the day, and he came for the same dose next morning. He walked about the country, supporting himself by selling copies of the Lord's Prayer, written in a most delicate hand in the space of a shilling's circumference, and the Belief in that of half-a-crown, and a long particularization of the mystical number seven, a copy of which I bought, and still have in my possession. The account he gave of himself was that he had been a non-commissioned officer in the army, had a pretty wife, and in resenting the improper advances of a superior officer to her he struck him, and was then dismissed the army; henceforward he commenced the opium eating. I dare say some of my cotemporaries can recall this; I can remember his appearance very well—wan-looking and thin. Since I have been in business the largest morphia consumer I have had took about three two-drachm bottles of it in fourteen days. He died some years back, and his account, like many of these customers', remains unbalanced.

John Rayner.

Long Row, Nottingham,

Election of Women to Membership.

Sir,—Several addresses have been issued by candidates for the Council, but I have seen nothing in them at present in reference to a question which will engage a considerable time at the next Annual Meeting. It will be remembered that in November of last year, two ladies who had passed the Minor examination in a highly creditable manner, applied to be elected Associates of the Society. In the opinion of some of our representatives the Council had not the power to act contrary to the decision of the members in general meeting. Others believed that members had nothing to do with it, but that it remained with the Council to elect or reject as they might determine. Even Mr. Hampson doubted whether the executive are legally bound to elect ladies at all. But there are some who think that sex has nothing to do with the question and consider when an application is made by any "person" educationally qualified, should the Council refuse, their decision could be set aside by mandamus. It is, therefore, important in the election of Council that members should know what are the views of candidates who desire a seat at the next Council table, because if the general meeting pass a vote in favour of female admission the Council might fall back upon what it considers its prerogative; but if the decision is given against the ladies, then the Council could cover its predilections under the plea of carrying out the vote of the members. Under any circumstances the result should be decided by the wishes of all, and as it is impossible for every one to be present at the Annual Meeting the opportunity ought to be given to those absent to vote for those who will best represent their wishes on a subject of considerable importance which will not be allowed to remain unsettled.

A. Wright.—Your specimens are probably correctly named, but such specimens can serve no useful purpose as it is impossible to identify them with certainty. The henbane leaves are probably the autumn leaves of the first year's growth of biennial plants.

Communications, Letters, etc., have been received from Professor Dymock, Messrs. Bailliere et fils, Professor Bentley, Dr. Symes, Mr. Paris, Curator.

EUCALYPTUS GLOBULUS.*

BY PROFESSOR BENTLEY.

The reputed influence of plantations of *Eucalyptus globulus* in destroying the malarious character of marshy districts, and thus preventing the fever which is their usual accompaniment, and the many other uses ascribed to this plant, have naturally excited very great interest, and have induced me to make it the subject of my lecture this evening, and at the same time to refer generally, to the properties and uses of other species of the same genus.

This very fine tree was first discovered in 1792, by the French botanist Labillardière, in the island of Tasmania. It is also to be found abundantly in Flinders Island, in Bass's Straits, and on the mainland of Australia over a large area. It appears that M. Ramel had his attention called, while in Melbourne, by Baron Mueller to this tree, and in 1856 he sent some seeds to Paris, the first that had been forwarded to Europe. M. Ramel then called attention to the great value of the *Eucalyptus globulus* as a forest tree, and also claimed for it the power of destroying the miasmatic influence of marshy districts. It is to M. Ramel, therefore, that we owe the introduction of this plant into Europe, and also for first directing attention to its reputed antimalarial influence.

The plant has since been introduced into Southern Europe, and many parts of Africa, Asia, and America, where it has now become naturalized. Specimens may also be now commonly seen in this country, where, however, except perhaps in the West of Ireland and Cornwall, it cannot support the winter without shelter. It has even flowered in the open air at Wexford. But it is very sensitive to frost, so that even throughout the South of Europe, where it flowers and fruits abundantly, and even produces ripe seed, it is sometimes cut off by frost.

Subsequently to M. Ramel's notice of the antimalarial influence of this tree, many physicians have borne testimony to the febrifugal properties of its bark and leaves when administered internally, and of other valuable properties and uses of this and other species of *Eucalyptus*; so that it is especially important that it should be brought under the notice of the Pharmaceutical Society. We commence, therefore, by referring generally to the botanical characters of the genus.

Botany.—The genus *Eucalyptus* belongs to the natural order *Myrtaceæ* of botanists, the same order to which belongs the Myrtle, the Clove tree, the Pimento or Allspice, the Cajuput-oil plant, the Pomegranate, and many other plants, which are well known as ornamental trees or shrubs, or for their timber, or from yielding various valuable medicinal and economic substances. All the *Eucalypti*, of which there are about 150 species,† with the exception of a very few, and, in some cases, doubtful species, are natives of Australia, where they are commonly known either as "gum trees," from yielding what are usually described as gummy or resinous products, or as "stringy-bark trees," from their rough fibrous barks. Various other local names are also applied to the different species by the colonists in Australia, such as "blue," "red," and "white" gum, peppermint, turpentine, iron-bark, etc. All the species have evergreen leaves, which (like those of certain species of *Acacia* and other trees that are natives of Australia) after the trees have arrived at a few years of age, in consequence of the twisting of their petioles, hang in an oblique or even vertical direction from the branches, and thus give a very peculiar aspect to the forests of Australia by the differences in the light and shade produced by such trees from those of forests generally in other parts of the world. The leaves, like those of the myrtle, orange, rue, and numerous other plants, are studded with internal glands or receptacles of strongly scented volatile oils, as may be seen by holding them up before the eye so as to allow the light to shine through them, when they present a semi-transparent dotted appearance. The flowers, which are usually pinkish or white, are frequently very beautiful. These flowers, when fully expanded and white, much resemble those of the myrtle, but are at once distinguished from them by the absence of petals; and in the bud state by their peculiar calyx, which is closed at the top by a little lid, which is thrown off as the flower expands. This little lid, which is technically known under the name of operculum, is generally regarded to represent the petals soldered together and much modified. It is from this lid that the name of the genus is derived as follows:—ευ, well, and καλυπτός, covered. The stamens are very numerous. The fruit, which consists essentially of the hardened and enlarged calyx tube and disk enclosing the capsule, is somewhat globular or tubular; it contains a large number of seeds. These are generally extremely minute; thus, according to Mueller, one ounce of the seed of the *Eucalyptus globulus* tree contains over 10,000 seeds, and a similar weight of another species more than double that number, and thus, provided all germinated, from one pound of the seeds of *Eucalyptus globulus*, nearly 162,000 plants could be raised. Mueller has also stated that if even the seedlings of one quarter of the seeds of one pound were finally established, they would suffice to "cover 404 acres of ground, assuming that we planted at the rate of 100 trees to the acre."

We now pass to the more particular description of *Eucalyptus globulus*.* This plant is commonly known in Australia as the "blue gum tree." As already noticed, it is a native of Tasmania and of parts of the mainland of Australia, its favourite situations being damp slopes of valleys with a southern aspect. The foliage presents in a remarkable degree the changing aspect so noticeable in the species generally. Thus in young plants the leaves are opposite, on short straight stalks, placed horizontally, and of a very pale greenish-blue almost white colour; but on the full grown tree they are alternate, with stalks about an inch long, and twisted half way round, so that the blades which are then sickle-shaped, hang vertically or somewhat obliquely on the tree, instead of horizontally. These leaves are also of a dull green colour. The flowers, which are large and axillary, and almost sessile, are solitary, or in clusters of two or three crowded closely together; and in the bud-state they are covered by the lid or operculum of the calyx, which separates entire from the calyx-tube at the flowering period. The specific name is derived from *globulus*, a little ball,

* Lecture delivered before the Pharmaceutical Society, April 17, 1878.

† Baron Mueller is now preparing for the press an illustrated work on the genus *Eucalyptus*.

* For a coloured figure and full botanical description of this plant, see Bentley and Trimen's 'Medicinal Plants,' · a 15, tab. 109.

from the button-like form of the fruit; or from the somewhat rounded character of the operculum.

Growth.—One of the most remarkable facts connected with this plant is the extraordinary rapidity of its growth, both in height and girth of stem. It has been well said "that any man in twenty years time, could find himself, if he chose, surrounded by a forest of his own planting." This may be illustrated by numerous examples of its growth. Thus, M. Raveret-Wattel says,that a tree "of ten years old, ordinarily presents the development of a well-grown oak of a century, and it is not rare to meet in Australia with specimens in their fiftieth year from 160 to nearly 200 feet high, and 50 to 60 feet in circumference at the base."

These statements are also fully confirmed by the rapid growth of the Eucalyptus trees in Spain, Algeria, Italy, and other parts of the globe, which are suitable for their development. Thus, in the neighbourhood of Mentone, as it appears from the following extract of a letter to the late Daniel Hanbury from his brother, in reply to one written at my request in 1874, that, "In a good soil with a moderate amount of moisture the growth of the *Eucalyptus globulus* is astonishingly rapid. In the ground of the Palazzo Orango, four miles east of Mentone, there is a specimen which was planted in March, 1869 (this is just five years ago), being then a seedling of about three feet high. This tree was measured a few days ago, when it was found to be forty-eight feet high, with a trunk having a circumference of three feet at a yard above the ground." Mr. Frederick Janson Hanbury, who has recently been on a visit in the same district, says that many trees in Mr. Hanbury's garden at Mortola must now be at least seventy feet high. A pupil of mine, Mr. Hardwick, now at San Remo, in a recent letter to another pupil, Mr. R. H. Parker, also states, that trees which were planted there twelve years ago are now eighty feet high.

As might be expected, a tree which grows with such marvellous rapidity, frequently attains to a great height, very commonly over two hundred feet, or about the height of the Monument near London Bridge. In some cases it even reaches over three hundred feet, and in one instance a tree has been known to attain the colossal dimensions of three hundred and fifty feet in height, and one hundred feet in circumference; thus rivalling in these respects the Mammoth Pine of Oregon (*Wellingtonia gigantea*). There is no question that with the doubtful exception of this tree it excels in dimensions any tree in the world; and as it appears from recent measurement that the height of the *Wellingtonia gigantea*, Lind., has been much exaggerated, it may ultimately be proved to be the tallest of all trees.

A tree of such rapidity of growth and beauty, independently of its important properties and uses, to be presently noticed, has naturally excited much interest, and it has now become naturalized in various parts of Europe, Asia, Africa, and America, so that in many parts the aspect of the country has been entirely altered. It has recently been planted along the line of the Central Pacific Railway, the company of which has arranged to have 40,000 trees set along the five hundred miles of their right of way. This is only the first instalment, as it will require about 800,000 trees for the five hundred miles of valley where they are to be cultivated. The important object sought to be gained by planting this tree on such a large scale is to increase the humidity of the region, and lessen its liability to droughts. It is well known that the deficiency of forest trees over large tracts of country has a most injurious effect on the climate; hence should the conditions be found favourable in this part of the world, which we very much fear, for its growth, we anticipate very important results from this new application of a now celebrated tree. But we must proceed, as far as time will allow, to refer generally to the properties and uses of this tree, as well as incidentally to those of other species of Eucalyptus.

Properties and Uses.—The first and most important influence which the *Eucalyptus globulus* is now commonly said to exert, and that which has brought it more especially into notice, is its power of improving miasmatic climates by destroying the paludal miasm which causes fever in such districts; from which circumstance it has been called "the fever-destroying tree."

Its influence in this respect was first noticed in its native country Australia, and evidence to the same effect has now been obtained from all parts of the world where it has been introduced, and which are favourable to its growth. Thus, in Algeria, where it has been tried on a large scale, and in Spain, districts previously noted for their pestilential air, and consequent prevalence of fever, have now become quite free from disease. At the Cape also, in a very few years, its cultivation has completely changed the climatic condition of the unhealthy parts of that colony; thus, in the neighbourhood of Constantia especially, it has been stated that a noted fever spot, which was covered with marsh water, both in winter and summer, has in five years been dried up by the planting of 14,000 of these trees, and the inhabitants now enjoy excellent health. In Cuba again, marsh diseases are fast disappearing from the unhealthy districts where this tree has been introduced. An interesting statement to the same effect has recently also been reported from Italy, where the planting of some Eucalyptus trees, which in six years had grown to a height of over thirty feet, had rendered healthy a part of the Campagna, which had hitherto been regarded as the most fever stricken part of that unhealthy district. The tree has now been planted to a large extent in Italy, and hopes are entertained that in a few years malaria will be as effectively expelled from that country as ague has been from Lincolnshire. The testimony in favour of its anti-malarial influence is so strong that, allowing for exaggeration in some cases, it can scarcely be doubted that this tree does produce a most beneficial effect by destroying the fever-producing miasm of marshy districts; and that it should consequently be introduced into all countries and districts where the climatic influences are favourable for its development, and where such miasmatic emanations are to be found.

The influence of the Eucalyptus in this respect is commonly regarded as being serviceable in two ways. First, by the far spreading roots of this gigantic tree pumping up water as it were, and thus draining the soil; and secondly, by the odorous emanations from its leaves having a disinfectant and antiseptic influence on the paludal miasm. The influence of the latter has been generally supposed to be but small, but in a lecture on the Eucalyptus, which I delivered at the Royal Botanic Gardens in Regent's Park, four years ago, I then stated my reasons for believing that the emanations from the leaves of groves of Eucalyptus had some influence in destroying marshy miasms, and thus improving the healthiness of the district. Since then the very interesting investigations of Kingzett have proved that under the influence of air and moisture, both peroxide of hydrogen and camphoric acid are formed from volatile oils, the former a powerful disinfectant, and the latter an antiseptic; and hence I think there can now be no doubt, that the healthy influence of Eucalyptus trees is, to some extent at least, and probably more than we imagine, due to the volatile emanations from the leaves under the influence of air and moisture, possessing direct disinfectant and antiseptic properties and thus destroying the injurious effects of paludal miasms.

Another circumstance which has an important bearing upon the antiseptic properties of the leaves of Eucalyptus is that the *eucalyptol* of Cloez, the chief constituent of the volatile oil contained in the leaves, has been recently proved to possess great antiseptic properties.

The greatest influence is, however, in my opinion, produced by the power the roots possess of absorbing water from the soil. It is stated that a moderate sized Eucalyptus tree absorbs as much as ten times its weight of water from the soil; and hence, allowing for exaggeration, the enormous suction power of large plantations of such trees may in some degree be judged of; so that when thickly planted in marshy places, "the subsoil is drained in a little while as though by extensive piping." That the main influence of Eucalyptus trees is thus due to the absorptive power of the roots is also borne out by the fact that other plants of rapid growth, when planted in marshy districts, have a sensible effect in diminishing their malarial influence. This is notably the case with the Sunflower, which is grown for this purpose to a large extent in the swampy regions of the Punjaub and other parts of the world; and the effect has been that districts which were previously remarkable for their insalubrity are now reported to be entirely free from miasmatic fever.

We must now leave this interesting subject and proceed to allude briefly to the other properties and uses of this tree and of other species of *Eucalyptus*.

In the first place we may refer to the essential oils, which are obtained in large quantities by aqueous distillation from the leaves of the *Eucalypti*. This oil is stored up in the pellucid glands already referred to as contained in the leaves, and readily observed when they are held up to the light, by the semi-transparent appearance they then exhibit. These oils are now prepared on a large scale, and form an important article of commerce between this country and Australia. They have generally a somewhat camphoraceous smell, but the odour differs much in the various species; thus, that of the *Eucalyptus globulus* is by no means agreeable in its concentrated state, while that of *E. citriodora* has a pleasant citron-like odour. Most of the oils as imported have a yellowish colour, although others are somewhat blue, but when redistilled they are all nearly colourless.

These oils have been employed for various purposes; thus, that of *Eucalyptus oleosa* as a solvent for resins is much used in the preparation of varnishes; but they are also of value for diluting the more delicate essential oils which are used in perfumery. Mr. Rimmel has especially recommended them for this purpose, and specimens of soaps and other substances thus scented are now exhibited. The oils more especially recommended on this account are those of *Eucalyptus amygdalina*, *E. globulus*, and *E. citriodora*.

A recent application of the oil of *Eucalyptus globulus* is also by Mr. Rimmel, who has introduced what he has termed an "Aromatic Ozonizer," and which he recommends as a *pleasant disinfectant*. It is in the form of a coarse powder, composed, I am informed, of pine-wood saw-dust, through which is diffused the oil of eucalyptus, and also the oils of lavender, rosemary, and thyme. I have tried it for some time in my library and elsewhere, and it certainly communicates an agreeable freshness and pleasant odour to the air of the rooms. It has also been elsewhere stated that an excellent disinfectant may be made by adding from one to four ounces of eucalyptus oil to a bushel of deal saw-dust.

Eucalyptus oil has also been used as an external application for similar purposes as that of cajuput oil, but it is far inferior to it in value.

From the quantity of oil contained in the leaves of *Eucalyptus globulus*, they yield, when burned, a very large proportion of gas; and it is stated that one of the towns in the gold regions of Australia was for a long time lighted by gas thus obtained. The oil thus derived is said to produce a very brilliant flame; and as much as 10,000 cubic feet have been obtained from a ton of leaves. But the expense of collecting these leaves in a country where labour is so costly, appears to have proved a barrier to its employment, except under altogether exceptional circumstances.

This oil is by far the most important constituent of the leaves. Its principal constituent was found by Cloëz, some years since, to be a colourless liquid, which he regarded as analagous to camphor, and to which he gave the name of *eucalyptol*. This has been recently shown to be a mixture of at least two hydrocarbons, a *terpene* and *cymene*, and an oxidized substance.

It was formerly imagined that eucalyptus leaves also contained quinia, or some one or more of the other well-known alkaloids of cinchona barks. But the experiments of Broughton entirely disprove this; for upon careful examination of the leaves and likewise of the bark, this chemist states that neither quinia, nor any of the other alkaloids of cinchona barks, as quinidia, cinchonia, or cinchonidia, exist in any proportion.

The timber of several species of Eucalyptus is remarkable for its solidity, hardness, and durability; it has also great power in resisting the attacks of insects and the teredo, and the influence of moisture. Moreover, this plant, as recently noticed by Sir Joseph D. Hooker, "seems to be proof against parasitic plants; the bark being deciduous causes the seeds of any parasite to be dislodged before they have time to germinate and so obtain a footing in the tissues of the plant." So that, as Sir Joseph Hooker says, in countries not too hot for its growth, "its timber will probably turn out to be extremely useful." This plant is, however, not always protected from parasites, as may be seen by the interesting specimen on the table, of a piece of the stem of Eucalyptus, from which the parasitic Loranthus is growing, and for which I am indebted to Mr. Holmes.

The great length of the planks that may be obtained from this tree is another important element in its favour. Thus, as it commonly does not send out a branch until the trunk is 100 feet high, in many cases, planks of this wood have been cut of one hundred and sixty feet in length, twenty inches broad, and six inches in thickness; and larger planks may be obtained, for in 1855, a plank was prepared for the Paris Exposition, but no vessel could be found capable of conveying it to Europe. These qualities render the timber especially valuable for ship building, railway sleepers, maritime works, and where beams of great span are required, and for numerous other purposes.

Baron von Mueller has also shown that the ashes of the wood of the species of Eucalyptus contain a very large proportion of potash. Their richness in this respect may be estimated from the fact that while the produce from the ashes of the Elm and Maple, which are the trees most esteemed for this purpose in America, is estimated at about 10 per cent., the ashes of the Eucalyptus yield as much as 21 per cent. of potash.

The barks of various species of Eucalyptus have also been applied to useful purposes. Thus, in the *first place*, they are extensively used for tanning and dyeing; and they owe their value in these respects to the presence of similar constituents to those contained in oak bark and other substances commonly employed for such purposes in this and other countries. *Secondly*, the barks of many species may be used in paper making. Several specimens of packing and printing papers thus prepared are now exhibited, as also a specimen of writing paper from the bark of one species.

A number of species of Eucalyptus also exude a very astringent substance, which, from its resemblance to the ordinary medicinal kino, is commonly designated as *Australian*, *Botany Bay*, or *Eucalyptus Kino*. This substance, which, when it first exudes, trickles like blood down the bark of the trees in a semi-fluid state, ultimately hardens into dark red shining masses, which have a very astringent taste. It is employed for similar medicinal purposes as our official kino, and also for tanning, dyeing, and other important purposes.

Another substance called Australian or Eucalyptus Manna is also yielded by one or more species of Eucalyptus. This manna is usually in small, rounded, opaque, whitish masses, which have an agreeable sweet taste. In its action it is similar to the ordinary manna used in this country; it contains a peculiar kind of sugar, called *melitose*. It exudes abundantly during the summer months through punctures or wounds made in the leaves and young bark. As it exudes it hardens, and drops from the leaves on to the ground in pieces which are sometimes as large as an almond.

We have now, in conclusion, to allude very briefly to the medicinal properties of the *Eucalyptus globulus*. So many medical practitioners have testified to the febrifugal properties of the leaves that their value in the treatment of intermittent fever can scarcely be doubted. In Australia also, and in some other districts where the plant has been introduced, the leaves have long had a popular reputation in the treatment of fevers. Their antiperiodic properties are, however, far less manifest than those of cinchona barks, and some of the exaggerated statements that have been made in reference to the efficiency of the leaves appear to have arisen under the mistaken impression of their containing one or more of the alkaloids of cinchona barks. The bark is also said to possess similar properties in this respect to the leaves. Several preparations of both bark and leaves, such as the tincture, fluid extract, syrup, extract, lozenges, pills, and many others, are now exhibited; but the best form of administration is probably the alcoholic tincture. Eucalyptus leaves have been likewise used for their stimulant and antispasmodic properties. The tincture has been especially recommended in bronchitis; and in the form of cigarettes the leaves are now frequently smoked, and are reputed when thus used to be efficacious in asthma, whooping cough, bronchitis, and other affections.

The preparations of eucalyptus have also been used with success in other affections; and lately a new method of dressing wounds, by using eucalyptus leaves instead of lint, has likewise been recommended. The leaves are simply laid on the wounds; and it is said that their balsamic nature not only cures, but also removes all the unpleasant odour.

It should be especially noticed that in making preparations of eucalyptus leaves, the narrow, somewhat sickle-shaped ones which are obtained from the full-grown tree, should alone be used, as it has been proved that these are more efficacious than the broader leaves which are derived from the young plant.

Another popular use to which this now celebrated plant has lately been applied is to suspend a branch over a restless sleeper, or to place some leaves under the pillow, when it is said to produce sleep.

After numerous other illustrations of the products of the *Eucalypti*, Professor Bentley concluded by saying, that having given a general sketch of the properties and uses of the various species of *Eucalyptus* and more especially of those of *Eucalyptus globulus*; that when we regard the beauty of the different species, the proved influence of *Eucalyptus globulus* in destroying the pestilential character of marshy districts, and the numerous important economic and medicinal products which the Eucalypti yield, it must be admitted, after allowing for much exaggeration, that the genus was one of the most important to man in the vegetable kingdom.

NOTE ON THE WAX CONTAINED IN THE LEAVES OF ILEX PARAGUAYENSIS.*

BY P. N. ARATA.

When the solution obtained by exhausting *Ilex paraguayensis* with ether, or better with ether-alcohol, is treated with lime, filtered and evaporated, it leaves a fatty residue, resembling wax. It was freed from chlorophyll by treating its ethereal solution with animal charcoal; the ethereal solution was then agitated with water, to remove caffeine and other substances, and on evaporation left the pure waxy matter. When boiled with an aqueous solution of potassium hydrate, this was partly dissolved, leaving a residue soluble in ether, and much more butyraceous than the original substance. This was separated by treatment with alcohol into an insoluble portion, transparent, and of a yellow colour, and a soluble portion, which is white, and melts at 55° C.

On neutralizing with hydrochloric acid the alkaline solution obtained by saponification of the wax, a white precipitate is produced, which has acid properties, and is soluble in ether and in boiling alcohol. It melts at 105—110°, and has a density of ·8151 at 26°. From the results of the analyses it does not appear to belong to the acetic series, but its molecular weight is very high. The author proposes to call it *mateeric acid.*

THE COUNCIL REPORT.

THE month of May, which brings with it a general aspect of revival in external nature, and a stimulus to encounter the labours of human life, is a period at which similar influences are exercised in regard to pharmaceutical affairs, for it is not only the time at which various agreeable reunions take place, but what is even more important, the time when the executive body, which may be termed the Parliament of Pharmacy, is to a great extent reconstituted and empowered to carry on for the ensuing twelve months the general government of the trade.

Within another ten days those members of the trade who possess the right to vote for members of Council will have been called upon to exercise that privilege, and by so doing to contribute their share towards the realization of the objects for which the organization of pharmacy was attempted by the formation of the Pharmaceutical Society and by the passing of the Pharmacy Acts. It will be no news to our readers that on the present occasion the system of issuing addresses to the electors has been carried out more extensively than has hitherto been the case when the only opportunity of taking this course was obstructed by considerations of "tariff." Another medium has now appeared in the shape of the Birmingham Association, the latest development of pharmaceutical organization, and a number of prominent members of this body have undertaken to relieve electors from the trouble of judging for themselves whom they should vote for by nominating three out of the fourteen candidates who have to be elected.

We do not pretend to question the propriety of this course any more than we question the desirability of the individual elector knowing something of the opinions and business qualifications of the candidates he votes for, and looking back to the past we venture to hope that one result of the system which is becoming more general will be that of exciting greater interest in the election of the representative body. Hitherto there has been great reason for regret that the number of votes recorded is far from being so large as it should be in proportion to the number who have a right to vote.

In some quarters also further benefits are anticipated to result from the electioneering influence which the Birmingham Association aspires to exercise, and we understand that many entertain a hope that the winter of their discontent may be made glorious summer by this agency.

In addition to the addresses of candidates for election as members of Council there are at the present time being issued several other documents which call for the attentive consideration of all who desire to exercise their functions as electors. First in importance among these may be mentioned the report of the Council, a printed copy of which will be sent with this number of the Journal to every member of the Society and to every associate in business, numbering between three and four thousand. The subjects it treats of as having been under consideration during the past year comprise many of importance to the trade, which we will briefly recapitulate. First it shows that the financial position of the Society is increasing in strength. As regards the examinations there has been an increase in the number of candidates for various grades, which does not confirm the apprehension entertained by some that these examinations operate as a barrier to those who would enter the trade, and though the considerable number of failures to pass have been a subject for regret they do not appear to have been inconsistent with a due regard to that primary "trade interest," the maintenance of a fit standard of competence.

The Library, the Museum, the Evening Meetings of the Society and the attendance upon the classes of the School of Pharmacy are all represented in the report as presenting evidence of satisfactory progress, and the efforts of students to avail themselves of these opportunities for improvement have been as marked as their general good conduct.

In the retrospect of legislative matters affecting pharmacy mention is made of the successful action of the Council in obtaining the withdrawal of the Medical Act Amendment Bill during the last session of Parliament and in securing in the present Bill the absence of any provisions injurious to chemists and druggists. This and the equally successful result of the objections made by the Council to the proposed restriction of dental practice show that the Council has rendered substantial service in the protection of "trade interests," while in regard to the abnormally stimulated action of the Society of Apothecaries in opposition to "counter practice" by chemists and druggists, the Council, while adhering to the principle that the Pharmaceutical Society should not encourage the practice of medicine by its members, has obtained from the Society of Apothecaries a satisfactory assurance that simple counter practice by chemists and druggists will not be interfered with.

In the enforcement of the provisions of the Pharmacy Act it has generally been found unnecessary to incur the expense of legal proceedings inasmuch as the discontinuance of the offences complained of has been secured by simpler means.

The possible need of amendments in the Pharmacy Act has engaged the attention of a standing Committee of the Council during the past year, and its report has been accepted as a basis for action when a suitable opportunity offers.

Among the legislative matters which are still undecided, attention is drawn in the report to the Weights and Measures Bill as being of considerable importance to the trade, and the female question is mentioned as likely to come before the annual meeting of the Society.

Lastly the work of the Council in reference to the Benevolent Fund is summarized, and we regret to find that there is still occasion to point out that though all chemists and druggists on the register are eligible to receive aid in case of need, the number contributing to the Fund bears a very small proportion to the number on the register.

THE PRELIMINARY EXAMINATION.

THOSE of our readers who have taken an interest in the recently revived discussion respecting the Preliminary examination will do well to read an extract from a report made by the examiner who conducted the Society's last Preliminary examination on behalf of the College of Preceptors, which is printed on p. 872. It will be found that while not quite devoid of subjects for congratulation, it also makes clearly manifest some of those baleful influences against which examiners have to contend.

It will be seen, for instance, how the limitation of the area from which the Latin excerpts for translation are to be drawn appears to foster "cram" in its very worst form. It has been argued that this opprobrious epithet is often unfairly applied to the acquisition of information which is valuable in itself, and this may perhaps be admitted, with the qualification that the object sought being the ability to answer certain expected questions, the information has a superficiality that robs it of much of its value, whilst the proceeding being generally tainted with an intention to deceive is therefore demoralizing. But when a man who is to be tested in his knowledge of a language commits to memory beforehand somebody else's translation of the possible test passages, trusting that some feature in the one chosen will enable him to recognize it and quote from memory the appropriate translation, not only is the information acquired of no practical service, but the proceeding becomes increasingly demoralizing and dishonest. It has been suspected that the occasional superiority of the translation compared to the answers to the grammatical questions might find an explanation in this way, and this is confirmed by the fact that, as in the ludicrous illustration given, sometimes when what may be termed a colourless passage is given, the candidate fails to find his clue and is betrayed into giving a translation of another part of the book.

Another painful subject referred to is that in several instances there have been indications of copying, and in one case this has amounted to a certainty which appears to have been appropriately dealt with by the Board of Examiners. It is one disagreeable fact that young men seeking to enter an honourable calling should act dishonourably on its very threshold; it is another to find that gentlemen who, in consequence of the possibility that such action may be attempted, undertake duties of supervision do, in some cases, so far neglect them as still to leave the temptation in the candidates' way.

As has before been intimated, arithmetic is *the* weak subject, more than 75 per cent. having failed to answer rightly a simple question; not one on the metric system, which some think to be the chief stumbling block, but one given to test accuracy of work.

It is, however, a pleasure to find that compared with three previous occasions, there has been marked improvement in all three subjects. Nor do we think at all unsatisfactory the result from the unexpected, and perhaps somewhat unwarranted, introduction of sentences to be retranslated into Latin.

ARSENICAL VIOLET POWDER (?).

WE have watched with no little interest during the last two weeks for the appearance of some report in the daily papers of proceedings against the sellers of arsenicated violet powder, who, to judge from the statements that have appeared in the *Lancet*, and in some other papers, are neither few nor far between. But though the public was positively assured that numerous deaths of children in the neighbourhood of London were attributable to the application of violet powder containing arsenic, and though this inference was glibly accounted for by the fact that white arsenic is cheaper than starch, we have been unable to learn that any prosecution has been instituted against persons for the sale of such an abominably adulterated article. This circumstance would seem to indicate a very reprehensible degree of negligence, for the statements made in the *Lancet* of the 20th of April, convey the impression that there was even then no lack of knowledge of such details as would be sufficient to justify a prosecution. In the editorial paragraph referring to this matter in our medical contemporary, it is unreservedly stated that "a very serious and extensively fatal series of instances in which poisoning has resulted from the unsuspecting use of powder publicly sold as harmless and proved to contain arsenious acid, has occurred near London," and if there be any adequate grounds for such an alarming statement we are at a loss to conceive why they have not been made use of in a more legitimate manner to put a stop to such an evil as is alleged to exist than by the mere publication of a vague sensational paragraph. We are equally at a loss to reconcile with the words we have quoted the concluding passage of the sentence in the *Lancet's* paragraph, to the effect that this alleged adulteration "is now under official investigation."

As the matter stands it would be out of place to enter into any argument as to the probability of such an article as white arsenic being used to adulterate violet powder, but we must protest against the disregard of public duty manifested by those who profess to be in possession of the evidence that would suffice for the punishment of offenders against the law and for the preservation of the public from a serious danger.

BOTANICAL LECTURES AND DEMONSTRATIONS AT THE GARDENS OF THE ROYAL BOTANIC SOCIETY.

IT will be seen by reference to the advertisement of the School of Pharmacy of the Pharmaceutical Society of Great Britain, that Professor BENTLEY will commence his course of lectures and demonstrations on systematic and practical botany, at the Gardens of the Royal Botanic Society, in the Regent's Park, on Saturday morning, May 11, at 8 o'clock. These lectures will be continued on the succeeding Friday and Saturday mornings till the end of July.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, May 1, 1878.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present — Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Gostling, Greenish, Hampson, Hills, Owen, Robbins, Sandford and Shaw.

The minutes of the previous meeting were read and confirmed.

Professor Bentley's Lecture.

The President. having referred in eulogistic terms to the lecture lately delivered by Professor Bentley on *Eucalyptus globulus*, moved—

"That the best thanks of this Council be given to Professor Bentley for the lecture on *Eucalyptus globulus* which he delivered to the Society on April 17th last.

The Vice-President seconded the motion, and Mr. Sandford supported it, speaking in very high terms of the lecture.

The motion was carried unanimously.

Elections.

MEMBERS.

Pharmaceutical Chemists.

Barrow, Frank Arthur ....Dullingham.
Bayston, George Coryndon ......South Kensington.
Brown, George German ....Great Malvern.
Collinson, Frederick William...Alnwick.
Greenhill, Samuel Osborne ......Colchester.
Greenough, Hugh Fairhurst ...Warrington.
Hutton, Harry ....Compton Verney.
Heywood, John Henry............Lincoln.
Mead, Charles John...............Burnham.
Radford, Charles ....Sutton-in-Ashfield.
Rohan, Robert Aldor ....Mauritius.
Stephenson, George Herbert ...Beverley.
Tompsett, Leighton Stovold ...Bexley Heath.
Vernon, William Henry ....Derby.

Chemists and Druggists.

Douglas, Alexander ....Dunblane.
Gordon, William ....Aberdeen.
Rendle, Richard Hosking ......Ivybridge.

ASSOCIATES IN BUSINESS.

The following having passed their respective examinations, being in business on their own account and having tendered their subscriptions for the current year were elected "Associates in Business" of the Society:—

Minor.

Bell, John Waller ....Todmorden.
Bennett, Henry Charles ....Portwood.
Brasnett, Robert John............Erith.
Brumwell, William Preston ...Gateshead-on-Tyne.
Cattell, John Thomas ....Birmingham.
Clegg, Edmund.....................Eccles.
Crang, Walter ....Ilfracombe.
Edwards, George ....London.
Green, George ....Alford.
Hargreaves, Joseph ....Warrington.
Hodgson, Ralph ....Balham.
Holding, John ....Barnsbury.
Holmes, James Williams.........Hull.
Howe, Oliver George ....Liverpool.
Jones, William Nathanael ......Stoke Newington.
Law, Alfred ....Chelsea.
Lloyd, Rees ....Penyraig.
Marsh, William Henry ....Holloway.
Mence, William Cookes ....Surbiton.
Minett, Thomas Samuel ....London.
Mumford, Richard ....Cardiff.
Munday, John ....Bridgnorth.
Neale, Edgar........................Chippenham.
Ordish, Thomas .... New Normanton.
Richardson, George ....Hexham.
Ridley, Edward Henry ....London.
Smith, Robert Frazer ....Whiteinch.
Stubbs, Edwin ....Hull.
Thomas, Henry James ....Landore.
Vincent, Philip, jun. ....Fulham.
Warburton, William..............Ramsbottom.
Warrell, Edmund ....London.
Williams, Alfred Joseph ....Landport.
Wood, Henry.....................Gateacre.

Modified.

Batting, Thomas Gilbert.........Tunbridge Wells.
Bell, Matthew Whitelock ......Wandsworth.
Bradshaw, Charles Henry ......Hackney.
Brunton, William Walker ......Kensington.
Coates, George ....Halifax.
Jenkins, David......................Bridgend.
Pape, Tom..........................Helmsley.
Ramsey, Joseph ....Northwich.

ASSOCIATES.

The following having passed their respective examinations and tendered their subscriptions for the current year were elected "Associates" of the Society:—

Minor.

Aston, Walter ....Tarporley.
Barrat, Reuben......................Kingston-on-Thames
Bevan, William ....Ipswich.
Blaymire, Thomas Croskell......Kendal.
Bosher, Alexander ....London.
Broadhead, Richard...............Levenshulme.
Chalmers, John......................Newport, Salop.
Clayton, Christopher ....Caistor.
Cole, Samuel John ....Exeter.
Davies, John.........................Newcastle Emlyn.
Dawson, George Robert ....Southend.
Donaldson, James ....Edinburgh.
Glaisyer, Edmund ....Brighton.
Gravill, Edward Day ....Gainsborough.
Grimble, Albert ....Boston.
Holmes, Charles Newman ......Battersea.
Hunt, George ....Landport.
Hutton, William ....Portobello.
Jennings, Francis Rice ....Falmouth.
Jones, Charles Alfred ....Birkenhead.
Jones, Henry Stevens, jun.......Fulham.
Kent, Benjamin John ....Boston.
Leigh, Marshall ....Middlesborough.
McConnal, Alan ....Dudley.
Madeley, Edward Stanbury ...Barnes.
Metcalfe, John......................Bedale.
Nicholson, Charles ....York.
Parker, Thomas ....Preston.
Richards, William ....Nottingham.
Sadler, William, jun. ....Margate.
Sangster, John Graham ....Southsea.
Skelton, Thomas ....Maryport.
Sutcliffe, George Hargreaves ...Bacup.
Thomason, Thomas Watson ...Birmingham.
Walker, Charles Joseph ....London.
Whitrod, Henry Frederic ......Diss.

Modified.

Garrett, James Oliver ....Newport, Mon.

APPRENTICES OR STUDENTS.

The following having passed the Preliminary Examination were elected "Apprentices or Students" of the Society:—

Aspell, John Stanley	Douglas.
Baker, William	Leicester.
Barlow, Charles	Prescot.
Bennett, William	London.
Blachford, Jem	Bournemouth.
Blyth, William Brew Adam	St. Andrews.
Brown, Walter Howard	Halstead.
Bryant, Richard William	Swansea.
Coates, Udolphus Aylmer	Walsall.
Cooper, Frank Peacock	Nottingham.
Cotton, John	St. Helens.
Crowther, William Fearne	Beverley.
Davies, Arthur William	Hay.
Forret, John Alexander	St. Andrews,
Giddings, Alfred	Lancaster.
Grover, Sydney	Lower Norwood.
Hansford, Charles	London.
Hedley, Charles Alfred	South Shields.
Jeacock, Frederick Dawson	Alcester.
Job, Andrew Theaker	Clapham.
Joy, Francis John Jessopp	Cardiff.
Kennish, Thomas Looney	Whitehaven.
Kershaw, William Henry	Sale.
Lessel, Robert James	Dunecht.
Loxton, Frederick William	Dudley.
Marshall, Arthur Willis	Rusholme.
Miller, John	Strood.
Milne, Andrew Miller	London.
Monkton, George Joseph	London.
Ogden, Alfred	Radcliffe.
Parkes, Harry Charles	Fareham.
Phillips, John James	Hyde.
Pritchard, Edward Thomas	South Norwood.
Sankey, Joshua	Wellington.
Scowcroft, James	Bolton.
Shaw, Alfred James	London.
Smith, Albert Edward	Sudbury.
Smith, Arthur William	Redditch.
Soutter, James	York.
Stephens, David	Huddersfield.
Taylor, Henry	Stockport.
Walker, Benjamin	Yarm.
Wallace, John	Kelso.
Weatherley, Arthur	New Barnet.
Wildgoose, Thomas Downing	Dronfield.
Williamson, Henry	South Shields.
Willoughby, Arthur John	St. Leonards.
Worsley, William	Wigan.
Wride, Francis Blake	Shirley.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

The name of the following person was restored to the Register of Chemists and Druggists:—

William Briggs, 241, Jamaica Level, Bermondsey, S.E.

CONVERSAZIONE.—REFRESHMENTS.

The PRESIDENT informed the Council that since the last meeting of the Conversazione Committee the refreshment contractor at the South Kensington Museum had intimated that he should not open his refreshment rooms on the occasion of the conversazione unless the old plan were reverted to of paying a fee of one shilling per head for every person who entered the building. He had, however, offered the use of the refreshment room to any other contractor, but not of the kitchen arrangements. It seemed to him a question whether the Council should make an announcement that owing to circumstances not under its control no refreshments could be supplied, or whether the Lords of the Committee of Council on Education should be written to representing the inconvenience which would arise from this determination on the part of the contractor. It was now too late to abandon the conversazione, as the tickets had been issued.

A long conversation ensued, in which the opinion was unanimous that the Council should adhere to the principle it had already laid down, not to submit to what appeared to be an unjustifiable demand, and which course there was every reason to believe would be supported by other societies.

Ultimately it was resolved unanimously, on the motion of Mr. SANDFORD, seconded by Mr. BETTY—

> "That intimation having been given by the purveyor of refreshments at the South Kensington Museum that he will not open the refreshment room on the occasion of the conversazione unless a fee of one shilling per head be paid by the Society for each visitor entering the museum, the Council determine to hold the conversazione irrespective of this intimation."

It was further decided that the Committee should make the best arrangements possible under the circumstances.

PRELIMINARY EXAMINATION.

Candidates.

Examined.	Passed.	Failed.
324	181	143

Ten certificates received in lieu of this examination:—
5 College of Preceptors.
2 University of Cambridge.
1 University of Durham.
1 University of Oxford.
1 Faculty of Physicians and Surgeons of Glasgow.

EXTRACT FROM THE EXAMINER'S REPORT TO THE DEAN OF THE COLLEGE OF PRECEPTORS.

"I am pleased to be able to state that as compared with the work at these Examinations that has on previous occasions come under my notice there is a marked improvement in all three subjects; there are more papers that may be distinguished as very good, fewer as very bad, and the general average is higher.

"The Arithmetic is still the weak subject, and it is surprising to find how large a proportion (more than 75 per cent.) fail in a simple question given to test accuracy of work.

"It has sometimes been exceedingly unsatisfactory to have to award to a candidate for his perfect translation of the passage from Cæsar full marks, when his faulty answers to the grammatical questions have led one to suspect that he simply committed the English to memory and two or three words with which he has been familiar have given him the clue to the passage. Sometimes, indeed, a candidate fails to recognize the lines selected, and gives an excellent rendering of another portion of the book. An example of this occurs at this examination, when ———, a candidate from ———, gives this translation:—

Latin.	*English.*
"Nam etsi sine ullo periculo legionis delectæ cum equitatu prœlium fore videbat, tamen committendum non putabat, ut pulsis hostibus, dici posset eos ab se per fidem in colloquio circumventos.	"All these differ among themselves in language, in institutes and in law. The river Garum divide the Gauls from the Aquitanians and the Seine divide them from the Belgæ.

"To assist in detecting this cramming I this year introduced a question (5)* requiring three very easy sentences, translations from the Cæsar, to be re-translated into Latin; not with any idea of testing the power of the candidates to translate English into Latin, but to see how far they were acquainted with the construction of the Latin; and as this does not come strictly within the letter of the regulations I have taken care that no candidate has been prejudiced by imperfectly answering or even ignoring the question. The result has been exceedingly satisfactory; very few indeed have failed to attempt to construe these sentences, and about half succeeded very fairly.

"I regret to find that in several instances there are *indications* of copying, but as the evidence was not sufficiently clear to establish the case against them I have not thought it necessary to report the names, giving them the benefit of the doubt. But in one instance there is such clear evidence of copying and apparently of negligence on the part of the Superintendent that I have thought it my duty to draw your attention specially to it. The case is that of candidates ——— and ——— (the latter having copied from the former) of ——— where only two candidates were examined. I have set out in some detail the evidence of the copying for your satisfaction should any question arise with the authorities of the Pharmaceutical Society in connection with the case."

The PRESIDENT said everything tended to show that the Council would have to modify the system of centres. It was at the small centres, where only one or two candidates came up, that the irregularities occurred. He hoped that at the proper time the Council would see its way to make a change in this respect.

Mr. CHURCHILL thought superintendents might differ as to what would prevent copying, and therefore it would be well to define the distance which should separate the candidates.

THE DEPUTATION TO EDINBURGH.

A long and detailed report by the deputation from the Board of Examiners which recently visited Edinburgh was read, and it was resolved that the best thanks of the Council be given to the deputation for the same.

THE ANNUAL REPORT.

The annual report and financial statement as revised was adopted and ordered to be printed and circulated with the voting papers for the election of Council and Auditors.

* See before, p. 834.

REPORTS OF COMMITTEES.

FINANCE.

The report of this Committee, recommending sundry accounts for payment, was received and adopted.

BENEVOLENT FUND.

The report of this Committee included a recommendation of the following grants:—

£10 to the widow of an associate in business, having five children dependent on her.

£20 to the widow of a pharmaceutical chemist and life member. Applicant has eight children living, four entirely dependent upon her. The Secretary was also directed to suggest to the applicant the desirability of taking steps to procure the election of one of her children to an orphan asylum.

£5 to the daughter of a late annuitant.

£17 to the widow of a chemist and druggist, to be paid to a school in Belgium towards the education and clothing for one year of applicant's youngest child.

Mr. OWEN said he rather objected to the last item, inasmuch as if this were continued, as it probably would have to be, it would be a larger sum than had ever been paid by the Council in one case. He thought that it would be much better to get a child elected into an orphan asylum.

The PRESIDENT said this was only one way of distributing the Fund, and it appeared to him a very judicious mode of applying it.

Mr. OWEN said he had voted for the grant under protest, and he should be very happy if he were returned to the Council again to know that he might come before the Committee, and obtain an annual grant for the education of a child.

The PRESIDENT said every case should be treated on its own merits.

The report and recommendations were received and adopted.

LIBRARY, MUSEUM AND LABORATORY.

The report of this Committee included the Librarian's report, showing an average attendance in the Library for the previous month of 32 in the day; 13 in the evening. Circulation of books, in town, 166; country (23 places) 35. Carriage paid, 14*s.* 3*d.* He also reported the following donations to the library:—

'Proceedings of the American Pharmaceutical Association,' from the Association.

Cooley's 'Cyclopœdia of Practical Receipts.' 6th ed. Part 2. From the Publishers.

Payen's 'Industrial Chemistry.' Edited by Dr. B. H. Paul. From the Editor.

The Committee recommended the purchase of the following:—

General Fund:—

Thudichum and Dupré on 'Wine.'

Pasteur's 'Études sur le Vin.'

Mohr and Redwood's 'Practical Pharmacy' (to replace missing copy).

Hanbury Fund:—

Bentham and Mueller's 'Flora Australiensis.'

The Curator had reported the average attendance in the Museum to have been, day, 17; evening, 4. Also that the specimens exhibited at the last evening meeting, as well as a series of specimens illustrating the President's paper on "Salicylic Acid," had been presented to the museum. Also the following donations:—

Crystals of Biniodide of Mercury, from Mr. Mead; Fruit of Baobab Tree (*Adansonia digitata*); Root of *Pastinaca grandis*; Bulb of *Ledebouria hyacinthoides*; *Pachyma Cocos*; Chinese Insect Wax; Root of *Kæmpferia rotunda*; Root of *Valeriana Harwickii*; Root of Ammoniacum Plant; Chaulmoogra Seeds; and Oil Leaves (*Ricinus communis*), from M. Chantre; Cascarilla Moss

(*Parmelia perlata*), from Messrs. Hearon, Squire and Francis.

A letter had been received from the Rev. William Leay, M.A., Vicar of Downside, Bath, offering the Society for incorporation into the museum a collection of minerals brought by him from South America, forty years ago, and now lying in the British Museum. The Curator had been instructed to examine the specimens to see if they were suitable for the Museum.

The question of supplying reprints of papers read at the evening meetings had been further considered, and the Committee recommended that the authors of such papers, read either in London or Edinburgh, and published in the Journal, be each entitled to twenty-five copies of such papers, and that the Editor be instructed to supply them without waiting for application.

The Professors had reported favourably of their respective classes.

The Secretary had reported that he had received a copy of the Pharmaceutical Register of Victoria for the current year, and he had been instructed to thank the Honorary Secretary of the Society for the same.

Mr. Shaw said one portion of the minutes seemed to be a repetition of what took place last month with reference to the supplying of copies of papers read at London and Edinburgh. He then spoke in favour of the same privilege being extended to authors of papers read before provincial associations. He certainly thought the authors of such papers should have twenty-five copies if they requested them. Wherever a good active working association was in existence in the provinces, it should be enouraged as much as possible.

The President reminded Mr. Shaw that the question submitted to the Committee was confined to the papers read in London and Edinburgh. This was a different question, which Mr. Shaw was quite entitled to raise, but it must come before the Council separately.

Mr. Shaw said he was told on a former occasion that provincial associations would not be excluded, and if such were the case he should be satisfied. But he thought the Council might as well say yes or no at once to the very moderate request he was making.

Mr. Atkins said this matter arose out of a remonstrance by Mr. Mackay, who distinctly said he did not refer to provincial associations.

Mr. Betty was not aware that the subject of provincial associations was in question at all. He could as a member of the Committee assure Mr. Shaw that there was no desire to interfere with the privileges of country members.

Mr. Greenish said he understood Mr. Shaw simply to ask that any gentleman who read a paper at a provincial association, which was printed in the Journal, should be entitled, if he wished it, to twenty-five copies gratis. He thought this was a very reasonable request indeed, and if Mr. Shaw would bring forward a motion to that effect he would support him. If a paper were worth printing in the Journal it was worth giving copies of, and he would go further, and inform the authors what would be the cost of printing an extra number of the papers.

After some further conversation,

Mr. Shaw said he would let the matter rest for the present, and if it appeared necessary he would bring it forward at a future time.

The report and recommendations were then received and adopted.

HOUSE.

The report of this Committee included an estimate for the work to be done to the Society's premises during the recess, which the Committee recommended be adopted. It also recommended that certain additions to the furniture and fittings of the Editor's room be made.

The report and recommendations were received and adopted, and the Committee instructed to order such other work as was necessary.

LAW AND PARLIAMENTARY.

The report of the Committee included a letter from the Duke of Richmond, stating that the views of the Society with reference to the Medical Act Amendment Bill should receive his Grace's careful attention.

The Solicitor had sent his usual report of cases in hand, and several other matters relating to alleged infringement of the Pharmacy Act had been considered.

The Committee recommended that a letter, a draft of which was included in the report, should be sent to the President of the Medical Council, calling attention to the changes introduced into the Weights and Measures Bill, whereby the use of Apothecaries' weights and some of the Pharmacopœia measures would be rendered illegal, and even the possession of such weights and measures a punishable offence.

The report and recommendation were received and adopted.

The Sale of Vermin Killers.

The following communication from the Local Government Board was read by the Secretary—

"Local Government Board,
"Whitehall, S.W.,
"20*th April*, 1878.

"Sir,—I am directed by the Local Government Board to forward to you, for the information of the Pharmaceutical Society of Great Britain, the enclosed copy of a report recently forwarded to the Board, which was made by the public analyst for the borough of Penzance for the Michaelmas quarter of 1877.

"I am, sir,
"Your obedient servant,
"J. F. Rotton,
"*Assistant Secretary.*"

(Copy Report).

"Penzance Michaelmas Sessions, 1877.

"Report of the Public Analyst.

"To the Chairman and Magistrates of the borough of Penzance in quarter sessions assembled.

"Gentlemen,—I have to report that during the past quarter no samples of food, drink, or drugs have been brought me for analysis, under the provisions of the "Sale of Food and Drugs Act," from the borough of Penzance either by the police or the public.

"Although not strictly coming within the scope of my appointment, I would beg to call your attention to a matter of considerable importance which has come under my notice.

"On the 31st of July I received from a gentleman at St. Just, the body of a duck, one of nine which had died under very suspicious circumstances, and on analysing the intestines and contents, I found strychnine present.

"On the 28th August I received the stomach of a fine pig from the same gentleman, and in this I also found strychnine, which had no doubt been the cause of the animal's death.

"It appeared probable that this poison had been administered wilfully, and in order to discover the culprit I suggested that inquiries should be made of the druggists in Penzance as to who had purchased poisons within the last few months.

"This was done, but nothing could be learnt, since it appears the Penzance druggists are in the habit of selling vermin poisons containing strychnine without taking the names of the purchasers.

"I am informed that they do not sell arsenic without this precaution, which is ordered by Act of Parliament, but that the sale of mixtures containing the far more dangerous strychnine is practically unrestricted.

"Whether this is generally the case or not, I am unable to say, but I have felt it my duty to mention the facts related above.

"I am, gentlemen,

"Your obedient servant,

"J. H. COLLINS,

"*Public Analyst for the borough of Penzance.*"

To this communication the Secretary had written an acknowledgement, stating that he would bring the matter before the Council, and also calling attention to the 17th section of the Pharmacy Act, 1868.

Mr. SHAW said his practice always was to treat vermin killers, containing poisons mentioned in schedule 1, as requiring to be registered.

Mr. ATKINS said a serious charge was here brought against the whole body of chemists in Penzance. His friend Mr. Cracknell and himself were there together last summer, and found a considerable body of most respectable men carrying on business in that town, and he was hardly prepared to believe what was stated. There could be no doubt what their obligations were; they were called upon by law to register the sale of every vermin killer that contained strychnine, and to take the signature of the person to whom it was sold. That was personally, a matter of great inconvenience to him, particularly on market days, but he never allowed it to be omitted. Chemists and druggists were sometimes called upon to produce their registers to the police, as he had been only a short time since. He was surprised to hear such a sweeping assertion made that the whole of the chemists in Penzance were not in the habit of registering sales. He had heard in his neighbourhood of one or two men boasting they never did so, but the majority obeyed the law. He thought it was only right that this communication should be published in order that the chemists of Penzance might see what was said of them and have an opportunity of replying. With regard to arsenic chemists and druggists were placed in exceedingly difficult circumstances in the country. They registered all small sales of arsenic, but if a farmer sent for a half-hundredweight it was not the practice to require his signature, but to file his letter containing the order.

Mr. BETTY submitted that this report of a Penzance analyst had no *locus standi* before the Council at all. It was not the duty of the Council to respond to all these reports which were spread about. Here was a public analyst who had nothing to do, as he himself said, and who went out of his way to deal with matters not belonging to him, and send up a report that a pig and a duck had been poisoned. It was not just to pay attention to statements of that sort.

The PRESIDENT reminded Mr. Betty that the Local Government Board considered the communication of sufficient importance to send it on to the Council.

Mr. BETTY was sorry to find the Government thought it necessary to send the Council a report that a pig and a duck had been poisoned.

The PRESIDENT said the Government had sent the information that the druggists of Penzance were in the habit of selling poisons without registering the sales.

Mr. BETTY contended it was a vague charge without the slightest proof. His opinion was, the Council should send an answer to the effect, that any evidence of in-infringement of the Pharmacy Act would be considered by them, but that the Council could not take action without definite evidence. Supposing he said, "a great deal of crime prevails in London"; nobody could deny that, but it was not a statement on which any action could be taken.

The VICE-PRESIDENT said if he had a pig or a duck poisoned he should feel very indignant, and if he found that in the town he was living in the provisions of the Act of Parliament were not carried out, he should feel it his duty to look into the matter. That state of things had been represented to the Council, and he thought it ought to take some action so far as to intimate, if not directly to the chemists at Penzance, by publication in the Journal that such correspondence had taken place and pointing out the importance of complying with the Act of Parliament. After referring to a recent absurd report in the *Lancet* with regard to the adulteration of violet powder with arsenic, which had been copied into all the newspapers, and which in his own neighbourhood he had taken means to show the absurdity of, he said he thought there should be some notice taken of this communication.

Mr. HAMPSON thought the Council could not let the correspondence rest without an answer, but he understood the Secretary had already replied, as far as he could gather, very completely, to the effect that it lay in the hands of the police to discover and prosecute any breach of the law in this respect. He thought the discussion which had now taken place would of itself disseminate the information that certain accusations had been made, and no doubt that would call attention to the subject, which was all that was necessary.

Mr. CHURCHILL did not think it would be beneath the dignity of the Council to take proper notice of this matter. He thought it would be as well for the Secretary to write to the chemists at Penzance, saying that such a communication had been received, and asking for information. Unless something were done the public analyst might communicate with the police, which might make some of their brethren in Penzance feel extremely uncomfortable.

The PRESIDENT suggested that the Local Secretary be communicated with and his attention specially drawn to the report in the Journal.

Mr. GREENISH hoped this discussion would be published, so as to give the chemists at Penzance an opportunity of refuting the charge.

Mr. BETTY also suggested that a postscript should be added, that the Council would be glad to receive any reply the Local Secretary might make. He should be glad to get such a reply from Penzance, as it might be sent to the Local Government Board.

Mr. SANDFORD observed that the parties referred to might say they did not know the vermin powder contained strychnine. He himself never allowed these things to be sold without being entered in the poison register; but the sellers were not bound to know the composition of proprietary articles, and that might be mentioned in the answer to Mr. Rotton. There was evidence in the analyst's letter that these men did their duty in the matter of arsenic, and no doubt they would do so in the matter of strychnine also if they were aware of it.

Mr. ATKINS thought no chemist and druggist could plead ignorance as to the composition of Battle's vermin killer, for it had been mentioned repeatedly in criminal prosecutions, and Mr. Battle had himself given an intimation through the wholesale houses that it did contain strychnine and required registration. He should be perfectly content if this discussion were published in the Journal, as it would no doubt produce a reply, for he could scarcely believe the charge to be entirely true.

Mr. GOSTLING thought the subject should not be treated in the light manner in which Mr. Betty had dealt with it, but that the Local Secretary at Penzance should be communicated with. There was a certain amount of evidence, whether correct or otherwise, which had gone before the Government Department, and its truth should be ascertained. The Pharmaceutical Society was a body to which the safety of the public was committed in these matters, and he thought it was its duty when it heard a complaint of this kind to put itself in communication with the parties charged.

Mr. SHAW said the charge was uncorroborated, and under ordinary circumstances, the Council should not entertain it until it had more direct evidence. If it thought proper, the Local Secretary might be asked what was the practice, and if he should reply that it was the practice to enter the sales of these vermin killers, it would remove the onus from them; but otherwise he thought it would not be desirable to publish the matter in the Journal.

It was then moved by Mr. Cracknell, and seconded by Mr. Robbins :—

"That the communication from the Local Government Board be published in the Society's Journal, and that a copy of it be sent to each chemist in Penzance."

Mr. Bottle would much prefer that the chemists at Penzance should be communicated with through the Local Secretary before the matter was made public at all It seemed to him, upon the face of it, that the report was somewhat contradictory, because the public analyst said he had had no article of food or drug to analyse for a certain length of time. He did not know what views that gentleman held as to what was food, but in his neighbourhood they looked upon pigs and ducks as articles of food. His conviction was, that the vermin killer was used in its legitimate way, that the vermin were destroyed by its use, and that the pigs and ducks had swallowed the poisoned animals. He would move, as an amendment:—

"That the Local Secretary at Penzance be communicated with, with reference to this matter, before any public notice be taken of it."

Mr. Shaw seconded the amendment.

Mr. Hampson remarked that not long ago he saw an announcement on a bill of a proprietary article that vermin killer might be obtained through the post, so that it did not follow that the poison in question was supplied by a Penzance druggist.

Mr. Shaw said it might have been brought from London by a gentleman's gamekeeper, for large quantities of strychnine were used by that class of persons for the purpose of destroying weasels and other vermin which preyed upon game.

Mr. Betty saw no objection to the discussion being published. It was all very well to throw an accusation amongst them and then say they should keep it quiet. The moment it became a public accusation it was a public matter, and the parties charged should have an opportunity of rebutting the accusation. He did not think it at all probable that the Penzance chemists did not comply with the Pharmacy Act. He disliked an official wandering beyond his official office, and if the analyst had nothing to do, as he stated, he should not meddle with foreign affairs by making a sweeping charge. The least the Council could do was to make the affair as public as the act of a public man could make it, and give those whose conduct was arraigned every opportunity of publicly disclaiming it. If they were guilty, let them bear the blame, and if they were innocent let them show these public officials that they were not to throw dirt on members of the trade in that way. He hoped that the amendment would be withdrawn.

Mr. Sandford agreed that the discussion should be published, but he thought that the Council ought not to publish the letter until it had received permission from Mr. Rotton.

Mr. Gostling said the communication as soon as it was sent to the Society became public property.

After some further conversation, Mr. Bottle then withdrew his amendment and the motion was put and carried by a majority of seven to four in the following form:—

"That the communication from the Local Government Board be published in the Society's Journal."

Cochineal and Kino.

The Secretary then read a communication from the Colonial Office, enclosing one from the Secretary of State of the Bahamas asking information with regard to the preparation of cochineal and kino for export, and stated that the Curator had been instructed to make inquiries which he was now prosecuting.

Statute Law Revision.

The Secretary also read a letter he had received from the Statute Law Revision Committee, asking if any sections of the older Pharmacy Acts had now become obsolete. He stated that he would go carefully through the Acts and submit the results to the Law and Parliamentary Committee.

Meeting at Newcastle.

The Secretary also read a letter from the Local Secretary at Newcastle containing two resolutions which had been passed at a recent meeting of chemists in that town referring to the pending prosecution in relation to counter prescribing and to the labelling of proprietary medicines containing poison.

Notice of Motion for the Annual Meeting.

The Secretary read the following notice to be moved by Mr. Wade at the ensuing annual general meeting—

"That all persons being duly qualified (irrespective of sex) shall be eligible for admission into the Society in accordance with the bye-laws thereof, and this meeting is of opinion that ladies should not be excluded from participation in the privileges of the Society."

BOTANICAL PRIZE FOR 1879.

A Silver Council Medal is offered for the best Herbarium, collected in any part of the United Kingdom, between the first day of May, 1878, and the first day of June, 1879; and should there be more than one collection possessing such an amount of merit as to entitle the collector to reward, a second prize, consisting of a Bronze Medal, and also Certificates of Merit, will be given at the discretion of the Council. In the event of none of the collections possessing sufficient merit to justify the Council in awarding medals or certificates, none will be given.

Competitors must be Associates or Apprentices or Students of the Society, and under twenty-one years of age.

The collection must consist of phanerogamous plants and ferns, arranged according to the natural system of De Candolle, or any other natural method in common use, and be accompanied by lists, arranged according to the same method, with the species numbered.

The collector must follow some work on British botany (such as that of Babington or Hooker), and state the work he adopts. The name of each plant, its habitat, and the date of collection, must be stated on the paper on which it is preserved.

Each collection must be accompanied by a note, containing a declaration signed by the collector, and certified by his employer, or a pharmaceutical chemist to whom the collector is known, to the following effect:—The plants which accompany this note were collected by myself, between the first day of May, 1878, and the first day of June, 1879, and were named and arranged without any other assistance than that derived from books.

In estimating the merits of the collections, not only will the number of specimens be taken into account, but also their rarity or otherwise, and the manner in which they are preserved, and should a specimen be wrongly named, this will be erased from the list.

The collection must be forwarded to the Secretary of the Society, 17, Bloomsbury Square, on or before the first day of July, 1879, indorsed "Herbarium for Competition for the Botanical Prize." After the Prize Distribution in October, they will be retained one month, under the care of the Curator of the Museums, for the inspection of persons connected with the Society, and then returned to the collector, if required.

STATEMENT OF ATTENDANCE OF MEMBERS OF COUNCIL ON COMMITTEES FOR THE YEAR 1877-78.

	Committees held once a Month or oftener.		Committees held Occasionally.

Churchill, Walter John	12	Owen, John	9	Williams, John	11

Number of Council Meetings during the year, 12.

NORTH BRITISH BRANCH, EDINBURGH.

Annual Meeting.

The annual meeting of the North British Branch of the Pharmaceutical Society was held in the Society's Rooms, 119A, George Street, on Friday, 26th April, at 12 o'clock. Mr. J. B. Stephenson, President of the Branch, in the chair.

The President opened the meeting by asking the Honorary Secretary to read the—

Annual Report.

The Council of the North British Branch beg now to submit, as usual, the report of the proceedings of the Society in Edinburgh for the year 1877-78.

The operations and work of the Society continue to be carried on in the same rooms, and with equal satisfaction. Much inconvenience, however, is felt from the want of accommodation, which is gradually becoming more inadequate. Another room is urgently required in connection with the examinations, while nearly all the available wall-space is already occupied by the museum and library.

The rooms are still much frequented by candidates preparing for the Major and Minor examinations, and the arrangements made for these purposes are taken advantage of to a considerable extent. Attendance: day, 749; night, 313; total for the year, 1062; from the opening of the rooms, 5265.

With the concurrence of the London Council, opportunities have been afforded during the winter, by which two medical societies have been accommodated, one for monthly evening meetings and the other for occasional examinations. This arrangement has been found, however, to act prejudicially as regards pharmaceutical students and otherwise, and the Edinburgh Council have under their consideration the propriety of discontinuing it, and of reserving the rooms exclusively for the requirements of the Branch after the close of the present session. The London Council will, of course, be communicated with on the subject, and sufficient reasons given for asking them to concur in the view now proposed by the Council in Edinburgh.

The museum has had several presentations both of value and interest during the past year. Notably may be mentioned a stuffed musk deer from Mr. Howden, of Gracechurch Street, London, as well as several specimens of native drugs and other articles from Mr. Jamie, Singapore, who has in the same way on many previous occasions shown his warm interest in the progress of the Society in Scotland.

The library has also been enriched by the addition of a few valuable volumes, and the books are now taken advantage of to a fair extent. Number of books taken out during the year, 123.

The number of candidates presenting themselves for examination in Edinburgh during 1877, was as follows:—Preliminary, 49; Minor, 94; Major, 4; Modified, 8. The percentage of failures in the three latter was 33·5. The total number of examinations in Edinburgh was 13, of which 4 were Preliminary.

The special tickets issued by the Honorary Secretary to pharmaceutical students for full courses of chemistry, botany, and materia medica, were 19. It must be remembered that there were no separate courses in connection with pharmacy during the past session, and students were therefore left to the ordinary university and other lectures.

Very much has been said, and not a little written, about the continued large percentage of failures, not only in the Preliminary but also in the other examinations. The Council do not altogether concur in the outcry regarding the stringency of the first or classical examination. They think the questions, as put by the College of Preceptors, are, on the whole, fair and reasonable, and such as no duly educated lad should fail in answering. They believe, however, that the questions with relation to the metric system are probably one of the stumbling blocks with some of the defeated candidates, as this system has hardly yet taken its place in the ordinary course of education, at least in Scotland, and they further believe that when it does so take its place, which it is rapidly doing, the cause of complaint will disappear.

Regarding the remarks made as to the difference in the examinations between the London and Edinburgh Boards, the Council are glad to report that Edinburgh was recently honoured by a joint deputation from the London Council and Board of Examiners, and as those gentlemen remained in the rooms, and witnessed the whole system pursued by the examiners in Scotland, they had every opportunity of comparing notes, and forming an opinion, and it is believed they are satisfied that the very closest resemblance exists in the conduct of the examinations as carried on in London and Edinburgh.

The scientific meetings have been six in number, and the Council beg to thank those gentlemen who have so ably contributed papers on these occasions. It has afforded much satisfaction to find that all the meetings were well attended. A new feature in connection with one of them was an invitation from Professor Archer, of the Museum of Science and Art, to assemble in the Museum, where a very pleasant and instructive evening was spent, a notice of which appeared in the Journal.

The Council are glad to find that the Society has taken action in more than one instance of illegal trading in poisons. They are also pleased to know that there is every prospect of what may be called "legitimate prescribing" remaining undisturbed. They feel that while it may be a right and proper thing to discountenance medical and general practice by those who cannot be presumed to possess the requisite qualifications, yet it would militate very much against the interest of chemists, and be also a somewhat serious matter to the general public, if chemists were debarred from giving across the counter any simple medicine to relieve such cases as almost every hour of the day present themselves, and this seems to be the feeling of the apothecaries themselves, and the Council have the confident assurance that our Society will be prompt in resisting any uncalled for interference, by medical defence or other associations, with the legitimate position of dispensing chemists and druggists.

No new Bill has been applied for with the prospect of success, which had any clause considered antagonistic to the working of our Pharmacy Act. One or two such attempts have been made, but they may be only thus incidentally alluded to, as in every case representations made by the Society in London were at once responded to, and the objectionable clauses expunged, or the Bill itself withdrawn.

A Parliamentary Committee sits from time to time in Bloomsbury Square, and the Council here feel that it is not likely to overlook any opportunity which may occur to improve or extend the operations of the Pharmacy Act.

The same system in regard to the election of Council, and which has given satisfaction for a year or two back, has again been followed on this occasion, with the additional precaution of communicating direct with the nominees, so as to get from them a written concurrence to act in event of election.

Since this report was drawn up, the Council regret to learn that the select Parliamentary Committee on the Weights and Measures Bill have reported in favour of discontinuing the permission now granted to chemists to use the *scruple* and *drachm* weights. If this view is embodied in the Bill it will render illegal not only any sale effected by these weights, but also the mere possession of them, and even the use of the terms in any form whatever. The great inconvenience of having no intermediate denomination between the grain and ounce will be obvious at once, and it may be remembered that it was the practical experience of this that led the Medical Council in the 1867 edition of the Pharmacopœia to withdraw the prohibition of these weights, which they had laid down in the first edition of that work. The Council observe that the Parliamentary Committee of the Society in London have had their attention directed to the subject, and they cannot doubt but that, when representations are made in the proper quarter, the threatened interference will be averted.

Mr. Kinninmont in a few remarks expressed his sympathy with the paragraph in the report referring to the Weights and Measures Bill, and he was followed in the same strain by Messrs. Stephenson, Kemp and Mackay.

Mr. Gilmour commented on the examinations with particular reference to the questions put at the Preliminary examination, and while he expressed himself generally satisfied still he thought that some of the questions were not stated in a sufficiently distinct manner.

Mr. Young followed Mr. Gilmour on the same subject.

Mr. Mackay suggested that as Mr. Gilmour was one of the deputation appointed to be present at the examinations in London, in June, he thought *then* would be the proper time to get the matter thoroughly discussed.

Mr. H. C. Baildon moved the adoption of the report; the motion was seconded by Mr. Blanshard, and carried.

The Chairman then laid before the meeting the result of the voting for the new Council, which was tabulated in such a way that the audience could see at a glance the relative number of votes recorded. The following gentlemen had the highest numbers and were duly elected as Council for 1878–79 (the names are given alphabetically):—

Mr. William Ainslie	Edinburgh.
Mr. H. C. Baildon	„
Mr. George Blanshard	„
Mr. James Buchanan	„
Mr. Thomas Davison	Glasgow.
Mr. Daniel Frazer	„
Mr. Alexander Govan	St. Andrews.
Mr. William Gilmour	Edinburgh.
Mr. David Kemp	Portobello.
Mr. Alexander Kinninmont	Glasgow.
Mr. Alexander Napier	Edinburgh.
Mr. Alexander Noble	„
Mr. A. Seath	Dunfermline.
Mr. J. B. Stephenson	Edinburgh.
Mr. James R. Young	„

The Chairman said that 196 voting papers had been issued, and of these 93 were replied to. One paper was rejected as informal.

On the motion of Mr. Gilmour, Mr. J. B. Stephenson and Mr. A. Napier were unanimously re-elected as President and Vice-President.

Mr. Mackay was unanimously re-elected Honorary Secretary.

The following gentlemen were appointed Auditors for the year:—Messrs. Stephenson, Napier and Young.

Provincial Transactions.

GLASGOW CHEMISTS AND DRUGGISTS' ASSOCIATION.

Annual General Meeting.

The annual general meeting of this Association was held in the Manager's Library of Anderson's College, on Wednesday, the 1st inst. Mr. Daniel Frazer, President, in the chair. After the usual preliminaries had been gone over, the Secretary was called upon to read the annual report, of which the following is an abstract.

The report, in briefly referring to the work of the Association for the current session, stated that during the last summer a botany class, under the auspices of the Association, was conducted by the late lamented and talented Professer Keddie, F.R.S.E., for which 22 enrolled as members. For this summer, it has not been seen fit, owing to the many advantages already enjoyed in the city, to organize a subsidized botany class, but to recommend the one now and for so long carried on in connection with the Andersonian College.

The following classes were conducted during the winter months:—

Tutorial class opened November 12, and conducted two nights per week, by Mr. Archibald Fairlie, C.M., for which 26 entered, the average attendance being 14.

Theoretical chemistry, opened November 13, met once a week, conducted by Dr. Milne, 16 entered for this class, average attendance 8; 13 of these enrolled for the—

Practical chemistry class, also conducted by Dr. Milne, one night per week, the attendance at which was regular.

The library has, during the session, been largely patronized. The following books have been presented by the Council of the Pharmaceutical Society: 'The Calendar,' and the 'Catalogue of the Museum of the Pharmaceutical Society;' and one copy weekly of the *Pharmaceutical Journal*; the *Chemist and Druggist*, by the Proprietors; 'Year-Book of Pharmacy;' Hanbury's 'Science Papers' and 'Pharmacographia,' by the Executive of the Pharmaceutical Conference; and by Dr. Christe his exhaustive work on 'Cholera Epidemics in East Africa,' for all of which the thanks of the Association are due.

The price list committee have, during the session, made what slight alterations the fluctuations of the market demanded, and which have been generally adopted by the trade, but it is earnestly recommended that all should, as far as possible, adhere to the retail price list, which would tend to the mutual advantage of all, and avoid complaints on the part of the public.

The early closing committee, though at their work, have not yet fully accomplished their objects, and particular attention is drawn to their desire of uniformity of hours, the late hours observed by some neither tending to benefit themselves, the trade, nor the public.

The Council regret the loss of Mr. J. L. McMillan, secretary, and Mr. James Murdoch, librarian, owing to both having left the city last autumn; their places were filled by Mr. John Walker and Mr. W. McKenzie respectively.

In accordance with a resolution passed in November last, the Council of the Pharmaceutical Society was approached with reference to the high percentage of failures in Preliminary examinations, the burden of the reply to which may be found reported in the Journals for December. It is believed by the Executive of the Association that good has been effected by directing the attention of the trade throughout the country to this matter.

The thanks of the Association are due to the various gentlemen who have forwarded donations, some of whom had thus showed that though they, for various reasons, do not attend the general meetings, they are nevertheless interested in the Association.

From the Treasurer's statement, it was shown that though the income has not been quite up to last year's, the expenditure has not exceeded it, thus leaving the exchequer in a favourable state.

The lectures (without going over each) have been both interesting and highly instructive, and the report expressed a hearty appreciation of the kindness of each and all the lecturers; but stated that it is matter for regret that there should be such difficulty in getting the members to take an active part in the monthly meetings. Another matter, and perhaps greater discouragement has been the poor attendance at most of these meetings. The Council feel strongly on this matter, because having asked eminent gentlemen, outside the Association, to be at the trouble of preparing papers, when these gentlemen came to deliver them, it was felt to be, to say the least, rather discouraging that so few members should attend the meetings.

The reports having been adopted and other business discussed, The President (Mr. Daniel Frazer) read his Valedictory address as follows:—

Gentlemen,—The difficulty which certain high dignitaries of the country experience at this moment of getting into fisticuffs with their real or supposed enemy, that of not quite clearly seeing what they are to fight for or about, is a trifle to the difficulty I have had in fixing upon a topic to speak upon to-night. I have never been very good at erecting a man of straw for the mere fun of having the opportunity of knocking him down as soon as he was got on his legs; sometimes an ignoble, and always an easy task. That means, in this instance, that not knowing of any real object of interest to us pharmacists, *as pharmacists*, on which I could throw any new light, I have not attempted to conjure up a merely fanciful one with which I might needlessly have occupied your time. In fact I do not know a single pharmaceutical topic now under the horizon that has not already been threshed to very chaff.

For instance, you do not need me to tell you about the Trade Association. I wearied you almost to death on that subject at the beginning of last session, and you revenged yourselves upon me at your next meeting by unanimously acting in the very teeth of my opinions. Since then I do not know that anything new has occurred in regard to this Association. It is still, I believe, going on in the even tenor of its ways, and so also is the Pharmaceutical Society. My notions regarding these two societies remain precisely as they were eighteen months ago. I still think it a pity that any chemist and druggist should remain outside the original society. I still think that the members of the Trade Association who are not also members of the Pharmaceutical Society, should, where it is possible, become so, and so enjoy all the advantages offered by it as one of the legally recognized institutions of the land. Or, to quote from my address given in November, 1876—"Let the two really become one. Let them enter into the marriage relation now, and, becoming one, and with one governing and a truly representative head, the whole body, fitly joined together, will move on sweetly, and without a jar."

Then this "sale of patent medicines" question does not need discussion here. The letters and articles in our journals surely do not want to be supplemented by long speeches! On this subject all I venture to say is, there is little use in barking when you can have no possible hope of biting. The Government of this country most assuredly will not legislate merely to benefit us; it will not stop our neighbours selling articles they are quite as competent to sell as we are, any more than it will stop us selling articles just as foreign to our legitimate business as patent medicines are to the trade of grocer or of bookseller. I think, too, it is needless to be distressed about other folks selling them at a ruinously low price. That cannot last long. It will not pay them, any more than it will pay you or me, and if you leave them alone they will soon be glad to cast this sort of "physic to the dogs," and to be content with their own legitimate business. Meanwhile you keep up the prices at their makers' standard, and you will find yourselves winners in even this race—by and bye.

As to counter practice, I have still nothing new to add here to what I said when Professor Redwood addressed us on the subject in September, 1876. I never was afraid and am not yet afraid of giving my advice, so long as I charge nothing for it, to any one who asks it. I will not go out of my premises to give that advice, nor will I use a lancet or a pair of forceps on any unhappy patient who might be foolish enough to ask me to do so. But I intend to do in the future, Nottingham case notwithstanding, precisely as I have done for over forty years in the past, and as all of you may do without let or hindrance.

I have nothing new to tell you on educational matters. I still hold the views I did when years ago advocating in the London Council much greater liberality in their grants. I still think the various examinations unnecessarily high, and the fees much higher than our students can well afford, but as I failed to get support for my views on these subjects then I did not and do not care to continue to wage a war of mere words, and where no action can be expected to follow.

Yet one more burning topic of a year or two's standing, the "milk of sulphur" one. Happily it, at least for the present, seems to be burnt out, and so I do not desire to stir it up again, for if I did I fear I would only get my own fingers burnt for my pains, and for that I see no urgent call at present.

Having now exhausted the list of the topics on which there was "nothing" to say, I will, before closing, with your permission, make a few remarks upon a topic broached, so far as I know, for the first time, by myself here at the close of last session, viz., the mode of electing representatives to the London Council. My words on that occasion were as follows:—"At this hour the whole country is called upon to elect fourteen councillors to supply that number of vacancies. You, in Glasgow, are asked to record your votes for men you never saw, and never heard of, at least there are not a few names of whom I have never heard, and whom, to my knowledge, I have never seen. I felt this to be an anomaly the first time I sat at the Council table, when every face but that of Mr. Mackay was strange to me, and our Vice-President came all the way from Dartford, in the extreme south of England. I said to him that he could know nothing of me and I could know as little of him. I then suggested territorial representation, that the country should be divided into districts, London, of course, getting the lion's share in the representation, each sending a man known to it. Scotland, I suggested, should have two, one for the east, and one for the west half, or for the north and south halves, as might be arranged, etc. I broached this subject frequently in private, and would have brought it before the Council by a motion, could I have got any support to warrant me in doing so, but failing this I left the matter over. This is one point in which I agree with the Trade Association, territorial representations, and if it takes this topic up as it bears upon the London Council, I, for one, will wish it every success in it."

I have but little to add to this. Every year, and no year more than the present, has confirmed me in the opinion so expressed last year. It has been objected to this scheme that considerable difficulty would be experienced in deciding upon equitably distributed electoral districts. But surely if this difficulty was overcome with some success in fixing upon centres for carrying on the Preliminary examination, it could also be overcome here. It may, perhaps, be urged as an objection to its adoption that some of the existing and much respected councillors might by it lose their seats at the Council. I do not see that this is a necessary consequence. If Liverpool and Manchester preferred Mr. Bottle, of Dover, to any Liverpool or Manchester man willing to go into the Council, then they might elect Mr. Bottle, supposing Dover was so far left to itself as to give them the opportunity.

I do not wonder that in some quarters it has been strongly urged upon candidates for the London Council to publish their views on pharmaceutical matters, in addresses through the press, and had I been a new candidate for election, and so my views not have been known, or had it been the use and wont in existing members to publish such addresses as some of the electors desire, I would willingly have done so myself.

But I think the mode now advocated a more excellent one. Printed addresses can only give a vague idea of the candidate's general qualification for the office he seeks to fill, and tell how he intends to vote in the future, whereas if the plan of district or territorial representation be adopted, and a local man is selected as the candidate for any given district, his whole character, his social standing and influence, as well as his views on the pharmaceutical topics of the day would be thoroughly known. What he had done in the past would be as well known as what, by published addresses, he proposed to do for the future. In fact, he would be known inside and out.

If it be objected that this plan is an innovation upon the existing mode of election, I answer, it is so more in appearance than in reality. For even as it is at present the existing members of Council, though they have been put into it by the votes of the whole country, come to be looked upon in the Council, as also out of doors, as *local*, instead of as imperial representatives. The actual London men are invariably spoken of as the "London members," and as Mr. Mackay and myself too well know, he and I were everywhere and always termed "members of the North British Branch," even though it is quite certain the great bulk of our votes were English ones!

In closing these remarks it only remains, that I thank you, as I do most sincerely, for the great forbearance and indulgence you have for the last two years shown to me while occupying this chair, and I assure you that in now retiring from it, I shall continue to do all in my power, in other ways that may open to me, to show that I have not been ungrateful for the confidence and trust you have so largely extended to me during those years.

Mr. J. M. Fairlie moved a vote of thanks to Mr. D. Frazer for his address and presidency during the session, which was unanimously adopted.

At this state of the meeting Mr. Frazer had to leave, and Mr. J. M. Fairlie, Vice-President, took the chair.

Mr. Paris moved, seconded by Mr. Kitchen, "That all Council meetings be held in the evenings so as to admit of office-bearers of the assistants' section being present." An amendment being proposed and seconded, the motion was carried by a small majority.

Mr. J. A. Clarke moved, seconded by Mr. Pettigrew, "That owing to the awkwardness in getting books from the library at present, and knowing that J. Walker was willing to take charge of same at 34, Virginia Street, the case be removed there and the said party appointed librarian." Unanimously agreed to.

With reference to this motion it is particularly requested that all books out be returned to Mr. Walker forthwith.

The election of officers and council was then proceeded with, the result being as follows:—

President, Mr. A. Kinninmont; Vice-President, Mr. J. M. Fairlie; Treasurer, Mr. J. A. Clarke; Librarian, Mr. J. Walker; Council, Messrs. Daniel Frazer, John Currie, sen., T. Davidson, W. Greig, R. McAdam, W. Whyte, J. W. Pettigrew, R. Brodie, J. Foster, R. C. Rait, J. L. Hatrick, and A. Pane; Auditors, Messrs. J. Fenwick and J. C. Steele.

Owing to none present willing to accept the office of secretary, Mr. J. Walker was asked to act as such *pro tem.*

Assistants' Section.

The sixth and final meeting of the present session was held in the Andersonian College, on Wednesday evening, April 10; Mr. W. Simpson, President, in the chair.

The minutes of previous meeting were read and confirmed, after which Mr. George Gilmour read a paper on "Health."

After a few remarks by the Chairman, Messrs. Cluckie, Law, and others, the Secretary (Mr. Paris) proposed a vote of thanks to Mr. Gilmour, which was cordially given.

The annual report was read and adopted.

Mr. Simpson, after a few valedictory remarks, thanked the members for the confidence reposed in him during his term of office, and hoped that the attendance next session would be a great deal better than had been characteristic of the one now near its close.

The election of office bearers was delayed till the annual meeting of the Association, which takes place on Wednesday, May 1.

Proceedings of Scientific Societies.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held at 17, Bloomsbury Square, on Thursday evening, April 25; Mr. W. R. Atkins, Vice-President in the chair.

A paper was read, by Mr. Graham, on "Explosives." All explosions are, according to the author, due to the sudden liberation of a quantity of gas many times the bulk of the original substance. Gunpowder, as the most important explosive agent, was treated of first. It is said to have been used by Chinese as early as 200 B.C. Its composition, its decomposition, and the products of its decomposition were also described. The next explosive compounds treated of were the picrates. Picric acid when mixed with chlorate of potash forms a powerful detonating compound, as does also a mixture of picrate of ammonia and saltpetre, the latter mixture being a more powerful agent than gunpowder. The manufacture of guncotton was described, accompanied by a short history of it. The effect of the compression and confinement of guncotton in a small space was experimentally verified by the ignition of small prepared cartridges. Guncotton, however, appears liable to spontaneous decomposition, sometimes with sometimes without explosion, due apparently to small quantities of free acid acting upon it, and producing heat. Another powerful explosive is nitroglycerine; this liquid incorporated with a porous siliceous earth forming dynamite. Fulminates, as fulminate of mercury, are largely used for the preparation of percussion caps. Powerful detonating compounds might also be made by pressing powdered chlorate of potash damped with water into moulds, and treating the mass so produced with a combustible substance, such as bisulphide of carbon. Many other explosive bodies of minor importance were treated of, and the paper was accompanied throughout by experiments whenever practicable.

A discussion followed the paper, and the evening terminated with a vote of thanks to Mr. Graham for his admirable paper.

Parliamentary and Law Proceedings.

The Prosecution of Soda Water Manufacturers.

At the Huddersfield Borough Police Court, on Tuesday, April 23, the case in which George Brighouse and others, trading under the style or firm of "The South Yorkshire Aerated Water Manufacturing Company," were charged with selling soda water which had no soda in it, was called on.

Mr. Piercy stated that the case had been adjourned in order that his clients might have an opportunity of considering whether they should call evidence or submit to the penalty which the Bench expressed their intention of inflicting. The defendants had been advised by their solicitors to submit to the penalty, and the defendants therefore left themselves in the hands of the Bench. The directors proposed to have two classes of water in future, soda water proper and aerated water simply, so that the public might have their choice. The directors had had a sample of the soda water analysed by the borough analyst of Bradford, and his certificate was to the effect that there were three grains of soda in it, but no copper or lead.

The Bench fined the defendants Brighouse and others £2 and the expenses.

They also fined Charles Tinker, Huddersfield, soda water manufacturer, £2 and the expenses; and John Ellis, Westgate, fruiterer, and Benjamin Crampton, landlord of the Plough Inn, Westgate, were each fined 10*s.* and the expenses.

Serious Charge against a Medical Practitioner and a Chemist and Druggist.

At an inquest held last week at the Sussex County Hospital, Brighton, respecting the circumstances attending the death of a young woman named Hockley, evidence was given that resulted in a serious charge being made against a medical practitioner and a chemist and druggist. A man named Cole, who was cautioned before being sworn, stated that in consequence of the deceased believing that she was *enciente* by him he had applied to Mr. Darley, chemist and druggist, who had supplied him with several bottles of medicine, for which he had paid 5*s.* per bottle. Deceased took this medicine, but the object not being attained, Mr. Darley introduced him to Mr. Moon, a surgeon residing in Pelham Street, Brighton, who undertook the treatment of the deceased. Deceased subsequently died in the hospital, after a miscarriage. At the adjourned inquest, on Monday, the jury returned a verdict of wilful murder against Moon, and one of being an accessory before the fact against Darley.

The subject has also been before the Brighton Bench, and the magistrates have committed Moon and Darley for trial on similar charges.

Obituary.

Notice has been received of the death of the following:—

On the 23rd of February, 1878, Mr. Richard Wilson, Chemist and Druggist, Clay Cross, Derbyshire. Aged 54 years.

On the 12th of April, 1878, Mr. Leonard Abraham Uttley, Chemist and Druggist, Blackburn. Aged 48 years.

On the 27th of April, 1878, at North Walsham, Mr. Albert Richard Priest, Chemist and Druggist, formerly of Parliament Street, Westminster. Aged 33 years.

On the 30th of April, 1878, after a long and painful illness, Mr, Rowland Powell, Chemist and Druggist, Temple Street, Bristol. Aged 50 years.

Dispensing Memoranda.

[54]. Creasote Dispensing.—Not unfrequently I dispense mist. creasoti, B.P.

O.

[104]. Palma Christi.—The preparation intended by the doctor was Greenish's fluid extract of Palma Christi. I have often sent out this preparation and found it correct. The patient was evidently troubled with a deficiency of milk, and this preparation is strongly recommended for promoting an abundant flow of milk.

Also *vide* "Squire," which states: The decoction of the leaves of Ricinus applied to the breasts is said to produce an abundant supply of milk.

Exeter. An Associate.

[104]. What was meant by Palma Christi was no doubt Liq. Fol. Ricini, a specialty by Mr. Greenish, and once largely used for increasing lacteal secretions.

G. J. Knight.

[105]. Parrish's unquestionably; although some wholesale houses put Easton's in their lists under that name.

The Trade Side of Pharmacy.

Sir,—Admittedly, pharmacy dwells on the border land between professions and trades, partaking therefore, more or less of the character of both. Those who have done anything in the study of natural history know full well how many of the minute forms of life have been handed by microscopists to and from one or other of the two kingdoms. Now an eminent naturalist declares the Diatom to be an animal, then another equally eminent proves most conclusively that it must be vegetable, and so it remains till a third discovers some new character which again ranks it with the higher form of life.

Just in the same way, whilst most pharmacists throughout the country know pharmacy as a trade only, there are those who regard it entirely as a profession; let us on the present occasion look at it from a trade point of view. I have taken this first because it is of primary importance, without it the pharmacist would cease to exist, therefore, the second or professional position would be null and void.

The whole country lies before us, with its towns, large and small, and its villages too; its aristocratic and democratic neighbourhoods; its seaports, agricultural, manufacturing and mining districts, all of which must be supplied with that very necessary individual the pharmacist. It is too much to expect any one individual possesses a nature so plastic as to adapt himself to the varied requirements of these different positions, and the first important business transaction in the pharmaceutist's history is the proper selection of a locality, the requirements of which his special nature or training renders him a fit individual to supply. A mistake in this has often proved a most serious one for life. Some have "gone to Rome without doing as Rome does;" how far they have succeeded the Bankruptcy Court and Benevolent Fund will probably be the most eloquent exponents. There must be a proper adaptation of the individual to the environment, or a suitable selection of environment for the individual, as a necessary preliminary to success.

Having commenced business, the first problem is how to live? If his lot has fallen in a good neighbourhood, where medical men do not dispense their medicines, he will have to avoid prescribing and the prominent display of patent and proprietary articles as far as possible. But if in a country town or poor neighbourhood, such a course would be suicidal. He must prescribe in simple cases, must freely sell patents, possibly homœopathic medicines, and might even have to add some other trade to enable him to solve the problem "how to live." He is in a free country; the law demands of him, it is true, honesty and integrity; but is there anything incompatible with this in trade conducted thus? Most assuredly not. In any other calling, energy, fair competition and the display of a man's abilities are commended; why, in pharmacy, should they be questioned? Life itself is a competition, a struggle for existence, with its inevitable result "the survival of the fittest." The demands of his business or other considerations might necessitate his supplying some few articles sold by the grocer; the latter, observant of this, adds to his stock toilet soaps, and perhaps the later encroachment, patent medicines. The medical man, too, finds that some of his patients consult the pharmacist for the relief of their minor ills, but unlike the grocer he has no available means of entering into competition, therefore he falls back on the protective principle, and asserts that legally the chemist has no right to prescribe. It appears, however, much easier to assert this than to prove it; indeed, prescribing from medical and pharmaceutical points of view is essentially two different things; with the former it is the acme of professional duty, with the latter it belongs to the trade side of pharmacy; the former trusts to his own diagnosis, whilst with the latter the most important part of the prescribing is done by the patient himself, the chemist merely giving such remedy as seems to him most desirable or most suited to the case as described by the patient. The matter is now being contested in the courts of law, and whilst we have every promise of a satisfactory issue it is well not to anticipate. From the fact that the law requires certain qualifications on the part of the medical man he is entitled to a certain amount of protective legislation, the only question for decision is where the line is to be drawn. The chemist also conducts his business under legal restrictions, the breach of which renders him liable to prosecution, fines and penalties; and he, too, has a just claim on protective legislation, which in fact is really granted in the exclusive right to retail and dispense poisons, and in the reservation of certain titles. Now no one can dispute that, wherever this reservation of right is violated, he might fairly ask at the hands of the law the full protection that it gives as an equivalent for what it exacts. There are at least two flagrant instances in which if not law most certainly justice is being set at nought; I refer to the sale of patent medicines containing poisons by drapers, stationers, and other unregistered persons; and to the sale of not only these but other poisons, and dispensing the same by co-operative societies under the pretext of having a qualified manager. By a clause in the Pharmacy Act we know that a patent medicine stamp is allowed to be more than an equivalent for common sense, but I fail to find any exception in favour of co-operative stores. It might be this latter is an illustration of what we are told is usually the case, viz., "that a coach and four might be driven through any Act of Parliament," and if so the sooner we unitedly and vigourously set about repairing the breach the better. For my own part I cannot conceive that there would be any difficulty in demonstrating to our legislators in a satisfactory manner that to correct these two anomalies would be to benefit the public at large quite as much as the existing poison regulations can possibly do.

But we are considering trade pharmacy as a whole, and I certainly feel that it is not alone, or indeed, chiefly to protective legislation that we must look for the extension of our business. There is much that is closely associated with pharmacy which lies waiting for development. Dietetics, for example, are still open to much improvement and extension of sale; preparations for the use of the agriculturist are still behind the progressive condition of the age; dyes, colours, mordants, etc., are all compatible with pharmacy—indeed, to every chemist, whatever his position or locality, there must and does occur at some time or other means by which extension of business would most assuredly follow well directed efforts. But my subject is proving too lengthy; it appears to widen rather than draw to a close, and I must terminate somewhat abruptly these reflections with a hope that they might at least be found suggestive, and might possibly help some brother pharmacist to see his way to an amelioration of the difficulties he has to contend with, or to the extension of a small and insufficient business; if so the space which I have occupied in this Journal on the trade side of pharmacy will not be lost.

CHARLES SYMES, PH.D.

THE ELECTION OF COUNCIL.

Sir,—To the naturalist few questions have a greater interest than that known as "protective mimicry." Mr. Bates, the author of the 'Naturalist on the Amazons,' has described how a tribe of butterflies, of gaudy colour, enjoys exceptional immunity from the attacks of birds. There is also found a species of a structurally distinct genus which has assumed the facies of these Heliconidæ and finds its reward in sharing the immunity of the butterfly it simulates. Mr. A. R. Wallace and many other observers have added confirmatory facts, drawn from many classes of animal life and from many countries.

The student of sociology is not without somewhat analogous instances. The contest between rival candidates for the honour of representing us on the Council of the Pharmaceutical Society has, I believe, supplied such an illustration. Before me lies the card of a candidate, who states—"It has been suggested by some of my friends that I should issue a post card to the leading chemists, asking a vote from such as feel with us the desirability of having the trade interests of our body more thoroughly represented in the Council of the Pharmaceutical Society. If you will kindly record a vote in my favour it will further this object and oblige * * * "

Having been a good deal identified with the principal movements in defence of trade interests, this profession of zeal for them from such a quarter was not what my memory would have led me to anticipate.

By a few references to your columns I find that this candidate's recorded services to trade interests have been the following:—(1) When the trade was stirred as it never had been before by the obnoxious poison regulations of 1871, he moved, "That this meeting approves of the proposed poison regulations," and found two supporters only in the largest provincial town in England; (2) in a following year he recorded his opinion of the Pharmaceutical Council of 1872, elected under strong feelings in favour of trade interests, "That it too much resembles the executive of the Chemists and Druggists' Society—too little the old Pharmaceutical Council."

And although, as a much-harassed people, we have often had to take up arms for self-protection, our candidate has never done even as much in that direction as Diogenes, who fell in with the popular humour so far as to roll his empty tub up and down the streets of Athens when all her citizens were preparing for war.

It is, of course, somewhat cheering to believe that trade interests are in the ascendant, and far be it from me to check an incipient zeal for these in any neophyte. I will grant that he may have had the germ even when the outward manifestations were so much against the probability. But to accept this as a proved fact requires almost as much literalism as it would to agree with the man who insisted that he had been cut in two because he once sliced off the top of his little finger.

The coming election will bring before the constituency candidates who have been staunch friends of trade interests within the Council and some who have shown similar devotion outside that body. If any profess such zeal without past evidence let us distinguish the real from the mimetic and see that the result shall be "the survival of the fittest."

FIDE SED CUI VIDE.

April 30, 1878.

THE WEIGHTS AND MEASURES BILL.

Sir,—I hoped to have seen some notice of the Weights and Measures Bill in your correspondence columns to-day, but was disappointed to find a subject of so much importance entirely unnoticed. I trust the Council of the Society will make an attempt to restore the permission to use the apothecaries' weight in the sale of drugs by retail, or we shall all be in a very serious position, and indeed entirely unable to carry on our business lawfully.

If the measure pass in its present form it seems to me that not only will the ʒj and ℈j weight be illegal, but almost every weight that we use in dispensing, and all our glass measures will be so likewise, as it will be unlawful to have in our possession any weights or measures not of the Board of Trade denomination, which I suppose scarcely any weight that we use from 2 grains to ℥j. or any graduated measure will be. It may perhaps be said that dispensing is not trade, and therefore the law will not apply. But if dispensing is not trade its results are; and even supposing the weights as now used to be allowed in dispensing we should not be much the better, for there is not a day in which we are not obliged to use these weights in trade; if people do not want a scruple or a drachm they want 20, 30, 40, or 60, or some odd number of grains, and how are we to supply them with avoirdupois weights, or how supply a fluid ounce of sal volatile or paregoric?

Unless some means are taken to protect us the Bill will provide a rare harvest for the flock of cormorants who under the name of analysts, inspectors, and officials of various denominations are always on the look out for prey in the shape of fines, costs, etc., from us unfortunate shop-keepers under the pretence of protecting the public from adulteration and fraud, but who as far as I can see seldom interfere in any real cases of either.

W. WILKINSON.

Manchester,

THE SALE OF PATENT MEDICINES.

Sir,—Will you please kindly allow me space again to say a word or two in notice to the sarcastic spirit of "Hampshire" in reply to mine upon the degrading low price system of some of the drug trade of the present day, and at this I only aimed. I should not have troubled you to give any answer to the long "stride" of "Hampshire," perceiving he has been much further afloat than it has been my lot, but I suspect he is indeed one of those who favour the very system of the so-called co-operative drug companies upon which I gave my mite in discharge of my knowledge and thoughts of the subject, and I do not now eat my words. Let Mr. "Hampshire" or any one else gainsay and "peck" at every word that is said, the facts are the same, and he himself says the statements given are "only too true."

My signature, "Sussex," seems particularly to annoy him, so much so that he would alter it into an old, withered, wrinkled man or woman—"senex." This act of forgery and all connected passages of the same strain are to my own mind only "jeers," and I may add that I have no thought of being a lounger or living an idle gentleman, being always fond of my business, and so remain to the present time, and were I possessed of £10,000 would prefer being in my business rather than an idler, although I am an aged man. Moreover, I do not think as he thinks or as he says; I think, let every man think and say for himself—what is true!

I beg to close these few lines in some little response to the many score that have been rightly or wrongly construed and written in reply to my simple letter on the subject of the disgraceful prices that are now charged for drugs, etc., even in the aristocratic queen of the South Coast, Brighton, namely, 4 ounces of epsom salts for 1*d.*, 1 ounce of castor oil for 1*d.*, etc., etc. "Hampshire" says, "there is no help for this sort of thing." Who began this sort of thing? Oh, fie! Oh, fie! Nevertheless, all this bandying of words is not to much purpose as far as my small friend "Hampshire" cares. Still, my friends may suppose if I now remain silent that I am altogether "stunned" by this "Hampshire" blow.

I will say here that I do not use Sacred Scripture in every trivial thing, so pass over this slur.

Do forgive the old man "Sussex's" singular education in consideration that his school days were in the time of poor old "Squeers."* But for a final hint. Monopoly, or monopolize, is a proper word for a man who would engross all the drug business into his own hands by selling at ruinous charges. Competition there can be none, for who dare to compete here?

"Sussex."

Sir,—It appears to me to be inconsistent on the part of your correspondent "Hampshire" to take up more than a column and half of the Journal, whilst deprecating the actions of your previous correspondents who have, in the exercise of their liberty of thought and opinion ventured to address you on the state of our trade.

The tone exhibited in your correspondent's letter is most pugnacious and unbrotherly, and in my opinion deserves censure. It is quite enough to have foes outside the camp; we ought to be united and sympathetic within.

It is, I think, a gross piece of presumption for "Hampshire" to say to a brother chemist, "Surely in that time (fifty years) he should have made a fortune, and should at least now leave the field to younger blood," etc.

Surely it is "a waste of your valuable space" for Hampshire to "go ahead" in the reckless denunciation of those who have grievances which they seek by a fraternal appeal to remedy.

It would be a waste of my time to follow "Hampshire" all through his "rigmarole."

The remedy I suggest for the evil complained of, is a mutual agreement between the chemists and druggists in each town as to prices, etc., etc., as far as the various natures of their respective businesses will permit.

16 *and* 17, *Cliffe, Lewes.* W. T. Martin.

The Stamped Nostrum Trade.

Sir,—When a chemist and druggist permits his name to appear at the foot of a handbill for Professor Pillaway's pills or Dr. Pinchbeck's golden ointment he is justly supposed to endorse every statement, however extravagant, that may be uttered thereon.

It is also assumed that nothing he himself compounds can by any possibility be so good as the article for which he is thought to have solicited the agency.

Throughout the length and breadth of the land our windows are blazoned with chlorodyne transparencies, Dr. Burntsucker's sarsaparilla, exhilarating salines gorgeously wrapped, Sixbob's plumbic hair restorer, and some other shady preparations which I need not name.

The only specific for these specifics is, combine to cease from exhibiting them, cease from all placards, transparencies and handbills concerning them, compound such remedies as there is good reason to believe will be truly serviceable, and for counter bill purposes use printed circulars giving truthful names and uses of such remedies only as are put up in our own pharmacies.

If the trade would only combine for this instead of working out our own extinction as preparers and compounders of medicines by cramming the community with all the nostrum bills foisted gratis upon us through the wholesale houses and so effacing ourselves and debasing ourselves, I think we should have less to complain of than now.

Even if the sale of stamped medicines were confined to our own ranks, stupidity, envy, and greed amongst ourselves would break out and cut prices perhaps more fiercely than ever. Moreover, there is no skilled thought or labour in the mere vending of these stereotyped articles. If your readers will stretch their minds to a consideration of this circumstance they may discern results flowing which it is impossible to overcome.

Any one can sell stamped medicines as easily as postage stamps, and for the life of me I can see no reason why all traders may not sell one as well as the other.

It may be urged that for the protection of the public they are best in our own hands. Protection of the public, indeed! How many amongst ourselves protect our customers from the plumbic hair restorers mentioned above? How many in the trade feel that they have influence enough or even care to protect a poor family from purchasing a 2*s.* 9*d.* Gander's ointment when a stone of flour would for them be a more desirable investment?

On the contrary, our old chatty friend, "Counter Practice," brings one more to the knowledge of their condition and thereby into sympathy with their requirements.

Counter practice—Oh dear no! trouser the 2*s.* 9*d.* and no more bother. This is the policy of too many; too many have neither heart nor brains for any exertion beyond the supreme felicity of putting three shillings into a till and handing out three pence change; in other words, doing nothing and getting well paid for it.

Ictus Equi.

QUINIRETIN.

BY PROFESSOR FLÜCKIGER.

Forty years ago Geiger was well aware of the fact that aqueous solutions of salts of quinine are decomposed in sunlight. It would appear that Pasteur* attributed this alteration to the formation of quinicine and cinchonicine, for in his researches on the two latter substances, he remarks: "J'ai reconnu, en effet, qu'en exposant au soleil, seulement durant quelques heures, un sel de quinine et de cinchonine quelconque, en solution étendue ou concentrée, il s'altère à tel point que la liqueur prend une coloration rouge-brun extrêmement foncée. Cette altération est d'ailleurs de la même nature que celle qui s'effectue sous l'influence d'une température élevée." He recommended the manufacturers of quinine not to expose to direct sunlight either their products or even the barks.

Carles† exposed powdered Calisaya bark to sunshine during the month of August and found it to yield afterwards less quinine than before. Broughton‡ likewise pointed out the detrimental influence of direct sunshine on barks collected in the Government plantations in the Nilghiris.

Hesse,§ on the other hand, stated that the influence of light was by no means so powerful and did not favour very vigorously the formation of amorphous alkaloids. He exposed for seventy-three days to sunlight an aqueous solution containing 3·72 per cent. of quinine in the form of sulphate. Quinicine was found to be at last contained in the liquor, besides a red amorphous substance no longer possessing the property of neutralizing the acids. Hesse did not meet with the latter in the barks as might be expected, supposing sunlight to act in the same way on the alkaloids contained in the tissue itself.

Mr. David Howard‖ ascertained that quinicine at least occurs in the mother-liquids obtained in manufacturing quinine, and Dr. de Vrij¶ is of the opinion that not only quinicine and cinchonicine but another third amorphous alkaloid is present in the barks.

The influence of sunlight on the latter and on their bases is a very interesting question, as shown by the experiments just alluded to. They refer not to the alkaloids, but to salts of them. What part is played by the acids with which the alkaloids are combined? Are the alkaloids themselves likewise altered by sunshine or only their salts?

I thought it of some interest to submit quinine to a few experiments and was struck to see how rapidly and thoroughly it is altered. 2000 parts of water at 17° C. dissolve a little more than 1 part of quinine, yielding a clear solution, which remains colourless and clear for any length of time, provided it be kept in the dark or in dispersed daylight, in closed or in open phials. But on exposure to sunlight, in July or August, for a few hours, the liquid turns yellowish or brownish, the coloration being developed uniformly in the whole solution, not beginning at the surface. By and by it becomes turbid, and after a few days a flocculent brown matter sinks down, amounting when dry to nearly the quantity of quinine originally employed. A very little of it remains in solution, for the latter remains brownish and has always a bitter taste reminding of quinine. Yet in the clear solution the alkaloid is present in so trifling an amount that the brown liquid becomes but very faintly turbid on addition of either tannic acid or iodohydrargyrate of iodide of potassium. By both these tests, as well known, precipitates are produced in a solution containing even less than 1 part of quinine in 2300 parts of water, before it is submitted to the action of light.

The transformation of quinine into the brown flocculent substance, which for the sake of brevity may be termed quiniretin, is due to sunlight exclusively. If water is boiled in order to deprive it of air as much as possible, and then saturated with quinine, the cooled filtered solution keeps perfectly colourless until it is exposed to sunlight, when it soon begins to turn yellowish. It is true, however, that in a closed tube, in the dark, the aqueous solution if quinine turns red, yet not brown, as soon as it is heated to 170° C.; at 300° it affords an intensely red liquid. The effect of sunlight is the same if the solution of quinine is deprived of air by a current of hydrogen and the tube immediately closed; the solution thus absolutely deprived of oxygen becomes brown in sunlight.

The brown substance which I call quiniretin must therefore continue to have the same composition as quinine, but it is modified in an extremely remarkable way; it is neither quinine or quinicine, nor does it contain a trace of either. Quiniretin is devoid of an alkaline reaction, insoluble in both alcohol and ether as well as in hot or cold water, softening but a little in boiling water. It is not fusible, but melts only far above the melting point of quinine, yet quiniretin then undergoes a thorough decomposition.

Quiniretin is dissolved by acids, but unable to neutralize them or to combine with them. It is abundantly soluble in hydrochloric acid, 1·11 sp. gr.; this solution displays an intensely brown colour and may be diluted with water without becoming turbid. Its very bitter taste reminds of that of quinine, but it is at the same time somewhat, I may say, aromatic. The hydrochloric solution of quiniretin is not precipitated by tannic acid; this is likewise in favour of the statement that it is not an alkaloid. The solution is precipitated on the other hand as soon as it is neutralized by ammonia, yet quiniretin is not dissolved by an excess of the latter, and in this respect too it differs from quinicine.

It must be granted that the iodohydrargyrate of potassium (1·35 per cent. chloride of mercury, 5 iodide of potassium, 100 water), yields an abundant precipitate in the hydrochloric solution of quiniretin, but the same may be said with regard to other salts, for instance, chloride of ammonium or sodium.

A small quantity of dilute sulphuric acid (1·112 sp. gr.), gently warmed and shaken for a day or two with a large excess of quiniretin, affords always an acid liquid of a yellowish hue, far less coloured than the hydrochloric solution. The former is not fluorescent and is decolorized by chlorine water. On addition of ammonia the latter assumes a dingy green hue or yields a greenish precipitate; these reactions succeed better if quiniretin is immediately dissolved in chlorine water (it will usually contain an appropriate amount of hydrochloric acid), and ammonia added to it. This behaviour agrees with that of quinine, quinicine, and quinidine (conquinine), yet quiniretin

* *Comptes Rendus*, xxxvii. (1853), 114.

again differs from these three alkaloids, inasmuch as it does not afford that red tar (Grahe's test), which makes its appearance if barks containing quinine, or the allied alkaloids, or certain salts of them, are heated in a glass tube.

Quiniretin consequently differs very widely in many respects from quinine, its mother substance, the composition of which quiniretin must necessarily share with regard to the conditions of its formation, as pointed out above. I may add that I have restricted myself to ascertaining the presence of nitrogen as a constituent of quiniretin. The intense action of sunlight, especially in summer, causes the quinine to be transformed. The alteration is not precisely more favoured by acids; the aqueous, and also the alcoholic solution of pure quinine is more rapidly transformed. Dry quinine requires more time. The other alkaloids of cinchona are much less affected by sunlight than quinine, at least in aqueous solution. This no doubt depends upon their sparing solubility, quinine being more readily dissolved by water. It is interesting to see how little kinic acid is altered by sunlight; saturated or diluted aqueous solution of it was but almost imperceptibly affected after a summer's stay in sunshine. As to quinovin, I noticed the absolute absence of any coloration after a similar treatment.

Aqueous solution of morphine is very slightly coloured by sunlight, solution of codeine very much; solution of strychnine is scarcely altered, that of brucine turns brown. It is evident that the amount of solubility is of prominent importance in these experiments, codeine as well as brucine being much more abundantly soluble than morphine and strychnine. Further experiments relating to these remarkable effects of sunshine should be simultaneously instituted by means of other solvents than water.

I thought my few observations worthy of notice, inasmuch as they refer to quinine itself, other chemists having examined its salts. It would appear that the absence of acids prevents the formation of quinicine.

THE TURPENTINES AND RESINOUS PRODUCTS OF THE CONIFERÆ.

BY DR. JULIUS MOREL,

Professor of Chemistry in the Industrial School, Ghent.

This plant grows in the northern regions of both hemispheres, and is met with also as a shrub in the mountains of the south. The fruit, which is a soft fleshy cone or galbalus, is sold in commerce under the incorrect name of juniper berries. These are collected at maturity, that is about the end of the second year after they appear, when they have become of a dark violet-blue colour. The globular cones contain three seeds, which are triangular, ovoid, and bear upon their surface, and especially on the dorsal surface a number of large oleoresiniferous glands. The oleoresin is at first fluid, but gradually hardens, and penetrates the surrounding tissues.

The principal supply of juniper berries comes from the south of France, but some also comes from Austria and from Italy.

Preparation.—The character of the volatile oil and the quantity yielded varies according as it is extracted from ripe or from green berries. In the green berries two essential oils of different densities are met with; the ripe berries contain only the heaviest of these two oils. The oil is obtained by the method of distillation generally employed in the preparation of essential oils. The distillation of green berries gives a larger yield of essential oil than that of ripe berries, but the proportion of the heavy volatile oil is not so large as when the ripe berries are used.

Planchon has pointed out that the yield may also be affected by the manner in which the distillation is carried on. If the ripe berries be distilled directly with water about 0·4 per cent. of oil can be obtained; but if the precaution be taken of allowing the berries to macerate previously in cold water, as much as 0·75 per cent. of oil can be obtained from the same fruit. For these reasons the yield may be described as varying between 0·4 and 2·0 per cent.

The oil obtained from the berries is that ordered in most pharmacopœias; essential oil can, however, be obtained from juniper wood, but the proportion yielded is much inferior to that from the berries.

Characters.—Oil of juniper is usually a colourless or very pale yellow liquid, sometimes yellowish-brown or even greenish. It has a strong odour resembling that of the fruit and other parts of the plant, a hot, resinous and aromatic taste, and a specific gravity varying from 0·86 to 0·88. It distils between 155° and 280° C., and is neutral to litmus. Examined in a column 50 mm. long it rotates the plane of polarized light 3·5° to the left. The oil is soluble in 10 to 12 parts of 80° alcohol, in half its volume of absolute alcohol, and in all proportions in ether. According to most authors iodine, projected into the oil, causes an explosion, an elevation of temperature and the evolution of violet vapour. In fact, a very smart explosion takes place when recent oil of green berries is used; but the explosion is less energetic with older oil. Oil of juniper does not dissolve fuchsine in the cold, but with heat it reduces it. Sulphuric acid causes an elevation of temperature, the formation of vapour and a turbid solution, at first brown but afterwards passing to blood red or cherry red; upon the addition of alcohol this solution changes to a chamois or a dirty rose colour and remains turbid even when heated. Like turpentine oil it absorbs hydrochloric acid gas and forms with it a liquid compound, which when left in contact with water a sufficiently long time gives a crystallizable hydrate. Solution of bromine in chloroform does not at first colour oil of juniper, but after a few moments a greenish-blue coloration takes place. Chloral hydrate does not immediately produce any change, but in a short time the oil becomes yellow, passing successively to greenish-brown, clear green and deep green. Alcoholic solution of hydrochloric acid colours it brownish red. Frohde's reagent produces a deep brown colour, passing first to clear red and then to deep red. Fuming nitric acid, picric acid and ammoniacal solution of silver nitrate give the same reactions as with turpentine oil. Most of the foregoing reactions have been quoted from Dragendorff's 'Studies on Essential Oils' (*Pharmaceutical Journal*, [3], vol. vi., p. 541).

Composition.—The two essential oils, which, as before mentioned, are obtained in very variable proportions according as the green or the ripe berries are operated upon, are two hydrocarbons having an identical composition. One, represented by the formula $C_{10}H_{16}$, has a sp. gr. of 0·839, begins to boil at 155° C., and is very slightly soluble in 80 per cent alcohol; the other, $C_{20}H_{32}$, which is predominant in the ripe berries, has a sp. gr. 0·878, boils at 205 C., and is generally more coloured than the first-mentioned. Both these oils readily absorb oxygen, and when exposed long to the air deposit a camphor that is slightly soluble in water, very soluble in ether, and soluble in boiling alcohol. The alcoholic solution left to cool deposits crystals of camphor.

According to Donath (*Pharm. Journ.* [3], vol. iv., 417), besides the vegetable constituents met with in all fruit and the essential oil, juniper berries also contain acids, waxy matter, 8·46 of a green resin soluble in ether, 1·29 per cent. of a brown resin soluble in alcohol, and 0·37 per cent. of a bitter principle called juniperin.

Adulterations.—Oil of juniper is frequently adulterated with lower priced oils and especially with turpentine oil. Turpentine oil renders the characteristic odour of juniper oil much less agreeable, and in many cases the odour is sufficient to raise a suspicion as to the sophistication. The chemical reactions above described, taken in conjunction with those given under turpentine oil, are sufficient for the easy detection of this adulteration.

According to experiments made by Dragendorff, recent juniper oil dissolves in three times its volume of 93 per cent. alcohol and in four volumes of 91 per cent. alcohol. A larger proportion of alcohol produces turbidity. The recent oil dissolves in all proportions in 95 per cent alcohol. It has therefore nearly the same solubility as turpentine oil.

According to the same author the same oil, after having been prepared five years, dissolves in 0·25 times its volume of absolute or 98 per cent. alcohol, and in 0·30 times its volume of 97 or 96 per cent. alcohol. A larger quantity causes turbidity, but the extent will be larger in proportion as the oil contains water. Less concentrated alcohol will not give a clear solution, but the greater part of the oil dissolves in four volumes of 90 per cent. alcohol, five volumes of 92 per cent. alcohol, seven volumes of 90 per cent. alcohol, and ten volumes of 86 per cent.

It follows therefore that the different solubility of juniper oil after a certain time allows of its being distinguished from turpentine oil by means of alcohol. In the 'Jahresbericht über Pharmacognosie' for 1873, p. 414, there is a table indicating the adulterations of juniper oil with turpentine oil, copaiba oil, and eucalyptus oil, showing the proportions of the adulterants and relative quantities of alcohol to be employed to detect the presence of foreign oils.

Uses.—The essential oil of juniper constitutes the active principle of the plant (wood, leaves, and cones), to which it owes its stimulant and diuretic properties. The oil is prescribed in doses of 2 to 6 drops, in pills, as an emulsion, or in mucilage. For external application it is used in alcoholic solution (Spiritus Juniperi), and it enters into the composition of several liniments, opodeldocs, etc. In medicine the use of the berries is frequently preferred to that of the oil, which is not free from danger. The inspissated juice is used in the preparation of an alcoholic drink, from which the English name, "gin," takes its origin; it is the French *genièvre*, the Dutch *genever*, and the German *Wachholderbranntwein* and *Steinhäger*.

Formerly the resin was collected from the stem of the plant, and sent into commerce under the name of German sandarach.

(*To be continued.*)

REMARKS ON PRESCRIBING.*

BY WILLIAM CRAIG, M.D., F.R.S.E.,
Lecturer on Materia Medica, Edinburgh School of Medicine.

The subject of prescription writing is one in which both physicians and pharmaceutists ought to take a deep interest. It forms a bond of union between the two professions. We meet here on common ground, and I trust it will not be altogether inappropriate that I make a few remarks on this important question this evening.

It is no part of my intention in this short paper to refer specially to those various questions regarding prescriptions which have been discussed so fully in your Journal during the past year. I have no wish to occupy your time with such questions as this, whether ℞ originally refers to an invocation to some heathen deity, or whether it is not simply a contraction for the Latin word *recipe*, a word which if it be not expressed is certainly understood in all prescriptions, and governs the quantity of the medicine prescribed.

I wish to consider this subject in a twofold aspect, both as regards physicians and pharmaceutists, pointing out our mutual relations to these prescriptions and endeavouring to find out in what way each of us can do his part to make our prescriptions as good as possible. With this object before my mind I shall consider prescriptions in their twofold relation, to the writers and the dispensers. Both have certain duties to perform and it is of importance that these be properly executed.

You can easily perceive how this subject is one of deepest interest to every member of our profession and I presume it is not less interesting to chemists and druggists. The number of prescriptions which are daily issued by members of the medical profession must be enormous. A physician seldom sees a patient without prescribing some medicine for him, and that irrespective of the age, rank, or malady with which he is afflicted, and surely it is of the utmost importance that the medicine prescribed be not only the best possible medicine but that medicine in the best and most agreeable form. Not only is the number of prescriptions very large, but the effects which they produce on our fellow men must be very considerable, and thus this subject is one whose importance it is not easy to over estimate.

* Read at an Evening Meeting of the North British Branch of the Pharmaceutical Society, April 19, 1878.

I have always maintained that this subject has never received the attention it deserved in the teaching of medical science. The student in many cases is not taught sufficiently the great principles which ought to regulate all prescription writing.

I shall first say a few words about prescription writing in so far as it bears on medical practitioners:—

I. Having selected the medicine we wish to give the patient, the first thing which we have to consider is, the dose of that particular medicine and the frequency of its administration. The question of dose is one of considerable importance, much more so than many members of our profession are apt to suppose. It is one thing to know the dose of a particular medicine, and another thing so to arrange a prescription that the patient shall receive that dose. Very many of the mixtures containing solids in solution are so made up that the dose intended by the prescriber is not the one which the patient actually receives. This arises to a great extent from the circumstance that many members of the profession altogether overlook the fact that solids in solution add materially to the bulk of the liquid, and that to a much greater extent than is generally imagined. I believe I am correct in stating that the great majority of prescribers never consider that solids when dissolved add to the bulk of a mixture. This is a question which has not hitherto received the attention it deserves. Some years ago I was led to look at this subject and lately I have made some experiments with the view of ascertaining how much the bulk of fluids is increased by having solids dissolved in them I do not pretend that the following results are rigidly accurate, but they appear to be so very near the truth that for all practical purposes they may be regarded as a very near approximation to the truth. I experimented on a considerable number of substances, especially those that are most commonly prescribed in mixtures.

I shall now give some of the results obtained:—

One drachm of the iodide of potassium dissolved in a mixture will increase the bulk of that mixture by about twenty-five minims.

The following substances increase the bulk of a mixture to the same extent as the iodide of potassium, viz.: bromide of potassium, carbonate of potassium, bicarbonate of potassium, and nitrate of potassium; one drachm of the chlorate of potassium increases the bulk of a mixture by about thirty minims. The citrate of potassium increases the bulk of a mixture to the same extent. One drachm of the acetate of potassium dissolved in a mixture increases the bulk of that solution about thirty-five minims. The sulphate of copper does not occupy much space when dissolved in water, one drachm being equivalent to about twenty minims. The sulphate of iron occupies more space, each drachm when dissolved increases the bulk of the solution by fl℥ss. The carbonate of ammonia occupies very little space in a solution, one drachm being only equivalent to about ten minims, whilst one drachm of the chloride of ammonium is equivalent to about forty minims. One drachm of white sugar when dissolved in water increases the bulk of the water by about forty minims. One drachm of the hydrate of chloral dissolved in water increases the bulk by about half a fluid drachm. One drachm of the citrate of iron and ammonia increases the bulk of a mixture by about fifty minims, whilst one drachm of the citrate of iron and quinine increases the bulk of the solution by about forty minims. The sulphate of quinine when dissolved in an acidulated solution increases the bulk to the extent of its own weight. Thus one drachm of the sulphate of quinine dissolved in an acid mixture increases the bulk of that mixture by one fluid drachm. Camphor does the same thing. One drachm of camphor dissolved in rectified spirit increases the bulk by one fluid drachm.

These results are quite sufficient to prove that solids when dissolved in liquids increase their bulk to a very considerable extent and this fact ought to be borne in mind when writing prescriptions, otherwise the dose marked in the directions will not be exactly what the prescriber wished the patient to receive. Now there is a very easy way of getting over this difficulty and the only practical one, viz., to end our prescription by introducing the word *ad* before the last quantity named. This will inevitably enable us to give our patients the dose intended. Let me illustrate this by an example. It is no uncommon thing in certain diseases of the heart and blood vessels to give iodide of potassium in twenty grain doses several times a day. The following or some similar prescription being by no means uncommon:—

℞ Potassii Iodidi . . . . ℥ss.
Aquæ . . . . ℥vi
Sig. A tablespoonful three or four times a day.

The prescriber in such a case expects to give twenty grains of the iodide of potassium in every dose. If the prescription be accurately dispensed, instead of a six ounce mixture, the patient would receive fully a fluid drachm and a half more than the six ounces.

All prescriptions containing solids and liquids should be made up to a given quantity.

II. Prescribers should see that no two medicines in the same prescription are incompatible. The subject of incompatibility in medicine is a very wide one, and one at which I can only glance in this paper. Suffice it to say that there are two kinds of incompatibility in medicines, chemical and physiological, both of which as a rule are to be avoided in our prescriptions. Both of these primary divisions are capable of being subdivided, but the chief thing that the physician has to attend to is to make sure that there is no reason, chemical, physiological, or therapeutical, why any two substances should not be prescribed in the same mixture. I could illustrate this by many examples; I will content myself by mentioning only one, viz., lead and opium in the same solution. In almost all works on surgery we read of lead and opium lotions, but in few instances is a recipe given for such a lotion. I believe it was only last year that a discussion on this very subject engaged the attention of this Society, and I hope you will pardon me if I again refer to it, for on that occasion the true solution of the difficulty was not propounded by any of the speakers. When opium is added to a solution of a salt of lead we get a precipitate of the meconate of lead. If the solution be filtered the meconate of lead is got rid of, which is undoubtedly an advantage, inasmuch as the lotion is thereby rendered more seemly, whilst its action is in no way interfered with, inasmuch as the meconate of lead is an inert substance. In all such cases I prescribe a salt of morphia instead of opium. This gives a perfectly colourless solution, and possesses all the properties of the lead and opium lotion. It does not discolour the skin, and as a rule will be much more agreeable to the patient, which is a matter not to be overlooked. I am not only in the habit of always ordering a salt of morphia in all solutions of lead where it is desirable to add a sedative, but when a teacher of practical pharmacy in this city, several years ago, I was in the habit of teaching my students to do the same thing, and of practically demonstrating to them the differences in appearance between the two lotions.

III. The prescriber should always order his medicines in the most convenient form. Whenever there is a preparation in the B. P., which will serve the purpose of the prescriber, that ought to be preferred to any other, and of those contained in the B. P. the one most easily dispensed, *cæteris paribus*, is to be preferred. An imperfect acquaintance with the British Pharmacopœia is by no means an unfrequent cause of faulty prescriptions. I suppose you have all seen prescriptions defective in this respect. There are many preparations in the B.P. which seldom find their way into prescriptions, solely because medical men appear to forget their existence. I shall refer to a few of these. *Liquor zinci chloridi* is a preparation which is seldom seen in prescriptions, and yet it is the preparation which ought always to be ordered when we wish to give chloride of zinc in solution. This salt of zinc is not unfrequently prescribed in solution, and it is an exceedingly difficult thing for the dispenser to weigh accurately a few grains of the chloride of zinc, and it is seldom that more than a few grains are contained in any one lotion. The great hardness and extreme deliquescence of this substance render the duty of dispensing it neither an easy nor a pleasant task. In all cases we should order the liquor zinci chloridi. By so doing we would be much more certain that we had the exact quantity of the chloride of zinc in the mixture, and would at the same time render the duties of the chemist much more pleasant. The reason why this preparation is not generally prescribed is that medical men forget that there is such a preparation in the B. P. At the same time it is rather unfortunate that the strength of the B. P. preparation is such that it is a somewhat difficult task to calculate accurately a given number of grains. Had it only been a little more diluted, so that two drops of the liquor would have corresponded to one grain of the salt, all difficulty in this respect would have been avoided. The spiritus ætheris of the B. P. is another medicine which should be more frequently prescribed. It is much more miscible in solution than ether, and all that the prescriber has to remember is that he requires to order three times the quantity of the spirit of ether. Unless ether be mixed with spirit it will float on the surface of the mixture, and unless the person administering the medicine be very careful the patient is apt to get the greater quantity of the ether at the first dose.

In prescribing deadly poisons for internal use, such as arsenious acid or strychnia, the solutions of these substances are to be preferred to pills. Strychnia is given in doses of from one-thirtieth to one-twelfth of a grain, and it is evident, not to speak of the difficulty of weighing accurately one grain in the ordinary course of dispensing medicines, that there is always the danger of the strychnia not being equally divided throughout the various pills.

I shall next consider prescriptions in relation to pharmaceutists. Here I know I am treading on delicate and debatable ground, and I trust that any remarks I may make will be received in the same friendly spirit in which they are given, and that nothing will be said to mar that good understanding which ought always to subsist between members of the two professions.

I. Pharmaceutists are not to be the writers of prescriptions. So far as a knowledge of drugs is concerned, including dose, actions, and uses of medicines, they are quite capable of writing prescriptions, but they lack the essential element of a knowledge of disease to enable them to prescribe for patients. I suppose we all believe the doctrine that no one can prescribe accurately unless he is first able to diagnose disease and point out the proper remedy.

II. Pharmaceutists should dispense our prescriptions accurately. This may seem a mere truism, but it is a question about which opinion is somewhat divided; some contending that it is the duty of chemists to take into consideration not so much what is actually written as what the prescriber intended to write. It is only, however, in very exceptional cases that this rule ought to be followed. It is only when it is very evident that some mistake has been committed by the writer, that a druggist would be justified in not dispensing the prescription exactly as it is written.

Cases from time to time occur in which through a *lapsus pennæ* a mistake has been committed so serious that but for the intervention of the chemist results the most serious would inevitably follow. In such cases it is the clear duty of the dispenser to rectify the mistake.

Again, mixtures have been prescribed containing substances so utterly incompatible that they could not be safely administered to any patient.

III. It is the duty of pharmaceutists to tell us what substances are chemically incompatible. I have already spoken of chemical incompatibility in medicine as distinct from physiological incompatibility, and I maintain it is your duty to investigate this subject for us. Consequently you should never dispense a prescription without asking yourselves the question, Is this mixture one in which all the ingredients are compatible with each other? It is also your duty to discover the reasons of this incompatibility and to lay, from time to time, the results of your investigations before the members of the medical profession.

IV. It is your duty to tell us what is the best form in which to give any particular medicine, whether as a powder, extract, tincture, or infusion, etc.

V. It is your duty also to find out for us what are the active principles contained in the various substances of vegetable and animal origin. This is a wide and rich field for investigation and one in which very much requires to be done, and one, let me say, in which I hope some of the young members of the North British Branch of this Society will greatly distinguish themselves.

VI. It is your duty still further to find out what is the most agreeable form in which a drug can be administered, to find out how the nauseous taste of a medicine may be best covered without interfering with its action. It is often of considerable importance to be able to render our medicines pleasant and we look to you chiefly to enable us to accomplish this most desirable end. Let me say to the young men before me, you should never dispense a prescription without asking yourselves the question, Can this medicine, by any other combination, be rendered more agreeable without diminishing its efficacy; and if so, how?

I must now draw these somewhat crude observations to a close. I regret exceedingly that other duties prevented me from giving that attention to the subject which it undoubtedly deserves. I am also aware that I touched on some very debatable points, but I trust I have said enough to convince the young men present that much more is required of them than simply to be able to dispense accurately what the physician writes. If you would prove yourselves worthy members of the noble profession which you have chosen, you must not only have a good general education, but you must study botany, chemistry, and materia medica, and above all you must try and make yourselves adepts in practical chemisty, for only by so doing will you be enabled to advance your profession. You have many noble examples set before you in the members of the North British Branch; even in Edinburgh, there are members of your profession of more than a European fame.

"Lives of great men all remind us
We can make our lives sublime;
And, departing, leave behind us
Footprints on the sands of time."

BENZOIC ACID IN PHARMACY.*

BY B. ARCHER.

Within the past two or three years the comparative merits of the various anti-ferments have been pretty thoroughly discussed, and the result has been to place benzoic acid first on the list. At present its use is limited to only a few officinal preparations, but there is no doubt it may be advantageously used in quite a number. In the next revision of the Pharmacopœia I would suggest, among the additions, that of benzoic acid water (gr. iv. to Oi) and its substitution for water in such syrups, infusions, decoctions and mixtures as are specially prone to decomposition. The instances in which there could be objection, either chemical or therapeutical, to such substitution would be rare, as it is harmless and will not materially affect the taste, odour or colour of the preparations. While benzoic acid in the small quantity here suggested will not make very instable preparations permanent it will so increase their stability that they may be kept as long as it is usually desired to keep them.

* From the *American Journal of Pharmacy*, April, 1878.

Some have recommended salicylic acid as an antiseptic, but this will not do for general use on account of the colour imparted to mixtures containing the salts of iron, and, besides, as an anti-ferment it is not the equal of benzoic acid.

I have found the benzoic water especially useful in preparing solutions for hypodermic use. The small phials of such solutions carried in the pockets of physicians, and thus kept at a high temperature, soon undergo change unless protected by some antiseptic. It may not be out of place to say just here that physicians who do not have daily use for their hypodermic syringes are often annoyed by the packing becoming dry and consequently so contracted that the piston will not work smoothly in the barrel. This annoyance may to a great extent be overcome by the addition of a few drops of glycerine to each fluid ounce of hypodermic solution.

In extemporaneous pharmacy it is often more important that the diluent in mixtures should play the part of an antiseptic than that of a mere flavouring ingredient, for it is a fact well known to all observing pharmacists that many of the mixtures, emulsions, etc., dispensed by them must become unfit for use, especially in the summer months, before all is taken by the patient. In dispensing such mixtures benzoic acid water may well replace water or the medicated waters. I have substituted benzoic acid water for water with great satisfaction in preparing solution of citrate of magnesium, mucilage and syrup of gum arabic, Jacksons' pectoral syrup, and many other officinal and unofficinal preparations which I need not enumerate.

The present formula is a most expeditious method of preparing syrup. ipecac., but this is all that can be said in its praise. It should be changed or else that for the fluid extract so modified as to yield a handsome preparation when mixed with syrup. By adding two fluid ounces of the fluid extract to one pint of benzoic acid water, filtering upon twenty-six troy ounces of sugar, and making two pints of syrup when cold, a beautiful and permanent preparation is the result.

There can be no doubt of the fact that benzoic acid contributes to the preservation of cerates, ointments, and all unctuous substances, but whether or not the difficulty of stability is entirely overcome by its use and the smallest quantity necessary to accomplish it I am not prepared to say. It has been stated that the addition of 5 per cent. of powdered benzoin to powdered ergot will preserve without alteration its physical and medicinal properties. Acting upon this suggestion, I added two grains of benzoic acid, dissolved in a few drops of alcohol, to one ounce of powdered ergot, mixed thoroughly and spread the powder on a sheet of paper an hour or two to allow evaporation of the alcohol before bottling. Sufficient time has not yet elapsed to say whether or not the ergot is thoroughly protected by this treatment, but from its present condition there is no doubt that deterioration is at least greatly retarded.

The instability of sweetmeats, preserves, marmalades, etc., is annually a source of much annoyance to housekeepers. If sugar enough is added to prevent change during the summer months, when the jar is opened in December they find a mass of candied fruit; while, if to prevent this trouble, a smaller quantity of sugar is used a few weeks of hot weather will produce lively fermentation. Four grains of benzoic acid, dissolved in a little boiling water, added to each pound of preserves while yet warm, will protect them without imparting any "physicky" taste.

CINCHONA IN SIKKIM.*

From the annual report to Government we learn that the year 1876-77 has been a very busy and successful one on the cinchona plantation. The crop of the year consisted of 201,455 lb. of dry red bark, and 6326 lb. of yellow and pale bark, or 207,781 lb. in all. Special attention continues to be paid to the three methods of harvesting, namely, thinning, uprooting, and coppicing. The total amount of bark obtained by thinning was 57,365 lb.; by uprooting 129,711 lb.; and by coppicing 12,108 lb. Thinning is an operation intended rather to benefit the trees left behind than to secure a crop. The respective merits of uprooting and coppicing are yet undecided. Some years must pass before an opinion can be formed (1) as to how young trees will thrive when planted on land cleared by uprootal, and (2) as to the quality and quantity of bark that can be collected from the shoots of coppice stools. The experience of the year has, however, proved that partial coppicing is a failure, as the young shoots are then thin and sickly, and suffer from the shade of the overhanging trees. No further trial will be made of the Nilghiri plan of cropping by the process of renewing the bark under moss. It is found quite unsuited to Sikkim. During the year 406,600 plants of red bark (*Cinchona succirubra*) were planted out, namely, 237,400 (equal to about 87 acres) on the new or Sittong division, and 169,200 on the old Mungpoo division. The experiment of growing crown bark (*C officinalis*) has also not been successful, but the new variety (as yet unnamed) promises to do well.

* From the *The Gardeners' Chronicle*, April 20, 1878.

CARBONIC ACID AND THE ATMOSPHERE.*

Recent observations by M. Ebermayer demonstrate (1) that the air in a large forest is in summer nearly twice as rich in carbonic acid as free open air; (2) that forest ground in summer contains much less CO_2 than unwooded ground (the CO_2 formed by slow decomposition of humus in the close forest seems mostly to pass into the air, and is probably utilized by the leaves for assimilation); (3) that, with rise of temperature, the increase of CO_2 in arable ground is very much greater than in forest ground; and (4) that the spread and motion of CO_2 in the ground seems to take place very slowly, for in two places quite near together the amount of CO_2 may be very different. Among other bearings of these facts, the ground covering of a forest can have no important influence on the amount of CO_2 and lime in spring water, and unwooded ground may have a greater action in this respect. Again, animals living underground, *e.g.* foxes, naturally prefer the ground air of the forest, with its little CO_2, to the ground air of the open field, which has much more.

ADMINISTRATION OF DIGITALIS.†

A very interesting discussion lately took place, at a meeting of the Société Thérapeutique, on the therapeutic influence and mode of administration of digitalis in disease. Most of the speakers gave the preference to a cold infusion of the leaves over any other preparation, and were almost unanimous in condemning digitalin as being dangerous and unreliable, as it does not possess the diuretic properties contained in the leaves. Dr. Héraud, who brought the subject to notice, recommends the following preparation: Macerate, for twelve hours, twenty-five centigrammes of the powdered leaves of digitalis in two hundred grams of cold water. This is then strained, and the patient is directed to take it in five or six doses, in the twenty-four hours, at some distance from meals. This dose, he said, should never be exceeded, if we wish to avoid its poisonous effects; and the quantity he prescribes is quite sufficient to produce the full therapeutic action of the drug, beyond which it is needless to push it. Dr. Héraud considers digitalis one of the best diuretics known in affections of the heart; whereas it is useless where there is no cardiac lesion, as, for instance, in cirrhosis, albuminuria, etc.

The Pharmaceutical Journal.

SATURDAY, MAY 11, 1878.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary*, 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE ALLEGED IRREGULARITY IN THE SALE OF STRYCHNIA AT PENZANCE.

THE report of the public analyst for the borough of Penzance, which was forwarded by the Local Government Board to the Council of the Pharmaceutical Society, contained such grave charges against the chemists and druggists of Penzance, that it is not surprising to find further reference to it in the correspondence columns to the Journal. The letter written by Mr. C. B. ALLEN, with the advantage of some years' experience of the mode in which the chemists and druggists' business is carried on in Penzance, gives a direct contradiction to the statement of the borough analyst that "the Penzance druggists are in the habit of selling vermin poisons containing strychnine without taking the names of the purchasers," and at the same time furnishes convincing reasons for the belief that they do on the contrary conform to the requirements of the Pharmacy Acts in the sale of vermin powders containing strychnine.

Of course no chemist and druggist can well plead ignorance of the composition of BATTLE'S Vermin Killer, since the maker of this article has intimated to the retail trade that it contains strychnine, and that it consequently requires registration of sales; and though the time and trouble requisite for that is often a source of serious inconvenience, it is in certain districts, as our correspondent points out, a matter of business interest to the chemist and druggist to register the sales of this poison, independent of all considerations of compliance with the law on conscientious grounds.

The borough of Penzance is situated in a part of the country where there are such inducements to observe the law, for it appears that whenever foxes are poisoned in that neighbourhood some person connected with the hunt visits the druggists' shops to look over the sale of poison registers, with the view of ascertaining who has purchased vermin killer, and thus to gain a clue to the perpetrators of what they regard as a grave offence.

The pig and duck of Mr. COLLINS'S client we will take for granted came to an untimely end from eating a bait set with poison for the destruction, either of foxes or of the vermin that are so unwelcome in the farmyard, and if BATTLE'S Vermin Killer is used at the place in question, there is not much ground for surprise, for both animals are foul feeders, and will devour almost anything. But if that circumstance was to be used for drawing attention to any existing neglect of the poison regulations, it seems to us the proper course to have taken would have been to examine the sale of poison registers, and ascertain whether sales of vermin killer were entered. The statement that inquiries had been made, but nothing could be learnt from the druggists as to who had purchased poisons during the last few months, is far too vague to be much value in any respect, and as evidence that the Penzance druggists are in the habit of selling vermin killer containing strychnine without taking the name of the name of the purchaser it is totally worthless. It is indeed a violation of the decency which should characterize the conduct of a public official that such slender material should be made use of for casting imputations on any member or class of the community.

Still this is the sort of conduct that is too frequently presented to view by the public analyst. The simple performance of his legitimate work does not afford him sufficient scope for producing the sensational effect he too often longs for, and so he seeks to command notoriety at the expense of some of his neighbours. It is, we think, fortunate that the publication of the report and the discussion which took place at the Council meeting will enable the chemists and druggists of Penzance to deal with the charge made against them. The letter of Mr. ALLEN, which appears on page 902, is calculated to justify the expectation that this will be done, and although we thought it desirable not to take the initiative in offering any remarks on this subject we shall have pleasure in affording all the opportunity we can to the Penzance chemists and druggists to make known their repudiation of the charge brought against them by the borough analyst and to support Mr. ALLEN'S statement that they are not open to reproach in this respect.

THE ELECTION OF MEMBERS OF COUNCIL.

WE regret having moved the susceptibility of the President and Secretary of the Chemists and Druggists' Trade Association by suggesting the existence of some connection between that body and the election circular referred to in our editorial article last week. The President denies that the Association has endeavoured to influence voters, and the Secretary repudiates the idea that it has any such aspiration. We cannot quite recognize the validity of the objection to our remarks, for out of the eleven signatures to the circular, seven are those of the Honorary Secretary and members of the Birmingham Executive Committee, the other four are those of members of the General and London Committees, while of the three candidates recommended to the electors two are also members of the Birmingham Executive Committee, and the other is a member of the General Committee.

THE WEIGHTS AND MEASURES BILL.

A DEPUTATION consisting of the President of the Society, Mr. SANDFORD, Professor REDWOOD, and the Secretary, waited upon Mr. FARRER on Thursday morning, at the Board of Trade Office, to represent to him the objections to the proposed Weights and Measures Bill now before the House of Commons. The Hon. EDWARD STANHOPE, M.P., and Dr. ACLAND, the President of the Medical Council, were present and discussed the various points with the members of the deputation. We have reason to believe that measures will be taken to remedy the evils that it is considered would result if the Bill were to pass in its present form.

THE ANNUAL MEETING.

OUR readers need scarcely be reminded in this column of the three gatherings in connection with the anniversary of the Pharmaceutical Society to take place next week, namely, the Dinner of the members and their friends at the Grosvenor Gallery on Tuesday, the Annual Meeting in the Society's House, Bloomsbury Square, on Wednesday at noon, and the Conversazione in the evening of the same day, at the South Kensington Museum. We would remark, however, in order to prevent delay and disappointment, that the time has past during which tickets could be obtained from the Stewards, and that gentlemen wishing for them must now apply direct to the Honorary Secretary, Mr. RICHARD BREMRIDGE, 17, Bloomsbury Square. With respect also to the Conversazione we are pleased to be able to say that the difficulty which was under the consideration of the Council at its last meeting has been overcome, and that the Refreshment Department at the South Kensington Museum will be open for the sale of refreshments on the evening of the Conversazione from 9 to 12 o'clock.

COMMERCIAL JABORANDI.

PROFESSOR BAILLON has examined specimens of all the jaborandi which has been sold in the Paris pharmacies during the last two years. He states in the bulletin of the Linnean Society of Paris, that he finds three kinds; the first is *Piper* (*Serronia*) *Jaborandi*, now become very rare in commerce, and the other two are species of *Pilocarpus*, viz.: *P. pennatifolius*, Lem., and, especially at the Pharmacie Centrale of M. Dorvault, *P. Selloanus*, Engler. M. BALANSA also has observed this latter species of *Pilocarpus* employed at Assomption and collected for exportation to Europe as jaborandi. M. BAILLON has been able to compare it with the type of the 'Flora Brasiliensis' in the collections of Sellow in the Berlin Herbarium, and considers the identity to be absolute.

P. pennatifolius furnishes a very active jaborandi. M. HARDY has found pilocarpine in its fresh leaves, and it produces salivation and sweating. *P. Selloanus* is equally active; it produces a painful sensation in the pharynx. Can it, however, be considered certain that these are two distinct species rather than varieties of the same one? The answer would naturally vary according to individual views, and Professor BAILLON does not here answer it. *P. Selloanus* often has the inflorescence and the flowers themselves smaller than those of *P. pennatifolius*; but this is not constant, as is shown by the figure in the 'Flora Brasiliensis' itself. In this book (fasc. 65, p. 136, t. 30), *P. Selloanus* is distinguished by having two or three pairs of leaflets glabrous on both sides; slender pedicles six times as long as the buds and a very glabrous ovary; whilst *P. pennatifolius* has one to three pairs of leaflets, hairy chiefly on the veins beneath, linear-oblong, with the median and lateral veins prominent. The author also observes that in the former the bark towards the top of the branches is more yellow or of a pale brown. It is perhaps *P. Selloanus* that is grown in some hothouses under the name of *P. simplex*, but this cannot be determined without flowers, which it appears are much more rare than those of *P. pennatifolius*. Many leaves of *P. Selloanus* have four pairs of leaflets, and some fresh leaves of typical *P. pennatifolius* are entirely without any hairs on the veins both above and below. Possibly all the species of this genus possess the medicinal properties proved to exist in these two, which will be seen no doubt if the medicine keeps in vogue.

M. D. PARODI, of Paraguay, has informed M. BAILLON that the Picoda de la Trinidad, where BONPLAND collected the jaborandi, is not in Corrientes but in the environs of Assomption. M. PARODI recorded the plant in 1861 as a masticatory and sialogogue under the name of *Ibirà-tày*.

A CASE OF MIXED POISONING.

UNDER this title Mr. A. J. BELL contributes to the *Lancet* a report of a curious case of poisoning through a patient swallowing, instead of an anodyne mixture which he had sent her, a liniment containing—methylated belladonna liniment, nine drachms, tincture of opium, one drachm, and methylated soap liniment to two ounces and two drachms. After energetic treatment with the stomach pump, rectal injections of coffee and whiskey, galvanism, and artificial respiration, the patient recovered, but it was observed that notwithstanding the large dose of belladonna, and although the eyes were widely dilated shortly after the poison had been taken, it was ten hours before the delirium characteristic of belladonna poisoning manifested itself. Mr. BELL says that the bottle containing the liniment bore a red poison label, but it is fair matter for speculation how far he himself contributed to the unpleasant accident by giving a housemaid "plain directions" that the contents were to be "used as an epithem on hot flannels."

Provincial Transactions.

LIVERPOOL CHEMISTS' ASSOCIATION.

The thirteenth general meeting was held at the Royal Institution, April 11, 1878. The President, Mr. T. Fell Abraham, in the chair. The minutes of the previous meeting were read and signed. The donations to the library were duly acknowledged.

Mr. R. G. Dempster was elected a member.

Mr. Michael Conroy, F.C.S., called attention to a report in the *Pharmaceutical Journal* of a discussion that had occurred at a meeting of Council of the Pharmaceutical Society, relative to the publication of papers read before provincial associations, and to the very commendable part which Mr. Shaw had taken in that discussion. He considered the members of the Association were indebted to Mr. Shaw for defending their interests. He therefore moved that a vote of thanks be given Mr. Shaw. The motion was seconded by Dr. Symes, supported by the President and Mr. Sumner, and carried unanimously.

Fungoid Growth in Chloroform Water.

Dr. Charles Symes said I wish to call your attention to a fungoid growth which I have found in aq. chloroformi of the British Pharmacopœia. It is a very unusual thing, insomuch so that we have always looked on chloroform as preventing such growths in other liquids when added to them in small quantity. The water was in a stoppered bottle exposed to a comparatively strong light, but did not appear to have lost anything of its pungency. The fungus differs in character from that described by myself as occurring in infusions (*Pharmaceutical Journal* for 1864), and also from those described by Dr. Pereira in the early volumes of that Journal. When first examined the filaments were not articulated or branched, but now septa have formed and fine fibrillæ branch off having a somewhat beaded appearance. On exposing it in a small unstoppered bottle, so as to allow the chloroform to evaporate, animal life developed, but on adding a few drops of chloroform it rapidly disappeared; the fungus, however, still appeared to progress in its development. I have it here under the microscope with a quarter-inch power; examined under a one-sixth of an inch objective there is no further structure revealed, merely greater magnification.

Chloroform.

Mr. A. H. Mason, F.C.S., read a paper on "Chloroform." After calling attention to the various methods for the production of chloroform, and the reactions as published in text books, the probable method of production on the large scale was explained. The object of the paper was to show that pure chloroform was chloroform obtained from whatever source it may be, and ultimately that what is called methylated chloroform is just as pure and reliable as alcoholic chloroform. The impurities found in chloroform and methods for detection were explained and demonstrated, and it was shown that the process necessary for the purification of chloroform prepared from methylic alcohol was such as to render it probably more pure than that prepared from ethylic alcohol, and the fact that it is now being largely used in preference would imply that it is as reliable in administration.

The various specific gravities published were enlarged upon, and attention was called to the fact that the latitude given in the British Pharmacopœia is prejudicial. Chloroform prepared strictly in accordance with the British Pharmacopœia has a sp. gr. of 1·497, whilst absolutely pure chloroform has a sp. gr. of 1·500. It was explained that the substance soon deteriorates when absolutely pure, and to obviate this the manufacturers add about one per cent. of absolute alcohol to preserve it, and this addition reduces the sp. gr. to 1·497, but the British Pharmacopœia gives the sp. gr. 1·49, thereby admitting the addition or presence of such a quantity of alcohol as would be prejudicial in administration. The American Pharmacopœia gives the sp. gr. 1·480, and for this reason most of the American chloroform is reported as adulterated and large quantities are imported from other countries.

Six samples were marked representing chloroform prepared from ethylic, methylic alcohols and acetone, and the members were invited to state the source from which the chloroform was obtained, but detection was impossible.

The only difficulty from a pharmacist's point of view was the fact that the British Pharmacopœia prescribes the use of ethylic alcohol in the manufacture, but this might be obviated in a new edition, in which it will be necessary to state definitely the sp. gr.

Mr. Mason said the subject was one of importance, and its facts would be appreciated by every chemist; at the same time from a medical point of view there would be imaginary responsibility. But from an economical standpoint, if it could be shown that the one is as valuable as the other, why should the national revenue benefit from the production of a substance which is used to alleviate human suffering in its most acute form. The labours of Sir James Simpson, to whom we are indebted for its introduction as an anæsthetic, were alluded to.

The President thought it would not be out of place to mention that to Mr. David Waldie, the first lecturer to the Association and one of its honorary members, belonged the honour of having suggested to Professor Simpson the use of chloroform as an anæsthetic. With reference to the relative merits of chloroform made from pure and from methylated spirit, he (the president) stated that he had been assured by physicians whose opinions were entitled to all respect that the effects of the two were not identical. He thought it not altogether impossible that by united representation the excise might be induced to arrange for the remission or reduction of the duty on spirit used for the manufacture of this important article.

Mr. Shaw said he had listened with pleasure to the paper which had just been read. It was interesting from both a chemical and pharmaceutical point of view. He well recollected the time of the introduction of chloroform as an anæsthetic in Edinburgh, by Professor Simpson, and the success which attended its administration. It was correct, as the president had stated, that Mr. Waldie was the first to suggest its preparation for anæsthetic use. The manufacture of chloroform for some years was almost exclusively carried on in Scotland, in consequence of the excise duty on rectified spirit being so much less there than in England, and no duty being charged on its exportation southwards. This circumstance virtually gave a monopoly to the Scotch manufacturers, which they have to some extent maintained, notwithstanding the equalization of the duty on spirit some years ago. He was scarcely prepared for the statement that it was impossible to tell the difference between chloroform prepared with pure spirit and that prepared with methylated. He was under the impression that the flavour of methylic ether was very distinct when tested in a certain manner.

Dr. Symes said that chloroform of equal purity is prepared by Messrs. Macfarlane and Co., to that of Messrs. Duncan and Flockhart and possibly by other makers. Chemically speaking there is absolutely no difference between chloroform prepared from pure and methylated spirit if properly purified, but he was not prepared to say that constitutionally there is none—none that can be detected by the human economy, this being a question for the medical man rather than for the chemist. The sulphuric acid test of the Pharmacopœia, as shown by Mr. Brown some years since, is incorrect. Impure chloroform is not appreciably coloured by agitation with sulphuric acid; the acid itself, however, is deeply so. Pure chloroform, on the other hand, when agitated with sulphuric acid, and afterwards carefully examined by reflected light, is found to possess a slight colour. The presence of a small quantity of alcohol considerably enhances the keeping qualities of chloroform, and as regards its detection Mr. Dott has shown that specific gravity is even more delicate than the molybdic acid test of Dr. Davy.

Messrs. A. C. Abraham, Michael Conroy F.C.S., E. Davies F.C.S., F. J. Mackinlay, R. Sumner, A. E. Tanner, and other members took part in the discussion, With a cordial vote of thanks to Mr. Mason for his able paper, which was carried by acclamation, the meeting was brought to a close.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, May 2, Dr. Gladstone, F.R.S., President, in the chair. After confirmation of the minutes, etc., the names of the following candidates were read for the first time: E. R. Budden, A. A. Drinkwater and J. Collins.

The President then called on Mr. SIDNEY H. VINES to deliver a lecture on—

The Chemical Aspects of Vegetable Physiology.—The investigation of substances which occur in the cells of plants has for a long time formed a favourite theme for chemists, whilst the decomposition of these substances has added largely to our knowledge of chemistry. It is strange that but few researches have been made in the direction of determining the reason of the occurrence of these substances and the part that they play in the economy of the plant. One of the most typical of these substances is chlorophyll. Chlorophyll, which occurs in nearly all plants, is essential to the function of assimilation, which consists of the decomposition of carbonic acid and the formation of starch in the cell, this process being accompanied by the liberation of oxygen. As early as 1690 it was observed by a French botanist that bubbles of gas were given off by green leaves submerged in water; it was next noticed that if the water had been previously boiled no gas was evolved. Priestley found that the gas given off by leaves in sunlight was of a "purer and better nature," *e.g.*, air which would not support combustion could be so purified by introducing a green plant and exposure to sunlight, as to be again capable of supporting life and combustion. The next point noticed was that some sort of proportion existed between the amount of "fixed air" (CO_2) present, and the "dephlogisticated air" given off. De Saussure then observed that this process was accompanied by an increase of weight in the plant. Our knowledge of the subject remained at this point till about 1837, when the circulation of starch granules was discovered and their development studied. Sachs next took up the subject and proved that starch grains are not formed in plants which are bleached from the absence of light, and that their formation in the chlorophyll corpuscles depended on the exposure of the plant to bright sunlight. Godlewski proved that if no carbonic acid was present, no starch grains were formed. So we have two sets of phenomena, namely, the evolution of oxygen with absorption of carbonic acid, and the formation of starch grains, for both of which three conditions are essential, viz., sunlight, chlorophyll, and carbonic acid. So we may justly conclude that the two sets of phenomena belong to the same function.

Starch is not the only product of this assimilation. In the onion we find no starch, but in its place another carbohydrate, grape sugar. Some experiments of Briosi which seemed to show that substances other than carbohydrates are formed, *e.g.*, oil drops, has been lately disproved by more exact observations of Godlewski. So that as far as we know the only substances formed as a consequence of assimilation are carbohydrates, and to their formation therefore the increase of weight of the plant is due. De Saussure found that a plant increased in weight 531 grm., whilst the carbon in the carbonic acid was 217 grm. These numbers fairly correspond with the increase, supposing the carbon to unite with hydrogen and oxygen to form starch, thus $C_6H_{10}O_5 = 162$ to $C_6 = 72$.

The next points are what is the function of chlorophyll? and what part does it play in the formation of starch? As regards the composition of chlorophyll we have but little information. There are at present several distinct views as to its proximate composition: one that it is a definite and distinct chemical entity, the second, that it is a mere mixture of colouring matters, or rather of two groups of colouring matters, one group being blue to which the name cyanophyll is applied, the other being yellow and termed xanthophyll. Another view supported by Pringsheim, Karl Kraus, etc., holds that chlorophyll is nothing less than the cyanophyll of other observers, whilst the xanthophyll is a distinct substance which is a product of the degradation or formation of chlorophyll, but forms no integral part of it. The same diversity of evidence prevails with the ultimate constitution of chlorophyll. According to Pfaundler it contains 0·37 per cent N.; other results give 7 per cent.; whilst a Russian observer, Timiriazoff, believes it to be an ammoniacal compound and has called it chlorophyllin. One point seems to be agreed upon by all observers, viz., that it contains iron in its molecule. The opinions which prevail as to its action are various. Wiesner thinks that the growing cells absorb CO_2 from the air; that the chlorophyll combines with the O, whilst CO unites with the elements of water to form carbohydrates: the chlorophyll in its turn is deoxidized, and the oxygen thus set free is evolved by the plant; so that according to this view chlorophyll acts as a carrier. Karl Kraus suggests that the process is one of reduction and that chlorophyll is formed by the combination of a substance, leucophyll (for whose existence there is no experimental evidence), with the products formed by the reduction of the carbonic acid absorbed from the air. The chlorophyll is then split up by the action of light into leucophyll and other bodies, the latter forming starch. The leucophyll recombines and so the process goes on continuously. According to Sachs, chlorophyll is a product of assimilation, and by the further action of light is converted into starch. By the action of purpurol on resorcin, colouring matters, more or less remotely resembling chlorophyll, have been formed. It is known, moreover, that carbohydrates can be oxidized into aldehydes and aromatic substances. From some experiments of Karl Kraus it is probable that some substance resembling an aldehyde exists in seedlings, while Gorup Besanez has detected pyrocatechin in plants. Some results of Karl Kraus seem to show that in seedlings an aldehyde and an aromatic substance unite in the dark to form ætiolin, but in the light to form chlorophyll. So that on the whole there is some foundation for the theory of Sachs, which may be summed up thus: that seedlings have the power of decomposing their stored up carbohydrates, forming acids and aromatic substances; the former are reduced to aldehydes uniting with the latter to form chlorophyll (or in the dark ætiolin), the ultimate product being again starch. If we trace out the probable destiny of the carbohydrates we find that one portion is used to build up the vegetable cell wall, and is there deposited as lignin, etc.; a second part combines with nitrogen to form protein, but of the seat of formation of this protein we have no idea; whilst a third portion is decomposed into chlorophyll for the newly formed parts of the plant. If any excess remains it seems to be stored up for another year. The lecturer then concluded this portion of the subject, merely pointing out how much remains to be done before conclusions can be arrived at with any certainty.

In the second part of the lecture Mr. Vines considered the origin of vegetable acids and their bearing on the first part of his discourse. Liebig and Mulder, from observations on the ripening of fruits, came to the conclusion that acids were the first products of assimilation, and from these the carbohydrates were formed. This theory breaks down under the test of experiment, and then the question arises, by what process are the acids formed in the plant if not by assimilation? Hoppe-Seyler, by the decomposition of sugar with alkalies in the absence of air, has produced formic acid and pyrocatechin. Karl Kraus has observed in the onion, which contains much grape sugar, that from the external dry scales much pyrocatechin can be obtained; these dry scales also have deposits of calcium oxalate, whilst the internal scales contain only sugar, so that here the sugar is decomposed into an oxalate and an aromatic substance. In the germination of leguminous plants a substance occurs, asparagin, which has much significance in vegetable physiology. It has been found that in the germination of the Leguminosæ the amount of nitrogen in the seed does not vary; the nitrogenous substance of the seed is oxidized into asparagin, with the evolution of CO_2. If the germination is in the dark the asparagin accumulates, but when the plant is exposed to light the asparagin disappears and the plant forms carbohydrates. It has been suggested that asparagin is formed by some process analogous to that of digestion. It is known that some seeds contain a peptic ferment, also that aspartic acid is formed when gluten is digested by the pancreatic ferment, so that the suggestion is not without some foundation. The lecturer concluded with some remarks as to the proximate composition of seeds, about which much uncertainty exists. It is stated that seeds contain much legumin. By some of Hoppe-Seyler's pupils legumin is said to be a sort of globulin. The solanin from potatoes is now believed to resemble asparagin rather than belong to the alkaloid family. Chenopodin, from the chenopodium, has been said to be identical with leucin. In concluding, the lecturer said that his principal objects had been to sketch the points of contact between vegetable physiology and chemistry and to point out the sort of information which the vegetable physiologist was most desirous of obtaining from the chemist.

The President said that in listening to the lecture three points had especially attracted his notice: (1) That the subject of vegetable physiology was of great interest from a chemical point of view; (2) that the subject was one of which the fellows very rarely heard anything; and (3) the very great clearness and ability with which Mr. Vines had introduced and handled the subject.

Dr. Gilbert could but agree with the President in thanking Mr. Vines for his lucid account of what is known, as well as for showing the lack of knowledge, and indicating the lines of work which it was specially necessary to follow up. Mr. Vines, though principally directing his attention to assimilation of carbon, had not omitted to refer to the assimilation of nitrogen, which from one point of view was even of greater importance. If he might suggest a line of research which would be of the utmost importance to agriculture, as well as interesting to the vegetable physiologist, he would recommend an investigation especially as regards nitrogen in plants from the seed upwards, belonging not only to the leguminous order but also to some widely different order, *e.g.*, a gramineous plant.

Mr. Kingzett could but notice how much speculation existed in the various theories which had been brought before the Society; in his opinion much might be learned by studying the products of chlorophyll when acted on by different reagents. He also called attention to the great want of analytical data in the papers of Hoppe-Seyler's pupils which Mr. Vines had referred to.

Professor Thistleton Dyer pointed out that for the study and elucidation of these processes all the delicacy of the histologist and all the analytical skill of the chemist were required. The subject could either be investigated by the vegetable physiologist from a morphological aspect or by the chemist who concentrated his attention on the products of the machine. The latter investigator was sometimes too apt to consider vital products as substances which could be split up by reagents; this method, although giving us much information as to the substances when dead, often furnished us with but little knowledge of their condition when alive. Some substances which were of the greatest importance to the chemist, etc., were of little interest to the vegetable physiologist and were viewed by him as mere excretions. Thus the cinchona alkaloids seemed to be merely casual concretions in the bark of some plants, and if the bark containing all these valuable alkaloids were removed the plant seemed none the worse. The great problems are, how does a plant get its living and how does it assimilate its food? It seemed to the speaker that chlorophyll brings up vegetable life to a point where fungoid growth starts. Thus if we cut through the stem of a tree we find the outside parts green, the inside parts white, and feeding on the nourishment afforded by the external layers.

Professor Church said that mucilage was transformed in a manner similar to starch; this was proved by experiments with the seeds of the flax plant, which contain mucilage but no starch.

Mr. Vines in reply thanked the Society for the kind interest with which they had listened to his lecture and reiterated his desire for the cordial co-operation of the chemist and the vegetable physiologist. With reference to Mr. Kingzett's remarks as to speculation, he would only say that the vegetable physiologists would only be too glad to build their theories on more facts when the chemists furnished them.

After a vote of thanks to Mr. Vines for his lecture the Society adjourned to May 16, when the following papers will be read:—1. The Action of Hypochlorites on Urea, by H. J. H. Fenton; 2. On the Behaviour of Metallic Solutions with Filter Paper; and On the Detection of Cadmium, by Thomas Bayley; 3. On the Action of Bromine upon Sulphur, by J. B. Hannay; 4. On the Determination of High Boiling Points, by T. Carnelly, D.Sc., and W. C. Williams; 5. On Essential Oil of Sage, by M. M. P. Muir and S. Suguira; 6. On High Melting Points, by T. Carnelly, D.Sc.

SOCIETY OF ARTS.

Electric Lighting.*

BY DR. PAGET HIGGS.

I feel that it is great good luck that I am among the first to bring to the notice of this Society, so great a pioneer in the application of science to industrial arts and manufactures, some details on the subject of electric lighting. This subject is not only now of the highest importance to certain technical classes, it also gives promise of development to matters concerning our lives as private individuals. As a mode of public illumination it has attained definite success.

Time was when subjects still in the domain of science were very far from industrial realization; to-day an invention or discovery is in the hands of the investigator in his laboratory; to-morrow it is universally applied, and the world wonders how it ever did without it in its absence. The railway and the telegraph are not very ancient inventions; there are still living many thousands who have travelled by stage-coach and thought ten miles an hour wonderful speed; and the telegraph is not yet a generation old. We all have heard of the telephone. We know that it can be used for five hundred miles or more on a practical telegraph line; two years ago, had we been told that we could hear our friends laughing a day's railway journey distant, we should have regarded our informant as indulging in tall talk. A few months ago many of us had never heard of the phonograph, now we know that we can effectually register speech.

With these precedents, how can we say that electricity, which is even now far removed from the *rôle* of a mere laboratory aid, may not, in perhaps some such short period, be a means of illumination generally adopted. At

* Paper read before the Chemical Section of the Society of Arts. From the *Journal of the Society of Arts*.

the present moment, as far as I know, there is no competition between our present means of illumination, namely, gas lighting and electric lighting. I use the term no competition, because these two illuminating methods have, at the present time, two distinct fields. Electricity is still at a disadvantage in its application to the lighting of small spaces, or where many small lights are required. Gas is not advantageous in the lighting of large spaces. It might also be said that it is under considerable disadvantages in the lighting of public thoroughfares; and that, when it is employed for the lighting of large engineering or open-air works, it is absolutely ineffective. By its aid, also, it is impossible to distinguish colours, however brilliant or perfect its light may be. It is well known that blue and green—unless the latter be a so-called gas-light green—cannot be distinguished in gas-lighted rooms. Further, even in large enclosed spaces, the use of gas is attended with a deterioration of atmospheric purity prejudicial to health. With the electric light, on the contrary, not only does the light leave the oxygen of the air unconsumed and uncontaminated, but, by generating ozone, it might be said to act as a purifier. That this generation of ozone is not inconsiderable is known to every one who has stood within a few yards of the electric light. For this reason alone we should look forward with increased interest to the probability of electric lighting in its domestic application.

In the course of this paper I shall endeavour to show the relative economies of electric lighting and gas lighting, as applied to manufacturing industries. But electric lighting, supposing that its economy would not be less than that of gas, would still have many and important advantages over gas lighting in certain cases. For instance, the intensity of its light admits of large works of an engineering or constructive character being carried on, practically, as well by night as by day. No method of gas lighting has yet attained this position. In silk mills, dye works, picture galleries, stores, etc., where to distinguish colours by night as by day enables the manufacturer or vendor to labour continuously, gas lighting must again give place absolutely to electric lighting; for by the electric light scenes are painted, rooms decorated, delicate colours assorted, and looms fed as well as by day.

The advantages of the electric light have also been found in shipbuilding, and with ships themselves upon the ocean; it is unrivalled for lighthouse applications, and it promises to afford a means to the submarine diver that daylight itself has not achieved.

In the fine arts, it will, undoubtedly, be used to illuminate our picture galleries, as it is now used to light portions of the Louvre at Paris. To photography it has given so much assistance that your sun-picture may be taken by this artificial sunlight at midnight. Of its use in war, in detecting the movements of attacking armies, the course of torpedo-boats, etc., it is unnecessary here to say anything.

The applications thus briefly noted are to be regarded as accomplished facts. In soliciting your attention to the description and details that follow, it is necessary to state definitely and decidedly that the application of the electric light to industrial purposes is no longer a chimerical idea, but that in consequence of the recent rapid marked improvements in electro-magnetic apparatus electric lighting demands the attention of every manufacturer and constructor, not only as a system of lighting superior to any other in use for his purpose, but because by it results may be had that have hitherto been unattainable.

Electric lighting, as a system for lighthouse illumination and experimental purposes, has been known for some years, but from the large space occupied by the magneto-electric machines, their cost, and the high motor power required to drive them, its practical use has been limited.

Going back to first principles, we have that of magneto-electricity as discovered by Faraday. His experiment with a bar of iron surrounded by a coil or spiral of wire, and the production of electric currents in the coil by approaching to or drawing a magnet from the bar, and the correlative laws, are well known. Pixii, in 1833, constructed the first magneto-electric machine, upon which Saxton and Clarke improved. With these machines an electric current was obtained by causing permanent magnets and coils of wire to revolve with their poles in juxtaposition. Nollet, of Brussels, improved and enlarged Clarke's machine, and modifications of this machine have been constructed by Holmes, of London, and the Compagnie l'Alliance, of Paris. In 1854, Dr. Werner Siemens, of Berlin, improved the revolving coil giving to all magneto machines with permanent magnets what may be considered at the present time as the final step in this description of machine. But electric machines with permanent magnets are disadvantageous in use, because increased dimensions (beyond certain limits) do not give increased electrical results.

Magneto-electric machines (with electro-magnets) of the present powerful construction are due practically to Dr. Siemens and Sir Charles Wheatstone, who, within a short period, independently discovered the principle of accumulation by mutual action. Taking advantage of the fact that iron always has a certain amount of magnetization said to be residual or remanent, these inventors cause a coil of wire to revolve between the poles of an electro-magnet which is in electrical circuit with the coil itself. Starting with the current induced in the coil by the residual magnetism, this current passes from the coil to the electro-magnets, making them more strongly magnetic, and giving rise to still more powerful currents in the coil.

Magneto-electric machines based upon this principle are now in use under two forms of construction. Of these forms I have only one to show you, namely, the Siemens machine. The machine invented by M. Gramme, of Paris, and extensively used in France, I do not purpose to describe, as the results obtained by both machines are so similar that a description of one will afford understanding of the other. However, in dealing with the question of economy I shall borrow largely from the published results given by M. Gramme, as aiding to show the advantages of electric lighting from the point of view of two independent sources.

In the latest form of construction of the Siemens magneto-electric machine, the armature, as the revolving coil may be called, consists of several lengths of insulated copper wire coiled in several convolutions upon a cylinder. The whole surface of the cylinder is covered with wire, laid on in sections, each convolution being parallel to its longitudinal axis. For about two-thirds of its surface the wire cylinder is surrounded by curved iron bars, there being just sufficient space left between these curved iron bars and the wire cylinder to allow of its free rotation. The curved iron bars are prolongations of the cores of large flat electro-magnets; the coils of these electro-magnets and the wire on the cylinder (from brush to brush) form a continuous electrical circuit. On revolving the cylinder (which is supported upon a longitudinal axis in suitable bearings, the axis carrying a pulley) an initially weak current is generated into its wires by their passage through the magnetic field formed by the residual magnetism of the iron cores of the electro-magnets, and the current being directed into the coils of the electro-magnets increases the magnetism of the cores, which again induce a stronger current in the wire cylinder. This mutual action may continue until the iron has attained its limit of magnetization. The maximum magnetic power acting upon each convolution is attained at every revolution of the armature, when the convolution passes through the centre of both magnetic fields, and gradually falls to zero as the convolution becomes perpendicular to that position. Each convolution has, therefore, a neutral position, and a convolution leaving that position on the one side of the axis and advancing towards the north pole of the electro-magnet, would be subject to a direct induced current, and that portion of the convolution on the opposite side of the axis would be traversed by a current of opposite direction, as regards a given point, but of the same direction as regards circuit.

Each of the sections of wire coiled upon the cylinder consists of two separate coils, leaving four ends; two of these ends are connected to each of the segments of a circular commutator divided into parts. But all the coils are connected to the several segments of commutator in such a manner that the whole of the double sections form a continuous circuit, but not one continuous helix.

Two brushes, placed tangentially to the segments of the commutator, collect the electric currents; these brushes are connected one to each electro-magnet, and the two free ends of the electro-magnet coils are connected to the conducting wires leading to the lamp.

The dimensions, weight, number of revolutions, made by the armature, light equivalent in normal candles, and h.p. required for driving, are for three sizes of machines as follows:—

Dimensions in inches.			Weight in lbs.	Revolutions of cylinder.	Candles' light.	H.P.
lgth.	wdth.	hgt.				
25	21	8·8	298	1100	1000	$1\frac{1}{2}$ to 2
29	26	9·5	419	650	6000	$3\frac{1}{4}$ to 4
44	28·3	12·6	1279	480	14,000	0 to 10

In the lamp which it is preferred to use with the Siemens machine, the points of the carbons after being separated are brought together again by the gravitation of the top carbon and its holder. The descent of the top carbon actuates, by means of the straight rack it carries at its lower end, a large pinion, the spindle of which carries a small pinion gearing into a second neck attached to the lower carbon holder, the superior weight of the top carbon and holder in conjunction with the multiplying ratio of the two pinions producing a continual tendency of the carbons to approach each other. The large and small pinions are connected to each other, and to the spindle that carries them, by an arrangement of friction discs, and the object of this construction is to allow of the two racks being moved equally and simultaneously up or down for the purpose of focussing the light when required. This movement is effected by means of bevelled gearing and actuated by a milled head which can be pressed into position when required. On the spindle carrying the large and small pinions and the friction discs is placed a toothed wheel connected with the spindle by a pawl and ratchet. This wheel is the first of a train of wheels and pinions driving a regulating fly in the usual way. The pawl and ratchet are provided to allow of the rapid distancing of the carbon holders when it becomes necessary to introduce fresh carbons. The spindle of the fly also carries a small finely toothed ratchet wheel. This ratchet wheel is actuated by a spring pawl, carried at the end of a lever, which lever is the continuation of the armature of the electro-magnet, in such a manner that when the armature is attracted by the electro-magnet the spring pawl engages in the teeth of the ratchet wheel and causes the wheels in gearing therewith to act upon the racks of the carbon holders to draw them apart.

The action of the lamp is as follows:—The current passes from the conductor to the top carbon holder, thence through the carbons to the bottom carbon holder, then to the coils of the electro-magnet situated in the base of the lamp. From the coils of the electro-magnet the circuit is completed to the other conductor. Upon the current passing through the circuit, the armature of the electro-magnet is attracted, and the abutment from the armature lever caused to short-circuit the coils of the electro-magnet, releasing the armature. The armature being released, the short circuit is removed from the coils of the electro-magnet, and the cycle of movement repeated; in this manner an oscillatory motion is given to the armature lever, which, by the spring pawl, actuates the ratchet wheel, the train of clockwork, and the racks of the carbon holders, forcing the carbons apart until the distance between their points sufficiently weakens the current, so that it no longer attracts the armature of the electro-magnet. Thus, by the combined action of gravitation of the top carbon in drawing the carbons together, and of the current to separate the carbons when they approach too closely, a working distance is maintained between the points with perfect automatism.

Magneto-electric machines have chiefly been employed for the production of the electric light, but they are also applicable for the transmission of power and for electro-metallurgical processes. In this paper we shall confine our attention to their use for the production of the electric light.

With regard to the improvements in recently constructed dynamo-electric machines, we learn from Professor Tyndall's report to the Elder Brethren of the Trinity House, that magneto-electric machines of old construction cost ten times more, occupied twenty-five times the space, and weighed fourteen times as much as the recent machines, while they produced only one-fifth of the light, with practically the same driving power; that is to say, taking light effect in each case into consideration, the new machines cost one-fiftieth, and are, as regards space occupied, a hundred and twenty-five times more advantageous than the earlier forms.

Against the use of magneto-electric machines for practical purposes, there has been quoted the disadvantage of stoppage due to wear and renewals, but in the present form of machines the chances of stoppage are no more than those that arise generally with machines of any ordinary construction. The Trinity House report, previously referred to, states that the Siemens machine then tried "worked well from the 7th March to the 7th April without any necessity for a stoppage. On the 11th March the commutator plates and brushes were again adjusted; and on the 6th April, the commutator plates and brushes were renewed."

The limit to the duration of the light is at present set by the size of the carbons and the rate of their consumption, which depends much upon the power and quantity of the current, and consequently upon the size of the machine employed. In the lamps, the lower carbon is eight inches, the upper carbon sixteen inches in length, and the holders are arranged to receive a round or square carbon of nine to twenty-one millimetres diameter or side. Eight to ten hours is the longest time of duration of the carbons. Attempts have been made to construct lamps with the carbons in the form of circular discs set edge to edge, and caused to revolve by clockwork in order to lengthen the duration of burning, and a lamp so constructed by M. Regnier has been said to have given good results, but the difficulty of obtaining homogeneous carbons may be considered to be insuperable to the practical introduction of this lamp.

I now come to the more interesting portion of my paper, that relating to the efficiency of electric lighting, and its comparison with methods of gas lighting. We may assume, I believe, without fear of contradiction, that gas cannot be manufactured under a cost, including working profits, of two shillings for one thousand cubic feet as an average price. A gas-burner of twenty candles' light will certainly consume six cubic feet of gas per hour. Eight thousand candles light would necessitate four hundred burners, consuming two thousand four hundred cubic feet of gas per hour, costing four shillings and nine pence. The cost of fixing gas pipes, burners, cocks, etc., at ten shillings per burner, pipes included, would be £200. Assuming three hundred working nights, with an average time for lighting of five hours per night, or fifteen hundred hours, and reckoning cost of renewals, repairs, and shifting with work in progress, to be included in an interest of twelve per cent. per annum, we have—

Interest on £200	£24 0
Cost of gas for 1500 hours . . .	356 5
	£380 5

If only five hundred hours were worked during the year the cost would be—

Interest on £200	£24 0
Cost of gas	118 15
	£142 15

The cost of a magneto-electric giving this light intensity, with lamp and steam motor and connecting wires, would not exceed £250. The cost per hour for carbons, coals, attendance, oil, renewals, etc., may be taken at two shillings per hour under the most unfavourable conditions. This gives—

Interest on £250	£30
1500 hours at two shillings . , . .	150
	£180

which is a ratio in favour of the economy of electric lighting of 2·1 to 1.

If five hundred hours' lighting be taken, the cost for the electric light would be £80, or in the ratio of nearly 1·8 to 1 in its favour. But this is not strictly a just method of estimating the value of the electric light, because the one lamp will brilliantly light a space which would be so badly illuminated by the distributed gas-burners that work could not be carried on except under great inconveniences.

An actual comparison of these methods of lighting may be made by referring to some data given by Messrs. Siemens Brothers from the system as employed by them in one of the departments of their telegraph works, which, previous to the introduction of the electric light, was imperfectly lighted with one hundred and twenty gas-burners. The imperfection of the light, and the progress of the work necessitated frequent alterations in the gas fittings. Each of the burners consumed six cubic feet of gas per hour at a cost of three shillings and nine pence per thousand. The cost of fixing gas pipes, including cost of pipes, burners, cocks, etc., for the whole number was £60; interest may be taken at 15 per cent., to include wear, tear, renewals, and removals, per annum. During extensive orders, day and night work are continuous, and one thousand hours' consumption per annum is below the actual expense.

Interest	£9 0 0
Cost of gas consumed	135 0 0
	£144 0 0

The one hundred and twenty burners will give only two thousand four hundred candles' light; actually, but a percentage of this is attained, and with steam or fog the gas jets are obscured. It is necessary to employ three lights for the three spaces to be lighted. Three machines, with lamps, conducting wires, and mounting, etc., cost £250.

Interest at 15 per cent. on £250 .	£37 10 0
Carbons, coals, attendance, renewals etc., for 1000 hours	35 4 0
	£72 14 0

This is an economy of 2 to 1 in favour of electric lighting; but, if the ratio of light intensities were adopted, the advantage would be as 6 to 1 in favour of electric lighting.

The economy varies with the motor power; the light is cheapest when water power is to be had, and most expensive when a gas engine is employed. At M. Dieu's workshop at Davours, with the Gramme machine, the cost per hour is one shilling and eleven pence, against two shillings for gas. M. Ducommun states that the electric light costs two and a quarter times less than gas light, when wear, tear, and interest are taken into consideration.

It must not be forgotten that, in calculating these relative costs, the gas is taken as supplied to other consumers than the works in question. If it were necessary to construct a special gasworks, requiring special technical knowledge and attention, where the waste products of the gas manufacture could not be utilized, the cost of the gas would rise to ten to twelve times that of electric lighting, and in many cases would be absolutely inapplicable under conditions where the electric light might be easily instituted.

Generally, one small machine will illuminate five hundred square yards of fitters' shops and machine shops, and two hundred and fifty square yards of weaving and spinning mills, etc., while in the open air, on yards, and landing places, two thousand square yards may be easily and brilliantly illuminated with a single lamp.

In the celebrated chocolate factories of M. Ménier, fourteen machines are employed, and these are so arranged that the electric light can be supplied to the drawing and dining rooms, conservatories, and gardens of the residence.

At Paris, the Chapelle-Paris goods depôt has been provided with the electric light, with an economy in the staff of twenty-five per cent., for the reason that work can be carried on so much more expeditiously.

The electric light is in use in Paris, also, in the magazine du Louvre, and the Avenue de l'Opera, the *Figaro* offices, the works of the new Grand Hotel, the Exposition Buildings, and nearly every important public building in course of construction.

In the erection of the Tay Bridge by Messrs. Hopkins, Gilkes, and Co., two machines were employed, distant three hundred yards from the lamps, which were three hundred yards apart. The cost of working, including motor power and attendance, was about one shilling and fivepence per hour for each lamp. When both lights were thrown in one direction, a newspaper could be read at a distance of two miles.

Messrs. Head, Wrighton, and Co., of Stockton-on-Tees, have employed the electric light for night work for about three months, during which time the interest on the outlay, superintendence, and cost of carbons was fully covered by the charge of one shilling per hour for a thousand candles' light.

These typical cases will serve to show that electric lighting supplies a long existing want in industry.

The methods of utilizing the current for light purposes are still somewhat crude, and there is much yet to be done before the electric light can be employed with comfort in illuminating rooms and halls of ordinary dimensions. A source of inconvenience is the want of chemical purity in the carbon rods, but this inconvenience is not apparent in the lighting of large spaces, and, doubtless, when an efficient means of tapping or subdividing the electric current has been devised, the electric light will take the position of gas lighting in every household. And, although the attempts to subdivide the current, so as to obtain many smaller lights, have only promised, but have not attained success, I believe I may conclude, as I have mentioned in the introductory remarks, that we cannot say how soon this may be brought about. Indeed, I have in the laboratories of my friends, both in England and France, seen arrangements in action that go very far to fulfil what is required, and I should not be surprised at any moment to learn that the difficulties have been overcome, and that the future means of illumination for all purposes would be electricity.

In utilizing the electric light, the lamp is sometimes, as in lighting large spaces, unprovided with glass or shade; in other cases opal and milk glass globes are used to soften the light; but both these methods cause fatigue to the eye, when the operator or workman has the habit of looking directly at the light. To obviate fatigue from the direct rays, it has been proposed to place the electric focus in a reflector, and to project the rays upon a whitened ceiling, or upon another reflector, so as to diffuse a soft and pleasant light throughout the room. This method would also be applicable for street lighting, in thoroughfares or public places where the direct rays might be considered inadmissible.

In this paper I have purposely omitted to make mention of the Jablochkoff lamp, or so-called "electric candle." The attention of the members of this Society has, I believe, been called to this invention. Although in use in Paris, I am not aware that it is employed in England. These candles have serious drawbacks. They can be used only with a machine giving alternate currents. Such machines, for equal light effects, require a larger expenditure of motor power than machines that give a permanent current; the consumption of carbon is greater than in an electric lamp; and these disadvantages will, I am afraid, interfere with the extended introduction of this system of electric lighting. To M. Jablochkoff is, however, due the merit of opening up a new era in this method of illumination, because he showed how very nearly practical results were at hand.

I may conclude this paper with a *résumé* of the advantages of electric lighting. In the first place, electric lighting can be economically employed, both with regard to its intensity and colour effect, where gas lighting or other modes of lighting are valueless. In lighting large workshops, stores, etc., electricity enters into competition with gas, both in economy and safety from fire.

I have to call the attention of the Society to the machine and apparatus put before them by Messrs. Siemens Brothers, and to thank you, Mr. Chairman, ladies, and gentlemen, for your attention to a paper that has unavoidably been fatiguing from the amount of detail it has involved.

Parliamentary and Law Proceedings.

Alleged Adulteration of Flour at Selby.

At the Selby Petty Sessions, on Tuesday, May 7, before Mr. B. Hemsworth, Mr. W. S. Smith, and Mr. J. Adams, Messrs. John Croysdale and Sons, flour millers, Whitely Bridge, who also occupy flour stores at Selby, were summoned on two separate informations under the "Sale of Food and Drugs Act, 1875," for having sold flour mixed with alum, in one sample equal to 18 grains of alum to 4 lb. weight of flour, and in another sample to 10 grains of alum to 4 lb. weight of flour.—Superintendent Gill, the officer appointed under this Act, prosecuted; and Mr. Heaton Cadman, barrister, appeared for the defence.

Mr. Cadman reminded the Bench that when the case came before them on the 15th of April a request was made under the Adulteration Act that a sample or samples of the flour which they were going to be told had been got from the stores of the defendants should be sent for analysis to the authorities at Somerset House. In accordance with that application samples were sent to Somerset House, and a report upon them had been received from the analyst there, and he wished to know whether Superintendent Gill, on the face of that report, proposed to proceed with the case. He said, advisedly, that if the case was proceeded with, after the report of the authorities in London, who were really the final court of appeal in a case of this kind, then the prosecution would assume an aspect of distinct malice or of some ulterior motive.

Superintendent Gill said that he had determined to go on with the case. Having been sworn, he stated that on the 11th February he visited the defendants' stores at Selby. He there purchased two samples of wheat from the manager, and numbered them 29 and 30 respectively. He sealed them and sent them to Mr Allen, West Riding analyst, at Sheffield, for the the purpose of obtaining his certificate after having analysed them. With respect to the sample numbered 30, the certificate was to the effect that it contained alum to the proportion of 18 grains to the 4 lbs. of flour. This was a smaller amount than was usually employed, the common proportion being about twice that found. Alum was added to inferior flour to improve the apparent quality of the bread made from it. In the proportion found he did not think it would render the bread indigestible. With respect to sample 29, the certificate was to the effect that it contained alum in the proportion of ten grains to four pounds of flour. This was a very insignificant amount, the usual proportion employed being about four times as great. In the very small proportion found alum would not render the bread indigestible. In accordance with the request of Mr. Croysdale he had sent the samples to Somerset House to be there analysed, and had received that morning the following certificate:—"The two samples of flour referred to in the annexed letter, and marked No. 29 and No. 30, were duly received, and the seals were perfect. We hereby certify that we have analysed the same, and declare that No. 29 contains alumina equivalent to 9 9-10th grains of ammonia alum per four pounds of flour; and that No. 30 contains alumina equivalent to 21 1-10th grains ammonia alum per four pounds of flour. The amount of alumina calculated as ammonia alum naturally present in flour examined by us has ranged from 2·0 to 10·3 grains for four pounds of flour. Sample 29, therefore, according to our experience contains no more alum than is found in genuine flour, and with regard to the excess of alumina in No. 30, the results of our experiments do not enable us to confirm that it exists in the flour in the form of alum. (Signed.)—J. Bell, R. Bannister, H. J. Helm."

Mr. Cadman said it was for the prosecution to make out their case upon that certificate. It said, "It contains no more alumina than is found in genuine flour." There was not a word about alum. Alumina, it was admitted, was found in flour; but there was no more in this flour than was usual.

Mr. Smith thought that what the authorities at Somerset House called alumina Mr. Allen called alum.

Mr. Cadman: But alumina is not alum.

Mr. A. H. Allen was then examined by Superintendent Gill, and said that he was public analyst for the West Riding, for the Northern Division of Derbyshire, and for the borough of Sheffield. He had read the certificates received from Somerset House, and in his opinion they were in accordance with those which he had given.

Mr. Cadman: The certificates speak for themselves. That is a matter of opinion.

Superintendent Gill: Have you had very extensive experience in the examination of flour? Yes. I have examined a large number of samples of bread and flour.

What is the greatest extent in which you have found alum in flour? I have had an instance of as much as 70 grains in a 4 lb. loaf. In flour, 30 or 40 grains in 4 lbs. weight is the largest amount I have found.

With respect to the sample No. 30, do you say that you found alum in it? Yes, distinctly. I found alum as distinguished from alumina. Witness, at the request of the Bench, said that he would call alumina the active principle of alum. There was a definite amount of it in alum, so that, having found so much alumina, one could calculate the amount of alum or *vice versâ*. Some chemists were content with simply finding alumina, but he used a test by which he could find the amount of alum. The Somerset House analyst had stated that the amount of alumina calculated as ammonia alum naturally present in flours examined by them had ranged from two to ten grains for four pounds of flour. He made an allowance for only two grains. Some chemists allowed eight or nine grains, but he believed there was no instance on record of more than ten grains occurring naturally. According to the Somerset House certificate one of the samples in question contained twenty-one grains of alumina, which was eleven grains in excess of the highest quantity ever known to occur naturally. He would not say that the amount of alum he found in the flour rendered it injurious to health.

Mr. Cadman called the attention of the Bench to the concluding words of the Somerset House certificates:—"With regard to the excess of alumina in No. 30 sample, the results of our experiments do not enable us to confirm that it exists in the flour in the form of alum." The flour was sent to them to ascertain if there was alum in it, and they had declared that they could not find it.

The Chairman: Was it sent for the purpose of finding alum in it?

Mr. Smith: It was sent, I presume, for the purpose of checking Mr. Allen's certificates.

In reply to the Bench, witness said that if the flour contained alum it had certainly been added to it. There was no such thing as alum in pure flour. There might be alumina in flour naturally. As he had already said, he made an allowance of 2 grains.

Mr. Cadman again asked the Bench whether upon the certificate from Somerset House they thought there was any corroboration of Mr. Allen's certificates.

Mr. Smith said that judging from the evidence then before them there was adulteration—

Mr. Cadman: Pardon me. But on this information there must be adulteration with alum. The information speaks of flour mixed with alum—ten grains of alum to four pounds weight of flour. It must be alum or nothing.

Witness in cross-examination by Mr. Cadman said that the samples of the flour sent to him were first made into bread by his servant. His test for finding alum was this—bread made of pure flour when put in a mixture of tincture of logwood and carbonate of ammonia turned a pink colour, and after being taken from the solution became a dirty brown. Bread containing alum, on the other hand, acquired a deep blue colour after undergoing a similar test. The bread in question acquired a blue colour, such as he had observed in the case of bread to which he had purposely added alum.

In answer to the Bench witness said that this was the first sample sent to him from the West Riding in which he had detected alum.

The witness was further cross-examined as to various other methods of analysis, after which the case was adjourned for a week.—*Leeds Mercury*.

Review.

THE ISLAND OF MONTSERRAT. ITS HISTORY AND DEVELOPMENT, chiefly as regards its Lime Tree Plantations, with a Short Description of Lime Juice and its Use as a Medicinal Agent, and as a Beverage. Carlisle: Hudson, Scott and Sons. 1878.

Every one knows how important lime juice is as a medicinal agent. Ten years ago an Act rendered it compulsory that every ship should take on board lime or lemon juice in sufficient quantity to serve out so much per day to every member of the crew during the voyage. The practical failure of the Arctic Expedition, which was entirely attributed by the Committee appointed to inquire into the matter to the oversight of those in command not taking a supply of lime juice on the sledges has again recently brought into very great prominence the value of lime juice as an antiscorbutic. The head-quarters of lime tree cultivation is now the little island of Montserrat in the West Indies. At the beginning of last century this, with a few other islands, had a monopoly of the English sugar market, consequently sugar was largely grown, and was a very profitable crop. The conquest of Trinidad and Demerara, at the beginning of the nineteenth century, opening up a cheaper field of supply for the home market, the Montserrat production gradually decreased, until, ten years ago, the export was only about 950 hogsheads, a third of what it was eighty years ago. At the time when "Sturge's Montserrat Company" was established, the whole of the northern part of the island had gone out of cultivation, and Montserrat had reached a very low point of depression. Now, the company just mentioned has 600 acres of lime tree plantations, and employs a large number of hands in collecting and manipulating the fruit. According to the 'Blue Book' for 1875, the recovery of Montserrat to its present state of substantial prosperity is to be attributed very much to the aid (while, of course, seeking their own advantage) afforded to industrious and energetic planters by the company referred to, and by local capitalists. With the brighter prospects of the island, the cultivation of the sugar cane has again been taken up, and a year's shipments now reach 2500 hogsheads.

The lime, *Citrus limetta*, a member of the orange family, is found in a wild state in many tropical countries, but does not flourish even so far north as the Azores. It is a thorny evergreen tree, with handsome dark green leaves, which are so fragrant that they are universally used in the West Indies to perfume the water in the finger glasses at dessert. The flowers, too, exhale a delicious perfume, but they are much smaller than those of the orange. The lime comes into full bearing about seven years from the planting of the seed, and grows best in light soil near the sea. Montserrat seems to suit it admirably, for the temperature there is remarkably uniform, the thermometer at night seldom falling below 69°, or rising, even at mid-day, above 90° Fahrenheit, with an average of 78° to 80°. The average rainfall is from fifty-four to sixty-four inches a year. The lime harvest is heaviest from September to January, but the Montserrat plantations yield a considerable return all the year round. The fruit is carried down to two central manufactories, where it is sliced by water power, and afterwards subjected to pressure until all the juice has been obtained. That from the choice fruit is headed up in casks, with as little delay as possible, and shipped to the English consignees, and that from the inferior fruits is boiled down for the citric acid makers.

A large quantity of lime juice is obtained from the fruit of the trees that grow wild in Jamaica, Tahiti, and elsewhere, but often little care is taken in its collection. The negroes in some parts of Jamaica gather the fruits they find under the scattered trees, and squeeze them into a pail with a wooden kitchen lemon-squeezer; the juice thus obtained is bought by the merchants for a few pence per gallon. In order to increase the bulk salt water is sometimes used as an adulterant. Besides, as lime juice decomposes very rapidly when exposed to the atmosphere in a tropical climate, it is not to be wondered at that many samples of the article in the English markets have a mawkish taste, which does not recommend them to most people.

In the elegant little *brochure* from which we have culled the above information are several chromos, giving an excellent idea of the beauty of the lime orchards, and graphic descriptions of the general vegetation of the island. It concludes with a list of the various lime juice products now to be obtained.

Dispensing Memoranda.

[54]. CREASOTE DISPENSING.—My experience certainly has not been so large as Mr. Martindale's, but I have dispensed very many prescriptions for mixtures containing creasote, and I also remember dispensing a prescription (℥vj mixt.) at the Square, given me to dispense by Mr. Haselden (and, by the bye, let me here add I found him a most courteous examiner), containing creasote, pot. bicarb. and tinct. camph. co.; so it is quite evident Mr. M.'s experience must be quite exceptional.

AN ASSOCIATE.

[54]. Creasote Dispensing.—I frequently dispense a prescription for a lady in which is ordered a mixture containing gtt. j. doses of creasote combined with tinct. camph. co. and sp. ammon. co.

B. Hunn.

[93]. Ext. Cinchon. Flav. Liq. and Potassii Iodidum.—May I be permitted to offer an improved form for this very inelegant compound?

I find the following a great improvement in appearance, and keeps without deposit.

℞ Ext. Cinchon. Flav. Liq. . . . . ℥iss.
Glycerini puri . . . . ℨvii.
Misce bene, et adde solutionem.

℞ Potassii Iodidi . . . . ℨii.
Aquæ . . . . ℨss.
Misce, fiant guttæ.

When one drachm is diluted with an ounce of water for use it turns rather cloudy, but does not deposit for some time.

I have tried J. B. L. M.'s method but did not succeed, for the flocculent deposit, although it would shake up at first, could not be moved from the sides of the bottle after twenty-four hours without great difficulty, and after violent shaking it came away all in a lump. On the second and third day it was much the same, and on the sixth day it had to be removed by a glass rod.

I observe in "The Month" exception is taken to the term resin of the bark, and I admit that it would have been more correct to have written the active principles of the bark as a resinous looking deposit.

On referring to the *Pharmaceutical Journal*, March, 1867, you will find a somewhat similar formula given by Mr. Hanbury under "Concentrated Medicines."

℞ Ext. Cinchonæ Liquidi,
Liquoris Calcii Chloridi . . . . āā ℥ss.
Misce.

Mr. Hanbury remarks that this deposits the resin of the bark for want of a suitable vehicle and recommends each to be diluted with water before mixing.

Returning to the original No. 93, I would only remark that as the liquid extract itself varies so much, and cannot be kept long without depositing, the mixture when dispensed would be to my mind a very unsatisfactory one, and I think it is very questionable whether the patient obtains the full effect of the bark.

George Brown.

Sandown, April 30, 1878.

[95]. Tinct. Sapo. Virid. Co.—In the Journal for April 13, under "Dispensing Memoranda" No. 95, allusion is made to Tr. Sapo. Virid. Co., and a suggestion that Tr. Verat. Virid. might be meant. This is an error. I append the formula in use for it.

Tr. Sapo. Virid. Co.

Sapo. Virid.,
Alcohol,
Oil Cade . . . . . . each 1 ounce.
Oil Lavender . . . . 1½ dram. Mix.

Tr. Sapo. Virid.

Sapo. Virid. . . . . 1 ounce.
Alcohol . . . . 2 ounce.
Ol. Lavender . . . . 1 dram. Mix.

Both the above are considerably used in skin affections, and are regularly dispensed as above under the titles given.

Sapo Viridis is the officinal soft soap of the 'German Pharmacopœia.' A note in the Druggists' Circular of March, 1878, will give some information on the subject of Sapo Viridis.

P. W. Bedford.

New York.

[102]. In mixing the ingredients of this mixture a white precipitate is produced consisting of citrate of bismuth. The supernatant liquid contains sulphate of magnesia, nitrate of bismuth, citrate, nitrate and sulphate of ammonia, and inf. calumbæ (the berberine of the latter combined with sulphuric acid?).

Citrate of bismuth is nearly insoluble but is easily dissolved by liquor ammoniæ or alkaline or neutral solution of ammonia salt. The smallest quantity of free acid added to a perfectly neutral liquor bismuthi will precipitate the citrate. If citrate of iron and ammonia is present neither free acid nor alkali will precipitate the bismuth salt.

W. H. Langbeck.

[103]. It is impossible to dispense the prescription in a perfectly clear state. If allowed to stand a few hours the first turbid mixture will get clearer. I do not think the liquid ought to be filtered.

W. H. Langbeck.

[104]. Oleum Palmæ Christi is identical with Oleum Ricini, *vide* Flückiger and Hanbury's 'Pharmacographia,' page 510.

W. H. Langbeck.

[104]. N. K. was quite right in sending castor oil. The doctor must be excused for his want of knowledge, and might be referred to Balfour's 'Class Book of Botany,' Pereira, and above all to Dr. Cauvane's 'Dissertation on the Oleum Palmæ Christi,' 2nd ed., 1769.

Hy. Brown.

[106]. G. F. W. would not be justified in using sodæ bicarb. instead of sodæ carb. or of subcarb. The sub. is often omitted. Many physicians prefer the subcarbonate of soda to any other form in catarrh. In the case of children, the subcarbonate is most usefully combined with vin. ipecac. and other expectorants. I think the rule should be to dispense a prescription in which sodæ carb. was an ingredient, as if it was written subcarb., unless the dispenser was acquainted with the mind of the physician, and knew his mode of ordering to the contrary. In the case of powders I would most assuredly give sodæ carb. sicc.; but if they were for use as an effervescent, then the bicarbonate should be used.

Sodæ carb. is often ordered with ginger, calumba, and rhubarb in powder, and in this case the dried sodæ carb. should be used. With the equivalent proportions between sodæ carb. and sod. carb. siccat., we have nothing to do at present.

Hy. Brown.

[106]. G. F. W. would be wrong in dispensing sodæ bicarbon. if sodæ carbonas is prescribed.

W. H. Langbeck.

[107]. Hoffman's Anodyne.—I beg to say to S. L., Belfast, that Hoffman's Anodyne is spiritus ætheris compositus, and differs from spiritus ætheris in containing ethereal oil. Squire is wrong in stating on p. 25, ed. xi. of his 'Companion,' that spiritus ætheris is called "Hoffman's Anodyne Spirit." I can find no proof for such a statement; but all authorities are against such statement, and it should be corrected. The date of Hoffman's Anodyne may be carried back into the early part of last century, and it is said he was taught its composition by an apothecary called Martmeier.

In the Ph. Lond. for 1836, it was called compound spirit of sulphuric ether, and in that of 1851, compound spirit of ether. The Edinburgh spirit of ether, or of sulphuric ether, the same as the B.P. preparation, has never been called by the name of Hoffman's Anodyne.

I observe there is considerable difference in the quantity of ethereal oil used.

Hooper's 'Dictionary of Medicine' gives :—Spt. of sulph.

ether, one pint; ethereal oil, two fluid drachms, M. Lond. Ph.: Æther. sulphuric, fl. ℥ eight; rect. spirit, fl. ℥ sixteen; ethereal oil, fl. drachms three, M. Stille gives: Ether half a pint, alcohol a pint, and ethereal oil six fluid drachms. The sp. gr. is 815.

Wood gives the same formula, and adds: "Hoffman's Anodyne is sometimes offered for sale without the ethereal oil. Forty drops of the genuine preparation will render a pint of water distinctly milky; but if no oil of wine be present, milkiness will not occur."

Hoffman's Anodyne seems to have a more persistent effect upon the system that ether or spirit of ether; but the true mode of action of ethereal oil is still unknown. Hoffman's Anodyne is very useful in hysteria and other nervous affections, and the apothecary is not justified in following Squire's authority and substituting spirit of ether for spt. æth. comp.

If it is a crotchet of the Messrs. Squire that no good is gained by the addition of ethereal oil, the sooner they are disabused the better, and all who possess the 'Companion' should write the correction.

When a book gains such a position as to be in the eleventh edition, such a paragraph as a synonym for spt. ætheris should not appear as this: "U. S. spiritus ætheris compositus, with ethereal oil." Surely, the Americans copied the mode of making Hoffman's Anodyne from some of our pharmacopœias, and why in Squire's 'Companion' a proper formula is not given, but one that may mislead a student or chemist, I do not know. The "Memoranda columns" will do vast good in checking such mistakes as calling Liq. Hoffmani simple spiritus ætheris.

Henry Brown.

Northallerton.

---

[107]. Hoffman's Anodyne.—I always dispense Sp. Æth. Sulph. Co. made as follows when Hoffman's Liquor Anodynii is ordered, and I think it correct:—

℞ Ether . . . . ℥viij.
Rectified Spirit . . . . . ℥xvj.
Ethereal Oil . . . . ℥iij.
Misce.

An Associate.

Exeter.

---

[107]. Liquor Hoffmani.—In reply to query 107 in last week's Journal, the spt. æth. sulph. co. should be used for Liquor Hoffmani. The following may be found in Dr. Collier's review of the Pharmacopœia in 1840.

℞ Sulph. Æther. . . . . . . ℥viij.
S. V. R. . . . . ℥xvj.
Ol. Æther. . . . . ℥iij. M.

Synonyms—Hoffman's Anodyne Liquor, Liquor Anodynus Mineralis, vide supplement, page 17.

Jno. Hurst.

Louth.

---

[107]. For the information of your correspondent S. L. in this week's "Dispensing Memoranda" of *Pharmaceutical Journal*, I beg leave to hand him formula for Liq. Hoffmani according to Dorvault.

"Ether sulfurique, alcool à 90°, āā P. E. Mêlez (Codex).

"L'Esprit d'éther sulfurique composé, Liqueur nervine de Baug; sp. æther comp. (Lond.) est composé de: éther sulfurique, 192; alcool 384; huile douce de vin 9. Il est donné comme représentant la véritable liqueur d'Hoffmann. Edimb. supprime l'huile douce.

"Dose: 1 à 10, 0 dans un liquide approprié."

G. W. Stephens.

Hereford.

---

[107]. Liquor anodynus mineralis Hoffmanni seu spiritus æthereus of the Pharm. German., is the same as spiritus ætheris of the Brit. Pharm.

(Spec. gr. 0·808 – 0·812).

W. H. Langbeck.

[108]. Can the following be accurately prepared so as to make a clear solution, and if so, how should it be mixed?

℞ Acid. Salicylic. . . . . ℨss.
Sp. Vini Rect. . . . . ℨiv.
Glycerin. . . . , ... ℨvj.
Aqua . . . . ad ℥viij.
M. ft. gargar.

The above has been sent out by two West-End houses perfectly clear.

A Novice.

---

[109]. Would some reader experienced in preparing phosphorus pills, kindly state how the following could be prepared so that the pills, when completed, would not appear larger than an ordinary four grain pill?

℞ Phosphori. . . . . gr. $\frac{1}{30}$
Quiniæ Sulph. . . . . gr. i.
Ferri Redacti . . . . gr. iij.
M. ft. pil.

Apprentice.

---

[110]. Will any reader kindly give the best method and quickest way of dispensing the following, as all attempts on my part to produce a permanent emulsion have failed.

℞ Ol. Terebinthinæ . . . . . ℨiij.
Acid. Acetic. Fort. . . . . . ℨv.
Aquæ Rosæ . . . . ℥iiss.
Ess. Limonis . . . . ℈iv.
Vittelli Ovi. . . . . j.
Ft. emulsio.

Apprentice.

---

[111]. Resine Copaibæ.—Can any one inform me how this prescription can be prepared? It was sent to me today from one of our leading physicians.

℞ (*sic*) *Resin.* Copaibæ . . . . . . ℨiij.
Syrupi Gummi . . . . ℥j.
Ether. Chloric. . . . . . . ℨj.
Aquæ . . . . ad ℥viij.

M. ft. Mist. Sig. ⅛th part with ℥ss. aqua added three times a day.

Devonia.

Notes and Queries.

[592]. LIQ. SANTAL. FLAVÆ CO.—The product to mix clear with water. A formula for this preparation will oblige.

O.

---

[593]. PERFUME FOUNTAINS.—J. P. requires some information respecting Perfume Fountains, and how to make them.

---

[594]. BROWN DYE.—Can any one oblige me with a form for making a good brown dye for leather?

Aniline dye has been tried but failed.

The Sale of Strychnia in Penzance.

Sir,—From the fact of having served my apprenticeship in the oldest established business in Penzance, one which boasts of being a centenarian, I am naturally much interested in the report which has been brought to the notice of the Council by the Local Government Board, and which at the instance of the analyst for the borough of Penzance, Mr. J. H. Collins, implies a serious charge of neglect on the part of the whole pharmaceutical body in that town.

I had been an apprentice about twelve months when the Pharmacy Act of 1868 was passed, and although at first there was some little doubt as to whether or not Battle's Vermin Killer came within the meaning of the first part of Schedule A, a few weeks sufficed to prove that it did, and from that time until the expiration of my apprenticeship its sale in the establishment to which I allude was always faithfully registered. All other poisons were sold "in conformity with the Act," and though it is now more than five years since I left there I feel sure that the Penzance chemists will be fully able to defend themselves on the question at issue, and will do so without loss of time.

Comparatively speaking but very little poison is sold in the borough, the market town of a large district. Strictly, however, it is not agricultural in the sense which we understand the Midland Counties to be, the greater proportion of the land in West Cornwall being devoted to market gardening, and therefore large quantities of poisons are but seldom required.

Red lead and sulphate of copper have perhaps the largest sale. Corrosive sublimate and arsenic are sold only rarely, and in small quantities.

I am perfectly sure that no chemist in Penzance would think of selling strychnia, or any other such virulent poison, without complying in every particular with the requirements of the Act.

It frequently happens, in hunting districts especially, that the small farmer shows such utter disregard for "sport" as to lay a poisoned bait for the fox which has thinned his poultry yard, or possibly as a mode of showing personal spleen to the members or master of the hunt. For the latter cause no apology can be given; the former will always be a vexed question as long as there is a fox in England.

The poison invariably employed in such cases—I speak exclusively of West Cornwall now—is Battle's Vermin Killer, as it is in fact the only one which can easily be used by the tenant farmer for such a purpose.

If ever suspicion was formed that there was something wrong with the foxes, it was the custom of some person or persons connected with the hunt to pay a visit to different pharmacies in the town and ask to look over the poison register, and from the relation in which the proprietors stood to them, they being representatives of the landed interest in the county, the chemists could scarcely refuse their request.

I well remember undertaking the analysis of the stomach of a foxhound, one of several which had died under suspicious circumstances. The mode of analysis I employed was one which had not long before appeared in the Journal I was successful in detecting strychnia, and, moreover, the stomach was so thoroughly blue as if from the presence of colouring matter, that I was convinced that Battle's Vermin Killer had been the cause of death. A reward was offered for the detection of the culprit, but no one was discovered.

I have little doubt but that the poison was intended in that instance for the fox, but unfortunately it was the means of destroying some valuable hounds.

Much more might be said on the question, but probably I have written enough to prove that it becomes a matter of business interest to a chemist in a district, like the one involved, to register his poison sales, even setting aside the desire of every conscientious man to act according as the law directs.

There must be many chemists who have a similar experience and it is a question of some interest as to how far they are justified in producing the poison register when asked for it, and to whom is granted the authority of insisting on its production.

If Mr. Collins's client's pig and duck have both died from the effects of strychnia, it is more than likely that they have fallen victims to a bait set by a would-be vulpecide, or for badgers, weasels, and other such unwelcome farm-yard visitors; or what is still more reasonable to suppose, as suggested by Mr. Bottle, they have partaken of a rat or a mouse which has died from the effects of "Battle." Ducks eat mice readily, and pigs are never very particular.

I shall be anxious to know the outcome of so vague a report as Mr. Collins's, one which seems founded on indefinite supposition, rather than matter of fact inquiry.

CHARLES B. ALLEN.

London, N.W.

THE ELECTION OF THE PHARMACEUTICAL COUNCIL.

Sir,—Your leading article upon Saturday last contains some remarks upon the election for members of the Council, which I feel I cannot allow to pass without notice. You are pleased to speak of the Chemists and Druggists' Trade Association, of which I have the honour to be the President, as the "Birmingham Association," and to style it as the "latest development of pharmaceutical organization." I also consider your article is calculated to convey an impression upon the minds of your readers that the "Association" had endeavoured to influence the voters at the election of members of the Pharmaceutical Council. This I beg to say is not correct. As an Association we have not taken any part in the election; every member has been free to take any course that he may consider desirable, or that may tend to advance our common interests.

S. U. JONES.

Chirton House, Leamington,
May 8, 1878.

Sir,—I was somewhat surprised to observe in your editorial on "The Council Report," published in the last issue of the Journal, that you charge the Chemists and Druggists' Trade Association with aspiring to exercise electioneering influence in the forthcoming elections of the Pharmaceutical Society.

I take the earliest opportunity of repudiating this assertion; no such action has been taken by the Association. Until I received a copy of the circular to which you refer, I had no knowledge that such a document was about to be issued.

W. F. HAYDON,

Secretary, Chemists and Druggists' Trade Association.
Birmingham, May 7, 1878.

THE ELECTION OF WOMEN AS MEMBERS.

Sir,—I observe that the following notice of motion is down for the annual meeting of the Pharmaceutical Society.

"That all persons being duly qualified (irrespective of sex) shall be eligible for admission into the Society in accordance with the bye-laws thereof, and this meeting is of opinion that ladies should not be excluded from participation in the privileges of the Society."

Being unable to be present at the general meeting, permit me respectfully to submit, that however much personal feeling may have been averse to the recognition of women as members of the Pharmaceutical Society, I could not allow it to weigh, for a moment, against the intrinsic merits of their claim. If they have satisfied the Boards of Examiners, securing thereby "registration," to debar them from the privileges consequent upon their respective certificates of qualification is manifestly illogical and unjust.

C. PIERSON, A.P.S.

Leeds, May 7, 1878.

THE WEIGHTS AND MEASURES BILL.

Sir,—I do not see why Mr. Wilkinson need be so alarmed at the above Bill, for had he applied to any M.P. he would have been furnished with a copy, and then he might have read for himself (page 30) "Measures for the Sale of Drugs," and if this does not mean our graduated measures, then I should like to know what it does mean. Then as regards the weights, he will see (page 31) that instead of there being no standards for weights from two grains to ʒi, there is quite an array of standards from 56lb. down to $\frac{1}{2}$ (avoirdupois) dram, and decimal grains from 4000 down to ·01. The principal inconvenience is in the omission of the 60-grain weight, and on this item I had an interview with Mr. A. Pell, M.P. (one of the Select Committee), and he promised to try and get the Board of Trade to include it in the list. If we have not the scruple weight in the Bill, we have twenty grains, and what is to prevent Mr. Wilkinson calling it a scruple if he chooses to do so? There is no argument for quoting prices by ʒ, as this is now an obsolete weight; but prices may be quoted by the avoirdupois dram, and as it is usual to buy by that weight in larger quantities, why should there be an exception? It must be admitted that a concession is made in providing "metric" standards, and this should prevent factious opposition to what is on the whole a good Bill.

WILLIAM THIRLBY.

2, *Highcross Street, Leicester.*

[*** So far as our correspondent's opinion is based upon the assumed occurrence of the words "Measures for the Sale of Drugs," in the Schedule on p. 30 of the Weights and Measures Bill, it has no support in fact, for those words have been erased by the Select Committee, and the Bill as it stands does not appear to contain any provision for allowing the use of the minim, fluid drachm, or fluid ounce measures.—ED. PHARM. JOURN.]

THE SALE OF PATENT MEDICINES.—A PRACTICAL SUGGESTION.

Sir,—There can be no doubt that the ruinous competition of co-operative companies and others is snatching the sale of patent medicines out of the hands of chemists and druggists. That this is an injustice to us, I think no one can fairly deny. It amounts to this, that we the chemists and druggists who have served an apprenticeship and passed examinations in order to become the proper and legitimate dealers in and compounders of drugs, are to be opposed by persons and companies, most of whom carry on other businesses, and who simply by taking out a patent medicine license and underselling us, are able to withdraw from us the bulk of our trade—for half the world is now physicked by patent medicines.

What then is to be done? To attempt to compete with these parties, who only regard the patent medicine trade as a small branch of their system, and who can afford to take 5 or 10 per cent. profit on their turnover, would be merely an act of mercantile suicide; while to remain passive is to court a slower but no less certain destruction. Many of your correspondents have urged that the Council should endeavour to pass an amendment to the Pharmacy Act, in order to secure the sale of these medicines to chemists only, and there is little doubt that if this could be accomplished our difficulties would be almost at an end; but legislation of this kind does not always favour its promoters, and I think that some reasonable assurance of success should be obtained before the attempt is made.

I think that a different course should first be tried. I hold a firm conviction that if a good majority of the retail trade would only combine together we should be able to stamp out this wretched competition. Why should patent medicines ever find their way into the warehouses of co-operative stores and cheap-jacks? Let the trade demand of the makers of patents that they shall not supply their preparations to any of those people who notoriously undersell us, nor to any wholesale house who will not give a distinct undertaking to act on the same principle. The chemists' trade protection society might carry out such a scheme—make a canvass of the wholesale trade and make out a list of those who would and those who would not accede to such a request. We could then deliberate on a course of action with a view to isolate the black sheep, whether makers or wholesale houses. With regard to the former, we might agree not to recommend their goods even in the most qualified terms (and the chemist's recommendation is worth something); as for the latter, who are of course the chief offenders, we could easily cut them off by declining in a body to have any dealings with them whatever.

Some considerable opposition would of course be experienced, but if we were really united, I feel sure that we could so far carry the day as to be able to snap our fingers at the "stores," grocers, tailors, and all the wretched lot of adventurers who, like parasites, always endeavour to live on other people.

W. T. R.

"NOT ONLY PATENT MEDICINES, BUT GENERAL PHARMACY IS COMING TO GRIEF!"

Sir,—The letter I ventured to write you a fortnight since "to show the reed on which they leant" who deemed the Council could find them a panacea for the frightful competition to which they are subject by the sale of "patents" and drugs at little more than nominal profits, not only by co-operative stores, but by traitors in their own ranks, evidently contained some home truths. Home truths are generally unpalatable and unacceptable to those to whom they are addressed and whom they concern, and instead of any attempt being made to refute my statements, recourse is had to the old formula, "No defence, abuse the opposing party." Hence I am denounced as "sarcastic," guilty of "gross presumption" and writing "rigmarole," which Mr. Martin's "time is too valuable to follow through" (!) I will not rate my time too valuable to notice his remarks, nor will I be so rude as to call them "rigmarole." Mr. M. says "it is quite enough to have foes without the camp, we ought to be united and sympathetic within." "The three tailors of Tooley Street" were unsurpassed in their unity and their mutual sympathy, but history does not record that they accomplished much. I am afraid history will not record that Mr. Martin accomplished more. The grievance is admitted on all sides to be great, and by most deemed irremediable, but Mr. Martin's profound penetration has discovered a "remedy." It is that the druggists in each town should combine to have a mutual agreement as to prices! If this be not an instance of a "parturient mountain producing a muscipular abortion," let Mr. Martin prove the contrary by inducing "fraternal agreement" among the druggists not of "each town" but of my town only, of the present condition of the drug trade in which I gave him, in my "rigmarole," a precise and lucid description. Mr. Martin seems not to know that it is one thing to bring horses to water and quite another to make them drink.

I recommend Mr. Martin and others who, like him, are "leaning on a broken reed," to read the sensible remarks in a letter signed "Ictus Equi" in this week's Journal, and the no less sensible advice in Mr. Frazer's admirable address at Glasgow, who points out that "there is little use in barking if you can have no possible hope of biting," and I further recommend him if he write again on the subject to make at least some slight attempt at ratiocination, instead of ignoring all argument, and in place thereof applying unpleasant nouns and adjectives to those who differ from him.

I regret exceedingly if I said anything in my last calculated to wound the susceptibilities of "Sussex," whose anonyme I suggested might be "Senex," simply because he alluded to such a far off past that I concluded he must be an old stager. Though "variety" is said to be "charming," —and if so after fifty years, it might fairly be supposed that he would relish a change,—he seems still so well pleased to stand behind a counter that, instead of regretting his being obliged to do so, I congratulate him on his evidently possessing that "contented mind" which is said to be "a continual feast."

HAMPSHIRE.

The Sale of Patent Medicines.—"*Chemicus*" thinks that chemists and druggists have themselves to blame, they having given "other trades" the initiative as regards "low prices." Years ago he was frequently told by customers that they could get patent medicine and other proprietary articles much cheaper than the printed price on packages, and he thinks there is still too great a desire amongst chemists, and even pharmaceutical chemists, to undersell their neighbours, both in dispensing and also the one hundred and one articles kept by them. He thinks there has been too little combination and friendliness, and too much petty jealousy, and that it rests with the younger branches of the business to mark out a different and broader path for their future career, the old hands being, he is afraid, too stereotyped in their narrow groove.

THE ANNUAL DINNER.

The Seventh Annual Dinner of the members of the Pharmaceutical Society and their friends was held at the Grosvenor Gallery on Tuesday evening. The company was very numerous, and amongst the guests present were The President of the College of Surgeons (Mr. John Birkett), The President of the Medical Society (Professor Erasmus Wilson), The President of the Chemical Society (Dr. Gladstone), The Medical Officer of the Local Government Board (Dr. Seaton), Professor Williamson, Dr. Swaine Taylor, Professor Odling, Dr. De Vrij, The Dean of the College of Preceptors, Dr. Ramsay, Dr. Leared, and Dr. Langdon Down.

The usual loyal toasts having been given and heartily responded to, the President proposed, "The Army, Navy, and Reserve Forces," coupling with the toast the name of Dr. Ramsay.

Dr. Ramsay, in responding, said that if unhappily war should break out it would be found that never in our history had the Army and Navy been better qualified and prepared than at present; as for the Reserve Forces, he saw so many around him belonging to that force that he need say nothing as to the readiness with which they would respond to the call of duty.

Mr. Schacht proposed the next toast, viz., "Science." He said he did not know why he should have been called upon, except for his connection with the scientific side of pharmacy, as President of the Pharmaceutical Conference. In a few eloquent sentences he spoke of the claims of science on pharmacists, and concluded by coupling with the toast the names of Professor Williamson, Dr. Gladstone, and Dr. Frankland.

Professor Williamson, in responding, said it seldom happened that any one word was always used strictly in one and the same sense, and at any rate such uniform use did not occur in the use of the word science. It must have often struck those present that different people used this word in exceedingly different senses. As far as he knew, the popular sense attached to it was that it denoted the knowledge of some very out-of-the-way and abstruse things, of interest only to old gentlemen who pursued them, and of no possible value in themselves; and matters which were studied by the persons who acquired a habit, not merely of simplicity of mind, but of unworldliness to a degree that they hardly knew how to take care of themselves; that in fact a scientific man almost wanted a nurse to take care of him. On the other hand, very recently a distinguished orator and statesman was reported in an after-dinner speech at the Society of Civil Engineers to have credited that body with all the most important discoveries of the age. That definition of science was about as remote from the popular one as anything could be. The masterly achievements of the Civil Engineers no doubt were attained by the aid of the scientific knowledge they possessed, but it certainly was satisfactory to find that these masterly results were the fruits of science. Amongst other views held of science there seemed to prevail an opinion that science was something which tended above all things to harden the nature and to make men very unsociable. On the other hand, in that distinguished company there would doubtless be some gentlemen who would be inclined to attach to the word "science" a meaning which would suggest something about exact knowledge, and not only so, but exact knowledge which was classified so that the different items of which that knowledge consisted were arranged in an orderly manner. However, if men differed as to the use of this word there was one thing about science which all people agreed in, and that was the remarkable development which it had taken of late years; not merely that science and scientific results came to be more associated, but that a number of active measures were being taken on a greater and greater scale for the promotion of science as compared with what was formerly the case. Amongst these various indications one of the most striking instances was the circumstance that men who pursued science were year by year more inclined to associate themselves in bodies for the promotion of the particular branches or applications of science with which they were specially concerned. Amongst the bodies thus formed he could not but bear testimony to the great usefulness, especially to scientific chemists, of the Pharmaceutical Society. It was not only useful in collecting and disseminating knowledge, but as a teaching body. The lectures of the distinguished Professors of the Pharmaceutical Society had done a great deal of good, not only in advancing the interests of the members of the Society, but in promoting the interests of pure chemistry, for amongst the various schools of chemistry, that of the Pharmaceutical Society held an exceedingly important place.

Dr. Gladstone said, as representative of the Chemical Society he begged to thank the meeting most heartily for the honour they had done to science. In coming amongst them he felt that scientific chemists might be taken as coming amongst those who were their elder sisters, for pharmacy existed long before scientific chemistry was born. He did not know how far back in the history of the world it was when men began to swallow all kinds of things and found that some things had very curious results on their system, and that some vegetable, animal, or mineral substances were of great benefit to their health. Of course it was very much by rule of thumb that this early pharmacy was pursued, yet one of the most curious results of modern research was that on turning up the old Egyptian books in which the receipts were written which were employed 3000 or 4000 years ago on the banks of the Nile, it was found that they were not very different to those employed in the present day. They might even go to China, and find that men in their longing after immortality thought they might discover some mineral which would confer this gift, and thus they were long led to search for that which they called cinnabar, and this was continued for many centuries. No doubt it caused them to die first, but that did not abate their zeal, until two of their emperors having themselves died, notwithstanding their use of it, it seemed to grow into disrepute, and became unfashionable. However, the science then passed from China westward towards Arabia, and thence into Europe, and so became the parent of modern chemistry. Without going any further into the history of the matter, they were all aware that this early pharmacy was the origin of chemical science, using the word science with the meaning given to it by Professor Williamson. But in speaking of this science he felt that there was an honour due to all practical applications of science, and that they should bear in mind how one department bore on the other. As he had spoken of the way in which chemistry was indebted to earlier pharmacy, so they might see how the attention paid to the medical necessities of man had brought an immense number of substances before the scientific chemist, and enabled him to elaborate his science. At the same time the chemist had been able to throw much light on those substances which were used in pharmacy, to show in what their value consisted, to separate that which was adventitious, and to produce pure substances for use in medicine. Moreover, the purely scientific study of chemistry had produced a large number of drugs and compounds which were of incalculable service in the relief of suffering humanity. He need hardly in that room refer to the various anæsthetics, such as chloral, chloroform, and others; and he had no doubt they would find many more, because it was the duty of organic chemists to build up these compounds. As they had been able to make turkey red for dyers, and vanilla for confectioners, so he hoped they would one day be able to build up quinine and other matters of the same kind. That might yet be a long way off, but he wished to call special attention to the desirability of the two things going hand in hand together, the pure, dry light of science, and its practical application in pharmacy. Pharmacy was now pursued on scientific principles, and he trusted that hand in hand pure science and pharmacy might long work together.

Mr. Sandford next proposed "The Medical Profession," which he said was above all others entitled to honour. The members of that profession were always ready to alleviate the sufferings of their fellow men, and anxious to devise and perfect new remedies, to minimize disease, and to do their best for the public good. They were told that they should honour the physician with the honour due to him for the uses they could have of him; that the skill of the physician shall lift up his head, and n the sight of great men he shall be in admiration. If the whole public ought to honour the physician, how much more should they as pharmacists do so, who saw so much of their work? He knew of no men who did more to promote the establishment of the Pharmaceutical Society than the medical profession, and therefore all honour was due to that profession from their members. He was delighted to see that they had so many distinguished members of that profession amongst them, and he begged leave to couple with the toast the names of Mr. Birkett, the President of the Royal College of Surgeons, and Dr. Seaton, who held one of the highest medical appointments in the gift of the state.

J. Birkett, Esq., in responding, said he felt it a great compliment to be invited to partake of that banquet. As a surgeon, he was not so intimately associated with pharmacists as physicians were. Surgeons were rather concerned in the operative departments, although no doubt they were highly indebted to pharmacists for the discovery of those beneficent agents by means of which they were able to perform the most delicate operations without causing suffering to their patients. He recollected the introduction of ether and chloroform, and therefore he felt they were very much indebted to chemists for the ease with which they were now able to perform difficult and painful operations. Surgeons, however, now gave as little physic as possible. In old times a surgeon never operated without a physician at hand, but these days were gone by, and they acted on their own independent judgment, and put medicine on one side as far as possible. He would only say, in conclusion, that he did place great confidence in medicine to a certain extent.

Dr. Seaton said it must be acknowledged that much which was said by Mr. Sandford was really deserved. There was no doubt that medical men were always ready to do their duty; but all men, all Englishmen at all events, were ready to do that, even though their duty was often an unpleasant and painful one, which taxed to the utmost their energies, both of body and mind. He did not know that they were particularly well remunerated for what they did, and he recollected very well the late Sir Benjamin Brodie, whom he was always proud to call his friend, saying to an assembly of young medical men, "You have chosen a very bad trade, but you have chosen a noble profession." When they saw what medical men would sometimes do—when they would go abroad, and run all risks of war and pestilence, which was far worse—to do good, they might fairly acknowledge that they were deserving of some credit. Money could not reward such duties; but it was not the money they looked to, but to the sense of having done that which was right and useful, and to the gratitude of those for whom they had done it. The kind feeling evinced towards them in that assembly he might say was thoroughly reciprocated. Education had done immense things for pharmacists, on whom medical men were largely dependent; it had elevated their status, and done a great deal towards producing proper relations between the two professions.

Professor Erasmus Wilson then said: Mr. President and gentlemen, I rise to propose a toast which, I am inclined to believe, must be considered as the toast of the evening, it is, "Success to the Pharmaceutical Society of Great Britain." If I had had the opportunity of choice I should not have been so presumptuous as to have selected this toast; but, seeing that it has been committed to my charge, I must confess that I know of none other to which I could address myself with greater satisfaction. In the year 1841, now approaching nearly half a century ago, a period of anxious thought and trial, in respect of the formation of this Society, was succeeded by one of unity and fraternity. The scattered pharmaceutical sticks were gathered into the traditional bundle and were so firmly bound together that, for the future, so long as the sticks elect to live in social harmony, no power in the universe will be capable of dispersing them. Thus, out of darkness there issued light, and out of separation and distrust unanimity and strength. In that same memorable year, 1841, a small but heroic phalanx of the leaders in pharmacy, few in number, composed this Society, then in its infancy. And the need of such a society and its present vigorous growth are manifested by its existing constitution. Glancing cursorily through the pages of the 'Calendar' of the Society for the present year, I find the present number of its constituents, including members, associates, and apprentices, amounts to about 6000; that besides its regular meetings for the intercommunion of knowledge it possesses a house which may be considered as its college; a museum of unequalled excellence and richness; a library and reading-room; a school, with its scholarships and prizes, and of the latter no less than three hundred have been carried off by its meritorious students; a Journal, the value of which I need not mention; and, moreover, not forgetting the exigencies and vicissitudes of human life, a benevolent fund, which has distributed more than £1300 during the past year. Truly these are signs of healthy vitality in a sound and vigorous constitution. There is another institution in connection with the Pharmaceutical Society which I for one am inclined to consider as of the utmost importance. I allude to this annual assembly of its members for the purposes of recreation and friendly intercourse, not overlooking the pleasant gathering which we hope to enjoy to-morrow evening. Ancient peoples attached a peculiar significance to the custom of partaking of salt with the stranger, and I myself firmly believe that we all entertain a stronger feeling of kindliness and regard for our fellow man after we have had the opportunity of enjoying a repast in his company. In such an act we seem to realize the "one touch of nature" of the poet, a sympathy to which we are all more or less susceptible. And then, again, there is the happiness, to say nothing of the privilege, of being brought into direct relation with the original founders of the Society and of those past presidents, of whom the greater number still remain amongst us, of those men who continue to be the lights and the leaders of the Society. Let me recite from amongst those honoured names that of Allen, your first president and a fellow of the Royal Society; of Payne, of Savory and Morson, of Squire, Ince, and Herring, of Gifford, Dean, and Davenport, of Sandford and Evans, and of Haselden and Hills. One name I have reserved from a motive of affectionate regret; it is that of a dear friend, whose memory holds a first place in the hearts of many of us, and who was among the most active of the founders of the Society, I need hardly say that I allude to Jacob Bell. Mr. President, I may say, with the utmost truth, that the Pharmaceutical Society has gained the fullest confidence of the medical profession. It has not alone succeeded in binding its own members together in friendly chains, but it has likewise thrown its silken fetters around us. Our prescriptions we know to be perfectly secure in your keeping, we are convinced that the best materials and the best combinations will be employed for the carrying out of our intentions; we commit to you with confidence our own dearest trust, the health of our patients, and with it the honour of ourselves. We seek you not unfrequently for information, which we are certain to have cheerfully supplied, and we know that whenever you make any discoveries which you believe will be of service to the public you are always ready to communicate them to us. I have said, and said from my heart, enough to prove that the Pharmaceutical Society of Great Britain is worthy of our deepest respect and esteem, and I feel assured that the Society will gain in lustre from the judicious and wise control of you, sir, its president.

The PRESIDENT having responded in a few appropriate words to the toast, and thanked the meeting for the cordial manner in which it had been received,

The VICE-PRESIDENT proposed "The Honorary Members of the Pharmaceutical Society," amongst whom he said there were many gentlemen who had distinguished themselves in various walks of science. In fact there were so many who held this position that he would not attempt to mention their names, but would simply couple with the toast the name of a distinguished gentlemen who was amongst them that evening, Professor Odling.

Professor ODLING, in responding, said some present might have heard a great deal said lately about the depressed state of pharmacy, and judging by the observations made by the President of the College of Surgeons, the prospect did not appear to be very brilliant for the future, but still it might be some gratification to know that the distinguished persons with whom he had the honour to be associated did nevertheless esteem it a high honour to be associated with this decaying Society. It was a remarkable illustration of the natural perversity of things that just at the time when pharmacists were being highly educated in the sciences with which they were connected,—botany, chemistry, and pharmacy,—to serve the public better than ever, it should be suggested that medical men might almost dispense with pharmacists and recommend their patients to take no more medicine than they could possibly help, and to take that in the most concentrated of forms. If there was a teacher to whom more attention was paid now-a-days than to medical men, it was the political economist, and whilst the surgeon told people to take as little medicine as possible, the political economist told them to buy it in the cheapest market. At the same time they knew that that which was cheapest was generally associated with qualities of a somewhat unsavoury character, and notwithstanding all these gloomy forebodings, he had no doubt that the Pharmaceutical Society would go on, and flourish as it had done hitherto; that it would still have honours to bestow, and not merely barren honours, and that the association of pharmacy and pure chemistry would bring, as it had done, reciprocal advantage and pleasure.

Mr. ATKINS proposed the last toast, namely, "The Visitors," their distinguished guests, without whom their *cuisine* might be worthy of Epicurus, but though they certainly might meet, they could not be said to dine. Many of their visitors were distinguished not merely for personal gifts and personal achievements, but as representative men. They had medicine, surgery, botany, and literature represented, and might be truly said to be getting into good society. It was said of the late Emperor of the French that he went into the Crimean war in order to get respectable alliances; but if they were seeking influential alliances they were doing it from no unworthy motives, but because they believed that between the practice of pharmacy and those noble professions there were points of contact, sympathy, and mutual co-operation. At times there seemed to be some trenching on their part on the noble profession of medicine, but the faculty must remember that after all they were a poor hardy race of mountaineers who had been defending their ancient dearly bought liberties. If at times a free lance from the hills had gone down into the fat meads below, that must not be regarded as the policy of the whole body of pharmacists. He begged leave to couple with the toast the name of Dr. Leared.

Dr. LEARED thanked the meeting for the cordial manner in which the toast had been received, and remarked that though pharmacists had in modern times departed from many of the rites and ceremonies with which they conducted their operations in ancient times, they had certainly not forgotten to exercise the rites of hospitality.

The Pharmaceutical Journal.

SATURDAY, MAY 18, 1878.

THE ANNIVERSARY MEETINGS.

THE full report that is given in the present number of the proceedings at the various meetings that have taken place during the past week, in connection with the Pharmaceutical Society, together with the full account of the arguments and evidence in an important action against a so-called Supply Association for breach of the Pharmacy Act, precludes, notwithstanding the supplementary pages, more than the briefest reference to the incidents of the week in these columns.

First in order comes the annual dinner of the members of the Society and their friends. This was in respect of the members and influence of the guests, and the character of the post-prandial proceedings, a decided success. So much, however, can hardly be said of the arrangements of the caterers, though the resources of the establishment were apparently strained to the utmost in the attempt to provide for the wants of the numerous company.

At the Annual Meeting the report of the Council gave rise to a running fire of friendly criticism, which it is only reasonable to expect upon the only occasion during the year when the members have an opportunity of direct expression of their opinions. And although some of the speakers seemed to be afraid that the members of the Council were oblivious as to the bearing which breaches of the Pharmacy Act by hucksters and co-operative stores, and the sale of patent medicines, might have upon the practice of their business, there was a general recognition that the Council is on the whole acting wisely in the interests of the trade. As the President pertinently remarked, the Council can only enforce the law, and that it is not always to be decided off hand, or *ex parte*, what this is will be evident to those who read the report on p. 926 of the case now awaiting the judgment of the Judge of the Bloomsbury County Court. The question of the admission of women into the Society, referred to the Annual Meeting by the last Council, was introduced affirmatively in an eloquent speech by Mr. WADE. The result proves that the equal balance of opinion among the members of the Council was a fair reflex of the opinion of the members of the Society. This renders of less importance a misunderstanding which is said to have led the Chairman to give an erroneous decision in declaring the amendment of the "previous question" carried. Some explanations at the adjourned meeting induced the President to correct this decision, and an arrangement was made that leaves matters *in statu quo*. We may mention that we had received a letter from Mr. WADE pointing out this mistake, but its publication is now no longer necessary.

The meetings came to an end on Wednesday evening with the Conversazione, at which about 2,400 persons were present.

The second annual meeting of the Chemists and Druggists' Trade Association was also held on Tuesday last, but we are compelled to defer a report of the proceedings until next week.

Transactions of the Pharmaceutical Society.

MEETINGS OF THE COUNCIL.

Wednesday, May 1, 1878.

HONORARY AND CORRESPONDING MEMBERS.

The following gentlemen were unanimously elected Honorary and Corresponding Members of the Society:—

Greenhow, Edward Headlam, M.D., F.R.S.

Hooker, Sir Joseph Dalton, M.D., K.C.S.I., C.B., Pres. R.S., etc.

Petit, Arthur, Lic. ès Sc. Phys., Mem. de la Soc. de Pharmacie de Paris.

Squibb, Edward R., M.D., of Brooklyn, U.S.

Vogl, Dr. A., Professor of Pharmacology, etc., University of Vienna.

Wednesday, May 15, 1878.

MR. JOHN WILLIAMS, PRESIDENT.

MR. WILLIAM DAWSON SAVAGE, VICE-PRESIDENT.

Present—Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Gostling, Greenish, Hampson, Hanbury, Hills, Owen, Mackay, Rimmington, Robbins, Sandford, Schacht and Shaw.

Several individuals were restored to their former status in the Society upon payment of the current year's subscription and a fine.

A letter from Dr. Greenhow was read, thanking the Society for his election as an honorary member of the Society.

The Weights and Measures Bill.

The President stated that since the last meeting of the Council, further progress being made with the Weights and Measures Bill, he had found it necessary to seek an interview with Mr. Farrer, the Permanent Secretary of the Board of Trade. He was accompanied by Mr. Sandford and Professor Redwood, and having communicated with the Medical Council, Dr. Acland came up specially from Oxford to attend. They had a long interview with the officials of the Board of Trade. The Honourable Edward Stanhope, who had charge of the bill, being present. The bill now stood for Friday next, and he believed he might say that the Government had so far acceded to the views put before them as to modify some of the clauses, and put in an exemption clause, which would allow the use of apothecaries' weights, and also of glass measures not of a capacity mentioned in the schedule to the bill. That was one of the great difficulties that the common ounce measure, graduated to drachms, would be illegal. He found that all their lives they had been using weights and measures for which there was no authority in any Act of Parliament. There was, however, an exemption clause in the old Weights and Measures Bill; with a similar clause in the present bill he thought they might be satisfied. He had pointed out to the representatives of the Government that pharmacists were bound under penalties to follow the directions of the Pharmacopœia, which authorized the use of apothecaries' weights.

The Paris Exhibition.

Mr. Greenish said it was much to be regretted that no report of the portion of the Vienna Exhibition, 1873, bearing on pharmacy, had ever appeared in the pages of the *Pharmaceutical Journal*, and the same observation would apply with regard to the Philadelphia Exhibition, of 1876. He believed it was the wish of the Council that the Journal should be kept abreast of the age in all that was of interest and benefit to pharmacists, and that could only be done by availing themselves of such opportunities as the one now presented by the Paris Exhibition. He thought the Editor should be afforded an opportunity of making arrangements for securing a report on the contents of that building, which would appear in the pages of the *Pharmaceutical Journal* as a permanent record of that portion which had a scientific interest and practical value to pharmacists.

On the motion of Mr. Greenish, seconded by Mr. Sandford, a vote was passed to defray the expenses requisite to obtain a thorough report on the Paris Exhibition as bearing in any way on pharmacy.

The Annual Meeting.

The Council then proceeded to arrange the course of business for the annual meeting.

Mr. Betty suggested that members of Council should not take an active part in the discussion of the resolution of which notice had been given for the admission of ladies membership, but leave it rather to the members generally.

Mr. Sandford thought the members of Council should not sink their own individuality, but that each one should express his own opinion.

The President agreed with Mr. Sandford that members of Council who had thought over this matter a good deal should state what conclusion they had arrived at.

Mr. Greenish regretted that this subject had been brought before a general meeting which could never be considered to fully represent the whole feeling of the trade.

Mr. Atkins and Mr. Schacht were inclined to agree with Mr. Betty that the discussion should be left chiefly to the members, but at the same time they did not think they should pledge themselves to any hard and fast line not to speak.

Mr. Bottle advocated the same view.

The Council then adjourned to the Annual General Meeting.

ANNUAL GENERAL MEETING.

The President took the chair at 12 o'clock, and the Secretary having read the notice convening the meeting, the President read the following address.

The President's Address.

I have again to say a few words of welcome to the members of the Pharmaceutical Society assembled in Annual General Meeting. Much has occurred since last we came together to excite feelings of deep interest. The annual Report of the Council, however, sufficiently enters upon such questions, and it is not necessary that I should now enlarge on them. With your permission I will confine my remarks mainly to what I may term my presidential experiences of the past two years. My term of office has expired and I can do so without prejudice to my successor.

Any one occupying the honourable position of your President is soon made conscious that it commands a certain amount of respect from other highly influential bodies. The courteous and distinguished manner in which your President is received by many public bodies, not only medical and scientific, but governmental, is not only gratifying, but has great significance. Various Government departments on many occasions during the period of my presidentship have sought the advice and the opinion of your Council, and when our interests were supposed to be threatened by the formation of a new institution which proposed to examine candidates and grant to them a title already appropriated to us under the Pharmacy Acts, the Government took especial care to inform us of the fact, that nothing should be done which could be injurious to our interests. These and many other incidents which have come under my notice, often little in themselves it is true, but making a large whole when taken altogether, have led me to the conviction that the Society as now carried on possesses the confidence and sympathy of other bodies both governmental and scientific to a degree which must be gratifying and advantageous to all members of our body, and to the trade at large. I cannot but think that this state of things is due to the wisdom of the past. We are indeed now reaping some of the benefits of the labours of those who wisely founded the Society upon broad and sound lines, the line of the public good, mainly at first by the elevation of the chemist and druggist educationally and professionally, and ulteriorly by securing increased safety to the public and the confidence of the medical profession. This has been a slow process. Years have elapsed since the foundation of the Society, but had our founders attempted to go too fast depend upon it the results would have been very different and much less satisfactory. Some of our members, I am aware, would urge us to pursue what they term a more active policy with reference to strictly trade interests, and think the Society would do well to strive to advance such ends by more rapid means. I must say I cannot altogether agree with this view. By the indirect but very certain process which we have hitherto adopted, always bearing in mind that as a public body we exist for the public good, the Society is making progress towards securing that position which should be the constant and consistent aim of every member of the trade to attain. I am looking forward to the time when the educated pharmaceutical chemist will be the one and only dispenser of medicine in the kingdom, when he will take his position in the ranks as an auxiliary of the medical profession and occupy the position the pharmacist on the continent does at this moment. When in due time we have convinced the medical profession that such a state of things would be for the public benefit, and have educated the public to look to the skilled pharmacist as the necessary coadjutor to the skilled physician, depend upon it we shall have no difficulty in obtaining recognition of our rights. It may be asked, Is this change likely to occur in our time? In answer to that I should say much depends upon ourselves. The cultivation of the sale of patent medicines will not help us much; but consistent and intelligent conduct of our business will. I think I see that things, at any rate in London and other large towns, are already tending in the desired direction. Although I cannot anticipate the immediate realization of my wishes, still by keeping our object steadily in view success may be vastly accelerated.

I remember well that when the Society was first founded, and after it had succeeded in its defence of trade interests at that time threatened by an obnoxious medical bill, the scientific meetings held every month were looked upon as a most important element in the effort then being made to raise the position of the chemist and druggist. Let me say that in my opinion the importance of supporting those evening meetings is now as urgent as ever. I wish I could make our country members feel more strongly that these meetings are their meetings quite as much as they are those of the London portion of our members. It is from our country members we want support in the shape of papers showing the results of work, I am sure I may add good pharmaceutical work, which has been done in many a pharmacy in the provinces. I am aware that much of this work now goes to the local associations and to the British Pharmaceutical Conference. To all such bodies I cordially wish success, but still our country members ought to remember that Bloomsbury Square has great and permanent claims upon them, and I do hope future Presidents will not have to fear taking the chair at our evening meetings with little or no matter to bring before the members.

Our magnificent museum and library must be a source of pride and gratification to all our members. They realize all that the founders of our institution could have anticipated; as President I have taken great interest in watching the progress made. Much good I am sure must result from the large and increasing circulation of books. I have observed that but few applications come from Scotland. Of course I am aware there is an excellent library in Edinburgh; but I would remind our friends north of the Tweed that the library in London is as equally available for distribution in the north as in the south, and the more use made of it the better for all.

I have been thrown much in contact with Journal matters during my term of office. I think that candid critics must admit that the influence exerted through its means is of a high and educating character, whilst it is so conducted as to receive the approval of its readers. It certainly has been, as far as I can judge, most impartial when any matter involving division of opinion has been under discussion.

Of our school much might be said. It has done good sound work in the past, and I trust will long maintain its high position, and continue in its career of usefulness. Now that other schools have arisen to more or less perfectly meet the educational wants of the trade, it behoves our school to buckle on its armour, in friendly rivalry, determined not to be outdone, but to make the education given to the students as pre-eminent in quality and quantity as endowment and the many advantages possessed by it may be supposed to ensure.

It is the privilege of your President to act *ex officio* as chairman of the Board of Examiners; this gives him an opportunity of seeing much of the working of the system of examination both in London and Edinburgh.

The result of my observations is most favourable, and I am quite convinced that this, perhaps the most important function of the Society, is conducted in a manner most fair and honourable. I am quite sure substantial justice is done to the candidates, and anything like intentional want of courtesy or kindness towards them is quite out of the question, although it is perhaps natural that a candidate who has failed may, in the irritation of the moment, have a different impression. I wish to take this opportunity of saying how much I have appreciated the manner in which the examiners perform their very onerous and responsible duties. I think also the two Boards may be congratulated on having such gentlemen as Dr. Greenhow and Dr. Maclagan occupying the position of Government visitors; their courtesy and attention is most marked and gratifying.

The prosecution of offenders under the Pharmacy Act is a function of the Society not of the most agreeable kind, however necessary it may be for the protection of the public interests. Your President frequently finds himself personally appealed to upon such cases when immediate decision is required. The Society, however, commands the services of gentlemen who are officially able to advise so wisely that I believe the best interests of the Society and the trade at large are well cared for.

Another duty devolving upon your President, is to watch the action of Parliament, and assist in taking steps to effect the alteration or rejection of measures which might prove injurious to the interests of our body. Even within a day or two of this time I have had to seek an interview with the authorities of the Board of Trade, respecting the Weights and Measures Bill now before Parliament, and believe I can announce that some objectionable clauses will be altered, and other exempting ones added, to render the bill harmless as far as it affects the interests of our trade. In this matter I received the very valuable assistance of Mr. Sandford and Professor Redwood. I am also much gratified in adding that Dr. Acland, the President of the Medical Council, came up from Oxford to represent the views of that council in support of our own.

Of that more advanced stage of usefulness, the actively taking part in the passage of legislation which would be beneficial to us I have had no experience during my term of office; my more distinguished predecessors had done in the past so much, and so well, as to leave but little opportunity for those who follow. Still there are matters upon which by universal consent it would be most important to get fresh legislation when we see our way to a prospect of doing so successfully. I trust my successor in the office of President may be more fortunate than myself, and have the happiness to announce that he has been instrumental in advancing our objects.

One word before I conclude in allusion to the Council and officers of the Society, and to thank them earnestly for the assistance they have afforded me and the kind forbearance to my shortcomings. It has not been a difficult task to preside in a Council where party spirit is unknown, but every man expresses his own individual opinion upon the subject immediately before the meeting. I trust such a state of things may long continue, and that our councillors will never be degraded into mere delegates, but will continue to be the fair representatives of the intelligence of the whole trade. I fail to see that there are local interests to serve requiring special representation. Our interests properly understood are one and undivided, and although it is most important that members of the Council should be taken from various localities—as being able to give valuable experiences and assistance—still, upon every question which comes before the Council it is the duty of each member, from whatever part of the country he may happen to come, to consider every matter as of equal importance.

And now, gentlemen, I conclude, trusting the discussion of such matters as may come before you for consideration to-day may be carried on in that spirit and manner which will best conduce to the advancement of pharmacy and the interests of the Pharmaceutical Society.

The PRESIDENT asked whether the Report of the Council should be taken as read.

Mr. ANDREWS said he should not object to that course on the present occasion, but he hoped it would not be made a rule to do so always.

The following Report and Balance Sheet were then taken as read :—

REPORT OF THE COUNCIL.

The financial statement of the year 1877 presented herewith shows an increase in the receipts of the Society and an augmentation of its numerical strength on the one side, while on the other the general expenditure is shown to have been sufficiently within the income to enable the Council to purchase £2000 New 3 per cent. stock, as an addition to the previously invested capital.

The number of candidates for examination in the various grades is perhaps the most important point brought forward periodically for consideration, and an advance therein occurred in 1877. The numbers were as follows: Preliminary, 1,083; Minor, 536; Major, 98.

Comment has been made by various writers in the *Pharmaceutical Journal* on the large percentage of failures reported from time to time by the Board of Examiners, and the subject has frequently been under discussion in the Council. However much these failures may be a cause for regret, there is ample evidence to show that they result not from too great stringency in the examinations but from a want of competence in the candidates. The amount of knowledge required in those to whom the important duties of pharmacy are entrusted by the Legislature must be the standard insisted on, rather than, as some writers seem to suppose, the capabilities of the young men presenting themselves for examination. In other words, the standard must be fixed according to the requirements of the public, not according to the acquirements of the candidates.

In this matter, some question has arisen on the difference in the number of rejections in London and Edinburgh. It is manifest that for the well-working of the Pharmacy Act, uniformity, as nearly as it can be attained, should exist in the conduct of the examinations at the two centres. To ensure that, as well as to maintain the cordial feeling which has always pervaded the members of the Pharmaceutical Society, in England and Scotland, occasional visits have been exchanged between them with the best possible result. In February last two members of the Council, accompanied by three of the London Examiners, were deputed to visit Edinburgh at the time of the examinations, and specially to ascertain if any important difference existed between the two Boards. It was gratifying to observe that the arrangements for conducting the examinations were in most essentials as satisfactory, and the regulations as strictly carried out, as those at Bloomsbury Square, the same high sense of duty animating the conduct of the Examiners of both Boards.

During the year 1877 many valuable books have been purchased for the Library, as may be inferred by the increased outlay under that heading in the financial statement. Judging from the large number of readers now constantly found in the Library, there is perhaps no department of the Society's establishment more important, and the Council has always endeavoured to render its advantages as accessible and its arrangements as convenient as possible. A few years since it was decided to pay carriage one way, outwards or inwards, on books applied for by members and associates in business in the country, and the appreciation of this resolution has been evinced by an increased circulation. In order to extend still further this benefit the Council recently decided that when associates or apprentices in the country applied for books, the carriage to or from them also should be paid by the Society, and that the time allowed them for retaining books should be the same as that allowed to members.

The Museum has been enriched by many important additions, and in perfecting the classification many duplicate specimens have been liberated, some of which have been appropriated to the North British Branch; others are being offered to Local Associations.

The catalogue compiled by Mr. Holmes, the Curator, has been completed, and, containing as it does much information beyond a mere list of the specimens enumerated, will be useful, not only to those who by its aid examine the contents of the Museum, but also to all who are interested in chemistry or materia medica.

The evening meetings at Bloomsbury Square have been well attended; many papers on interesting subjects have been read, and the discussions arising therefrom well sustained. Extra meetings were held in May, 1877, and February last, when Professor Redwood delivered lectures on "Spectrum Analysis," using for their illustration the electric light; also in April last Professor Bentley lectured on "*Eucalyptus globulus*."

The professors have reported from time to time that a fair average number of students were attending their classes, and, what is equally important, that the conduct of the students has been marked by great diligence and an evident desire to avail themselves of the opportunities offered for improvement.

No legislation has been proposed directly restricting the trade of chemists and druggists since the last Annual Meeting, with the exception of the Medical Act Amendment Bill, introduced last year by Dr. Lush and Sir Trevor Lawrence. Had the Bill passed in its original form, even that amount of prescribing which the most determined against "counter practice" are compelled from time to time to undertake would have become illegal, and much inconvenience would have resulted both to chemists and the public. It is due to Dr. Lush to state that immediately on it being represented to him by a deputation from the Council of the Pharmaceutical Society that this injurious effect would be produced, he undertook to remove the objectionable provisions in the Bill, stating at the same time that he had no desire to do anything adverse to the interests of chemists and druggists. The Bill, which failed to pass last session, has been again introduced in an unobjectionable form this year, but as the Duke of Richmond has brought forward a comprehensive measure to consolidate and amend the Medical Acts, private members of Parliament will probably leave the ground clear for the Government. The same fate probably awaits the Dental Practitioners' Bill, as dental practice is provided for in the Government Bill.

Dentistry, although no part of pharmacy, has always been more or less practised by chemists, especially in many small places, where dentists exclusively following that profession are not to be found. It was therefore felt by your Council that care should be taken that those chemists who have hitherto practised dentistry should not be precluded from registration and consequently debarred from the privileges pertaining thereto. On this point the Council immediately addressed Sir John Lubbock and the promoters of the Dental Practitioners' Bill, who complied with the request that certain words which rendered the matter doubtful should be erased.

Considerable excitement has been occasioned by unusual activity, apparently on the part of the Society of Apothecaries, but in reality, perhaps, of the "Medical Defence Association," in the prosecution of chemists for infringements of the "Apothecaries Act, 1815." This has been a very delicate question to deal with. The 21st section of the Act of 1815 reserved to chemists and druggists the right to carry on their business as fully and freely after as they did before the passing of that Act, and there are still many men living who can testify as to the custom of chemists prior to that date; still as no positive line can be drawn between ordinary medical practice and counter prescribing, it is most important that a good understanding between the two parties concerned should be established. It is very well known that the Pharmaceutical Society has never encouraged the practice of medicine by its members; it has rather fostered the idea of the separation of the duties of the prescriber and the dispenser, and the due qualification of each for his office. Nevertheless, it is obvious that, more or less, all chemists are called upon to advise as to the nature and uses of the medicines which they sell, and to supply them not only in their simple but also in compounded forms. To be restricted in doing this would be injurious, both to the chemist and the public. Under these circumstances the solicitor of this Society was instructed to put himself in communication with the solicitor of the Society of Apothecaries, and the result of their correspondence, which has already been published in the Journal, may be considered reassuring and satisfactory.

Upwards of 150 informations of infringements of the Pharmacy Act have been received by the Registrar during the past year. In nearly all cases it has been found unnecessary to take legal proceedings; in most of them the offences having been discontinued in compliance with the premonitory letters addressed to the offenders by the Registrar. The names of two persons who had improperly obtained registration as chemists and druggists have been erased from the Register by order of the Council.

It will be remembered that in the last report a case of fraudulent personation of a candidate for the Preliminary examination was mentioned. The offender, although convicted on that occasion, was not punished; but afterwards two other similar cases were discovered against him, and at the second trial in August last he was sentenced to six months' imprisonment.

A Committee having been appointed to consider whether any, or if any what, amendments were required in the Pharmacy Act to promote a more efficient working thereof, presented a report to the Council containing various suggestions. This report has been duly received and accepted as a basis for action on the occurrence of a suitable opportunity.

Representations as to the danger arising from the indiscriminate sale of Chloral Hydrate having been sent from coroners in various parts of the country, some direct to the Council, others to the Home Secretary, after full consideration that substance has been added to the schedule of poisons, and must now be dealt with as an article included in Part 2 thereof; this has been intimated by order of the Council to every chemist and druggist on the Register.

The Board of Trade having under consideration a measure for consolidating the Acts relating to Weights and Measures in the United Kingdom addressed a letter to the Council, accompanied by a copy of the proposed Bill, asking information as to the practicability of withdrawing the right to sell drugs by apothecaries' weight, a right which had been reserved in the Act of 1835. The Committee by which the question was considered replied that many articles of a potent and expensive character were constantly purchased and sold by apothecaries and chemists in very small quantities, and that much inconvenience would arise by prohibiting their sale by the drachm or scruple, those being the denominations of quantity still current in prescribing. This objection being admitted as a fair one the Board of Trade determined not to interfere with the old practice. More recently, however, the Bill has been altered by a Select Committee of the House of Commons and apothecaries' weight entirely ignored. The Council are still taking active measures to remedy this evil.

During the past year some ladies have applied for admission into the Pharmaceutical Society. The question was discussed, but the Council bearing in mind that in 1873 the Society, in general meeting, had by a large majority adjourned the question of admitting ladies as Members, Associates, or Students of the Society, *sine die*, it was decided that it was the right of the whole Society rather than of its Council to alter that decision. The subject will probably be submitted at the Annual Meeting at which this report will be read, and it will be for the members to signify their wishes upon this question.

The increasing claims upon the Benevolent Fund have commanded and received careful investigation and liberal consideration at the hands of your Council, who feel the desirability of extending the benefits of this excellent institution by every possible means. On the evening preceding the last Annual Meeting a festival was held, which was largely attended, and which resulted in donations and subscriptions amounting to upwards of £1600.

This very gratifying result emboldened the Council to aid more liberally in the provision for, and education of, orphan children by securing their election to public asylums; also to augment the pensions of

FREDERICK ANDREWS
FREDERICK BARRON
WILLIAM HODGKINSON
} *Auditors.*

February 28th, 187

Annuitants who have attained the age of 65 years. Some changes have been made in the "Regulations" for administering this Fund. A new clause has been introduced, which carries to the credit of any subscriber or donor, or his widow, who may by adverse circumstances be compelled to become a candidate for an annuity, "such number of votes . . . . as shall be represented by the whole amount of subscriptions or donations," he may have contributed to the Fund.

It is still a matter for regret that though all "chemists and druggists" on the Register are eligible to receive aid in case of need, whether connected with the Society or not, the number contributing to the Fund bears a very small proportion to the number on the Register.

Mr. G. H. Wright moved—

"That the Report of the Council, as now read, be received, adopted, and printed in the Society's Journal and Transactions."

Dr. Symes (Liverpool) seconded the motion.

Mr. R. O. Fitch (Hackney) wished to ask what steps had been taken with respect to co-operative stores selling poisons, and not entering the sales as required by the Act. Last year he mentioned this matter, but withdrew his resolution on the understanding that the new Council would take cognizance of the matter. He held in his hand a report showing that a well-known man had been ordered by Mr. Justice Huddleston to be prosecuted for selling cyanide of potassium to a photographer, and he believed he was prosecuted and fined, yet to his knowledge there were several stores in London where no poison book whatever was kept, and poisons were sold openly. He had with him a co-operative store list in which "Easton's tonic syrup" was quoted, which contained one-thirty-second of a grain of strychnia in each drachm, and, when the Act stated that strychnia and all its preparations were not to be sold except to persons known to the chemist, or introduced to him, he thought it ought to be enforced. At the time of the Bravo poisoning case the question arose whether the poison was purchased at Balham, or elsewhere, but Mr. Bravo was a barrister, and like most barristers, was probably a member of the stores, but no question was asked whether it was purchased at them. He thought the Society should communicate with the police, and say that such things were so kept and sold. With regard to the opinions given by counsel that it was not politic to prosecute the stores, he did not think an honest opinion could be got from counsel on this point, because they were nearly all either ticket holders or shareholders of the stores; and they would not speak against their own shop. In the case which the Society recently prosecuted, the magistrate showed unmistakably that he was interested in the stores, and he thought the question ought have been put to him whether he was or not, because it used to be a maxim in England that no man should sit in judgment on a matter in which he was interested. There was a report in the Journal recently that two stores in the country had been prosecuted for selling spirit of nitre which contained 56 parts of nitre and 44 of water. It was generally supposed by the public that they got their things more genuine at these stores, and at a much cheaper rate; but at any rate these stores ought to be made to observe the Act in the same way as chemists were, and in fact, if the Society did not do this he was empowered to say that a body of outsiders would go to the Court of Queen's Bench for a mandamus to compel the Society to carry out the Act fairly and properly. If he were to take an assistant into partnership they would not allow him to paint his name up unless he were on the register, and they ought to be equally strict with the stores as with the trade. Some twelve months ago he had a gentleman come to him and ask him for some handbills with the prices showing what he was selling patent medicines at, and one member of the Council had written to him upon the subject. He recollected telling him that there was a tea dealing establishment in his neighbourhood sending out price lists showing $9\frac{1}{2}d.$ for many articles, and he was obliged to do it in his own defence. Yet he had seen a not very complimentary allusion to himself as being the cut-throat of the trade. That was not fair, because he came to the Council in a manly way and asked it to interfere. It did not choose to protect the trade, and therefore he had taken measures to protect himself, and if that worked hardly on some poorer members of the trade it was the want of action on the part of the Council which led to it. A remark had been made in the President's address with regard to the courtesy with which young men were treated coming up for examination, though those who did not pass would not think so, and he was quite certain they did not think so, and he did not think they were treated fairly in not being told in what part of the examination they failed. Nor were all the questions fairly put. One question in July, 1876, was—Give the feminine form of a certain animal. When he read it he thought it must be a mistake, and that they must have supposed the young men to be candidates for a zoological society or something of that sort. He had asked an M.A. of Oxford and of Cambridge to answer it and neither could do so off-hand, though one did after some time. The question was "Give the feminine form of a fox," and he contended it was not a fair way of putting the question. Some one he knew was told by a chemist in the country with great exultation that his son had passed the examination, but some time afterwards when in London he met one of the examiners who intimated pretty plainly that the young man in question was not quite up to the mark. At the time the young man's father had a seat on the Council; he did not say it had any influence, but it looked suspicious. He should move as an amendment—

"That it is the opinion of this meeting that it is expedient that the Council should at once take legal proceedings against the proprietors of one of the co-operative stores in order that the legality of their action should be finally settled."

The President said it was hardly an amendment, and it had better be put as a resolution subsequently, but he might remind Mr. Fitch that they could only carry out the law; they could not prevent people selling patent medicines.

Mr. Long thought all the members must be very well satisfied with the report, and certainly their thanks were due to the Council for the able manner in which it had carried on the business of the Society. The Society was now something like thirty-six years of age, and was pretty strong, but it did not represent the drug trade. There were a great many more chemists outside the Society than there were in it, and one of the questions usually asked was, what does the Society do for us? He would ask, what do we do for ourselves? It was all very fine to expect the Council to provide bread and butter for them, but as a society they must keep themselves. He did not think the Society did for them, or that they did for themselves, what they were entitled to. A few years ago they had a business and were able to pay their way and be comfortable. They obtained an Act of Parliament to protect themselves, and to prevent other people infringing their rights. At that time there was a great discussion on it, and what he suggested was that they should remove opposition whenever the Act was obtained and admit everybody who was in buisness, and then they would get a good Act. But that was not carried out. Sir Fitzroy Kelly took their case in hand, but Sir John Shelley took up the case of the outsiders, and therefore Parliament was very careful what sort of Act it passed. The result was they had a fine affair for putting their heads into a yoke, which saddled them with all sorts of disadvantages, and gave them nothing in return. Any one could be a chemist, so long as he did not put "chemist" up, which was perfectly unnecessary. All he had to do was to invest in a number of bottles, and stick out some carboys with coloured solution in them, and people thought that that meant a chemist. The only thing he could not do was to sell poisons. But who wanted to sell poisons? They were the very bane of their existence. Poisons were no advantage to them, and yet that was the only protection they had. He considered that their Act was entirely deficient, and that a large body like theirs ought to be able to go to Parliament and show the disadvantages under which they laboured, the immense amount of anxiety, responsibility, and capital they had to employ in preparing for, and conducting their business, and to insist on some return for their money and labour. As for the Council going to oppose co-operative stores in the present state of the law, it could not do it. Here was an Act of Parliament passed, under which if he were not a chemist he could not purchase a certain stock and stick a qualified man in to keep it, but he could evade the Act by getting a certain number of persons to join him, and calling it a co-operative store. There is no co-operation about that; it was wholesale shopkeeping, that was all. A co-operative store was something in which each person had an interest, and if fifty people chose to combine together and purchase a certain thing and divide it beween them, he did not think the law would ever touch them. If a druggist died, his widow could not carry on the business for her own advantage, and why should anybody else be allowed to do so? The Act was inoperative, and they ought to have a new one. The drug trade was in a very unsatisfactory state, and was killing men off very fast, as could be seen by the obituary. He did not mean that the Council could do anything in that way; they must themselves do away with some of the wear and tear and worry of it. They must do away with that idea that they were always ready to attend to anybody whatever time they came, have definite hours of business, and make people come within those hours or else pay an extra fee. Their philanthropy was as great as anybody else's, but why should a man, just as he was sitting down to read, be disturbed by Mrs. Jones who had forgotten a simple thing which she could have got in the middle of the day?

Mr. Urwick wished to make a few remarks on the balance sheet. He heartily congratulated the Council on the state of the funds, which enable it to still lay by money; but he thought the time was coming when the Council would have laid by a sufficient sum to give the Society a permanent standing, and should seek to do something else with it. The income was about £9735, and the expenses were £7462, giving a considerable balance to the good. There was £1000 in the Treasurer's hands in December, and £2000 had been invested that year, making £3000 to the good in the working of last year. He took it that the accumulated fund was now £15,000, and £2000 added would make £17,000, and this year they would be able to lay by £3000 more which would bring it up to £20,000. He had always looked forward to the Society having such a sum, but he thought it would then be time to make a different application of the fund which remained over and above the working expenses. His idea was that when that time came they should reduce the subscription to half-a-guinea, which would still leave them a surplus of £700 a year over the working expenses. Objection might be raised to this, and some might say that a guinea was none too much for a man to subscribe to a respectable society; but if they could get the same advantages for half-a-guinea he did not see why they should not do so, and it would increase the number of members throughout the country. One item he did not quite understand was the £483 for rent, which seemed somewhat larger than it used to be.

The President said the rent was £230, but there was another £100 for rent paid for Mr. Bremridge's house, and the rates and taxes made up the remainder.

Mr. Urwick thought those items ought to be separated.

Mr. Robbins said he should be very glad, as a member of the Council, if they could accept Mr. Urwick's figures as correct, but he thought that he had rather misled the meeting with regard to the amount of money saved during the year. £2000 had been invested as he stated, and he said there was another £1000 in the Treasurer's hands; but if he looked to the beginning of the year he would find there was a balance of £1700 brought forward, consequently, it showed a saving of about £2000 instead of £3000.

Mr. Urwick said he had taken all the figures carefully, and he believed he was right.

Mr. Richardson said the criticism indulged in on these occasions had, he believed, always been conducted in a friendly spirit towards the Council, but he would beg to suggest what appeared to him important in drawing up the report which would have met some of the objections. His proposal was that the report should be in three parts; the first containing the financial portion; the second, the Benevolent Fund; and the third, the general policy of the Council. They would not then have the irregularity of gentlemen moving amendments to the reception of that which they did not object to. He felt pretty strongly with reference to the sale of drugs by unregistered persons. Very often there were very great hardships on registered chemists and druggists in small towns and country districts. If these men could not be protected from little shopkeepers in every street, it was a great hardship on them that they should have to go through an expensive education and yet be on a par with all the hucksters in their neighbourhood. He regretted to find that the Society was still too lenient. One portion of the report stated that there had been upwards of one hundred and fifty informations of infringement of the Pharmacy Act received during the past year, but in nearly all these cases it had not been found necessary to take legal proceedings, the offences having been discontinued in consequence of the premonitory letter sent by the Registrar. Now these people always discontinued for a certain time. The premonitory letters had an effect for probably a year or so, and then the evil grew up again; but the registered chemist on the spot would not again interfere because these things became known, and he was often very much pestered in consequence. When a chemist had made one *bonâ fide* complaint and had brought forward the proof necessary, then the Council said, No; we must send this man a caution and shall not prosecute him unless he does it again. The chemist then got disgusted and declined to have any further interest in the matter. Very recently he met the Coroner for Leicester, who complained very much of these sales of poisons by unregistered persons. In his district there were many deaths of children arising from poisoning by means of Godfrey's cordial, which could be obtained at almost every little shop, and he thought the Society should take more stringent means to prevent the sales of these poisons by unregistered persons. In his own town there was no necessity for excessive competition, but there was a gentleman there who issued a voluminous monthly list enumerating almost every article in the Pharmacopœia, and all the patent medicines in daily use, and some of the prices he gave were quite startling. A combination was made by the retail chemists and respectful circulars issued to the wholesale houses in London, calling attention to the fact that this gentleman was doing this sort of thing. He got one of these circulars which they had been sending and sent a copy to every respectable inhabitant of the town, saying this was the pressure brought upon him because he endeavoured to let them have things at a reasonable rate. Therefore, before they attempted to take action against co-operative stores they should wash their own dirty linen at home. The President in his address had rather deprecated the sale of proprietary medicines, and that might be very well for Regent Street and Oxford Street, but the patent medicines were an important element in the drug trade in this country, and he did not see why they should be ashamed to sell them when they had houses such as Morson's and Davenport's who sold them. He would also call the attention of the Council to the prohibition lately introduced against the importation of English patent medicines into France. Some few years ago these medicines were admitted under a certain tariff, and they gradually got an extensive sale. But the Frenchmen finding the English were getting an advantage they went to the Minister of the Interior and obtained a veto on any of these patent medicines sent from England. This was a matter which he thought the Society might bring before the Government. Of course, the less scrupulous smuggled their articles into France, and in some of the English pharmacies you might see the windows filled with certain quack medicines. In conclusion, he begged to express his regret, which he was sure would be met by all the members, at the intimation given by the President that he was about to resign his present position.

Mr. ANDREWS, as one of the auditors, wished to mention that some years ago he suggested that the £100 a year allowed to Mr. Bremridge for rent should be placed under the heading of salary, and he would throw out the suggestion for the Financial Committee to consider.

Mr. SLIPPER wished to repeat some remarks he had made on a former occasion with regard to the Preliminary examination. As he had mentioned some years ago, in the examination there were introduced subjects which were not taught to boys in any school in this country so far as he knew. He referred to the metric system. This was not required in the Oxford or Cambridge examinations or at the College of Preceptors, and yet certificates of those bodies were received. He did not say it was not necessary for druggists to understand the metric system, but it was not a thing which ought to be introduced into the preliminary examination. Boys could only prepare for it by a little cramming beforehand, and that ought to be discouraged. He could only suppose that there was some gentleman connected with the Educational Committee who had a crotchet about this, and he hoped it would be attended to, or if not, he would on some future occasion move a resolution. Could any gentleman on the Council tell him of any public school where boys were instructed in the metric system?

Mr. CRACKNELL replied, at University College School, in Gower Street.

The PRESIDENT said, the metric system was included in the Pharmacopœia, and therefore they were bound to include it in the general knowledge of candidates.

Mr. SLIPPER did not object to the metric system, but thought it should be part of the technical instruction obtained by the candidate during his apprenticeship.

Mr. CORDER said he lived in a rather out-of-the-way part of the world, and yet in all the schools with which he was acquainted, namely, the grammar school in Norwich, the commercial school, and the county school, the metric system was taught. Apart from that, was it any great grievance to be required to learn that which any ordinary boy could learn in a day without difficulty? and surely it could be no great injury to anyone that a little extra knowledge should be given to a boy. He never found himself that information of any kind did him any harm. This rather reminded him of a story of a man who was standing outside a wild beast show. The manager came out and said, "Walk in, gentlemen, I can let you see a Babylonian lion." The man said, "I bet you a sovereign you can't.,' He said, "Done," and took him into the show, brought him in front of the cage and said, there was the Babylonian lion. The man said, "I don't see it." The keeper replied, Don't see it, why there it is in front of you." But the man's answer was conclusive. "I was born blind."

Mr. MARTINDALE asked Mr. Slipper if he could name any public school in which the metric system was not taught. That system was universally adopted throughout Europe, and though they were very much behindhand in England, he hoped it would soon become general.

Mr. VIZER endorsed what had been said with reference to the premonitory letters being sent to offenders. He thought it was time that these letters were put in the fire instead of the post office. The law had been in action for some years now, and it was well known, and every one who infringed it ought to be dealt with as an offender. Honour should be given to those to whom honour was due: he gave the Council every credit for what it had done; but there were two paragraphs in that report which he thought might have been altered, namely, those referring to the Dentistry Bill and also to the Apothecaries' Company *v.* Shepperley. He thought it would have been better if in each of those cases some recognition had been given of the very efficient support, he might almost say guidance, given by another Association, not a Birmingham Association but an Association of the trade generally throughout the country. With reference to the examinations, he also thought the students should be told in what branches they failed, because it put them at a great disadvantage not to do so. Lastly, he thought the thanks of the meeting ought to be given to Mr. Owen for the great amount of work he had done in connection with the Benevolent Fund, especially in gaining admission for children into orphan asylums.

Mr. HANBURY wished to inform Mr. Vizer that so far as the Dentistry Bill was concerned, some days before the meeting took place of the Association referred to, he had an opportunity of seeing Sir John Lubbock, who at once fully acceded to all that the Council or the Society desired to have done, so that the matter was practically settled before that action was begun to which Mr. Vizer alluded, and there was not the slightest reason for referring the change in the Dentistry Bill to the action of anybody outside the Pharmaceutical Society. He did not in any degree undervalue the operations of the Trade Association, but it was only right to state the true facts.

Mr. VIZER said, he did not think the Council would lose anything by recognizing the work of the Association.

Mr. SYMONS (Barnstaple) said the observation of Mr. Hanbury reminded him of what he was told by the Secretary some years ago with regard to the jury question, and probably the Secretary's experience in that affair would lead him to conclude that it was not well to consider a question settled because Sir John Lubbock had agreed to leave out certain words. With regard to the Jury Bill the thing went forwards and backwards several times, was settled and unsettled repeatedly, and if it had not been for the accident of meeting with Lord Wensleydale in the lobby of the House of Lords, they might have been overthrown after all. He did not wish to introduce any element of discord. He had been connected with the Society for some years, and also for a year or two with another Association, and he must say he had been sorry yesterday to hear some remarks made with regard to the parent Society, and had also seen with regret some injudicious words which had appeared in the Journal. The truth was, as had been said yesterday, the Trade Association could do work which the Society could not do. There was work for them both, and why should they be in any position of antagonism to each other. Holding these views he intended at a later period to propose a resolution to this effect. "The shareholders trust that the Council of the Pharmaceutical Society will co-operate with the Committee of chemists and druggists of the Trade Association in bringing about a satisfactory settlement of the dispensing and prescribing question, and that they will contribute £50 to the special fund now being raised by the Trade Association to accomplish this and other objects for the general benefit of chemists and druggists." He hought it would be useful to pass that resolution in order to remove any feeling of jealousy which might have sprung up in some minds. He also heard yesterday some remarks about the scientific character of the Journal. He thought it ought to be of that character. He was very pleased to see those articles on the Month; but there was another department which was attempted for a little while, some short time ago, and then given up, he did not know why, namely, an article dealing with the drug market, perhaps not every week, but a monthly review of the trade. He was not in time to hear the remarks of the President with regard to proprietary medicines, but it would never do to give them up. At the present day many physicians prescribed proprietary medicines. He had seen prescriptions ordering them, and it would be perfectly impossible for the chemists and druggists to give up dealing in them. They ought rather to try and keep the trade for themselves. Anything like direct legislation they could not carry, and some of the observations made in the correspondence which had lately appeared were perfectly absurd. But he remembered some practical remarks once made by a late member of the Council, Mr. Edwards, on a question which was agitated before the present bill was carried, when he said that anything which could be done must be done indirectly. They had a policy to pursue in that respect by some enlargement or amendment of the present Bill, and it was only in that way that they could secure that branch of the trade for themselves. He did not see why there should not be a third schedule of poisons including articles which should require a caution label, and a clause introduced requiring the proprietors of patent medicines containing poison to specify the quantity of poison contained in the article on the label, and confining the sale of that kind of medicine to registered persons. It would not then be worth the while of outsiders to go in for patent medicines at all.

The PRESIDENT begged to remind Mr. Symons that the Council of the Society had no antagonistic feeling whatever towards the Trade Association.

Mr. MACKENZIE (Edinburgh), said it was not often that members from Scotland could come to those meetings and as he was there he had ventured to make a few remarks, but they would be made in the best possible spirit, and he hoped they would be received in the same manner. He would say very little about the report except that to his mind it was rather remarkable for what it was not than for what it was. He should have liked to have seen in it that the Council had done more for those in the trade. The desire in his mind was that there should be that unity in the trade which there ought to be, and there were from time to time grievances arising out of the action of the Council, which never could secure that union unless they were removed. He was in the habit of canvassing gentlemen to join the Society and had been successful in many cases, but the first question always was, "What has the Pharmaceutical Society done for us and what will it do?" This was a question very difficult to face. As had been said already it would rather seem as if there was an enemy in the camp than that they were all friends, because the Council was allowing the coroperative stores to do what it denied its own members the privilege to do. Was that what they had a right to expect from the Council? The members of the Council were in the position of managers and magistrates, but they were not a terror to evildoers. The time had gone by when these warnings could be put aside; it was unfair to the trade and to those who paid their guinea a year. The Council ought to take a wide view of the trade—not a London or Oxford Street view of it, but a wide Great Britain view—and it would thereby become more popular, for in many districts it was not so popular as he should like to see. With regard to the examinations he did not think it altogether just not to tell young men where they failed, and if this were adopted the Council would gain an immense amount of popularity and would lose nothing. With regard to some of the figures which had been mentioned he thought that officers should always be well paid, but he would make the financial report so plain as would prevent any one rising and quizzing out things which ought to be stated distinctly on the face of it, and he hoped in future the report would be so framed as to prevent the possibility of any such questions being asked again. It had been said by some that there were those in the trade who did not act as they would like to see, for their own interests and certainly not for the trade generally. There was an old adage "To know the disease is half the cure." In many cases those people had made complaints to the Society of parties in their neighbourhood doing certain things, but no one interfered with them, and then they got soured and said, "What are we to do if the Society will do nothing for us? We must compete with these people." If the Council were more decided in its action these evils might be prevented, and he hoped the day was not far distant when the large amount of money the Society had would be more generously spent. There was an old saying "There is that scattereth and yet increaseth, and there is that withholdeth more than is meet but it tendeth to poverty." If the Council would act upon that, and scatter the money more widely for educational purposes he thought it would be well. He should like to see the subscription reduced to half a guinea, but he would rather see it remain as at present and more money spent.

Dr. SYMES (Liverpool) said the President had referred to the papers read at the evening meetings, and it was rather suggested that the evening meetings in London did not receive so much support as they ought to. The country associations also felt the necessity of the same thing and found as great difficulty in getting papers as the parent society did, and the existence of these country associations was very essential to the welfare even of the parent society. At one of the recent Council meetings some remarks were made with regard to papers sent from the country for publication, and it appeared then to be the opinion of the Council that persons reading papers should be entitled to receive copies if they were read in London or Edinburgh, but it was distinctly understood that there was a great difference in papers read there or in Edinburgh and those read at provincial associations. Unless he misunderstood the report, it ended in this, that copies should be given to authors of papers read in London or Edinburgh, but no such permission was granted for members in the country. He failed to see the difference, and he was quite sure the Editor would agree with him that a great deal of the valuable matter in the Journal originated more or less with country members. As seconder of the motion, he would remind some gentlemen who spoke earnestly on the question of going to Parliament that that was not without danger. It was a matter which would require gave consideration, for they might find that they not only got what they asked but something more which would be very unpleasant. They could not expect to get the rose without the thorn. Several speakers had agreed in condemning the action of the Council, but they had done so in good part, and it was quite true that many country members would put that question, "What had the Council done for them?" Those who had agreed in condemning the Council for not having done enough had also agreed that they did not do enough to help themselves, and he certainly felt that it was their own fault in a large degree that many of these evils existed. One he would particularly point out, namely, the sale of medicines by small shops in country towns. He did not think they should condemn that so loudly when nearly the whole of those shops were supplied by chemists themselves, for when he was an apprentice a great part of his occupation was to put up pills in packets of small quantities to be disposed of in this way. It was useless, therefore, for one half of pharmaceutists to supply these shops and the other half to complain of their selling them. He could speak personally of the very courteous manner in which the examinations were conducted twenty years ago, for he was certainly asked nothing which he ought not to know, and every candidate was treated with the greatest kindness, especially those who were nervous, and he remembered that one gentleman was so overcome when he got into the room that he had forgotten his own name. That was twenty years ago, but when he mentioned this fact very recently at a dinner in Liverpool he was immediately corroborated by a gentleman who had only recently passed his examination. With regard to patent medicines he was sometimes ashamed of the extent to which the medical profession prescribed these things though ignorant altogether of their contents. Reference had been made to the Journal. They all recognized the distinction between the two leading journals which between them gave all the information they could require, and he thought it would be quite impossible to blend the two together. The Society's Journal gave valuable information on matters which were useful for reference, and the *Chemist and Druggist* would keep them well posted up in trade matters, but he could not see that the introduction of price lists and such things into the Journal would benefit them very much, while it would be only interfering with another publication which supplied them with that kind of information perfectly.

Mr. Chipperfield said it was often alleged that the Pharmacy Act conferred certain privileges on chemists, but, as had been well said, the only privilege was the sale of poisons, and that they did not care about. The question arose whether it was not possible for their privileges to be increased and enlarged, and for the Pharmacy Act to be so altered or some other Act passed which would give increased privileges to registered chemists and druggists, and prevent unregistered persons from selling any medicines except certain simple things which might be sold with impunity by anybody and everybody. It might be said that that was not right to the public, but the same thing was done in other cases. It was very desirable for every one perhaps to live in the immediate neighbourhood of a qualified medical practitioner, but still there were hundreds and thousands of villages too small for a medical man to obtain a living in, and yet the law would not permit an unqualified practitioner for the benefit of the public to practise as a medical man there. Would it not then be right to enlarge the privilege of chemists and druggists so that they only should be allowed to dispense prescriptions of any kind whatever, or to sell any medicines except those of the most simple character? He threw that out for the consideration of the Council. But with regard to the prevention of co-operative stores selling poisons, his opinion was that the infringement of the Act by co-operative stores was infinitesimal compared with its infringement by chemists themselves. There was a time when he used to sell a fair amount of poisons, but since they had to be registered, and, in compliance with the law, he had required persons wanting Battle's Vermin Killer to sign their names, and go through the requsite formality, he had found that they looked very sour over it, left the shop, and nine times out ten he never saw them again. He had no stores in his neighbourhood, but they must get these poisons somewhere else, and he believed that three-fourths of the chemists did not carry out the Act, but when a customer raised any demur simply told him to take care of it and supplied him. Some remarks had been made about medical men recommending proprietary articles, and only recently he had a patient come to him with directions from his medical adviser to ask for a castor oil pill. After what they had heard about those things in the Journal he was rather surprised at this. He regretted to say that with all the efforts of that or any other council to further the interests of chemists and druggists, there must be a large number amongst themselves who were doing more harm to the trade than any Council or Defence Society could counteract. He feared the day was coming when a thorough revolution must take place in the trade. Things could not go on as they were. In every large town there was some unprincipled person who commenced selling drugs and proprietary articles at such a price that only one in such a town could get his living by doing so. When this course was pursued others would naturally retaliate, and the end would be that half the chemists and druggists must go to the wall. It had been pointed out to him also that there was an injustice with regard to the annual subscription required to be paid by gentlemen who passed the Minor or Major examination. So long as a young man remained a Minor he was only required to pay 10*s.* 6*d.*, but the moment he showed he had more brains, and passed the Major, they said to him, "Well, you are a clever fellow and you must now pay a guinea."

Mr. G. H. Wright said with regard to the remarks just made that the injury by the co-operative stores was infinitesimal, he was only informed the day previously that one store did many thousands of prescriptions in a fortnight.

Mr. Chipperfield said he only referred to the infringement of the Sale of Poisons Act.

Mr. G. H. Wright said a barrister who was an old customer of his had some medicine made up which came to 2*s.* 6*d.*, but shortly afterwards he came in and in a very friendly way said that he had been to the stores and they only charged him 8*d.*, adding, "You must get a rattling profit." He had never seen his prescriptions since.

Mr. Symons wished to explain that he did not advocate putting any price lists in the Journal, but referred rather to a monthly review of the drug market.

Mr. Humpage said there were two paragraphs in the report which he had read with a great deal of satisfaction. He believed they were unanimous in thinking that the Pharmacy Bill was not perfect, and therefore a Committee had been appointed and that Committee had made a report which would lead to some action. He could only say he hoped the Act would be so altered as to meet many of the difficulties which had been referred to. As to the grievance of a chemist in a large town underselling his respectable neighbours, what could the Council do? He should suggest that such a man should be called upon, and that it should be pointed out to him what an unfair, unkind, ungenerous thing it was for one man to undersell his neighbour in order to steal an advantage over him. If he would not be convinced, there was but one other course to pursue and that was to give him the go-bye, or what perhaps would be more effectual, although there might be some difficulty in carrying it out, for the trade in the town to co-operate and open a shop which should sell things still cheaper. With such a rod held over him he doubted much whether he would persist. What he could do others could, and what would be the result if all did it? They would all go down in a lump. Then they were told that no legislation had taken place to their detriment during the past year, and of course they endorsed that. But who had they to thank for it; it is no use disguising the fact. Those who were present at the dinner last evening had heard from eminent members of the medical profession what position they held, but there was a section of the medical profession which did attempt to starve them and deprive them of their rights. He had referred once before to the foundation stone on which the Society was built, and to the legacy of £800, the object of which was to elevate the Society in its social and educational position, and also to protect the legitimate interests of the trade. Until it could be shown that the chemists and druggists had no right to prescribe over the counter and to give a gargle for a sore throat to any one who came in for it, they should continue to do so, not on sufferance but as their right. It was clear to his mind that when any legislation was attempted a deputation should be appointed immediately to wait on the promoters of the Bill, and point out what its effect would be. When this was done they often were quite surprised, and said, "Oh; we didn't read it in that way." There were two ways of reading everything. They knew the tale perhaps of the man who wrote up over his door, "What do you think I will shave you for nothing and give you some drink." Two men went in, and thought they would get shaved and have something to drink for nothing; but the proprietor said, "Oh! you didn't read it correctly. This is the way to read it. "What! Do you think I will shave you for nothing and give you some drink?" He trusted that as there had been some communication with the representatives of the Apothecaries' Company some understanding might be come to by the Council before any measure was brought forward which should contain clauses of an ambiguous character, so that it might be clearly understood what the effect of the words would be. They admitted that any chemist who arrogated to himself that he was a medical man, and so represented himself, was a rogue; but he also maintained that a chemist had a perfect right to do as he had done for forty years past, to prescribe according to his own judgment. Then, again, the scheme of the Dental Hospital. When they proposed to confine to themselves the term "dental surgeon," he did not blame them, but when they asked that every chemist and druggist throughout the country should give up the power of calling himself a dentist and taking out teeth it was absurd, and he believed many chemists did it infinitely better than a regular doctor. They knew a little about these things, and how it was done, especially if the doctor did not happen to be at home. Let every educated gentlemen have his real title, and let those who wished to take his title from him be pointed out as committing a fraud; but they were not to give up their own rights.

The PRESIDENT remarked that the present position of things was, he believed, exactly what the last speaker had described, viz., that any man who deceived the public by proclaiming in any way that he was a medical man, or had a medical title, would be most properly punished, and he certainly would not be defended by that Council; but those who, as chemists in the conduct of their own business, did prescribe simple remedies would be held harmless. With regard to the Dental Practitioners' Bill he might inform the meeting that the previous night it had been ordered to be reprinted, so that in a day or two they would see what form it would take, and it would, of course, be watched by the Council and the Parliamentary Committee.

Mr. OWEN wished to say in reference to a remark which fell from Mr. Vizer, that he was only one of the Benevolent Fund Committee, and that an injustice would be done to other members by naming him personally. He had perhaps done a little more than some members, but any thanks were due to the Committee itself, and particularly to their friend, Mr. Robbins, who had greatly promoted the work they were engaged in, and had succeeded in carrying out the maxim which had been mentioned, "There is that scattereth and yet increaseth." They had scattered more than they ever did before, and the Fund was in a much better position.

The PRESIDENT reminded Mr. Urwick that if the subscription were reduced to half a guinea the members would really get all the advantages of membership for nothing, because the Journal was well worth the ten shillings and sixpence.

Mr. URWICK quite agreed that the Journal was valuable, but the question was what were they to do with the money.

The PRESIDENT said the funds would be employed as soon as they could see how to do so without wasting it.

Mr. URWICK said although the Journal was worth the 10*s.* 6*d.* it was produced for a much lower sum; and he thought the members were entitled to obtain it, therefore at cost price; at any rate if they acted on the cooperative principle.

The resolution was then put and carried unanimously.

THE ADMISSION OF WOMEN AS MEMBERS.

Mr. WADE then moved the resolution of which he had given notice—

> "That all persons being duly qualified (irrespective of sex) shall be eligible for admission into the Society in accordance with the Bye-Laws thereof, and this Meeting is of opinion that ladies should not be excluded from participation in the privileges of the Society."

He ought perhaps to apologize for taking upon himself the raising of this question, but he had been led to believe that it would be more agreeable to the Council if such a resolution came from an independent member than if it came direct from the Council and therefore he had not hesitated to take upon himself the responsibility of placing this matter before the annual meeting. It was five years since the question was brought before the Society, and no doubt a number of fresh faces were present, and some might have forgotten what then took place, so that he might recapitulate to some extent what then passed. It would be remembered that Mr. Hampson in a very able speech said it was only fair and proper that ladies who had complied with the Act of Parliament and had passed their examination should be admitted to membership; and without depreciating or in any way disparaging those who differed from him on that occasion he might fairly say that the most intelligent and influential portion of the members who spoke held the same view as Mr. Hampson put forward. There were certain gentlemen who differed from him. Amongst others Mr. Pickering, who moved an amendment that the subject be adjourned *sine die*, and immediately commenced to argue the question on a false issue and misled the meeting; and he partly attributed to that misleading the fact that the vote was carried against Mr. Hampson. Mr. Pickering argued the point not whether ladies should be admitted as members of the Society but whether they should be admitted into the trade of chemists and druggists, and thereupon a strong feeling came out that if it was possible then and there to prevent ladies becoming chemists and druggists then was the proper time to do it; and the amendment was carried which adjourned the question *sine die*. Now they were not to discuss the question whether ladies were to come into the trade because the law had settled that long ago, and whether they liked it or not, they could not help it. The ladies were in the trade; they had been educated and examined by the Society and were engaged in the business and he should like to know from that meeting whether it still considered that it was right that having conformed to all the regulations of the Act they should still be debarred from enjoying the privileges of the Society. They were registered and qualified according to the Charter, Bye Laws and Acts of Parliament, but they were disqualified according to the opinion of some members because they were women. Mr. Sandford, who was a most honourable, open and straightforward opponent, had told them that there was one disqualification of ladies, and that was because they were women. That had never been disputed, but he also said that the Council had not refused to admit ladies into the Society, but that certain names having been submitted to the Council they had been rejected, and that if the ladies felt themselves aggrieved they had the right of applying to the Court of Queen's Bench for a mandamus. Now if ladies had the right, and he did not think it had been disputed, except that they were women, why should they be put to the expense of going to the Court of Queen's Bench simply to satisfy the opposition of what he might call pharmaceutical misogynists? Mr. Betty was horrified at the idea of the two sexes being educated together.

The PRESIDENT said they were not discussing the point of education, but whether ladies should be admitted as members.

Mr. WADE said he was referring to this matter because members of the Council had brought it forward in argument against the proposition. Mr. Betty was horrified at the idea of the two sexes being educated under one roof, and drew what he considered to be a very unfair analogy between boys and girls being educated at Eton, Harrow, and Rugby, and the two sexes being educated under that roof in Bloomsbury Square. If they considered what went on in the Art Schools at South Kensington, Bloomsbury, Lambeth, and throughout the provinces, it would be found that there were thousands of students of both sexes earnest in their work who were pursuing their duties in such a way as they must approve of; and who was there who should dare to say a word against the students under Government in the Art Schools? They had the same professors and attended the same lectures, and he maintained there would be in more harm in the Pharmaceutical Society than in the Art Schools. Such were the sentimental and personal objections raised five years ago. Legal objections there were none, because when the Solicitor was applied to he had not made up his mind on the question. He did not know whether he had done so now, but he remembered the only thing he held then was that this Society being a voluntary society the members had a right to be placed on the register, but those who who were registered had not the right to become members of the Society for this reason. He argued that in 1842 when the Charter was granted there was no condition made for ladies to come into the Society; it was never contemplated that they should do so, and because now ladies did contemplate coming in it was looked upon as something astonishing. There were no grounds, he said, for supposing they should come in; but he, Mr. Wade, maintained that if they did not make a special provision that ladies were not to come in those ladies had a perfect right to come in if they could not be kept out. There could be no legal objection brought forward to their being admitted; what did the Charter say? Line 70 said that members of the Society shall be those who were either in business at the time or who afterwards shall have become qualified for membership by examination. It did not say anything about their being women; and line 105 said that the Council itself should examine or shall employ others who shall be examiners to test the qualifications of persons when they came up for examination; and if it were found that they were able to fulfil all the conditions of the Act so that they were worthy of becoming chemists and druggists, they should be represented to the Council as worthy of election. He maintained that those ladies had shown themselves worthy of election. They had applied for it, and, contrary to the Charter, they had been denied admission. Who were those ladies who were objected to? Were they strong-minded females who were coming there to upset the institution? Were they clamouring for seats on the Council with an ultimate view to the Presidential chair? No; they were simply a few ladies, young maiden ladies, who had come simply for the purpose of asking the reward of their industry and labour. Not a word of reproach could be said against any lady who came to that establishment asking to be elected a member after having fulfilled all the conditions of the Act. He asked the Society not to be generous but simply to be just; to put aside the feeling that they were performing any gracious act, but to hold that ladies were justly entitled to what they asked. In giving them what they had a right to, members would not be taking anything from themselves. They would still have as much sunshine as if those ladies were not in the way. Therefore, he asked them to reverse the resolution come to five years ago and to vote for the ladies, not because they were women, but because they being men were willing to give that which was a woman's right.

Mr. KEER seconded the motion.

Mr. VIZER said he should move an amendment to Mr. Wade's resolution.

Mr. CHURCHILL asked what was the amendment.

The PRESIDENT read the amendment which had been handed in, viz.:—

"That in the opinion of this meeting it is not considered desirable to admit ladies as members."

Mr. CHURCHILL submitted that was not an amendment but a simple negative.

Mr. VIZER said he was glad of the opportunity of bringing forward his amendment, inasmuch as he was almost afraid, when he read a report of the Council meeting some time ago, that certain members seemed to think that the Council was not in any way bound by the action of a general meeting. He must confess he was sorry to hear such an expression, because such vote was deliberately taken, and as this would be a question of vital importance, it ought to have due weight with the Council, not only by courtesy but by right. The amendment he should move would be this:—

"That in the opinion of this meeting it is not considered either necessary or desirable that ladies should be admitted as members, associates, apprentices, or students of this Society."

His reason for enlarging it was because he thought they were steps one from another, and that if they educated them as students they logically must go on step by step and admit them as members. He would ask two questions: Were they, as a Society, compelled to receive ladies as members? and next, Were they doing those ladies any injustice by declining their presence as members? With regard to the first question his own feeling decidedly was that they were not called upon so to do. A great deal of capital had been made out of that clause of the Act of Parliament which said, that "Every person registered as a pharmaceutical chemist shall be eligible to be elected as a member of the Society. Hence it was argued that because they were eligible, therefore they must of necessity be admitted. He could not see any analogy between the two. No one would venture to say that because a person was eligible to a post that of necessity he must be elected to it. A lady might be fully eligible for election to the post of commander-in-chief, but by reason of her sex she would hardly receive the appointment. So also a young gentleman might be fully competent to take charge of a large ladies' educational establishment, but it could hardly be expected he would be appointed to that position. On the other hand, ladies were eligible and serviceable for certain public appointments, such for instance as the School Board, where their presence was valuable; but with regard to their own Society, things were decidedly different. If ladies were admitted to membership they would have a right to take part in the general meetings, to sit on the Council and to have a voice in every legislative point in reference to the Society. He must confess, that as a Society pre-eminently composed of gentlemen, the legislative powers ought to be carried out by gentlemen solely. But were they doing these ladies any injustice? He contended they were not in the slightest degree, but they were doing them the utmost justice in feeling that they ought to keep their position as ladies. He felt satisfied that in the present day there was an attempt by some parties to put the female out of her position, and were thus doing the female sex injury rather than good. They liked to look up to ladies, to respect and love them, not to feel that they were in antagonism to them. It was not a question whether they should admit ladies to the business; that was clear, they were already admitted to every privilege in connection with trade interests. They could pass their examination and open a shop, and carry on business to the fullest extent. Therefore they were not deprived of any legitimate right in reference to making their way in the world. It had been said that a Member of the Pharmaceutical Society was thought more of than a Pharmaceutical Chemist, but he could not conceive that such an erroneous idea could ever be accepted. They might as well say that a Member of the Royal College of Surgeons was better than an M.D. Which was the higher degree? A pharmaceutical chemist was the higher position. Again, were they depriving the public of an acknowledged need? Was there any public demand for the admission of ladies into the trade or business? There was no such demand. Some time ago when there was a great outcry made about the admission of ladies as doctors, there was a certain class which felt that ladies had a right to be able to consult ladies in certain cases, and a question of delicacy was raised and it was said it was their right to be educated by the medical profession. But there was no such condition in their business, therefore they were not depriving the public of anything they had a right to expect. Were they to see a large body of ladies, after years' experience in business, coming forward and proving that there was a serious injury done them by their not being members of the Society, no one would be more willing than himself to put aside his personal feeling and admit them, but until that was proved he considered they had a perfectly legitimate right to say they preferred carrying on their own business for themselves without the assistance of their lady friends.

Mr. Mackenzie in seconding the amendment, endorsed every word uttered by the mover, and added that he felt it was a thing which might be lawful, but was not expedient. It was not necessary, it was not an injustice, and although they had done so much it was no reason they should do so much more. This subject seemed to him to have always been a bid for popularity, but notwithstanding that he should state his views openly, and he did it out of respect for the ladies. He had dwelt with those who had had to fight this same question in another sphere. On one occasion he had spoken to a person who had laboured long amongst the savage races of Africa, and he told him that we had one edge of the wedge here, but that they had the other end of it Africa. He believed that the action of some people in the present day was tending to reverse the order of civilization. There was no country under heaven where women had such a noble position, or were held in higher respect than in the British Islands. As long as any nation respected the Bible it would respect woman, and the reverse was decidedly the case; even in those parts of our own isles which approached most nearly to heathenism, there they found that woman did not receive that honour and respect with which she did elsewhere. If they put woman out of her true position they would be only bringing her back to that state of things which he hoped he would never see. They must treat things as they were around them; there was no necessity for this change, and there was no injustice inflicted. It was not within the meaning or spirit of the Act.

Mr. Chipperfield asked if the amendment in its amended form was in order.

The President said he thought he must rule that this was an amendment.

Mr. Owen asked how far they were going. They had ladies who were pharmaceutical chemists and who had actually passed at the top of the list; were they now to reverse everything they had done? Was the Council to be bound by the opinion of this meeting?

A Voice: Certainly.

Mr. Owen said if so he should decline to sit upon it if re-elected. If he went to the Council he should go to act upon his own judgment.

The President reminded Mr. Owen that the Council had passed a resolution that they would take the opinion of the meeting on this subject, and he thought that opinion would be binding on the Council.

Mr. Owen: Only for twelve months.

Mr. Hampson regretted that Mr. Vizer, who was generally right on pharmaceutical politics, was so grievously wrong in this case, but he seemed to be badly advised. It would be a very serious matter if such an amendment were passed, because it would exclude any female student from receiving instruction in that building; at least so he understood it.

The President said he did not understand the amendment in that way. He took it it would simply exclude them from being placed on the list as members, apprentices, or students of the Society. They could still attend the lectures.

Mr. Hampson said a few women had thought it advisable, in order to enable them to earn a livelihood, to follow pharmacy. The Solicitor, when consulted some years ago on the interpretation of the Act whether they could be examined or whether they would be excluded, advised that it was legal to examine them, and, in consequence of his advice, a certain number had been examined and had qualified themselves. Those present had heard a good deal that day about their rights, the words "rights and privileges" had resounded through the room several times, but there were also the rights of two or three women. If they were not permitted to become a part of that Society they were viewed as pariahs and outsiders and interlopers, and looked upon with considerable suspicion and distrust; at any rate, the Society would not give them any countenance. Now he thought, as the Solicitor considered it within the law that these ladies should be examined when they presented themselves, it was advisable in the interests of the Society that they should have something like a moral control over those ladies. It would be a misfortune if they were not admitted, because some of them might think they would go into the ranks of pharmacy, and do certain things which they had the power of doing, but which if they belonged to the Society they would not. He did not believe any lady member at the present time would have any disposition to do anything of that sort; but it was only a matter of justice to admit them. It had been said there was no injustice in refusing, but he maintained there was a distinct injustice. In the first place, they were pharmacists in the eye of the State, and had to obey certain restrictions made by the State. That Society had the power of altering those restrictions, and adding to them, and had certain legislative functions which they must comply with. Now, in simple justice, lady members ought to have some voice, however slight, in the actual management of the Society. Besides that, they were excluded from the museum; they had no right there simply as examined persons, but only came on sufferance. Again, if they wished to take the *Pharmaceutical Journal* they would have to pay full price for it, and they had also the disadvantage of not using two titles which he believed many persons considered to confer a commercial advantage. In the country he knew the title of Member of the Pharmaceutical Society was considered to be at any rate equivalent to the title of Pharmaceutical Chemist, and even the initials "A.P.S." were often seen in shop windows, and were considered of commercial value; thus a direct injustice was done by excluding any person who was eligible. But he would rather appeal to their sense as gentlemen and men. He felt that in holding out the hand of the Society to them, and admitting them within pale of pharmacy, they were simply doing an honourable act, and it certainly would not add to the honour of the Society to exclude them. It could not be doing it any injury to confer an additional strength on a few women. Was there anything to fear for the Presidential chair? Not the least. Or that they would come and turn out the masculine element on the Council? Not the least. In the distant future it was quite possible, in 200 years time when the Society would probably be no longer ashamed of a few women being admitted, there might be some eminent woman pharmacist who had entered into original research who would be an honour to this Society, and it was desirable that if there was any talent in the women who had the temerity to enter their ranks that they should be welcomed. Then to take the public aspect of the question, it was said that there was no clamour outside that women pharmacists should practise. It might be true, but he could quite understand there were many things a woman would prefer asking a woman for in a chemist's shop to asking a man, and if there were a certain number of ladies who would prefer a few women pharmacists they had a right to their opinion. After all, it would depend upon that, for if they did not fill a public want they would soon die out and the Society would not be troubled with them.

Mr. Mackay had listened to the eloquent speeches of the gentlemen who had just spoken and to the endeavours which had been made to show that a great injustice was about to be perpetrated if they declined to admit females to membership, but he had failed to gather the smallest speck of injustice in the matter. It was not the wish or intention of any one connected with the Society to close the door of the lecture room against females or to prevent their being examined, opening a shop and dispensing, or that they should not participate in their grand Benevolent Fund. So far from that being the case he understood all were desirous that they should have all privileges, and with regard to their feeling towards females who had once been in business and who from misfortune or failing years had been obliged to apply for relief, he knew of one case in Scotland where on two occasions the Benevolent Fund showed a proper appreciation of her case and gave assistance. He had made special inquiries in Edinburgh as to the feeling of the members there, but could not find one wish that females should be admitted to membership. He had attended every meeting for examinations from the first, and throughout the whole of that time they had never had but one female who came before the Scotch Board. She failed the first time, particularly in dispensing, but to her credit she again studied, came up the second time, passed, and was put on the register. Speaking of Scotland it would be found that every female on the register was admitted under the 1868 Act, so that as far as Scotland was concerned the question was very much narrowed, and he did not see why they should open the door of the Society to ladies.

Mr. Long said Mr. Mackenzie had so thoroughly expressed his view, that he would not detain the meeting with any remarks. He did not think it made much difference one way or the other as to the practical result, but at the same time, as society was being so thoroughly upset in all its bases, they had better not add to the confusion.

Mr. Urwick said ladies were admitted by Act of Parliament, and they were doing them an injustice not to carry them on into the higher stages of the Society. By doing so he felt they would exercise a good influence on them when they went into business, which would lead them to conduct that business properly. It was always felt amongst themselves to be a good thing to influence the rising generation to join the Society, because it kept them from carrying on a low kind of business, and so it would be with ladies; if they were admitted they would have a name and position to sustain. One of the maxims which had been most thoroughly instilled into his mind was "Do to others as you would be done by."

Mr. Fryer (Scarborough), said he felt so strongly on this question that he had come from the north of England almost on purpose to say a word or two in support of Mr. Vizer's amendment. He was not aware that such an amendment was going to be brought forward, but he should thoroughly oppose the motion of Mr. Wade.

The President said the Solicitor had pointed out to him that the best way to take this vote would be not on the amendment, but simply on Mr. Wade's original resolution, striking out the first part which was unnecessary, and confining it to these words—

"That this meeting is of opinion that ladies should not be excluded from membership of the Society."

Mr. Vizer did not see why his amendment should not be put.

The Solicitor said the question put in that form would raise the simple isssue contemplated, whether ladies should or should not be excluded from membership.

After some conversation on the form of the resolution it was arranged that the vote should be taken on an amendment to be moved by Mr. Vizer of the previous question.

Mr. Chipperfield said they had been told in the Journal that the age of chivalry would be gone if ladies were admitted as members of the Pharmaceutical Society, but he took it that a more unchivalrous act could not be perpetrated than to refuse them admission. No one would deserve the name of a chivalrous man who would simply refuse admission to any person because of her sex. The Solicitor had told them they were not bound to admit any one to the privilege of membership unless they thought proper, but they never had refused any one who had passed their examination he believed.

The President said they had certainly.

Mr. Chipperfield: To men?

The President: Yes.

Mr. Chipperfield: Then you had a good and sufficient reason.

The President: Certainly.

Mr. Fryer thought they had had a great deal of dust thrown into their eyes on this question. Mr. Wade told them that it was unjust to exclude women from membership, but did not attempt to prove it, he merely made the assertion. Mr. Hampson had attempted to prove it in one or two points; one being that they were pharmacists in the eye of the State, and therefore they would be doing them an injustice in refusing them the further title of members of the Society. He maintained this was no injustice. The State regarded a woman in a totally different light to a man. He very much objected to the motion as it originally stood, where it said they must proceed irrespective of sex. The State did not proceed irrespective of sex; there were privileges accorded to women which were not accorded to men. They were exempted from the police service and from the army and navy; they might have all the qualifications, but because of their sex the State excluded them. That was a Society of men, and they were doing no injustice to women in excluding them.

Mr. Atkins said he was not going to discuss the matter but wanted to clear up a preliminary point. He was one of those who had to go to the country, and possibly he might not have the honour to be returned at the next Council; but he wanted to know, if he were returned, in what position the Council would stand. He had heard in the Council that this matter should be referred to the General Meeting and was glad that they had had so many opinions expressed; but what he did protest against, with all due submission, was this, that if the meeting to-day recorded a vote, as probably they would not by an even number, but by a preponderating majority, the Council were bound to register its decision. That was an important point, and the Council ought to have a most distinct conviction upon it. If the Council were simply to register the decision of that meeting the members became simply delegates.

Mr. Bostock said he had come a long distance to attend that meeting. In his own neighbourhood there were several females conducting the business of chemists and druggists with great credit and success. In one instance, the husband had got into such bad company that he came almost to ruin and had to emigrate, but his wife had continued the business with great credit to the present time. In another case the man was laid aside by sickness through overwork, and his wife for twelve months had conducted the business, and had since carried it on for the last fourteen years. He knew of another case also, and none of those three ladies had ever dishonoured the profession. He would suggest as a compromise that they should admit them to the Society when they passed their examination, because they had a moral right at any rate. They were going to meet them that evening at the conversazione, and if they sat by their side in that room he did not see what harm would be done. If they had ladies passing the examination it would stimulate the young men, and he felt sure that if this resolution were passed, they would never regret it. He would also suggest that all their subscriptions should go to the Benevolent Fund.

Mr. Sandford was as anxious as his friend Mr. Atkins that this matter should be referred to the annual meeting, but he did not take the same view of it. That gentleman spoke of the new Council being merely delegates, but he thought in a great question of this kind, which positively altered the constitution of the Society, they were bound to follow the wishes of the members generally. Mr. Wade commenced by very kindly alluding to him as having taken the benighted side of the question, but he still adhered to the same opinion, and to the principle of keeping women in the social position in which God had placed them. He would never interfere in any way with the rights of women, but he believed that the best of women would only be too glad to silence those who were too anxious to push themselves forward. When Mr. Hampson asked if they were afraid of being pushed off those benches, he must entirely demur to that charge, but he thought it possible that ladies who would like to come there were ladies who wished to wear the breeches, and he must say he should be exceedingly sorry to find women taking part in the business of the Society. They surely would not send women to Parliament. Women were on the School Board, it was true, because they had to regulate schools for girls as well as for boys, but this was an altogether different case. They did not interfere in any way with the privileges conferred by the Benevolent Fund, or take away their right of carrying on business, or passing examinations, or being educated. They would give them the highest title they could have, that of the Pharmaceutical Chemist. The other day, when the Duke of Richmond introduced his Medical Act, he drew attention to a certain point in it; there had been great discussion as to the right of women to be examined, and it was found that Mr. Russell Gurney's Act in one respect required amendment. That was an Act requiring women to be examined, and it was so drawn as to enable women to be members of the corporation and senate, which was never intended. By this Bill of the Duke of Richmond, women would be debarred from those privileges which they were now seeking to give them in connection with that Society. He had been attacked in one of the medical journals as encouraging counter prescribing, because he said there five years ago that they were often in their shop asked to give advice—he did not mean medical advice—but to give advice in some matters which could not fairly and decently be brought before women. He repeated, they did hear in their shops continually things not fit for the ears of delicate females. Some one said they were admitted by Act of Parliament; but it was not so: they were admitted to examination and registration, and to the full power of carrying on business. He hoped the effect of the vote would show that it was not the desire of the Society to admit women as members.

Mr. Hicks said it was very well for Mr. Sandford to speak of the inexpediency of women becoming members of the Society, but those who had wives would be often glad to have them standing behind their counters and of obtaining from them that help which it was only fair and right they should be able to obtain. He had the pleasure of sitting on a School Board of which a lady was a member, and she was the best member on that board, and that not only with regard to matters relating to girls, but with regard to the general work of the board. It was said, what injustice did they do them? Simply this. They said to them virtually, whatever talents you possess, however good an examination you pass, you must stand in a subordinate position. We are the lords of creation, and although your talents may be superior to ours, and you pass a better examination, you must stand there while we take a higher position.

The President said women could become pharmaceutical chemists just the same as men.

Mr. Hicks said he was not aware of that before, but the Society had to legislate to some extent for the whole body, or to influence legislation, and it seemed to him very hard, seeing these ladies were engaged in business, that they should not have a voice as to what laws should be made. He could not understand why they should not be admitted, nor had he heard anything like a sufficient reason given. They should remember the golden rule which had been alluded to—"Whatsoever ye would that men should do to you, do ye even so to them."

Mr. Wade said there was very little for him to reply to. He must say the whole of Mr. Vizer's speech was apart from the question, and Mr. Mackenzie followed him in the same route. They still harped upon the question which was not before the meeting. Whatever might be his own proclivities, if the question were whether it was right for ladies to come into the trade he should not have ventured to bring it before the assembly. That was what had been argued, and the spirit of that had been carried through whether it was desirable women should be in the trade. But that was not the question. There were ladies who had come into the trade, and he had no doubt they had a good reason for it. Mr. Mackay and others had shown how very few had come in; in Scotland there was hardly such a thing known. Therefore there was no danger whatever of the Society being upset by the number of ladies coming into it. If such was the case, why should they be debarred from coming? The President in his opening address drew a pretty picture, and he hoped he might live to see it, when the chemists and druggists' business would be of that delightful character that counter practice would be put aside, no naughty things would ever be uttered over the counter, and it would be one continual reception of physician's prescriptions. When the trade got into that happy state, and when they had nothing to do but to receive the prescriptions over the counter, and hand them over to the dispenser to be made up, a lady would be as competent to dispense the prescriptions as a man. He had heard nothing which could in any way affect the resolution he had placed before the meeting, and would therefore not detain it any longer, but simply ask it to confer on ladies the rights which he contended they had under the charter.

On the previous question being put, the President gave his opinion that it was lost by a considerable majority. This opinion being challenged, a division took place, when it was announced that the amendment was carried by 59 votes to 57.

Scrutineers having been appointed to examine the balloting papers for the Council,

Mr. Sutton proposed—

"That the cordial thanks of this meeting are due and are hereby tendered to the Council for the valuable services they have rendered to the Society and to chemists and druggists generally during the past year."

He said it was very easy to come there and make complaints of what the Council had done or omitted, but he had been an old councillor himself, and knew the business was very important, and was perfectly certain that up to the present time the Council had done its best for the real interests of the Society and for chemists in general.

Mr. Vizer seconded the motion, which was carried unanimously.

The following Registers were placed before the meeting by the Registrar in compliance with the provisions of the Pharmacy Acts, 1852 and 1868:—

Register of Members, Associates, and Apprentices of the Society.
Register of Pharmaceutical Chemists.
Register of Assistants.
Register of Apprentices and Students under the Pharmacy Act of 1852.
Register of Chemists and Druggists under the Pharmacy Act of 1868. Six volumes.

The meeting was then adjourned until Friday morning to receive the report of the scrutineers.

ADJOURNED MEETING.

Friday, May 17, 1878.

MR. JOHN WILLIAMS, PRESIDENT, IN THE CHAIR.

The Scrutineers brought up their report as follows:—

Scrutineers' Report.

We, the undersigned Scrutineers, appointed at the Thirty-seventh Annual General Meeting of the Pharmaceutical Society of Great Britain, do hereby certify that we have examined the voting papers committed to us, and report the following:—

Voting papers issued, 354[illegible]

Voting papers received		1872
Voting papers disallowed :—		
Informal	18	
Received by post too late	142

W. K. Hopkin, *Chairman.*

J. Horncastle.
C. E. Turner.
A. W. Postans.
A. Senier.
R. S. Bathe.
W. F. Haydon.
J. C. Ellison.
Maurice Howell.
C. Newman Holmes.
Arthur L. Savory.
F. Nicholson.
T. Edward Greenish.
G. F. Strawson.
W. Cadwaladr Jones.
Frederick Tibbs.
Walter Hills.
William Gulliver.

The New Council.

The Chairman then declared that the following gentlemen would constitute the Council for the ensuing twelve months:—

Atkins, Samuel Ralph, Market Place, Salisbury.
Betty, Samuel Chapman, 6, Park St., Camden Town, N.W.
Bottle, Alexander, 37, Townwall Street, Dover.
Churchill, Walter John, 46, New Street, Birmingham.
Cracknell, Charles, 217, Edgware Road, N.W.
Fairlie, James Mitchell, Charing Cross Corner, Glasgow.
Frazer, Daniel, 113, Buchanan Street, Glasgow.
Gostling, Thomas Preston, Market Hill, Diss.
Greenish, Thomas, 20, New Street, Dorset Square, N.W.
Hampson, Robert, 205, St. John Street Road, E.C.
Hanbury, Cornelius, Plough Court, Lombard St., E.C.
Hills, Thomas Hyde, 338, Oxford Street, W.
Mackay, John, 119, George Street, Edinburgh.
Rimmington, Felix Marsh, 9, Bridge Street, Bradford.
Robbins, John, 372, Oxford Street, W.
Sandford, George Webb, 47, Piccadilly, W.
Savage, William Dawson, 4, Park Road East, Brighton.
Schacht, Geo. Frederick, 7, Regent St., Clifton, Bristol.
Shaw, John, 24, Great George Place, Liverpool.
Williams, John, 16, Cross Street, Hatton Garden, E.C.
Woolley, George Stephen, 69, Market Street, Manchester.

Auditors.

There being only the requisite number of candidates (five) for the office of Auditors, the Chairman declared the following duly elected for the ensuing twelve months:—

Harvey, Edward, 6, Giltspur Street, E.C.
Hodgkinson, William, 127, Aldersgate Street, E.C.
Squire, William, 5, Coleman Street, E.C.
Stacey, Samuel Lloyd, 300, High Holborn, W.C.
Thompson, H. Ayscough, 22, Worship St., Finsbury, E.C.

The Vote on the Admission of Women as Members.

Mr. Giles then said: I think there is an important matter which I do not mention with any intention of embarrassing the Council at all, but quite the reverse. My object is that every transaction that takes place here shall be perfectly clear; that it shall not only be perfectly straightforward, which I am sure it is, but that there should not be the smallest doubt about it, and that it shall be perfectly intelligible to those outside. We did hear at the Conversazione on the evening of the public meeting, that some mistake had occurred in the announcement of the numbers who had voted on a question of considerable importance, or rather on the question which preceeded the question of considerable importance, that is, with regard to the election of women as members of the Society, those women having previously passed the examinations required by the Act of Parliament. As a life member of this Society I have the right, as it were, to speak here, and to attend and vote, but as no longer a living member I should certainly feel it my duty, and as a matter of good taste, to abstain from any interference with the policy and management of the Society, and I certainly should not have voted on that question at the annual meeting. But as a matter of fact I did vote upon the previous question, because I regarded that as a question whether certain business should be transacted or not, and therefore I felt justified in voting on that question, although I certainly should not have thought it right to interfere with the administration of the Society. For similar reasons I am exceedingly anxious that the business of the Society should be perfectly clear, and that we may know exactly in what position we stand. I would therefore ask you, sir, if you will be kind enough to tell us what view you take, and, if you have consulted other members of the Council, what view they may take upon the position. I think it is exceedingly immaterial what the decision arrived at was, because virtually I consider a practical issue has been obtained; that we know that whereas very naturally and properly, and as we should expect, there has been a considerable division of opinion in the Council upon this measure, that that quite reflected the feeling of the trade, and that there is an equal balance of opinion in the trade outside as to the course which it is expedient for the Society to adopt upon this question. The last thing I should desire to occur would be that by any inadvertance or oversight a result should be, as it were, caught, which might be unsatisfactory to others, and I think the best issue we could arrive at really would be that the question is still hung in suspense, and that we afford time for the ripening of opinion on this measure, which is of considerable importance, and that a mature and definite judgment should be more emphatically pronounced before any action is taken; at the same time I attach great importance to the order and form of public business, and I consider this most important that we should not have any decision of this Society recorded which is not strictly formal. Perhaps you will kindly tell us what course you have been advised to take in this measure, or if the facts are as they have been generally understood.

The President: You are aware that this question was put in a way that is not quite usual, and I must say that my inexperience as a chairman of public meetings did not quite make me familiar with the nature of a motion for the previous question. As I think you suggested just now, had it been simply a vote, yes or no, whether ladies shall become members, we should have all understood the voting better. As it is, in the evening, when talking over the measure, the idea struck me tha.

I had mistaken the figures handed in, and that I had mistaken them from the circumstance that 1 took the figures handed me by the teller on one side, namely, Mr. Vizer, as the figures on his own side, whereas he was really telling on the opposite side; and in the same way Mr. Wade, who told on the other side, and I am afraid I took his figures as representing the opinion which he was supporting. But I see Mr. Vizer is present, and I am very glad to have the opportunity of asking him whether he did hand me in the larger figure, 59, or whether he did not. I find that the original number I put down was 53, from the number of hands I counted, and then I got 59 down, and I think that was the figure Mr. Vizer gave me. In future, if ever again I have to superintend a meeting of that kind, I should certainly insist on the tellers handing in their report each of them in writing, which would save any such question arising. I see now that I committed an error in not insisting on that little formality. As it is, in the excitement of the moment I must have overlooked that each teller was telling on the opposite side, and the vote therefore appears to have been recorded as in favour of the amendment, that is, for the previous question. I must say, looking at the question from a broader point of view, I do not think it is of practically much importance, because we called upon the general meeting of the Society assembled from all parts of the country to assist the Council, which is the only executive in this Society, to come to a decision as to the propriety of admitting females to the membership of this Society or otherwise, and I think the question has been answered, and answered most emphatically in this way, that the Society is divided upon the question, and about equally divided; and whether the votes show a majority of one or two one way or the other would, I think, have little weight with the Council. The Council would not be bound by a small vote of one in a meeting which only includes some 120 members out of the 5000 we have. The Council has to exercise its judgment in all these cases, and of course its judgment is very much influenced by a vote, but that vote, if it is merely a turning vote one way or the other, still leaves the Council, I apprehend—for that is the view I shall take as a member of the Council—quite unbiassed, to act to the best of its judgment on this question. Under these circumstances, practically, the mistake or error, if it be one, and I will call on Mr. Vizer presently to inform us whether it is so or not, will not make any practical difference to the question. I think the question is one that has advanced very rapidly since five years ago, when I believe only three hands were held up in favour of ladies being admitted, until now we had half a room, within one at any rate, and one gentleman did tell me at the Conversazione that he had voted in the majority and intended to vote the other way, which would leave them equally balanced. Under these circumstances I should have felt it my duty to vote for the *status quo*—to leave things until there is a distinct majority. We must remember that those who oppose the principle of admitting ladies to the trade are men whose opinions deserve great weight, and we ought therefore to feel that in considering this question, until there is a decided opinion one way or the other, it would be wise for the Council, and I shall certainly so advise in my place at the Council, to let this question rest for a time. It is coming, I am quite convinced, but I think it would be hardly wise to take action on a mere bare majority one way or the other. I will now ask Mr. Vizer to tell us whether I am right in saying that an error was committed.

Mr. VIZER: I am sure we shall all quite accept the explanation of our worthy President that it was a pure accident on his part in the decision. I could not pledge my word as to what my figures were, but I gave them to the President in writing on a piece of paper.

The PRESIDENT: You showed me the figures, but did not hand that writing in to me.

Mr. VIZER: My only reason was that my opponent should not hear how many I had counted, and therefore I simply wrote on a piece of paper the number, and I believe it was fifty-nine. I think we shall all agree that the decision was so exceptionally close that we must leave it in the hands of the Council, and, I suppose as is usual in those cases where a chairman has to give a casting vote, he generally gives it in the direction not to alter things, but to leave them as they are rather than as they are not; therefore, probably the action of the Council will be to defer the question to the next meeting, when, perhaps, the division will be more decisive. I think that is everything I need say. I quite accept your explanation, that in the excitement of the moment order was not exactly kept. I, for my part, wrote to Mr. Wade, last night in reference to it. I was surprised at the mistake, and that brings me here this morning. Mr. Wade quite thinks with me, that of course we must leave it in the hands of the Council.

The PRESIDENT: I am advised by our solicitor that it cannot now be changed unless we have a special meeting summoned expressly for the purpose of considering the question again; that it is impossible to alter the decision at this adjourned meeting, because it will be necessary then to put the original motion to a vote, and it would obviously be very unfair to do so in a small and not representative meeting as this would be.

Mr. URWICK: I believe Mr. Wade has written a letter to Mr. Vizer, in which he speaks with no uncertain sound as to the number. Mr. Vizer does not quite recollect, and perhaps he will kindly read Mr. Wade's letter. I also believed myself that Mr. Wade had the highest number.

The PRESIDENT: I gave him the information myself. I hope you will all understand that I had no wish to misrepresent the state of the case, and as soon as I discovered I had made an error I communicated with Mr. Wade.

Mr. URWICK: As Mr. Vizer was not quite sure what the number was, I think if he would kindly read Mr. Wade's letter of explanation the meeting would be perfectly satisfied. He has addressed a letter to Mr. Hampson, but Mr. Hampson is not here. Of course we all feel there was an error, because the first decision was perfectly right as to the number, as far as I could see; but we, of course, accepted your decision in a candid and generous spirit, and considered that you were infallible, having had the figures so clearly placed before you. All that I want is that Mr. Wade's letter should be read.

Mr. VIZER accordingly read Mr. Wade's letter to him, stating that he should be unable to attend the meeting, but he would leave it in Mr. Hampson's hands to do whatever might be arranged, and suggesting that the matter should be left to the new Council to act upon the spirit of the meeting by adopting the real verdict, as it would be practically impossible to call a special meeting for the purpose.

The PRESIDENT: I think some little excuse is due to myself that the decision was not challenged by the tellers, because they must have known surely which side they were telling for.

Mr. VIZER: Pardon me, I may honestly say that until Mr. Wade met me last night I did not know his figures. I believe Mr. Wade was inclined to challenge the vote at the time, but there was a call of "No, No."

Mr. GILES: We have now full information on the matter, but we have arrived at no course of action. I think it is quite possible to take a course which would give perfect satisfaction to everybody. It is admitted that there was an error in the figures, and you cannot possibly, with a knowledge of the matter, record it as a part of the transactions of the meeting. I should propose that according to the custom adopted in the House of Commons you should correct the error by an entry in the Journal, and that you record the fact that the vote of the previous meeting was in favour of the discussion. I would then ask you, sir, at this meeting, to put the motion for the admission of ladies, that we should none of us vote either one way or the other; that you should give your casting vote for the *status quo*, and the meeting would be ended.

The President: That would perhaps be a proper way of settling this difficulty. It is evidently not right that a vote should go forth to the world which is incorrect and known to be incorrect.

Mr. Giles: I may say that in the meantime I have communicated with Mr. Palgrave, the assistant clerk to the House of Commons, and I have a very kind letter from him in which he has advised me, and expressed his readiness to discuss the question further with me if necessary. I am acting, therefore, under the very best advice.

Mr. Vizer: As far as I am concerned I am perfectly ready to adopt Mr. Giles's suggestion.

The President: I could not permit the meeting to take any effective action, it being so small.

The President then formally announced that there was an error in his decision respecting the previous vote, and that the numbers were, for Mr Vizer's amendment on the previous question 57, and against it 59, and therefore the amendment was lost. He then formally put the motion of Mr. Wade, and no one voting for it on either side he gave his casting vote against the motion.

Mr Greenish: If you will allow me, Mr. President, I will make a remark or two on the voting papers. I have on a former occasion directed your attention to the number of voting papers issued as compared with those returned, but it is a source of congratulation on the present occasion that we have had a much larger number than for several years past. In 1874, 1166 were returned; in 1875, 1077; in 1876, 1073; in 1877, 1464; and in 1878, 1870. But it is to be regretted that the number of papers disallowed as informal are rather increasing. It is also much to be regretted, now that so much interest is taken in the proceedings of the Council, that there is so much apathy on this matter that out of 3540 persons to whom papers are issued only about one-half should take the trouble to vote.

Mr. Wills said he was glad to have this opportunity of thanking those gentlemen who had voted for him, although he was not successful. He was proceeding to read some remarks with regard to the sending out of the voting papers and the mode of filling them up, but was called to order.

The Secretary stated that the voting papers were sent out with the greatest care, each one being checked by a second clerk. Of course he could not say whether all the papers reached their destination.

Mr. Giles then proposed a vote of thanks to the President. It was seconded by Mr. Vizer and carried unanimously.

The President said he felt he did not deserve their thanks.

A vote of thanks to the Scrutineers was carried and acknowledged by Mr. Hopkins on behalf of his colleagues and himself. He said that there were upwards of 1700 voting papers examined, and they were all scanned as closely as possible, so much so that if any one appeared a little different to the others it was brought under the notice of the whole body of Scrutineers and each paper was decided on its merits.

This terminated the proceedings.

Parliamentary and Law Proceedings.

The Pharmaceutical Society *v.* The London and Provincial Supply Association (Limited).

This case, which was an action for the recovery of a penalty for infringement of the 15th section of the Pharmacy Act, 1868, came on for hearing at the Bloomsbury County Court on Friday, May 10, before G. Lake Russell, Esq., the Judge. Mr. Flux appeared for the Pharmaceutical Society, and Mr. Sanders, instructed by Messrs. Crouch and Spencer, for the defendants.

Mr. Flux, in opening the case, said: In this case the defendants having retained the learned Recorder for Bath may perhaps excuse my opening the case at some greater length than is usual when these cases are before your Honour. I may, perhaps, at this point mention that I have received an intimation that this case may be thought to be distinguishable from former cases which have been before your Honour, on two grounds, one being that the defendant is an Incorporated Company and is not amenable to this law, or in other words that there is a *casus omissus* in the statute; and the other point is that assuming the defendants to be amenable to the law, the ground is covered by the circumstance that in one at least of the sales upon which the action is based a person was employed by the defendant company, which person happens to be a duly registered chemist and druggist. From the point of view represented by me neither of those propositions can distinguish the case, and I am entitled to recover the penalty particularized in the claim. Your Honour observes that there are four instances of sales of poisons, and that I have made them the basis of a claim for one penalty only. I have claimed only one penalty in deference to the suggestions which have come from the other side that they consider this question involves one of principle, and the Society which I have the honour to represent would desire in this and every other court to avoid any appearance whatever, of oppressively using those powers which the law has entrusted to them. The Act of Parliament is that of the 31 and 32 Vic. chap. 121, commonly called the Pharmacy Act, 1868, and I may just call attention to a few clauses. In the first place to the preamble as introducing the matter: "Whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing or compounding of poisons, and persons known as chemists and druggists, should possess a competent practical knowledge of their business." Then in section 1, from and after the date there named, "it shall be unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons," or to assume or use certain titles "unless such person shall be a pharmaceutical chemist or a chemist and druggist within the meaning of this Act, and be registered under this Act, and conform to such regulations as to the keeping, dispensing, and selling of such poisons as may from time to time be prescribed by the Pharmaceutical Society with the consent of the Privy Council." Then in clause 4 there are words which point to assistants in the conduct of business, which may have a bearing, and it provides that "any person, who at the time of the passing of this Act, shall be of full age, and shall produce to the Registrar on or before the 31st day of December, 1868, certificates according to schedule (E) to this Act, that he had been for a period of not less than three years actually engaged and employed in the dispensing and compounding of prescriptions as an assistant to a pharmaceutical chemist, or to a chemist and druggist, as defined by clause 3 of this Act, shall, on passing such a modified examination, etc.," "be registered as a chemist and druggist." Then section 15 is the one under which these penalties are claimed; from and after the date named, and which is now past, "any person who shall sell, or keep an open shop for the retailing, dispensing, or compounding poisons, or who shall take, use, or exhibit the name or title of chemist and druggist, or chemist or druggist, not being a duly registered pharmaceutical chemist or chemist and druggist, or who shall take, use, or exhibit, the name or title pharmaceutical chemist, pharmaceutist, or pharmacist, not being a pharmaceutical chemist, or shall fail to conform with any regulation as to the keeping or selling of poisons, made in pursuance of this Act, or who shall compound any medicines of the British Pharmacopœia, except according to the formularies of the said pharmacopœia, shall for every such offence," and I would point to the word "offence" as coming within certain words of certain other statutes, "be liable to pay a penalty or sum of five pounds, and the same may be sued for, recovered, and dealt with in the manner provided by the Pharmacy Act for the recovery of penalties under that Act." Then in section 16 there is provided an exception, which exception I refer to as establishing the rule, "Nothing hereinbefore contained shall extend to or interfere with the business of any legally qualified apothecary." Then you come in the fifth line to the exception, "and upon the decease of any pharmaceutical chemist or chemist and druggist actually in business at the time of his death, it shall be lawful for any executor, administrator, or trustee of the estate of such pharmaceutical chemist or chemist and druggist to continue such business if and so long only as such business shall be *bonâ fide* conducted by a duly qualified assistant." That which I submit to your Honour is, that this is really the only case in which a duly registered person can be the means by which persons not duly registered can carry on this business. Then in section 17 there are provisions under which, in a police court, Mr. Mackness, whose name will appear during these proceedings, and this company which is defendant, have in respect of two of these matters specified in the particulars, been the subject of proceedings under this 17th section, which indicates certain penalties where sales take place of poisons improperly labelled and without certain conditions. That clause has on a former occasion been urged upon your Honour's attention, and on a former occasion a defendant has urged that he has previously in respect of the same matter been the subject of a proceeding in the police court; but your Honour having considered the subject determined, and I have an informal report of the case, that the police proceedings and the penalty therein recovered were quite separate and apart from the penalty under the 15th section for which I am suing to-day. Then the 26th section has an indirect bearing on the matter, because it shows that there is vested in the Privy Council a power of control over the duly registered persons, which of course cannot be exercised if it be possible that an assistant can by force of being employed as a servant confer a qualification on the person who chooses to pay his salary. "The Privy Council may direct the name of any person who is convicted of any offence against this Act which, in their opinion, renders him unfit to be on the register under this Act, to be erased from such register, and it shall be the duty of the Registrar to erase the same accordingly." Then there are schedules which go to show that assistants were distinctly in the contemplation of the Act of Parliament, but that as assistants they were in their proper place, that is to say, as assisting duly qualified persons and not as conferring a qualification. Now, referring again to section 17, you will find that the penalties under that clause are to be recovered in the manner provided by the Pharmacy Act; and that leads me to refer you to the Pharmacy Act which was passed in 1852, the 15 and 16 Vic. chap. 56. That goes to show that on this side of the border I am to sue by plaint in the County Court, and in Scotland I sue before the Court of Sessions in the ordinary form, or by summary action before the Sheriff of the County. That, so far as the law is concerned, shows that what I have to establish as concerning this company is that it is not above the law; in other words, that this association of persons is not in any more favoured position than an individual. It is only a firm, a partnership, and under the law of this realm this company may be sued. So far as interpretation statutes are concerned there are two, one is 7 and 8 George IV., cap. 28, and the other statute I may name at the same time is the 13 Vic., cap. 21. The earlier of the two statutes contains a clause, 14, to this effect, "And be it enacted that wherever this or any other statute relating to any offence, whether punishable upon indictment or summary conviction, in describing or referring to the offence or the subject matter on or with respect to which it shall be committed, or the offender or the party affected or intended to be affected by the offence, hath used or shall use words importing the singular number or the masculine gender only, yet the statute shall be understood to include several matters as well as one matter, and several persons as well as one person, and females as well as males, and bodies corporate as well as individuals, unless it be otherwise specially provided." Concerning that, I submit that it covers the ground, and that the words, "whether punishable by indictment or summary conviction," are not of the essence of the enactment, but that it will run for all practicable purposes thus, wherever this or any other statute relating to any offence, in describing or referring to the offence or subject matter, and so on. But if your Honour should not be with me on that, then I submit that the suing which is authorized by the Pharmacy Act, in other words that the judgment which your Honour is asked to give, will be a summary conviction within the meaning of this statute. Now, sir, there have been many cases before the courts in which it has been held that companies are not above the law, even by the common law apart from this statute. I do not find that in any case this statute has been relied upon in an action against a company for penalties, and I do find very many cases where the courts have in actions of this kind given judgment against the defendant. I may mention in passing the Brighton Aquarium case, which has been before the public, and is probably in your Honour's mind, but I will deal with these cases more in detail if the argument should extend so far. These cases have put the law concerning these penal actions in civil courts against companies on the footing which I have ventured to submit, and which, I think, can be substantiated. The statute of the 13th Vic. contains in clause 4 this sentence. The statute is a statute for shortening the language used in Acts of Parliament; it is generally called Lord Brougham's Act, and I believe it is generally considered to have accomplished the shortening intended in all cases. The word companies is not mentioned in the clause, but though I cannot invoke the clause as enacting that for which I am contending, I think that I may base upon the absence of the word an argument that Parliament, in framing and passing this statute, recognized the state of the law that companies were included by and subjected to all the penalties which were indicated by statutes against the person. I am in your Honour's hands whether at this stage I should furnish you with all these cases, but Terry *v.* The Brighton Aquarium Company is reported in 10 *Law Reports*, Queen's Bench, page 306.

The Judge: What is the statute of the 13 Victoria?

Mr. Flux: Cap. 21.

Mr. Sanders: It only goes to this, that the singular shall include the plural.

Mr. Flux: The word Company does not appear there, but it enacts that the singular shall include the plural, and surely a company is nothing more than a plurality of persons. I have the Brighton case here, and in the note your Honour will find the Act of Parliament on which the action is brought, and at the foot of page 307 the words of the Act which were material, and which are as nearly as possible parallel with mine, will be found "the keeper of such house, room, or place shall forfeit the sum of £200 for every day that such house, room, or place shall be open or used as aforesaid on the Lord's day." Now the words of my statute are "who shall keep open shop." Where the language is not precisely the same it would be difficult to find language more closely corresponding; and then the further words of the statute give to any person who chooses to be the informer, the right to sue for that penalty in a civil action. In this case the penalty was sued for in a civil action, and judgment was given for the plaintiff. The defendant was represented by the learned Solicitor-General and Mr. Bosanquet, and no argument was raised to the purport that because the offence was committed by a company, the company was not a keeper within the meaning of the statute, such as is suggested here. In that case, so far as I am able to form an opinion, there is distinctly an authority in favour of my proposition. On three distinct occasions the Brighton Aquarium Company's case has been before the Courts, and in neither instance can I obtain a trace of this point having been raised. Warner *v.* The Brighton Aquarium Company is in 10 *Law Reports*, Excheq. 291. There the learned counsel engaged were Sir John Holker, Mr. Manisty and Mr. MacMillan, but this point was not raised; and I refer to the newspaper report of another case of Girdleston *v.* Brighton Aquarium Company, which was before the Court of Exchequer *in banco*, within the last month, but it was decided so recently that it has not yet appeared in the authorized reports. It is in the *Times* newspaper of the 5th March this year and again May 2nd. Then there is a case of Green *v.* The London General Omnibus Company (Lim.), in 29 *Law Journal*, New Series, Common Pleas, page 13. The head note is this, "In an action against a corporation (who were incorporated for the purpose of driving omnibuses) for interfering with the plaintiff's business of a carrier of passengers, by driving the omnibuses of the corporation in such a manner as to molest him in the use of the highway, the declaration set out various acts of such interference, which were all connected with the driving of such omnibuses, and were alleged to have been wrongfully and maliciously committed by the corporation:—Held, on demurrer to the declaration, that the action would lie against the corporation, although the acts complained of were done wilfully, since they were done within the purposes of the incorporation, and in such a manner as to constitute an actionable wrong, if done by an individual." Here is an actionable wrong done by the individual. At page 17 I have marked a passage in the judgment of Lord Chief Justice Erle. It runs "and the ground of the demurrer relied upon for the defendants is, that the charge is a charge of a wilful and intentional wrong, and that a corporation cannot be guilty of such a wrong, and therefore that the action does not lie. But I should state that the whole of the acts that are charged against the defendants are acts connected with the driving of their vehicles; and this is a company incorporated for the purpose of driving omnibuses, and therefore, the actual things done by the defendants are acts within the purpose of their incorporation. Unless they had been wrongfully done, of course there could be no ground of complaint; but being wrongfully done, we think clearly the action lies, and that there are abundant authorities to show that under those circumstances the action will lie. I take the whole tenour of authorities, from Yarborough *v.* The Bank of England down to the case of Whitfield *v.* The South Eastern Railway Company, to show that an action for a wrong does lie against a corporation, where the thing done is within the purpose of the incorporation, and that it has been done in such a manner as to constitute what would be an actionable wrong if done by a private individual." Then I will not trouble your Honour with anything until we come to the 7th line on page 17: "And I may add, as an additional reason for our decision, the inconvenience to the public that would arise if we were to hold that these companies, incorporated for the purpose of trade, had a restricted limitation put upon their liability by reason of such incorporation, and were exempt from responsibility because they intentionally wronged the public." There are other cases which I might bring to your Honour's attention, but if my learned friend will concede to me the liberty that I may if needful rely upon those cases, I, having opened the view shortly which I have the honour to submit to your Honour, I will not now trouble you with a number of cases which industry and examination have placed at my disposal. Then concerning this particular case. That which I would mention and am able to prove is this, that in the month of December last the attention of my clients was called to No. 113, Tottenham Court Road, where a large business was being conducted under the style of being a co-operative store. It was called the "London and Provincial Supply Association." The word "Limited" was no part of it. It was ascertained that the sole proprietor of the business was one William Mackness, an unqualified person, and a purchase of poison was made, which was labelled "London and Provincial Supply Association. E. H. Longmore, Chemist." Upon that I committed that which the police magistate has described as an error of practice. Of course if I commit an error in practice I shall be glad to be set right, but the impression on my mind is that in a civil court I should be regarded as committing an error of practice if I pursued the converse course; that is to say instead of coming to this court and issuing a plaint and exposing the defendant to the costs of the plaint, I pursued the ordinary courtesy of a solicitor's office, and sent a letter before action. On that letter before action Mr. Mackness, who was thus addressed, did, by his solicitors, Messrs. Crouch and Company, communicate with me and forward a cheque for the penalty which was pointed to. That letter I will bring to your Honour's attention, and the letters which passed between my friend and me.

Mr. Sanders objected to any matters being gone into not bearing on the alleged offence as it would only lead to interminable false issues.

Mr. Flux: I trust your Honour will have some confidence in me that I will not press you with matters which do not appear relevant. I will not waste the time of this or any other court if I can possibly help it. When the penalty was sent to me there came a letter asking indulgence until proper arrangements could be "completed," and I laid by. Presently I found that the arrangements were the incorporation of the company, and the continuation of precisely the same business without any change whatever, externally or otherwise, excepting the addition of the word "Limited" as part of the title. I then came to ascertain the constitution of that company, and I will not apply the word to it which naturally rises to my lips, but I will ask your Honour to look at it. Mr. William Mackness takes to himself three other gentlemen named Mackness, I believe his father and two brothers, a clerk of his solicitors, Mr. Longmore and two other persons, who are in his employ, and whilst the law will allow twenty persons to carry on a private partnership these seven incorporate themselves as an incorporated company, and they set up the Joint Stock Companies Act which empowers persons to incorporate themselves as companies for any lawful purpose—not for any unlawful purpose; they take advantage of that Act of Parliament and they say because we have thus classed ourselves together and registered a something at Somerset House and got a thing sealed we can set the law at defiance. Now the Articles of Association of that company provide for the appointment of a managing director and at the first meeting of the so-called board, which consists of two Macknesses and somebody else, Mr. William Mackness is appointed managing director. The articles confer upon the directors the right of preemption of every share, and when I come to look to the manner in which the capital of the company is held, without going into the question as to whether any of these gentlemen do or do not hold their shares in trust for Mr. William Mackness, I find that he holds 564 shares with £10 paid, or a total capital of £5640, and that the rest of the shareholders put together hold a capital of £82 10*s.* That is the company which comes here and asks your Honour to hold that they are above the law.

Mr. Sanders: I do not say that we are above the law.

Mr. Flux: Outside the law then.

Mr. Sanders: If my learned friend will give your Honour the facts we should get on better. He has been about an hour and he does not seem to have half finished his opening yet.

Mr. Flux: About the facts, I shall give your Honour the usual evidence, but in the proceedings before the police magistrates, Mr. Longmore, being examined as a witness, admitted——

Mr. Sanders again protested against any matters being gone into not specified in the summons.

Mr. Flux: Then under those circumstances I will put aside the admission and will prove that Longmore, when he effected these sales, whether he was or was not the registered holder of £7 10*s.* of paid up capital, was a hired servant, nothing more or less, and subject to dismissal. The point which I submit to your Honour is this, that this Act of Parliament, passed for the protection of Her Majesty's subjects, contemplated that the business of a seller of poisons, should be conducted only by a person possessing every skill, the skill to be excercised as a master, and not as a servant, that the law contemplated that a master having a qualification may delegate to his servant certain acts and certain powers, but that by the hiring of a qualified assistant, an unqualified person could not acquire this status which the Act of Parliament said, was necessary for the protection of Her Majesty's subjects. I will now prove the various acts of sale.

Mr. Joseph Brooker Ward sworn, examined by Mr. Flux, said:—

I am a clerk of Messrs. Flux and Co., the plaintiff's solicitors. On the 4th of Feburary last, I went to 113, Tottenham Court Road, which had the appearance of a large general shop. There were posters outside which described the shop as being The London and Provincial Supply Association, Limited. On the left-hand side of the door there was a part of the shop fitted up as a chemist's shop. I went to that counter and addressed a person, whom I now know to be Mr. Longmore, and asked for a small quantity of red precipitate. It was supplied to me, and I paid 2*d.* for it. I produce the packet. It has been in my possession from that time until the 1st March, when I handed it to Professor Attfield, of the Pharmaceutical Society, for the purpose of making an analysis. I received it back from him at the Marlborough Street Police Court, and it has been in my possession ever since. On the 20th February, I attended at the same shop. I went to the same counter, but I did not see the same person on that occasion. I asked for a small quantity of oxalic acid. It was supplied to me by a person whom I have not seen since, and had not seen before. I said, I want a small quantity of oxalic acid. He asked me how much I wanted. I said a small quantity. He asked me if two pennyworth would be sufficient. I said "yes," and he supplied me with this packet for which I paid him twopence. I handed the packet to Professor Attfield, and received it back from him on the same day as the other. After I made that purchase I spoke to a gentleman who was walking about the shop and told him I wanted to see the register of shareholders of the company. He said he did not think they had one. I asked who was the secretary or where the secretary was. He said the secretary was out. We had some conversation and I told him they ought to have a register for inspection by the public. Eventually he told me that he was the secretary, and that Mr. Mackness, who had the general management of the affair, was out, but would be in shortly. I said I would come back and see him, which I did. I saw the secretary again and Mr Mackness in the counting-house of the company. Mr. Mackness told me they had no regular register, as his solicitor had not had time to get the whole thing in order, but they showed me a rough list of shareholders on a half sheet of foolscap. I inspected that, and asked if there were any more. Mr. Mackness said not at present, but we have applications from our three managers, or something to that purport, and he showed me three forms of application for shares from Mr. Longmore, Mr. Polley the secretary, and another man. He told me if I would come up again in a day or two he would communicate with the solicitor, and no doubt he would have all the things in order. I had a conversation with Mr. Mackness, and I took the oxalic acid out of my pocket, and told him he was infringing the law by selling it. He sent for Longmore and talked to him about it. I had made a purchase at the same shop before.

Mr. Sanders objected to any matter being gone into before the date of the offence charged.

Mr. Flux submitted that the memorandum of association would show that the object of the company was to purchase Mr. Mackness's business, and therefore he contended it was relevant to show that Mr. Mackness's business comprised the selling of poisons.

The Judge: You had better not hamper your case with such dangerous matter.

Examination continued.

I know the handwriting of Mr. Crouch, the solicitor for the defendant. I produce various letters from him to the plaintiff's solicitor.

Mr. Flux called for his original letters to the defendant's solicitors.

Mr. Sanders produced the letters, but objected to any of these letters being used, as not being evidence; some discussion ensued, the result of which was that Mr. Sanders admitted the letters to be genuine, but denied their being evidence in the present case.

The learned Judge said that *prima facie* they would not be evidence. Mr. Flux had better call for a particular letter and raise the question upon that.

Mr. Flux: Take the letter of the 30th January, which contains these words, "we enclose cheque"—

Mr. Sanders: That will not do; this has no relevance to this inquiry.

The Judge I will read it *de bene esse.*

The learned Judge having read the letter, said: I do not see how this can bear on the matter.

Mr. Flux, to the witness: Have you any knowledge as to whether a penalty was paid?

Mr. Sanders objected.

The Judge: I admitted the objection that it was not evidence.

Cross-examined by Mr. Sanders.

I did not want the articles I purchased for my own use. I did not pay for them out of my own money.

In other shops it would have cost a shilling what you paid twopence for?—I cannot say; I am not in the trade.

You did not think it necessary to go anywhere else to buy anything of the sort?—I did not see the necessity.

You bought it for the purpose of making up a case?—Certainly. I know Mr. Longmore. I did not then. He is a registered chemist and druggist. I knew that before.

Re-examined.—I want to ask you whether that oxalic acid is or is not labelled in accordance with the requirements of the act?

Mr. Sanders objected that that was a question under section 17, not under the one under which they were summoned.

Mr. Flux: That oxalic acid was sold as if it was so much sweets.

Mr. Sanders: I object to this. The magistrate had that before him, and adjudicated upon it.

Mr. Hugh Joseph Stalker, said: I am a clerk to the plaintiff's solicitors. On the 19th March, I was told to go and went to 113, Tottenham Court Road, and I presented a prescription at the chemist's counter. I saw a gentleman whom I now know to be Mr. Longmore, and asked him how much it would cost to dispense it. He said 8*d.*, so I left the prescription with him to make up. He told me to call back in an hour or so's time. I went back in about two hours' time, and I asked an assistant who was there for a prescription for Mr. Stalker. He handed me a bottle, with the prescription tied round it, for which I paid 9*d.* I kept it in my possession until the 7th May, and then I handed it to Professor Attfield. On the 20th March, also pursuant to orders, I went again to the same address. I saw Mr. Longmore and also two assistants. Mr. Longmore was busy, so I spoke to one of the assistants, and asked for a pennyworth of white precipitate.

He asked me what I wanted it for. I told him it was for ointment for the head. He made it up into a little packet and gave it to me, and I paid a penny. I kept that until the 7th May, when I took it and the medicine to Professor Attfield of the Pharmaceutical Society.

Cross-examined.—You did not go to make a *bonâ fide* purchase, but to make out a case, did you not?—Yes.

You did not want it for your head, you wanted it to make evidence of?—Yes.

You did not tell him that did you?—No.

You told him a story when you said you wanted it for your head?—Yes.

Was that out of your own head or out of Mr. Flux's head. Did he tell you to say that?—No.

You did not lay out much money, only twopence in all?—Tenpence.

You got what in any other shop would be a shilling's-worth for a penny?—I do not think it would be so much as that.

Tenpence at all events?—I do not know.

The Judge: You do not know whether it would be cheaper than elsewhere.

Professor Attfield was then called, and Mr. Sanders stated that if this witness were only to prove that the articles were poisonous he would admit that.

Mr. Flux said he would not take any admissions, and it would be more regular to have the case proved. It had been said that in a penal action no admission could be taken.

Professor Attfield examined, said: I identify as poisons the various articles deposed to by the previous witnesses.

Now look at the prescription which is produced, is there any poisonous ingredient there?—Yes; the prescription mentions solution of perchloride of mercury, that is a poison. The directions are to take two teaspoonfuls three times a day. I have examined the contents of the bottle, and find in them perchloride of mercury. The directions are wrong, and the mixture is very dirty, otherwise it is in accordance with the prescription. The direction on the prescription is to take two teaspoonfuls three times a day, but the directions on the bottle are to take two teaspoonfuls twice a day.

Mr. Sanders: All the better for the patient.

Witness: It is not good for patients that there should be any error on the part of the dispenser. The other packet contains white precipitate of mercury. Perchloride of mercury is another expression for corrosive sublimate.

Cross-examined by Mr. Sanders.

I have heard the evidence of Mr. Ward and Mr. Stalker, as to the prices they mentioned as having been given. I do not know that they are much below the ordinary prices of a chemist's shop. This prescription could be made up for prices varying from eightpence to a shilling. Not more. I do not know anything about this case beyond what I have heard from being in court this morning, and being at the Marlborough Street Police Court.

Mr. Edward Henry Longmore, examined by Mr. Flux: Are you a registered chemist and druggist?—Yes.

Do you reside at No. 10 Storey's Gate, St. James's Park?—I have lived there. It is not my address now. It was on the last occasion.

Give the Judge your address, that we may know where to find you.

Mr. Sanders objected to the question.

Mr. Flux said it was usual for a witness to give his address.

Where are you living?—38, Harrington Street, Harrington Square.

What is your employment?—Chemist and druggist at 113, Tottenham Court Road.

How long have you been at that place?—Since the beginning of October last.

Are you the proprietor of the shop?—Part proprietor.

What part?—The drug department.

What is the part of which you are the proprietor?—Five £10 shares.

Two pounds ten paid?—It is £12 10*s*. paid.

Two pounds ten each, or a total of £12 10*s*.?—Yes.

Who are your co-partners?—I think you have them there.

Your co-partners are your co-shareholders in the registered company?—Quite so.

(Handing a document to the witness.) Does that relate to the company in which you are a shareholder? I have a letter from my friend in which he says he will admit that is a true copy of the Memorandum and Articles of Association of the Company.—Witness: That is not the company; my name does not appear.

Mr. Sanders: That is the company, although your name does not appear.

The witness: I see the names of the directors are there. I am well aquainted with all those names. That is the company.

Mr. Flux: Were you a shareholder before the 19th February last?—I was.

At what date did you become a shareholder?—I can scarcely tell you. My memory does not recall to me the date.

Do you receive a salary?—Yes.

Tell us the amount of it?—Am I obliged to answer that question.

The Judge: Yes, you are.

Witness: Two pounds six shillings and twopence per week.

Mr. Flux: Who engaged you?—Mr. Willian Mackness.

Are you engaged by the week or by the year or hour?—I have no definite engagement.

You have no definite engagement as to it?—No.

Who could dismiss you?—That is a question I could not answer. I do not know. There are three or four who could dismiss me.

To whom do the moneys received for sales of poisons go?—To the cash-desk.

Who keeps the cash-desk?—There is a man appointed especially to keep the cash-desk and give in such bills as are taken during the day.

Who manages?—For which department?

The poisons?—I do.

Do you pay for them out of your own pocket?—Not likely.

Who does pay for them?—The association.

And the company—the association—receives the money from the cashier?—Yes, quite so.

Did you pay the £12 10*s*. for your shares?—I did.

Was it handed to you for that purpose?—Certainly not.

Do you hold them for your own sole interest?—Certainly.

Not subject to any agreement for sale?—Certainly not.

Other people besides yourself serve at the chemist's counter, do they not?—Qualified assistants.

Who engages them?—I do.

What are their names?—William Betts, a modified assistant, and Walter Owen, a registered chemist and druggist. They are both registered chemists and druggists. One is by passing the minor examination the other by the modified examination.

Who pays their salaries?—I do.

Out of your own pocket?—No, for the company.

In other words the company sends you the money with which they are paid?—Just so.

Cross-examined by Mr. Sanders: I do not think my learned friend has made much of you, and I do not think I have much to say. You are a member of the Pharmaceutical Society are you not?—I am a registered chemist and druggist by examination under the Pharmacy Act.

Perfectly qualified to dispense?—Duly qualified to carry on business for myself.

Do you attend regularly personally to this chemist's department at these stores?—Yes, always.

To that and nothing else?—To nothing else. I may mention that the Pharmaceutical Society's clerk has always taken the opportunity of coming when I was absent to my dinner.

I do not want to hear about that. You have two qualified assistants under you?—I have.

So that the public are perfectly protected?—Quite so.

You never make any mistakes I suppose?—Seldom or ever. Mistakes will occur with the best regulated firms, but they are very few and far between with us.

But as far as acquired science will enable you, you do conduct your business free from mistakes?—Certainly.

I need hardly ask you, the chemicals you sell are very much under the ordinary prices, are they not?—Yes, 25, 30 and 35 per cent. The prescriptions sometimes cent. per cent. less.

Arthur Ralph Polley sworn, examined by Mr. Flux, said:—

I am not now the secretary of the company.

The Judge: When did you cease to act as secretary?—In February last. When it was made into a company. Before February 4, I had ceased to be secretary.

By Mr. Flux: I am now manager. I became manager on February 4, when the company started. I am manager under the company and over the assistants. I engage and dismiss some of them. I have nothing to do with Mr. Longmore. The secretary is a gentleman named Cannon. I have been subpœnaed to produce the register of shareholders, and I produce it.

Mr. Flux: Look at that register and see on what date the witness Longmore became a shareholder?—I cannot tell you.

Mr. Flux: It is registered on February 19.

The Judge: Is that so; are you able to say that?—Yes, February 19.

Mr. Flux: Does it appear by that register, and is it within your knowledge, that Mr. William Mackness holds 564 shares credited as £10 paid?—Yes.

There are nine other shareholders only?—Ten altogether.

And the remaining nine hold between them only thirty-three shares?—Yes.

Each credited with £2 10*s.*?—Yes.

A total of £82 10*s.* against £5640?—Yes. I produce the minute-book of the company.

Mr. Sanders objected to the minute-book being examined as not bearing on the case.

Mr. Flux submitted that it was material to him to show that Mr. William Mackness was the managing director. He did not care for the exact date except for the purpose of showing that at the first meeting of the Board Mr. Mackness was appointed managing director.

Mr. Flux: I should like the date and the fact of the appointment. It may be well to see what directors were present and made that appointment. Whether in fact, Mr. William Mackness went through the form of requesting other people to appoint him.

Mr. Crouch: It is on February 18.

Mr. Flux: What directors were present?

The Judge: Supposing you say it is a company, which practically is Mr. Mackness, what then?

Mr. Flux: I submit that so far as this company deals in poisons, at any rate, that if it is formed for the purpose, it is not a lawful company.

The Judge: Would it be an unlawful company because out of ten shareholders nine hold one share each and the other holds the remainder.

Mr. Flux: Not by reason of the proportion certainly.

The Judge: Would not the course be to have the register cancelled? But so long as the register stands does not the Act of Parliament make the registration sufficient?

Mr. Flux: *Primâ facie* the register stands, but the company or the persons composing it are not protected from the consequences of their acts. I think I could show that, on the ruling of Lord Hatherley, in the case of Betts *v.* De Vitre, where the court held that the directors were responsible.

The Judge: Did he hold that it was no company.

Mr. Flux: I do not think he went that length.

The Judge: Besides you are suing the company. If there is no company, why do you sue it? The defendant here is the London and Provincial Supply Association, Limited.

Mr. Flux: According to the law as it now stands, I can sue any company or partnership by the name, style, or title by which they carry on their business.

The Judge: You are blowing hot and cold. You are suing them by that name and then say that they have no existence—that this is a fraud.

Mr. Flux: I sue them by that name and I venture to submit this to you that if they are a company they are responsible as a company, and if they are not a lawful company then they are responsible as individuals, and I am entitled to a verdict against them as individuals by their generic name.

The Judge: You cannot say when he became the managing director?

Mr. Crouch: Yes, sir, on February 19.

Mr. Sanders: I do not trouble you, Mr. Polley, with any questions.

Mr. Sanders: My learned friend has put before your Honour this case, and I think you must have arrived by this time at the conclusion that this is a case of much ado about nothing. I do not know what they complain of. If they are here in the interest of the public, the public has not suffered and the public cannot suffer, because every protection that the legislature says they should have the public have got. Why! in the association there is a perfectly qualified gentleman always in attendance, and who on every occasion of these sales was present superintending the sales. Not only that, but he has two duly qualified men under him, so that in point of fact no evil can arise out of this sort of trade. Whatever my friend, on the part of the Pharmaceutical Society has to complain of, I really do not know. If they had found here some unqualified man dispensing these poisons that would be another thing, but they themselves produced before you the very gentleman, a perfectly highly qualified man who is always present, he says, and managing this department. It is not left to anybody else, he says "I am always there." And what is the evidence before you, that on every sale of which they now complain Mr. Longmore, the qualified man was present. What is there to complain of? This is no doubt a most important question, because it not only affects this association, but it affects others, and your Honour knows there are some associations here in which the shareholders are probably numbered by thousands. I think the Civil Service Association, to which I have the honour, I will not say the honour, but the advantage, of belonging, number more than five thousand shareholders. Does my friend contend that all these five thousand shareholders must be members of the Pharmaceutical Society before they can venture to sell chemicals containing poisons. That is the contention. What does he say? He says the manager and the other shareholders with the exception of Mr. Longmore are not pharmaceutical chemists, and therefore they have no right to sell poisons. How are they to be pharmaceutical chemists. Many of these shareholders of course are females, and you cannot have a female pharmaceutical chemist? Are all the shareholders of these great associations to become pharmaceutical chemists before they can venture to sell anything containing poison? All they can do is this, to put amongst the number a qualified man. It does not matter whether a shareholder or not, but by putting a qualified man to dispense these poisons, they do all that can be expected and all that they really can do. Now, if my friend in his candour will tell me what we are to do to get out of the difficulty he says we are in, we will do it. What are we to do, Mr. Flux? Can you tell me what we are to do? He says, "Do not sell poisons at all." But why are chemicals, of course including poisons, to be excluded from the things these stores are to sell? I do not know why. If there is any advantage, and the public seem to recognise the advantage of these associations, why is not that advantage also to include the sale of chemicals, which we all require at certain times. But according to my friend's argument that branch of business never can be a portion of these co-operative stores' sales, because you never can have, according to his argument, a properly qualified body to sell. We have here one individual shareholder, a person who has under him other qualified men. My friend says that will not do. What will do? According to his notion I suppose they must all be members of the Pharmaceutical Society. What! all the members of the body composing this association? The thing is morally impossible and the legislature would never go so far as that. This act of course is a most beneficial Act, and it ought to be construed as strictly as the circumstances will admit, but you must not expect impossibilities to be accomplished, and my friend is asking for an impossibility. What the Act of Parliament intended was that the public should have some protection against unqualified and ignorant people dispensing dangerous substances; that was the object of it; and in order to do that, it says those dangerous things shall not be dispensed by people who do not know the difference between epsom salts and arsenic. You know the joke in Pickwick about the juryman who was a chemist, who said I want to be away. I have only a small apprentice-boy and he does not know the difference between arsenic and epsom salts. He was obliged to go into the jury box, and he says I am not responsible for the poisoning that goes on. That is the danger the legislature intended to guard against, that these dangerous things should be sold by people who are not qualified to understand their nature and to caution the people to whom they sell them. As regards the sale of poisons there are very stringent regulations, and you will see that when poisons are sold then there must be a label with the name of the party, and under some circumstances there must be an inquiry as to whom the party is to whom it is sold, and the party must be introduced by a person known to the chemist, and all must be entered in a book. All that is under the 17th section; but we are not dealing with that section now. The section we are dealing with now is the 15th, which I will call your Honour's attention to, because I wish to make some remarks upon it. (The learned counsel having read the section continued): We have not violated that. It says "any person," that is the person who sells; Mr. Longmore is one of the shareholders. He has sold and he is a duly qualified pharmaceutical chemist, or chemist and druggist. He says he is a chemist and druggist. Then how have we violated this section? I cannot understand. "Any person who shall sell." If Mr. Longmore, not being a person with this qualification, had sold he would have been within the terms of the section. But he comes under the designation, and in selling these things is duly qualified. Then it is said that you are only one of a greater number; there is a Mr. Mackness, who is managing director, and he is not a qualified chemist. I admit that, but you cannot expect to have the whole society pharmaceutical chemists, the thing would be an absurdity; you would require to have in some cases four or five thousand people to be pharmaceutical chemists before they could be allowed to serve these things in these great stores. No doubt Mr. Mackness is managing director. In these large establishments you must have some head, but that does not make him the man who sells. He is a shareholder amongst the other people, and delegated to him there is the duty of general management. It has been endeavoured to be shown to your Honour that Mr. Longmore is not that which he says he is, and that he is merely a servant. Well, to some extent he is; that is to say, he has a salary, but that does not in any way derogate from his position as a qualified man. Take all our railways. Who is a shareholder? Who are your directors? Paid men. Every director and every chairman certainly of every railway is a paid man. He receives a salary, but he is also a member of the association. I do not wish at this late period of the day to detain your Honour. My friend opened this case at great length, and spoke more than an hour, I think, and if I have your Honour with me I do not want to delay you further. It does seem to me we have done everything we could and everything the law requires. We have a qualified man to superintend the dispensing of these drugs, and he himself is a member of the copartnership. It is said that as regards the 4th February he was not a member of the partnership. Perhaps not at that time, but still he was a qualified man, and that is all the law requires. It must be a man qualified by the law, and he is qualified by the law, and it does not follow that because he is associated with other persons who do not have that qualification, that therefore that sale is within the section at all. You see by the preamble, which my friend read, what was the purport of the Act of Parliament—to protect persons from being served by persons who are incompetent to judge of the things they are selling; that is the Act of Parliament. How do we carry out this object. By putting over the dispensing, and giving the sole control of that department to a gentleman who is perfectly qualified, and who has under him perfectly qualified men also. They have not shown a single person connected with this establishment in the dispensing line who is not qualified. Is your Honour, therefore, to say that this establishment is conducted contrary to law? If you do you will have to apply the same rule to all the other great supply associations. The Army and Navy, the Civil Service, and all the rest. Your Honour's judgment will be then that every member of these large associations, four or five thousand in many cases, I know it is in the Civil Service, must all be members of the Pharmaceutical Society or they cannot venture to sell chemicals. It comes to that. I do not think your Honour will go so far, and I really think I should be unduly occupying your Honour's time by addressing any further observations to you.

Mr. Flux was about to address the Court in reply, but Mr. Sanders contended that as he had called no witnesses his friend had no right to address the Court a second time.

The Judge: Should you say that in Savory and Moore's and Messrs. Bell and Co.'s there can be no unqualified partner?

Mr. Flux: Certainly; just in the same way as I should say there can be no unqualified partner in a firm of solicitors. The law has imposed a personal qualification just as much as the revenue laws say that persons who are licensed shall do certain things. No one ever heard that one man, holding a license, could thereby license a multitude to employ him, and I submit, also, that as the law of master and servant applies that is fatal to the defence.

Mr. Sanders again objected to Mr. Flux being heard further.

The learned Judge said: I must adhere to the established practice.

Mr. Flux said there were some other cases he should like to call to his Honour's attention.

The learned Judge said Mr. Flux might write down the names of the cases, and hand them to him, and he would look at them, and he would give judgment that day fortnight.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Robinson, Broomfield, Bostock, Ivatt, Williams, Edward, Ball, Squire, Asselin, Martin, Glover, Jackson, Rayson, Laverack, Hadfield, Cardwell, Smith, Stevens, Taylor, Gibbons, Tucker, Abraham, Syrupus, Arsenicum, An Associate, Occidens, Sligo, Experientia docet, F. W. B., A. P. S., G. H. B., J. W. L., A. J. S.

"THE MONTH."

The suburban streets of London are now dressed in their very best. Unpromising as the weather appeared to be at the commencement of the month, the soft warm showers have brought out the flowers with a rapidity almost as magical as that of an arctic summer. The refreshing green tint of the young foliage is now at its brightest and contrasts delightfully with the pretty pink of the hawthorn, the golden tint of the laburnum, and the handsome white blossoms of the horse chestnut. Botanists and naturalists feel as if they had received a new lease of life, and perceiving that their harvest-time has come, begin to set to work in earnest to gather in their treasures. Most appropriately the lectures on botany commence early this month, for from May to August there is an abundance of material for study, and dry as botanical details may be to read, they wear quite another aspect when flowers can be handled and their wonderful fitness for the purposes for which they were designed is gradually unfolded to the thoughtful mind of the careful investigator.

The list of medicinal plants for the month must of necessity be a long one, although comprising few that have not been already noticed.

At the Botanical Gardens at Regent's Park, for the first time during several years, *Rheum palmatum* has blossomed freely, and young fruit is beginning to set, so that it may be hoped this comparatively rare species will be grown more abundantly hereafter. Of all the numerous species grown in botanical gardens this seems the smallest and most delicate. But few leaves are generally formed and these do not attain any great size. The main root is said to be liable to rot. This plant is also in flower in the Botanic Gardens at Edinburgh. The flowering appears to be rare, since the authors of 'Medicinal Plants' state that they were unable to procure a living flowering specimen. The inflorescence of the plant at Regent's Park is more spreading than the figure in that work, but possibly it becomes denser and more erect as the fruit ripens, as appears to be the case with *Rheum Rhaponticum*.

Arctostaphylos Uva-ursi is also in blossom. The waxy looking white corolla is prettily tinted with pink, and were the flowers on each little stem numerous the plant would be a very ornamental one for rockeries. The anthers open by pores at the apex, behind which they have two hair-like appendages; the style is remarkably blunt, and the base of the ovary is surrounded by a shallow annular disk. In the Economic House the *Quassia amara* is putting forth its crimson buds and will soon be covered with flowers. Among the flower-beds the Boraginaceæ, Labiatæ, Rosaceæ, Euphorbiaceæ, Liliaceæ and Iridaceæ afford abundant material for study. The *Carum Carui*, with its curious pinnate stipules, an organ very rare in the Umbelliferæ, is now in full blossom, while the Sweet Cicely (*Myrrhis odorata*) affords a very visible illustration of the stylopodium or enlarged base of the style.

The way in which the gardens of the Royal Botanic Society are kept in order, notwithstanding the large amount of time which must be spent by the gardener in gathering flowers for lectures, students, etc., reflects great credit on the able secretary Mr. Sowerby. The exhibition of flowers on the 22nd was very good, and the weather being fine was well attended, the Crown Prince and Princess of Germany, and the Prince and Princess of Teck being among the visitors. The plants exhibited included some magnificent azaleas, some of which were a perfect mass of blossom, not a leaf being visible among the flowers. Among the novelties were some handsome large begonias, with double flowers, and some pretty and delicate varieties of aquilegia, the former especially attracting considerable attention. In one corner was a magnificent specimen of *Sarracenia purpurea*, apparently exhibited as a foliage plant. Some of the orchids were splendid plants; the lovely flowers of *Lælia purpurata* and *Masdevallia Mossiæ* being especially admired, as well as the *Masdevallia Haryana*, the brilliancy of its colouring being almost dazzling to the eye.

We learn from Edinburgh that the following medicinal plants are now in blossom in the botanical gardens there, *Carum Carui*, *Rheum palmatum*, *Quassia amara*, *Chelidonium majus*, *Arum maculatum*. The extent to which this valuable garden is being used for teaching purposes may be gathered from the fact that 48,820 specimens of plants were used for lectures and demonstrations during the year 1877, and the number of students attending the botanical class was 389, although the class room only accommodates 230. The venerable and beloved Professor Balfour has recently been prevented by ill health from giving his usual lectures, which have been delivered by his son, Dr. Isaac Balfour. It is to be hoped that better accommodation than that afforded by the present class room will soon be forthcoming, and that the small extra sum of £300 annually, which is necessary to meet the working expenses of the garden, will soon be granted. As it is, there is no botanical garden of the same extent, used for teaching purposes, which is kept at so small an outlay.

'Medicinal Plants' for this month contains an account of the following species:—*Pilocarpus pennatifolius*, *Astragalus gummifera*, *Copaifera Lansdorffii*, *Manihot utilissima*, *Juglans cinerea*, *Quercus alba*, *Quercus tinctoria*, and *Zingiber officinale*. The authors express their opinion that *P. Selloanus* is probably a variety of *P. pennatifolius*, and quote Professor Baillon's opinion that the jaborandi of commerce is most likely obtained from both. The figure shows the leaves rather more pointed than they are usually met with in commerce, and does not represent the notch at the apex which is so frequently noticeable in these leaves. The history of the drug is very thoroughly and clearly summarized, but a few of its more recent applications are overlooked. *Copaifera Lansdorffii*, commonly, but erroneously (as the authors point out) spelt "Langsdorffii," has been chosen as the source of copaiba, apparently on account of its being a native of a large portion of Brazil, whereas the plant officially specified in the Pharmacopœia is a very doubtful member of the genus, and *C. officinalis* does not grow in Brazil. *Juglans cinerea*, or butternut, is an American medicinal plant of which the authors only mention the aperient qualities, although the extract is not uncommonly used as a vermifuge. *Quercus tinctoria*, or black oak bark, is the source of the well-known tanning and dyeing material, quercitron bark. The plates are rather better than usual.

Botanical artists of the male sex had better look to their laurels, for a report reaches us from Kew of a lady artist, whose faithful delineations and clear and careful analysis of the flowers, etc., according to the *Gardener's Chronicle*, "remind us not a little of the beautiful touch which the late Sir William Hooker exhibited on similar work."

At the drug sales this month, among comparatively new drugs, there have been offered casca bark (*Erythrophlœum guineense*), caroba (*Jacaranda procera* and other species), and peach root. Japanese aconite root continues to be offered in large quantities. It would be interesting to know whether it is being used instead of the German root, and if so in what preparations, for although it might do no harm in a liniment, its use might be dangerous in tincture until its relative strength is better determined than is at present the case. The "peach root" is, we have reason to believe, not the root of the common peach, but the root of the negro peach, *Sarcocephalus esculentus*, a native of the same countries as the casca bark, and used by the natives as a tonic and stomachic. This plant belongs to the Cinchonaceæ, and it would be worth while to ascertain if it contains any bitter alkaloid, bearing relation to quinine.

A quantity of false sumbul appears to be in commerce. It may be known from true sumbul by its pale reddish-brown colour, and by the taste of the tincture, which decidedly is that of ammoniacum; the tincture also is darker in colour than that of the genuine root. We hope to lay further details of this before our readers on another occasion; meanwhile, those who have tincture of sumbul in stock will do well to taste it and see if it be genuine.

In boggy meadows and wet places may now be found the bogbean (*Menyanthes trifoliata*), one of our loveliest wild flowers, but growing usually on such treacherous soil as to render it by no means easy to gather. Like the primrose this plant has blossoms of two kinds. The form with short styles is said by Darwin to have larger pollen grains than the long-styled form, and the former appears to be sterile with its own pollen, since at Kew, where it grows alone, the seeds never germinate. Like some other aquatic plants if the flowers remain submerged, they continue closed and fertilize themselves.

In damp meadows the bistort may here and there be seen raising its pretty pink head above the tall grass, but is easily overlooked unless carefully searched for. The curious twisted root of this plant is said to contain an abundance of sphæraphides similar to those of rhubarb root. By the wayside everywhere now, the herb bennet, or avens, of which the root was formerly known as *Radix caryophyllata*, from its clove-like taste, may be found in blossom. The curious purple meditullium of the root is very marked, and is a feature by which it is easily distinguished from arnica root, with which it has occasionally been mixed in commerce. The leaves afford an illustration of the terms lyrate and interruptedly pinnate. Another pretty little plant may be found in damp hilly meadows near streams, the ladies' mantle, *Alchemilla vulgaris*, which is worth notice from a botanical point of view, from being a rosaceous plant with only four stamens and from most of the flowers having either the anthers or the stigma more or less rudimentary, as if, from the Darwinian point of view, it were becoming diœcious.

In the Economic House at Kew the cinnamon and cassia plants are now in blossom, as well as the ipecacuanha plant and the chocolate tree, while the coca plant is covered with buds and will soon be full of blossom. *Asclepias curassavica*, the ipecacuanha of the West Indies, is still in blossom. The flowers of the cinnamon, although not very conspicuous, on account of their small size, are interesting on account of the parts of the flower having a ternary arrangement. The upper portion of the six perianth lobes usually breaks away transversely. Of the nine stamens, six are introrse, and three which form an inner whorl are extrorse. The stamens, as is usually the case in the Lauraceæ, have valvate anthers, but only the inner whorl have glands at the base of the filaments. The structure of these anthers is well shown in Bentley and Trimen's 'Medicinal Plants,' No. 224. The cocoa tree, which is here a diminutive plant, scarcely a yard high, has a very singular appearance from the small pink flowers springing from the trunk, the extrorse anthers being held back in the hooded bases of the petals somewhat after the fashion of the Kalmia, so that it is almost impossible for the flower to become self-fertilized.

In the open ground the phu, or valerian of the Greeks (*Valeriana Phu*), is in blossom, although the officinal species is only in bud. It must not be forgotten that the plant commonly called Greek valerian, or Jacob's ladder, belongs to an entirely different family, Polemoniaceæ. The American valerian with its handsome yellow flowers is now in blossom: this plant belongs to the ladies' slipper genus of orchids, *Cypripedium*, and is used in North America as a nervine tonic. *Carum Carui*, *Podophyllum peltatum*, and two of the plants yielding orris root, *Iris florentina* and *Iris germanica*, are also in blossom. The former is easily recognized by its delicate pale-blue flowers. The stigma must be looked for by turning back the apex of the petaloid styles. *Sarracenia purpurea* will also be in blossom in a few days.

At the gardens of the Apothecaries' Society at Chelsea numerous medicinal plants are in blossom: *Geranium maculatum*, one of the plants yielding alum root in North America; coriander (*Coriaria myrtifolia*), a poisonous plant whose leaves were once found mixed with senna on the continent; dulcamara; and masterwort, formerly used in medicine, and the root of which was recently detected among German aconite root. The mulberry, woad, horseradish, and a fine specimen of biennial henbane are also to be seen in flower. The latter with its usually eccentricity has sprung up in the wrong place and need not be looked for in the bed appropriated to the solanaceous plants, but under a small tree near the Curator's house. There are to be seen in this ancient but valuable garden some fine specimens of *Rheum palmatum*, var. *tanguticum*, which has been stated to be one of the principal sources of Chinese rhubarb. The plants seem to be of much more vigorous growth than the specimen of the old *Rheum palmatum*. The new variety has much longer leaf-stalks, more numerous and larger leaves, and the veinlets on the under surface of the leaves are scarcely visible, while in the old plant they look almost like black lace. This is owing to the new variety having the under surface of the leaves densely covered with forked hairs, which are scarcely perceptible in *Rheum palmatum*. The leaf-stalks are rounded at the base, but towards the leaf form a very marked angular keel on the upper surface. In *Rheum palmatum* the leafstalks have a furrow instead of a ridge on the upper surface close to the leaf.

A paper on casca, or sassy bark has recently appeared in the *British Medical Journal*.* Those who

* April 6, p. 490.

are preparing tincture for commercial purposes will do well to remember that merely powdering it in a mortar causes most violent sneezing as well as poisonous symptoms, and that it should therefore be moistened before being powdered. Until recently great difficulty was experienced in obtaining this drug, and notwithstanding Dr. Brunton's description of its physiological action, it has until recently scarcely been noticed. Now, however, an abundance is obtainable, several bales of the barks being this week offered at the London sales. It has been suggested that as there is a possibility of confounding the names casca and cascarilla, it will be advisable to call the tincture, which is the preparation recommended to be used, *tinctura erythrophlœi.*

Sarracenia purpurea has recently come to light again as a remedy, in a Russian medical paper, this time for gout, the powder being given in doses of one or two teaspoonfuls morning and evening. The violence of the attacks are said to become greatly lessened under its use.

New Remedies, for April, quotes a statement, by Dr. U. H. Long, of Louisville, to the effect that he has used mistletoe (*Viscum album*) for ten years successfully as a substitute for ergot. He states that it acts with more certainty and promptness, and that it causes natural, *i. e.*, intermittent contractions, so that it can be used at any stage of labour, and that the full action of the drug becomes manifest in from twenty-five to firty minutes after ingestion. The tincture is made by taking eight ounces of dried leaves, saturating them with boiling water, and adding alcohol to make one pint, letting the tincture stand ten days before filtering. The infusion is made by taking two ounces of dried, or four ounces of the fresh leaves, and pouring on them a pint of boiling water; when cool it is ready for use. From two to four ounces are given as a dose, and may be repeated in twenty minutes if necessary. Dr. Long prefers, however, the fluid extract, for which a formula is not given; but it may be presumed that it is prepared according to the United States Pharmacopœia process. The green leaves are said to impart a disagreeable taste, which is lost in drying. The mistletoe used grows generally in his neighbourhood on *Ulmus nemoralis* and *Quercus aquatica*, but Dr. Long is of opinion that the properties of mistletoe are not affected by the character of the tree on which it is parasitical.

Mr. E. Perret has described a method of removing the colouring matter of scammony resin. He states that the colouring matter is in combination with alumina and lime, and is easily precipitated by adding a few drops of sulphuric acid to the concentrated tincture, which has an alkaline reaction, until it becomes neutral. When the precipitate has settled, the clear colourless liquid, after removing the spirit by distillation, and heating the residue to 102° C., yields a pure and white resin.

A new reagent for microscopists has lately been discovered in the shape of phoroglucin, which has the property of colouring woody tissue reddish violet. The woody tissue is first moistened with hydrochloric acid, and then with an alcoholic solution of an extract of cherry root bark, which as well as that of the apple and pear, contains phoroglucin.

Dr. Haussmann reports, in a Berlin medical paper, that a 5 per cent. aqueous solution of carbolic acid proves more effectual in the cure of sore nipples than either nitrate of silver or lead lotion.

Dr. Lausing, of the Philadelphia *Medical Times*, has found a new use for ergot, with which he says he has successfully treated severe cases of hæmorrhoids.

In the *Lyons Médicale*, Dr. Planat states that arnica acts most rapidly and effectually upon boils or similar eruptions. He administers doses of twenty-five to thirty drops of the tincture every two hours, or applies a poultice, composed of ten parts of extract of fresh arnica flowers, and twenty parts of honey, or if that be too liquid, he adds lycopodium, a drug which homœopathists assert to be almost a specific for boils. Another homœopathic remedy has recently attracted the notice of the allopaths, viz., *Anemone pulsatilla*, which is now being tried for leucorrhœa and other female disorders.

Chaulmúgra oil, pure specimens of which were exhibited at a recent meeting of the Pharmaceutical Society, is now coming into commerce, and appears likely to receive that attention from the medical profession which is merited by its undoubtedly powerful alterative properties. Those who obtain it will do well to remember that the article is one which is very liable to adulteration in India, and that tests for its purity have been published by Dr. Dymock in this Journal.

From New Zealand a new remedy for diarrhœa in men and animals is reported, of which it is asserted that two doses of the decoction will always effect a cure, even in bad cases. The remedy is one which is said to have long been used with success by the Maories. It consists of the leaves of a shrub called "roromiko," but of the botanical name of which no information is at present attainable. The decoction though slightly bitter, is said to be not disagreeable.

A curious use for a rosaceous plant, *Comarum palustre*, is mentioned in Dr. R. Stierlin's recent work on 'Beer, and its Adulterations, etc.' It is there stated that in Germany it is added to beer to cause thirst.

Mr. Sidney H. Vines's lecture "On the Chemical Aspects of Vegetable Physiology" recently delivered before the Chemical Society, has been already noticed in this Journal. The subject, however, is one of such extreme interest as to merit some further observations in the "Month." That chlorophyll does play an important part in the act of assimilation by plants, is as certain as that the colouring matter of the blood is vitally concerned in the process of blood oxidation. It is also known that the act of assimilation primarily concerns itself with the decomposition of carbonic anhydride existing in the atmosphere under the influence of sunlight, and that starch is an accompanying product. But as regards the precise reactions by which these final results obtain, or even of the constitution of chlorophyll itself, our knowledge is most imperfect. For instance, while most observers agree that iron enters into the molecular composition of chlorophyll, this is by no means universally conceded, and the statement has been characterized as a bold and unwarrantable attempt to compare chlorophyll in its general nature, with hæmatocrystalline of the blood. Again, it is disputed whether chlorophyll is a nitrogenous substance; it probably is, but no final assertion can be made upon the subject. From these facts and others of a like kind it follows that it is entirely premature to speculate upon the precise quality and quantity of those reactions and functions excited by substances of which even the composition is uncertain; and that any such speculations are premature, is proved by their number and their discordance. Certain vegetable physiologists who were present and took part in the discussion following the lecture in question, said they only waited for the chemists to discover more facts before they were prepared to substitute a better philosophy for the one at present in use. This is all very well, but such a philosophy surely comes better from the chemists who discover the facts. If the vegetable physiologist is to sit down while the chemist works and merely apply the discoveries effected by others, then his function in nature is not a very serviceable one; at least, it is one which can be dispensed with. This discussion about chlorophyll reminds one of an older discussion about bile, and as it was doubted whether the bile was a chemically individual colouring matter, or a mixture of different colouring principles and other substances, so the same doubt attaches to what this day is known as chlorophyll. Chemistry, however, discovered solvents for these principles of the bile, and gradually they were separated and obtained in isolated pure states; but the animal physiologists have not even to this time arrived at a proper knowledge of the functions of bile, and when the explanation arrives, it will arrive in all probability from chemists. What is wanted as regards chlorophyll is that which was done with bile. It should be extracted in as pure a state as is possible by solvents, and when thus obtained it should be analysed and submitted to processes in which the products should be qualitatively and quantitatively determined. These processes should be in imitation, as far as can be, of those believed to occur in nature, and what is supposed to occur under other conditions. Thus the chlorophyll should be exposed to carbonic anhydride and aqueous vapour in sunlight. It should be exposed to the action of atmospheric gases. Further, these two processes should be alternately repeated; finally, chlorophyll should be submitted to processes of hydration and oxidation. Even if it were not possible to start with pure chlorophyll, one could start with a preparation in which this substance should form the predominating constituent, and accordingly the predominating products of change would be those resulting from the chlorophyll. The line of study and research here indicated is one which it is not only desirable to apply to chlorophyll, but it could be profitably extended to the other subjects touched upon by Mr. Vines in his interesting and useful *résumé* of the points of contact between chemistry and vegetable physiology.

Gréhaut's recent experiments* upon the absorption of carbonic oxide by the blood have not only confirmed previously acertained facts, but have given them a quantitative expression. It is well known that poisoning by carbonic oxide occurs through the combination of this gas with the colouring matter of the blood, so that in this way the red corpuscles are incapacitated for taking up oxygen. Gréhaut has determined that an animal breathing an atmosphere containing only $\frac{1}{770}$th of carbonic oxide may absorb enough of this gas in thirty minutes to destroy the capacity of fully one half of the red corpuscles for taking up oxygen. The way in which he arrived at this result was as follows:—A sample of blood was drawn from the superior cava of a dog, which was then made to breathe an atmosphere containing a known amount of carbonic oxide for a definite time; another sample of blood was then withdrawn. Then, again, the animal was made to breathe pure air, and a third sample of blood taken. These three samples were defibrinated and shaken with oxygen, after which the contained gases were extracted *in vacuo* and analysed. From the amount of oxygen thus obtained, it was easy to calculate the degree in which the oxygen absorbing capacity of the blood corpuscles had been destroyed by the carbonic oxide.

* *Comptes Rendus*, April 8, 1878.

Von Mering has conducted an investigation regarding the destiny of saccharine matter contained in the digestive tube; not only as regards sugar introduced as such into the body, but also that resulting from the change of starchy matters. He finds that the lacteals are not concerned in the absorption of sugar; the lymph and chyle contain invariably about as much as the serum of the blood, which also constantly contains sugar. The portal blood alone contains a superior quantity of saccharine matter during the digestion of carbohydrates. Von Mering thinks that the liver abstracts this excess of sugar from the portal blood during its passage through that organ.

O. Nasse has published an interesting paper upon the influence of different gases on fermentation, and among many other experiments he describes the following: Ice-cold solutions of cane sugar were mixed with invertin (a ferment derived from yeast), in glass tubes and saturated with various gases. The contents of the different tubes were then heated to boiling and a determination made of the amount of inverted sugar in each. In one case where carbonic anhydride had been employed 20 miligrams of inverted sugar were found; with hydrogen, 8 miligrams, and with air 7 miligrams; while those which had been treated with oxygen and carbonic oxide contained none at all. In other words oxygen and carbonic oxide inhibit the power of the particular ferment employed.

It appears that other minerals besides quartz are liable to contain fluid cavities. A. Schertal has described a specimen of Spanish blende having a cavity filled with fluid containing sodium chloride and sulphate of zinc, the former being the predominating constituent.

The *Academy* of the 11th inst. points out very justly that the new quarterly journal termed *Brain* is an instance of a general tendency exhibited by the times; it is a good thing which is superfluous. "There is no single article in the first number of *Brain* which might not have found an appropriate home elsewhere."

Another of the men who have done honour to pharmacy has recently passed away in Félix Boudet, who was one of the earliest editors of the *Journal de Pharmacie et de Chimie*. M. Boudet was elected an Honorary Member of the Pharmaceutical Society of Great Britain in 1841.

Many are the uses to which the telephone is already applied, and among them is the following:—The fishing season happens when the herrings come into the shoals and deposit their eggs; the fish often remove, however, to deep water again before the fishermen are aware of their presence. Of late to avoid this calamity about 120 miles of submarine cable have been laid in the Norwegian herring fisheries, and with it there are a number of telephones in connection, so that all the fishermen on the coast can be immediately notified.

M. Bréguet has described a new form or so-called mercurial telephone, while Messrs. Arthur Le Neve Foster and H. Hall have applied the telephone to coal-mining service. By connecting the instrument with an anemometer in such a way that at every tenth revolution a small pin strikes against a steel spring, the sound is communicated to the telephone. In this way by counting the sounds in a given time it is possible to determine the rate of the air current, and thus above ground the state of ventilation below may be ascertained.

Among other uses of the telephone there is one to which the *British Medical Journal* draws attention in its issue for the 11th inst. According to this contemporary the telephone has been in use in the house of a medical man, to enable one of the family who is suffering from an infectious exanthem to communicate with her family and friends. Obviously this application of the telephone is one which could find useful extension in fever and other hospitals.

A correspondent has stated in effect that the Dispensing Memoranda will do a vast amount of good by checking such errors as that of calling a preparation by a name which originally applied to one differing materially in composition; it may also be added for the guidance of correspondents that the value of the formulæ supplied would be more appreciated if the sources from whence they are derived were added.

In the case of tr. sap. virid. co., it has been stated in several replies that it was merely soft or green soap in spirit. This view of the subject was called in question last month. If a simple tincture of soap, why should "co." be added? A communication from Professor Bedford, of New York, in the Journal of May 11, sets this subject pretty well at rest, in giving the formulæ for tr. sap. virid. and tr. sap. co. Had some further observations on the source of the authority for these formulæ been added, the information would have been more valuable. The same writer will probably on a future occasion supply the deficiency.

The first prescription in the usual order is that of No. 102; it is somewhat complex in its character, but the reactions that occur have been well stated by Mr. Langbeck in the subsequent week's Journal. The resulting white precipitate is citrate of bismuth.

A separation must necessarily take place in mixing together equal parts of tr. benz. co. and tr. conii, as in No. 103, the one being a rectified spirit tincture, whilst the other is made with proof spirit. The mixture should be shaken before being used, but unless verbal directions be given to that effect, there should be no filtration. It is quite usual to send out tr. benz. co. either alone or combined with tr. conii for inhalation. If the tr. benz. co. be combined with a proof spirit tincture, as that in question, a separation must necessarily take place, and in no case should the deposited portion be removed. From one to two drachms of rectified spirit will remove the cloudiness of the mixture caused by the separation of the resin of the benzoin, but such an addition is not to be recommended without the writer's sanction, as it is only the appearance that is sought to be improved. There must be a separation of resin to a much greater extent when the quantity ordered is mixed with hot water for an inhalation, and it is possible to sacrifice the medicinal effect of a prescription by an endeavour to make it assume an elegant appearance. Both tinctures are B.P. preparations, and, dispensed accordingly, the mixture must be cloudy and temporarily deposit some of the resin which can without difficulty be shaken up on each occasion of its being used.

The name Palma Christi of No. 104 applies to a preparation made from the leaves of the castor oil plant and used as a lactogogue; the leaves are very extensively used for this purpose in India. In a paper read before the British Association in Edinburgh in 1850, and afterwards published in the *Lancet* of the same year, Dr. McWilliam brought the medicinal effect of the plant under the notice of the profession. Dr. Tyler Smith also gave his attention to it and arrived at the conclusion that the plant possessed distinct lactagogue properties. A paper on the same subject was subsequently read at the Medical Society of London by Dr. Routh. From the replies which have been received it appears evident that the reference is to a proprietary preparation, the source of which must be sought in the advertisements of this Journal.

With regard to syr. ferri superphosph. co. of No. 105, at an evening meeting of the Pharmaceutical Society, May 1, 1851, Mr. Greenish read a paper directing attention to a preparation consisting of phosphate of iron dissolved in metaphosphoric acid. The salt formed was, after cooling, deliquescent, of a slaty colour, soluble in water, and free from any inky taste. A syrup was made by dissolving 5 grs. in the drachm of simple syrup. The term superphosphate of iron was introduced into medicine for the first time with this preparation. Subsequently an additional syrup was made by adding phosphate of lime to the former one, which was called syrup of superphosphate of iron and lime. In the B.P. 1867, there was introduced a formula for a syr. ferri phosph., but to this the name of superphosphate has not been given. The name syr. ferri superphosph. would therefore apply to the preparation described in the paper to which reference has been made, and the addition of "co.," which has no place in the original, would not render it Parrish's Food, and certainly not Easton's Syrup, neither could the "co." override the "superphosph." If there is no syr. ferri superphosph. co. by that or any other maker, the syr. ferri superphosph. should be used.

Those who write prescriptions can scarcely be expected to keep strict pace with science, and in the prescription referred to (No. 106), unless it contained some indication to the contrary, sodæ bicarb. should certainly be dispensed. Considering that in very few establishments any other label than carbonate of soda is used, it does seem straining a point to argue that in all cases when sodæ carb. is written in a prescription that sodæ carb. should be employed, and not the bicarb., which would be retailed to a request for carbonate of soda. The carbonate, formerly subcarbonate, is only occasionally and in very exceptional cases prescribed and then usually as subcarb. It would be an anomaly to dispense sodæ carb. in prescriptions, whilst at the same time the B. P. directs the preparations of sodæ bicarb. only for internal administrations. When, therefore, sodæ carb. is ordered in a prescription, sodæ bicarb. should be used and carb. only when specially directed.

Liq. Hoffmani, No. 107, sometimes called Hoffman's anodyne spirit, is a *compound* spirit of ether, and when ordered that alone should be used. Hoffman's anodyne is a preparation of ether with the addition of ethereal oil, or oil of wine as it is sometimes called, and most probably was originally an impure ethereal product; the distillation being continued after all the ether had passed over resulting in the production of some ethereal oil at a higher temperature. Medical authorities have reported in favour of oil of wine as a tranquilizing and anodyne remedy. It is just possible that by some pharmacists it may be considered as superseded by sp. ætheris, B. P., but as the sp. ætheris differs in composition from that to which the name of Hoffman's anodyne originally applied, the one cannot be substituted for the other. However much it may be desired that the sp. æther. B. P., should supersede the compound spirit, so long as the preparations differ in composition this cannot be done by the dispenser, and like so many other very desirable things, the change must be initiated by the medical profession ordering sp. ætheris, instead of sp. ætheris co., or Hoffman's anodyne. Many of them may probably be under the impression that in writing Hoffman's anodyne or sp. æther. co., they are ordering the B. P. preparation, sp. ætheris or spirit of ether.

In the 'Pharmacopœia Londiniensis' of 1826, the compound spirit of sulphuric ether contained ethereal oil, and in 1851 the name was altered to compound spirit of ether, still retaining the ethereal oil. But in the B. P. spirit of ether appears without the ethereal oil.

Several foreign Pharmacopœias give the formula for spirit. ætheris without ethereal oil, and add as a synonym, Hoffman's anodyne, as pointed out by Mr. Squire in his reply to this query; but since the ethereal oil has been left out of the formula in the British Pharmacopœia that synonym has been omitted.

Pereira gives the formula for a compound spirit of sulphuric ether containing ethereal oil, and states, "This preparation is commonly called Hoffman's mineral anodyne liquor, being made in imitation of a preparation described by Hoffman, 'De acido vitrioli vinosi,' 1732." It is clear, therefore, that the sp. æth. sulph. co. was called Hoffman's anodyne, and it is equally clear that from the absence of the ethereal oil from the formula that the spirit of ether is neither the sp. æther. co. nor Hoffman's anodyne, and cannot correctly be dispensed when either of these two is ordered in a prescription.

The insolubility of salicylic acid in water, as in No. 108, has been on previous occasions commented on. The prescription referred to cannot be sent out clear, if accurately dispensed, but it is quite possible that the previous dispenser had an eye to elegance and sent out a clear mixture, which may be accomplished by dissolving the salicylic acid in a little more spirit, about half as much again, then adding the glycerine and finally the water. There is, however, a probability that the salicylic acid will crystallize out at a lower temperature. If the writer of the prescription resides near to where the prescription was first dispensed, it would have been better that the dispenser should have received his sanction to such an addition before he adopted it; and this course would have enabled the writer to order a larger quantity of spirit so as to keep the salicylic acid in solution, if other circumstances warranted him in doing so; if they did not, which is quite possible, then the dispenser would not be justified in adding the extra quantity of spirit. Each case must be judged on its own merits, and the dispenser should be careful when he studies elegance at the expense of accuracy, and increases the quantity of any one ingredient in a prescription, or adds one not already there to accomplish what he may conceive to be a more elegant result.

Phosphorus when ordered in pills, as in No. 109, may be dissolved in bisulphide of carbon. A very satisfactory method in this instance may be adopted by making the quinine and ferri redact. into a tolerably stiff mass with glycerine and tragacanth, dissolving the phosphorus in a mortar with a few drops of bisulphide of carbon, and before the fluid evaporates, adding ol. theobromæ in the proportion of ½ grain to each pill, that is 6 grains to 12 pills, then mix the dissolved phosphorus well with the ol. theobromæ before adding the mass of quinine and ferri redact., and work them together. The mass makes readily, and keeps well. The phosphorus is in an unoxidized state, and the pill is of the size required.

The prescription No. 110 is a turpentine emulsion, and may be satisfactorily made by rubbing the yolk of egg in a mortar with the acetic acid, previously mixed with an equal quantity of rose water. These being put into a bottle of double or treble the capacity required, the turpentine should be gradually added, the bottle being shaken after each addition, and finally the essence of lemon. Its emulsive character improves by keeping.

In No. 111 it may be a question whether resin. copaibæ was intended by the writer, but it is clearly enough written and an effort must be made to accomplish an emulsion. This may be done by rubbing the resina copaibæ with ℥i sugar of milk, and ℥iv powdered gum arabic, gradually adding the water and finally ℥iv syrup with the chloric ether. Different samples of resin yield very different results. From the tenour of the letter, it would seem that the prescriber is a resident in the town where the prescription was sent to be dispensed. The writer states "it was sent to me to-day by one of our leading physicians." Such being the case the writer of prescription should have been referred to. It is a duty the dispenser owes to the prescriber to bring under his notice any apparent, as well as any absolute, error in a prescription that he may have written, any decomposition affecting one or more essential ingredients; and it is a duty he owes to his colleagues to sustain his position as an educated pharmacist, receiving on one hand a combination of therapeutic agents in the form of a prescription from the medical attendant, and on the other dispensing that combination with accuracy, honesty, and intelligence. The medical profession resent the pushing of nostrums under their noses, but they appreciate a proper representation with regard to an apparent error in a prescription. In this way only can mutual confidence be established, and the pharmacist occupy his proper place in relation to the physician.

In a "Note on the Exhibition of Resin of Copaiba,"* Mr. Gerrard, of University College Hospital, objecting to the usual method of rendering the resin of copaiba miscible with water, by means of spirit and mucilage of acacia, suggests the following formula. Take of—

Resin of Copaiba	15 grains.
Compound Powder of Almonds . .	30 „
Water to	1 ounce.

Rub the resin with the powder until well incorporated, then add the water after the manner of forming an emulsion.

However valuable this suggestion may be, it will be evident at a glance that the almonds cannot be employed as the emulsifying agent in a private prescription.

The Pharmaceutical Journal.

SATURDAY, MAY 25, 1878.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary,* 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

THE ALLEGED ADULTERATION OF FLOUR WITH ALUM.

THE credit of public analysts as a body will certainly not be enhanced by the case lately brought before the magistrates at the Selby Petty Sessions, in which certain millers in the locality were prosecuted for having sold flour alleged to be mixed with alum to the extent of ten grains and eighteen grains in the four pounds of flour. This prosecution had been instituted upon the basis of a report made by Mr. A. H. ALLEN, the analyst for the West Riding, and when the case first came on for hearing application was made for samples to be sent up to the authorities at Somerset House for other analyses to be made. The result of this further examination was that the Excise chemists reported the samples of flour to contain quantities of alumina corresponding tolerably well with the data given by the West Riding analyst, but there was this important discrepancy between the two reports, that while the one asserted that the alumina found in the flour represented alum actually existing in the flour, the report of the Excise chemists declared that the flour did not contain alum at all, inasmuch as the alumina in one of the samples of flour examined by them did not exceed the amount which they had found to be present in genuine flour, and as regards the other sample, in which a larger amount of alumina was found, the Excise chemists could not confirm the presence of alum, for though the alumina was in excess of that found in genuine flour, their experiments did not admit of their regarding it as representing alum present in the flour.

Upon the basis of this report of the Excise chemists the counsel for the defence naturally claimed the acquittal of his client, but one of the magistrates, who probably believed in the existence of adulteration, without apparently having such a knowledge of the subject as to be able to perceive that the presence of alumina was not necessarily evidence that alum had been added to the flour as an adulterant, did not take the same view, and he conjectured that what the Excise chemists called alumina the West Riding analyst called alum.

It is evident that the discrepancy in this case between the analysts was mostly in regard to the interpretation of a particular result, viz., the detection of alumina in the flour, and that with the precipitancy too common with public analysts it was assumed, in the first instance, that the alumina found represented alum that had been added. But there is no part of the evidence for the prosecution which justifies this conclusion, except that relating to the experiment with bread made with the flour, which, like all colour tests, is not perhaps so satisfactory as might be desired, and is moreover not direct evidence.

In connection with this subject it must be remem- that as much as twenty years ago, Mr. RICHARD REYNOLDS pointed out in this Journal that although there may be good reason for the opinion that the ash of wheat does not contain alumina as a normal constituent, still there were circumstances under which alumina was likely to be present in the flour made from certain kinds of wheat. As the result of a number of experiments made independently by Mr. REYNOLDS and Dr. LETHEBY it was found that Egyptian wheat was often so largely coated with aluminous earth that the flour made from it gave a considerable percentage of alumina.

Here then is possible explanation of the presence of alumina in flour or bread which entirely does away with the value of evidence based solely on the detection of alumina as such. Even the opinion based upon the amount of alumina present is not to be relied upon, for there is no means of determining whether it is not entirely due to the clay adhering to the grain.

We will not undertake to express any opinion whether or not small quantities of alum would be injurious to health, but it was admitted by the witnesses for the prosecution that such quantities as were found in these cases would probably be harmless, and we desire to draw attention to this fact as indicating on the part of the public analyst a want of due caution in framing his report. Such neglect is no less an injury to the public than the sale of adulterated food. There is quite as much reason for showing that tradesmen, as constituting a section of the public, shall be protected from the damage and annoyance of prosecution as there is for claiming protection against adulteration or any other form of fraud. In a case such as the one now referred to it would have been safer, more prudent, and more just to all concerned, if the analyst had taken the pains to point out to the local authority to whom his report was addressed that there were possibilities of the alumina he had found being derived from another source besides the illegal addition of alum, and consequently that there was at least room for doubting whether a prosecution would be justifiable.

We refer to this point, because the present case furnishes evidence that there is too much need for the chemist to have regard to the reputation not only of himself, but of his class. At best an air of suspicion hangs over the evidence given by chemists, and not unfrequently, this estimate of the class finds expression in such terms as those used by one of the magistrates at Selby, to the effect that analysts could without difficulty be got to say anything. In the case now referred to, it is evident that there is no other foundation for these remarks than the magistrates' notion that alumina and alum were the same thing, and that the use of the word alumina by the Excise chemists was merely a device for misleading the court.

From this point of view, and having regard to the trouble and annoyance caused by unnecessary prosecutions under the Food and Drugs Act, we think that one of the most serviceable amendments in the carying out of that Act would be to cause all cases of alleged adulteration to be referred to a superior body or committee empowered to decide whether the facts adduced in the analyst's reports were sufficient to justify proceedings under the Act. We do not think that the protection afforded to the general public by the Act would be thus in any way reduced, while we feel sure that it would at the same time be a protection to analysts themselves and also to the trading community.

COUNTER PRESCRIBING.

The case of the Apothecaries' Company *v.* Wiggins came on for hearing on Thursday morning in the Court of Queen's Bench, and in some degree it bids fair to supersede the case of the same body against Shepperley as a test case. The prosecution appears to have restricted its pleas to cases in which it contends that the counter practice of the defendant has exceeded that which a chemist and druggist is entitled to engage in, not only by virtue of long established usage, but also, by the twenty-eighth section of the Apothecaries Act, exempting chemists and druggists from the operation of that Act.

At the time of our going to press the case for the prosecution was completed, and Mr. McIntyre, the counsel for the defence, was addressing the Court, when the case was adjourned until Friday morning. We purpose publishing a verbatim report of the case next week. It would obviously be premature to offer any remarks upon this case at present, but we may state as a matter of fact that considerable difficulty appeared to be felt by the Judge from the want of definitions of the apothecary, the surgeon, the physician, and the chemist and druggist, etc., by means of which it would be possible to arrive at some conclusion as to whether certain acts were or were not within the province appertaining to those several designations.

THE WEIGHTS AND MEASURES BILL.

The Bill to consolidate the laws relating to weights and measures has made no progress in Parliament since our last notice, owing, doubtless, to the press of more exciting subjects in the House of Commons. The Council of the Pharmaceutical Society, however, has not been idle in the matter, and the Hon. E. Stanhope, who has charge of the Bill, has, in compliance with remonstrances addressed to him, given notice of amendments which will apparently remove the difficulty anticipated by chemists. By the first notice the right to continue the apothecaries' weight in the sale of drugs will be secured; the second imports the ounce, drachm, and minim into the standard "measures of capacity."

Provincial Transactions.

CHEMISTS AND DRUGGISTS' TRADE ASSOCIATION.

The annual general meeting of this Association took place on Tuesday, the 14th inst., at the Inns of Court Hotel.

The business of the day commenced with a meeting of the General Committee at 11 o'clock, Mr. Jones of Leamington, President, in the chair.

The following gentlemen were added to the Committee: Messrs. Passmore, Exeter; Dyer, Halifax; Rimmington, Bradford; R. Wood, Macclesfield; Thomas Bates, London; T. B. Gostling, Diss; Dr. Symes, Liverpool; Hales, Hull; George Brown, Sandown, I. of W.; G. H. Wright, London; Haffenden, Brighton; Applegate, London; Pattison, London; Stoddart, Bristol; Corey, Newport, I. of W.; Swann, Newcastle-on-Tyne; J. Horncastle, London; Jaap, Glasgow; R. Drane, Cardiff; Thomas Williams, Llandudno; Hayman, Neath; Ainsley, Edinburgh; Hillier, Bath, and Thornton, Exmouth.

The report of the Executive Committee was received and adopted, the discussion upon it being deferred until the general meeting later in the day, on the motion of Mr. Vizer (Brighton), seconded by Mr. Jessop (Halifax).

The General Committee then proceeded to consider the list of Executive Committee to be recommended to the general meeting. The Chairman called attention to the fact that at present there was no member of the executive resident in the district south of London.

Scrutineers having been appointed, the following list was adopted for recommendation to the annual meeting. *England.*—Abraham, J., Liverpool; Andrews, F., London; Arblaster, C. J., Birmingham; Barclay, T., Birmingham; Brevitt, W. Y., Wolverhampton; Churchill, W. J., Birmingham; Cross, W. G., Jun., Shrewsbury; Cubley, G. A., Sheffield; Delves, G., Exeter; Greaves, A., Chesterfield; Greenish, T., London; Hampson, R., London; Holdsworth, T. W., Birmingham; Jervis, W., Sheffield; Jones, S. U., Leamington; Reynolds, R., Leeds; Shaw, J., Liverpool; Southall, W., Birmingham; Vizer, E. B., Brighton; Walker, G., Coventry; Earle, F., Hull. *Scotland.*—Fairlie, J. M., Glasgow; Kerr, C., Dundee; Mackenzie, J., Edinburgh.

Mr. Barclay, vice-president, drew attention to the notice of motion given for the general meeting with the object of raising the subscription from 5*s.* to 7*s.* 6*d.*, to which he strongly objected. Their desire was to have, if possible, every member of the trade enrolled in the ranks of the Association, and he was quite satisfied that the proposal if carried out would cut off a large number of members, and he doubted if it would result in any addition of funds to the Association. Mr. Jones no doubt brought forward the motion with the idea of increasing the funds, in order to meet the heavy expenses consequent on the pending law proceedings. He was quite sure that it was the unanimous desire of the trade to fight out this question of counter practice to the very end, even to the House of Lords if necessary, and this would entail a very heavy expenditure. He thought, therefore, the better way would be to retain the subscription at 5*s.* and raise a special fund, say of £2000, for the purpose of conducting this battle. It might be desirable to ask the Pharmaceutical Society to assist in this matter and subscribe to the fund. During the last year that Society had expended over £4000, apart from the educational department, £246 being incurred for legal expenses. He did not wish to bring this matter before the annual meeting unless he were supported by the the General Committee, and that was why he brought it forward then.

Mr. Cotterell (Dover) supported the views expressed by Mr. Barclay. There was, he believed, the residue of the former fund raised for special purposes, which went to the funds of the Pharmaceutical Society. He should like to know if that were so, and if it could be obtained for this purpose.

Mr. Vizer endorsed Mr. Barclay's views as to the subscription, but he was not quite clear about starting another fund. He recommended a further canvass for new subscriptions and donations to the general fund.

A Member suggested that in case of firms each member should subscribe at least 5*s*.

Mr. Slipper did not think it advisable to increase the amount of subscription. He did not think there would be any lack of funds for carrying on the legal proceedings if necessary, but it seemed to him rather premature at present to anticipate having to go to the House of Lords.

Mr. Bates (Macclesfield) thought a large additional number of members were to be obtained with very little difficulty if the trade were properly approached.

Mr. Owen said he came prepared to support the motion to raise the subscriptions, but after what had been said he should not do so.

The Secretary said he had communicated over and over again with the members of the General Committee and others, urging them to endeavour to obtain subscriptions and donations. Besides that, circulars had been sent more than once to every one in the trade.

Mr. Hampson was satisfied that it would be unadvisable to increase the amount of subscription. They wanted to encourage more fellow feeling amongst the trade, and get every one to join so as to obtain more cohesion. He thought it would be wise to initiate a special fund for legal purposes, and a large fund would be necessary.

Mr. William Jones (Birmingham) said that after what he had heard he should not bring forward the motion of which he had given notice.

Mr. Thornton (Bradford) said there was a bill at present before Parliament, which would, if passed, repeal that part of the Apothecaries Act which enabled the Apothecaries' Company to prosecute chemists.

In reply to Mr. Vizer, the Secretary said that the annual report had been issued to every member of the trade.

Mr. Thomas Barclay again urged the necessity of raising a fund for legal purposes.

Mr. Andrews suggested that it would be well if the motion were put before the meeting, and a vote taken upon it. He thought that more might yet be done by canvassing for new members, and he heartily endorsed the remarks of Mr. Hampson, that a more fraternal feeling was needed amongst chemists and druggists themselves.

Mr. Hampson said the fund to which allusion had been made had been absorbed into the general fund of the Pharmaceutical Society and could not be got at as a separate fund. He deprecated the idea of going to the meeting of the Pharmaceutical Society and putting pressure on the Council in the form of a resolution, but if that body were approached in a proper mode, it might possibly be induced to open its coffers and assist in the work.

Mr. Barclay said he thought there would be no undue pressure if a number of members of the Pharmaceutical Society, who thought the Society should contribute to the Shepperley fund, brought it forward in the form of a resolution.

Mr. Owen said it would be much better not to mention any particular case; they ought to go on the ground of principle.

Mr. Preston deprecated any increase of subscription, but at the same time it was necessary that the executive should be well supported with funds if it were to carry on the work effectually. He did not see the necessity for raising a fund at the present moment, but the new Executive about to be elected should have power to call for further support, if needed.

Mr. Barclay said that it was his intention.

Mr. Mackenzie (Edinburgh) thought they were all agreed not to raise the subscription, but if they wanted to strike terror into their foes they must have plenty of money at their command.

Mr. Barclay said he would move a resolution at the general meeting to the effect that a special fund of at least £2000 be raised by donations to be used in protecting and furthering the legitimate interests of chemists and druggists.

The notice convening the general meeting was then read, and the business proceeded with; Mr. S. U. Jones in the chair.

The President, in opening the proceedings, said it afforded him great pleasure to meet the members again. He need scarcely say that during the past year the members of the executive had had a great deal of anxious work. Many questions affecting the interests of the trade had come before them, and had caused much anxiety, but if their labours were rewarded, as he hoped they would be, by bringing these questions to a successful issue, they would not consider that they had laboured in vain. The first serious question which had occupied their attention during the past year, had been the case of the Apothecaries' Company *v.* Shepperley. That case had been before the law courts for some little time, and the judges appeared to consider that the county court judge had not had sufficient evidence before him, and decided that the case should be brought before the Court of Exchequer, where it should be thoroughly argued and decided. That course was agreed to by Sir Henry James, the Association's counsel, and it now remained for the Court of Exchequer to decide whether or not chemists and druggists had a right to prescribe behind their own counters. He would draw particular attention to the remarks which fell from one of the judges, Mr. Baron Cleasby, during the argument of the case. In speaking of the 28th section of the Apothecaries Act, he said that section recognized chemists as a branch of the profession, and reserved to them all the rights which they were in the habit of exercising before 1815. That was what they contended for, and asked for, that chemists and druggists should have the power of exercising those rights which were exercised before 1815; they asked for no more, and would be content with no less. It would therefore be their object to put into the witness box gentlemen who would be prepared to state their own experience of what was done by chemists and druggists prior to 1815, and that they should ask the court to say they had a right to do at the present time. Some of the cases under the Adulteration Act had been a source of great annoyance to chemists during the past year, and the executive had been obliged to instruct the solicitor to defend some parties, especially Messrs. Cutting and Son, for the sale of soda water, which it was said did not contain soda, and also for having sold cayenne pepper said to be adulterated. Those cases were decided in their favour, and therefore he hoped that before analysts dragged chemists before the magistrates again they would be careful to see that the analysis was correct. A Medical Act Amendment Bill had been brought into the House of Commons, by Dr. Lush, which would have set the question of prescribing at rest as far as they were concerned, because it would have prevented it altogether. But although there was very little time left for taking action in that matter, they did take action, They met at Birmingham, and Mr. Chamberlain and Mr. Samson Lloyd deserved their warmest thanks for the assistance they gave. The result of the opposition was that Dr. Lush withdrew the Bill. The next matter he need mention was the Dental Practitioners Bill. According to that Bill a chemist would not be able to draw or stop a tooth without infringing the law; but being convinced that was not intended, they made a suggestion to Sir John Lubbock, who kindly met a deputation at the House of Commons, and said the objectionable words should be removed or a clause inserted securing chemists the rights they now possessed. The Association numbered now 4000, which, he thought, was pretty good to begin with. But he was not yet satisfied; he hoped for a still greater increase, and that the members should form themselves into a compact, solid, and united body for the purpose of resisting any encroachment which might be made on their interests, or to prevent any action being taken to damage those interests which they thought they ought to protect. He hoped, therefore, they would be united and firm in their action, that the executive for the current year would be supported, and that the society would continue to flourish and increase, so as to be a service to chemists and druggists of Great Britain.

The printed report was taken as read.

Mr. Lance moved, and Mr. Postans seconded, a resolution that the report of the Executive Committee, with the statement of accounts be received and adopted.

Mr. Owen having remarked on the satisfactory nature of the report,

Mr. Clark (Leicester) drew attention to the fact that there were about one hundred firms on the list of members who only subscribed five shillings for the firm, whereas they should be asked to subscribe five shillings for each member. He hoped the executive would remember this during the coming year.

The resolution was then put and carried unanimously.

Mr. G. H. Wright (London) moved a vote of thanks to the Executive Committee for its labours during the year.

Mr. Thornton (Bradford) seconded the motion, which was carried unanimously.

The President returned thanks for himself and colleagues for the courteous manner in which the report had been received, which they felt extremely gratifying, and said they would continue to do their best to promote the interests of the trade.

Mr. Churchill (Birmingham) moved as an amendment to Rule 1: "That this Society shall be called 'The Chemists and Druggists' Trade Association of Great Britain.'" It had been thought desirable to add the words "of Great Britain," because there seemed to be in the minds of some people such a cloudiness on this question that they thought it was merely a local Association at Birmingham. The attendance in the room would show that this was not so, for many towns had sent more representatives than Birmingham. He had no doubt this would be agreed to, so that there should be no doubt in the mind of anybody that the Association was for the benefit of chemists and druggists throughout the whole of Great Britain.

Mr. Slipper (London) did not think himself that this resolution was necessary, but as their Birmingham friends were so modest and did not like to have all the honours attributed to them or anything else thrown upon them, he should be happy to second the resolution. He was sorry to say that in one instance the Editor of the *Pharmaceutical Journal* had thought proper, as he considered in exceedingly bad taste, to apply the term, "Birmingham Association," to this body; not that it was any discredit to the Association that it originated in Birmingham, much to the credit of that town, but still he thought it was in exceedingly bad taste to speak of it as the Birmingham Association when it was a trade association of Great Britain.

Mr. Fairlie (Glasgow) had much pleasure in supporting the resolution. He felt that the friends who had supported this society had never been looked upon by the great bulk of the trade as having any particular relation to Birmingham further than having had their head-quarters and office there. They had now about two hundred members from the other side of the border in the total of four thousand, which showed that it was a truly representative association of the whole trade.

Mr. Postans suggested that it would be advisable to go a little further and make it the Chemists and Druggists' Trade Association of Great Britain and Ireland. He thought it would be very well if they could make one large association, and as the Pharmaceutical Conference would be meeting this year in Dublin probably the time was not far distant when there would be a Pharmaceutical Society of Great Britain and Ireland, and it would be a step in advance if they were to take the initiative.

Mr. Pond (London) thought it would tend to the dignity and prosperity of the Association to include Ireland in the scope of its operations.

Mr. Cross (Shrewsbury) stated that the Executive Committee had received applications from Ireland to extend their operations to that country, but it had not been able to accede to the application for want of sufficient information.

The Solicitor remarked that although it might be desirable for trade purposes that an association should be formed in Ireland, there would be almost insuperable difficulties in working that association from any centre in England, the law in Ireland being so entirely different.

Mr. Hampson said it was very desirable there should be one association for the two countries, but he could not help remembering the correspondence which had recently taken place with the Pharmaceutical Society, when he was anxious there should be only one association. There was, however, such a strong national insular sentiment on the part of their Irish friends as would, he thought, prevent the attainment of their wishes. At any rate it would be premature to attempt to carry out anything of the kind at present.

The resolution was put and carried unanimously.

Mr. Ponder asked what connection, if any, this Association had with the Pharmaceutical Society.

The President said not any.

The next business on the agenda paper was the motion of which Mr. W. Jones had given notice.

Mr. W. Jones said he had asked permission to withdraw it, his only object being to strengthen the hands of the executive, and it appeared from the discussion which had taken place at the meeting of the general committee that it did not meet with approval.

Mr. Barclay said he quite sympathized with Mr. Jones's object, because he was sure they all had but one object, namely, to increase the funds of the Association, but he felt very strongly that to increase the subscription beyond five shillings would be disadvantageous to the general interests of the Association. What they wanted was political influence; they wanted to get the whole of the trade in this country banded together in one association, and anything beyond five shillings would be a tax upon their brethren which would be hard for them to bear, and therefore he thought it was that they should keep to the subscription of five shillings, which was the minimum, and did not preclude any one from sending donations to the secretary. But it was necessary they should have money, and especially as the meeting had approved of the report, which committed the executive to the costly warfare in the law courts in defending chemists against the Apothecaries' Company. The case of the Company against Wiggins would come on that week, probably the next day, and, as far as they could tell, the expense of that alone would be two hundred pounds. Through the success which they had achieved already in Shepperley's case they were now in a position which would enable them to appeal from court to court until they got to the House of Lords, and he believed it was the wish of the meeting and of the chemists throughout the country that they should fight that case out to the very end. That feeling he was sure would be endorsed in any meeting throughout the country, as it had been endorsed already in many places, for no question was so popular just now in the country as that of defending their legitimate rights in counter prescribing. But if this case had to be fought the chemists must find them in funds, and, since it was not their wish that the subscriptions should be raised to 7*s.* 6*d.*, it was only right that they should look at the question how the money should be found. If they took the balance sheet for the past year they would find that £1300 had been expended, of which something like £370 had been expended in law, leaving about £1000 for current expenses, and that was really their whole income during the past year. That being so, how could they, with a subscription of five shillings, commit themselves to fight this battle without having some funds in hand? True they had £500 in hand, but they had all kinds of work to do besides this particular case. They had to defend chemists in the courts against the undue interference by analysts under the Adulteration Acts, and he was quite sure it was the wish of members that they should take up every pressing question that presented itself, and that the executive should defend them at any time against any unfair attack, Five hundred pounds was not sufficient for this, therefore he proposed to move this resolution:—"That a special fund of at least £2000 be raised by donations to be used in protecting the legitimate interests of chemists and druggists." That fund would be found to have a great influence in many ways. It would show they were a powerful body, and when they went as a deputation to the Government on any question it would show they had the support of the chemists of the country. He knew they would all subscribe to a fund if the necessity arose, but experience had shown him it was much easier to get money before a contest than after it. The money would not be frittered away, as could be seen from what had been already done. They had expended 25 per cent. of their income in protecting the chemists of the country, whereas if they looked to another body it would be found that from an income of £5000 or £6000 the whole they had expended in this direction was about 4 per cent. The Executive Committee might be trusted to expend it only in such way as would protect the interests of the trade. In the first year of the Association's existence there were something like twenty donors of ten guineas each, twenty of five guineas, others of three guineas, and so on. It would be necessary that that amount should be doubled, because there was now a much wider area to appeal to, and therefore he hoped £2000 would be raised without much difficulty.

Mr. Lance, in seconding the motion, remarked that the members of the Medical Defence Association fixed their subscription at 10*s*. 6*d*. He thought the chemists and druggists could find as many half guineas as they could, and that there ought to be no difficulty in getting this small amount together.

Mr. Urwick had great pleasure in supporting the resolution, because he thought it was the best way of raising the money. The subscription was fixed at a small sum in order that the Association might include all chemists and druggists, and if it had been fixed at a higher rate the Association would not have had so many members as now. It was much better to get the members already enrolled to work in their several districts and to bring in others to increase the funds, than to raise the subscription. The Association had now shown that it could do real work, and it commended itself to every member of the trade. He had heard on very good information that the prosecution in Shepperley's case would not go further because the promoters had reason to doubt whether they would succeed; but he hoped the Association would insist on the case being carried further, because he felt it could be brought to a successful issue. He considered that the Pharmaceutical Society was greatly indebted to that Association for what it had done, for if it had not been for the action taken in Shepperley's case in and opposing Dr. Lush's Bill, there would have been very little matter for congratulation in its present report. Therefore, as a pharmaceutical chemist, he begged to thank the executive of this Association for its labours. Another matter he might mention was this. He had signed a circular supporting three candidates for seats at the Council of the Pharmaceutical Society, and he did so not because he was a member of this Association, but from regard to the Pharmaceutical Society. He was first a member of the Pharmaceutical Society, and had not ceased to love it, although he did feel it had not done its duty in defending chemists where they needed defence. The Society was founded not only for educational purposes but to protect the rights of the trade, and he felt that that ought still to be done. If the Apothecaries' Company should succeed he hoped the Society would go to Parliament and get fresh powers. If chemists and druggists were obliged to give up anything they ought to be in a position to treat with the medical profession, that each should do that which was right, and for the good of the public.

Mr. Pond thought the resolution might be strengthened by stating more definitely the particular purpose for which it was required. They wanted £2000 for a special purpose, not £2000 to be constantly in hand.

Mr. Reynolds (Leeds) suggested that the resolution should be altered so as to read that a special effort be made to raise at least £2000 by donations. He could quite feel there was a good and sufficient reason for increasing the sinews of war, because it did not seem they were likely to have an entirely peaceful life. He had in his pocket a Leeds newspaper which showed the latest doings of the gentlemen alluded to in the Selby case. He had taken under his protection the staff of life, and had the usual alum on the brain which every young analyst generally commenced with. The case had been tried before the Selby magistrates, and Mr. Allen having caused the prosecution of some highly respectable millers for having added alum to their flour, the case had been adjourned once, and the decision was now given after the opinion of three analysts at Somerset House had been taken. Their opinion entirely disproved Mr. Allen's statement, and proved there was no alum whatever in the bread, and that the whole blunder arose from there being a little alumina derived from the clay in the Egyptian wheat, a thing which he might be excused for saying he exposed in the *Pharmaceutical Journal* at least fifteen years ago. That periodical was probably not exalted enough to come under the notice of gentlemen like analysts, but at any rate chemists and druggists, if they were entrusted with duties of public analysts, would not make these blunders. He would suggest that the next time the Food and Drugs Adulteration Act came up for its periodical revision—for it seemed to be a standing dish with the House of Commons—there should be a clause introduced which should protect the public against adulterated chemistry, and that there should be some remedy provided by the Act against the gross ignorance or carelessness of analysts which subjected innocent persons to prosecution. He was glad to support their proposal for increased strength being given to the executive, because it was evident that their expenses during the present year were not likely to be much less than they had been before.

Mr. Vizer (Brighton) quite endorsed Mr. Reynolds's remarks. He had a great objection to raising special funds for special objects in connection with an association of that kind, because it divided the work unnecessarily. He was quite certain that if the whole trade were canvassed it would respond to the appeal. The Association had a large general committee, and if the members of that committee were to canvass each in their respective neighbourhoods, he had no doubt there would be no difficulty in raising the £2000 required.

Mr. Preston felt sure they were all of one mind with regard to the necessity of supporting the executive in the future; the only difference of opinion was as to the best mode of doing so. From the observations which had been let fall as to the prosecution in Shepperley's case being abandoned, many persons might consider that it was not certain that a large sum would be required in the ensuing year, but it was quite clear that things might arise which would require efforts on the part of the executive and require it to be able to put its hands on funds if necessary. It would seem to him, therefore, to meet the case better if a guarantee fund were proposed without mentioning any particular object for which it should be raised. The meaning of that would be that the whole number who put down their names would be responsible *pro ratâ*, according to their subscriptions, if called upon for any particular purpose. Their guarantee might be spread over a number of years, and that would strengthen the hands of the executive far more than even raising

£2000 at once which they did not know would be suffi- for the work to be done. He had seen this plan carried out in several societies and it had always succeeded.

Mr. Chipperfield objected to this last suggestion. He had never but once put his name down to a guarantee fund, and should never do so again. Life was short, and they might guarantee to pay a sum of money during the next ten years, and a great many of them might depart from the scene before that time. He understood Mr. Barclay to say that if a similar response were made now to that made at the commencement of the Association it would suffice for what might be required. He thought all the members of the trade should have it put very plainly before them, that it was their duty to do their utmost in this matter. Mr. Barclay seemed to think that they were to look forward to those who had generously responded before to do so again, but on looking down the list he thought there were many other people who ought to respond to such an appeal. There might be generously disposed persons who would out of their wealth respond a second time, but this battle was to be fought mainly for those who had a difficulty perhaps in making response to such applications. Those gentlemen who had before put down their names for £20, £5, and so on, were mostly engaged in businesses where they were little likely to be attacked; it was those in the lower ranks of the trade who were more likely to be prosecuted. It had been said that if the subscriptions were increased to 7*s.* 6*d.* the total amount received would not be so much, which he was sorry to hear, because he thought there could be scarcely anybody so poor who could not afford to pay 7*s.* 6*d.* in twelve months. He was not going to urge that that should be done, but simply that every member of the trade should be appealed to to support the Association as far as his means would allow, and if that were done he was quite sure they would have ample funds. It was said that gentlemen should canvass in their immediate neighbourhoods, but that would practically come to canvassing their own towns only, and that led him to suggest that as far as possible the general committee should embrace representatives from a larger number of separate towns.

Mr. Pollard (Ryde) thought it was quite possible for any member of the committee to put himself in communication with his fellow members in the trade in contiguous towns, so that canvassing might be made effectual. At the same time he thought it essential that they should have some definite information to put forward. There was an old proverb that a fool and his money were soon parted, but he thought there were very few fools amongst chemists, and he very much doubted if that body would grant a financial vote of credit. They would say, "What do you want it for?" and they would not give it for general purposes. When they went canvassing they would have to say there was some particular end in view, or else the money would not be raised.

Mr. Dean (Bow) did not think the matter need be placed in the hands of the committee if each member of the Association would do what he could towards increasing the number of subscribers. He could not conceive of any man of business being so foolish as not to want to part with five shillings when he considered what was done for it. They found many people in the trade subscribed to the higher society, if he might call it so, and paid their one guinea; for what, he did not know, and had never been able to learn. But this Association did its work wonderfully cheap, at least half as cheap as could be expected, and many of those who did not subscribe at present, if they only had some troublesome person coming into their shop and raising a difficulty, would soon hurry off to their friends at Birmingham and ask them to take the matter up. He did not see why there should be any antagonism between the Association and the Pharmaceutical Society, and he was sorry to see there had been anything of that sort either in articles or letters. He believed if the Pharmaceutical Society had taken up the position that the Association had it would have been supported even at a guinea subscription. He, for one, should have been glad to do so if it had gone in for their trade interests, and not so much for that very interesting matter which they saw in the early pages of the *Pharmaceutical Journal*; it was very learned but not very interesting to most people who had to do with making up pills and mixtures. With regard to the Dental Practitioners Bill, he had been in business for thirteen or fourteen years and had attained some little success in teeth extracting and matters of that kind. He did not set himself up as a dentist, but he thought they ought to be left alone in these simple matters. He wished to ask the committee if they thought it was safe for a person in his position not to go in for the full qualifications of a dentist, but to let the matter rest as it was. If Sir John Lubbock carried out what he said, that he did not intend the Bill to apply to those who only extracted teeth, then his position would be safe; but a promise was one thing, and an Act of Parliament was another. A great many chemists at the East End did the same thing, and he did not think they were overstepping their duties in so doing. He did not agree with the guarantee fund, but thought they should do their utmost to strengthen the general funds of the Association.

The President, in reply to the last speaker, read a portion of the reply of Sir John Lubbock to the deputation which waited upon him, showing it was not the intention of the Bill to interfere with teeth extracting or stopping. He did not think the Bill had yet been committed, but it would be carefully watched.

Mr. Dean said he should be satisfied to leave the matter in the hands of the executive.

Mr. Lenty said he had subscribed five shillings simply because he did not know there was any need for anything further, but as it had been stated that it was necessary that more funds should be raised he should have no objection to subscribe one guinea a year, and would take upon himself to canvass his own neighbourhood, and had no doubt he should meet with a ready response.

Mr. G. H. Wright remarked that sometimes they heard gentlemen say that they did not prescribe and objected to it; he had been for many years connected with a large business in London, and he never knew a day in which all their assistants did not prescribe. If a person came in and bought an ounce of castor oil and asked how much was a dose, if they gave the information required that was prescribing—in fact, every one prescribed. If anything were to happen which would put a stop to this, the whole business would fall, and it must necessarily greatly affect the interests of the wholesale druggists, and therefore he thought they might fairly look to those gentlemen for their £50 subscriptions to assist them, seeing that they were the persons who would really be affected. One gentlemen said he thought there were very few fools amongst the chemists, but he must say he had sometimes doubted whether he had not been a fool for being one, and all the more when he saw what a disposition there was to enforce pains and penalties upon them. He did not, however, see that there was any necessity for passing resolutions of the kind proposed. If every gentleman in the room would put down a guinea no one would oppose it, and if ever they did get into a difficulty he was sure their friends, the wholesale druggists, would come forward and help them out of it.

Mr. Postans hoped whatever steps the Association might take would be with a view of acting in the greatest possible harmony with the Council of the Pharmaceutical Society. He thought not only had this Association great cause for congratulation, but that those members who promoted its formation were entitled to especial credit, especially as it appeared to him that the amount of work done by the Pharmaceutical Society in defence of the trade during the time the Association had been in existence had not been equal to that which it had done. The Pharmaceutical Society was an educational body, and there were many matters which it was very difficult for such a body to take up. This Association, therefore, was just the sort of thing which was wanted. His idea of a Pharmaceutical Society was that it should grow up like a tree sheltering all sorts of societies under its branches, and those branches could not but help to support the mother stem. The question before the meeting was how this amount was to be raised which the executive said was required for the carrying on of what was unquestionably a test case. Various propositions had been made, and he thought men as a rule would support and subscribe to special objects when they would not in other ways, and if an application were made he had no doubt the money would be raised, but he should object to increasing the annual subscription.

Mr. Haffenden (Brighton) said they surely were not so poor that they need go to the wholesale houses for assistance. Any matter affecting themselves as a body they should all feel was of such vital importance as to be always ready to find the necessary money.

Mr. Barclay remarked that he believed they could undertake a great many things which the Pharmaceutical Society could not well do, and there should not be the slightest antagonism between the two bodies. He, for one, should not have taken any part in the formation of that organization if he thought he was going in any way to damage its *prestige*. He thought the action of the Society the other day in prosecuting the London and Provincial Association, would have been done much better by the Trade Association. The Pharmaceutical Society could hardly take up a case in which it ran any risk of failure, and if it did fail it was damaged in the eyes of the public. That Association ought to support the Pharmaceutical Society, and work hand in hand with it, and now that the Pharmaceutical Society had committed itself to support the chemists against the Apothecaries' Company, he thought they were justified in going to it and asking for a subscription towards the Defence Fund.

Mr. Owen was glad to hear the last remark, because he felt satisfied the Council of the Pharmaceutical Society, as a body, did not deserve the censure which was sometimes passed upon it. It was quite true there were certain things which it could not so well do as that Association.

The resolution was then put, and carried unanimously in the following form :—"That a special effort be made to raise at least £2000 by donations, to be used in protecting and furthering the legitimate interests of chemists and druggists."

Mr. Thornton (Bradford) said it had been suggested that the prosecution in Shepperley's case would not be proceeded with, and he thought this was very possible if the Apothecaries' Company thought that by delaying it, those gentlemen would be removed by death, who would be able now to give evidence, and thus they would have a better chance of succeeding. It would be, however, for the executive to compel them to go on. Then when they had once got rid of an invading army, the next thing was to prevent their coming again, and he begged leave to propose a resolution, pledging the executive committee to support the Medical Act Amendment Bill, and to memoralize His Grace the Duke of Richmond to persist in his efforts to repeal those clauses in the Apothecaries Act bearing on the profession or trade of chemists and druggists. The Duke of Richmond seemed determined to do this if he were supported, but there was a strong pressure brought to bear upon him from the other side, and therefore it was necessary for them to bring what influence they could to bear in support of it.

Mr. Cotterell (Dover) thought the best course would be, instead of wasting time in defending these cases, to get an Act of Parliament establishing their rights, and preventing any one being prosecuted for doing that which had been done previous to 1815.

The President suggested that the latter portion of Mr. Thornton's resolution should be omitted, leaving it more general.

Mr. Owen thought it was unnecessary to pass such a resolution, since the whole work of the executive from the commencement had been to the effect now proposed.

The President suggested that the matter should be left in the hands of the executive to watch the Bill, and not to allow the clause referred to to be withdrawn if it could be prevented.

Mr. Thornton said that was all he wanted, and he would therefore not press the resolution.

Mr. Preston then moved, and Mr. Jones seconded, and it was carried unanimously, that the list of names submitted by the general committee, be elected as the executive committee for the ensuing year.

The President said the next business was to elect officers.

Mr. Owen asked if this could not be done without balloting.

Mr. Reynolds suggested that they should follow the American plan, which was to pass a resolution deputing some one gentleman to deposit a ballot on behalf of the meeting, which would save all the trouble. He would move that Mr. Owen be requested to do so. This was seconded and carried unanimously, and the ballot being taken in this way the President, Vice-President, Treasurer and Honorary Secretary, were re-elected.

The President, having briefly returned thanks for himself and colleagues, said it was suggested that the next election of the general committee should take place in April, 1880.

Mr. Fairlie (Glasgow) remarked that the election was an expensive affair, and he would therefore move, as suggested, that the next election should take place in April, 1880.

Mr. Bell (Hull) seconded the motion, which was carried unanimously.

A vote of thanks to the President for presiding was then passed unanimously, which terminated the proceedings.

Donations to the amount of over fifty guineas, were announced by the Secretary before the meeting separated.

LIVERPOOL CHEMISTS' ASSOCIATION.

The fourteenth and concluding general meeting was held at the Royal Institution, May 2, 1878. The President, Mr. T. Fell Abraham, in the chair.

The minutes of the previous meeting were read and confirmed.

The donations to the library were duly acknowledged.

Messrs. J. H. Jones and J. B. Kershaw were unanimously elected members.

Two phonographs were exhibited, one belonging to Mr. C. H. Stearn, the other to Dr. Symes. Their construction, mode of action, and the practical difficulties found in working them were explained and pointed out by their owners. Numerous experiments, attended with various degrees of success were made, and the thanks of the meeting accorded to the exhibitors.

Charles Symes, Ph.D., read the following paper on

Microscopic Germs in Pharmacy.

In using the term microscopic, I do not wish to convey an impression that we are dealing with organisms which necessarily require the aid of the microscope for their detection or that the microscope is capable of thoroughly defining them in their entirety. I use it rather in a general sense as expressive of minuteness. When, however, we contemplate that the atmosphere in which we live is pregnant with these organisms, carrying them hither and thither, ready to deposit them wherever a suitable soil is found for their development, be that amongst the squalid masses of narrow streets, in the overcrowded and badly drained houses of the poor, or the mansions of the opulent, amongst the flocks, herds, and crops of the agriculturist, or in the laboratory and store room of the pharmacist, when, I say, we contemplate this, we find their vastness is equal to their minuteness. Time will not permit me to enlarge on the merits and demerits of what is known as the "germ theory," but for the sake of those who have not given the matter special attention, I may say it is one which has furnished matter for speculation and experiment amongst the most profound philosophers of the past and present ages, and is closely interwoven with that great problem "the origin of life." Some of the early schools of reasoners went so far as to answer that the lower forms of insect and reptile life, and indeed some of the higher, sprang suddenly into existence, being formed from the materials in or on which they were found; subsequently their views were confined to the more minute forms of life. These were followed by others who held that no creation of life had taken place since an early period in the world's history, and that all existing life was produced from a parent or germ. The doctrine of the former is known as that of "spontaneous generation," or heterogenesis, whilst that of the latter as the "germ theory," or homogenesis. In this country and at the present day the leading advocate of the former is Dr. Charlton Bastian, and of the latter, Professor Tyndall, who, following in the footsteps of Pasteur, and aided by other workers, has succeeded in establishing the claims of this so thoroughly that few are to be found who will venture to doubt its correctness. I must say, however, that I cannot bring my mind to accept it as a really established fact; it has on its side a large amount of experimental evidence and some good reasoning, but looking at the matter from all points I cannot regard the germ theory as more than a possible and plausible hypothesis, holding in biology a position similar to the atomic theory in chemistry, highly useful for the comprehension and exposition of a large number of phenomena, and for veiling our ignorance of others. Those who hold this doctrine (and as I have said they are many) do not believe that the origin of life was coincident with the earth's advent, they really believe in heterogenesis, but at a very remote period. Why they should draw an imaginary line of demarcation, beyond which this could not occur, I am at a loss to understand. The arguments have been numerous on both sides. As regards experiments, my own have been few compared with Professor Tyndall's "cloud of witnesses," but I have reasoned on the experiments of others, and have been carefully observant of the phenomena calculated to throw light on this matter which have come under my notice during the last fifteen or sixteen years, with the result of leaving me still open to conviction and unwilling entirely to endorse either view on what I regard as insufficient evidence.

We are told that some of these germs are ultra-microscopic; but some of them can be seen with the unaided eye in a strong beam of light. You are all familiar with the effect of the sun shining through a keyhole or through a slit in a closed shutter, and have observed the "myriads of particles dancing merrily in the sunbeam;" these are germs, but not all, a large proportion consists of organic matter and organic *débris* in which life has become extinct. Strain out these particles, and you have a moteless or protected atmosphere, in which it is believed no life is capable of developing. If I pass a ray of light across the room from this lantern the floating particles are at once revealed. We can burn them up by the heat of a spirit lamp, or placing this glass vessel in the track of the beam, and exhausting it of the mote-laden atmosphere, admitting such only as is strained through this packing of cotton-wool, we get in each case darkness as evidence of the absence of solid particles. If, instead of exhausting this vessel, we had allowed it to stand a few days unmoved and closed, the same effect as regards the beam of light would have been obtained by subsidence. Professor Tyndall in most of his experiments smeared the inside of his cases with glycerine, so that when these particles had subsided they could not again rise. Now it is the dropping of these atmospheric motes into organic and indeed inorganic solutions, which brings about one class of changes in these bodies. I say one class, because we have others acting independently of any recognized form of life, a class of changes which are considered to be purely chemical or physical.

If, for example, I take these two white powders, place them on a sheet of paper, and mix them with a spatula, they almost instantly assume a bright scarlet colour; their action on light has become changed, their chemical constitution has changed also; but it does not obtain in the present day that this has anything to do with vitality. Change under the influence of germs is slower than this, and differs somewhat in character; respecting its beginnings, however, very little is known. Our townsman, Mr. Dallinger, in conjunction with Dr. Drysdale, has done very useful work in this direction, by tracing out the life history of the monad, by series of continuous observations, the whole extending over several years. Independent of this, bacteria in a fully developed form is the only positively vital condition in which we know anything of germs; in other words, here is an entity, an existence. A source is implied; we find these floating particles, and by a train of reasoning and experiment connect the two; missing links in the chain will be obvious, and it is these which give room for doubt. Professor Lister, who is constantly operating, one might say, in living demonstration of his belief in the germ theory, says (*Brit. Med. Journ.*, Dec. 22, 1877): "There never has been evidence of any ultra-microscopic germ. For my own part, I think it extremely improbable that bacteria in general have any germs. They are actual reproductive organs, constantly multiplied by segmentation, and if there be any organism in existence which does not require germs, I should say it is the bacterium. I have never yet found any organism which resisted the temperature of 210° F. for half an hour." Be it observed the professor regards the bacterium as its own germ, or, at least, requiring no lower or more minute form for its reproduction. Professor Tyndall assuming the existence of ultra-microscopic spores or germs of bacteria, says that, although a temperature of 150° is sufficient to destroy fully developed bacteria in a liquid, these germs will retain vitality after five hours' boiling. Mr. Dallinger, assuming they exist, says they will bear a temperature of 300° F. and remain fertile. Again, Mr. Willmott, in a paper read before the British Pharmaceutical Conference last year, stated as the result of a large number of experiments, that in the moist state a continued temperature of 150° was sufficient to kill both bacteria and spores, and to render the liquid sterile, and that boiling, except in some instances, was quite unnecessary for the purpose.

To us, as pharmacists, it matters little perhaps what theories (as such) obtain, but it is of considerable importance how and under what conditions we can best preserve such pharmaceutical preparations as are prone to decay or fermentive change. What avails it that we select the best of materials, use the most approved of modern appliances, and operate with the skill of the adept, in producing medicinal agents, if when they are required for use sufficient change has taken place in their constitution as to admit of a question as to whether they have lost anything of their activity by age?

The liquids chiefly experimented on by scientific inquirers have been infusions, and it is amongst this class of medicinal preparations that the pharmacist meets one of his first difficulties in combating germs. One way of surmounting this is the use of concentrated infusions, containing a large percentage of spirit, and although this is better than using an infusion which has been kept till in an incipient state of change, it certainly cannot compare with the recent infusion as ordered in the Pharmacopœia. Another method consists in the exclusion of air, *ergo*, the floating particles which it contains. The first notice of this method I find in vol. i. of the *Pharma-*

ceutical Journal, 1842, in a paper on "Decoctions and Infusions," by Mr. Jacob Bell, where he quotes a paper by Mr. Alsop, written in 1836, which for want of a suitable periodical in which to publish it in this country, was sent to the *American Journal of Pharmacy*. It consists of filling bottles, say of four, six, or eight ounce capacity, with freshly strained infusions, placing these bottles in a vessel of water, heating up to the boiling point, continuing the ebullition for a few minutes, corking so as to have but a small air space between the cork or stopper and the surface of the liquid, and carefully sealing, so as to prevent completely the access of air.

Infusions so preserved will retain their medicinal properties for months, or even a year or two. Here are some which have been kept more than a year. Lemon juice might be preserved in the same way, but heating to the boiling point injures the flavour, and in 1863 I made some experiments to ascertain the lowest temperature to which it could be heated and satisfactorily preserved. The result of these experiments I published in the *Pharmaceutical Journal*, vol. v., 2nd series, in a short paper on "Lemon Juice and its Preservation." The experiments were made in the winter, and a temperature of 150° was found quite sufficient for the purpose, and the juice retained much of its fresh flavour after being kept about nine or ten months. The experiments repeated in the summer (using the same temperature) were not so successful; but this might arise from different causes: the lemons would be fresh in the winter, the atmosphere in a more moteless condition; but whatever was the cause of difference, the fact remains that I found a temperature of 150° continued for some little time, sufficient to preserve a number of specimens of the juice, and in these instances proved equally efficient to boiling, which fact has been rediscovered quite recently, and considerable importance attached thereto. The addition of certain antiseptics has been recommended from time to time, and amongst them chloroform. This is usually effectual and might be used in hospital dispensing with the sanction of the medical men; but its use in the pharmacy is inadmissible. It effectually prevents the development of bacteria, but at our last meeting I showed a fungoid growth which had developed in aq. chloroformi of the B.P. The addition of glycerine to fluid extracts and other preparations of the kind, instead of alcohol, has been largely advocated in America; but my experience is not favourable to its excessive use. Indeed I might safely say that the next edition of the U. S. Pharmacopœia will contain less glycerine in its preparations than the last. Extracts are also subject to the attacks of germ life, usually those which develop as fungoid growth. The presence of moisture facilitates this, and it might be said in general terms that the greater the concentration or dryness of the extract the less prone will it be to this form of decay.

But competition in price amongst rival manufacturers tends to produce extracts containing an undue amount of moisture, their keeping qualities being thus endangered; therefore, where extracts can be obtained in powder without prejudice to their medicinal efficacy, this is undoubtedly the best form. But in other cases, where it is undesirable to carry the desiccation thus far, I can recommend the addition of a small quantity of glycerine towards the end of the process of evaporation, which latter should be continued until the finished product when cold, is of a firm pilular consistence. If too much glycerine is added it renders the extract hygroscopic but with only just sufficient to retain the pilular character it merely replaces an equivalent bulk of water, and replacing that water with an antiseptic agent, otherwise harmless, we get a better preparation and one which proves an unsuitable soil for the development of organic life. The latter remarks apply equally to confections where they are required to be kept for a long time in a moist state. Syrups are also subject to fermentative change, but with these I have already dealt in a paper read before the British Pharmaceutical Conference last year.

The paper was illustrated by numerous experiments, and at its conclusion a cordial vote of thanks to the author was carried by loud acclamation.

The President delivered the following address—

Gentlemen,—This meeting is the fourteenth and last general meeting of the twenty-ninth session of our Association, and it now becomes my duty to deliver up to you the charge committed to me twelve months ago.

It has been the practice in some recent years for this meeting to be occupied in great measure with a valedictory address from the president, but I felt very strongly that in my own case it would be a custom "more honoured in the breach than the observance."

I felt that I had nothing to say of interest but such matters as belong more properly to the report of the Society for the session.

I cannot, however, allow the opportunity to pass without, in the first place, thanking those gentlemen who have done us the favour of reading papers for their very valuable assistance. The papers read this session have been exclusively contributed by members of our Association, and it may fairly, I think, be considered a subject of congratulation that the interest of our meetings should have been sustained from internal resources.

To those gentlemen also who by their miscellaneous communications have added to our general store of knowledge, our thanks are also due.

The numerical progress of our Association has been good, twenty-one new names having been added to our roll.

In conclusion I have only to thank the members generally for the uniform kindness and indulgence with which they have received my humble endeavours to forward the interests and aim of our society.

The ballot of the meeting for the President-elect for session 1878-9 was taken, and resulted in the re-election of the retiring president.

ABERDEEN SOCIETY OF CHEMISTS AND DRUGGISTS.

The last lecture for the season of the Aberdeen Society, was delivered on Thursday, May 2, by Mr. Strachan, Secretary of the Society, in the Hall, St. Nicolas Lane. Mr. Sinclair occupied the chair. The subject of the lecture was "The Origin and Progress of the Pharmaceutical Society," which the lecturer traced in a very interesting sketch for several years, embodying in his narrative of the Society's career, brief biographical sketches of the various pharmacists who figured most prominently in its formation and establishment.

LEEDS CHEMISTS' ASSOCIATION.

The sixth general meeting of this Association for the present session, was held on Wednesday evening, April 17, the president, Mr. Jefferson, occupying the chair, when a discussion took place on "The Utility or otherwise of Provincial Chemists' Associations." The subject was introduced by Mr. Edwin Yewdall in the affirmative. In the discussion, however, which followed, the course turned not so much upon the merits of these associations in general, as upon the work being done by this one in particular. The result was a unanimous expression of opinion that the Association was fairly entitled to the sympathy and support of the trade of the district for the educational work it was doing, as also for the sake of its library, and its forming a central focus of organization.

The seventh and last meeting of the session and the fifteenth annual meeting of the Association was held in the library on Tuesday afternoon, May 14, at 3 o'clock, Mr. Jefferson again occupying the chair.

The minutes of the previous meeting having been confirmed, the annual report was read by the Secretary.

It stated that there had been an increase in the numbe of members on the previous year of one, and a net decrease in the number of associates of five, two having given up their connection with the Association, and seven left the town, whilst only four fresh ones had been added. Notwithstanding this slight falling off in numbers, the financial condition of the Association was really better than when the last report was presented; the balance in hand being £6 in excess of that of last year.

The library had been supplied with the usual periodicals, as also with the calendar, the register, and one copy weekly of the Journal, presented by the Council of the Pharmaceutical Society; and with the 'Year-Book of Pharmacy,' presented by the Executive Committee of the Pharmaceutical Conference; to both which bodies the thanks of the Association were due. Owing to want of space, only two new works had been added to the library, namely, Griffin's 'Chemical Handicraft,' and Bentley's 'Botany,' latest edition; but it was suggested that the state of the funds would probably induce the new committee to provide increased book accommodation.

Arrangements had been made for having the materia medica cabinet supplied with specimens of new remedies, and the curator was then employed in carrying them into effect.

During the winter months the room of the Association had had a fire lighted in it each evening, at 7 o'clock, for the comfort of such members or associates as might wish to make use of it, and it was gratifying to find that it had to some extent been appreciated.

The educational arrangements for the previous year consisted of the admission of the associates to Mr. Ward's classes on Chemistry at the Mechanics' Institute, on the same terms as members of that institution, nine availing themselves of the opportunity; and of a class on Materia Medica, conducted by Mr. Abbott and attended by six students.

The general meetings held during the past session, of which that was the seventh and last, were:—

The first was held in the Assembly Room of the Queen's Hotel, when a tea was provided, open to the whole trade by 2*s.* 6*d.* tickets, followed by addresses from the President and other gentlemen. At the second a paper on "Colour and its Lessons" was read by Mr. Henry Pocklington, F.R.M.S. The third was occupied by a paper on "Spontaneous Combustion and the Causes of Fires," with experiments, by Mr. Thomas Fairley, F.C.S. At the fourth a paper on "The Geographical Distribution of Plants" was read by Professor L. C. Miall, F.G.S. The fifth: A lecture entitled "The History of a Loaf of Bread," by Mr. E. O. Brown. The sixth: A discussion on the utility or otherwise of Provincial Chemists' Associations.

During the year there had been no burning questions to call into activity the energies of the Association, but had the occasion arisen its voice would no doubt as heretofore have been heard in the discussion and settlement of any question bearing upon the well-being of the trade. Finally the committee appealed to those present and to all connected with pharmacy in the district to give the Association increased personal as well as pecuniary support, so that its future career might be one of much greater usefulness.

The adoption of the report was moved by Mr. George Ward, F.C.S., seconded by Mr. James Abbott, and carried.

The election by ballot of officers and a committee for the ensuing year was then proceeded with and resulted as follows:—President: Mr. Peter Jefferson; Vice-President: Mr. Richard Pick; Treasurer: Mr. John Land; Secretary *pro tem.*: Mr. Samuel Taylor; Committee: Messrs. Edward Brown, John Hellowell, Edwin Yewdall, T. B. Stead, Richard Reynolds and J. A. Hirst; Auditors: Messrs. Freshfield Reynolds and James Abbott.

A vote of thanks to the officers and committee of the past year was proposed by Mr. Longley, seconded by Mr. Ward, and carried.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

The usual monthly meeting of this Association was held at Britannia Chambers, Pelham Street, on Monday, May 6, the chair being occupied by the Vice-President, Mr. R. Fitzhugh, F.C.S. There was a fair attendance of members and associates. After the minutes of the last meeting had been read and confirmed the Honorary Secretary (Mr. R. Jackson), announced the receipt of the following donations:—£5 5*s.* 0*d.* from Messrs. Hearon, Squire and Francis; Wills's 'Elements of Pharmacy,' from Mr. James Beardsley; 'The Calendar of the Pharmaceutical Society'; 'The Catalogue of Collection in Museum,' and *The Pharmaceutical Journal* regularly every week, from the Pharmaceutical Society. On the motion of the Chairman a hearty vote of thanks was awarded the donors. Some new members and associates were elected. The Chairman then announced that Mr. J. H. Atherton had resigned the Presidency of the Association, in consequence of leaving the town, and said the Council had presented him, before leaving, with an illuminated address as a slight recognition of the valuable services he had rendered the Association since its commencement, and evidence of the regret they felt at losing so able and energetic a President and a colleague with whom they had worked so harmoniously. He then introduced Mr. F. H. Spenser, one of the Science teachers at the Mechanics' Institute, who delivered an instructive lecture on "Electricity," illustrated with numerous and interesting experiments. The lecture was listened to with great attention, and at its close a hearty vote of thanks (proposed by Mr. R. Jackson, seconded by Mr. W. Widdowson and supported by the Chairman) was given to Mr. Spenser, and the proceedings terminated.

Parliamentary and Law Proceedings.

Supposed Death from Strychnine.

The body of a married woman, named Sarah Morris, has been disinterred at Crewe, on an order from Mr. Churton, coroner, it having transpired that there was reason to believe her death had not arisen from the cause set down in the burial certificate. It appeared that her husband on returning from his work on the morning of the 8th inst. found his wife in great agony, suffering from spasms at the heart. The doctor was called in, but on his arrival the woman was about breathing her last. She had occasionally suffered from similar spasms. Dr. James Parker Brumwell said that when he saw the woman her lips were livid and her face in a cold, clammy sweat. The action of the heart was intermittent and laboured, and there was spasm of the intercostal muscles and spasm of the diaphragm, but there was no tetanic spasm of the muscles of the limbs whatever. Before stimulants could be administered the woman died. He judged it to be a case of spasm of the heart, and the history of the case was that she had had the same thing before. He gave a certificate—*angina pectoris.* On making the *post mortem* examination, however, he found evidence of strychnine in the stomach such as left no doubt whatever that that was the real cause of death. Had there been spasm of the limbs he might have suspected strychnine, but there was not. The coroner was unable to elicit that there had been anything irregular in the woman's habits of living, the evidence being to the effect that she was very temperate; but it transpired that she had contracted a number of debts unknown to her husband, and had been in the habit of pawning his clothes. It was proved that deceased had purchased two-pennyworth of a vermin-killer whose principal ingredient was strychnine, from the shop of Mr. M'Neill, chemist, the day before her death, and the jury returned a verdict that deceased had died from the effect of strychnine administered by herself, but that there was no evidence to show in what state of mind she was at the time.—*Liverpool Post.*

A Curious Defence.

A case was heard in the County Court, Lime Street, Liverpool, on Monday, May 13, before Mr. J. F. Collier, judge, in which Mr. James Taylor, described as a chemist, carrying on business in South Street, sued Dr. E. Hughes, of Church Road, Walton, for £1 17*s.* 11*d.* the amount of a bill for drugs. The plaintiff, on examination, said the drugs were sold by his manager, by whom the business was conducted. The defendant disputed the claim on the ground that the plaintiff was not a licensed chemist under the provisions of the Pharmacy Act of 1868, which declared it unlawful for any person not a registered chemist to keep a shop open for the sale of such articles as those which formed the subject of the action.

The plaintiff, in reply to his Honour, said he was not a registered chemist, but his manager was. The shop had belonged to his son, now dead, and on the son's death he took out letters of administration.

Some discussion took place as to the legality of the plaintiff's continuing the business longer than was necessary to administer the estate, and his Honour adjourned the case to Tuesday next in order that the letters of administration should be produced.—*Liverpool Daily Post.*

The Alleged Adulteration of Flour at Selby.

The adjourned hearing of summonses against Messrs. John Croysdale and Sons, flour millers, for having sold flour alleged to be adulterated with alum, took place at the Selby Petty Sessions on Monday, May 13, before Mr. B. Hemsworth (chairman), Mr. W. T. Smith, and Mr. J. Adams.

Mr. Cadman, for the defendants, said that at the previous hearing of the case, in the course of conversation with respect to the report from Somerset House, it was stated by one of the magistrates that if Mr. Allen's certificate had been sent to the analysts there they would have used the word alum distinctly instead of alumina.

Mr. Smith remarked that what he said was that Mr. Allen's certificate had not been sent to the analysts at Somerset House, or they might have used another name.

Mr. Cadman said that at any rate the gentlemen engaged in the prosecution of this case had not the common honesty to tell them that a copy of Mr. Allen's certificate had been sent to the authorities at Somerset House, and he now asked for the letter that was sent to be read.

Mr. Hemsworth deprecated any imputation against the prosecution, as he was sure that Superintendent Gill had no feeling against the defendants.

Mr. Cadman: I ask again, was a copy of Mr. Allen's certificate sent to Somerset House?

Superintendent Gill: Undoubtedly, in accordance with a letter which I will read to you.

Mr. Cadman said that at the former hearing it was certainly the impression of the Bench that merely a sample of the flour was sent to London, with a request to the authorities there to make a report on it. Now it seemed that a sample had been sent, together with the report of Mr. Allen. The authorities at Somerset House were either to corroborate Mr. Allen's report or repudiate it, and they said, "The results of our experiments do not enable us to confirm that it (the alumina) exists in the form of alum." He wished to know whether a letter had been received from Somerset House since Monday last.

Superintendent Gill said that he had got a letter on the previous day. He explained that he had sent to Somerset House particulars of Mr. Allen's analysis, in accordance with a request from the analysts there. Since the last hearing he also sent the following letter to Somerset House:—

"In reference to the samples of flour sent up to Somerset House for analysis on the 22nd ult., and your certificate relating to sample No. 30, which states that you cannot confirm that the alumina exists in No. 30 flour in the form of alum, etc., the Justices for the West Riding of Yorkshire acting in this division desire me to request that you would be good enough to say whether the sample did or did not contain alum, or whether you decline to express an opinion on the point; also whether you had sufficient quantity of the flour for examination."

To that he received the following reply:—

"With reference to the preceding letter, we have to state—First, we are of opinion that the samples did not contain alum, and we intended this to be understood by the terms of our certificate. Second. Both samples were very limited in quantity, that marked No. 30 barely weighing five ounces. Although we were enabled with the quantity at our disposal to prove by duplicate experiments the presence of an excess of alumina in No. 30, and to satisfy ourselves of the absence of alum in both samples, it would have been more satisfactory to us to have had a larger quantity, that we might have been able to determine and state in our certificate in what form the excess of alumina existed in No. 30 flour.—(Signed) J. Bell, R. Bannister, and H. J. Helm."

Mr. Cadman said that the defendants had been brought into court to answer a charge of adulterating their flour with alum, and the analysts at Somerset Hourse had certified that there was no alum present in it. That being so, was it necessary longer to take up the time of the Court? The defendants would not have been charged, but for a mistake on the part of Mr. Allen, and because of an inaccuracy in his tests of analysis.

Mr. Smith thought they should hear further evidence. It seemed to him as if the analysts at Somerset House were persons who were not chemists, and were simply creating confusion. He thought, on the other hand, that Mr. Allen had given his evidence in a proper and straightforward manner.

Mr. Cadman asked again if the Bench insisted that the case should go on.

Mr. Smith said that they were bound to hear the case out.

The cross-examination of Mr. Allen, the analyst, by Mr. Cadman, was then resumed. He stated that he first tested the bread he had made from the sample of flour sent to him by the logwood test, which told him that there was something wrong with the flour. Having found this, he then ascertained the amount of alumina it contained by a process he had already described.

Mr. Cadman: To put it shortly, you found something wrong by one test; by another test you found what you call an excess of alumina, and then you put the two together and calculated alum. Is that so?—Yes.

Mr. Cadman: Did you by any process you used find one speck or tittle of alum as alum?—No, nor nobody else. Nobody ever found alum in bread as such.

Mr. Hemsworth: You say there is an excess of alumina in the flour, and that it exists in the form of alum?—Yes. I believe it exists in the form of alum.

Mr. Hemsworth: The analysts at Somerset House agree as to the alumina, but they don't say in what form it is. We want to know their opinion as to what that excess is. There is a property in the flour which ought not to be in it.

Mr. Cadman: Which is capable of explanation. But what the prosecution had to make out was that the flour was adulterated with alum—pure and simple, if the phrase might be allowed. The defendants said that there was no alum in their flour.

Mr. Hemsworth: There is an excess of alumina which has not been found before.

Mr. Cadman: Because I don't think there is a place in the country capable of grinding flour as this is ground. That excess of alumina might arise from the process of manufacture, and that being so, under the words of the section the defendants cannot be convicted. They had heard that Egyptian wheat was very dirty. Well, the defendants had special machinery for scrubbing and washing the wheat. They brushed it to take off every bit of clay, but if any specks remained it might be sufficient to account for the presence of alumina.

Mr. Richard Bannister, one of the analysts at Somerset House, was then called by Mr. Cadman, at the request of the Bench. His evidence was to the effect that the result of his and his colleagues' analysis of the flour was the same as Mr. Allen's, but they came to different conclusions as to the excess of alumina. Mr. Allen said it existed in the form of alum, but they found that it was not alum.

Mr. Hemsworth: Then what is it?—I am sorry I cannot tell you.

But there is something in the flour that ought not to be?—There is more alumina, but it may come from clay of dirt, or something which we are unable to say.

Mr. Cadman reminded the Bench that the question before them was alum or no alum. They could not go beyond the information to prove something else.

Mr. Allen, in answer to the Bench, said he still maintained his belief that there was alum present in the flour. At the same time Mr. Bannister was quite justified in what he had said, because he had failed to get the precise result which he (Mr. Allen) got. He had the authority of Dr. Hassall that the test used sometimes failed.

Mr. Bannister said that at the time they tested the samples sent to them they also tested 20 other samples of what they knew to be pure flour, and the result in all the cases was the same. They then added alum to some samples, and the test showed when the alum was present; so that he thought they were justified in concluding that the test was a good one.

After this evidence, the magistrates retired and consulted, and on their returning into court,

Mr. Hemsworth said that they had thought the matter over, and found the evidence so conflicting that they had decided to dismiss the information.

Mr. Cadman said that had the Bench not thought it right to dismiss the charge at that point, he would have called witnesses to prove that it was impossible for a miller to put alum into the flour.

Mr. Hemsworth: Let us say no more about it.

Mr. Cadman applied for costs, but the Bench would make no order.—*Leeds Mercury.*

Important Appeal Case under the Sale of Food and Drugs Act.

On Saturday, May 18, the argument in the case Rook *v.* Hopley, which raises an important point under the sale of Food and Drugs Act (38 and 39 Vict. c. 63), and was part heard some time ago, was resumed and concluded in the Exchequer Division of the High Court of Justice, before the Lord Chief Baron and Baron Pollock, sitting in banco.

Mr. J. Brown, Q.C. (with whom was Mr. Sutton), argued for the appellant; Mr. Ambrose, Q.C., appeared for the respondent.

It was an appeal from the decision of the Manchester Bench of Magistrates, who declined to convict the respondent, under the above Act, for selling one pound of lard, which was found, on analysis, to contain 15 per cent. of water. The lard in question was part of a larger quantity purchased by Mr. Hopley in Liverpool, with the following bought-note:—"Bought by Mr. J. Hopley, of Manchester, of W. Walker, cheesefactor, etc., Liverpool, four tins lard, No. 1;" then follows the weight. As to the figures, "No. 1," no evidence was offered, and it was admitted that they did not point to any particular lard, good or bad. Section 25 runs:—"If the defendant in any prosecution under the Act prove to the satisfaction of the Justices or the Court that he had purchased the article as the same in nature, substance, and quality as that demanded by the prosecutor, and with a written warranty to that effect, and that he had no reason to believe at the time when he sold it that the article was otherwise, and that he sold it in the same state as when he purchased it, he shall be discharged from the prosecution," etc.

Mr. Brown contended that the above bought-note was not a "written warranty" within the Act, being merely descriptive. He relied on "Chaunter *v.* Hopkins," the case of the patent fire-consuming furnace, and "Josling *v.* Kingsford," the case of oxalic acid. He was stopped by the Court before he had concluded his argument.

Mr. Ambrose submitted that he came within the exceptions of section 6. The water introduced was not a matter injurious to health, but was necessary to the manufacture or production of the article. The prosecution ought to have proved that the lard and water was not lard, and that the 15 per cent. water added was not necessary and injurious. Lard, he believed, was pigs' fat boiled down and in water.

Mr. Brown: Oh, no. I have consulted a housekeeper, and she says it is no such thing.

The Lord Chief Baron: We cannot take judicial notice of questions of chemistry.

Mr. Ambrose: The fact that the analyst has found that, in spite of the adulteration, it is still lard, is rather in my favour.

Baron Pollock: Recollect the preamble of the Act, to which Lord Coke used to attach great importance; the law regarding the sale of food and drugs is to be amended, the object being to avoid adulteration, and get pure and genuine articles.

Mr. Ambrose: It is found in the case that the article purchased was the same as that asked for, and with a written warranty. This document is not an invoice which records a debt, and is an account of goods already sold, but is to all intents and purposes a contract. The learned counsel then sought to show that the words in the note constituted a "warranty," and cited numerous cases tending that way. "Allan *v.* Lake," where, in a "sold" note about turnip seed, words of description were held to be a warranty; "Nicholls *v.* Godts," about rape oil; "Gardiner *v.* Gray," about waste silk; "Barr *v.* Gibson," a stranded ship; "Bannerman *v.* White," the hop case; "Jones *v.* Just," the jute case; "Randall *v.* Newson," and "Bowes *v.* Shand." If the statute be thus construed, he continued, it will hit perfectly innocent people, who are buying honestly, and however good the article may be.

Baron Pollock: The real question is, Will this prejudice the purchaser?

Mr. Ambrose: The Legislature only intended that the evidence of the warranty must be in writing and not verbal, to prevent shuffling excuses. It never was meant to catch honest tradesmen in a trap of this sort and render them liable to very severe pains and penalties.

Mr. Brown was not called on to reply, and

The Lord Chief Baron proceeded to deliver judgment as follows:—In my opinion the appellant is entitled to our judgment, but I come to that conclusion with very great regret, for it is a very hard case indeed. But hard cases make bad law. The respondent purchased, paid for, and sold the article in question as lard. Does he come within any of the exemptions of the Act? The analyst has found that this is adulterated lard; is that lard within the Act? As to the question whether words of description in an invoice constitute a warranty, I do not decide that now, for I may be called on to do so in the Court of Appeal at some future day, and I wish to reserve myself the liberty of deciding in either way. But in "Josling *v.* Kingsford" words of description were held not to constitute a warranty, though adulteration afforded a ground for repudiating the contract. Here the magistrates and the analyst have found that there is adulteration; and to stop that, as we gather from the preamble, is the whole object of that important, useful, and generally beneficial Act. In these circumstances our judgment must be for the appellant.

Baron Pollock: I come to the same conclusion, and I base my decision on the construction of the Act which forms the basis of the magistrates' jurisdiction. This is a very important case, and we find that the Legislature in the earlier Acts about the sale of food and drugs had required proof that the seller had himself adulterated the goods, or that he sold them knowing them to be so adulterated. (See 35 and 36 Vic., cap. 74.) Now new and more stringent provisions are introduced, and the Courts must be careful to put a proper construction on the Act and one consistent with the protection of honest dealers. The analyst is made by the statute the official person to determine the true character of the articles sold. There are exceptions which were open to the respondent to take; he might have raised defences before the analyst, as that the ingredient added was not injurious, and necessary to the manufacture; he might have asked for an analysis by the chief officer at Somerset House, or he might have appealed to Quarter Sessions. He did not avail himself of any of these. Is the thing sold prejudicial to the purchaser, and not of the nature demanded? I think both, though I do not mean that it is calculated to poison him or interfere with his health. The instrument relied on is a mere bought-note, and not an express written warranty. Mr. Ambrose, in his strenuous argument, said that lawyers were bound to infer that lard did not necessarily mean perfectly pure lard. That is not the way to construe the Act, to which we must give a full construction and one favourable to those selling the article. But it must not be by legal inference from language which is not express. The case must be remitted to the magistrates, telling them their decision is wrong, for them to fix the penalty.

Appeal allowed, with costs.—*Times.*

Dispensing Memoranda.

[78]. This can be dispensed without any separation of quinine taking place by first dissolving the citrate of iron and quinine in the aromatic spirit of ammonia and adding to it gradually the bromide of potassium, previously dissolved in the water.

G. H. B.

[107]. Hoffman's Anodyne.—I am asked why I write against Spiritus Ætheris—"called Hoffman's Anodyne"—in my 'Companion to the British Pharmacopœia.' I answer, because the mixture of ether and rectified spirit is so called in all the Pharmacopœias I am acquainted with (the United States excepted). I quote the following for reference:—

Austria, 1824, 1855, 1869.
Baden, 1841.
Belgium, 1854, 1856.

The Vote for Admitting Women as Members of the Pharmaceutical Society.

Sir,—On reading your report of the Adjourned Annual Meeting of the Pharmaceutical Society, which was held on Friday last, for the purpose of receiving the report of the Scrutineers as to the election of Council for the ensuing year, a meeting at which it is generally understood that no other business will be introduced, I was much struck by the introduction of the question of the correctness of the President's declaration on the preceding Wednesday of the result of the voting on the admission of ladies to membership of our Society.

I find that some doubts had arisen, some ideas had presented themselves, in certain minds that an error had occurred. Not one of the parties mentioned had any positive recollection on the matter. According to law or usage the declaration of the numbers could not then be called in question; nevertheless on this conjectural (it is not strong enough to be called circumstantial) evidence the vote was pronounced to have been opposite to the previous declaration.

I regret, sir, that I was not present on Friday, because from my position at the table when Mr. Wade and Mr. Vizer delivered the result of their counting, I was enabled to hear distinctly that 59 was given by the former and 57 by the latter. Mr. Carteighe (who, by the way, was opposed to me in the division) confirms me precisely in this matter, and I could produce other witnessses to give similar evidence.

May 23, 1878. George W. Sandford.

Sir,—Perhaps you will allow me to say a few words through the medium of the Journal on the dilemma which the last annual meeting fell into whilst discussing and voting for the election of females as members of the Society. That it proceeded not as orderly and systematically as it might have done cannot be disputed. Myself, and perhaps a few more feeble orators, were completely quashed and unnerved by the cries of "vote, vote," and "sit down."

I was greatly astonished on my receiving the Journal, together with the report of the *Chemist and Druggist*, to find both stating that there had been a misunderstanding between the tellers and President, because before the motion was put there was a considerable time spent in endeavouring to make things perfectly plain. It was audibly mentioned that those who supported Mr. Vizer's motion should be seated on the right side from the bottom of the theatre, whilst those in favour of Mr. Wade's were to take the other side; really I think it was so plain that a child six years old could scarcely fail to recognize the side to which he belonged. When Mr. Wade, next to whom I stood, gave in his number I feel somehow certain that he called out 59, which number I think the President took down. But Mr. Vizer did not give in his number till a few seconds after, which was not called out but handed over to the President on a piece of paper, and was echoed through the crowd as being 57, which the President afterwards corroborated. To me the error, if there has been any, seems to be ridiculous in the extreme, and is rendered a great deal more so from the fact that the 57 lady-gentlemen claimed to be the most intelligent portion of the members present, which renders it hardly feasible that they should be so completely outwitted by those whom some of their speakers denominated as benighted friends. May I, in concluding, once more ask why should not the Society issue voting papers to all members, both in London and in the provinces? for I maintain that unless more than about 120 members are present it cannot be deemed a satisfactory result whichever side will be preponderant, and unless there be a far greater majority than there was on this occasion. That this is an important question no one can deny, to me it appears to be nothing less than upsetting the whole apple cart.

A Benighted Member.

48, *Great Marylebone Street, London, W., May* 20, 1878.

Sir,—Many thanks are due to Mr. Wade and Mr. Hampson for the able and honest manner in which they upheld the "right" on Wednesday last.

Much as certain "members of the Council of the Pharmaceutical Society" may oppose the admission of women (eligible for election), there seems no justice in the decision of a body of men acting in opposition to their own byelaws.

Laurel Bank, Fulham, S.W. ELIZABETH LEECH.

WHAT HAS THE SOCIETY DONE FOR US?

Sir,—It is not my custom to take part in the annual discussion on the report of the Council, which is too often a weary reiteration of puerile grumbling, ending in no practical result. I generally prefer as a silent member to listen to the sentiments of country members, and to learn from them their opinion of the Society's doings, and the state of provincial trade. This year has more than ever impressed me with the contrast between the jubilant pæan of our genial President, and the funereal dirge moaned by most of the speakers. The trade is in a death struggle, it will soon be dead; but the Council has this year saved two thousand pounds to bury its members, and the house in Bloomsbury Square will be converted into a handsome mausoleum, where future dispensers at co-operative stores may sometimes make a pilgrimage in devotion to the memory of its founder, a man who if he had one purpose more than that of educating the young members coming into the trade, it was to protect the interest of those who were already in it. This, sir, was the theme of our last gathering.

Every year the speeches of members express more and more their dissatisfaction at the apathy of the Council in all matters that concern the trade. What is the Society doing for us? is the question asked from Cornwall to Scotland. If this is the whisper of its own body, what is the feeling of the outside trade respecting its arrogating to itself to be the representative of the trade, while in the same breath it declares itself to be a private club, a voluntary association, which need not admit any one to membership if a personal prejudice exists against them, no matter what their qualifications are, and of leaving all things affecting trade interests to the Trade Association.

Without holding the pessimist views of the majority, I feel that the trade is in a very critical state, and wants a united body to enable it to stand its ground; but I consider the Pharmaceutical Society to be in a more dangerous condition, and that nothing short of a revolution will save it from perishing through the disgust of its own members, and its exclusiveness. I have very little sympathy for the children of the Society, because they have had the power to alter in their own hands, and for years refused to wield it, and are only now opening their eyes to the truth. It is for the outside men, who have no voice in the election of their governors, that I commiserate. To a certain extent they also have themselves to blame for not coming into the Society; but how can they be expected to have any desire to be associated with us when they continually hear the question, "What does the Society do for us?"

The Society lost its best chance when the Incorporation Act was passed, by not making itself popular with all, and striving with a liberal policy to bring in the whole of the outsiders. If this had been done, we might have had real representative men on the board, and the Society by this time would have been all powerful and respected, because undivided. It is not yet too late. Twice before you have permitted me to express these sentiments, and I now repeat that it would be for the advantage of the trade, as well as the Society, if the two could be brought to acknowledge the need that each has of the other.

The Pharmaceutical Society is the natural governing body and not a voluntary association, yet up to the present time it has been only a stumbling block, and worse than useless, except as an educational institution. Much as I appreciate the efforts of the Trade Association, and as an earnest member of it, I know full well the good it has already accomplished, and how much there is in store for it to undertake; but it can never occupy the place the Society is intended to hold. It must of necessity play second fiddle, and can never have the same influence.

The Society might by changing its entire policy become a powerful agent in altering the depression now settling upon the retail tradesman; it can only be done by reversing the whole of its past behaviour.

I call upon the new Council to consider the welfare of all chemists and druggists. Even to forget, for a year, that it merely represents a fraction of them, called the Pharmaceutical Society. Let it, for the next twelve months, stay its efforts to advance education, and see how much it can accomplish in support of general business. Let it forget the Society in working for the fraternity.

Then, sir, on the next May meeting we shall not have waggoners crying out to Jupiter for help, or piteously asking "What has the Society done for us?" They will be able to say our Society has now made itself representative. It has given up its old crochets and exclusiveness. It has assumed its proper position as the head and protector of the entire trade. I think the highest honour it can gain is the goodwill of the little country trader equally with the patronage of dispensers to the upper ten, and it invites every one to aid it in its worthy endeavours.

Mr. Urwick, one of the staunchest supporters and best friends the Society ever had, struck the key-stone when he suggested the reduction of the membership fee for the purpose of bringing others into the Society, and although I do not agree with this proposition, I admit this principle. I would again, as I have done before, urge the abolition of the two guinea entrance fee, for this has been an important barrier to the Society's augmentation; then, I believe, few would object to the payment of a guinea per annum, especially if the Council adopted a bold and vigorous motto.

Perish the Society for its own sake, but save the Society and trade combined.

Years ago I worked with this object in view, and I have never yet despaired of seeing it accomplished, and before I close let me, Mr. Editor, acknowledge my appreciation of the extraordinary accuracy of your reporter in reproducing the remarks I had the honour of submitting to the annual meeting on behalf of the admission of ladies to membership. The Pharmaceutical Journal.

SATURDAY, JUNE 1, 1878.

LEGAL DECISIONS AFFECTING TRADE INTERESTS.

In consideration of the unusual interest attaching to the legal cases of which we publish reports this week, and the importance of the decisions in both cases, we have decided to make the ordinary matter of the Journal give place to those reports and to issue a supplement which will admit of their being accessible in full to our readers without delay.

In doing this we think that the requirements of the occasion will be best provided for without entering upon any minute consideration of the points and arguments advanced on either side. As regards the case of the co-operative stores and associations of persons trading under the Limited Liability Act, it is especially desirable to abstain from discussion in these columns, since it is probable that there may be an appeal from the decision of the County Court Judge.

The judgment in the case of the Apothecaries' Society against WIGGINS is, however, so far decisive in regard to that particular instance that there will be no impropriety in offering some remarks on certain features of the case as they bear upon the general question of counter prescribing.

In the first place we may point out that the decision of this case, though adverse to the defendant and on that account to be regretted by all who have the interest of pharmacy at heart, is at the same time so far satisfactory that it does not in the least call in question the right which chemists and druggists claim to possess by long usage and by the authority of the 28th section of the Apothecaries Act. The verdict of the jury places this fact in a very clear light, and it is, as Mr. Justice FIELD remarked, "quite clear of any doubt," inasmuch as it declares that the defendant acted as an apothecary in treating medically cases that were dangerous.

In this respect, therefore, we must regard the prosecution as being quite consistent with the intention recently expressed by the Court of the Apothecaries' Society not to interfere with cases of simple counter practice by chemists and druggists. The object of that body, as we understand it, is not to interfere with such instances of the recommendation of simple remedies or of prescribing and supplying medicines for simple ailments, as those stated by the witnesses for the defence to have been within the ordinary practice of chemists and druggists before the year 1815. These witnesses repudiated the disposition to treat complaints of a serious nature, and declared that while they would have selected for themselves such cases as they felt competent to deal with, they would have sent persons suffering from dangerous disorders to a doctor.

According to the evidence of the witnesses called for the defence, then, it appears that the right claimed by chemists and druggists to carry on what is termed counter practice is not one that the Apothecaries' Society would dispute, and in this respect there is ground for satisfaction that the case has been brought into court.

This case, however, is one which the Pharmaceutical Society could never have attempted to defend under any circumstances, and we venture to think that the position of the chemist and druggist has not been in any way improved by the defence that has been made. There are indeed considerations which lead us to fear that the trial of this case and the discussion to which it has given rise may prove injurious to the interests of the trade generally. Among other things it has brought prominently forward the fact that a line must be drawn somewhere between the practice that is legitimately no less than reasonably within the province of a chemist and druggist, and that which it was no doubt the object of the Apothecaries Act to prevent even in the case of the apothecaries of the time when it was passed.

We have on previous occasions expressed our opinion that from the legal point of view there is in this country no direct monopoly in the practice of medicine, and without going into the question whether that is a desirable state of things or not, common sense would lead to the conclusion that if it be admissible for any member of the community to prescribe for his neighbour or treat him medically it would be absurd to debar from doing so those men who have more special knowledge of drugs and their uses than the majority of people.

But the decision of the case now referred to has the effect of placing the chemist and druggist at a greater disadvantage in this respect than other people. He enjoys, it is admitted, an exemption under the provisions of the Apothecaries Act from the restrictions that were imposed upon apothecaries by that Act, but by a strange sort of paradox he is now held, almost as it were in virtue of that exemption, to have less liberty of action in regard to the practice of medicine than other people who are certain to have even less capability of applying drugs for treating disease than he must necessarily have acquired from his daily experience.

It is in this respect that we consider this trial has had the effect of placing the chemist and druggist in a worse position than he was before, and the result of it confirms the view we have always held in regard to the question of counter practice; in the abstract it is desirable that the pharmacist should not engage in the treatment of disease, or do anything which trenches upon the province of a class of men with whom he has relations so intimate as those existing between pharmacy and medicine. It is equally desirable that the province of the pharmacist should not be invaded by the medical practitioner. But since there is in both directions a want of proper allocation of duties, and in many instances, serious obstacles in the way of any such adjustment of the functions of medical practioners and pharmacists, as would satisfy both classes, we believe that more is to be expected from the cultivation of mutual esteem than from the assumption of the defiant and antagonistic attitude which is unavoidable when a court of law is made the arena for establishing a principle.

ARSENICAL VIOLET POWDER.

A PROSECUTION has at length been instituted in respect of the sale of violet powder, alleged to be mixed with arsenic, and several witnesses have given evidence, that after using the powder in question, for children, eruptions of the skin were produced and in several instances more serious results followed. The case for the prosecution, however, was not completed, and the hearing is adjourned. We purpose giving a full report next week.

Parliamentary and Law Proceedings.

THE PHARMACEUTICAL SOCIETY *v.* THE LONDON AND PROVINCIAL SUPPLY ASSOCIATION, LIMITED.

In the Bloomsbury County Court, before the judge, Geo. Luke Russell, Esq.

JUDGMENT.

The Judge: This is an action to recover a penalty under the Act of the 31 and 32 Vict. cap. 121, that being an Act for regulating the sale of poisons, and the defendants are a company duly registered under the Companies Acts, a limited company. It was urged before me in the action, that when the memorandum and articles of association and the register of the company are referred to, and the facts known, the company is in truth a sham and a fraud against the Act, but I am not able to go into that question at all. I cannot go behind the registration, and indeed the action is brought against the company without any co-defendant. It is not against any individual, and therefore, in this action at all events, it would be wrong if the company were not the proper parties to contest the matter.

The facts of the case are these. The defendants are the London and Provincial Supply Association, Limited, professing to be, and I must take it to be, a company similar to many that are now known for the supply of goods, of which the Civil Service Supply Association is a very well known example. The defendants include in their store a regular chemist and druggist's shop, and carry on there the business of chemists and druggists, including the sale of poisons absolutely, and also those included in the prescriptions which they make up—medical prescriptions prescribed by medical men. That branch of the business is in fact carried on by Mr. Longmore, who is a duly qualified chemist and druggist, and a shareholder. He is assisted in the business by two gentlemen, who are also qualified to assist in a chemist and druggist's shop. Amongst the shareholders there is one, at least, who is not a registered chemist and druggist; and indeed Mr. Mackness, who is in fact really the company, for he holds shares representing £5640, and all the rest of the shareholders only hold shares to the extent of £360—it is obvious, therefore, that substantially Mr. Mackness is the company and I understand that he himself is not a registered chemist and druggist.

Now the question is, whether a company of this sort, in which a shareholder is not a registered chemist and druggist, is at liberty to sell poisons without committing an offence under the Act of Parliament, and incurring the penalty imposed by it. Now section 1 of the Act recites that "Whereas it is expedient for the safety of the public that persons keeping open shop for the retailing, dispensing, or compounding of poisons, that persons known as chemists and druggists should possess a competent practical knowledge of their business," and so on, that they shall be registered. Then it enacts that "from and after the 31st December, it shall be unlawful for any person to sell, or keep open shop for retailing, dispensing, or compounding poisons" (omitting the other part of the section) "unless he shall be a chemist and druggist within the meaning of the Act," and so on. Then section 15 says this: "From and after this day, any person who shall keep an open shop," and so on, "not being a chemist and druggist, shall for every such offence be liable to a penalty of £5," to be enforced in the manner pointed out by the Act. Then section 16 provides for the fact of a regularly authorized chemist and druggist dying, and says, "It shall be lawful for his executors, administrators, and trustees to continue the business, if and so long only as such business shall be *bonâ fide* conducted by a duly qualified assistant," and so on. Those are the clauses of the Act to which my attention was called. In addition to that my attention was also called to an earlier Act for the construction of statutes, in which it says that in certain cases the word "person" shall include a corporate body. Upon that it was contended that this corporate body, including persons who are not duly qualified chemists and druggists, could not carry on such business without incurring the penalties imposed by the Act. Now the first thing that strikes one is that if Mr. Longmore had sold these things for himself alone he would not have committed any offence whatever. He is a duly qualified man, and if he had kept an open shop and sold poisons he was duly qualified to do that, and it would be no offence whatever. However, it is said that it was committing an offence because the business was so conducted that money is acquired, and the profit so made goes into the pockets of other people. That obviously is not within the mischief intended to be remedied by the Act. I have carefully considered it and have availed myself of the very able argument of Mr. Flux on the part of the plaintiffs, but the result I have come to is that it is not an offence within the Act when done in the manner this has been done. It does not become unlawful when done on behalf of the company, so long as the business is conducted by a duly qualified chemist and druggist who, if carrying it on for his own benefit would not be within the penalties of the Act. It is not within the mischief intended to be prevented, and I am of opinion that no offence within the Act therefore was committed. Now the Act 7 and 8 Geo. IV. is the Act containing the interpretation clause, and I am asked to determine that there is no company at all, but that it was an unqualified man carrying on business, and in point of fact the company was a sham. If that were so I can quite understand that it was to the interest of the public that the thing should be stopped, but, as I have said before, I cannot go into that question—I cannot go behind the register. All I can do is to give judgment for the defendants.

Mr. Crouch: With the costs of the suit.

The Judge: Yes; they follow.

Mr. Flux: It is possible my clients may desire, as this involves a question of principle, to carry it further. If any leave of your Honour to go higher is necessary you will, of course, give it.

The Judge: Do you ask leave to go to the Appeal Court?

Mr. Flux: Yes.

The Judge: Certainly. You are raising the point in the interest of the public, not for your own benefit, and it is my duty therefore to give you every facility to question my judgment. You had better apply under the last section of the last Act. You will have my notes. You raise a point of law, you have my decision upon it, and upon that you go to the Court of Appeal.

Mr. Flux: I think there are alternative courses, a motion or a special case. Concerning that I am very much in your Honour's hands as to which would be the better course.

The Judge: It is under the 38 and 39 Vict. cap. 50, that you will proceed.

The Registrar: It is judgment for the defendants with £1 13*s.* 6*d.* costs.

THE SOCIETY OF APOTHECARIES *v.* WIGGINS.

This suit, which was an action against a registered chemist and druggist, residing at Bermondsey, commenced in the High Court of Justice, Exchequer Division, Bail Court, Westminster, on Thursday, May 23, 1878, before Mr. Justice Field and a common jury.

Mr. Morgan Howard, Q.C., Mr. Finlay, and Mr. Gore appeared for the plaintiffs; Mr. McIntyre, Q.C., and Mr. Higgins appeared for the defendants.

Mr. Gore opened the pleadings.

Mr. Morgan Howard: May it please your Lordship, Gentlemen of the jury. This is an action, as you have heard, brought by the Society of Apothecaries in London, to recover penalties against the defendant, Mr. Wiggins, for practising as an apothecary contrary to the provisions of the law in that respect. I present the case to you as a case of considerable importance as affecting the privilege which the public are entitled to enjoy with reference to the medical attendance which they are able to get in this country, under the provisions of the various statutes which have been passed for their protection, and I shall ask you to say if Mr. Wiggins, who is a chemist, I believe, has infringed the statutes and made himself liable to the penalties for which the plaintiff claims. I will not at this stage of the case occupy your attention with the character and constitution of the Apothecaries' Society. It may be enough if I remind you that the Apothecaries' Society are a very ancient company in the city of London, in whose favour, for public benefit, there has been a good deal of legislation from time to time; they were originally constituted in the reign of some of the early kings of this country, and they have received the attention of the legislature for the purpose of administering skilfully medicine in this country, from time to time down to the present time. I think there was a charter in the year 1617 which it is important for you to bear in mind, by which it is provided that no person should act as an apothecary unless he had undergone an apprenticeship of seven years, and had undergone an examination; so that you see as early as the year 1617 there had been attempts made by persons who had not undergone a proper examination so as to satisfy the legislature that they were able to administer medicine for the cure of diseases, and by that charter it was made compulsory on the persons who were to administer medicine that they should undergo an examination which was to be a test of their skill.

Mr. Justice Field: It is not an obligation.

Mr. Morgan Howard: Yes, my Lord, it specifies the penalties which persons are under who had not undergone the examination specified in the charter. Now, in the year 1815, the legislature, recognizing the still greater importance of preventing persons from affecting to prepare medicine and from attempting to cure diseases without having undergone proper examinations in that respect, interfered and passed an Act, which is the Act under which this action is brought. I may state very briefly to you with reference to this Act of Parliament, that power was given to the society to appoint a Court of Examiners, and it was enacted that from and after August 1, 1815, it should not be lawful for persons except those already in practice at that time to practise in England and Wales, unless he or they should have been examined by the Society of Apothecaries. "And to prevent any person or persons from practising as an apothecary without being properly qualified to practise as such, be it further enacted, that from and after the first day of August, one thousand eight hundred and fifteen, it shall not be lawful for any person or persons (except persons already in practice as such) to practise as an apothecary in any part of England or Wales, unless unless he or they shall have been examined by the said Court of Examiners, or the major part of them, and have received a certificate of his or their being duly qualified to practise as such from the said Court of Examiners, or the major part of them, as aforesaid, who are hereby authorized and required to examine all person or persons applying to them for the purpose of ascertaining the skill and abilities of such person or persons in the science and practice of medicine, and his or their fitness and qualifications to practise as an apothecary; and the said Court of Examiners, or the major part of them, are hereby empowered either to reject such person or persons, or to grant a certificate of such examination, and of his or their qualification to practise as an apothecary as aforesaid: provided always that no person shall be admitted to such examination until he shall have attained the full age of twenty-one years." Then it was further provided, "That no person shall be admitted to any such examination for a certificate to practise as an apothecary unless he shall have served an apprenticeship of not less than five years to an apothecary, and unless he shall produce testimonials to the satisfaction of the said Court of Examiners of a sufficient medical education, and of good moral conduct." Such is in brief outline the statutory obligations which rested on persons, and still rests on them with reference to the right of practising medicine as such in this country, as distinguished, you know, from the right which persons have under the Pharmacy Act of keeping open shops for the mere sale or vending of compound medicines. Now, by the Act of 1815, the legislature specified certain penalties against persons who should sin against that Act after the protection which is given, and those are the penalties for which we are suing to-day and for which the Apothecaries' Society are bound to sue, and which is the mode which the Act of Parliament indicates as the proper mode of procedure. Then it is provided, "That if any person (except such as are then actually practising as such) shall after the said first day of August, one thousand eight hundred and fifteen, act or practise as an apothecary in any part of England or Wales without having obtained such certificate as aforesaid,"—and that will not be attempted to be proved here, I believe I am at liberty to say, by my friend at the trial—it says that if any person act or practise as an apothecary without having obtained such certificate as aforesaid of the Society of Apothecaries, showing that he is qualified to act as such, he is liable to the penalties stipulated there. By that Act it was provided, "That nothing in this Act contained shall extend or be construed to extend to prejudice or in any way to affect the trade or business of a chemist and druggist in the buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicinable compounds, wholesale and retail; but all persons using or exercising the said trade or business, or who shall or may hereafter use or exercise the same, shall and may use, exercise, and carry on the same trade or business in such manner, and as fully and amply to all intents and purposes as the same trade or business was used, exercised, or carried on by chemists and druggists before the passing of this Act." It is on that part of the case that I believe my friend will endeavour to say something to you. That is the only point really made on these pleadings, and I will examine briefly the section of the Act of Parliament on that part of the case. The defendant alleges that before the passing of the Act of 55th George III., "It was usual and customary for chemists and druggists in using, exercising, and carrying on the trade or business of a chemist and druggist to prepare, compound, and supply medicines of their own selection, in their own shops, for the cure of simple complaints;" and the defendant says that if he did attend, advise, and supply medicines (which he denies), he did so by preparing, compounding, and supplying medicines of his own selection, in his own shop, for the cure of simple complaints, in accordance with the use and custom aforesaid, and not otherwise.

Now, gentlemen, section 28 of the Act of Parliament which stipulated that chemists and druggists were not to be affected by the Act, is in these terms, "Provided always, and be it further enacted, that nothing in this Act contained shall extend, or be construed to extend, to prejudice, or in any way to affect the trade or business of a chemist and druggist in the buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicinable compounds, wholesale and retail; but all persons using or exercising the said trade or business, or who shall or may hereafter use or exercise the same, shall and may use, exercise, and carry on the same trade or business in such manner, and as fully and amply to all intents and purposes as the same trade or business was used, exercised, or carried on by chemists and druggists before the passing of this Act." I will not, at this period of the case, detain you by a detailed criticism on the difference between the statement of defence of the defendant, and the provisions of that section of the Act of Parliament, but merely at present remind you that in the cases which I have to present to you we have nothing to do with the cases of simple ailments, and that, therefore, that is no defence to the action.

Now, gentlemen, the cases which I shall have to present to you by the witnesses in the witness box, are the cases of children suffering under complaints of a serious character. The complaints were so serious indeed that during the attendance of the defendant they died. I think there were three or four children, I am not going to say that they died, I would rather not say, I desire not to say it, and I do not say, that their deaths are to be attributed to any negligent treatment. I only mention the fact that the children did die, and I do so to point out to you that the children were suffering from very serious illnesses, of which he took their treatment, by which he has made himself liable to the penalties claimed. For instance, two children were taken to his own shop—taken by the parents. He examined them, asked what they were suffering from, that is, he asked their symptoms and asked the questions which you would expect to be asked by a person affecting to be skilled in medicine, and, having ascertained that, he then pronounced the disease from which they were suffering, and, in one case, he said the child was suffering from diarrhœa. He selected medicine, he made it up, he sold it, and received the money for it, and shortly after the administration, so serious in point of fact was the illness from which the child suffered, that the child died.

Now I take another example. A child is taken to the shop and the examination which I have described to you is made again, and the defendant says that the child is suffering from scarlet fever, and he makes up the medicine. The medicine is repeated, five or six times, I think. I think, in this case, the mother saw the defendant five or six times with reference to this particular child. He treats the child for scarlet fever; he takes the money for the medicine which he makes up and supplies, and that child dies.

Now another case is the case of a child ——

Mr. McIntyre: there are only two cases mentioned, my Lord, in the statement of claim.

Mr. Morgan Howard: We have given notice of a third.

Mr. Justice Field: I think you should amend by putting it in.

Mr. Morgan Howard: We have given them notice of it, my Lord.

Now, in another case, gentlemen, a child is evidently taken very ill. The child is not taken—probably it was too ill to be taken; the mother went to the shop and saw the defendant and told him the state of the child. He inquires what are the symptoms—what are the indications of the illness, and so on; and then, having heard all these things which he thought it necessary to learn, treating it with all the art and craft, if I may say so, which belongs to medical men who are qualified by long experience and by the practice of their profession, he decides that to be some simple case, such as wheezing on the chest or something of that kind; and that child dies of a disease known to physicians as pneumonia.

Now take another case. A child is taken to the defendant's shop. He examines her and goes into the question of the symptoms, and he decides her to be suffering from bronchitis. He mixes up medicines and he is paid for it. The child goes away, he sees her again and examines her, and then, I think it was upon that occasion, he advised—feeling that the child was in a critical position, he seems to have had some apprehensions that a fatal result might ensue—that a properly qualified man should be called in to see the patient. That child also died, and in respect of those four cases which I have offered to you as illustrations, I think I am entitled to say this: we can see the importance of the legislation which has been introduced into this country from time to time in not permitting persons who are not qualified by medical education and experience, which we all know is a matter of greatest difficulty, and can only be acquired by a patient and constant study, to act as duly qualified persons, and to protect the public from the maladministration of medicine.

Now, gentlemen, what the defendant says is, that he was entitled to do what he has done, as a chemist and druggist, and at all events entitled to treat simple ailments. Now if it were necessary to treat the case from that one point of view I think it would be enough to solve the question which my friend puts to you, to ask you if they were simple ailments. I think you will say they were not. If your children had such complaints, and a gentleman called them simple ailments, you would come to the conclusion that he was not skilled as a medical man, and scarlet fever, pneumonia, and so on would require a skilful man to treat them.

Now, gentlemen, the truth is that chemists and druggists are in no way hampered or hurt or injured by this legislation. They have been well taken care of by the legislature. They have the privilege of excluding from the practice of their own business all medical men who are qualified as medical men. They are entitled to be registered under the Pharmacy Acts in order to practise the business of a chemist and druggist. Therefore they have no right to complain, and whether or not a chemist or druggist was or was not such a person as is suggested by my friend in the pleadings in the year 1815, when this Act of Parliament was passed, I think will be quite unimportant to you. At that time it seems to have received consideration, as I think you would expect it would receive, from the legislature of King George III. The trade of a chemist and druggist is described as buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicinable compounds, wholesale and retail. I say, as it must be said, that the legislature of that day did not have the smallest objection, and nobody can have, to a chemist and druggist buying, selling, preparing, compounding, and vending drugs and medicines, and medicinable compounds, wholesale and retail. It is necessary that he should do that and not step over the line which he is not authorized to do, to prescribe in serious cases and administer his medicines as a duly qualified person, for that purpose. This definition of chemist and druggist has been recognized in later Acts of Parliament which it is not necessary for me to refer to, but I must own to you that it is now necessary for them to be registered under the Pharmacy Act.

Mr. Justice Field: Can you tell me of any definition of the words chemist and druggist?

Mr. Morgan Howard: Yes there is an examination provided for chemists and druggists, and I show you that it cannot be competent for them to deal with these cases where the law has declared that there shall be an examination in the proficiency of medicine or surgery, neither are they entitled to practise medicine, surgery, or any branch of it. There is an express provision as to the practice of surgery. The legislature has down to these days, within half a dozen years—so extremely anxious and jealous have they been of the attempts which were made by incompetent persons who have attempted to practise surgery—provided that they should not be permitted to undertake the cure of diseases which they are not competent to do, and to administer medicines for those diseases the character of which they do not understand. On the other hand, chemists and druggists can be registered under the Pharmacy Act, and therefore the legislature has taken care of both parties, and it is for the protection of medical men on the one side and for the public on the other that the proceedings are taken, in the only way in which they can be taken, to recover the penalties for the offences committed.

Now I have given you a brief outline of the case, but I may say in passing that my friend has put a plea on the record, as I have told you, about the trade or business as a chemist or druggist, but it is very noticeable with regard to the 28th section of the Act of George III., that whereas the section provides that it should not extend to, or prejudice the business of a chemist in the buying, preparing, compounding, and dispensing drugs, medicines, and medicinable compounds, wholesale and retail, the plea put on the record is, that before the passing of the Act it was usual for the persons to prepare, compound, and prescribe medicines of their own selection, in their own shops, for the cure of simple ailments. We shall see what they say, and I believe there is some intention on the other side of presenting to you some venerable personages who have survived since so long back as the year 1815, for the purpose of showing you that they prescribed for simple complaints in their days; but I do not think that it is a defence that because they did before, and in the year 1815, when they were young and vigorous, practise as chemists and druggists by curing simple complaints, and that therefore if they did it then they are entitled to do it now, and that that is a defence to the action. I think we shall find it is no kind of defence at all, and I present the case to you as being virtually an undefended action. Now the legislation of the country has received careful judicial exposition, and in the year 1843 there was a similar action to this, the case of Attorney-General against Lotinger, which is cited in the 2nd Moody and Robinson, at page 495. That was a question between the apothecary and the surgeon.

Mr. Justice Field: I see in the Attorney-General and Lotinger, Mr. Justice Cresswell seems to say that a surgeon is a person who professes the use of surgery—that is to say, he may cut off a limb as a surgeon, and that he may practise as an apothecary, if I may use those words, because he may prescribe something. It is said that he could do so.

Mr. Morgan Howard: You see, therefore, what Mr. Justice Cresswell, a judge of the greatest eminence, declared was the proper view to be taken of the difference between practising as an apothecary and a druggist, and as your good sense would suggest to you without the aid of law, the chemist is to make up the medicines prescribed by a physician and take his money for his medicine or pills. But the licensed apothecary, having undergone medical examination and medical education, could judge of the disease and be able to say what was the proper medicine which the patient ought to receive. Now if evidence is laid before you, as I believe it will be, that this gentleman judged of internal ailments by the symptoms, and ascertained, or professed to ascertain, what the patient was suffering from, and that he selected his medicines, made them up, and charged for them with a view to curing the patient—now if that is proved in that way, I think it would be difficult to have a clearer case than this, of a person practising as a medical practitioner who is not duly qualified. Now the apothecaries have this duty put on them by the legislature, and I ask you to return a verdict when you have heard the evidence for the plaintiff, and thus assist us in repressing and in bringing to a conclusion some of the attempts which are made to evade the proper province of proper medical practitioners who are duly licensed, and thus protect the lives and health of our fellow creatures; and gentlemen, I say it is not because they are poor that they are to be left to the incompetent hands of mere chemists and druggists, who do not profess, or who ought not to profess, to understand the art and science of medicine and surgery, and who are prohibited expressly by the legislature from acting as either the one or the other. I do not think I ought to detain you any longer at this stage of the case, but I shall have an opportunity of saying a word or two to you afterwards.

Now it would be safe if I were to refer your Lordship to a few cases. I cite to your Lordship the case of Ellis *v.* Hayden, 4th Bingham.

Mr. Justice Field: I want to know as a matter of law what a chemist is?

Mr. Morgan Howard: I think there is great warrant for saying that your Lordship can say that upon the construction of the Act of Parliament.

Mr. Justice Field: What is the qualification of a surgeon?—In the last Act the qualification of a surgeon is recognized.

Does it appear what the qualification of a surgeon is?—Section 31 of the last Act says, "Every person recognized by this Act shall be entitled according to his qualification or qualifications to practise medicine or surgery, or medicine and surgery, as the case may be." Now I want to know what is his qualification. What is the meaning of that "According to his qualification"?

Mr. Morgan Howard: I will refer your Lordship to Glenn's well known treatise, where your Lordship will find the qualifications of a surgeon.

Mr. Justice Field: But what is the qualification; where does the law lay it down. I know what the word means in common sense, but I want to know when the statute says he may practise under the name of surgeon. May I cut off a man's leg?

Mr. Morgan Howard: No, my Lord, you may not.

Mr. Justice Field: Why not.

Mr. Morgan Howard: Because you have no diploma.

Mr. McIntyre: Your Lordship may cut it off if you do not charge for it.

Mr. Morgan Howard: I will find it out by a specific reference; but I think here the question which we have to try is of a different character.

Mr. Justice Field: I quite agree the facts in this case do not point to surgery at all; but in construing the Act I have to say what a surgeon is, what an apothecary is, and what a chemist and druggist is. If I may cut off a man's leg, and in cutting off that leg, if I may administer cooling medicine, I should be acting both as a surgeon and as an apothecary, which I may do if I do not charge. I may cut off a leg and administer an aperient or cooling medicine.

Mr. Howard: That would be acting as a surgeon.

Mr. Justice Field: Yes, I, sitting as I am, not having gone through any Hall at all. Of course if I were to do it negligently I might be liable to be indicted for manslaughter or for murder.

Mr. Morgan Howard: Which we should be very sorry to contemplate. I will point out to your Lordship by and by what the precise qualification of a surgeon is, and I will now conclude what I have to say, that although for the purposes of the case it may be necessary by and by to construe the Act of Parliament, I will give your Lordship the definition in point of law of what a surgeon is and so on, yet upon the facts I have opened to you this is a case which is clear from any such difficulty which may arise as to that, because it is clear that an unqualified person keeping a shop as a chemist and druggist practised that which he is forbidden to practise, the art and science of medicine, and practised as an apothecary, which is only to be practised by a duly qualified person, and having prescribed for diseases of which really he knows nothing, administered medicines for the cure of those diseases and charged for the same, contrary to the provisions of the Act of Parliament. Now if I establish those facts before you I shall have made out a very clear case of infringement of the Apothecaries Act, and I trust you will assist the Apothecaries' Society in their endeavours to put down this unlicensed practising which is so detrimental to the community at large.

Elizabeth Culverwell sworn. Examined by Mr. Gore.

Do you live at 229, Fort Street, Bermondsey?—I do.

In September, 1876, had you a child of the name of Alice?—Yes.

At that time was it two years old?—It wanted a week to it.

Mr. Gore: In September, 1876, was it suffering from illness?—From a slight cold.

Did it keep its bed or not?—No.

Do you recollect going to Mr. Wiggins's shop—the defendant's?—Yes; on the Monday after it was taken ill.

Did you take your child with you?—No.

What shop does Mr. Wiggins keep?—It is a chemist's shop, I believe.

Did you see Mr. Wiggins there?—Yes.

What did he tell you about your child?—I told him my child was poorly; he asked me what I thought was the matter with the child.

Mr. Justice Field: Did he know your child? Had he seen it before?—Yes; I had taken it before.

What did you take her to him before for?—For the same complaint, a cold on the chest.

You had taken the child then had you?—Yes; before had, but not this time.

What happened next?—He said, what do you think was the matter with the child?

What did he tell you?—He said it was a cold, and if I could keep the wheezing there would be no danger.

He told you?—Yes; he said it was a cold.

What did you say to him?—I told him she had a wheezing on the chest, and she was very thick at the chest.

Mr. Justice Field: Is that all you told him?—Yes.

What did he say then?—He said if I could keep the wheezing there would be no danger, but if the wheezing stopped, and she got thick, there would be danger.

Mr. Gore: Did he say at all in what case it might be dangerous?—No he did not.

But if the wheezing continued there would be no danger?—Yes.

Did he give you anything?—He gave me a bottle of medicine and he told me to put mustard plasters on.

Mr. Justice Field: To put mustard plasters on her chest?—Yes.

Mr. Gore: Did you wait while he prepared the medicine?—Yes.

Did he prepare it himself?—No, his assistant.

In his presence?—Yes.

Mr. Justice Field: His assistant prepared it?—Yes. I think Mr. Wiggins went out of the room at the time.

Did he give directions to his assistant to prepare it?—Yes.

Mr. Gore: Did you see the assistant prepare it?—Yes.

Did he prepare it from one bottle or more bottles than one?—That I cannot tell you, it is a long time ago.

Mr. Justice Field: You cannot say if it was a mixture?—I cannot say; it is such a long time ago.

Mr. Gore:—Did you pay him for the medicine, and take it away?—Yes.

How much did you pay?—I think it was 7*d.*

Did he give directions how it was to be taken?—Yes.

What did he say?—I think it was a teaspoonful three times a day.

Mr. McIntyre: Did he say so, or was it written on the bottle?—It was written on the bottle, but he told me so besides.

Mr. Gore: Did you give it to your child?—Yes.

Did she take it?—Yes.

Did you go again to him?—Yes.

How soon afterwards?—I think it was the following night, as soon as the bottle was taken—the next night.

What did you tell him about your child then?—I told him I thought she was a little better.

Did he ask questions about it?—He told me to continue on the same that I was going on.

Mr. Justice Field: With the same medicine?—Yes.

Mr. Gore: What did he do on that occasion; what did he give you?—The same medicine, I believe.

Did he prepare it himself?—No, the assistant.

Mr. Gore: Was he there when it was prepared?—Yes, Mr. Wiggins was in the room, I think.

Did you hear him give any directions to his assistant?—Yes, I did; the same.

Did you give the medicine to the child?—Yes, my child was under him up to the Saturday. She was under Mr. Wiggins from the Monday to the Saturday.

Mr. Justice Field: What day was this?—We thought she was getting better, but afterwards we took further advice for her.

What happened on the Saturday?—On the Saturday we got further advice, and on the Monday she was taken very ill.

Mr. Gore: Did you administer any further medicine before the Saturday?—Yes, up to the Saturday.

How many doses?—I think it was about four bottles, not more; perhaps three.

Did you go to the shop for it twice?—Yes.

Did you see him on either of those occasions, or only the assistant?—Only the assistant.

Mr. Justice Field: You had three or four bottles of the same preparation, and on the Saturday you had further advice?—Yes.

Mr. Gore: I may take it that you paid on each occasion for the medicine that you got?—Yes, he always did her good each time I took her.

Who did—Mr. Wiggins?—Yes.

You mean on a former occasion?—Yes.

I believe your child died?—She did.

When did she die?—She lived until the Tuesday evening. I gave Mr. Wiggins up on the Saturday, because he could not attend the child.

On Saturday the child went to bed?—Yes.

And then you called in further advice?—No she was playing about on the Saturday, and I called in further advice because I was advised to, and on the Saturday she was taken to her bed and never got up again.

She was not so bad on the Saturday?—She seemed well to me, but it was other people.

Other people advised you to get other advice, and you did so, and she took to her bed, and was confined to her bed and died on the Tuesday?—Yes, but she did not die under Mr. Wiggins. I think if Mr. Wiggins had attended her, the child would not have died.

You think she would have recovered?—Yes.

Mr. Justice Field: We are not trying that question.

Mr. McIntyre: No, my Lord.

Mr. Justice Field: That is quite irrespective of the question. The question is, if he has come within the Act. We must keep clear from any imputation on Mr. Wiggins's knowledge of the science.

Mr. McIntyre: Yes, my Lord.

Mr. Justice Field: The question is, did he do a thing which the law says he ought not to do?

Mr. Morgan Howard: I abstained in addressing the jury from saying anything of the sort, except as to the fact that the children had died.

Mr. Gore: What did the child die of?—I do not know.

Cross-examined by Mr. McIntyre.

You took further advice. Was that the advice of a medical gentleman?—Yes, I believe so.

Did he call himself a doctor?—Yes, Dr. Cooper.

Did Dr. Cooper attend the child from the Saturday until the time the child died?—Yes.

During the time that Dr. Cooper attended the child Mr. Wiggins had nothing to do with the child?—No.

Mr. Justice Field: After the Saturday he had nothing to do with her?—No.

Fanny Grist sworn. Examined by Mr. Morgan Howard.

Do you live at Blue Anchor Road, Bermondsey?—Not now. I did at the time.

Had you a child named Lucy Grist?—No; Louisa.

She was unwell, was she not?—Yes.

Do you remember taking her to Mr. Wiggins's shop?—Yes.

When was that?—On the Sunday evening of July 1st.

July of last year?—Yes.

Had you been there with her before?—Yes.

The child had been suffering before?—Yes, but she had not been under Mr. Wiggins.

She had not been under Mr. Wiggins before?—No.

Now when you took her to Mr. Wiggins in July, 1877, she was ill, was she?—Yes.

What did you say to Mr. Wiggins when you took her to the shop?—I asked him to give me a little medicine for my child.

Was anything said about what was the matter with the child?—Mr. Wiggins did not say.

Did he inquire of you what was the matter with the child?—Yes. I told him I thought she was going to have convulsions.

Mr. Justice Field: What did he say to you when you asked him if he would give you a little medicine?—He said, "Yes, I will."

Well, what was next?—He asked me what were the symptoms, and I told him.

What did you say?—I told him I had given her half a teaspoonful of castor oil in the morning and she had been lying very ill all day. I told him when she was five months old she had had convulsions very bad.

How old was she then?—Twelve months.

When she was five months old what was the matter with her?—She had had convulsions and I thought by appearances she was going to have them again, and Mr. Wiggins thought the same.

Did he say so?—Yes.

Did he examine her?—Yes, he did.

And he said, "I think so too?"—Yes, and he gave me a bottle of medicine.

Did he prepare it?—Yes, he made it up himself.

Did you see how he made it up?—No, I did not notice that. And he gave a powder.

Did he make the powder?—I do not know. He took it from the drawer. I could not say.

Do you know whether he made up the medicine?—Yes, he did not take it down from the shelf.

Mr. Morgan Howard: Were there any directions as to how the medicine was to be taken by the child?—Yes, as soon as I got home I was to give her the powder, and an hour afterwards I was to give her a dose of the medicine. which I did.

Mr. Justice Field: Do you know what the draught was?—No; I think it was two teaspoons.

What sort of draught was it?—I think there was rhubarb in it. It was an aperient draught. My children had had something similar before.

Did you pay for this medicine and powder?—Yes: I am not sure how much; it was either 6*d.* or 9*d.*

Did it act on the child's bowels?—No.

You administered the medicine to the child?—Yes.

How many doses were in the bottle, do you remember?—She only took one dose.

Did you take her to the shop?—Yes.

On the Sunday evening?—Yes.

Mr. Justice Field: Did you give her the whole of the contents of the bottle?—No. She died just after we gave her the first dose.

How much was she to have of the mixture?—I won't be sure, it was either one or two teaspoonfuls, but we gave her only the one.

After the first dose she died?—Yes, she died in convulsions.

Mr. Morgan Howard: Did you see Mr. Wiggins after that?—Yes.

When was it?—When the child was taken with this fit, my husband ran over to the nearest doctor. It was Dr. Reid. He came over immediately, but when he came the child had just died.

Did you see Mr. Wiggins after this?—Yes, I went and told him on the Monday.

How long was that after the death?—The day after.

What did you tell him?—I told him my little one had died and I had called on Dr. Reid and he could not give me a certificate.

Did you tell Mr. Wiggins why he could not give a certificate?—Yes.

Mr. Justice Field: He had not attended the case.

Mr. Howard: I only wanted to get it *pro formâ.*

The Witness: I should like to say when I came away from Mr. Wiggins's on the Sunday night, I asked him if he thought she was very bad, and he said, "Yes, she was, and if she was no better I was to call in a medical man the first thing Monday morning.

Mr. Justice Field: He told you that on the Sunday night?—Yes.

Then you gave the child the mixture on the Monday?—No, on the Sunday. It all happened on the Sunday.

When was it you saw Mr. Wiggins?—On the Sunday.

And he said that the child was very ill?—Yes.

And if it was not better in the morning?—No, she died on the Sunday evening.

I want to know what he told you about it.—He said, if she was no better I was to call in a medical man on the Monday morning.

Mr. Morgan Howard: I understood you to say he told you when you saw him first about the child that he thought it might be convulsions?—He said, probably, it might be that.

Did he say anything more about that?—He asked me if the child had had diarrhœa, and I said, "No."

Mr. Justice Field: That was on the Sunday?—Yes.

Mr. Morgan Howard: The child was then in the shop with you?—Yes.

Did he examine her tongue?—Yes.

And feel her pulse?—Yes, he did feel her pulse.

After the examination you had the mixture for her?—Yes.

Mr. Morgan Howard: When you had taken the child to him on the previous occasion, had you taken her for any illness that you wanted him to look at?—Yes. When she was three months old I took her to him and he would not prescribe. He told me to take her to a medical man then.

Mr. Justice Field: On a previous occasion you told him what?—That she seemed as if she was teething.

Mr. Morgan Howard: Was she then about three months old?—Yes.

Cross-examined by Mr. McIntyre.

Mr. McIntyre: Was the child teething on the last occasion when you took her?—Yes, I think it was that.

You think she was teething then?—Yes.

And on this last occasion, I believe, you only took her once, and that was on the Sunday evening?—Yes.

Did Mr. Wiggins on that Sunday evening tell you that if the child at any time had convulsions coming on you were to send for a medical man?—He did not distinctly say at any time.

But if not better that night, or if she became worse that night, did he say you had better send for a medical man?—No, but if I thought she was worse I should have sent for one.

What time was it?—It was about half past six.

Mr. Justice Field: What time did the child die?—About eight o'clock.

Mr. McIntyre: Did the child die in convulsions:—She had one fit.

Did she die in that fit?—Yes.

Re-examined by Mr. Morgan Howard.

There was only one fit?—Yes.

Had she had any convulsions before you took her to the shop on that day?—No.

Rosina Bennett sworn. Examined by Mr. Morgan Howard.

Do you live in Bermondsey, and do you know the defendant, Mr. Wiggins?—Yes.

Do you remember in the month of January, 1877, of last year taking your child to Mr. Wiggins's shop?

Mr. Justice Field: It is February.

Mr. Morgan Howard: It is February in the pleadings, but I think it is January.

Was your child unwell?—Yes.

Mr. Justice Field: What age was she?—Four years old all but two months.

Mr. Morgan Howard: Did you take her to Mr. Wiggins's shop and did you see him?—Yes.

Did he ask you anything about the child?—He looked at her.

Mr. Justice Field: What did he say?—She had bronchitis very strongly and I was to take great care of her.

Mr. Morgan Howard: Did he ask you anything about it, as to how long she had been unwell?—No.

He looked at her and said she had bronchitis.—Yes.

I must ask you what part of her did he examine. Did he look at her mouth?—He looked at her throat.

Mr. Morgan Howard: Did he give you any medicine for her?—Yes.

Did he make it up?—Yes; in my presence.

Was it in a bottle?—Yes.

Did you pay him for it?—Yes; sevenpence.

Mr. Justice Field: Did he make it up?—Yes.

From one or more bottles. Did he mix anything together?—I did not notice that.

You cannot say whether it was all one thing?—No; I did not notice that.

Mr. Morgan Howard: What did he take the medicine out of which he put into the bottle?—Out of bottles.

Did he give you any directions as to how the child was to take this medicine?—Three times a day.

Did you give that bottle of medicine in doses to your child?—Yes.

Did the child get better under that or not?—She was getting worse.

Did you go again to the shop?—No.

Did Mr. Wiggins see the child again?—No; I took her to Mr. Cooper.

What I wanted rather to get from you was this. After you got that bottle of medicine and gave it to the child, you say she did not get better?—No.

Did you get another bottle of medicine from Mr. Wiggins?—No; I took her to a doctor after that.

You went to a doctor then?—Yes; to Dr. Cooper.

Your child died, I think, the next day?—No; not the next day; on the Saturday morning.

A day or two afterwards?—Yes.

Cross-examined by Mr. McIntyre.

Had the child been ill before that?—No.

Had not she had the measles?—Yes, she had had measles and caught cold.

You treated her for measles yourself?—Yes.

Was it after the measles that you took her—when she had caught cold?—Yes.

You say that Mr. Wiggins looked into the child's mouth?—Yes; over the counter.

He looked over the counter, and looked at the child as she was there?—Yes.

And you had this bottle of medicine?—Yes.

Did he say, "The nurse is as good for the child as the doctor, take care of her"?—Yes: it depended on the nurse as well as it did on the doctor.

Do you recollect what day of the week it was that you took her on this occasion?—No, it is so long ago.

How many times did Dr. Cooper see her?—Only once, and I went and got a bottle of medicine afterwards.

After Dr. Cooper had seen her you went and got another bottle of medicine from him, Dr. Cooper?—Yes.

Can you tell me how many days the child lived after Dr. Cooper first saw her?—I cannot remember.

You can tell me whether it was a week?—Not a week.

Was it on the Saturday that she died?—On the Sunday.

Was it on the Monday before that that you went to Dr. Cooper?—I think it was on the Tuesday; I think so.

I believe you could not go to him before because you had not the money?—Yes, my sister gave it to me.

You got that on the Monday before the child died on the Sunday?—It was either the Monday or Tuesday.

Re-examined by Mr. Morgan Howard.

Can you tell me whether Mr. Wiggins saw your child previously to this at any time?—Yes, he did see her once before when she had the yellow jaundice.

When was that:—That was long before. He cured her.

Mr. Justice Field: What was that?

Mr. McIntyre: The witness said the doctor cured her. Care must be taken not to suppose that this is a question of skill in cure. We know children will die. There is nothing in that.

Mr. Justice Field: The Act of Parliament is the only thing which we have to deal with.

Caroline Leggatt sworn. Examined by Mr. Morgan Howard.

Do you know Elizabeth Loades?—Yes.

Was she related to you?—She was my grandchild.

Did you go to Mr. Wiggin's shop about her?—Yes.

When was this; do you remember?—On the Monday morning; the last week in March.

Did you see Mr. Wiggins?—I did.

Did you tell him the child was ill?—Yes.

Did he ask you to describe what was the matter with her; what she was suffering from?—Yes.

What did you tell him?

Mr. Justice Field: I suppose he said "What is the matter with her?"—Yes.

Now what did you say?—I told him it was a violent cold.

Mr. Morgan Howard: Did you describe anything else about her to him?—I said she was very sick.

Mr. Justice Field: Had she been very sick?—Yes.

How old was the child?—Four years and ten months.

Mr. Morgan Howard: Did he ask you anything else about her?—No.

I mean as to whether there had been action of the bowels or anything of that sort?—No.

Having told him what you have told us, what did he say was the matter with her?—He did not say; he said he would make a little medicine.

Mr. Justice Field: Did he examine the child?—She was not there.

Mr. Justice Field: He said he would give her some medicine?—Yes.

Mr. Morgan Howard: Now had he previously to that seen the child himself?—Never.

Did you get some medicine from him?—Yes.

Did he make it up for you?—Yes, I believe he did.

In your presence?—Yes.

Did you see him do it?—I do not think any one else was there.

Mr. Justice Field: Did you see what he did?—I saw him go to one or two bottles and he gave me the medicine.

Did you see him mix the two up together?—Yes.

Mr. Morgan Howard: Did he give you any directions as to how the mixture was to be taken?—The label was put on the bottle.

Did he write anything on the label himself?—That I cannot say.

There was a label on the bottle?—Yes.

Did he put it on the bottle?—He did.

Did you pay him?—Yes, I paid sevenpence.

I do not know whether you yourself saw him after that?—I went to the shop once after that.

Before he saw the child or afterwards?—He never saw the child.

When did you go to him again; how soon after you got the medicine?—I think it would be on the Tuesday.

Was that a day or two after?—I went on the Monday first.

And you went the following day?—Yes.

Did you see him yourself?—I did not.

Did you see the assistant?—No, I did not.

Whom did you see?—I saw Mrs. Wiggins.

You need not tell us anything that passed between you and Mrs. Wiggins; did you get any more medicine?—Not then.

When did you?—Mr. Wiggins was not in.

You left a message I suppose?—Yes.

Did you go again?—I did not, I wished the mother of the child to go.

Cross-examined by Mr. McIntyre.

I did not catch the date when you were there?—It was about the last week in March.

Do you say he went to more than one bottle, or gave you the mixture out of one bottle?—I cannot say that.

It is a long time ago as you say?—It is two years ago.

Were you asked about the circumstances since?—I was not asked about it until that gentleman called on me, I think in August.

Which gentleman?—That gentleman [pointing].

The solicitor?—The solicitor.

You do not know which it was; the gentleman came in August?—Yes, I believe it was in August.

Mr. McIntyre: Did she say it was two years ago that she took it, my Lord?

Mr. Justice Field: Yes.

Mr. McIntyre: That is not either in the particulars or the statement of claim, or anything else.

Mrs. Elizabeth Loades sworn.

Mr. McIntyre: Upon that your Lordship sees the particulars are confined to 1877—March, 1877.

Mr. Morgan Howard: The witness said March, 1877.

Mr. McIntyre: She said it was two years ago, my Lord.

Mr. Morgan Howard: I have called a witness. She said March, 1877.

Mr. McIntyre: She said two years ago.

Mr. Morgan Howard: Here is the mother.

Mr. Justice Field: "Ada Elizabeth Loades, from 14th of March, 1877, or thereabouts."

Mr. McIntyre: They gave the names, but when we applied for the addresses they refused to give them.

Mr. Morgan Howard: Do you object that this is not in the particulars?

Mr. McIntyre: Yes.

Mr. Morgan Howard: The witness has already said it was in March, 1877.

Mr. McIntyre: She says two years ago.

Mr. Morgan Howard: She had said 1877; it is a mere matter of arithmetic.

The Witness: It was two years ago last March.

Mr. Justice Field: Then it is clearly two years last March. You have given a wrong date in the particulars. I do not know whether it is to go off on that account.

Mr. Morgan Howard: We gave the names.

Mr. McIntyre: But you refused to give the addresses. Before the Judge in Chambers they said they were not bound to give the addresses, and did not do so. My learned junior attended it himself.

Mr. Morgan Howard: The order of the judge I have here:—"I do order that you deliver particulars of the other persons and the cases complained of in the statement of claim, or file an affidavit stating that the plaintiff can give no further particulars." Then they delivered the particulars, "Ada Elizabeth Loades, from the 14th March, or thereabouts."

Mr. McIntyre: They filed an affidavit stating that they could give no better particulars, and after that they gave another case.

Mr. Morgan Howard: Yes, particulars, not another case. As soon as we discovered the facts we sent them the information.

Mr. Justice Field: The question is whether, I think, the defendant is prejudiced in that respect. Do you propose to call the defendant?

Mr. McIntyre: Yes, my Lord, if necessary.

Mr. Justice Field: We will take the evidence and see whether he is prejudiced. Take the evidence before the objection is taken.

Mr. McIntyre: Your Lordship in taking the evidence would say not only should the particulars be amended, but the statement of claim should be amended altogether.

Mr. Justice Field: That I should have no difficulty about. If the information is given by particulars, which embody the statement of claim as a rule, I think the parties had better deal with it as it stands, but the difficulty I feel is that you have had no notice of this case; you had notice of Elizabeth Loades.

Mr. McIntyre: Not except by name.

Mr. Justice Field: The case of Ada Elizabeth Loades. You are told it was in 1877. Now if it should turn out that there was a witness who might have assisted you in 1876 who is not here, that would be a matter to be considered.

Mr. McIntyre: As this is an action for penalties, brought under this Act of Parliament, they ought to be very strict in giving their particulars.

Mr. Justice Field: That is a rule I do not understand.

Mr. McIntyre: But it has been understood by your Lordship's predecessors, or at least acted upon.

Mr. Justice Field: Yes, you are well warranted in saying that, but I do not know why I should not. If it is a good or a bad action I have nothing to do with it. I have nothing to do but to enforce the law, whether I think the law is good or not; I may have my own view and other people may have theirs, but I have to try cases so that neither parties should be prejudiced. If I could see at the present moment any reason to suppose that your defence would be different in Loades's case, or that you would be worse off with regard to Loades's case by reason of a mistake in the date—I am sure it is a mistake—I would adjourn the matter.

Mr. McIntyre: I do not know, because we have had other persons. We endeavoured to get particulars and resistance was made to every attempt.

Mr. Justice Field: Of course the Society of the Art and Mystery of Apothecaries have their duty to perform, and it is their duty to get up evidence. We know how even if you are the client yourself, you do not like to give the solicitors dates. I do not say that you would not, but you might not like to. Just consider how easy it would be. For that woman who first came here said first of all that it was in 1877, but that was because Mr. Morgan Howard put it to her.

M. McIntyre: And she adopted the date, whatever it was.

Mr. Justice Field: On the whole I think I will do this. You had better try it out now. If I see that you have any reason to be prejudiced on that particular matter I will protect you when I come to that particular case, or if necessary I will adjourn for a short time, if you show me that there is any injury done to you, for you to get any witness you like so that you shall not be harmed.

Mr. McIntyre: Very good, my Lord.

Mr. Justice Field: It is very much the same character as the two other witnesses; it is not a question of amount here, it is a question of principle.

Mr. Morgan Howard: Quite so, my Lord. It is not the pecuniary penalty that my friend so much fears.

Mr. Justice Field: No; I dare say Mr. Howard would not ask for the penalty.

Mr. Morgan Howard: I will say this at once to my friend, that out of those four cases, which I hope to submit by and by are entirely proved, I shall only ask for one penalty.

Mr. Justice Field: I assume that is the only object of the action.

Mr. Morgan Howard: Quite so, my Lord.

Examined by Mr. Morgan Howard.

The lady who was last in the witness-box was the grandmother of your child?—Yes.

She has told us that she went to see Mr. Wiggins. Did you after her visit go and see Mr. Wiggins yourself about the child?—Yes.

Was that after your child had taken the medicine which was brought from the shop?—Yes.

Was the child better or worse when you went?—No, I think she was worse.

You went and saw Mr. Wiggins at the shop. What did you tell him?—I told him that she had had a restless night.

Mr. Justice Field:—Had you employed him before?—Not in that case.

Mr. Morgan Howard: Was it a boy or a girl?—A girl.

You told him she had had a restless night?—Yes; I told him that she was not quite so feverish as she was.

Not quite so feverish?—No. I think I asked Mr. Wiggins what he was attending my child for from the first, and he then told me it was scarlet fever. I then asked him whether he thought my child was getting on all right. He said yes, as long as her throat did not swell; that is all that he said.

Did you get any medicine from him?—I think so, but I am not certain.

Just try and remember whether you did. Did you give the child medicine after seeing Mr. Wiggins?—Myself; yes, I do not think I was without medicine.

Did you have a bottle after the one the grandmother had brought the child?

Mr. McIntyre: She does not say so.

I am not certain.

Mr. Morgan Howard: You do not remember whether she had another bottle from Mr. Wiggins or not?—No.

Do you remember paying him any money since that?—I do not.

How often did you see Mr. Wiggins yourself?—I only saw him once; that was on the Wednesday evening.

Did you get a powder at all?—Yes, a powder.

Mr. McIntyre: My friend ought not to lead, my Lord.

Mr. Justice Field: No.

Mr. Morgan Howard: I believe you called in Dr. Cooper to see the child, did you not?—Yes, on the Friday morning.

When did the child die?—On the Friday night.

Cross-examined by Mr. McIntyre.

The child was never taken to Mr. Wiggins, as I understand you?—No.

Mr. Justice Field: Did you say anything more than this? "I said she had had a restless night, but she was not quite so feverish." Did you tell him anything more about her symptoms?—I only told him that she had a very restless night, and I thought she was no better.

Did you describe any symptoms?—That was all after what mother described about her.

Mr. Morgan Howard: I have omitted one question which I ought to have asked, my Lord.

Mr. Justice Field: Very well.

Mr. Morgan Howard: When you asked him what he was treating your child for did he look at a book?—He did.

He looked at his book?—Yes, before he could tell me.

Then he said what?—Scarlet fever.

Mr. McIntyre: What sort of a book was it that he looked at?—I could not say, but I believe it was a long narrow book.

Was it a thin book, or a thick book, or a printed book, or what. Did you see that?—No, it looked like a book that he always put his medicine in.

Mr. Justice Field: A prescription book.

Mr. McIntyre: A day-book.

Mr. Justice Field: Or a copy of the prescription.

Mr. McIntyre: Before you sent for Dr. Cooper, had the child's throat swelled?—Not that I noticed, I do not know that it ever swelled at all, she was having poultices on her throat all the time.

When?—All the time she was ill.

Before your mother went to see Mr. Wiggins?—At the time.

At the time your mother went to Mr. Wiggins she had poultices on her chest?—Yes. Mr. Wiggins prescribed it.

After your mother came back from Mr. Wiggins they were put on the child's chest and kept on?—Yes.

How long had your child been ill before your mother went to Mr. Wiggins?—Only that morning.

When was your attention first called to this after that?—I do not remember whether there was a call before last August.

That was about the time when this was proceeding, the 28th of August. Who was it that called?—A gentleman who is here in court now.

Who is he?—There he is.

Mr. Justice Field: I should like to ask Mrs. Leggatt a question.

Mrs. Leggatt recalled. Examined by Mr. Justice Field.

Will you try and remember what it was you said to Mr. Wiggins when you saw him on the Monday about the child's state?—No I cannot.

Have you told me all you told him?—Yes.

All you told him was that she had a violent cold?—I told him I thought so.

And that she had been very sick?—Yes.

You did not describe any other symptoms at all?—I might have said that she had a headache. That I cannot say.

Had she any rash on her?—No.

When did the rash come out on the child?—I cannot remember.

Did you see the child before you went to Mr. Wiggins?—Yes.

At that time was there anything that you can remember that you told him of?—No.

Mr. George Joseph Cooper sworn. Examined by Mr. Gore.

Are you a member of the Royal College of Surgeons and have you practised for some time past at 9, Linden Villas, Blue Anchor Road, Bermondsey?—I have.

Do you recollect Mrs. Bennett, the witness called here to-day, bringing a child to your surgery in January, 1877?—She called on January the 4th.

Mr. Justice Field: Did she bring a child or not?—She brought the child.

Mr. Gore: Did you examine the child?—I did.

Did you ascertain what the child was suffering from?—Acute bronchitis.

Mr. Gore: What stage was it in of that disease?—An advanced condition.

I believe as a matter of fact it died the next day?—It died on the 7th.

That would be three days after you saw it on the 4th?—I told the mother it would die when I saw it.

From its condition on the 4th when you saw it could you say how long it had been suffering at all from this disease?—Several days.

Was it suffering from a serious disease?—Yes.

Mr. Justice Field: You said acute bronchitis. Acute advanced bronchitis.

Mr. Gore: Did it require medical skill and attention.

Mr. Morgan Howard: I think we may assume that it did.

Mr. Gore: Do you recollect also seeing a child of Mrs. Culverwell, a witness who has been called here?—I saw her on September 16, 1876.

Will you tell us what it was suffering from?—I examined that child, and found it was suffering from an advanced state of pneumonia—inflammation of the lungs.

From what you saw, Mr. Cooper, can you tell us whether it had been so suffering for a considerable time?—For four or five days.

Is pneumonia a serious disease?—Very serious.

Do you recollect a child of Mrs. Loades being brought to you or did you go to see it?—I was called to see it.

When was that?—On the 31st of March, 1876.

What was the child suffering from?—Dying of scarlet fever.

Mr. Justice Field: Dying from what?—Scarlet fever.

Mr. Gore: Was it a bad case of scarlet fever?—Yes, a very severe form.

How long did it appear to you to have been suffering when you first saw it?—From the condition of the throat I should say four or five days.

It did die, I think?—Yes; a few days after I saw it.

I think you have given us the date on which you went.—Yes.

I do not know if you saw any other child that has been mentioned to day.—No, I did not.

Cross-examined by Mr. McIntyre.

You have not given us your qualification.—I am a Member of the Royal College of Surgeons, and Licentiate of the Apothecaries' Society.

Have you been at all active in getting up this case?—Not at all.

Or in giving any information?—I certainly gave the information of these three cases.

To whom?—To the late Dr. Reed.

To a Mr. Lingford?—No, to Dr. Reed.

When was that?—I cannot tell the date, it was sometime in the autumn of 1877.

The cases occurring, two of them at all events, in 1876, What was Dr. Reed?—He was a medical man living close beside me.

A neighbour of yours?—Yes.

Was he anything else?

Mr. Justice Field; Was he a physician?—He was a Licentiate of the College of Physicians of Edinburgh and an apothecary as well.

Mr. McIntyre: And secretary of the Medical Defence Association?—I believe so, but I cannot say.

Did he keep a shop?—He had done so.

But he did keep the shop for selling patent medicines, did he not?—He had done so, he had put it down.

Mr. Morgan Howard: We should not object to that.

Mr. McIntyre: Now acute bronchitis does not always develope itself very rapidly, does it?—You can always tell the symptoms of it. The fatal symptoms develope themselves more rapidly.

Acute pneumonia. That is inflammation of the lungs, and it commences with a cold, and it may develop itself into pneumonia very rapidly?—I hardly know what you mean by "a cold."

I should have thought you would know it better than I do; you know what it is when a person catches cold. The first stage is catching a catarrh?—Medical men would examine the child's lungs. "A cold" is a popular phrase.

If you only had the report of the grandmother or the mother, you could not tell how long the symptoms had been developing?—Certainly; by the condition of the child.

Did you see the child before it was dead?—Certainly.

Re-examined by Mr. Morgan Howard.

Supposing a medical man had been applied to to see the child he ought to have seen it in the proper way?—Yes.

And have made a personal examination of the child? Yes.

Is Dr. Reed dead?—He is.

I do not know if you happened to see any of the physic that was given?—I believe Mrs. Loades showed me some, but I could not say what it was.

Mr. Morgan Howard:—That is our case, my Lord.

Mr. McIntyre: I should submit to your Lordship that there is no case to go to the jury. Your Lordship sees the penalties are sought to be recovered against the defendant, and what I submit to your Lordship is that the statement of claim both in substance and in words seeks to obtain the penalties against the defendant on account of his having acted and practised as an apothecary without such certificate, by attending, advising, and supplying medicines as an apothecary. Now, my Lord, first of all there is no definition, and my learned friend has not been able to show your Lordship one, of what is "acting and practising" as an apothecary, and as he seeks to recover penalties under this 20th section of the Act of Parliament, I submit to your Lordship that he ought to prove what is acting and practising as an apothecary, because as to giving medicines or compounding medicines, it is quite clear that physicians and dispensing doctors may do exactly what an apothecary may do in the mixing, preparing, and compounding medicines according to prescriptions.

Mr. Justice Field: But there is no prescription here at all you see. As the case now stands, a person goes into the shop, he does not produce any prescription, and he does not say, give me a liniment or a solution of magnesia or anything else, but says, my child is suffering from so and so, whereupon the defendant says, I will give her some medicine; or he is asked, will you give her some medicine, and he thereupon administers medicines in the one case, or powder and a draught. What they are composed of we do not know.

Mr. McIntyre: It may have been no more than a simple powder.

Mr. Justice Field: No.

Mr. McIntyre: I should submit to your Lordship that some discretion must be exercised by the person who gives the medicine. They have a right to sell the medicines.

Mr. Justice Field: I cannot tell. I tell you honestly that I do not know exactly what an apothecary means, and I do not know exactly what a druggist means.

Mr. McIntyre: And I do not pretend to know either.

Mr. Justice Field: You had better look at the Act of Parliament to see. I think the best thing we can do is to apply our minds and see what light the Act of Parliament throws on it. It is new to me as to the particular construction of it. The charter had its origin in those days when everybody who carried on a business was a member of an art and a society. It is just like the clothiers, and mercers, and tailors in the present day, they have exercised the art and they are combined in a craft. Now the people who carried on the business of the Society of Apothecaries are the plaintiffs here, and now let us see who the people were who were to become apothecaries.

Mr. W. McIntyre: They were at that time the same thing as the Company of Grocers.

Mr. Justice Field: Not at that time if you look at the Act.

Mr. McIntyre: I do not mean in 1815. I thought your Lordship meant earlier.

Mr. Justice Field: The foundation of the legislation was in the reign of King James I. I should have thought the better plan would have been to take the evidence. There may be one or two points of law arise, but I should not like to stop the case now.

Mr. McIntyre: As I am instructed I am anxious to get your Lordship's decision upon this as a point of law.

Mr. Justice Field: I cannot give it to you now. No power on earth could make me do that, as I do not understand it.

Mr. McIntyre: Your Lordship sees what I was saying about the grocers and apothecaries. I was quite right, for I hold in my hand the charter of King James I.

Mr. Justice Field: Never mind about the charter, take the Act which they are suing under, and look at the recital there: the preamble says this, "Whereas His Majesty King James I., by letters patent, under the great seal of Great Britain, bearing date the 6th day of December in the fifteenth year of his reign, did for himself, his heirs and successors, grant unto William Besse," who, I dare say, was a great apothecary in those days, "and divers others persons therein named, and to all and singular other persons whomsoever brought up and skilful in the art, mystery, or faculty of apothecaries, and exercising the same art, mystery, or faculty, then being freemen of the mystery of grocers," which exists now. Then, apparently, that was a sort of sub-faculty—it is a sub-faculty—attached to the grocers, which were known as those exercising the art, mystery, or faculty of the Society of Grocers; and then it goes on to say, "or being freemen of any other art, mystery, or faculty in the City of London (so as they had been brought up and were expert in the art or mystery of apothecaries)," so that there must have been at that time an art or mystery known as the art and mystery of apothecaries. That was done by the charter of James.

Mr. McIntyre: Yes, my Lord, that was done by the charter of James, which recites that it is expedient to separate these apothecaries from the grocers.

Mr. Justice Field: Now I must look and see what they are to do by that charter. (His Lordship referred to the charter.) Nobody asks whether or not this gentleman had anything over his door or over his shop. That is curious enough because the word apothecary after all only comes from the root of a Greek word, which is a deposit, or the place of deposit, and you know in Germany you always see "Apotheke" written up, which is the same thing. The monks were the original apothecaries in the world; they dispensed their medicines, and they still do so at the monasteries. Then we hear there was a certain Society of Apothecaries. Now what definition is there of apothecaries. Have you looked at the dictionary to see what it means?

Mr. Morgan Howard: It comes from the Greek word.

Mr. Justice Field: I know it does. I will refer to Webster's Dictionary and see, but I cannot say at present but what there is really evidence. I do not know what apothecary means, but I am inclined to think it may be something of that kind.

Mr. Morgan Howard: There is a case of Apothecaries' Company *v.* Allen, 4 Barnewell and Adolphus.

Mr. Justice Field: Is that the case in which it was said that the very fact of his coming with the prescription and could not make up the prescription was strong evidence that he was acting as an apothecary.

Mr. McIntyre: Yes, my Lord.

Mr. Justice Field: I say there is evidence for the jury as to the acting as an apothecary, but I will take a note of your point.

Mr. McIntyre: I call your Lordship's attention to this Act, and I want to have this section on your Lordship's note now.

Mr. Justice Field: I will give you the benefit of it at the end of the case. In the old days I should have said to you I will not stop the case, but give you leave to move. At present I reserve the benefit for you.

Mr. McIntyre: Will your Lordship also take a note of this case?

Mr. Justice Field: Yes, I will put the bane and the antidote side by side.

Mr. McIntyre: It is the Attorney-General against the Royal College of Physicians, 30 Law Journal, Chancery, New Series. The judgment of Vice-Chancellor Wood is at page 765, and there he speaks of what is the practising as a physician or practising as an apothecary.

Mr. Justice Field: I do not understand practising a business. I can understand carrying on a business, and in that business you may do two things: you may sell any one of those numerous things which a newspaper invites me to buy every day, namely, patent medicines, which you can get at a chemist's, but that is not practising it. I understand a practice to mean a practice of a barrister, or a solicitor, or a surgeon, or an apothecary. That is what I understand to be a practice of an apothecary. Well, it would not pay for a man to practise a pure apothecary's business, and so he combines with it the sale of every species of things that people are likely to want in that order of life, and who come to him for medicines and he sells them. That is clearly not practising as an apothecary. He also sells cigars, and lemonade and soda water. The question there is if it does not come within the Refreshment Act.

Mr. McIntyre: I cannot say, my Lord.

Mr. Justice Field: And he sells strengthening medicines which he gives you in the morning.

Mr. McIntyre: Then there is the 15th section.

Mr. Justice Field: "And whereas it is the duty of every person using or exercising the art and mystery of an apothecary to prepare with exactness"—that you are entitled to—"to prepare with exactness and to dispense such medicines as may be directed for the sick by any physician."

Mr. McIntyre: That clearly a chemist may do.

Mr. Justice Field: That indicates what a chemist is.

Mr. McIntyre: If that is so a chemist clearly may act.

Mr. Justice Field: Without a certificate?

Mr. McIntyre: Certainly. The 15th section seems rather to point out that the duty of the apothecary is to prepare with exactness, and to dispense such medicines as may be directed for the sick by any physician, and it imposes a penalty on him if he does not do it. And then it goes on "That if any person using or exercising the art and mystery of an apothecary shall at any time knowingly, wilfully, and contumaciously refuse to make, mix, compound, prepare, give, apply, or administer, or any way to sell, set on sale, put forth, or put to sale to any person or persons whatever any medicines, compound medicines, or medicinable compositions, or shall deliberately or negligently, falsely, unfaithfully, fraudulently or unduly make, mix, compound, prepare, give, apply, or administer, or any way sell, set on sale, put forth, or put to sale to any person or persons whatever, any medicines, compound medicines, or medicinable compositions as directed by any prescription, order, or receipt, signed with the initials, in his own handwriting, of any physician."

Mr. Justice Field: That is for the further security of the subject. There the obligation is put upon him.

Mr. McIntyre: Yes, that he shall prepare according to the prescription of the physician.

Mr. Justice Field: That does not limit him.

Mr. McIntyre: Then the 20th section is the penalty section. "If any person (except such as are then actually practising as such) shall after the first day of August, 1815, act or practise as an apothecary in any part of England or Wales, without having obtained such certificate as aforesaid, every person so offending, shall for every such offence forfeit and pay the sum of £20, and if any person (except such as are then acting as such, and excepting persons who have actually served an apprenticeship as aforesaid) shall after the first day of August, 1815, act as an assistant to any apothecary, to compound and dispense medicines without having obtained such certificate as aforesaid, every person so offending, shall for every such offence forfeit and pay the sum of £5." Then there is the 28th section: "Provided, and it is hereby enacted that nothing in this Act contained shall extend, or be construed to extend, to prejudice or in any way to affect the business of a chemist or druggist in the buying, preparing, compounding, dispensing, and vending drugs, medicines and medicinable compounds wholesale and retail; but all persons using or exercising the said trade or business or who shall or may hereafter use or exercise the same shall and may use, exercise, and carry on the same trade or business in such manner, and as fully and simply to all intents and purposes as the same trade or business was used, exercised, or carried on by chemists and druggists before the passing of this Act." Now your Lordship sees that they are allowed to buy, to sell, to prepare, compound, and to dispense medicines, that is they may prepare and compound, and when it is prepared and compounded they may dispense it. Now what I submit to your Lordship is this, that all that is proved here is at the outside the preparing, compounding, and dispensing.

Mr. Justice Field: And the vending.

Mr. McIntyre: Yes, and vending.

Mr. Justice Field: And he advised patients, and he made up and sold to them the medicines which he himself ordered.

Mr. McIntyre: Yes, my Lord. He was not a chemist, as your Lordship remembers. There is only a reservation in favour of chemists.

Mr. Justice Field: Yes, he did not come within the exceptions. At present, if you will forgive me, you are putting the two things together which I want to keep separate. They are quite separate. You are now submitting to me that there is no evidence that he practised as an apothecary.

Mr. McIntyre: Yes, my Lord.

Mr. Justice Field: Then what I say is in this particular case we will see what he did do.

Mr. McIntyre: I think you will find he visited.

Mr. Justice Field: Let us see what he did upon the evidence. Fanny Grist is the first witness. She says, "I said will you give me a little medicine for my child. He said, Yes, I will, but what are the symptoms? I told him I gave her a spoonful of castor oil in the morning; she had been very bad all day. I thought she was going into convulsions. He examined her and said, I think so, too. He made her a bottle of medicine and gave a powder." That is the evidence to go to the jury, as to the acting as an apothecary.

Mr. McIntyre: As far as the term "apothecary" is shown in the 15th section, it is preparing and compounding medicines according to prescription.

Mr. Justice Field: But he prepared it without a prescription. That is the thing it is directed to. If he prepared it with a prescription nobody would have found fault with it.

Mr. McIntyre: The writing down does not matter to the chemist. Supposing an unqualified person went into a chemist's shop and said, "I want you to prepare for me a pill, say compound extract of colocynth and blue pill.

Mr. Justice Field: If you tell him to prepare what you want he is merely selling it; if you say you want a round pill of so many grains of this and so many grains of the other, he is only selling it.

Mr. McIntyre: Yes, my Lord. Suppose two men of different temperaments go and say to him, "I want a colocynth and blue pill," to one he would give one quantity of mercury, and to another, another.

Mr. Justice Field: I think he would be in some danger.

Mr. McIntyre: But is he to do this, to put a lump of colocynth before him and say to him, "Break off a bit of the colocynth, I will weigh it for you; then break off a piece of blue pill and I will weigh that," or is he to use some discretion in the matter?

Mr. Justice Field: Tell me a case which you think comes within the Act.

Mr. McIntyre: I think persons who visit patients—who do not merely sell in the shop and dispense across the counter, but who go visiting the patients, seeing about their ailments, and then prescribe and have the medicines made up.

Mr. Justice Field: That will not hold. Supposing instead of going visiting, a gentleman put up a notice outside the door, "Dr. So-and-so will see patients from 10 to 11 on Monday morning;" and every mother in the neighbourhood brought her child there?

Mr. McIntyre: It would be holding himself out as a person to be consulted.

Mr. Justice Field: Would that be a case within the Act?

Mr. McIntyre: I do not go beyond dispensing across the counter; I do not go further than that.

Mr. Justice Field: It is a question of the character of the act. I will not stop the case, but I will give you all the benefit of it. If you wish to argue the point whether there is any evidence to go to the jury or not, I will give you the benefit of it.

Mr. McIntyre: Whether within the meaning of Mr. Justice Cresswell's decision in the case in the Queen's Bench, there is evidence of his acting and practising as an apothecary.

Mr. Justice Field: I think in that case you will find he did visit patients. He lived in lodgings, and he did not make up physicians' prescriptions, and he could not do so. He advised patients, and made up and sold to them the medicines which he had ordered. Mr. Justice Cresswell said a man compounding medicines and selling them under those circumstances did act as an apothecary in the ordinary sense of the word, and it made no difference if he prescribed as well as prepared the medicine. You are rather bringing into your mind the 28th section as bearing on this case, but the question simply is, did he practise as an apothecary?

Mr. McIntyre: I think upon the facts he visited patients.

Mr. Justice Field. I do not think so in the report which I have. I have no doubt he did. Now let us see what an apothecary is. An apothecary is one who practises pharmacy, one who prepares drugs for medical uses and keeps them for sale. He prepares them for the use of himself.

Mr. McIntyre: And every dispensing chemist does the same thing.

Mr. Justice Field: You are running your head against the exception.

Mr. McIntyre: I contend it must be something peculiar to an apothecary that he should do a particular thing. But a chemist does the same thing. He prepares medicines in the same way.

Mr. Justice Field: There is no magic in the word "Chemist." Mr. Huxley is a great chemist, but he does not do the one thing or the other. You have got first of all to consider the existing class. You are now contending that there is no evidence to show that he acted as an apothecary, and if there is you are protected by the 28th section, which is quite a different question, which we can deal with when it comes.

Mr. McIntyre: I do not call the doing of anything under the 28th section a practising as an apothecary. It is part of the thing which an apothecary does. The acting and practising as an apothecary means the act of preparing and dispensing.

Mr. Justice Field: I shall not stop the case on that point.

Mr. McIntyre: No, my Lord. One might make up medicine and give it away.

Mr. Justice Field: What does the defendant charge sevenpence for?

Mr. McIntyre: For the medicine itself.

Mr. Justice Field: I shall ask the jury about that.

Mr. McIntyre: Where he gave no medicine, he charged no price.

Mr. Justice Field: I shall not stop the case for that.

Mr. Morgan Howard: There is another case, my Lord, of Morgan *v.* Halliman, 8 Adolphus and Ellis, 489.

Mr. Justice Field: Every man who does a thing charges for it. It is like the case of the railway companies who used always to say "We do not make any charge for delivering your goods."

Mr. McIntyre: Yes, my Lord, "We do not make any charge for your using the station, but we make the charge for carrying you."

Mr. Justice Field: Every man who gets a reward for a compound act puts into his price in some way or other the trouble which he takes in the act. If he is a great man he puts in a good deal, and if he is not he puts in less. Every man charges something. If he has to hand over blocks of soap, he charges something.

Mr. McIntyre: Yes.

May it please your Lordship, gentlemen of the jury, my Lord has ruled that this is a case for your consideration, and I shall not occupy your time very long in asking you to come fairly and properly to consider what is the real question to be determined here.

Mr. Morgan Howard: There is another case, my Lord, of Ellison *v.* Haydon, 4 Bingham's Reports, 621.

Mr. McIntyre: This is an action that was commenced by the Society of Apothecaries through a local protection society against the defendant for the infringement of this Act of Parliament, and before you can find your verdict for them and make him liable for these penalties it must be most clearly and distinctly proved to your satisfaction that he has infringed this Act of Parliament by doing what he has done, and you will not strain the Act of Parliament so as to prevent the chemist, who has medicines and who prepares those medicines, from dispensing, as he has a perfect right to do under the 28th section, to which I have called my Lordship's attention, and which I shall dwell on in addressing you, he has a right to dispense these medicines, and in this case the present defendant has not gone beyond that right.

Now, the first thing they have to make out, is, that he has in the words which they have put into their statement of claim, acted and practised as an apothecary by attending, advising, and supplying medicines as an apothecary. They do not venture to leave it there, and to say that the attending, advising, and supplying medicines would make him liable under the Act of Parliament, but they add the words which they are compelled to add, in order to make out that case, that he attended, advised, and supplied medicines as an apothecary. Now, the attending, advising, and supplying medicines as an apothecary, is protected by that Act of Parliament, and the apothecary gets his fee and reward for that, and until a very recent Act of Parliament was passed, the apothecary was the only man who could recover for the supply of the draughts.

Now, gentlemen, let us see what an apothecary is. We cannot find a definition in the Act of Parliament. Then let us see what an apothecary does. From the last case which my friend cited, it is pretty well to be seen what an apothecary does. He sees patients; he goes about and sees patients; he advises those patients and he makes up the medicines for them either from his own prescription, or as he is compelled by the Act of Parliament, to carefully and accurately make up the prescriptions sent to him by physicians. Now, what do chemists do? and what have they a perfect right to do? If a physician writes a prescription, and you take that to a dispensing chemist, he is bound to make up that prescription, and to make it up with accuracy and precision, and to bring a competent knowledge of the drugs and the way in which they are compounded and prepared for the purpose of enabling him to make up that prescription. That would seem to be within the scope of what the 5th section of the Act of Parliament is. That seems to be one of the great duties of an apothecary. Nobody would suggest, and my friend would not, that a dispensing chemist is not entitled to make up the prescriptions of medical men which are brought to him, and dispense them by handing them to the persons who come with them. They are entitled to mix, make, and compound medicines, and when they are compounded they have a right to vend them, and the person who is to receive them can receive them across the counter and can sell them. I take it that a chemist by reason of the knowledge acquired in his business, and the knowledge which he acquires by having the prescriptions of eminent physicians brought before him, gets to know the prescriptions, and is enabled to make up the compounds which physicians order for particular cases. Take the case of bronchitis. A case of bronchitis has been treated by an eminent physician, whose prescriptions come to the chemist's shop. The chemist makes up the prescription which is given by the physician. The person comes backwards and forwards to the chemist and he discovers that that person is entirely cured, and is cured by the medicine which had been prescribed by the physician. He chooses from that to keep that medicine in stock, made up ready mixed, and in a bottle, to be sold for a price which he may fix upon it. A man comes and says to him, "I am not well; I have got a bad throat, it is bronchitis." Is the chemist, then, or is he not, entitled to take down that bottle of medicine which he has prepared from the prescription of the physician, and hand it over to him and receive the 1*s.* 6*d.*, or 1*s.*, or 7*d.*, or whatever it is which he is to receive? Now, supposing he is entitled to do that, and I submit most strongly in point of fact, and in point of law, that he is, and supposing he is out of that mixture, well, cannot he then go to the different bottles and mix them up into the one bottle that which he is going to give him, viz., the mixture which the man is to take away? If it is an infringement of the law, and my Lord will give you directions on that point, why, you will give your verdict against the defendant, but you will not strain the law. You would rather take care that those who have to make out a case which would prevent a valuable business, made valuable to the public and more valuable to the poorer members of the public, should do so, and I say you will not let that business be stopped unless you are clear that it is an infringement of the Act of Parliament.

Now in this case what do we find? A woman comes and says she wants something given to her for her child; something is given, the child gets worse, and she consults Dr. Cooper. Now what she says is she could not consult him first, because she had not got the means of paying him. She went and she got the money, and although she had not the means of doing so before, her case is this. He sees the child, and he prepares the medicine which is to be given to the child, and she takes the medicine away with her. I put it to you that it is a matter of discretion as in everything else. Supposing a person came and said to you, "I want this or the other particular article," you might then recommend another.

Mr. Justice Field: But that is not the case in point.

Mr. McIntyre: I am not taking it as a peculiarity but as an illustration. Supposing a person goes to a tea merchant and says, "The tea which I have had of you gives me a headache, cannot you recommend me a good wholesome tea that would not give me a headache?" Here the person goes to the chemist's shop and says, "My child is ill—my child wants some medicine." Very well, here is the chemist, who is empowered, and always has been, as I shall show you by evidence which I will call before you of persons who were in practice before the year 1815, that chemists had the right before the Act of Parliament, and it has clearly not been taken away by the Act of Parliament, to make, mix, compound, dispense, and vend medicines. He says, "Your child is not well; what is is the matter with him?" The child has a bad cold. "Very well, I will give it one of my compounds that I use for the purpose, and which has been very successful in treating colds." And if the medicine is made up he gives it, and he mixes it if it is not made up. That thing might be done, and he must have some discretion left to him, because he has a knowledge of drugs and would know better than the other person who came to him what is best for the child. Now what is he to do if a man comes and says, "I want a pill?" He says to the man, "What sort of a pill do you want?" The man says, "I do not know the names of the drugs. I cannot tell what sort of a pill I want, but I want an opening medicine." He says, "Very well, I will give you an opening medicine," and he compounds two things together, and having done so, he gives the man the pill and the man takes it away. I shall contend most strongly, in fact and in law, that is not acting as an apothecary, but doing what he has a right to do, to mix, dispense, and vend, and that is all he does do. But he also must exercise his discretion in vending the medicine that he does not give it too strong. Supposing a strong hearty man came into a chemist's shop and says he wants an aperient pill given him. The chemist gives him a pill of a certain size and strength. Perhaps he will give him a five-grain pill, three grains of compound extract of colocynth and two grains of blue pill, and he gives him that and that will do him good. But a child is brought to him and the child is suffering from the want of an aperient. Gentlemen, he would not give the child a pill of the same strength; he would not give him one mixed so that it would act so strongly on the organs of the child, but one that would do the child good. But what is he to do if my friend is right? He is to say, "You want an aperient mixture; I have a dozen different sorts; you take what you like; I will weigh it and then I will tell you what it will come to." That would be a perfect absurdity, and unless you go to that extent—and I will submit you must not go to that extent—when a person comes to a chemist's shop for the purpose of purchasing a mixture of that chemist, the chemist has a right, while he is in the shop mixing, vending, and dispensing his mixtures, to ask the nature of the complaint from which the person is suffering, so that he can administer and dispense the proper mixture which would be proper and valuable for the purpose for which it is wanted by the patient who is suffering. Supposing a person says "I want some medicine, it is to be an astringent medicine." Is he to be given salts and senna. The man does not know what is best. He knows he wants medicine and he goes to the chemist's shop for the purpose of buying it, but according to my friend's account that is to be entirely stopped, and they are to be able to say that no mixture shall be dispensed except by an apothecary, or if it is otherwise it must be given by a chemist upon the prescription given by some medical man. I contend that that is going far beyond what the Act of Parliament intended. The scope of the Act of Parliament is shown first of all in the section of the Act of Parliament which compels them, and puts them under penalties and liabilities unless they do it, to carefully and accurately make up physician's prescriptions. There is nothing in that Act of Parliament, and I think when my Lord comes to read it he will tell you that this is distinguished in the Act of Parliament which defines the giving a patient advice as being the meaning which a man is to have who is acting as an apothecary.

Mr. Justice Field: I want to draw your attention to this so that you may know what I am going to call their attention to by and by. I should like you to look at section 7.

Mr. McIntyre: I will read it:—"And whereas much mischief and inconvenience has arisen from great numbers of persons in many parts of England and Wales exercising the functions of an apothecary, who are wholly ignorant and utterly incompetent to the exercise of such functions, whereby the health and lives of the community are greatly endangered, and it is become necessary that provision should be made"——

Mr. Justice Field: The rest is nothing. Now, I want to draw your attention to this:—that the intention of the Act is to show what the apothecary does as distinguished from the chemist.

Mr. McIntyre: The way in which I read it is to protect the qualified medical practitioner against the unqualified medical practitioner, viz., the quack. He need not dispense medicines, but he can give his advice or he can make them up, he not being a duly qualified person.

That is how I should look at the first part of the section of the Act of Parliament. That is how it seems to me to show what the scope of the section of the Act of Parliament is. It is clear that if persons only make up one medicine or one sort of medicine, that they may always, without being an apothecary at all, go and dispense this medicine as much as they like. For instance, take Morrison's pills,—Morrison's pills No. 1, and Morrison's pills No. 2. A person would go to get Morrison's pills. For one state of symptoms Morrison's pills No. 1 would be given; for another state of symptoms Morrison's pills No. 2 would be given. Is not Morrison to ask what are the symptoms, or whether he is to sell him pills No. 1 or pills No. 2. According to them he could sell both, and if he sells both and asks no questions, no offence is committed; but if he asks what his symptoms are, so that he can give him the right pill, the one that will do him good, they say because you sell him the right one and not the wrong one, you infringe the Apothecaries Act. I put this limit on what I say the chemist may do, and in whatever the chemist may do there is not an infringement on the Apothecaries Act. When persons come to him for the purpose of preparing medicine, he may put the necessary questions to them to know which of his medicines he is to make up, mix and dispense to him. But he must not go beyond that. Afterwards, the person or person's friends say that this has done him so much good that he wishes for another, and he hands one across the counter to that person. I say that that would merely be dispensing and vending the medicine within the meaning of the section of the Act of Parliament.

Now with respect to this particular case, it is not taken as against Mr. Wiggins for anything that he has done, particularly here, but it is this. It is a sort of test case for the purpose of defining what would be an infringement of the Apothecaries Act of Parliament, and if you, upon the evidence such as there has been laid before you to-day, come to the conclusion that Mr. Wiggins has infringed the Act of Parliament, every single chemist who asks a person who comes to him for a cold, how long have you had the cold, or whether it is a cold in the head or a cold in his chest, every one who asks that question before he dispenses the cough mixture is an infringer of the Act of Parliament, and he can be proceeded against for the penalties. And the whole of the trade which is carried on, which is of great advantage by dispensing the medicines to, and charging for them alone to persons who do not think they require a physician—the whole of that would be stopped.

Mr. Justice Field: No, apothecaries can do it. Any apothecary may do it.

Mr. McIntyre: I say it would stop the whole of the business of a chemist who does it, but an apothecary is a medical man, charging his professional fee as well as for his medicine.

Mr. Justice Field: I cannot see how that enters into the question. Does it matter whether poor or rich people go to him? It may be a good reason why in the House of Commons they might wish to alter the law, but it cannot affect its construction.

Mr. McIntyre: I say when it is such as the result would be here, one ought to look very narrowly to see whether the case is proved. and see whether it is within the scope of the Act of Parliament.

Mr. Justice Field: The plaintiff must prove his case, whether it is an action for £5 for goods sold and delivered, or for a £10 penalty. The plaintiff must prove his case in both cases.

Mr. McIntyre: No doubt; but where, in a case like this ——?

Mr. Justice Field: If a case is proved, that is the only question. I cannot see why it is to be proved more in one case than in the other; the question is, has he proved it sufficiently for £5 for goods sold and delivered, or for a £10 penalty. I do not understand that there is any greater degree of proof in the case of a penalty than in anything else. I shall have to tell the gentlemen of the jury what the law is, and they will have to find the facts. Whether it was the question of a duke or a peasant I should say the same thing.

Mr. McIntyre: No doubt in one sense I quite accede to what my Lord says, but it was not in that sense that I was using the words, but I say where there is evidence both ways, and it hangs in the balance to a considerable extent, at all events, although it might be thought there was a little more evidence on the one side than on the other; I say unless it is completely proved, and not disproved, by the evidence which I shall lay before you, the verdict ought to be for the defendant. Under the 28th section I shall have a body of evidence to lay before you. That would consist to a considerable extent, of chemists who were in the practice or in the profession, or in chemists' shops before the year 1815, and they will tell you most distinctly that before this Act of Parliament passed in 1815, chemists were in the habit of having persons come to them in their shops telling them what their ailments were, and when they told them what their ailments were, the chemist made up, dispensed, and handed over to them their medicines.

Mr. Justice Field: I shall want you to satisfy me that your construction in your statement of defence of the 28th section is the true one.

Mr. McIntyre: I will address the jury on that part of the case to-morrow morning, my Lord.

At this point the Court adjourned until the next morning.

At the sitting of the Court on the next day the proceedings were continued—

Mr. McIntyre: May it please your Lordship, gentlemen of the jury, I was just coming to that part of the case to which the 28th section of the Act of Parliament applies when the court rose yesterday. Let me just put to you the distinction that I draw between the two parts of the case, because I understand from my Lord that probably two questions will be put to you.

Mr. Justice Field: I propose to ask the jury whether or not the defendant acted as an apothecary, using the words of the statute, and also within the meaning of the words, with the admission put upon it, in the statement of claim. When I have heard the nature of your evidence I will give my construction of the 28th section, because if my construction is adverse to you it is no use my listening to the evidence.

Mr. Morgan Howard: I was going to submit a proposition on that very point, but I will reserve it till later on.

Mr. Justice Field: You had better wait till the evidence is tendered.

Mr. McIntyre: Gentlemen, my Lord will ask you the question whether the defendant in this case acted and practised as an apothecary, because those are the words upon which he must rely. Upon that I shall submit to you, and my Lord, that acting and practising as an apothecary means more than doing something which an apothecary does. For instance, in one of the cases which my Lord read yesterday it was decided by one of the judges that preparing medicines according to the prescriptions of physicians, or other persons, was acting as an apothecary. I say that you must find that he is acting and holding himself out as an apothecary, and that he is not acting and holding himself out as a chemist. It must be something that an apothecary does, and that no one else but an apothecary may do. Unless that is made out to your satisfaction you must come to the conclusion that this man—although he was doing what an apothecary does, and what by the 5th section of the Act of Parliament an apothecary is bound to do, under a penalty if he does not do it, that is, to make up the prescriptions of other people—was acting as a dispensing chemist, and not as an apothecary. A man may act as an apothecary by holding himself out to the world as a chemist and druggist, and if he does that he comes under the Act of Parliament. If, on the other hand, he makes up medicines according to prescriptions given by physicians, it is clear that an apothecary may do that. I submit to you that acting and practising as an apothecary in order to bring him within the penalty clause he must do the whole of the things that an apothecary is bound to do, and the things that a chemist is not entitled to do.

Mr. Justice Field: I do not quite follow you.

Mr. McIntyre: I put it in this way; it is conceded, but I will prove it if necessary, that it is part of the business of chemists and druggists to mix medicines, and to make up prescriptions that are prescribed by medical men, either surgeons or physicians.

Mr. Justice Field: If a doctor gives a prescription you take it to your druggist and he makes it up.

Mr. McIntyre: Yes.

Mr. Justice Field: I want to see how far I can follow you. "Druggist" is an old word, but "chemist" as applied to this, is a new word.

Mr. McIntyre: Yes.

Mr. Justice Field: A druggist in olden times was a person who supplied the drugs to the apothecary. There were druggists, apothecaries, physicians, and surgeons—four existing professions or businesses in olden times. Now, the modern chemist and druggist is a man who confines himself to vending, preparing, and compounding medicines.

Mr. McIntyre: And dispensing.

Mr. Justice Field: Selling.

Mr. McIntyre: Dispensing, my Lord.

Mr. Justice Field: You take the prescription to the chemist, and he dispenses or vends the medicines according as that may be. It is clear from the language of Baron Parke, and from history itself, that the apothecary in 1815 had the duties which he had before, but that he was put under certain penalties.

Mr. McIntyre: The Apothecaries' Society by the Charter of James had the sole right to sell within seven miles of London.

Mr. Justice Field: That was a monopoly; how far they had it in point of law is not necessary now to decide. No doubt the apothecaries had, between the Charter of James and 1815, acquired a right of visiting and seeing patients. I dare say Mr. Howard will concede that; but then the question is whether the statute of 1815 interferes with that right.

Mr. McIntyre: The way I put it before your Lordship is this, they were acquiring this right ——

Mr. Justice Field: Do not call it a right.

Mr. McIntyre: A practice. While they were seeing their patients out of doors, and visiting patients, the practice was growing up by which a body acting with the chemists came into play, and they were the persons who dispensed the medicines in their own shops according to the prescription sent by physicians, surgeons, or apothecaries who had a visiting business.

Mr. Justice Field: An apothecary not only visited his patients, but his patients visited him, and he dispensed his own medicines; but he does not now.

Mr. McIntyre: It is not necessary now, because a man who has a large visiting practice out of doors writes his prescriptions, although he may be a licentiate of the Apothecaries' Company. They do not dispense the medicines prescribed by physicians and surgeons. That has departed from them in practice to a great extent, if not entirely.

Mr. Justice Field: What has?

Mr. McIntyre: Dispensing the prescriptions of other medical men.

Mr. Justice Field: I see what you mean now.

Mr. McIntyre: Virtually he has ceased to make up the prescriptions of physicians and surgeons. Then before 1815 there sprang into existence this body of chemists and druggists to whom the prescriptions of physicians and surgeons were taken, and they made up those prescriptions for them, and handed them or sent them, according to directions, to the house of the patients. Before 1815 also this further practice had grown up, that a person who came to the shop of the chemist or druggist would there receive from him across the counter a mixture as a remedy for the complaint under which he was suffering.

Mr. Justice Field: That is the practice which this action is intended to strike at.

Mr. McIntyre: Counter prescribing is a well-known term amongst chemists and druggists, and has been in existence before the year 1815. I should submit to your Lordship that one form of counter prescribing is prescribing across the counter by making up the prescriptions of a physician or surgeon. That is one mode.

Mr. Justice Field: I should not call that counter prescribing.

Mr. McIntyre: It is dispensing. The second mode is that when a person has come without a prescription from a medical man, and tells the chemist that he requires medicine, the custom has been for the dispensing chemist or druggist to ask him the symptoms of what he is suffering from, a cold or whatever it is, and then to recommend him a medicine, charging him only for the medicine.

Mr. Justice Field: I have been into the shop of Mr. Pedler many times, and said "I do not feel very well this morning," and he has said, "Have you got a cold," I have said "I have a bad cold," and he has given me something. No doubt he is an apothecary.

Mr. McIntyre: He will be here to-day, and will say he is not.

Mr. Justice Field: This is a very extraordinary case, and as far as I can judge it is the first time this question has been raised, with the exception of the case of Allen.

Mr. McIntyre: The cases of Allen and Warburton were very unsatisfactory in this sense, that the Judges decided both ways; they decided that a man who was incompetent to make up the prescriptions of medical men before 1815, although he had been in the habit of prescribing, and making up his own prescriptions, was not in practice as an apothecary before 1815, but a man who did that after the Act came into operation was, as far as the penalties are concerned, acting as an apothecary.

Mr. Justice Field; This is the first case on the point.

Mr. McIntyre: It is the first case in which the principle is involved. There is a case of the Apothecaries' Company *v.* Greenhough, 1st Q. B. Reports, in which the Judges said, if this was to be relied upon it must be established by evidence.

Mr. Morgan Howard: There was a case in which I was concerned before Mr. Justice Lindley a short time ago. Mr. Justice Lindley took time to consider his judgment, and ultimately gave judgment for the plaintiff. He laid considerable stress on Allen's case, and came to the conclusion that the defendants had infringed the Act. The circumstances there were, that a person kept an open shop, circulated some pamphlets, and got people to call at his shop under an idea they were ill, when he took them into a little room, asked how they felt, then gave them some medicine, taking money for it.

Mr. McIntyre: That is a different case from this.

Mr. Justice Field: This is a very important case. No doubt the Apothecaries' Society wish to have this point decided, and it is a matter which I think should be properly considered. Mr. Wiggins, the defendant in this case, is not to be blamed at all for what he has done, because he has been doing that which has been done no doubt by all respectable people. But whether the law is just or not is not for us to consider. We must endeavour to find from the facts of this case whether the acting does come within the meaning of this section. Poor people cannot afford to go to men like Sir James Paget, and it is a very important thing no doubt for them to be able to go to some one who will attend to them cheaply. In the same way you might say a person could not afford to employ a gentleman of great eminence at the bar, and, therefore he might employ a gentleman who could do the work no doubt very well and at a cheaper price. I could not go into each individual case, and say I do not see why such and such a person should not address me as well as any one else. In that case the State considers the subject ought to have the guarantee of the State by the State prescribing a certain course of examination and qualification, and a register on which the qualified person should be put.

Mr. McIntyre: I should state to your Lordship that the facts proved by the witnesses for the plaintiff I shall not attempt to dispute. Though we might very likely on some little minor point have a contradiction of testimony, that is not what we want; we want to have the broad principle settled, and, therefore, I shall assume those facts to have been proved before your Lordship, and shall confine my evidence to the custom which existed before the year 1815.

Mr. Justice Field: It may be that you may show that a practice has prevailed before 1815, and a certain practice has prevailed since 1815, and it may be that Mr. Howard will not dispute the fact. Then it will resolve itself into a question of law.

Mr. McIntyre: Before you can find a verdict against the defendant, you must be satisfied that he has been acting and practising as an apothecary, that he has held himself out as a person entitled to act in the way that an apothecary can do, and not in the way that a chemist is entitled to do; in the way that I shall show you by and bye. The distinction, as I understand it, drawn by my learned friend is this, that if a man merely makes up the prescriptions that are sent in writing to him, signed by a properly qualified practitioner, the chemist and druggist is entitled to do that, and is not within the scope of the Apothecaries Act. Technically that would be acting as an apothecary, if it is said to be doing what an apothecary does, and what is laid down, that part of the business of the apothecary is the making up of those prescriptions. Then it it said that in addition to that, he has done something more. That he has used his own brains for the purpose of seeing what the proper thing to be given to the patient is, and he says that is beyond what the chemist and druggist has a right to do, and that it is trenching upon the province of the apothecary, and is acting as an apothecary. I submit that is not so. When a man goes into a chemist's shop, and asks for a medicine, he must go for one of two things; he must either say what the medicine is, and what quantity he requires, or if he does not do so, but says: "I want a bottle of mixture for a cough," is he to be left by the chemist to take the whole of it in one draught, or is the chemist to put it into a bottle with divisions upon it, or to write upon a label: "One sixth-part of this mixture to be taken three times a day?" I should submit most positively that a chemist has the power to do that. I do not think it will be contended on the other side, that if a man asks for a bottle of a mixture, it is not within the province of the chemist to tell him how much he is to take at the time so that he does not take an overdose. If he does that, is he not to be allowed to recommend that medicine which he thinks best for the purpose? A man comes and says, "I feel ill, and have a very bad cold." "Is it a cold in the head or chest? is it a tight cough or loose cough?" says the chemist. According to the way in which that question is answered the chemist gives him a bottle of mixture with directions upon it. So far, I think, you will be of opinion that that would not be trenching upon the apothecary's province so as to bring him within the words of the Act of Parliament, by acting as an apothecary and supplying medicines. He is entitled to supply medicine. He is entitled to dispense medicine. And if he is entitled to do so, may he not, when a man gives him an account of his ailment, across his own counter, decide what particular bottle he will take the medicine from? A man may say what his ailment is, but he cannot ask of the chemist what is good for it! If he asks for an effervescing draught is not the chemist to use such things as he thinks best for the purpose? If this case is to succeed, my friend must go as far as that. There are four cases before you, two in which the chemist did see the children and two in which he did not. In the two in which he did not see the children, the symptoms were described to him, and he supplied them with medicine. With regard to the other two cases, in one instance he looked at the child's throat and gave a mixture for that child, and in the case of the other child it is said he looked at its tongue and felt its pulse. He felt the pulse in order to see what the state of the child was, whether the pulse were high or low, and he looked at the tongue to see whether it was furred or not, and he gave to that child the medicine which was fit and proper for it. If those things, under the directions you receive from my Lord, make you think he was acting as an apothecary, I must say I shall be surprised, after the evidence which I shall lay before you. But without giving any evidence, I think I may say that telling the public what to do, and giving them the medicine that is capable of doing them good, is not acting and practising as an apothecary, as is required before conviction under the penalty of this section. With respect to the second point that arises under the 28th section of this Act of Parliament, the section being this, "Nothing in this Act contained shall extend, or be construed to extend, to prejudice or in any way to affect the trade or business of a chemist and druggist in the buying, preparing, compounding, dispensing and vending drugs, medicines and medicinable compounds, wholesale and retail; but all persons using or exercising the said trade or business, or who shall or may hereafter use or exercise the same, shall and may use, exercise and carry on the same trade or business in such a manner, and as fully and amply, to all intents and purposes as the same trade or business was used, exercised or carried on by chemists and druggists before the passing of this Act." The question is not whether rightly or wrongly, before 1815, chemists and druggists exercised the practice not only of making and compounding medicines, which clearly is not disputed, but of dispensing the medicine and advising the person who came to take the medicine at their shop what medicine would be the best for them, and across the counter giving those medicines. The year 1815 is a long time ago, but several of the gentlemen whom I shall call before you can very well recollect the year 1815, and were themselves assistants before that year and in that year, and their practice must have been a very salutory and healthy one to enable them to appear before you at the present time in a good green old age. In addition to those who can speak of that period I shall call before you Mr. Pedler, a well known gentleman, who says he has always done it, and that it had been the practice of chemists and druggists to carry on business in that way. If that practice had not been interfered with, or if interfered with, the interference had failed, then you will find the presumption of law that it had existed before that time. Supposing the Apothecaries' Company were to lie by till one hundred years after 1815, and then seek to stop any practice of this sort although it had been continued up to that time. Could they say you must call some one to prove that it was in practice before that time? Of course we could not do so, because the people would then be dead. But if we show that it had been done before 1815, and that this practice has been continued from then until the present time, I shall submit to you that you will find as a fact that the practice adopted by the defendant in this action is a practice, "as the same trade or business was used, exercised, or carried on by chemists and druggists before the passing of this Act," that is, by persons who were in practice before 1815. I shall prove these facts and ask with some confidence for your verdict upon all the points of this case.

Mr. Justice Field: I have an old case which I had better read to you of The College of Physicians *v.* Rose, reported in 3rd Salkeld, page 793. (His Lordship read certain passages.)

Mr. McIntyre: My Lord, that case was reversed in the House of Lords; the judgment is not given, but the case is set out in Brown's report. I have the Register here, and I find that the defendant, Mr. Wiggins, is regularly registered under the Pharmacy Act.

Mr. Morgan Howard: I do not dispute it.

Mr. Justice Field: Under what section is he registered?

Mr. McIntyre: Under the 31st and 32nd Vict., chap. 121, sect. 13, which is an Act to regulate the sale of poisons and to amend the Pharmacy Act of 1852. It brings him within the 28th sect. of the Act of Parliament as a chemist and druggist.

Mr. Justice Field: How does it do so?

Mr. McIntyre: Because he is registered as a chemist and druggist.

Mr. Morgan Howard: I admit that he is registered, and I pray that in aid rather of my case.

Mr. Francis Cupiss sworn. Examined by Mr. Higgins.

Mr. Morgan Howard: I think now is the proper time for me *pro formâ* to submit my objection to the admission of this evidence.

Mr. Justice Field: I would much rather see what the question put is, and then you can take the objection.

Mr. Howard: I desire to submit the objection which arises upon the Act of Parliament.

Mr. Justice Field: Take the objection when the questions are put.

I think you reside at Diss, in Norfolk?—Yes.

You completed your 80th year last April?—Yes.

In the year 1814 did you go to Mr. Woolrych, a chemist and druggist?—Yes; as an apprentice.

You were apprenticed to him for four years?—I was apprenticed at Uttoxeter.

Then you went to assist his son who was a chemist and druggist at Lichfield?—Yes.

In 1822 I think you attended at the Veterinary College in London?—Yes.

Mr. Higgins: You went through a course of lectures?—Yes.

In 1823 you went down to Diss?—Yes.

And carried on business there till 1874?—Yes.

Are you acquainted with the practice known as counter dispensing?—Yes.

Is that a practice which is carried on——

Mr. Howard: Do not lead the witness.

Mr. Higgins: I am not going to do so.

Is that a practice carried on by chemists and druggists?—Yes.

Was it so carried on when you first became acquainted with the business of a chemist and druggist in 1814?—Yes.

Mr. Howard: I think I am now bound to take objection. The witness is now speaking to a time subsequent to 1815, and the protection afforded by the Act had reference to all matters done before the passing of that Act. I submit no evidence is receivable here after the date of the Act of 1815.

Mr. Justice Field: Section 28 says, "All persons using or exercising the said trade or business, or who shall or may hereafter use or exercise the same shall and may use, exercise, and carry on the same trade and business in such manner and as fully and amply to all intents and purposes as the same trade or business was used, exercised or carried on by chemists and druggists before the passing of this Act." I think I must strike out that last answer.

Mr. McIntyre: He says he knows the practice since, and he knows the practice before.

Mr. Justice Field: You must keep yourself to what was the trade. I doubt whether that will not be too large, but I assume you propose to ask him, was the trade or business of a chemist or druggist so used, exercised, or carried on before the passing of the Act. Mr. Howard will object to that because it omits the important words of the section.

Mr. McIntyre: Suppose this action was being brought fifty years hence, no witness could be called to show what was the practice before 1815, because there would be no such person living, but it would be evidence of what the practice of chemists and druggists was, to go back as far as living memory could go, and show that this is the universal practice.

Mr. Justice Field: That may be so. I quite follow you. If I find you, or anybody, doing an act for the last twenty, thirty, or forty years, which may have a legal origin, I am bound to presume that it has had a legal origin. But here you are doing an act subsequent to the statute, which is prohibited by the statute, and you are proposing to show what was the business carried on before the passing of the Act?

Mr. McIntyre: I put it in this way before your Lordship, and I think you will see the reason of the thing. Before 1815, when this Apothecaries Act passed, the scope of the Charter was limited entirely to London, and seven miles round, that was the whole scope of its action. Throughout the whole country there was no Act prohibiting anyone practising as a chemist and druggist, or as an apothecary in that sense. In this Act of Parliament it said, "All persons who up to this time have been chemists and druggists, and all persons who after this time shall be chemists and druggists may practise," without limitation to any place at all, and carry on the business in exactly the way in which it was carried on before 1815.

Mr. Justice Field: Not within the seven miles.

Mr. McIntyre: Anywhere. This gentleman proves it beyond the seven miles.

Mr. Justice Field: It is, "practise not within seven miles."

Mr. McIntyre: I do not think within or without the seven miles has anything to do with it, because the Act of Parliament is universal, and therefore the same question will arise whether it was within seven miles or seventy miles. It was the charter which limited it to the seven miles, not the Act of Parliament. When this Act of Parliament passed it made all persons who had carried on the trade or business of a chemist or druggist before the date of the Act of Parliament entitled for all future time to carry it on in as full and ample a manner as they had done up to that time.

Mr. Justice Field: I think you had better ask the question so that it can be properly objected to.

Mr. McIntyre: Very well. He says he is acquainted with counter practice as it is now carried on by chemists.

Mr. Justice Field: Put some question which you mean to stand by, and then we will have the objection.

Mr. McIntyre: Do you know whether that practice existed before 1815.

Mr. Morgan Howard: I object to that question.

Mr. McIntyre: Now I am going to ask what that was?

Mr. Justice Field: We must know what the practice was before.

Mr. McIntyre: What was that practice.

Mr. Morgan Howard: I object to that question.

Mr. Justice Field: I will hear you upon that.

Mr. Morgan Howard: The objection which I now submit is this. By the fifth paragraph of the statement of defence, the defendants have pleaded that "Before the passing of this Act it was usual and customary for chemists and druggists in using, exercising and carrying on the trade or business of a chemist and druggist to prepare compound and supply medicines of their own selection in their own shops for the cure of simple complaints. That if he did attend, advise, and supply medicine (which he denies) he did so by preparing, compounding and supplying medicines of his own selection in his own shop for the cure of simple complaints in accordance with the use and custom aforesaid and not otherwise." This evidence is of course addressed to the exception which is supposed to reside within the four corners of section 28. When that is looked at I submit it clearly appears that the exception is limited to the trade or business of a chemist and druggist as to certain particular matters which are there specified. They are thus specified: in the buying, preparing, compounding, dispensing and vending drugs and medicinable compounds wholesale and retail. These are the words which I submit your Lordship will put your own interpretation upon, as words running far short of the extent of the plea which is founded upon the exception, when it carries the case of the defendant further by saying he supplies medicine of his own selection in his own shop for cures.

Mr. Justice Field: You say he does what is alleged in paragraph 5, which is more than he is allowed to do.

Mr. Morgan Howard: That is extra the exception of the statute.

Mr. McIntyre: I submit it is most relevant to the issue we set up here, and that we are within the exception of the 28th section. The witness says he is acquainted with the counter dispensing practice before 1815, and I asked what that was. I say it brings it completely within the words of the section not "to prejudice or in any way to affect the trade or business of a chemist and druggist."

Mr. Justice Field: There is an issue upon that. It may be when I come to give judgment in the case I may entertain your view or Mr. Morgan Howard's view, but in the present state of the case I will take the evidence as there is an issue upon it.

Mr. Morgan Howard: Your Lordship will deal with it as we might have done. I thought your Lordship would say there was an issue upon it.

Mr. McIntyre: If your Lordship thinks we are tied down by that 5th paragraph perhaps your Lordship would give us leave to amend it.

Mr. Justice Field: In substance.

Mr. Higgins to witness: Will you tell us what the custom as to counter dispensing was before 1815?

The Witness: I dispensed medicines when they were asked for.

Mr. Justice Field: Do not use the word "dispense," because that is a word of art; tell us what you did, what was the practice.

The Witness: I must call it dispensing. We were in the habit of dispensing medicines which we recommended to persons.

Mr. Justice Field: Before 1815 you were in the habit of dispensing?—Yes, we recommended medicines to persons who asked us for advice.

Mr. Higgins: Will you explain exactly what you would do if a customer came into your shop?

Mr. Justice Field: You cannot have it more accurately than Mr. Cupiss has already given it. I suppose that was the practice before 1815.

Mr. Morgan Howard: It is very possible.

Mr. Higgins: There are certain words there that may have some meaning attached to them. If I ask him what he saw done in the shop before 1815, that may be more satisfactory.

Mr. Morgan Howard: You hear what the witness said, and I see now what the legislation was directed to.

Mr. Higgins: Suppose a customer came into your shop complaining——

Mr. Justice Field: Let us hear what was done.

Mr. Higgins: When a customer came into your shop and complained of some complaint what did you do?—I put some simple questions to him to ascertain what was the matter.

What would you do then?—Prescribe for him.

Mr. Justice Field: Would you examine his tongue?—If necessary.

And feel his pulse?—Yes.

What did you do then?—I then made up some medicine according to the best of my judgment and skill.

Should you give any directions as to the mode of taking the medicine?—Oh yes! I should not give it without.

In so supplying a customer with medicine should you give him the medicine which you had made up in your shop, or would you compound it for him?—I should compound it for him.

Should you charge him for the medicine only, or for the medicine and the advice?—Only for the medicine.

Mr. McIntyre: I submit that any one might prescribe or give to another any medicine. If they did it unskilfully they might be liable to be indicted.

Mr. Justice Field: Did the people pay for it?—Yes.

Mr. Higgins: What did they pay you for?

Mr. Justice Field: You are putting the inference to him. What passed when they paid you; did you say anything to them?—I may as well say at once that we never charged for professional advice.

What did you say to the person?—I simply told him the price.

You told him the price of the mixture or ointment, as the case might be?—Yes.

Mr. Higgins: Should you make any difference in the price whether you were making up the prescription of a physician or making up medicine of your own selection?—No.

Mr. Higgins: I propose, my Lord, to ask this further question. Has that practice continued from that time, 1814, down to 1874, when you left the business?

Mr. Howard: I object to that question.

Mr. Justice Field: When did you give up business?—December 31, 1874.

Mr. Howard: I object to the question on the ground that I have already submitted that they cannot give any evidence of acts done except before the passing of this Act.

Mr. Justice Field: You may ask any question in cross-examination to alter this, but subject to that I think the question should be put. I want to avoid if possible the danger of a new trial.

Mr. Howard: The custom alleged in the plea is founded precisely upon the statute.

Mr. Justice Field: Suppose the question were that it existed in the time of Richard II. How do you prove that? Then you say we call an old man, who says, "Ever since I was such and such an age this thing has existed."

Mr. Howard: It is evidence of reputation, but this is evidence which should be limited by the statute.

Mr. Justice Field: No.

Mr. Howard: As near as it may be. The practice depends upon this. Did the custom prevail before the Act.

Mr. Justice Field: I think I will admit it, but only in that sense, not as making it lawful, but as evidence to show what the custom was before.

To the Witness: You say the practice has existed down to 1874, and has been practised not only by you but by other chemists?—Yes; my predecessor practised it nineteen years before I took the business. When I purchased the business that was the representation made to me.

Cross-examined by Mr. Morgan Howard.

When did you begin to carry on the business of a chemist and druggist?—In 1823.

You had been an apprentice for four years? Had you ever had your attention called to the Act of Parliament, which we are now discussing, passed in the reign of George II., dated 1815?—Yes.

You were aware of the Act?—Yes

You bought your drugs from wholesale druggists?—Yes.

How did you prepare drugs?—From the formulas given in the Pharmacopœia.

If a physician's prescription came into the shop you prepared it according to that?—Yes.

The prescriptions were written in Latin in those days I believe?—Yes, and are now.

They are not always now if you will allow me to say so?—As a rule they are.

What language was the Pharmacopœia at that time written in?—Both Latin and English.

When physicians' prescriptions came to your shop, and you made up your medicines in accordance with them, you then dispensed the medicines; is not that so?—Yes.

That is dispensing, is it not?—Yes.

That is what we understand when we go into a chemist's shop and see "Prescriptions accurately dispensed." It means he makes up the prescription, puts it in a bottle, and hands it over the counter to you, and you pay for it?

Mr. Justice Field: It is described in the section.

Mr. Howard: I am only anxious to get what he did in 1815. (To the witness.) You prescribed medicine for those people who came in and asked you questions?—Yes.

Do you mean that you selected the medicines in your own mind, took down the bottles, and made them up?—Yes.

That is what you call prescribing?—Yes.

Did you use any book of reference or any medical work?—No.

Mr. Justice Field: You would make them up from your judgment and knowledge of drugs?—Yes.

You exercised your judgment accordingly?—Yes.

Mr. Howard: You had had no kind of medical education had you?—Yes I had; not in 1814. I was only an apprentice then.

You have never gone through any hospital or medical school?—Of course not.

That is what I desired to know. Except through the business which you carried on, first as an apprentice, and then as a chemist, you had no medical training?—Not up to the time I was an apprentice. I am speaking of what my master did.

You referred, perhaps, to Buchanan's practice of medicine?—No, I did not; I discarded that.

I may take it you never went out of your shop to practise?—I did not, and that is the boundary of the Act. I never visited patients, nor did my master.

Mr. Justice Field: That was your idea as to the distinction drawn by the Act?—Yes, my Lord.

Mr. Howard: Your idea is that you may examine patients, pronounce upon the case, and supply them with medicines to cure them so long as you do it within the four corners of your own shop?—Yes, that is my idea. I did it under the authority of the Act.

That was your view of the Act of Parliament in 1815?—I so understand it now.

Did you think that in 1815?—I did not act at all at that time. It was my master.

Whenever you began to act did you act under the impression that the law justified you to do so by this Act of Parliament?—Yes, because we were to do what we had done before the passing of the Act. That is our licence.

Mr. Justice Field: That is the point to be decided now.

Mr. Howard:—I suppose if I had had the good fortune to have lived in 1815 and to have had the headache, and I had come into your shop, you would have made me up a mixture for it?—I should.

Mr. McIntyre: And if he had cured you no doubt you would have been very much obliged to him.

Re-examined by Mr. McIntyre.

Was your master an apothecary or a chemist and druggist?—Nothing but a chemist and druggist.

Mr. Morgan Howard: There is another question which I should have put. I do not gather from you that in this practice, which you carried on in your own shop, you treated all sorts of complaints, of whatever character or kind they might be?—No, those we selected. If it was a dangerous case we should have nothing to do with it.

Mr. Justice Field: You would not touch what you considered a dangerous case?—No.

Mr. Morgan Howard: If a person had an attack of scarlet fever you would send that person to the doctor?—Certainly.

Take the case of acute inflammation of the lungs, would that be a case you would send to the doctor?—I have treated such a case, and successfully.

Was that the rule which you adopted?—

Mr. Justice Field: Should you think that was a case for you to treat?—I should not think so as a rule.

Mr. McIntyre: Take the earliest stages of acute bronchitis—wheezing and cold—would you have prescribed for them?—Yes.

Mr. Justice Field: Is that a stage of bronchitis?

Mr. Morgan Howard: My friend cannot give evidence.

Mr. McIntyre: The question is put to me by his lordship, and I suppose I may answer it. I should think it was.

Did you hear the evidence given yesterday?—Yes.

In 1814 you did not yourself do business?—No.

But in 1823 you did?—Yes.

Mr. Justice Field: He means to represent that as the practice of his master?

Mr. McIntyre: I think that is it.

Mr. Thomas Parsons sworn.

Mr. Justice Field: Is it worth while to carry this any further?

Mr. McIntyre: That depends upon my friend. I have several witnesses who will prove the same fact, and in order to bring it down to the present time I have Mr. Pedler.

Mr. Justice Field: I suppose they will all say the same thing?

Mr. McIntyre: Yes.

Mr. Justice Field: The last witness brings it down to 1874.

Mr. Morgan Howard: I suppose it will be the same in every case?

Mr. McIntyre: Yes.

Mr. Justice Field: How far does this witness carry it back?

Mr. McIntyre: I think to 1812.

Mr. Morgan Howard: If the evidence to be adduced hereafter is the same, I do not know that we need have it.

Mr. Higgins: I will ask him generally.

Do you live at Swithland in Leicestershire?—Yes.

Are you 85 years of age?—Yes, next August.

Were you apprenticed to Messrs. Blews?

Mr. Justice Field: Is it worth while going into that? How far can you carry your memory and knowledge as to the mode of carrying on a chemist's business—up to what year?—Soon after I was apprenticed.

When was that?—1809; for seven years in Worcester.

Mr. Higgins: Did your hear the evidence of the last witness as to the practice of counter prescribing?—Yes.

Do you agree with that?—Yes.

Was that carried on from the first time you recollect the business of a chemist and druggist?—Yes.

Mr. Morgan Howard: I will not trouble you further.

Mr. McIntyre: Then I will not call any other witness.

Mr. Morgan Howard: I submit there is no case made by the defendant.

Mr. Justice Field: You say there is no case for the defence—on what grounds?

Mr. Morgan Howard: The plaintiff's case being admitted, I submit there is no defence. The plea is pleaded, that if he did advise and supply medicines he did so by preparing, compounding and supplying medicines of his own selection in his own shop for the cure of simple complaints in accordance with the use and custom aforesaid and not otherwise. Before the passing of the Act he explains it by this: that it was usual and customary to carry that trade on by preparing medicines of their own selections for the cure of simple complaints. First of all I say there is no defence of having dealt with any complaints which the plaintiffs have proved to have been treated in this case. Then, my Lord, I say that the only defence which could be open to the defendant here would be under the 28th section, and that that limits it to buying——

Mr. Justice Field: I understand what you have already submitted.

Mr. Morgan Howard: Then I need not repeat that proposition. It is a very important one. The evidence of the witness who was examined shows very much my view of that section; but, however, that is a matter for argument. His evidence showed that dispensing was really making up physicians' prescriptions. I do not think it necessary to elaborate this further, but that is the principle. Unless the exception is proved, the plaintiffs' case is admitted. The defendant's case is the exception.

Mr. McIntyre: My friend must not assume that I am admitting the facts proved by the plaintiffs' witnesses. As to the last point of my learned friend's, that there was no evidence that complaints had been treated, such as in this case, that is hardly the way to put it, because we have given our evidence generally that when persons came in, the chemist asked what was the matter with them, and exercised his own judgment as to what it was necessary to prescribe. If my friend had indicated by his cross-examination that they had not dealt with these complaints we could have called witnesses to prove that. But I put it treating generally.

Mr. Justice Field: Do you wish to call other witnesses?

Mr. McIntyre: Certainly.

Mr. Justice Field: Then, I think, you are entitled to do so on that point.

Mr. George Godden sworn. Examined by Mr. McIntyre.

How old are you?—82.

Were you apprenticed to a chemist?—I was, in 1812.

For how long?—Five years.

To a chemist and druggist?—Yes.

Mr. Phillipson of Chichester?—Yes.

Before 1815, when you first went there, who used to see the customers and dispense to them?—My master.

Have you heard the evidence which was given by the first witness, Mr. Cupiss?—I have.

You have heard what they have said about counter dispensing?—I have.

Is that evidence correct?—I think so.

Mr. Justice Field: You mean dispensing with a counter between you and your patient; that is what you call counter dispensing?

Mr. McIntyre: You heard him say that the chemist asked the persons who came in the nature of their complaint, that he then made up medicine, and gave it to them?—I did.

Is that correct?—Perfectly correct.

Was that limited to any particular complaint?—Simple complaints.

What do you call simple complaints?—Cough, colds, local diseases, gonorrhœa.

Mr. Justice Field: Eruptions of the skin?—Yes.

Mr. McIntyre: You treated for local complaints?—Yes.

I will take the first case.

Mr. Justice Field: You must not ask him what he would do.

Mr. McIntyre: I will ask what was done.

Mr. Justice Field: He has given you his definition of local diseases.

Mr. McIntyre: Were those the only things for which you gave remedies?—For sore throats and for all simple complaints.

In the earlier stages of complaints.

Mr. Morgan Howard: Simple complaints.

Mr. McIntyre: Complaints that turn out afterwards not to be simple complaints?

Mr. Morgan Howard: I object to that.

Mr. Justice Field: I do not think we can have that.

Mr. McIntyre: Were such complaints as those mentioned treated by his employer before his time?

Mr. Justice Field: What complaints?

Mr. McIntyre: Wheezing.

Mr. Justice Field: If a man came to you wheezing you would give him something?—Yes.

If he came in an advanced state of bronchitis you would not give him anything?—No.

Suppose a man came to you wheezing and you thought it was bronchitis would you give him anything?—I have cured myself of it.

Mr. McIntyre: He calls that a simple complaint.

Mr. Justice Field: Your allegation is "simple complaints."

Mr. McIntyre: I should ask his Lordship to allow me to amend that. The fourth paragraph in the statement of defence is I submit very general. Will not your Lordship allow me to amend by striking out these words?

Mr. Justice Field: I should be doing you harm if I did.

Mr. McIntyre: Then teething and convulsions?

Mr. Justice Field: We do not want to take a case of that kind.

Mr. McIntyre: But that meets the objections of my friend.

In the case of a child being brought to you ——

Mr. Justice Field: Did he do it? Have you treated a child for convulsions?—No.

Mr. McIntyre: Nor did the defendant.

Mr. Justice Field: You put it to him and he says no.

Mr. McIntyre: I should ask him what he means by his expression "simple complaints."

Mr. Morgan Howard: He has already given you some illustrations.

Mr. McIntyre: Amongst others he has named bronchitis.

Mr. Justice Field: What do you mean by "simple complaint?"—Coughs, colds, cutaneous diseases, and other simple complaints.

Mr. Howard: Such as a boil or a cut finger?—Yes.

Mr. Morgan Howard: You may go; I will trouble you no more.

Mr. McIntyre: I will now call Mr. Pedler. (After a pause.) My Lord, I find that this witness will not go back to 1815, but only to 1830, therefore it is no use my calling him.

Mr. Justice Field: No.

Mr. McIntyre: Then that is my case.

Mr. Justice Field: I understand you are going to the jury upon the question that he did not act as an apothecary within the meaning of the Act. Do you propose to go to the jury upon that?

Mr. McIntyre: Yes. The form should be "advising and dispensing medicines." Their charge is "attending."

Mr. Justice Field: Do you propose to go to the jury upon that?

Mr. McIntyre: "Attending and advising."

Mr. Justice Field: You say he did not attend.

Mr. McIntyre: Not within the meaning of this Act.

Mr. Justice Field: I will ask the jury that question whether he acted as an apothecary by attending, advising, and supplying.

Mr. McIntyre: The only other question is whether what was done by this gentleman was the same as was done before the year 1815.

Mr. Justice Field: It is, first, did the defendant act as an apothecary; and, secondly, whether before the passing of that Act it was customary for chemists to compound and prescribe medicines in their own shops for the cure of simple complaints. You do not say the cure of such complaints as stated in your statement of defence. You may take it, if you like, in that shape; was he in practice for such complaints as appear in the statement of defence?

Mr. McIntyre: That is under that plea. First, there is a denial of acting and practising as an apothecary by attending, advising, and supplying. Another question will be whether the trade or business of a chemist and druggist was exercised and carried on before 1815 in the way it was exercised and carried on by the defendant.

Mr. Justice Field: I shall not put that; I do not think there is any dispute about that.

Mr. McIntyre: The third question would be whether what the defendant did was within that custom.

Mr. Justice Field: Did the defendant dispense, compound, and vend drugs in the same way as before the Act.

Mr. Morgan Howard: That is almost a question for your Lordship.

Mr. Justice Field: That is my impression.

Mr. Morgan Howard: I submit that it is.

Mr. Justice Field: I think it is.

Mr. McIntyre: The first question I should ask the jury to find is the fact that this gentlemen did not attend, advise, and dispense medicines as an apothecary.

Mr. Justice Field: Attend, supply, or advise; did he advise or supply as an apothecary? That is the question I should ask the jury.

Mr. McIntyre: He would be entitled to supply medicines.

Mr. Justice Field: As an apothecary?

Mr. McIntyre: It will be for your Lordship to tell the jury what that means.

Mr. Justice Field: What other question is there?

Mr. McIntyre: The other question your Lordship says is proved, that before 1815 chemists and druggists did in simple complaints dispense in fact.

Mr. Justice Field: There is no question about that to go to the jury.

Mr. McIntyre: Your Lordship rules that paragraph 5 in the statement of defence is proved.

Mr. Justice Field: I cannot say that.

Mr. McIntyre: I understood your Lordship to say it was. The second question is, whether what the defendant did was in accordance with that custom.

Mr. Justice Field: Were the children suffering under simple complaints—that is what you mean?

Mr. McIntyre: There is no evidence of that at the time he prescribed. Your Lordship limits it to "simple complaints."

Mr. Justice Field: You have so put it in your statement of defence. Were the complaints under which the children in question were suffering complaints of such a character as it was customary for chemists and druggists to prescribe for before the passing of the Act. I will ask the jury that question. We had better keep them to the simple complaints.

Mr. McIntyre: Gentlemen of the jury, the first question you will have to decide is, did the defendant act as an apothecary by attending, advising, and supplying patients with medicines? That is a question of fact which you will have to determine. You have the facts before you. In two cases a person came to his shop with a child, and in the other two cases, where the children were not present, the person who came described to the defendant what the children were suffering from. He, upon the description given to him, gave medicine to the people who were in his shop. He charged for that medicine, and they took it away. In the first case Mrs. Culverwell said he gave her that medicine, telling her that it would do the child good, but that if the child was worse she was to send for a medical man. In one case the child had what was thought to be a sore throat; and you have heard the evidence of the old gentleman this morning who showed what the practice was—that for sore throats and things of that sort they would be treated; the defendant gave medicine for the purpose of curing the child. In the third case the child was brought to him; he saw the child and gave it medicine. And in the case of Rhodes, where the child died of scarlet fever, he never saw the child at all, but he treated it by giving medicine according to the symptoms which had been described to him by the grandmother of the child. Although that child died of scarlet fever, the medicine was given to her on the Monday, and the child did not die until the Tuesday week following. The evidence of the doctor is, that the child might have been suffering for four or five days. But you all know that these diseases go on more rapidly at one time than at another time. The medical gentleman having had the symptoms described to him, treated the child. Is that attending, advising, and supplying medicine as an apothecary? I submit to you it is not attending and giving medicine, when a person comes into your shop and gives an account of what appears to be a simple complaint; he prescribes over his counter, and gives the medicine which he thinks will do for a simple complaint. The first witness, Mrs. Culverwell, said that her child had a slight wheezing, and the defendant told her that as long as that continued there was no danger, but if the child got any worse she was at once to call in a medical man. The next case was that of Fanny Grist. She saw Mr. Wiggins, and he told her the child was bad, and he told her to call in a medical man. It is true he gave some medicine to ease the child until the medical man could be called in. I put that point most strongly before you, that that is not acting as an apothecary by attending, advising, and supplying medicine. He was only doing that which would ease the child, and do the child good for the time, and the only advice which he gave was to call in a regular practitioner. That was on the Sunday night, and the child died upon the Monday. Then Rosina Bennett is the case which my friend relies upon, because the child was suffering from bronchitis. We have evidence of the last witness examined to-day, who said he himself would have treated bronchitis; that he treated that as a simple complaint, and certainly in the early stages it is a complaint which might very well be treated by a person acting as a chemist in the way they had acted before 1815. In this case the grandmother went to Mr. Wiggins's shop on the Monday, and told him the child was ill. He asked what it was suffering from, and she said the child was suffering from a violent cold. The defendant never saw the child at all. He acted upon the description the woman gave, and he gave the medicine to her; he never saw her again. It was the mother who came afterwards, and asked him what the child was suffering from, and she stated in the box that he told her the child was suffering from scarlet fever. There must be some mistake about that, which, no doubt, arises in this way: that the child having died from scarlet fever the mother knew all about it; from the time they called in Dr. Cooper they knew what was the matter with it, and therefore she thought the defendant told her the nature of the complaint. But the description which the chemist had to go upon was the description given by the grandmother, and the only medicine given to her was for a violent cold which she said the child had. That proves he was acting as a chemist, and not as an apothecary attending, advising and supplying medicine. The other question is, whether these ailments were such as were attended to before the year 1815. In the two cases where he saw the children, I submit, it is clear the state the children were in then were ailments such as would have been treated by chemists before 1815, and that they did dispense medicines for the curing of these very things. With respect to the cases where he did not see the children, the descriptions were given by the persons who came to him; he acted upon the descriptions given, and they were descriptions of simple complaints, such as were treated before the year 1815. I say in neither case ought your answer to be against the defendant, but for him.

Mr. Morgan Howard: May it please your Lordship, gentlemen of the jury, this case has lasted a long time, but I do not think it has lasted a moment too long when you consider what the important issue you have to determine is, and the important interests to the community at large. I also venture to submit to you that the time has arrived in the state of society in which we live when the relations which exist between the branches of the medical profession should be ascertained at once, in order to do away with the evils at which the legislature aimed some years ago, but which legislation has not been as effectual as it was contemplated it would be. The Act has been in force now for over sixty years, and the Apothecaries' Company, who are the guardians of this statute, which was passed not for their benefit, but for the benefit of the public at large, have watched the proceedings of unlicensed practitioners with a view to suppress that practice, and to protect society from their incompetency. No care has been wanting on the part of the legislature in surrounding chemists and druggists with every privilege that they can desire to have. They carry on a lucrative and important business, the profits of which are notoriously large; they are not hampered or fettered in any possible respect, and it is only when they overstep the limits which good sense suggests they should not overstep that proceedings are taken. We find that as long ago as 1815 great mischief had arisen from the incompetency of certain chemists. It is admitted that they do not undergo any examination sufficient to enable them to take the diagnosis of various complaints. I am sure you will think that the Apothecaries' Company are only doing their duty, which they are bound to discharge for the protection of society, in bringing this matter before you for your determination to-day. When issue, as we say, was joined in this case, what was in substance the question you had to try? It was whether or not the defendant had been acting as an apothecary. His Lordship will tell you that it is not in the smallest degree necessary that you should attach any importance to the word "attending." The question will be whether or not he did advise with the patients, and having advised, in the sense of diagnosing their complaint, he did make up a mixture for them. If you find that, his Lordship will direct you that is acting as an apothecary, not merely in the light of the statute, which has not been construed, but by the light of the decisions which have been given upon the statute. I have called my Lordship's attention to one or two cases which have expounded the statute where the judges laid down, what one would have expected, that where a man does commune, so to speak, with a patient, by saying, "What is the matter with you? Let me look at your tongue," or "feel your pulse," and supplies medicine to that person, and gets money for it, he would be acting as an apothecary within the meaning of the statute, and doing the very things which that statute was meant to obviate when it was passed in the year 1815. Gentlemen, this statement of defence was framed by an exceedingly able friend of mine who sits not very far from me, and he having been advised from the outset of the case, gave an interpretation to the conduct and acts of his client which was best suited to draw, if possible, from you a verdict in favour of the defendant. They have not had the courage to suggest to you to-day that the treating of serious diseases, such as scarlet fever, could be supposed for one moment as coming within the proper province or exception of this statute. It is "simple complaints," such as that very cheerful old gentleman whom I congratulated upon having reached the very mature age of 84, described, such as a cut finger, or a boil, any of those simple ailments which we ourselves commonly treat at home. If you have a wheezing, you put a mustard plaster on your chest with the assistance of your wife, or nurse, as the case may be. Such things are done without the suggestion of a chemist. But they did not invite your consideration upon this, whether the attendance of chemists in a case of pneumonia or bronchitis, which, when it reaches that stage has nothing to do with a mere cold, scarlet fever, which, according to our witnesses, and it is perfectly uncontradicted, was treated by the defendant after he had examined the patient, and after he had pronounced that it was a case of scarlet fever, was lawful.

Mr. McIntyre: He never saw the scarlet fever patient.

Mr. Morgan Howard: If you would only wait a moment you would hear what I was going to say. Gentlemen, this was the case of Rhodes. There were two cases of not seeing the children, and two cases of seeing them. I may as well make the observation at the outset that if it were possible to distinguish between the objectionable character of uneducated men, that is to say, uneducated in a medical sense, dealing with complaints of this character, you have it manifested in this instance where not only does he deal with a case of scarlet fever but deals with it in the absence of the patient. Can anything be more conducive to injury to the body politic? Here the grandmother comes for the medicine, which is given to her over the counter, for a child suffering from one of the most malignant, and very often fatal, diseases, scarlet fever. The child is treated by a chemist in his own shop in the absence of the child, and it is only when the case becomes alarming and he perhaps has the possibility of the law before his eyes, that he remits the case to the person to whom it ought to have been sent in the first instance, namely, a doctor, whose business it is to deal with such cases. I pray you, as representing here, not only the Apothecaries' Company, but as representing yourselves, for you form a portion of the community, to put a stop to this, and to do this by your verdict, to pronounce this is a thing not to be tolerated, having regard to the condition of society and to the acts of unlicensed practitioners, and to give the legislature, if necessary, the opportunity which they now are about to do, of reconsidering the Act of Parliament, and to legislate for the future; but to let it go forth that chemists are to treat persons suffering from a malignant disease, as was the case with this poor child, would be to give a premium to this kind of thing which would be availed of right and left throughout this metropolis and in all the large towns. Take the case of bronchitis. That is an extremely serious disease. My friend did not venture to suggest in cross-examination, when Dr. Cooper was here yesterday, that bronchitis was not a disease of a serious character. It is notorious that it is; it brings about other diseases, and very frequently indeed in some form or other it introduces complications into the system which ought to have a careful watching at the outset. And yet here is a case which Mr. Wiggins undertakes to treat, and does treat, by giving a bottle of medicine. It is not a case of a person going into a shop as you may do, and say "I do not feel very well. I want a dose of Gregory's powder." We all know what that means; there you specify the medicine, and the chemist runs no risk. If you are out of sorts you perhaps ask for a patent medicine, which the chemist is absolutely entitled to vend, and gets the profit upon so doing. If you ask for so many grains of this, and that, to be put up into a pill, you are the author of your own wrong if any occurs, and not the chemist. The mischief aimed at by the Act is this, that a person suffering from ailments, and not knowing how to treat them, goes into a shop, and the chemist subjects him to an examination, looks at his tongue, feels his pulse, and goes through other formalities, pronounces it a disease, and then says, "I can cure this," and thereupon makes up a bottle of medicine with all the solemnity with which he would make up a physician's prescription, and the result often is that people are made worse rather than better—though I do not say it was so in this case. I put it to you, after evidence of this kind, whether it is possible even to bring any case within the purview of a statute like this. Where cases are difficult to treat by the well ascertained rules of medicine, or by referring to the Pharmacopœia, it is monstrous to assume that chemists who have no means of undertaking them, who are never educated for it, and who undergo no examination for it, should be permitted to vend over their counter, merely for the sake of pushing an additional trade, so to speak, instead of being content with the abundant trade at their disposal, and their remunerative profits. The apothecary is a certified practitioner. Ever since the apothecary's rank in the profession has been ascertained he has had to undergo a series of examinations, which are as strict as it is possible to conceive, at the Apothecaries' Hall. He has to undergo an examination in the Pharmacopœia, in anatomy and various other branches of medical knowledge in order to acquire skill, without which he is not permitted to receive the certificate which it is necessary for him to have before he can practise, in order not to incur penalties under the Act of Parliament. But when such things are done as we have heard stated here it is time for the Apothecaries' Society to step in. If the legislature had pronounced these unlicensed and unqualified acts to be a misdemeanour punishable by fine and imprisonment, we should have had our friend Mr. McIntyre here today saying, "Do not send this man to prison, it is a monstrous thing." But instead of its being made a misdemeanour, the legislature, said when the thing is proved to the satisfaction of a jury there shall be a merciful way of dealing with it, namely, by suppressing the practice, and inflicting a moderate fine. Chemists and druggists will not find it convenient to continue the practice any longer, if they are liable to a fine for so doing. I invite you to say upon the first point that beyond all doubt Mr. Wiggins was acting in these cases as an apothecary. You will have my Lord's direction upon the law of the case, and therefore, it is not necessary for me to deal with that. It is said the cases treated by the defendant were simple cases; but you have heard that one was a case of scarlet fever, and that being so, anything more unlike the complaints spoken to by the defendant's witnesses, such as a bit of a cold, a cough, a cut finger, or boil, cannot be imagined. I say scarlet fever and bronchitis are not simple complaints at all, and that the only defence upon this record has failed. I may remind you, as I think I told you before, that people are in no difficulty whatever about going to chemists and druggists. They may go in and get their medicines just as they please, and the chemist has nothing to do but to dispense. He may sell patent medicines under the due protection of the law, but the only thing he may not do is that which every one will say he ought not, namely, to pronounce without medical examination upon difficult cases, and administer medicines under certain conditions up to a given point, and then when his skill fails him he shelters himself from risk by sending the person to a medical man, who ought from the first to have had charge of the case. If you want an illustration of this sort of thing have you not got it in the cases before you? Is it altogether unreasonable to suppose that some possible escape might have happened to one of these children if the mothers had been bound to take the children in the first instance to a medical man? If that had been done there might have been some hope that at least two of those children might have escaped and have been living at the present time. But they all died. Allow me to say here that I desire to shelter Mr. Wiggins from all responsibility in this matter. I do not say that they would have lived if they had been taken to a medical man; but still I put it to you that where it is desirable that persons should not entrust their lives to unskilful hands it is better to take the case in time to properly qualified persons, and not to run any risk. You will have two questions left to you: one is whether there was an acting or practising as an apothecary, and the other is, were the children suffering from infant complaints such as it is customary for chemists to prescribe for. I have already discussed more or less both propositions, and, therefore, I will not weary you by going over the ground again. It is impossible to say that these children were suffering from such simple complaints as we have heard described, because one of them had scarlet fever. You cannot say that scarlet fever, acute bronchitis, or advanced inflammation of the lungs are simple complaints, which you could go into a chemist's shop and ask for a pill or powder to cure. In so far as this issue is before you for decision there is no answer, as I submit to you, to the case which the plaintiffs make out, that the defendant acted and practised as an apothecary within the meaning of the Act. He has failed to show these were simple complaints which he was justified in treating, or that they were such complaints as were treated by chemists before the year 1815. There is nothing more to which I have to call your attention. I may add that the case has been considerably shortened by not calling witnesses one after another to go through the same details. Nothing has been withheld from you;

the defendant has not disputed the plaintiffs' case, and the question appears substantially this, whether these are simple complaints within the meaning of the plea as set up by the defendant. Unless that plea succeeds there is no answer to the case of the plaintiffs, because if the complaints were not simple complaints he was acting and practising as an apothecary within the meaning of the statutes, and was doing those things which were pernicious sixty years ago, and are now more pernicious still, for this reason, that the knowledge of medicine has been considerably extended of late years, and there are institutions established for the supply of medicine to all ranks of people, even to poor people who cannot afford to pay for it. Therefore, it is no excuse for chemists, who are extremely well treated by the legislature of this country, to invade the proper domain of the apothecary for a gain which, I submit, they ought not to receive.

Mr. Justice Field: Gentlemen of the jury, this matter although it is very properly described as a matter of importance is yet really a very simple matter. when you come to look into the real facts of the case, although no doubt a matter involving certain questions of importance one way and the other. But a great many questions that you have not unnaturally had drawn to your attention by the learned counsel on both sides, seem to me to be beside the question. In the first place you know Mr. Wiggins is not to blame for what has been done in any way; that is, there is no moral blame attaching to him for what he has done. No doubt he has done that which he for many years, and a great many other respectable people have been in the habit of doing, but you have still to consider whether that is within the Act of Parliament, or not. Then the poor children died. You must not take that at all into your minds as any blame to him at all, because the percentage of deaths of children is very high indeed, and it is not at all suggested that what he did was in any way bad practice. At the same time it is important as a fact in the case, to show that the diseases under which the children were suffering at that time were of such a character that they did very shortly end in death. That shows what the character of the complaint was under which the children were at that time suffering.

Then you have heard, of course, naturally enough, first of all about the advantages of the Act, and next you have heard the disadvantage, or suggested disadvantage, that poor people should be restricted in their right to go and pay a chemist or druggist 6*d*. or 7*d*., when if they had to go to a regular apothecary they would have to pay something more. Therefore it is said that that is an evil, and you are rather invited to come to the conclusion that this is a hardship upon these people. But there again we must not go into that; we should be making the law, instead of deciding it. What you and I have to do is simply to decide according to law. If the statute of 1815 is wrong, let the legislature by all means alter it, and I have always thought that the best way in which the legislature can be satisfied of the propriety of altering the law is by deciding according to the law. If we are to decide that this is not within the law, the legislature would not want to alter it, if they thought it wrong, and therefore the better way always is for courts to decide according to law, and leave the legislature to say when they see what the effect of the law is upon contracts or upon society, or upon the interests of the community whose interests they are called upon to represent: if they find that in effect it is a bad thing and they wish to alter it, they will alter it within such degrees and limits as they think right. What I wish to impress upon you particularly is this: please to dismiss all these topics from your mind. I will tell you presently what the statute means; I will tell you very shortly what acting as an apothecary means; and then I shall tell you what the evidence is, and you will say whether there is any doubt upon the evidence as to the defendant having so acted.

Now you know this is not the only exclusive legislation. It extends in this country, as in most other countries, to a great many professions and trades. That is, the Government of the country—whatever it may be—the State, thinks it is, and probably it is, at all events it thinks it is its duty to interfere, first of all to some extent with freedom of contract. You may go and pick out any shipbuilder you like all over the world; you may take the most ignorant man—a man who started a shipyard yesterday if you like, and nobody will interfere with you, or with him either. You may buy whatever goods you please of anybody who has only started in business yesterday and has no qualifications at all. All that the legislature leaves to freedom of contract, which is the foundation, no doubt, of all good systems of legislation; that is, to leave people as much as you can to judge for themselves who are the people they like to employ, and to consult, and let them take the consequences if they make a bad choice. But there are certain cases in which the legislature makes an exception. It is not confined to England. France and other countries have the same, and the principle upon which the legislature acts is this, "We think we ought to supply our citizens with the means of consulting certain persons of skill in the respective mysteries or faculties that they exercise." For instance a solicitor must undergo five years' articles before he can lawfully practise as a solicitor, and if he does it without that he incurs a penalty. I can very easily understand people saying, "Oh! but what a pity that is; because I could go to such a man and I could get advice. He would give me advice for 3*s*. 4*d*. which I should be quite as well satisfied with as if I went to a first-rate firm of solicitors." But the legislature says, "No; we think in consideration of that we will prohibit any other person doing it, because we think we are bound to provide our citizens with skilful people in certain particular arts and professions; that is we will take care that there shall be such people whom they can consult, and we will prevent anybody but those people giving advice in such matters. The medical profession is familiar to you; we all know it. The legislature says an ignorant person or a poor person has no means of knowing whether Mr. Smith or Mr. Johnson is a good man or not; therefore they must have a person who has undergone a certain examination. That is the state of the law at the present, here in this country, and the question is what falls within the law. Now before the passing of this Act—and we are dealing with an Act of some age, as far back as 1815, before the passing of this Act, it is quite obvious from the language of the Act itself that the medical profession was divided into four different branches. There was the physician then, as there is now. The physician prescribes for you. Originally no physician ever did anything more, because originally the College of Physicians, established I believe in the time of Henry VIII.—I am not quite sure,—but that college would not grant a licence to anybody as a physician unless he came under the condition that he would not dispense his own medicines. That state of things continued from that time down to 1838; and in that year the College of Physicians did pass a bye-law enabling their licentiates to administer and supply their own medicines; and the consequence of that is, it seems to me, very beneficial, for there are a great many gentlemen who are physicians, who have taken their degree and rank as physicians, who yet practise generally and give their patients the benefit of their experience and of their qualifications as physicians, and at the same time they give them the medicine which they are entitled under those circumstances to dispense. That is what the physician does. He does not supply anybody else with medicine, and he has a right himself to give you a prescription which you may take to your chemist and druggist to be made up, or he may supply it himself and you may take the medicine from him, or he will send it to you if you send to him for it.

Then, besides the physician there was the surgeon; originally he was the barber—the barber-surgeon. The difference between the surgeon and the physician was this: that the physician dealt with the ailments of the body, constitutional or functional derangements, gout, typhus fever, scarlet fever, or anything of that kind. The surgeon, properly, was limited to external operations or ailments, and also such internal operations or ailments as come within the science of surgery. For instance, if you break your leg the surgeon sets it for you; if you have a tumour inside your body, and you think it can be cut out safely, the surgeon will come and excise it for you. And the surgeon, as a rule—the surgeon *per se*, by himself, not at all operating in the way of surgery—if he were to give you advice and medicine, would be infringing this Act, because he would be acting in that case as an apothecary. As a surgeon he may do that which is ancillary; for instance, he may give you an anæsthetic, or give you something which he thinks will operate favourably upon you at the time. When you have a purpose ancillary to a surgical operation, then the larger thing, the surgery, covers the smaller thing, and no doubt in that particular case his giving a medicine is not an improper act, and he is not liable to a penalty for it, because it is the smaller thing, attendant upon and consequent upon his duty as a surgeon.

Then comes the third degree—the apothecary. There is no doubt that originally the apothecary was what afterwards became, to some extent, the druggist. That is, he culled his simples himself in the fields, dried them in his *apotheke*, or place where he deposited them, and from there administered them. That, no doubt, was originally the apothecary. But there is no doubt also—as the evidence we have had shows us—that before the statute of 1815 the apothecary had become not merely a seller, but had acquired, not any technical right, but as a fact the habit of attending people, advising them, and giving them medicines. What you call the general practitioner of today is an apothecary as created by this Act of Parliament. He is called a general practitioner because he is not merely either a physician or a surgeon, but also an apothecary under this Act.

Then comes the fourth, which is what is now called a chemist and druggist. He was in existence also, and carried on trade or business as far back as 1815, and you will see by this Act what his duties were, and what it was he did. That being so, the question for you is, whether or not—I will not say in attending, because that is a question which is in dispute, but in doing what he did in respect of these three children, Culverwell, Bennett, and Rhodes, the defendant acted and practised as an apothecary. The Company has laid down the way in which they say he did do it, namely, by attending, advising, and supplying medicines as an apothecary. Now do not run away with the idea that it must be attending, and advising, and supplying altogether. You may read all these distributively. If he advised, and supplied medicines; or you may take it in this case if he has attended, (because after all it would be a question whether he did not attend in this case), but if he advised and supplied medicines as an apothecary; if he advised as an apothecary; or if he supplied medicines as an apothecary—taking them all, that is the language of the Act—and the thing charged is that the defendant attended, advised, and supplied medicines as an apothecary, what does the Act say upon that question? The Act points to this: it begins by reciting the charter, and it speaks of the art, mystery, or faculty of apothecaries. That is how it describes it; art, mystery, or faculty. Art, you know what that is. Mystery, you know is what is called a secret. Faculty, you know what faculty is, a learned body. Speaking therefore, first of all of the practice of an apothecary, it is described as the art, mystery, or faculty of an apothecary. In respect of chemists and druggists, it is the trade or business of a chemist or druggist. You see the difference of language which the statute uses with reference to the two things. Then the charter and the statute supply you with what the meaning of it is. First of all it recites the charter, and it says it was granted "to all and singular other persons whomsoever, brought up and skilful in the art, mystery, or faculty of apothecaries, and exercising the same art, mystery or faculty, then being freemen of the mystery of grocers, or being freemen of any other art, mystery, or faculty, so as they had been brought up and were expert in the art or mystery of apothecaries." So you see that the persons limited by the charter were persons who had undergone some species of training before. They were to be members of the grocers, or if members of any other guild or mystery, they were to be brought up and expert in that.

Then this Act, after confirming the charter, and giving certain powers to the Master and Wardens of the apothecaries, says especially this, and here is the definition to some extent, not the whole of it. Mr. McIntyre says it is the whole; but it is not. Section 5 says, "It is the duty of every person using or exercising the art and mystery of an apothecary, to prepare with exactness and to dispense such medicines as may be directed for the sick by any physician lawfully licensed to practise physic by the president and commonalty of the faculty of physic in London." Then for further protection it provides for certain things. If there is the initial of a physician he must do it, and it provides a penalty also if that is not so done. Then the Act proceeds to appoint persons as Examiners for the purpose of seeing that the requisite skill is possessed by a person before he practises as an apothecary. Therefore he is to undergo by section 9 and various other sections an examination; he is to give notice. And then the 14th says, "and to prevent any person or persons practising as an apothecary, without being properly qualified to practise as such after the first day of August, it shall not be lawful for any person or persons to practise as an apothecary unless he shall have been examined by the Court of Examiners." What does that point to? It points to the acquisition of a certain quantity of skill, information and learning. He must be examined by the Court of Examiners, or the major part of them, and he must receive a certificate of his being duly qualified to practise as such from the Court of Examiners, or the major part of them. Now what is the examination to be for. They are "hereby authorized and required to examine those persons for the purpose of ascertaining the skill and diligence of such person or persons in the science and practice of medicine, and his or their fitness, and qualification to practise as an apothecary."

Now you cannot have anything more clearly laid down than what the nature of the duty is which an apothecary is to be called upon to execute. The legislature says he must attend this complaint, or that complaint, and that before a man shall practise as an apothecary he must be such a man as shall, on undergoing an examination by the examiners, be found to possess the requisite skill to practise as an apothecary. "Every person must give notice." I need not trouble you with that. That is the language of the Act with reference to the qualifications of an apothecary by which you may infer what the duty of an apothecary is.

Now we have another section which lays down what the chemist and druggist is, what he was, what it was intended he should not be prejudiced in by this Act. The 28th section says that: "Nothing in this Act contained shall extend or be construed to extend to prejudice or in any way to affect the trade or business of a chemist and druggist"—you see the different language—"in the buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicinable compounds, wholesale and retail; but all persons using or exercising the said trade or business," that is the trade or business before mentioned, in the vending these things, "or who shall or may hereafter use or exercise the same, shall and may use, exercise, and carry on the same trade or business in such manner, and as fully and amply to all intents and purposes as the same trade or business was used, exercised or carried on by chemists and druggists before the passing of this Act." The word there which Mr. McIntyre, of course very naturally, puts his case strongly upon is the word "dispense;" but now you will see whether this Act of Parliament throws any light on the meaning of the word "dispense." It is not the first time it is used; because you will find that the word is in the preamble to the 5th section, and you will see what it says about dispensing there. "Whereas it is the duty of every person using or exercising the art and mystery of an apothecary, to prepare with exactness, and to dispense such medicines as may be directed for the sick by any physician lawfully licensed to practise physic" by so and so. So that dispensing was part of their duty. They had no doubt a right to dispense also without that element, but they are also to dispense according to these directions; that is the apothecary. The chemist and druggist is described thus, although he may dispense : as buying, preparing, compounding, dispensing, and vending drugs and compounds, wholesale and retail. Dispensing in section 5, refers to the apothecary's duty. Dispensing here refers to this, but is not limited, although the word dispense has been used before, to the dispensing. He may dispense no doubt in this sense, that he may dispense medicine as he had before done. Then the question will be whether or not this was a mere case of dispensing here, or whether this was a case of advising and supplying medicine in the character of an apothecary.

Now I have before me the definition of an apothecary, as I find it laid down by those who have gone before me. "I should tell you that the duty of an apothecary is that he is a person who professes to judge of internal disease," (but internal here merely means as distinguished from surgical, it is not intended to mean one particular part of the body)—to distinguish ailments such as fevers; it would be difficult to find one word which expresses it all, but you know the meaning of that, "to judge of internal disease by its symptoms, and applies himself to cure the disease by medicines." That is the definition laid down by a very learned judge, Mr. Justice Cresswell, in a case he left to the jury as far back as 1845, and I adopt that and tell you that is the law. I take his language, adopt that language, and tell you that a person practises as an apothecary, if he does what Mr. Justice Cresswell here says : If he professes to judge of internal disease by its symptoms, and applies himself to cure that disease by medicines. I should ask you to keep that definition in your minds when I come to read you the evidence, and to see whether or not, what the defendant did here falls within that. Then I find another definition some years before, in which the learned Lord Chief Justice of the Queen's Bench of that day was of opinion that a man who kept no shop, but advised patients and made up and sold to them medicines which he himself ordered, did act as an apothecary in the ordinary sense of the term, and that it made no difference if he prescribed as well as prepared the medicines; he was still acting as an apothecary.

I give you those two decisions of two very learned judges, and I adopt them as the law which I lay down to you to-day. Therefore, what you will have to consider in the first instance is whether within those definitions the defendant did act and practise as an apothecary by attending, advising, or supplying medicine as an apothecary.

Now there are three cases in question, all of them cases of children. The first case was Mrs. Culverwell's, I think; and the case was of this kind. Mrs. Culverwell had a child called Alice, of two years old. The child had a cold, and had had a cold before. On a former occasion when the child had a cold, the child had been taken to the defendant, and it was for the same complaint, cold on the chest, so that he had known the child before. Under these circumstances just hear what Mrs. Culverwell did. She said, "I went to the shop without the child. He keeps a chemist's shop. I saw him. I said my child is poorly. He said, what do you think is the matter with her? He had known the child before. I told him that she had a wheezing on the chest; and she was very thick on the chest. He said if the wheezing continues there will be no danger. He gave me a bottle of medicine, and told me to put a mustard plaster on the chest. An assistant prepared the medicine. The defendant went out and left directions with the assistant. I saw him prepare it. I paid 7*d.*, and took the medicine away. The next night I went again. I told him I thought the child a little better. He said continue the same medicine. He then directed the assistant to prepare the medicine. Altogether I had three or four bottles of the same preparation. On the Saturday I took other advice." Now then, what was the matter with the child? She says she went to Dr. Cooper on the Saturday, and Dr. Cooper tells us that the child—No; I do not think he speaks about Culverwell.

A Juror: He said it was pneumonia, I think.

Mr. Justice Field: Now you must consider whether he was acting as an apothecary in doing that.

Mr. McIntyre: He said the child was in an advanced stage of pneumonia when he saw it.

Mr. Justice Field: You must consider whether in what he did there he acted as an apothecary. What was he doing? Of course, he was selling in one sense. He was selling medicine. He compounded it, he prepared it, and he dispensed, and vended it. He prepared, compounded, dispensed, and vended it. Did he act as an apothecary? What is an apothecary as distinguished from a chemist and druggist? A chemist and druggist you know has a prescription given to him, and he then is not advising, he is doing that as a chemist and druggist. All he does is to take the doctor's prescription, and make it up, according to what the doctor tells him.

The Foreman: In the way of trade, my Lord.

Mr. Justice Field: Of course a chemist and druggist also sells any particular medicine you may ask him for. You say, give me Powell's Balsam of Aniseed; or give me any other well known medicine. You take upon yourselves there to judge whether it is good or not for you; you do not ask any advice at all; you simply go and ask him for it. Mr. McIntyre says: Is a man to be prohibited from drawing out from one of his jars a certain quantity of matter, and putting it into a bottle with 1, 2, 3, 4, 5, and 6 upon it. That is not the question. If you go in and say, give me so much syrup of squills; give me so much of any common thing you like to have; of course the chemist and druggist is selling them, but not as an apothecary, because he is not giving you advice, or ordering anything at all. In this case you observe what happened is, he asked what the symptoms were, and having got the symptoms, he advises that if they continue, a certain thing will be good; if not, she must do something else which he ordered and gave to her to do. That is the case there.

The next case is that of Fanny Grist. She was taken to him, and therefore, unless attending is to be read as going away from your place, he attended upon the patient. There was the patient there. He saw the child. What she says is this: "I said, will you give me a little medicine for my child? He said, yes I will: what are the symptoms? I said, I gave her half a teaspoonful of castor oil in the morning; she has been looking very bad all day. I said when she was five months old she had been in convulsions; I thought by her appearance she was going to have some. He examined her and said he thought so too. He made up a bottle of medicine and gave it to me, and a powder. I do not know whether he made up the powder or not. He told me to give her the powder as soon as I got home, and an hour after to give her the draught. Then I paid 6*d.* or 9*d.* I gave a dose. After the first dose the child died. On the Sunday he said he thought the child was very ill. He asked if the child had diarrhœa. I said no. He examined her tongue and felt her pulse, and after this he prepared the medicine. On the Sunday he said he thought the child was very ill and if she was no better the next morning, I had better call in a doctor." That is the second case. The doctor tells us the child must have been suffering for several days from acute bronchitis.

Mr. McIntyre: I do not think he saw that child.

Mr. Justice Field: The third child, Bennett, "he looked at. He said she has acute bronchitis; you must take great care of her. He looked at her mouth and made up some medicine in a bottle in my presence. I do not know whether it was composed of more than one ingredient. He took it out of a bottle and told me the child must take it three times a day. I gave it in doses to the child."

What you have to say is, whether in this case he was supplying and acting and practising as an apothecary. He did the very things which in the law as I have laid it down to you, it is said must not be done. He used his skill; he did not merely do something acting on anybody else's prescription or orders. He did not give merely a specific article in answer to a request for a specific article, but was presented to the patient and made inquiries what the symptoms were, exercised his judgment, gave his advice, no doubt his honest, best advice, or gave his advice in the shape of medicine which he gave the mother of the child in this case, for the purpose of medicine.

Now having told you what acting as an apothecary is, you will have to say whether or not you think he did use the art and mystery and practice of an apothecary, and if so you will find a verdict for the plaintiffs on that question. If he did not, then of course there will be a verdict for the defendant entirely.

Then a question is raised under the 28th section, and it is said there was a custom. The allegation in the statement of defence is that for simple complaints there was a practice before 1815 to do this thing, which has no doubt been proved. It is not necessary now for me to say anything about that, but probably by and by, if it becomes necessary, I should have to say that that very practice was the thing the legislature intended to put an end to. It seems to me that was the very thing the legislature said. They said, "We do not want to interfere with the trade or business of a chemist in doing these things;" but the very object of the legislature was, that persons who had to exercise their judgment upon questions requiring judgment and skill, were persons who should undergo an examination, and should have a certificate, so that the public might know to whom they were to go, and see whether they were certified. However, the evidence proved by Mr. McIntyre went to this, that before 1815, and since that time, there has been a practice on the part of chemists and druggists, without undergoing any examination, or having any certificate from the Apothecaries' Company, in simple complaints—that is the phrase used in the defence, and used by the witnesses—to do this thing. The only question I am going to ask you upon that is, whether these three cases of Rhodes, Culverwell, and Bennett were simple complaints within the custom so proved or alleged. Now you know what they were. One was a case of advanced and acute bronchitis, another was a case of pneumonia, and the other was a case of convulsions. If you like, put aside the question of convulsions for the moment, for children are liable to them; still, considering the two cases of bronchitis and pneumonia, you know—everbody knows—what a serious thing pneumonia is, congestion of the lungs, inflammation of the lungs, and what a serious thing bronchitis is, and how often it ends in death; you must consider whether or no you come to the conclusion that those diseases or complaints under which the children were so suffering were such complaints as were within the practice detailed by Mr. Cupiss, a very respectable gentleman, and the other gentleman who was called after him. What Mr. Cupiss said was this: "I prepared my medicine when a patient came into a shop and asked for a remedy, to ascertain what was the matter with him, if possible, I would examine his tongue and feel his pulse"—pointing to the same things that were done here—"and then made up the medicine." In cross-examination he says: "I prepared according to their receipt. I never visited a patient. My idea is that I might exercise," so and so. "I never dealt with any case that I thought dangerous."

The other gentleman, Mr. Parsons, says he agrees with that. Then he explains that by simple complaints he means a cold or an eruption on the skin, cutaneous diseases, or things of that kind.

However, please give your answer. If you think that he did practise as an apothecary, please say so. I will take that separately from the second question. The second question is whether those complaints under which the children were suffering were complaints of the character which it had been the common practice to treat in the trade or business of a chemist or druggist before 1815. Of course the evidence as to that point is naturally limited to a year or two on account of age. You must remember that of necessity gentlemen cannot speak to a great length of time, and you cannot have much of that evidence. You also have the confirmative evidence of continuance of the practice on the part of Mr. Cupiss from 1815 downwards to modern times.

Gentlemen, please consider your verdict, and give me your answer to these questions. Did he act and practise as an apothecary in advising and supplying medicines, or both? Secondly, as to the complaints he so attended, were they complaints within the custom as proved by Mr. Cupiss and Mr. Parsons?

Mr. Morgan Howard: While the jury are considering their verdict I submit to your Lordship on the authority of that case in Barnewell and Adolphus, that if the jury find these facts to be done which were proved, your Lordship would direct them as a matter of law that he was acting as an apothecary.

Mr. Justice Field: I will consider that question. I know it was done by Lord Denman; but I doubt whether I should like to take that responsibility. I will consider the effect of that by and by.

Mr. Morgan Howard: The scarlet fever case, I do not think, your Lordship before mentioned to the jury.

The Foreman: My Lord, we find that the defendant acted as an apothecary in taking cases that were dangerous.

Mr. Justice Field: That is a verdict for the plaintiff on both issues. The verdict is quite clear of any doubt. I shall give judgment for the plaintiff.

Mr. Morgan Howard: I should ask for judgment, as I stated yesterday, only for one penalty.

Mr. Justice Field: Quite right. It will be judgment for one penalty. And, I think, you ought to have the costs.

The Associate: Judgment for £20 and costs.

Mr. Justice Field: £10 is it not?

Mr. Morgan Howard: £20 my Lord, is the penalty.

After a short pause:—

Mr. Justice Field: Mr. McIntyre, is there a measure before Parliament?

Mr. McIntyre: I think not anything that touches this.

Mr. Justice Field: I think it might be considered by chemists and druggists whether they should not communicate with the Apothecaries' Company and see whether something might be done. I cannot help thinking there might be some modification.

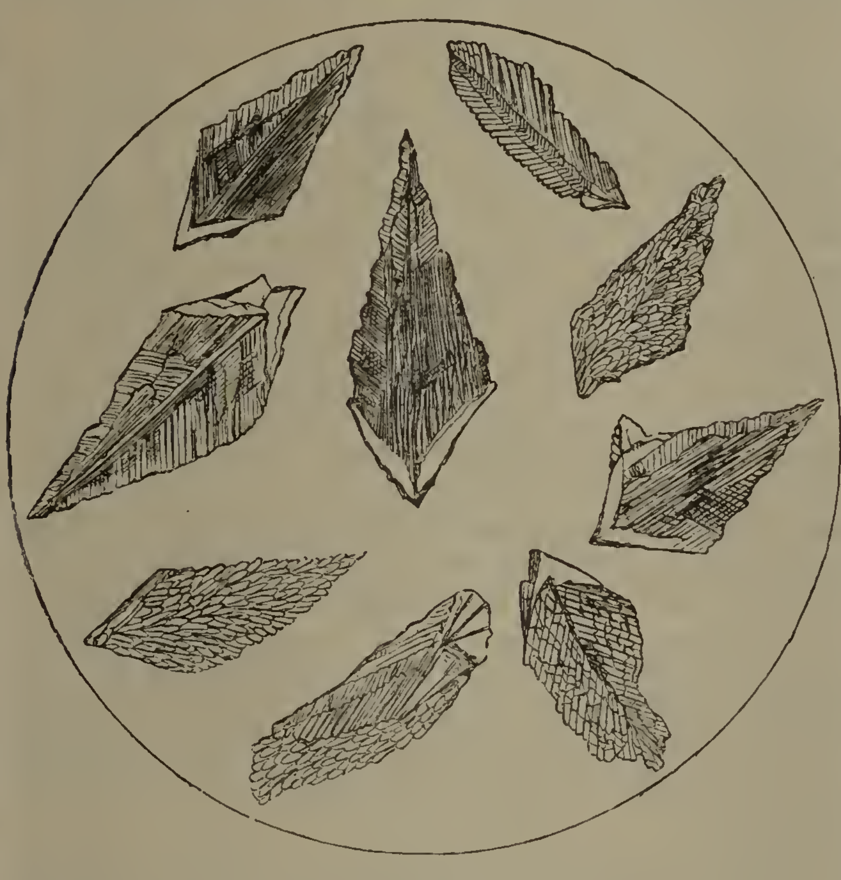
Mr. Howard: My Lord, I think I may say on the authority of my client, who I believe attended a deputation to the Duke of Richmond a day or two ago, that this question has been raised, and I believe his Grace has taken it into his consideration. I am not clear that there is not a proposal to transfer to the Medical Act the penalty which at present is to be found within the four corners of the Apothecaries Act. Probably that will have a beneficial effect. The intention of the Legislature would seem probably to remain the same.

MECONOIOSINE, A NEW DERIVATIVE FROM OPIUM.

BY T. AND H. SMITH.

In the final isolation of meconine, the oleaginous-like liquid containing it, upon being left to itself for some days, sets into a mass of crystals. Those crystals, upon being drained and cautiously washed with cold weak spirit, are to be boiled in a large quantity of water. The filtered liquid gives a crystallization of meconine, and the mother liquor, when concentrated, and upon being set aside for a time, yields beautiful leaf-like crystalline masses of the body to which we have given the name of Meconoiosine.

This remarkable crystalline form, which, in its impure state, is assumed by meconoiosine, as well as the brown colour of the crystals, enables this body to be readily distinguished from the soft and nearly white meconine, which crystallizes along with, and upon it, in a manner not unlike the incrustation of minute shells upon a rock. If this meconine be now



Sketch of crystals of impure Meconoiosine, of natural size.

removed, the meconoiosine, by means of a few crystallizations from hot water, with the aid of charcoal, may be obtained in the pure state, free from colour.

This substance is especially interesting because that now, in it, a second chemically indifferent body, existing in opium is met with. Hitherto meconine alone has been distinguished by this characteristic. Moreover, the respective chemical constitution of those two opium products reveals an apparent relation, meconine being represented by the formula $C_{10}H_{10}O_4$, and meconoiosine by that of $C_8H_{10}O_2$. Both bodies are freely soluble in alcohol and ether, but as regards their solubility in water, the two substances present a striking contrast. Meconine is very slightly soluble in cold water; and in boiling water, unless in the proportion of about 1 in 50, it refuses to dissolve, remaining at the bottom of the liquid, like a heavy oil. Meconoiosine on the other hand, is soluble in 27 parts of cold water, while, in boiling water, it is soluble to almost any extent, forming, as the heat rises, and before being shaken up, a syrupy solution at the bottom of the liquid.

We have not yet ascertained the boiling point of meconoiosine, but it has been heated to 280° C., without boiling. It melts at 88° C.

When heated with slightly diluted sulphuric acid, and when the evaporation has reached a certain point, meconine produces a beautiful green colour. With meconoiosine, under the same circumstances, the coloration is deep red, becoming purple.

In our case at the Paris Exhibition are shown crystalline specimens of meconoiosine, both in the pure and in the impure form.

THE TURPENTINES AND RESINOUS PRODUCTS OF THE CONIFERÆ.

Juniperus Sabina stricta, Hort.

In England the plant is known under the name of the common savin; in France as *sabine;* and in Germany as *Sadebaum*, *Sevenbaum*, and *Jungferpalme.*

The savin is a diœcious tree, met with in the Alps and Pyrenees, in Italy, Provence, Spain, the Crimea, the Caucasus, and even in North America. The young branches, usually bearing male flowers or fruit, are collected. Leaves occur under two forms upon the same plants; these have been referred to distinct varieties, one under the name of the "tamarisk-leaved savin," and the other as the "cypress-leaved savin."

Preparation.—Savin oil is obtained by distillation of the branches and fruits of the savin with water, the quantity of essential oil obtained depending upon the part of the plant employed. Thus the young branches in the fresh state yield only 1·30 per cent. of essential oil, whilst in the dry state the yield is about 2·5 per cent. The fresh berries give as much as 10 per cent. of essential oil. The wood does not yield any essential oil upon distillation.

Characters.—Savin oil is colourless when fresh or rectified, but more frequently it is pale or deep yellow. It gives off a strong and disagreeable odour, and has a resinous, bitter, and acrid taste. It has a specific gravity of from 0·89 to 0·940, and begins to boil between 155° and 161° C. Its reaction is neutral to litmus. Examined in a column 50 mm. long it rotates the plane of polarized light 27° to the right. This was the result obtained by Flückiger in operating upon a recent specimen of oil extracted from savin cultivated at Mitcham, and it corresponded to that obtained with a sample of oil, ten years old, from savin collected in the Vaud canton. But an oil kept in a badly closed flask, so that air has access to it during any length of time, has a much lower rotatory power.

Savin oil is soluble in two parts of 84 per cent. alcohol, and in all proportions in absolute alcohol and even in 93 per cent. alcohol. In contact with iodine it gives rise to an explosion, accompanied by considerable elevation of temperature. The addition of nitric acid to the oil produces an energetic and tumultuous reaction. Sulphuric acid produces a slight turbidity and a deep red coloration, which upon dilution with alcohol becomes raspberry red; the mixture remains turbid when heated. Treatment with hydrochloric acid gives rise to a crystallizable compound.

Composition.—Savin oil is a hydrocarbon isomeric with turpentine oil, $C_{10}H_{16}$. The plant contains besides a resinous matter and tannin.

Adulterations.—An addition of turpentine oil to savin oil can be easily detected with the aid of alcohol, since 1 c.c. of a mixture of 9 parts of recent savin oil with 1 part of turpentine oil requires 3 c.c. of 80 per cent. alcohol to make a clear solution, whilst 1 c.c. of a mixture of the commercial oil with turpentine oil in the proportion 3·1, requires 8·6 c.c. of 80 per cent. alcohol.

Uses.—Savin oil constitutes the active principle of the plant. It is employed as an emmenagogue, but caution is required in its administration. For internal administration the dose is from 2 to 6 drops. Externally, the oil as well as the powdered leaf is used as a vesicant.

XVIII.—OIL OF CEDAR.

Closely allied to savin oil is the oil of *Juniperus Virginiana*, L., known in this country as the "red cedar" or "North American savin," in France as the "*cèdre rouge des jardins*," and in Germany as the "*Cedernbaum.*" This plant closely resembles the *Juniperus Sabina*, but contains less essential oil. In the United States and Canada the oil replaces that yielded by the savin. The glandular cavity of the leaf is much smaller than that of the savin leaf.

In commerce the essential oil of cedar is met with as a soft crystalline mass, white, or slightly coloured yellow by the colouring matter of the wood. It is composed of two principles, one a liquid hydrocarbon named "cedrene," the other an oxygenated solid compound. To separate the solid compound, the oil is distilled and the portion passing at 300° C. collected, the thermometer being placed in the midst of the boiling liquid. The distillate consists of the solid body, mixed with a little of the liquid, which is removed by pressing it in a cloth. The solid portion is purified by crystallization from alcohol. In this way it can be obtained in magnificent silky crystals, having an aromatic odour and a slightly pungent taste, melting at 74° C. and distilling at 282° C. without alteration. It is very slightly soluble in water, very soluble in alcohol. Sulphuric acid imparts to it an amber colour. Walter represents this solid essence by the formula $C_{16}H_{28}O$; Gerhardt attributes to the formula $C_{15}H_{26}O$.

The liquid portion of the essential oil, or cedrene, is obtained by distillation after separation of the solid portion, and is rectified by a distillation from potassium. It can also be obtained by treating the solid portion with phosphoric anhydride and rectifying the product several times in the presence of the anhydride or of potassium. The liquid thus rectified boils at 237° C. and has a sp. gr. of 0·98. Walter represents it by the formula $C_{16}H_{26}$, Gerhardt by $C_{15}H_{24}$.

The essential oil as obtained by distillation rotates to the right the plane of polarized light; but its rotatory power is inferior to that of savin oil. It is soluble in one part of alcohol, commences to fuse at 74° C., and distils below 282° C. In contact with iodine it produces no explosion.

In North America this oil is employed as a tænifuge and an abortive, and several cases of poisoning by it have occurred. The wood is employed in the manufacture of pencils.

The *Juniperus Phœnicea* also has much resemblance to the savin, for which it is sometimes substituted. In the south of France it is improperly called "savin," but this monœcious plant has not the odour of the savin, and the backs of the leaves do not present the resiniferous vesicules of *Juniperus Sabina*. It is also met with in Greece, Syria, and the neighbouring isles.

XIX.—COLOPHONY.

Synonyms.—G. Colophonium; Geigenharz.—F. Colophane; Brai sec; Arcanson.

The name colophony is given to the residue obtained when turpentines are submitted to distillation in order to separate the essential oil. This residue is run off through a tubulure fitted at the bottom of the retort, and while liquid is passed through a filter having very fine metallic meshes, and then left to harden. The colour of the colophony thus obtained varies according to the method followed in its preparation. If the turpentine be distilled with steam, the colophony obtained is pale yellow, transparent or translucent, in which case it contains a small quantity of water. If the last traces of this water be eliminated by heating it at a higher temperature, or if the distillation be carried on over a bare fire, a brown transparent colophony is obtained, which may become black and dull if the temperature be raised during the last moments of the distillation.

The various kinds of turpentine each yield a colophony, but that which is met with in the European markets, with the exception perhaps of this country, is most frequently derived from common Bordeaux turpentine. In England, American colophony is most frequently met with, differing from the European in the yellow variety being slightly greenish and more transparent, and in powdering between the fingers, giving off an aromatic odour.

In France brown and black colophony still bear the name of *brais;* but although it is true that the colour depends upon the temperature used in the distillation, it would appear also that the origin of the turpentine is not without influence upon the colour of the product. Thus, for example, the colophony from Sweden and Norway, although prepared at a relatively low temperature, has a deep brown colour that appears red by transmitted light.

Characters.—Generally colophony has a feeble but characteristic odour; the taste is not very marked.

Yellow colophony, from common turpentine, softens at 80° C., and fuses completely at 100° C., giving a limpid yellow liquid. Heated to about 150° C. the liquid becomes darker, without losing weight;

at a higher temperature the colophony is decomposed. In the pure state it should be homogeneous, transparent, amorphous, and very friable, and have a sp. gr. of 1·07. It is insoluble in water, and between 15° and 20° C. it requires eight parts of 88° alcohol to dissolve it; the addition of caustic alkali favours its solution. It dissolves pretty freely in ether and fatty oils, but in acetone and benzol it dissolves in nearly all proportions.

When colophony is treated with boiling alkaline solutions it takes up the elements of water to form abietic acid, which then unites with the alkali present to form what is known as a resin soap, which is employed industrially mixed with other soaps. Sulphuric acid dissolves colophony with a deep orange colour. Nitric acid does not exercise any action upon this resin.

The colophony of Venice turpentine is soluble in two parts of hot 75° alcohol; stronger alcohol dissolves it more freely. Dissolved in half its weight of acetone and introduced into a column 50 mm. long it rotates the plane of polarized light 12·6° to the right.

The resin of Canada turpentine is also dextrogyre; two parts completely freed from essential oil and dissolved in one part of benzol rotating the plane of polarized light 8·5° to the right. It will be remembered that the essential oil has an inverse rotation and to nearly the same degree. In its chemical composition it differs from the resin of common turpentine.

The resin of Burgundy turpentine, dissolved in its own weight of absolute alcohol, rotates the plane of polarized light 3° to the left.

The resin of Strassburg turpentine, dissolved in half its weight of benzol, is slightly dextrogyre. It is completely soluble in glacial acetic acid, but incompletely soluble in absolute alcohol and in acetone. Strassburg turpentine contains about 72·4 per cent. of this resin.

Seen under the microscope the different varieties of colophony do not present the same characters. All those which are hard and vitreous are perfectly homogeneous and do not show any crystalline texture when examined by polarized light. The colophonies that are soft, dull, and have a fatty aspect, such as those that still contain oil of turpentine, consist of a nearly homogeneous hyaline substance, mixed with crystals of abietic acid and a granular matter.

Composition.—According to Undervorben the resinous matter of the turpentines is composed of two acids, pinic acid, or resin α, and sylvic acid, or resin β, and a neutral substance that he has called resin γ. Pinic acid and resin γ are soluble in 72° alcohol; sylvic acid is insoluble in it. Pinic acid and sylvic acid have the same composition, but pinic acid is amorphous and of a yellowish-brown colour, whilst sylvic acid crystallizes in rhombic prisms. Strecker has since stated that pinic acid is only an amorphous modification of sylvic acid.

The most recent investigators represent colophony of common turpentine by the formula $C_{44}H_{62}O_4$. Upon agitating it, coarsely powdered, with hot dilute alcohol, it takes up the elements of water and is converted into abietic acid ($C_{44}H_{64}O_5$). In this manner colophony can be made to yield 80 to 90 per cent. of its weight of abietic acid, and for this reason Maly and other modern authors have considered it to be an anhydride of that acid. Probably the resins from other conifers have an analogous composition. Consequently the plants of this family would contain only the anhydride of abietic acid, as the recent resinous liquid is limpid and becomes amorphous when the essential oil has been eliminated. Exposed to air the liquid loses its essential oil, takes up a certain quantity of water and solidifies as the crystalline acid. This modification is easily recognized with the assistance of the microscope in drops of turpentine that have just run from the trunk. For this purpose it is preferable to collect the limpid drops of turpentine from the *Pinus sylvestris* or *Abies excelsa* and preserve then in a bottle, protected from all moisture. In such a case the turpentine remains transparent, and if afterwards water be added crystals of abietic acid are formed which render it opaque. This explains also why turpentines, while flowing from the tree, lose gradually their transparency, and why they dry when exposed to the air and become harder and more granular. It also enables it to be understood why turpentines, before they have lost their essential oil by evaporation or oxidation, and before the crystalline modification has taken place, remain transparent if the essential oil be separated by distillation in the absence of water. Distillation in the presence of water is the explanation of the opacity of the residuary resin. Thus amorphous colophony preserves its transparency even in a humid atmosphere, and does not appear to become converted into abietic until it is in the presence of the molecule of water necessary for the transformation.

Laurent has also extracted from French turpentine pimaric acid, which corresponds in composition with sylvic acid. This acid might be supposed to have the same relation to abietic acid as pinic and sylvic acids. But Duvernoy and Flückiger allege that pimaric acid, of which galipot is for the most part constituted, differs from these two acids. When extracted from *Pinus maritima*, according to Laurent and Cailliot, it commences to melt at 125° C., and the latter chemist has isolated it under the form of ellipsoid crystals, which quickly absorb oxygen from the air and are consequently not stable. Alcohol containing 5·5 per cent. of this acid in solution rotates the plane of polarized light strongly (92·7°) to the left. The same acid, dissolved in alcohol or bisulphide of carbon, has a dextrogyre action if the temperature be raised.

The resin from Canada turpentine consists, according to Flückiger, of two ingredients, one soluble in boiling absolute alcohol, the other insoluble in it, but soluble in ether. The portion soluble in alcohol amounts to 78·7 per cent.; the portion soluble in ether to 21·3 per cent. Neither the alcoholic nor the ethereal solution gives crystals upon evaporation. Both portions redden litmus, but Flückiger failed to isolate a crystallizable resin acid like abietic acid, which is obtained easily by the treatment of ordinary colophony with dilute alcohol. Glacial acetic acid behaves toward both resinous substances similarly to absolute alcohol. Caustic alkalies dissolve neither Canada turpentine nor its resin.

Uses.—Dark coloured and only partially transparent colophony, the French "*brais*," is used in the preparation of "yellow resin" or "pitch resin." For this purpose* the colophony is put into boiling water and the mixture beaten up in a large trough

* Planchon, Traité pratique de la Détermination des Drogues Simples (1875), vol. ii., p. 214.

for about twenty minutes. As soon as the dark coloured colophony has assumed a light yellow tint, it is run into moulds and dried. In this way it absorbs 10 or 12 per cent. of water and becomes perfectly opaque and pliable; its terebinthinate odour is rather marked. This resin is especially prepared from the products of the Bordeaux pines.

In medicine, colophony is employed in the form of a powder as a hæmostatic, and it also enters into the composition of certain plasters and ointments.

It has an industrial application in the manufacture of resin soap, sealing wax of inferior quality, varnishes and cements. It is also employed in the soldering of metals, and the rubbing of violin bows.

(*To be continued*).

THE DISPOSAL OF REFUSE FROM CERTAIN MANUFACTORIES, IN CONNECTION WITH RIVER POLLUTION.*

BY J. FALCONER KING, F.C.S.,
City Analyst, Edinburgh.

This subject is one which both chemists and engineers have for years been considering and attempting to grapple with, and with, I am sorry to say, but indifferent success. The favourite plan at present with engineers is to get the refuse material conveyed as quickly and quietly as possible to the sea. When this can be done without annoying any one it is carried out without a moment's hesitation even though it infers a wanton waste of valuable material which might be profitably utilized. When this cannot be done other modes of disposal have to be adopted, and it is here that the aid of chemistry is invoked with occasionally beneficial and sometimes even profitable results. When no attempt at purification or utilization of the refuse from a town is made, the adjoining river, if there happens to be one, is transformed into a gigantic drain by which the sewage after having duly polluted the surrounding air is removed. The best example I know of this style of disposing of sewage is to be found in the Clyde at Glasgow Bridge. If you pay a visit to that odoriferous locality any tolerably warm summer day about the time of low water, and take a sail, say for a mile or two, in the cabin end of one of those floating steam palaces which are borne so plentifully on the bosom of this magnificent sewer, you will have the best evidence as to the disagreeable effects of this objectionable mode of disposing of sewage. The evil effects and the wasteful nature of the system which we at present pursue are, however, well known and admitted, the difficulty is to find a better; and I am sadly afraid this difficulty will remain an insuperable one as long as our present ideas regarding the use of water in our sanitary arrangements remain as they are. There is not the slightest doubt that we annually send down our sewers thousands of pounds' worth of fertilizing material, which, in consequence of being so extensively diluted, is of little or no value. And so I suppose we will continue while our money lasts to float up in our harbours and rivers cargoes of Peruvian guano costing £20,000 and £30,000 each, on what is often little more than weak solutions of the very materials which confer on the guano its agricultural value, and which are flowing towards the ocean to be lost to us for ever. As all plans, however, with the exception perhaps of irrigation, which have been tried hitherto for the utilization of sewage have, to say the least, not been very successful, I will not occupy time with this part of the subject but pass at once to the consideration of some processes for the treatment of other forms of refuse, which I think I may say have at least not been altogether unsuccessful. I do not wish you, however, for a moment to suppose that I consider the disposal of sewage an unimportant matter; on the contrary I think a system by which it is said we throw away material every year of the value of fifteen millions sterling and in doing so, not only suffer direct loss, but besides cause an immense amount of disease, is of the very greatest importance, and is one which demands the most careful and anxious consideration.

Of late years I have been engaged in several cases of so-called river pollution in which I have had occasion to deal with many difficult kinds of polluting matter. I shall, however, in the present paper refer more particularly to two cases, which as they are of a widely different nature may serve, even without reference to any others, to illustrate sufficiently the remarks I have to make. These cases are at the river Esk at Lasswade and the river Teviot at Hawick, and in which are concerned two of the most important river polluting industries to be found in this part of the country. I refer to paper making, and to the dyeing and scouring of cloth. I have chosen these two to illustrate what I have to say to-night; first, because of their magnitude they are of great importance and possess a certain amount of general interest; and second, because in the case of both of them, a very decided step in advance has been made in abating the nuisance caused by the discharge of this refuse. The first point we have always to consider in dealing with any plan or process for the prevention of river pollution is that of expense. Sometimes we are merely asked what will it cost; but occasionally, manufacturers having become rather exacting in consequence of some chemical schemes for the purification of their outflow, which they were forced to adopt, having turned out very profitable, we are asked how will it pay. It seems to me, however, that this is not the way in which to consider this matter. If a scheme for purification effects its purpose and pays also, good and well; but, if it only does the former, no one, I think, can object, unless of course the outlay amounts to something unreasonable. In the case of the Esk the purification scheme has paid, and I do not suppose the mill owners on the banks of that river would return to their former mode of working, even if they were allowed.

Just at the present time the subject of river pollution, and of course also river purification, is one of very great and peculiar interest to many people in this country. The offenders and those offended against in this matter are alike interested, although on different sides of the question. The peculiar interest which is at present evoked is of course caused by the action which government proposed to take in this matter. Sometime ago, a proposed Bill on river pollution was printed which gave rise, I have no doubt, to a considerable amount of uneasiness in the minds of manufacturers, who, having their works on the banks of rivers, are in the habit of using the water thereof in their operations, and of returning it to the stream in a more or less filthy condition. This Bill, among other things, contained a list of substances which were to be regarded as pollutions, and as such were not to be allowed to enter a river. The provisions certainly are very strict, and I am much afraid that if the Bill as it stands becomes law, it will have a most seriously damaging effect upon the trade of the country. While there is no one who would not deplore the advent of such a result, every one who has really the good of the country at heart, must feel that it is high time something were done to put an end to this gigantic nuisance, which is every year becoming worse, and will continue to do so, I am very much afraid, until decided action in one form or other is taken to compel the polluters to mend their ways. This something, I think, should not consist in fastening on one manufacturer or even one set of manufacturers, and forbidding him or them under heavy penalties to throw certain materials into rivers. Such a mode of procedure simply means, to many a manufacturer, ruin. A much better plan, I imagine, would be to appoint a body of scientific men to inquire fairly into the matter, and to ascertain

---

* Read at an Evening Meeting of the North British Branch of the Pharmaceutical Society, April 19, 1878.

and report as to the pollutions existing in each large river, and also to suggest means for the amelioration or removal of such nuisances. Of late years, as I have already said, I have been very much consulted on this subject, both by proprietors who consider themselves aggrieved by the state in which the water of their rivers was sent to them, and by manufacturers who thought they had been hardly dealt with by being threatened with all the pains and penalties of the law for simply what in their usual buisness they had been doing for years. In almost all of these instances into which I had an opportunity of inquiring, I found the absence of that which is almost a *sine quâ non* to insure success in having this evil rectified, I mean co-operation, and what, for want of a better expression, I call a meeting-half-way spirit on the part of both sides. It is almost as idle for proprietors in a manufacturing country such as this has become to insist upon having the rivers in a state of pristine purity, as it is impolitic and foolish for manufacturers to imagine that they are to be allowed to go on unchecked, and with impunity, making those rivers mere drains, and sending them down through the country which they were intended to improve and beautify, coloured all the hues of the rainbow, containing poisons of every kind, and giving off odours which render their banks and neighbourhood noisome and unsightly, instead of what they should be, and might still be, pleasant and salubrious places of abode.

In the neighbourhood of Edinburgh many of the streams are still comparatively pure, while others again are certainly foul enough. The river Esk, for instance, to which I have referred and which as every one knows has been the source of much contention, occupies a sort of midway position. It is not exactly, at all events by the time it has passed Lasswade, as pure as one would like to see it, nor yet I think as it might be, but it is certainly nothing like the water of Leith as that is seen in the vicinity of Canon Mills. The chief manufacturers, and I am afraid I must add the chief polluters, on the river Esk are the paper makers. There are no less than eight large mills on this river, and when we reflect upon the amount of washing, bleaching, etc., which has to be done at each of these mills we can easily account for some pollution in the river. Of late years a great deal has been done in this river by way of abating the nuisance; so much indeed has been effected that now I have seen it really look like an ordinary stream. Some ten or twelve years ago, however, its condition was simply scandalous, the water being frequently quite invisible at certain points owing to the thick persistent froth which floated on it completely covering the surface. This state of things, however, has been very much amended, and not only has the amenity of the river been improved by the change, but as I have already indicated a great saving has been effected to the paper makers. Tons of valuable material, which used to go down the stream, dealing death and destruction to all the inhabitants thereof, are now carefully saved and re-used. In order to describe properly how this saving and purification is being effected I should tell you that one of the essential operations in the manufacture of paper at the present day is the boiling of esparto grass in strong solutions of caustic soda. This is done by placing the grass in a large boiler furnished with a lid where it is subjected to the action of the boiling alkaline solution for several hours. At the conclusion of this process the resulting thick dark coloured strongly caustic liquid, containing a large quantity of organic matter in solution and possessing no end of frothing power, is either used again in a similar operation, or thrown into the river. Of course I am speaking now of things as they were before the manufacturers were compelled to mend their ways. The intolerable nuisance, however, which was caused by the large quantities of this most offensive liquid which was allowed to find its way into the Esk, brought about a change; legal measures were taken to compel the manufacturers to abate the nuisance and thus gave rise to the adoption of the famous recovery process which is now I suppose used voluntarily by every large paper maker in Scotland and very possibly in England also. The process is shortly this. The thick brown alkaline liquid, which is the root of all the evil, instead of being allowed to flow into the river is run into large evaporating pans or roasters where it is evaporated and calcined, then dissolved in water and causticized by being boiled with quick lime, when it can be used again.

By the faithful carrying out of this process no doubt a very great improvement has been effected, but still there is room for some more. The effluent water from these mills even though it does not contain the caustic liquid is hardly pure enough to send into a river, and in order to render it so different processes have been tried, three of which I superintended during their trial on the effluent from one of the mills on the Esk. These processes are, as all such processes must absolutely be, extremely simple and consist merely in adding to the impure water different materials which will, at a moderate cost and in a reasonable time, effect the partial or total precipitation of the polluting matter. The first process, which I will call the iron process, is carried out by precipitating the effluent with perchloride of iron and lime. The second process is somewhat similar, but instead of iron we use alumina. The third process, which in some respects is the best of the three, was first proposed by a friend and former student of my own, Mr. William Durham. It consists in adding to the impure liquid sulphate of alumina and subsequently a sufficiency of carbonate of baryta.

Even by this process and working on a weak liquid, material is recovered which can be turned to useful account and perhaps made a source of profit.

In the case of the dye work refuse we have quite a different effluent to deal with. Besides a large quantity of colouring material in the form of dyes there is generally a large quantity of soapy matter which is perhaps a form of pollution as objectionable even as refuse colouring material. This soapy substance gets into the rivers and communicates to a large body of water a disagreeable milky appearance, and further, owing to its greasy sticky nature it adheres to such things as stones over which it passes, and is altogether very offensive.

As has been done, however, with the alkaline refuse from the paper mills, this polluting material is now worked up with profitable results.

We have still, though, the colouring matter from the dyes to get rid of, and unfortunately this is a most powerfully polluting substance. A very little of it goes a long way in this direction, and to look at the great volumes of dark highly coloured liquid which pours from the works of Hawick into the river there, one would think it almost impossible to effect even a very partial purification only of the black dirty stream, and yet I have so far been successful even with this Augean stable.

In these purification processes what I always attempt to do is to produce a compound with the polluting matter which by subsequent treatment I can render insoluble and precipitate.

Now in this Hawick effluent, at least in some of it, and also in some of the effluent from Paisley—with the sewage of which town I have also been engaged—I find this compound ready made. It arises I have no doubt from some of the mordant used in the dyeing process, and all that has to be done with the liquids containing this compound is to add some substances which will make that insoluble, or at all events cause it to precipitate. The substance which I use for this purpose is lime. A very small quantity is sufficient, and where the mordant compound is present in proper proportions the precipitation takes place quickly and completely. The difficulty I have at present with this process is the disposal of the sewage or precipitate which is produced. It will not, I am afraid, be very valuable as manure, and I am quite at a loss to find any other outlet for it. It is quite possible, however, that when once it has been produced in quantity a use may be found for it.

COD LIVER OIL.

Dr. William J. Russell, M.D., Clapham, in a communication to the *Practitioner* for April, says: "Various opinions have been held regarding the curative qualities of cod liver oil. The late Professor Hughes Bennet, by whom the use of cod liver oil was first introduced into this country, was accustomed to regard the darker qualities of oil as the best. Medical opinion has latterly come to regard the paler varieties with more favour, but my own experience leads me to agree with Professor Hughes Bennet. My attention was drawn to the different kinds of oil when attending a phthisical patient during winter in the small fishing town of Anstruther. The medicinal treatment consisted of simple bitter tonics and cod liver oil, which she was at first unable to tolerate, the oil invariably producing vomiting and retching. Being strongly impressed with the importance of persevering in the treatment, she of her own accord suggested trying different samples of oil; to which I assented, not expecting to get a more digestible or palatable oil, but hoping that the stomach might acquire a certain amount of tolerance, and some part of the oil be retained, if it were perseveringly taken. Some time afterwards, on making my daily visit I was surprised and delighted to hear that the last sample of oil had not been vomited, and up to that time—some hours—had not caused much nausea. This last oil was denser in appearance, somewhat like unboiled linseed oil, and slightly darker in colour than the previous samples, which were clear and looked thin like water. Under its continued use the symptoms began to subside, the cough and expectoration diminished, the night sweats and hectic fever disappeared; she constantly gained weight, and when I ceased attending her had almost recovered. I subsequently tried this darker, unmixed, true cod liver oil on several patients, and had ultimately every reason to believe that it was the most easily retained and the most effective.

"The mode of administration was as follows:—The mouth was first gargled with strong salt water to deaden the nerves of sensation; the oil was then taken by itself, and succeeded by a draught of fresh water, to wash it down and prevent it sticking to the mouth. With a view to prevent sickness, pepper was sometimes taken before the oil. On inquiry, I found the darker, denser oil had accidently been made from the livers of the true cod (Gadus Morrhua) only; the usual practice being to include the livers of the closely allied species, haddock (Gadus æglefinus) and ling (Gadus molua). It was much more offensive to taste and smell than the clear oil from the mixed livers, which had a bland taste and very little smell. Four bottles of the different samples of oil being kept on the window-sill of the patient's bedroom: after a freezing night I noticed that the bottle of darker oil was concrete almost to the top, thus showing a very large proportion of margarin, and that the oil with least smell had very little frozen in it. When the darker oil was vomited it was generally within the first three or five minutes, and was apparently due to nausea, caused by its effect on the nerves of taste in the mouth and throat; if retained longer than five minutes it usually caused no uneasiness beyond an occasional slight feeling of nausea. The mixed clear oil and the oils of the haddock and ling are readily taken, and when retained seem equally efficacious; but are much more apt to cause nausea and vomiting some little time afterwards, generally from a quarter to half an hour after taking. This is probably due to decomposition of the oil and formation of acrid fatty derivatives in the stomach, while the darker true cod liver oil seems to be absorbed without decomposition. Fresh cream, with its own bulk of grated biscuit and a small proportion of brandy, is retained by phthisical children, where nothing else can be kept on the stomach. Emulsions of oil, especially those containing phosphorus, are sometimes rejected where pure oil can be taken, apparently from the same cause. I am inclined to think that the oil of the true cod contains either a greater number or more in quantity of the peculiar ethers and extractive matters than the oils of the allied species of fish, and that to this is due its being more easily absorbed by the stomach, as we see in well-cooked meat which develops a number of flavouring ethers.

"The process of manufacture of the oil, considerable quantities of which are made in the town, is as follows:—

"The fish are gutted as soon as landed, and the livers are thoroughly washed, all the bad pieces being cut off, and livers of diseased fish, which are frequently ulcerated and contain parasites, are rejected. While the fish are being gutted the livers are placed in large tubs, and as soon as possible are placed whole in the boiler; steam is not approved of, but slow heat from a coal fire is used; the oil should come up cool to the top, and is skimmed off with a large spoon, and after standing twenty-four hours it is strained through linen and stored for use. The more heat used the darker the oil, and that which rises first is generally thought to be the best. The livers are afterwards used for manure."

FERRUM ALBUMINATUM SOLUTUM.*

BY C. BERNBECK.

Dr. Triese, of Illingen, near Saarbrücken, has added a very valuable and therapeutically important preparation to the materia medica by publishing a formula for the preparation of ferrum albuminatum in the *Berliner Klinische Wochenschrift*. His formula reads as follows: Mix the white of an egg intimately with 10 grm. liq. ferri sesquichlorati by triturating them in a mortar, remove the excess of chloride of iron by washing with distilled water, and redissolve, by macerating for two days, the precipitate in half a litre of distilled water, previously acidulated with twelve drops of pure hydrochloric acid.

Numerous experiments made by me proved that only in the following manner, by carefully avoiding an excess of hydrochloric acid in the ferric chloride, a preparation may be obtained answering to the description given by Dr. Triese. It is well known that the officinal liquor nearly always contains an excess of hydrochloric acid, which in the preparation of ferrum albuminatum will cause a solution of the greater portion of the precipitate, which will then necessarily go to waste by washing. This loss is avoided by using a neutral ferric chloride obtained in the following manner: Dissolve six parts of dry ferric chloride obtained by evaporating the officinal liq. ferri sesquichlorati, in ten parts of distilled water, filter and mix the filtrate intimately with twenty parts of the white of eggs; place the brownish-yellow magma on a moistened strainer, press well with the hands and repeat it several times, after the addition of a little distilled water, until the excess of chloride of iron is removed. Dissolve the residue in half a litre of distilled water, acidulated with twelve drops of hydrochloric acid, by macerating for one or two days, and filter.

Dr. Triese administers this preparation in chlorosis without the addition of phosphorated ether; it must, then, always be freshly prepared. As a remedy for rhachitis he prescribes an addition of twelve drops of a solution of 0·05 grm. phosphorus in 30 grm. of ether to 250 grm. of the iron albuminate solution, which keeps the latter unaltered for at least six weeks, and permits it to be kept on hand for that length of time.

The Pharmaceutical Journal.

SATURDAY, JUNE 8, 1878.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary,* 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W. Envelopes indorsed "Pharm. Journ."*

ANOTHER MEDICAL ACTS AMENDMENT BILL.

WHATEVER may be the net result, the session of 1878 will be notable for the large amount of proposed legislation in relation to medical subjects. The introduction of the Dental Practitioners Bill into the House of Commons by Sir JOHN LUBBOCK was quickly followed by the introduction of a Medical Acts Amendment Bill into the House of Lords by the Duke of RICHMOND on behalf of the Government, and now the House of Commons has in its turn had a Medical Acts Amendment (No 2) Bill presented to it by Mr. ARTHUR MILLS.

Besides these there has been the Weights and Measures Bill which, were it to pass as introduced, would go far to render the dispensing of prescriptions impracticable. In each of these measures is to be found matter affecting the interests of chemists and druggists, and at one time prejudicially so. But thanks to the prompt action of the Council of the Pharmaceutical Society the mischief in the Dental Practitioners Bill and the Weights and Measures Bill was promptly scotched, whilst the most careful consideration is still being given to the provisions of the Government Medical Acts Amendment Bill.

The Dental Practitioners Bill, as amended in Committee, now contains an addition to the second part of section 5, calculated to provide that recognition of the rights of chemists and druggists who have been engaged in the practice of dentistry, which we have already pointed out it was only reasonable to expect. This clause, as it now stands, provides that among those who are to be entitled to registration, and subject to that formality, exempt from the penal provisions of the Bill, are to be included persons who at the passing of the Act are *bonâ fide* engaged in the practice of dentistry in conjunction with the practice of pharmacy. We may therefore regard this matter as being virtually settled in accordance with the desire expressed by the Council of the Pharmaceutical Society on behalf of the trade interests of the body it represents.

The position of affairs is not quite so satisfactory as regards the proposed legislation affecting what is termed, somewhat unhappily, "counter practice." The Bill introduced by the Duke of RICHMOND and GORDON, for the amendment of the Medical Acts was, on Thursday night, read a third time, and passed in the House of Lords. Before reaching that stage, however, an amendment was introduced, not very imposing in its apparent dimensions, but at the same time of grave significance as regards the position of chemists and druggists who carry on "counter practice."

In the original draft of this Bill, the schedule of Acts to be repealed included so much of the Apothecaries Act, 1815, as restricts persons who have not obtained the certificate therein mentioned from practising medicine or surgery. This provision, and the effect of it, had not escaped the notice of quiet observers watching the interests of the pharmaceutical body, and it was regarded by them as an effective remedy against the present tendency to strain the Apothecaries Act into a prohibition of any kind of prescribing by persons not having a medical qualification.

Recent events, however, appear to have directed further attention to this provision of the Bill, and to have led to the introduction of the amendment we have above referred to, which proposes that the twentieth or penal clause of the Apothecaries Act is to remain in force, and that sections 9 to 19 and 21 to 24 are to be repealed, as from the commencement of the joint board system of medical examination, together with so much of the Act of 1815 as restricts persons who, though registered in the medical register, have not obtained the certificate of the Apothecaries' Society, from practising medicine or surgery.

The effect of this amendment is to carry out the proposal referred to by Mr. MORGAN HOWARD, at the close of the case, tried two weeks ago, of transferring to the Duke of RICHMOND'S Medical Act the penalty which is at present to be found within the four corners of the Apothecaries Act. If the Bill were to pass with this amendment as it now stands there would be in fact no alteration of the position of chemists and druggists as regards the application of the Apothecaries Act, while the original provision of the Bill was in accord with the view expressed by the Duke of RICHMOND as to the impossibility of prohibiting even strictly medical practice by persons having no legal qualification, and it would have altogether done away with the power of the Apothecaries' Society to interfere with "counter practice" by chemists and druggists.

Such a renewal of the power claimed to be held by the Apothecaries' Society by virtue of the Act of 1815 would, we think, be not only mischievous in itself but diametrically opposed to the desires of the Apothecaries' Society and inconsistent with the opinions of the medical profession.

It is almost superfluous to say, in this place, that the Council of the Pharmaceutical Society, regarding the treatment of disease as beyond the province of the pharmacist in a general way, discourages such practice. At the same time it is impossible for that body to disregard the fact that the circumstances under which medical aid is available to a large section of the public make it imperative upon some, in cases of simple ailments, to have recourse to the chemist and druggist for advice and medicine. It is of course, very difficult to define the true line of demarcation between simple ailments that may be treated in such a way by a chemist and druggist or by any other person, and cases which, being outside their skill, are to be dealt with only by a competent medical practitioner; but we feel sure that throughout the entire medical profession, and more especially among the higher branches of it, there is a full recognition of the necessity under which chemists and druggists are placed in many localities to afford in some measure medical assistance to those who seek it from them. It is indeed with no little satisfaction that we are able to quote in this respect the words of a medical contemporary to the effect that medical practitioners generally do not wish to prevent chemists from giving their customers a bottle of mixture for any simple ailment, though they do object to the practices of those chemists who hold themselves out to the public to give medical and surgical advice and systematically prescribe for and treat disease without regard to the nature or gravity of the cases.

It is not to be wondered at that we find the same paper congratulating the profession upon the result of the late action and the prosecuting associations upon their successful manipulation to that end, even of such a clumsy engine as the Apothecaries Act of 1815. Nor can we disavow a certain feeling of sympathy with these congratulations, since it would be mere affectation to dispute the charge that some chemists and druggists overstep the boundary by which their counter practice should be limited. In doing so they naturally excite the dissatisfaction of medical practitioners who though legally qualified are in other respects on much the same footing as themselves, and are often the keepers of shops, similar to those of the chemist and druggist, for the retail sale of drugs. It is chiefly indeed under these conditions that mutual jealousy of the two classes is developed, and that defence associations take their origin and development with little benefit to either of the parties most materially affected, but with no small amount of damage to better relations between medicine and pharmacy.

THE ADMINISTRATION OF CHLOROFORM.

In order to obviate the inconvenience and danger attending the administration of chloroform to patients suffering from cardiac disease, Professor Occhini has been making some preliminary experiments as to the effect of ammoniacal inspirations immediately previous to the inhalation of the anæsthetic, the theory being that the stimulant action of the ammonia on the nervous and vascular system would counterbalance the depressing influence of the chloroform. The results are said to have been quite satisfactory, and Professor Occhini has come to the conclusion that the tolerance of chloroform can be assured by the preventive use of ammoniacal inhalations.

Transactions of the Pharmaceutical Society.

MEETING OF THE COUNCIL.

Wednesday, June 5, 1878.

Present — Messrs. Atkins, Betty, Bottle, Churchill, Cracknell, Fairlie, Gostling, Greenish, Hampson, Hills, Robbins, Sandford, Savage, Schacht, Shaw, Williams and Woolley.

The chair having been taken by Mr. Williams,

The minutes of the Council Meetings of May 1 and 15, were read and confirmed.

Honorary Members.

A letter from Dr. Squibb, of Brooklyn, was read thanking the Society for electing him as an Honorary Member.

A similar letter was read from Dr. Vogl, of Vienna.

Election of President.

The first business was the election of President for the ensuing year. A ballot being taken in the usual way —

MR. JOHN WILLIAMS

was re-elected President

Mr. Williams in returning thanks for the honour again conferred upon him, said it was both unexpected and undesired, for he felt great doubt whether he had efficiently fulfilled the duties of the responsible post which had been conferred upon him. He would, however, do his best for another year.

Election of Vice-President.

On a ballot being taken—

MR. W. D. SAVAGE

was re-elected Vice-President. He expressed his surprise at the result of the ballot, but said if it was the wish of the Council that he should continue in office he would endeavour to fulfil the duties to the best of his ability.

Election of Treasurer.

Mr. Sandford said he regretted to have to inform the Council that Mr. Hanbury was unable to continue to act as Treasurer. He would, however, beg leave to adopt the same course which he had taken for the last two years of nominating a Treasurer instead of balloting, and he would therefore beg leave to name Mr. Greenish.

Mr. Betty suggested that it would be better to return to the regular course, and take a ballot.

This having been done the result was the election of

MR. THOMAS GREENISH

who briefly returned thanks for the honour.

Appointment of Secretary and Registrar.

Mr. Hampson having moved the re-election of Mr. Elias Bremridge, as Secretary and Registrar,

Mr. Fairlie asked if it was necessary that the two offices should be united in the one person. He had found the register very defective. Possibly the Council had not done its duty in the matter, but he knew as far as Scotland was concerned that there were a large number of names on the register which ought not to be there at all, the persons having been dead many years. There were also other matters which seemed to show that too much work was thrown on the Secretary, and he would suggest that the offices might be separated.

The President said the Council had no power to separate the offices, which were united in one person by the bye-laws. He also pointed out that the defects in the register were not due to any neglect on the part of the central office, but to want of information (from the Local Secretaries and registrars of deaths. The latter were bound to send a copy of the registry of death of any chemist and druggist, and received a fee for so doing, but there were no means of compelling them to send this information and they often neglected their duty in this respect.

Mr. Betty protested against a matter of this kind being brought forward without any notice.

Mr. Atkins said he understood that Scotland was treated exactly in the same way as England, with regard to the lists being issued to Local Secretaries. He had been accustomed as a Local Secretary to receive lists and make all the inquiries he could, and he believed if there were any omissions it was rather a matter for local complaint than anything else.

Mr. Fairlie said he regretted having brought the question forward in any informal way. He would take an opportunity of doing so in a formal manner on a future occasion.

The resolution was then agreed to unanimously.

Appointment of Assistant-Secretary and Deputy-Registrar.

Mr. Richard Bremridge was unanimously re-appointed to this office.

Elections.

Pharmaceutical Chemists.

Betty, Robert Brown ....London.
Turner, George Thomas ....Bristol.

Chemist and Druggist.

Salter, Benjamin ....Shrewsbury.

Associates in Business.

The following having passed their respective examinations, being in business on their own account and having tendered their subscriptions for the current year, were elected "Associates in Business" of the Society:—

Minor.

Allan, Alexander ....Inverness.
Baines, Arthur ....Hanley.
Beaton, William ....Twickenham.
Billing, Charles......................Edinburgh.
Brown, George ....Brigg.
Cowie, John ....Falkirk.
Cross, John ....Reading.
Davies, Frank Henry ....Thornton Heath.
Hutchinson, George Bassett ...Westgate-on-Sea.
Kendrick, Alfred ....Harlesden.
Pike, John..............................London.
Staning, Walter ....Hull.
Stooke, Arthur ....Milton next Sittingbourne.
Summers, Frank ....Bury St. Edmunds.
Townend, Thomas Francis ......Bishop Auckland.
Walker, Benjamin ....Tetbury.
Wardle, William Stephens ......London.
Wilson, Richard Edward.........Dartford.

Modified.

Beer, James Henry Elias.........Calcutta.
Cooper, Thomas ....West Smethwick.
Dodds, John Henderson ....London.
Jones, William ....London.
Sharman, William ....London.

Associates.

The following having passed their respective examinations and tendered their subscriptions for the current year were elected "Associates" of the Society:—

Minor.

Clayton, John William ....Preston.
Harding, Christmas ....Denbigh.
Massey, Richard Francis.........Lower Tooting.
Russell, Matthew Rawlings ...Whitehaven.
Street, Walter Charles...........Lincoln.
Roberts, Thomas ....Margate.
Thompson, John Hartley.........Sheffield.

Modified.

Fawthrop, James ....Yeadon.
Judge, James........................Kilburn.

Apprentices or Students.

The following having passed the Preliminary examination and tendered their subscriptions for the current year, were elected "Apprentices or Students" of the Society:—

Althorp, Arthur ....Shipley.
Bowker, Ellis ....Radcliffe.
Burchell, Robert Henry ....Kettering.
Chaloner, Henry ....Hyde.
Chattwood, Joseph ....Manchester.
Clerke, William Burdett.........Leamington.
Davey, Thomas George ....Tregoney.
Davis, William.....................Ashford.
Desborough, James George, jun. Stamford.
Frost, Frederick Philip ....Bury St. Edmunds.
Greaves, Edward Harrison ......Bristol.
Harburn, Alfred ....London.
Hewlett, James.....................Northwich.
Jones, David Edward ....New Quay.
Kidner, Henry Richard Charles Bristol.
Kinross, William Mallock ......Edinburgh.
Knight, Charles ....Gloucester.
Lewis, John ....Hanley.
McBeath, John William ....Darlington.
Manners, John ....Shildon.
Matthews, John George ....Douglas.
Mead, Francis Henry .. ..Taunton.
Meadows, John Martin ....Swindon.
Thomas, Richard ....Llanfyllin.
Young, Ernest Alfred ....London.

Several persons were restored to their former status in the Society upon payment of the current year's subscription and a fine.

Admission of Women to the Society.

The President said there were on the list the names of three ladies who had applied for election. He did not know whether any gentleman would propose them.

Mr. Hampson moved that Miss Isabella S. Clarke be elected a member of the Society. He said that in discussing this matter it was impossible to forget what took place at the annual meeting; but at the same time there had also been an election of members to Council, which would to a certain extent express the opinion of the country even upon this question, though it may be considered a minor one. Indeed, he thought the election was really a better expression of the opinion of the country than the vote of an annual meeting. He therefore considered it quite in order that this question should be again brought forward. It was scarcely necessary, however, to go into the whole question of the admission of women. At the annual meeting there was a majority of two in favour of the principle, though from circumstances with which the Council was acquainted, that vote could not be acted upon. The Council had therefore now to decide on the matter, and he thought it would be in very good taste if it elected this lady who had passed all her examinations with great credit.

The President said he believed there was an error made at the annual meeting, but there was really some doubt about it, owing to the confusion which prevailed, and he was not quite positive that what he did afterwards was right. His own opinion was that the meeting was equally divided, and he could not consider it right for the Council to take a step of so serious a character as admitting ladies into the Society, which was not contemplated by the founders, without a more decisive expression of opinion. Therefore, although he was personally in favour of the principle, he should vote against it at present, considering that very many whose opinions were entitled to great weight were strongly opposed to it.

Mr. Gostling felt that after the strong expression of opinion on both sides of this question at the annual meeting, and as it was declared that the majority was against the admission of ladies, and especially after the letter of Mr. Sandford showing that there was still some doubt how the vote was really given, he certainly could not vote in favour of the motion until a more decisive opinion was given at another annual meeting.

Mr. Shaw said he had always asked himself the question what he ought to do when ladies applied to be admitted. He had looked at the bye-law over and over again, and could not see any objection to the proposal.

The President suggested that the Council need not discuss the general principle; it was rather a question of expediency at the present time.

Mr. Shaw thought it was expedient. With regard to the annual meeting, he was unfortunately away at the time the vote was taken, and one or two other members were also absent, attending at the Privy Council Office, who would probably have voted in favour of the motion. He had objected on former occasions to this question being relegated to the annual meeting, for it was a matter which belonged to the Council. It was the duty of the Council to elect members, and that being so, he thought the application ought to be fairly considered, if there were no special objections against it, and he had heard no sufficient reason raised. It was merely one of private feeling, or of taste, or in some cases of fear lest ladies should make their appearance at that table. Mr. Sandford had said on one occasion that it was very desirable that ladies should occupy that station which in the providence of God they had been called upon to occupy; but that rather reminded him of what Dr. Lyon Playfair had recently remarked with regard to the National Schools, that the children there were taught to pray, "God bless the squire and his relations; and keep us in our proper stations." He did not see that they had any right to keep women in the station which they might fancy was the one belonged to them.

Mr. Betty thought they must as members of Council be bound by their previous conduct. They had left the decision to the Society at large, simply because it introduced such a novel question, that the Council felt it ought to be left to its constituents. He therefore did not think it was quite in order to raise the question again now.

Mr. Fairlie thought the present Council had nothing to do with the resolutions of a previous Council. It was a new Council altogether.

The President said the question left to the general meeting was a question of expediency, the decision of the meeting was so uncertain that in fact it was equivalent to coming to no conclusion.

Mr. Betty was of opinion that the majority present, being members of the old Council, were bound by their previous actions, in the same way as their successors would be bound by the laws that governed them. He was quite willing to abide by the *bonâ fide* vote of the annual meeting, but the vote was uncertain. He was anxious it should be acted upon, which ever way it was, and he suggested that some means should be taken to ascertain what was the real result of the vote. If there were a majority of only one in favour of admitting women, he would accept it, though it was against his own opinion and he had always opposed it. At present, however, it seemed to him quite irregular to bring forward the question.

The President said the recorded vote of the last annual meeting was against the admission of ladies.

Mr. Schacht said there was the adjourned meeting, when it was stated that a mistake had been made, and that if that were corrected the vote would have been in favour of the admission of ladies. He took that adjourned meeting to be conclusive in the matter. He had always said the question ought to be referred to the constituency at large, and it seemed to him there was no escape from the President's last decision, that the majority of two was in favour of the admission of women. A mistake had occurred in the first place, but the final decision was that the advocates of the admission of ladies had the majority. Therefore he considered the members of the Council were bound to vote for the motion.

Mr. Robbins said he understood that the motion was not put at the annual meeting; it was simply the previous question, and even on that he was told that one gentleman had voted against it from mistake, so that in any case the voting would be equal.

Mr. Hampson said he knew of one gentleman who voted on the other side by mistake.

The President said the original motion was never put at all, and it was not to be assumed that the original motion for the admission of ladies would have been carried if it had been put. At the adjourned meeting the motion was put and the Chairman's casting vote was against it.

Mr. Sandford said he should simply address himself to the question of the vote of the annual meeting. It had been decided at a previous Council meeting that the sense of the annual meeting should be taken. So far as the voting was concerned he was prepared to make an affidavit that the voting was as first announced. He was prepared to swear that before any magistrate, and Mr. Carteighe was prepared to do the same. Mr. Mackay, with whom he had had no communication on the subject, had written to the office to say that he was fully able to confirm the statement which appeared in his (Mr. Sandford's) letter in the Journal. He took it, therefore, there was no doubt about the real vote; they were bound by that expression of opinion, and ought not to raise the question again during the present year.

Mr. Betty asked if Mr. Sandford would agree to the Council making an inquiry and taking evidence as to what was the result of the vote.

Mr. Sandford said he was ready to give what evidence he could.

The President said it all turned on this question. The first teller who came to him gave him the number 59; the question was, who was the first teller who gave him the number.

Mr. Sandford said he was ready to swear it was Mr. Wade.

Mr. Fairlie said he was ready to swear that it was Mr. Vizer.

Mr. Atkins thought it would be exceedingly unwise to discuss the general question. Having moved or seconded the resolution that the matter should be referred to the general meeting he would say that as far as he was concerned he only wanted to ascertain, if possible, the opinion of the whole body of pharmacists throughout the kingdom. Now confessedly there was no very definite opinion expressed, and, therefore he did not consider himself bound at all to register the decision of that annual meeting. Mr. Hampson had referred to the election of members of Council as an index to the state of feeling throughout the country; but he did not advise him to press that argument too far, because if he looked at the numbers attached to the names he might find that some of those who stood highest on the list had not avowed their gallantry.

The President suggested that the Council ought not to go into these questions. Every gentleman returned to it stood on the same level.

Mr. Atkins said it could not be disguised that some gentlemen received very large suffrages, and all honour to them for it; and some of those gentlemen he believed were not in favour of the admission of ladies. He regretted to say, being himself in favour of this motion, that on making inquiry in his own neighbourhood he did not find the general opinion coincided with his own. He only wished to say that he did not consider that as members of Council they were bound to put into force the votes of the annual meeting.

Mr. Robbins thought the question raised by Mr. Atkins was a very important one, whether the Council was bound to respect the decisions of the annual meeting.

Mr. ATKINS said that he had not so expressed himself.

Mr. ROBBINS said this question was constantly coming up, whether when a question was referred to the annual meeting, the Council was bound to act on the opinion there expressed. Now the charter unmistakably showed that the annual meeting had power to pass resolutions affecting the government of the Society.

Mr. SHAW submitted that that clause only referred to questions outside the bye-laws.

Mr. ATKINS said he should be the last to treat with any disrespect the opinion of the annual meeting. He simply raised the technical point whether the Council was bound to register the opinion of the annual meeting without any further discussion.

Mr. HAMPSON wished to ask the Council what majority would satisfy it. He very much questioned if Mr. Sandford would be satisfied with an overwhelming majority. He should like to ask him what majority he would be satisfied with.

Mr. SANDFORD said he was quite satisfied with the majority as it stood.

Mr. HAMPSON had no doubt that in a few years he would be dissatisfied with a majority of twenty or thirty in favour of the admission of women. Although he respected the opinion of the annual meeting he thought this was a matter for the Council to decide, because the annual meeting had not the power to elect members; the duty was cast on the Council by the Act of Parliament. A few women desired to become members; they were legally eligible, and it was only a bias on the part of some gentlemen which prevented their having what was their strict right. He still hoped the Council would vote in favour of the admission of women; it would not be flying in the face of the annual meeting, because that face was not yet drawn, or one person drew it in one form and another in quite a different manner.

The motion was then put to the vote, with the following result:—

For—Messrs. Churchill, Fairlie, Greenish, Hampson, Savage, Schacht, Shaw and Woolley—8.

Against—Messrs. Betty, Bottle, Cracknell, Gostling, Hills, Robbins, Sandford and Williams—8.

The vote being equal, the Chairman gave his casting vote against the motion, remarking that the Council evidently very fairly represented the Society at large.

Mr. HAMPSON then moved the election of Miss Minshull and Miss Stammwitz as associates. He said there might be some gentlemen who would think it desirable to admit these ladies as associates though they might object to give them the full privilege of membership.

Mr. SHAW seconded the motion. He said it had been contended over and over again that the word "persons" only referred to those of the male sex, but this could not be so because the same word was constantly applied to women, as, for instance, with regard to contributors to the Benevolent Fund.

Mr. BETTY said Mr. Shaw's argument only went to this, that they might admit ladies if they pleased, which no one disputed. He was astonished to find his friend Mr. Hampson, who was usually so bold, on this occasion beat a retreat. Before now he had repudiated any compromise, and said, on the principle of ladies being admitted, it must be insisted on.

Mr. SCHACHT thought Mr. Betty misunderstood the position, inasmuch as these were different individuals.

Mr. BETTY said he quite understood that.

Mr. SANDFORD did not see how the Council could admit ladies as associates if it was not proposed to admit them to membership.

Mr. ATKINS remarked that Mr. Hampson, so far from having beaten a retreat, had shown the usual quality of an Englishman of not knowing when he was beaten.

Mr. HAMPSON said he had no disposition at all to retreat in this matter; he thought the members of the Council were bound to consider every question which came before them in a formal manner. The two were quite distinct propositions.

The vote was then taken, with exactly the same result as in the previous one.

The motion was therefore lost.

APPOINTMENT OF COMMITTEES.

The Council next proceeded to appoint the Committees.

Mr. SCHACHT repeated a suggestion he had previously made, that two committees should meet simultaneously. He thought the object of having committees to do the business was that certain gentlemen should make themselves specially acquainted with a particular kind of work, and if this were carried out other members would be more inclined to bow to their opinions.

After a good deal of conversation as to the mode of constituting the various committees, it was resolved that the General Purposes Committee should in future take the duties assigned to the Law and Parliamentary Committee. Also that the Finance Committee and Benevolent Fund Committee should meet at the same time, so as to allow of the General Purposes Committee meeting at an earlier hour.

The following were then appointed:—

General Purposes.—The whole of the Council, four to form a quorum, to meet at six o'clock on the evening before the Council Meeting, and at such other times as may be required.

Finance.—Messrs. Bottle, Churchill, Cracknell, Fairlie, Gostling, Robbins, and Schacht. To meet at four o'clock on the day previous to the Council Meeting.

Benevolent Fund.—Messrs. Betty, Bottle, Greenish, Hampson, Mackay, Rimmington, Robbins, Sandford, Shaw, and Woolley. To meet at the same time as the Finance Committee.

Library, Museum, and Laboratory.—Messrs. Betty, Bottle, Greenish, Hampson, Hanbury, Hills, Robbins, Sandford, and Schacht. To meet at eleven o'clock on the second Wednesday of the month, excepting in August and September.

House.—The same as the Library, Museum and Laboratory Committee, and to meet on the same days, or as occasion may require.

THE RECENT PROSECUTION OF THE LONDON AND PROVINCIAL SUPPLY ASSOCIATION.

The Council resolved itself into Committee to discuss with the assistance of the Solicitor, the case of the Society *v.* The London and Provincial Supply Association, Limited, in which judgment had been given against the Society by the Judge of the Bloomsbury County Court. The matter having been thoroughly discussed in Committee, the Council resumed, and the following resolution was passed unanimously—

> "That the Society's Solicitor be instructed to appeal against the decision of the Judge of the Bloomsbury County Court, in the case of the Society *v.* The London and Provincial Supply Association."

APPOINTMENT OF THE EDITOR AND SUB-EDITOR OF THE JOURNAL.

Dr. Paul was re-appointed Editor of the Society's Journal for the ensuing year, and Mr. F. Passmore, Sub-Editor.

LOCAL SECRETARIES.

The SECRETARY suggested that the appointment of Local Secretaries should be referred to the Library, Museum and Laboratory Committee, as was done last year, to revise the list and to submit it to the Council at the next meeting. This was agreed to.

INAUGURAL SESSIONAL ADDRESS.

It was resolved that Mr. Corder be invited to deliver the Address to the Students in October next.

Reports of Committees.

Messrs. Cracknell, Greenish, Robbins and Savage, having acted *ad interim* as a Finance Committee, presented certain accounts which they had examined and recommended for payment. Their report and recommendations were adopted.

Mr. Churchill brought forward the case of a person who had misunderstood the regulation as to the fee for the Preliminary examination.

On the suggestion of the President the matter was referred to the Library, Museum and Laboratory Committee.

Library, Museum, and Laboratory.

The Librarian had reported that the average attendance during the previous month had been, day, 26; evening, 12. Circulation of books, in town, 131; country, to 21 places, 33; carriage paid, 17*s*. 3½*d*. He had also reported the following donations to the library:—

'New Remedies, 1871-7.' From the Editors.

Leithead's 'The Cosmical Force,' 1851. From Mr. P. S. McIntyre.

'Calendar of King's College, London, 1877-8.' From the College.

'A Key to Organic Materia Medica.' Second edition. 1878. From Dr. Muter (author).

'A Manual of Vegetable Materia Medica.' Third edition, 1878. From Mr. G. S. V. Wills (author).

'Liebig's Letters on Modern Agriculture.' Edited by J. Blyth. 1839. From Mr. S. Betts.

The Committee recommended the purchase of the following books—

Wood and Bache's 'U. S. Dispensatory,' 14th edition (a second copy for reference); Livy; Virgil; Cicero.

The Curator had reported that the average attendance in the Museum during the previous month had been, day, 19; evening, 4. He also reported that the specimens of minerals offered to the Society by the Rev. W. Leay were not suited for the Museum, being mostly illustrative of geology rather than chemistry; that the specimens from Dr. Keik had been received and were satisfactory. He had also received a letter from Mr. W. R. Robinson, of California, suggesting that he might be able to grow medicinal plants such as were only found in tropical climates, and asking for information. The Curator had been directed to write in reply, stating that this was not a commercial society, but offering any information in his power.

The Committee recommended that the Sub-Editor be requested to compile a general index to the Journal for the last ten years. Professors Redwood and Bentley had reported favourably of their respective classes. Professor Attfield had been absent through illness. A deputation had been appointed to wait on Mr. Farrer with reference to the Weights and Measures Bill.

The President stated that Mr. Sandford, Dr. Redwood, and himself had waited on Mr. Farrer, at the Board of Trade, and during the interview, Dr. Acland, the President of the Medical Council, arrived from Oxford. The result was so far satisfactory that it was understood that a clause would be inserted exempting chemists and druggists from the operation of the Bill so far as regarded the use of the apothecaries' weight. The Government also consented to put in a schedule to the Bill, providing for the use of glass measures for drachms and minims; and as far as he knew the Bill was now satisfactory.

Mr. Sandford also gave an account of the result of the deputation. Mr. Stanhope, who had charge of the Bill, promised to add as an exception to one of the clauses, "drugs, when sold by retail, may be sold by apothecaries' weight." The deputation had also given Mr. Stanhope a table of the measures of the British Pharmacopœia, which he had introduced in a schedule, viz., fluid ounces, fluid drachms, and minims. The only remaining question was whether these measures could be stamped, and he thought there would be a difficulty in that, but if that could not be done, no one could be blamed for having them in his possession unstamped.

Mr. Bottle thought the measures might be stamped by affixing a small portion of soft metal to the side of the measure, as was done in Germany.

The President remarked that he for one should be delighted if the Government would undertake to inspect and verify these measures.

The report and recommendation of the Committee were then received and adopted.

House.

The report of this Committee, recommending the acceptance of Messrs. Parkinson's tender for certain repairs, etc., was also adopted.

The Council went into Committee to consider various matters which would have come before the Law and Parliamentary Committee had it been constituted, and a lengthy discussion took place on the Medical Bill, the result being that the President, with Messrs. Sandford and Hampson, were appointed to watch the progress of the Bill and to wait on the Duke of Richmond with regard to it if necessary.

A communication was read from the Chemists and Druggists' Trade Association, referring to the prosecution of the London and Provincial Supply Association, and other matters, but its consideration was deferred until next month, when

Mr. Fairlie undertook to bring forward a motion founded upon it.

A letter was read from Mr. S. U. Jones, enclosing a resolution passed at a meeting of the chemists of Leamington, requesting the Council to appeal against the recent decision in the case of the London and Provincial Supply Association, and also to take steps to have the defective sections of the Pharmacy Act amended. The letter was ordered to be entered on the minutes.

Admission of Reporters to the Council Meetings.

A letter from the editor of the *Chemist and Druggist* was also read, asking to be allowed to send a reporter to the Council meetings, and to attend them himself. The consideration of this also was deferred until next month, when

Mr. Hampson said he would move at the next meeting of the Council that the request be acceded to.

Admission of an Orphan to an Orphan Asylum.

The Secretary read a letter from Mr. Owen reporting the successful result of his efforts to obtain the election of a child into the Infant Orphan Asylum, and offering his services for similar work in future.

On the motion of the Vice-President, the thanks of the Council were voted to Mr. Owen, for the great trouble he had taken in this particular direction, and for his efforts generally on behalf of the work of the Benevolent Fund Committee.

Provincial Transactions.

CHEMISTS AND DRUGGISTS' TRADE ASSOCIATION OF GREAT BRITAIN.

A meeting of the executive committee was held at the office of the Association, 23, Burlington Chambers, New Street, Birmingham, on May 27, 1878, at 1 p.m., Mr. S. U. Jones (Leamington), president, in the chair.

After some business in connection with the appointment of committees had been transacted, the president announced the result in the case of the Apothecaries' Company *v.* Wiggins, as reported in this Journal last week.

The Solicitor said there was no attending or visiting outside the shop, no consulting-room, and no use of instruments proved in the case.

Mr. Shaw said that the prosecution in that case was quite at variance with the profession of the Apothecaries' Company, as they had stated it was not their intention to prosecute except in cases where there had been visiting.

In reply to a question, the Solicitor said he did not consider there was any point in the case on which the Association could go to the court above; there was no misdirection by the Judge; the verdict could not be disputed on the ground that it was against evidence, nor had the Judge excluded any evidence; indeed, although the admission of evidence of the practice of chemists and druggists prior to 1815 was objected to by the counsel for the plaintiffs, Mr. Justice Field admitted it, and the jury found that the defendant did not come within the exception provided by the 28th section of the Act. They had in the contest enforced the admission of the evidence of custom, but the jury had found that the cases treated by the defendant were not similar to those which chemists treated prior to 1815, inasmuch as they were not simple complaints. It would appear that chemists might treat any person for a simple complaint, but if the same turned out afterwards to be dangerous they ran a risk of being prosecuted, and a jury might find that the cases did not come within the scope of the 28th section.

Mr. Hampson said if funds permitted he thought it would be advisable to carry this case to a superior court. The present state of society compelled a chemist to prescribe, and it was utterly impossible for a chemist to discover the malignity of a complaint or to anticipate the character it would develop when applied to in its earliest stages. He heard the evidence given by the plaintiff's witnesses, and he considered all the cases which Mr. Wiggins had treated were cases that would have been treated by chemists generally, from necessity, in poor districts. The Association had, he thought, done well in defending Mr. Wiggins, and he would remark that there was no assumption of title in the case, and no guise of quackery; all the witnesses for the plaintiff went to Mr. Wiggins knowing him to be a chemist, and in that capacity they sought his advice and purchased his medicine.

After some further conversation it was resolved—"That the finding of the jury in the case of the Apothecaries' Company *v.* Wiggins being as follows—'We find the defendant acted as an apothecary in taking cases that were dangerous,' this Committee is of opinion that no further steps should be taken in this action, but reaffirms its decision to defend the case of the Apothecaries' Company *v.* Shepperley now pending."

Mr. Hampson said he was exceedingly sorry to announce that the case of the Pharmaceutical Society *v.* the London and Provincial Supply Association had been decided against the interests of the trade. It would be admitted that the question as to whether co-operative traders should be permitted to deal in scheduled poisons was of great importance to duly qualified chemists and druggists.

It was moved by the President, seconded by Mr. Barclay, supported by Mr. Holdsworth, and unanimously resolved—"That this Committee, viewing with the gravest apprehension the decision in the case of the Pharmaceutical Society *v.* the London and Provincial Supply Association, respectfully urges the Council of the Pharmaceutical Society to appeal to a superior court and endeavour to reverse this decision. Failing success, this Committee trusts steps will be taken by the Pharmaceutical Council to obtain an amendment of the Pharmacy Act, 1868, to protect the trade and the public from such practices, which are entirely opposed to the spirit and intention of that Act."

It was moved by Mr. Jervis, seconded by Mr. Cross, and unanimously resolved—"That the Secretary be instructed to communicate with the members of the general committee requesting them to take steps to convene meetings of the trade in their localities, with a view to request the Council of the Pharmaceutical Society to endeavour to reverse the decision in the case of the Pharmaceutical Society *v.* the London and Provincial Supply Association, and if found necessary, to amend the defective clauses in the Pharmacy Act."

Mr. Henry Glaisyer was reappointed Solicitor; Mr. W. F. Haydon, Secretary, and Professor Attfield, Analytical Referee to the Association, for the ensuing year.

The question of the best means of raising funds to prosecute the appeal in the case of the Apothecaries' Company *v.* Shepperley, in order to obtain a final decision on "Counter Practice," and to be in a position to take action in other cases as they may arise, was discussed, and a resolution was passed requesting the general committee to do its utmost to obtain an accession of strength in the shape of members, and also to aid in raising the Special Fund of £2000, required to enable the Executive of the Association to defend the interests of the trade.

It was also unanimously resolved to ask the Council of the Pharmaceutical Society to aid by a donation in prosecuting the appeal in the case of the Apothecaries' Company *v.* Shepperley.

Proceedings of Scientific Societies.

UNIVERSITY OF EDINBURGH CHEMICAL SOCIETY.

The ninth meeting of this Society was held on May 15, 1878; John Gibson Ph.D., F.R.S.E., in the chair.

A paper was read by W. Inglis Clark, D.Sc., on "The Gallate and Tannate of Iron," in which he reviewed the work of previous experimenters, and then detailed the results which he himself had obtained in a very extensive experimental investigation into the nature and properties of these substances, and the modifications they undergo when exposed to the action of acids, sugar and other bodies. A series of curves, embodying the results of these experiments, were exhibited, and showed clearly the interesting deductions which the author was able to make from them. It was further shown that by the action of aqueous gallic acid on metallic iron, a black compound was obtained, which when heated to 120° C. gave a percentage of iron, corresponding to the formula $FeC_7H_3O_5$, while before heating, it corresponded to the salt $FeC_7H_3O_5 2H_2O$. Two combustions, closely agreeing, gave a deficiency of carbon of about 4 per cent., thus opposing the view that the body under question was ferric gallate. The author continues his researches on the matter.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, May 16; Dr. Gladstone, President, in the chair.

After the confirmation of minutes, etc., the following certificates were read for the first time:—W. R. Crispel, and C. T. Macadam. The following gentlemen were elected Fellows of the Society:—J. W. Knights, J. H. Wilson. H. R. Smith, G. A. George, F. Slinger, W. Jago, H. W. Jones, A. E. Tucker, and B. Gregory.

The first paper was read by the Secretary—

On the Detection and Estimation of Free Mineral Acids in Various Commercial Products. By Peter Spence and A. Esilman. The method is based on the fact that peracetate of iron, even in dilute solutions, has a distinct yellow colour, not perceptibly altered by acetic acid, or solutions of persulphates, but instantly bleached by free sulphuric, hydrochloric and nitric acids. The solution is made by dissolving ten parts of iron alum, and eight parts of crystallized acetate of soda in one thousand parts of an 8 per cent. solution of acetic acid (25 per cent.). The method is especially suited for alum cake, salt cake, etc. 200 grains of the sample are triturated in a mortar with an 8 per cent. solution of acetic acid, and the peracetate solution added until the mixture has a decided yellow tint, showing that all the free acid has been neutralized. The liquid is then diluted to one hundred measures with the acetic acid water, and a portion filtered into a test tube. In another test tube as many measures of the peracetate solution as have been used for the above liquid are diluted up to about eighty measures with the acetic acid water; standard sulphuric acid is then run in until the colour of the liquid is the same as that of the one hundred measures in the first test tube. The quantity of acid used is the measure of the free acid in the cake.

The second paper was read by the Secretary; it was entitled—

The Action of Hypochlorites on Urea. By H. G. H. Fenton.—The author has found that when urea is acted upon by a hypochlorite in the cold in the presence of a caustic alkali only half the nitrogen is evolved. Thus the mean of eighteen experiments gave 18·22 per cent. nitrogen, theory requiring 37·3. Several samples of hypochlorite and various specimens of urea were tried, but all gave the same result. If an alkaline carbonate be used in place of a caustic alkali the whole of the nitrogen is evolved. Thus ·10303 grm. urea gave 35·3 c.c. nitrogen, when sodium carbonate was present, but only 19·02 in the presence of caustic soda; theory requiring 38·4. The author then made some experiments to find out what became of the remaining half of the nitrogen. He concluded that it was neither present as urea nor as an ammonia salt, but as a cyanate, the reaction being $2N_2H_4CO + 3NaClO + 2NaHO = 2NaCNO + N_2 + 3NaCl + 5H_2O$; further experiments completely confirmed this conclusion. The author states that this reaction may throw light on the constitution of urea, and affords an easy method of detecting and approximately estimating urea in the presence of ammonia salts. There is a mean loss of $2\frac{1}{2}$ of nitrogen in all hypochlorite reactions with urea and of about 8 per cent. in hypobromite reactions with ordinary apparatus.

Dr. Russell said that some experiments, which he made with Dr. West, confirmed in the main the author's results. He was surprised to hear the large suppression of nitrogen when the action took place in the cold. Hippuric acid when pure gives off no nitrogen; this fact has lately been confirmed by Dr. Gamgee. Ammonia salts give all but the theoretical yield. Oxamide is by no means completely decomposed.

Dr. Armstrong pointed out that the above results seemed to favour the constitutional formula of urea, suggested by Gamgee and Wanklyn $C\left\{\begin{matrix}NH_2\\NH\\OH\end{matrix}\right\}$. It must be recollected, on the other hand, that oxamide does not give off all its nitrogen.

Professor Foster said that he could confirm Dr. Russell's statement as regards oxamide, which gives off only about three-fourths of its total nitrogen. He called attention to the importance of using hypobromite solution quite freshly prepared.

The next paper was read by the Secretary—

On the Behaviour of Metallic Solutions with Filter Paper and on the Detection of Cadmium. By T. A. Bayley.—The author found by quantitative experiments that filter paper has the power of withdrawing silver salts from solution. Some experiments, by Mr. Weston, prove that the same action takes place between filter paper and mercury salts. The author then investigated the action which takes place when drops of metallic solutions are placed on filter paper. The extent to which the solutions spread being tested by the action of sulphuretted hydrogen. In some cases the solution seemed to concentrate itself in the middle of the spot, and in other cases in a ring round the edge of the spot. The degree of dilution, temperature, and the kind of paper used have an important influence on this phenomenon. Thus a strong solution of cupric sulphate distributes the copper all over the spot; dilute solutions, on the other hand, concentrate the metal in the centre. The salts of silver, lead, and the persalts of mercury when moderately concentrated give a wide water ring containing no metal, while the salts of copper, nickel, cobalt, and especially cadmium, must be much more dilute to present the same appearance. This property of cadmium to spread itself over the whole drop is so marked that it affords an elegant means of detecting it in the presence of metals whose sulphides are black. The diluted solution is dropped upon filter paper, and the spot allowed to extend as far as possible. On exposure to SH_2 a black patch is formed, surrounded by a vivid yellow ring. A solution containing much nickel, cobalt, or iron, in presence of copper, etc., may be examined successively with SH_2 and SAm_2. The presence of free acid increases the mobility of copper salts considerably.

The next paper was read by M. M. P. Muir; it was entitled—

On Essential Oil of Sage. By S. Siguira and M. M. P. Muir.—The authors refer to a former paper on the same subject (*Phil. Mag.*, Nov., 1877). The sample of oil with which the present experiments were made had been recently distilled at Leipzig, and was obtained from Messrs. Wright, Layman and Co. The oil consists mainly of two terpenes, an oxidized liquid, and a camphor. The properties of the terpenes and of salviol, as far as these have yet been examined, are as follows:—1st. Terpene boils 152°–156°, sp. gr. at 15° 0·8435. Refractive index for D line at 20° = 1·46071, hence sp. refractive energy = 0·546. Spec. rotatory power for soda flame = + 12·4. 2nd. Terpene boils 162°–167°; sp. gr. at 15° = 0·8653. Refractive index at 20° for D = 1·4658; refractive energy = 0·538; sp. rotatory power for soda flame + 13·4. Salviol boils 197°–203°; sp. gr. at 15° 0·934. Refractive index for D at 20° = 1·4623; refractive energy 0·495; specific rotatory power for soda flame = + 16·19. The terpene of lower boiling point yielded acetic and carbonic acids on oxidation. The higher terpene yielded oxalic acid on oxidation with nitric acid. Salviol yielded oxalic acid, carbonic acid, and hydrocyanic acid on oxidation with nitric acid; a small quantity of what was almost certainly camphor was also produced on distilling the product of the action of nitric acid on salviol with water. The action of bromine upon salviol resulted in the formation of an unstable brominated compound and of small traces of camphor. Phosphorous pentoxide converted salviol for the most part into cymene, but a small quantity of a terpene appeared also to be produced. A small quantity of absolutely pure sage oil has been examined by the authors. It consists for the most part of a terpene, boiling at 264°–270° ($C_{15}H_{24}$); sp. gr. at 0°, ·9198, at 12°, ·9137, at 24°, ·9072, and at 41°, ·8970. 100 mm. rotated the polarized ray + 3°·14. The terpene is of a dark emerald-green colour. The authors are continuing their investigation.

In the discussion which followed, Dr. Armstrong stated that he obtained, by the action of bichromate and sulphuric acid on the camphene from American oil, a substance which was dextro-rotatory and resembled ordinary camphor.

The next paper was read by the Secretary—

On the Action of Bromine upon Sulphur. By. J. B. Hannay.—On treating ordinary flowers of sulphur with bromine the author found that some of the sulphur remains undissolved. This insoluble residue was found to consist entirely of prismatic sulphur and amounted to 0·07 per cent. of the sulphur used. Carbon disulphide leaves about 0·12 per cent. undissolved. Roll sulphur when treated with bromine dissolves completely. The author examined with a spectroscope the vapour overlying a mixture containing SBr. He found that even at 0° the vapour gave the characteristic spectrum of bromine vapour as mapped by Roscoe and Thorpe. If more sulphur were dissolved, however, the spectrum disappeared. Thus, with a layer of liquid 0·5 metre thick, the absorption spectrum ceased to be visible in a liquid containing S_3Br at +42°, S_5Br_2 + 33, S_2Br + 25, S_4Br_3 + 13°, SBr + 3°. The author finds that the liquid in large mass begins to boil at 72° and rises without any pause, so that no evidence of the existence of a definite compound can be obtained by the boiling points. On mixing bromine and sulphur in the requisite amount a rise of temperature of 20° was observed. Some of this rise the author believes to be due to the change of state of the sulphur, because the amount of heat when plastic sulphur is used is distinctly less, only 12°. The author also estimated the sp. gr. of various compounds or mixtures: S_3Br 2·293, S_2Br 2·625, SBr 2·628, SBr_2 2·820, SBr_3 2·880, SBr_4 2·905, but without obtaining any evidence of the existence of SBr. An examination of the freezing points showed that the liquids became oily without solidifying, even at temperatures at which bromine is solid. The estimation of the vapour tension was also without avail. If a small quantity of arsenic be dissolved in the liquid SBr, and the mixture cooled to 18°, beautiful dark red crystals are obtained of the composition AsS_2Br_3, probably AsSBr SBr_2. The author therefore concludes that the action of any quantity of bromine on any quantity of sulphur is an action on the whole mass and not in multiple proportion; but that if at low temperatures the compound SBr_2 meets a body with which it can form a molecular combination it assumes the crystalline form in conjunction with such a body. The action of bromine upon sulphur increases in a regular manner up to SBr_2, totally ignoring SBr; above SBr_2 we may have another curve to SBr_4 and another fainter curve to SBr_8, but we have no evidence of the existence of S_2Br_2.

Mr. Muir thought that there was some evidence of the existence of SBr in his experiments, there seemed to be a stop in the distillation at 200°. This was confirmed by passing CO_2 through a mixture for some time and examining the residue.

Mr. Groves observed that the rise of temperature which occurred in mixing the two elements did not give the whole of the heat evolved, as some heat must be absorbed by the sulphur in passing from the solid to the liquid state.

The next paper was—

On the Determination of High Boiling Points. By T. Carnelly and W. C. Williams.—The determination of the melting points of a large number of metallic salts by Carnelly enabled the authors, in cases where only approximate results were required, to ascertain the boiling point of a substance by observing whether or not certain salts fuse when exposed to the vapour of the substance in question when boiling. The metallic salts are contained in capillary tubes: thus determined—S boils 446—451° (Regnault gives 447°); Anthracene 339—359°; HgI_2 339—359°; AsI_3 394—414°; $BiCl_3$ 427—439°; SbI_3 414—427°; $ZnBr_2$ 695—699°; $ZnCl_2$ 708—719°; TlCl 719—731°; TlI 806—814°; Cd 772°.

The last paper was—

On High Melting Points. Part IV. By T. Carnelly, D.Sc. (Lond.).—The author has carefully investigated and got rid of two sources of error which existed previously in his method (*Chem. Soc. Journ.*, 489, 1876). He now uses a much finer platinum wire to suspend the crucible and has redetermined the value of his calorimeter with very great care. In the present paper he gives the melting points of over one hundred substances, and promises in a short time some interesting theoretical results which he has deduced from the above observations, the most important being that in simple binary compounds if one of the elements remains the same, then the melting point is a periodic function of the atomic weight of the other. The author also hopes to be able to indicate a method by which many unknown melting points may be predicted.

After the thanks of the meeting had been given to the authors for the respective papers the Society adjourned to June 6.

On Thursday, May 30, Dr. Gladstone, F.R.S., P.C.S., gave a *soirée* to the fellows of the Chemical Society at Burlington House. Amongst the numerous objects of interest were the following:—A magnificent collection of immediate principles from the brain, exhibited by Dr. Thudichum, who also demonstrated the absorption spectrum of a new colouring matter, ovocruentin, derived from eggshells, the bands being identical with those of cruentin obtained from the blood. In the library were specimens of artificial corundum and emerald, made by Feil and Frémy; a large Cape diamond, exhibited by Professor Tennant; a collection of precious stones from Hunt and Roskell, including a fine pink topaz, cats' eyes, and a large crystal of garnet; some interesting apparatus of Faraday, amongst which was his rheostat; a collection of alkaloids from opium, aconites and veratrum, by Dr. Wright; a splendid case by W. H. Perkin, illustrating the colouring matters from aniline, anthracene, etc.; a specimen of artificial alizarin and preparations of natural and artificial salicylic acids, the latter of which the exhibitors, Messrs. Hopkin and Williams, have succeeded in obtaining in crystals exactly resembling those of the natural product; minerals containing liquid carbonic acid were shown by W. N. Hartley, who also demonstrated the effect of heat on the liquid enclosed in the cavities; crystals from Owens College, including a large, almost perfect octahedron of chrome alum. Various interesting products, etc., were exhibited by Professor Odling, Professor Frankland, Dr. Russell, Dr. Armstrong, Dr. Witt, Dr. Schorlemmer, Dr. Hugo Müller and M. M. P. Muir. In the room adjoining the lecture room, were some candles which had been acted upon by sea water for 173 years, a large collection of meteoric stones, an interesting series of photographs of invisible fluorescent bodies, etc., exhibited by the President; a splendid photograph of the solar spectrum, shown by Professor Rutherford; the spectrum of bismuth was shown by Messrs. Browning; dichroic crystals of nickel and cobalt salts by J. M. Thomson; photographs illustrating the recent researches in solar chemistry, by J. N. Lockyer; an enormous cut cairngorm, weighing fifty-one ounces, an opal cameo, and various minerals, by Bryce Wright, etc. In the lecture and preparation rooms were the microphone, exhibited by Professor Hughes, which attracted considerable interest. Mr. W. De La Rue showed some phosphorizing tubes, which after a momentary exposure to some burning magnesium flashed back all the colours of the spectrum; Bryne's pneumatic battery and the copper zinc couple were shown in action. Messrs. Murray and Heath exhibited under the microscope some pretty crystals of gold, silver, etc. Sir Joseph Whitworth and Dr. Senier showed specimens of steel; in the same room, Dr. Guthrie exhibited the formation of cryshydrates; many other objects of interest were exhibited, but it would be impossible to enumerate all. On the whole, the *soirée* was most successful, and although the attendance was numerous the arrangements were so good that at no time were the rooms inconveniently crowded.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held on Thursday May 9, at 17, Bloomsbury Square, Mr. W. R. Atkins in the chair, when a paper was read by Mr. G. F. Gutheridge on "Water, its Properties, Impurities and Contamination."

The author first referred to the discovery of the composition of water, the merits of which he assigned to Cavendish, and then proceeded to the consideration of the first part of his paper, viz., the properties of water These are for the most part familiar to all; the deep bluish-green colour of pure water may be seen in some of the Swiss and Norwegian lakes and also, as shown by Dr. Frankland, in distilled water. Rain-water, the purest natural water we have, contains principally gases as nitrogen, oxygen, etc., dissolved it; river water is less pure than rain water and is liable to be polluted with sewage and organic contaminations; these contaminations are, however, in some measure removed by the flows of the river. Sea water owes its peculiarities to the salts, principally sulphate and chloride of sodium and magnesium, held in solution.

The impurities were divided into (1) natural impurities and (2) artificial contaminations. Under the heading natural impurities were considered organic and inorganic suspended matter and mineral impurities in solution; under artificial contaminations were classed (1) metallic impurities, such as lead, and organic contamination proceeding from sewage, etc. The methods for detecting the presence and estimating the amount of such contaminations were here considered. For this purpose the estimation of the chlorine sometimes affords valuable negative results, but the presence of a considerable amount of chlorine is not in itself sufficient to condemn a water for drinking purposes. The principal test is the estimation of the organic matter present. The methods chiefly employed for this purpose are the "albuminoid ammonia" process by which the organic matter is measured by the amount of ammonia yielded by its decomposition; and Frankland's combustion process which consists in the determination of the organic carbon and nitrogen in the solid residue.

The paper was followed by an interesting discussion and a vote of thanks having been unanimously awarded to the author, the meeting adjourned.

Parliamentary and Law Proceedings.

Poisoning by Santonin.

On Friday, May 24, Dr. Diplock concluded an inquiry at the Mitre, Golborne Road, Upper Westbourne Park, respecting the death of Ella Jeannie Edworthy, five years of age. The evidence showed that on Saturday evening, the 4th ult., the mother, a widow, gave the deceased a powder which she had received from a neighbour, and which had been obtained from a "self supporting dispensary" in Edgware Road, Paddington. The deceased died half an hour after taking the powder. Dr. Kilner, of Ladbroke Grove Road, Notting Hill, made an analysis, and the result showed that death ensued from santonin, six grains of which were found in the stomach. Mr. Beresford Pickers, of 399, Edgware Road, stated that he prescribed the powder. He told Mrs. Weeks it was to be given in two doses. Mrs. Weeks, upon being recalled, denied that she received any such instructions. The jury, after a long deliberation, returned a verdict of death from misadventure, and censured Mr. Pickers for not giving explicit and written directions with the powder.—*Kensington News.*

Poisonous Violet Powder.

At the Epping Petty Sessions, on Friday, May 31, Henry George King, wholesale chemist, again appeared o answer the charge of having caused the death of Eliza Sears and others, and further with having unlawfully and fraudulently sold violet powder containing large quantities of arsenic, to the danger of the public health. Mr. Poland prosecuted, and the prisoner was undefended. Evidence was adduced to show that many children had died after the employment of the violet powder upon their bodies. The defendant said, as soon as he heard of the facts, he tried to stop the sale of the powder, which was being sold all over London. Mr. Poland admitted that the defendant had done his best to restrict the sale of this powder, and hoped that he would give the names of his customers, so that the powder might be traced. The defendant said he wished to do so. He hoped the newspapers would publish the facts, that people might be warned. Dr. Dupré of Westminster Hospital stated the percentage of arsenic, ranging from fifteen to fifty-one, found by him in the packets submitted to him for analysis. He had examined two packets taken from the defendant's premises, and both were free from arsenic. He also received a packet of 'terra alba,' which was free from sulphate of lime and contained no trace whatever of arsenic. Mr. Barnard Thomas, of the Treasury, had handed him a packet of violet powder, one of those seized by Serjeant Roots in Cambridge Road on Monday, and, on testing it, he found it to contain a great percentage of poison. Any one accustomed to deal in starch and terra alba could easily distinguish them from arsenic, which was a dull, not white, powder. Terra alba was more white and opaque. Powders mixed with 30 per cent. of arsenic ought easily to be recognized by persons dealing in such things; in fact, they could distinguish the difference with the eye and with the hand, as there was a great difference in the weight. The symptoms described by the witnesses were similar to those which followed the application of arsenic to the skin. He knew that there were cases recorded in which death had ensued from outward application of arsenic. Fly-papers and insect powders, which were amongst the list of articles sold by the defendant, might contain arsenic. The case was again adjourned.

On Friday, at the time of going to press the hearing of this case was being continued, evidence being given as to injury resulting from the use of the powder.

Serious Charge against a Chemist and Druggist.

At the Bristol Police Court, on Friday, May 31, John Cook, a "foreman chemist," of Castle Street, and John Newman, turner, were charged with administering to Veronica Sidey "certain poisonous and obnoxious things."

Veronica Sidey said that some time since she spoke to Newman with whom she had been keeping company respecting her condition, and he gave her 2*s*. 6*d*. to go to a doctor. She went and saw the defendant, who told her he would give her some stuff that would soon cure her. He gave her some stuff and some pills. She took the stuff and kept the pills. She had three bottles of physic in one week, and they made her bad. She gave up the pills and several bottles to Mr. Stoddart. Newman gave her 2*s*. 6*d*. to see Cook. She went to him last March and he examined her, and said she ought to have taken the stuff Newman gave her more regularly. He then gave her a bottle of stuff that was so nasty that she did not take it. On the Thursday she received another bottle from Newman, and he told her not to take it till she had a room in which she could be attended to.

The case was at this point adjourned till Tuesday, when Mr. Stoddart deposed that he had examined the contents of the bottles, and one of them contained a drachm and a half of oil of savin and an ounce and a quarter of ergot.

Eventually Cook was discharged and Newman was committed for trial.

Mysterious Death of a Young Woman at Yorktown.

An inquest has been held at the Duke of York Hotel, Yorktown, before Mr. G. Hull, coroner for West Surrey, touching the death of Rose Annie Boddy, who was discovered dead in her bed.

Dr. A. B. Fry deposed that he was called to the house, and there found the body of the deceased on the bed quite dead. There were no external marks of violence. He locked up the house and sent for the police. He made a *post mortem* examination forty-eight hours after, and found the body well nourished. On opening the chest and abdomen, he found no signs of peritonitis. The lungs and heart were perfectly healthy.

The liver was healthy, and the kidneys congested, but otherwise healthy. The uterus was enlarged, and on being removed and opened contained a healthy male fœtus of about seven months. The uterus was perfectly healthy. The brain substance he found was perfectly healthy, and the ventricles also. In the cavity of the brain there was an effusion, and there was some considerable congestion of the vessels. The stomach presented strong indications of congestion. He found some pills by the deceased's bedside, which he thought contained strong doses of cayenne pepper. He could not find sufficient to enable him to account for death. The brain effusion was not sufficient to cause death, and he thought the cause of death might be found in the stomach.

Dr. Stevenson, public analyst, of Guy's Hospital, London, stated that he had examined some pills which had been given to him. The pills were coated with silver, and each contained from three to four grains of capsicum, which was a powerful stimulant, and used medicinally in doses of half a grain for various female complaints. It was unlikely that three or four grains would produce serious results. He was not aware that capsicum ever procured abortion. He was of opinion that the cause of death was effusion on the brain. Any irritant, such as capsicum, is often given with the view of procuring abortion.

John Pierce Joyce, chemist, residing at Windsor, said: The label on the box (produced) is mine. I cannot say that I know anything respecting the box of pills produced. I see that my own writing is on the box, but have no recollection of selling them; but if it was within a reasonable date I would recollect it. I should consider that they are our ordinary dinner pills. I do not know who bought them. I knew the deceased by sight, but am not aware that she bought the pills. My ordinary dinner pills would not contain about three or four grains of capsicum; we only give a quarter grain of capsicum to each pill.

Dr. Stevenson: I have made up a pill containing four grains of capsicum.

By the Jury: I did come down here the day after the deceased died. I was coming here, and was stopped by a woman, who said to me, "Are you going to call on Rose Boddy, and she died in a fit." I have not been in the habit of giving her pills. I have occasionally visited her, but have not come to Yorktown specially to do so. I have known her for a number of years, and she lived in my service some time ago. I never made any appointment to meet her in London.

The Coroner said that what the jury had to consider was the cause of death, and not any outside circumstances, which had no bearing on that subject. The medical evidence was to the effect that death had been caused by effusion on the brain, and they would have to return a verdict to that effect.

The jury returned a verdict in accordance with the medical evidence.—*Sheldrake's Aldershot and Sandhurst Military Gazette.*

POISONING BY VERMIN KILLER.—CENSURE OF A CHEMIST AND DRUGGIST.

An inquest was held at the Bradford Town Hall, on Tuesday, June 4, before Mr. J. G. Hutchinson, borough coroner, on the body of a female named Helen Crabtree, who died from taking a quantity of poison. The deceased was thirty-four years of age, and a few weeks since one of her children was taken ill with the scarlet fever, and was removed to the Fever Hospital, where it died. The deceased had always disapproved of the child being taken from her house, and after its death she expressed great grief at her loss, and at times was very depressed in spirits.

It appeared that on the previous Friday the deceased had sent one of her daughters, an intelligent child, eight years of age, who gave evidence at the inquest, to Mr Swaine, chemist and druggist, Bolton Road, for two packets of vermin powder. The child was served with the poison by John Arthur Swaine, son of the proprietor, and according to her statement no questions were asked of her, and no entry was made in any book whilst she was present, by the lad selling the poison. The poison was given into the hands of an elder sister, who in her turn delivered it over to the deceased. On Monday, about five o'clock, the deceased walked into the surgery of Mr. March, Tennyson Place, and informed him that she had taken some poison. In reply to questions from Mr. March, the deceased stated that she had taken two packets of "rat poison," which she had obtained from Mr. Swaine. She had taken the poison in some gin and sarsaparilla. Mr. March at once administered an emetic, after which the deceased moaned, and made a great deal of noise as if in pain, exclaiming several times, "What must I do?" Immediately after having administered the emetic, Mr. March went for his stomach-pump, and whilst he was gone, the deceased fell off the chair upon which she was sitting, in convulsions. Mr. March called in the assistance of two police-constables, and after having three other convulsive fits, the deceased expired. Afterwards a letter, in the deceased's handwriting, was found, saying, "If I die, I shall die of vermin killer."

The lad Swaine admitted having sold the poison to the child without making an entry, and stated that it was not the practice in his father's establishment to do so.

The Coroner summed up, alluding to the circumstances under which the poison had been sold, and remarked that it was within the province of the jury to give an expression of opinion thereon.

The jury returned a verdict of "Suicide whilst of unsound mind," and at the same time expressed a strong opinion with regard to the manner in which the poison had been sold to the deceased's child. At their request Mr. Swaine was called into the room, and severely censured by the Coroner, who pointed out the provisions of the Act of Parliament with reference to the sale of poisons.—*Bradford Observer.*

Dispensing Memoranda.

[105]. SYR. FERRI SUPERPHOSPH. CO.—Some remarks in "The Month" of last week appear to call for notice, lest passing unchallenged, they may appear to have received a general assent. If "those who write prescriptions can scarcely be expected to keep strict pace with science," still less does it appear reasonable to suppose the writer of a prescription of yesterday to have had in his mind a paper published twenty-seven years ago, not widely known then, and now practically forgotten.

A less fanciful interpreter would ascribe the super in syr. ferri superphosph. co. to a slip of the pen, or even to ignorance on the part of the prescriber, and if unable to consult him would supply Parrish's Syrup without much hesitation. With regard to Hoffmann's Anodyne the writer appears to have assumed the very point at issue when he asserts that it is a compound spirit. Cogent arguments will be required to turn the scale against the weight of authority produced by Mr. Squire.

Lombard Street, E.C. C. E. S.

[106]. "SODÆ CARB."—I am not quite of your opinion that sodæ carb. in a prescription should be looked upon as bicarb. unless specially pointed out. Were I ordering a mixture for dyspepsia I should not of course think of the subcarbonate; but I have known many physicians very particular about the sodas ordered by them, and a great deal must depend upon the other ingredients.

Suppose a pill of ext. aloes aq. and sodæ carb. ordered, I think it would be entirely out of place to suppose the bicarbonate was meant.

I have compounded such pills, and had no difficulty with the sodæ carb. siccat. But they will not keep.

In expectorant mixtures the subcarbonate was always meant by the physicians so prescribing.

Northallerton. HENRY BROWN.

---

[107]. HOFFMAN'S ANODYNE.—Allow me to correct an error made by your printer. The Italian formula is properly stated in my letter "ether 1, rectified spirit 2." I may also mention that the U. S. Pharmacopœia did not copy, as some suppose, from the British in attaching Hoffman's Anodyne to the formula sp. ether co., for in none of the original Pharmacopœias issued by the several Colleges of England, Scotland or Ireland will you find Hoffman's Anodyne mentioned.

P. SQUIRE.

---

[107]. HOFFMAN'S ANODYNE.—Having been away in the country, I have only just seen Mr. Squire's letter in the Journal of May 25.

For *old* names and *old* forms, one should go back to *old* books.

Dr. Anthony Todd Thomson (the first lecturer to the Society on Materia Medica), in his London Dispensatory of 1837, in speaking of Spt. Æth. Sulph. *Comp.*, P. L., says, "this is intended as a substitute for the Anodyne Liquor of Hoffman," and gives as its Italian synonym "Anodino Minerale dell' Hoffman;" and Professor Redwood (the first lecturer to the Society on Practical Pharmacy), in his Gray's Supplement, 1847, gives as Hoffman's Anodyne Liquor the Spt. Æth. Sulph. *Comp.* of the Lond. Phar., 1836.

With these authorities before us, I cannot think Mr. Squire justified in applying the name to the simple Spt. Ætheris.

J. M. HUCKLEBRIDGE.

---

[107]. HOFFMAN'S ANODYNE.—I am glad to observe in your notes for "The Month" that so much space is devoted to explanations and criticisms of correspondents' opinions, and I hope the "Memoranda" will steadily increase.

I must still dissent from Mr. P. Squire in regard to the calling of spiritus ætheris Hoffman's Anodyne. It matters not if all continental pharmacopœias call a mixture of rectified spirit and ether by the name, Hoffman's Anodyne; such mixture cannot surely be properly so called so long as there is the omission of the ethereal oil, which is the *sine quâ non* of the "anodyne," so to speak.

I must, then, emphatically deny to simple spirit of ether the appellation of Hoffman's anodyne liquor, and I am sorry to see Mr. Squire should call it by a name which for more than a hundred years has been connected with a spirit containing ethereal oil. We have no right to follow continental pharmacopœias, and Mr. Squire, as a great pioneer and authority in pharmacy, should endeavour to point out discrepancies, and call a spade by its proper name.

I pointed out in the Journal of May 11 that from time to time the proportion of ethereal oil, as given by authorities, varied slightly; but this does not affect the question.

We are not concerned with the question as to whether or not spiritus ætheris was to take the place of the old-fashioned anodyne, but with the fact that for more than a century an anodyne spirit, having ethereal oil as a constituent, was known in England by the name of Hoffman's liquor.

HENRY BROWN.

[108]. The prescription cannot be dispensed clear as written, but by the addition of a little borax (about two grains to the ounce) a clear solution is the result.

F. W. B.

[110]. "Apprentice" will find no difficulty in obtaining a satisfactory result by first rubbing the yolk of egg in a mortar with the acetic acid, diluted with the rose-water, and then adding the turpentine and ess. lemon; turn it into a twelve-ounce bottle and shake well together for a few minutes.

This liniment is said to resemble that of the famous Mr. St. John Long, and, although it is easily made as required, my experience is that it improves in appearance by keeping, as in a few days it assumes a creamy consistence and becomes quite white. It is a great favourite with many medical men, and is an excellent application.

FELIX STEVENS.

51, *Judd Street, W.C.*

---

[110]. I had the same prescription to dispense in 1853 (excepting that there were only ʒx Ess. Limonis) and have dispensed it many times since. I find no difficulty in making a perfect and permanent emulsion quickly. Stir the Vitell. Ovi with 1 oz. Aq. Rosæ till well mixed, pour into a bottle and add gradually the Ol. Tereb. and Ess. Limonis and thoroughly emulsify* by soaking after such addition; then add the remainder of the Aq. Rosæ in the same way, and lastly the Acid. Acet.

C. TUCKER.

Bridport.

P.S.—This was ordered for a young lady, supposed to be consumptive, to be applied to the chest on flannels I am happy to say she is alive now, and has two or three bottles every year, besides recommending it to her friends.

THE VOTE FOR ADMITTING WOMEN AS MEMBERS OF THE SOCIETY.

Sir,—After the extraordinary statement of Mr. Sandford, I shall not be surprised to hear that it was Mr. Vizer, and not myself, who moved the resolution in favour of the admission of women to membership of the Society.

Mr. Sandford has written: "Because from my position at the table, when Mr. Wade and Mr. Vizer delivered the result of their counting, I was enabled to hear distinctly that fifty-nine was given by the former, and fifty-seven by the latter."

As Mr. Vizer did not utter his numbers aloud, but handed them to the President on paper, in order that I, who stood between Mr. Sandford and himself, should not hear how many he had counted, it is impossible that Mr. Sandford could have heard the numbers direct from Mr. Vizer, although he might those which I proclaimed aloud, as others did who were standing near, and who have since written to me corroborating my statement.

Mr. Vizer believed his numbers to be fifty-nine. I never had a doubt as to my own being fifty-seven, and the President, who received the numbers from us, was of the same opinion. Why therefore we should all be under a delusion, and Mr. Sandford alone infallible, is what I think "no fellow will be able to understand."

JOHN WADE.

174, *Warwick Street, Pimlico, S.W.*
May 28, 1878.

Sir,—Considering the small number that attended the last Annual Meeting and voted on the admission of women question; considering also the practical outcome, that there were present six of one and half a dozen of the other; it would not be worth while to remark on the curious muddle that was made of the voting, were it not desirable to prevent a like occurrence in the future.

I cannot for the life of me make out from the published account what actually did take place, and Mr. Wade's letter seems but to make confusion worse confounded. The cause of the muddle was I apprehend an imperfect acquaintance with the rules governing the use of the "Previous Question" as it is termed. The question itself is "that this question be now put," and the object of its proposer, seconder, and supporters being to defeat the main question, they must vote against against the motion—properly speaking it is not an amendment. If the noes have it, the main question is not put and the matter ends. If the yeas have it the main question is at once put without amendment.

If Mr. Vizer counted the votes against his amendment, as Mr. Wade says he did, he did quite right, but whether those whose votes he took understood what they were about is a question impossible for me to decide; nor is it worth the trouble to attempt it, seeing that the meeting, as I have said before, was about balanced *pro* and *con*.

I will take this opportunity of complaining of the cruel kindness of some of the speakers in favour of admission, who would act towards the ladies as the ladies not unfrequently do towards children, give them what they ask for, though they know well it will do them harm.

A true friend of the sex should endeavour to repress a hankering after notoriety, and the tendency to adopt avocations incompatible with the performance of home duties—duties which, unless performed by women, cannot be performed at all with advantage to the rising generation.

Women compelled to work for a living may well wait for fresh openings for their exertions when advertisements such as the following cease to appear:—

"Wanted a man cook," "Ladies' mantles and jackets warranted tailor-made," "Wanted so many laundry-men," etc., etc. While for the higher ranks, it should be their ambition to render unnecessary the every-day announcement in connection with Ladies' Schools, "Experienced Masters teach such and such subjects."

THOMAS B. GROVES.

Weymouth, May 22, 1878.

Sir,—The equality of the divisions at the annual meeting I think all will admit was highly unsatisfactory, leaving the Council in exactly the same position of uncertainty as to the real wishes of their constituents upon a most important question.

I most thoroughly sympathize with the feeling expressed by some gentlemen that the Council is not a mere body of delegates, bound to carry out a certain line of policy under the trammels of a trade union, but upon a question so essentially affecting the very constitution of the Society by which they are elected, I consider they acted in a strictly constitutional spirit, and in full recognition of the representative position they hold, by referring the question to the decision of the annual meeting of members. Had the suffrages of the electors been sought by a distinct avowal, on the part of candidates, of their view upon this question, I would say leave the matter in the hands of your representatives and abide the consequence, but such not having been the terms of election I venture to suggest that a poll of the entire Society should be taken by the issuing of a circular to each member, putting the question in the most simple words possible, without note or comment, requiring an equally simple reply—yes or no—the expense would be but trifling, the result decisive.

EDWIN B. VIZER.

Belgrave House, Cliftonville, Brighton. May 20, 1878.

THE SELBY BREAD CASE.

Sir,—As the chemist employed by Messrs. Croysdale and Son for defending them against the unfounded charge of adulterating their flour with alum, I wish to be allowed to correct some inaccuracies which have crept into the reports of the press, and notably the one you have copied from the *Leeds Mercury*. The charge against my clients was adulteration of flour with alum, and this charge was based on the certificate of the analyst, Mr. Allen, of Sheffield, which stated that the two samples of flour were adulterated with different proportions of alum. This positive statement of Mr. Allen's led the magistrates and the reporters astray, when they deduced from his evidence that alum *per se* was separated from the flour, and thus the reporters in copying the Somerset House certificates give alum instead of alumina, and the magistrates, or one of them, said that to them alumina appeared another word for alum. Now, our contention is that alumina is present in all commercial samples of flour, being derived either from the flour itself or from clay, dust, or other accidental impurities present, more or less, in all wheat; but that alum, being a manfuactured salt of alumina, can only be present in flour as the result of deliberate adulteration, and that therefore the whole question turns upon the fact of whether the alumina present was in an insoluble condition, as it would be if derived from clay, or from the millstones, or in a soluble condition, as when derived from alum.

The quantity of alumina is not disputed; but when Mr. Allen was asked how he separated and detected the alum, he answered that he did not separate the alum as such, because neither he nor any other chemist could do so, but that he estimated the alumina as phosphate of alumina, and deduced from its weight the quantity of alum present, having first tried if the alumina was present as a soluble salt or not. But previous to testing he gave the samples to his maid-servant to bake into bread, and then tested the bread. The question may be asked, why not test the flour instead of the bread, for baking does not increase the solubility of alum? We must leave Mr. Allen to answer, for I cannot.

As to the opinions of the court on the 13th instant, I state, without fear of contradiction, that the magistates on Mr. Allen's evidence were prepared to convict Messrs. Croysdale and Sons, and they appeared annoyed with the report they had received from Somerset House, because the Government analysts said the two samples contained alumina equivalent to so much alum per four pound of flour, and that they could not affirm alum was present. One of them went a step further, and stated in open court that the analysts in question could not be chemists, or they would not have given such a certificate; but chemists will ask, "What other could they give?"

On the first day of the trial, April 6, Mr. Allen, while upon his oath, said to the magistrates that in his opinion the Somerset House certificates were in accordance with those he had given. This extraordinary and inexplicable statement misled the magistrates, and entailed heavy expenses on my clients. It was evident to every disinterested person that these certificates did not confirm Mr. Allen's analysis, but he insisted that they did, and hence my clients were driven to incur the expense and annoyance of another day's trial.

We were fortunately able to subpœna Mr. Bannister, one of the Somerset House chemists, to attend on the 13th, and after his clear and convincing evidence was given, the magistrates unanimously dismissed the case, thus proving that in their opinion their own analyst was wrong and the Government chemists right. If the case had proceeded we should have been able to prove from direct evidence that the flour was pure, and that the Messrs. Croysdale had been persecuted through the blindness of the analyst. The question left to be considered is, "Can the analyst be made responsible for the expenses and damages?" We hope he can.

M. D. PENNEY, F.C.S.

ELECTION OF COUNCIL.

Sir,—I think the present a most suitable time to question the method of electing the Council.

It is gratifying to observe the change which is gradually coming over the minds of those who desire to become members of Council, by the embodiment of their views, in the form of addresses, upon the debatable questions of the day.

The yearly election of suitable representatives is the most important duty we have to perform towards the Society; consequently, it becomes necessary to elect those representing our own peculiar views of questions; but in how few instances is there any possibility of our faithfully so doing.

Take the present as an instance: out of a list of twenty-one candidates we only have an address from three; the qualifications of some of these gentlemen are well known to us, others, from their dubious utterances at the Council table, leave us in uncertainty of their sentiments, while others again are only dawning upon the horizon of pharmaceutical politics.

How, then, is it possible for us in the present *régime* to select men who can possibly be representative of our interests?

I do not wonder at the indifference of chemists generally to this election; and, when it is said that above 60 per cent. never fill up their voting papers, so far from being surprising it is, in fact, in the circumstances, the only reasonable course open to the majority of chemists, because it is more consistent to withhold exercising electoral rights, when such can only be done mechanically. If it were according to the nature of things that the first fourteen on the list were necessarily the most competent men, then automatism would be synonymous with reason, but until this is the case we, who are not omniscient, must not be held as unreasonable if we do not vote, when we do not know what might be the result of our temerity.

For the sake of argument, even supposing each candidate to give us, in the shape of an address or otherwise, the benefit of his sentiments, and be elected by the majority of the members, I should hesitate to call this Council a true representative of our interests. For instance, under the present system, supposing the North of Scotland ventures to put forward a candidate to represent its interests, he would stand but little chance of success; not because he might not be sufficiently supported by those whose suffrages he is seeking, but because these, however manfully they poll, will be relatively disproportionate to their more fortunate brethren of the metropolis.

Therefore I think the present system of electing the Council at fault, and am of opinion that the system as advocated by Mr. D. Frazer of Glasgow a much superior one, and meriting what it has not yet received—the serious consideration of all interested in the future well-being of pharmacy. This is the delegate system of territorial representation, the country being divided into districts, and those districts electing from their own number one capable of representing the interests and claims of the body. With this system, instead of the elector being restricted in his knowledge of the candidate to general particulars it will be possible for him to thoroughly prove the merits and demerits of his man.

DAVID S. ANDERSON.

West High Street, Forfar,
May 15, 1878.

J. Cass.—Yes; the upper part of the stem is often comparatively free from spots.

J. H. Stanford.—The crystals are probably potassium chloride. This you can easily ascertain for yourself.

"*Lanark.*"—(1) Lime tree flowers (*Tilia europæa*); (2) Hops.

"*Nemo.*"—We cannot undertake to pronounce upon the legal question submitted to us. Consult a solicitor.

J. W. Dyas.—We cannot say.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Brown, Facey, Challice, Balls, Hughes, Thomson, Burgoyne and Co., Froger-Bourdon, Barnes, Boothby, Summers, Sumner, Davey, Glover and Co., Schmidt, Readman, Corry, Johnson and Nicholson, Boweller and Bickerdike, Ellinor, Symes, Bashford, Mawson and Swan, Best, Shaw, Thomas and Dower, Storer, Simpson, Hemingway, Rolls, Schweizer and Co., Propert, Wilkinson, Hayward and Clark, Markham, Gerrard, Gidney, Clark and Co., Macteas, Langbeck, Jackson, Stuart, Spence, Wyndham, Rimmington, Abraham, Bromhead, Tichborne, Dunmore, Rowland and Sons, Hafford, Macfarlan, Barberon and Co., Smith, Loret, Rigaut and Dusart, Bush and Co., Scuftleben, Meynet, Southall and Barclay, Fourmier, Pellier and Maze-Launay, Annie, M. P. S., Justitia, Country Apprentice, Fides, J.L.

DIALYSED IRON AS AN ANTIDOTE IN POISONING BY ARSENIOUS ACID.

BY W. GIBBONS.

It has already been proposed that the solution of dialysed iron should be used as an antidote in cases of poisoning by arsenious acid, but up to this time no one has given any proof as to the value of these suggestions.* The supposition was founded on the knowledge that freshly prepared peroxide of iron was the usual remedy used, as it formed with the arsenious acid held in solution in the stomach an insoluble substance, having the formula $Fe_3 2AsO_4$. This fact was pointed out by Dr. Bunsen about forty years ago.

On hearing this I was induced to make the following experiments:—

I heated ¼ litre of water in a flask to the temperature of the human body (98·4° F.) and mixed with that 7·1 c.c. (f ʒij about) of an acid solution containing 1 grain of As_2O_3 in the quantity taken (Liq. Arsen. Hydrochlor. B.P.), to that I added 14·2 c.c. of the solution of dialysed iron (strength 2 gr. in f ʒj) and kept this mixture at a constant temperature, *i.e.* 98·4° F., for about one hour without obtaining any result. Now as the usual method of administering moist ferric oxide is, first to give a dose of a solution of some precipitant such as bicarbonate of soda, or a mixture of magnesia and water, followed by a large dose of the solution of perchloride of iron, I determined to follow up that method. I took all as before but in addition I used a small quantity of a solution of bicarbonate of soda. I then found that the arsenical solution was acted upon and the desired result obtained. In the first case I allowed the mixture to remain together for about one minute only, and on collecting the precipitated oxide of iron and washing, I found that already it had absorbed some of the arsenious acid. A second mixture I kept together for one hour at the temperature already mentioned. I then found that about 40 per cent. of the acid was taken up. This I consider proves beyond doubt, that a dose sufficiently large of dialysed iron solution, preceded by a dose of a solution of bicarbonate of soda or of magnesia (to neutralize the acidity of the stomach, and using an excess) is an antidote in poisoning by arsenious acid.

According to Dr. Maclagan at least twelve parts of moist peroxide of iron prepared with ammonia are required for one of arsenious acid, from which we can conclude that three volumes (at least) of the dialysed iron solution (2 gr. in f ʒj) are required for one volume of either of the arsenical solutions of the B.P. But as yet I can give no proof as to the correctness of this statement.

Pereira says that, "moist ferric oxide is only an antidote where solutions of arsenious acid have been used, and not when the solid acid has been taken." But as the arsenic must enter into solution with the liquid contained in the stomach, it stands to reason that the antidote is as good in one case as in the other, especially as the arsenic has no action in the solid form.

In conclusion, I must add that the advantages over the ordinary method of administering the antidote are as follows:—

Firstly, the solution of perchloride of iron has to be largely diluted in order to make it palatable, whereas dialysed iron does not require much water, as it can almost be taken as it is, and moreover it can be given in large doses with greater safety than ferric chloride solution.

Secondly, the amount of magnesia or alkaline carbonate in the case of dialysed iron is but small, as it has only to overcome the acidity of the stomach before acting upon the antidote, but with ferric chloride solution it is much larger, for in addition to the acidity spoken of, the alkali has to overcome the acid of the ferric chloride solution used.

And lastly, as few chemists keep moist ferric oxide ready prepared, and even if they did it would have become inactive by keeping, whilst nearly all have dialysed iron, this supplies the most rapid mode, and also the best way or administering the antidote for this most painful poison.

* Some experiments in this direction by Mr. Mattison, which the author appears to have overlooked, are recorded in the present volume, before, p. 569.—Ed. Ph. J.

NOTES ON INDIAN DRUGS.

BY W. DYMOCK.

(*Continued from page* 747.)

Bauhinia variegata, *Linn.*: Leguminosæ. *The bark.*—Kachnár (Hind.); Kánchan (Bomb.); Kanchan (Beng.).

History, Uses, etc.—There are two varieties of this Bauhinia. The flowers of the one are purple or deep rose coloured, and of the other, white, yellow and green; both are noticed in the 'Bhavaprakása' under the names of kovidára and kanchanára, and are said to have similar properties, the bark being described as alterative, tonic, astringent, and useful in scrofula, skin diseases, and ulcers. Chakradatta recommends the bark of the first variety in scrofulous enlargements of the cervical glands, and directs it to be given in emulsion with rice-water and ginger. Sarangadhara also recommends it for a similar purpose, and prescribes it in combination with guggulu (gum-resin of *Boswellia serrata*), myrobalans, and a number of aromatics. Under the name, kachnár, the author of the 'Makhzan' describes the bark as astringent, attenuant, and tonic. He says it is used to check diarrhœa, to remove intestinal worms, and prevent decomposition of the blood and humours; on this account it is useful in leprosy and scrofula. A gargle made from the bark with the addition of akákiá (extract of acacia pods) and pomegranate flowers is mentioned as a remedy in salivation and sore throat, and a decoction of the buds in cough, bleeding piles, hæmaturia and menorrhagia.

Description.—The bark is grey, tolerably smooth, compact; fracture granular, reddish-brown; the external surface is covered thickly with little elliptic warts of a darker colour than the rest of the bark; the internal surface is white and woody. The taste is feebly astringent. Microscopic examination discovers nothing characteristic.

Zizyphus, Sp. Rhamneæ. *The dried fruit.*—Unnab (Arab.).

History, Uses, etc.—This is the jujube of Arabic and Persian works on materia medica, and is not produced in India, but is largely imported in a dry state both from the Persian Gulf and China. Meer Mahomed Hussain describes it as the fruit of a well-known tree of nearly the same size as the kunar (*Zizyphus Jujuba?*), and olive; but having leaves a little thicker and longer than those of the kunar, with one side downy. The bark, wood, and fruit of the tree are red. The best fruit comes from

Jurjan, China, and Nipal. It should be sweet and moderately astringent, about the size of a dried date, and with a small stone. He gives a long account of the medicinal virtues of the jujube, from which we gather that he regards it as a suppurative, expectorant, and purifier of the blood; its uses would appear to be in many respects similar to those of dried prunes with us. The bark of the tree is used to clean wounds and sores, the gum in certain affections of the eyes, and the leaves when chewed are said to destroy the power of the tongue to appreciate the taste of disagreeable medicines. In Western India we have several cultivated varieties of *Z. Jujuba* which afford edible fruit, as well as a wild variety. None of these are considered medicinal, but their bark is powerfully astringent, and a kind of lac, known as bhooree lák, is found upon the branches. The fruit of the wild kind is dried and powdered. This powder is called in Hindu, bér-choonee.

According to Ainslie the root is prescribed in decoction by the Vytians in conjunction with sundry warm seeds, as a drink in certain cases of fever. The white pear-shaped fruit of *Z. rugosa* (Toorun, Bomb.) is eaten by the natives. The fruit of *Z. xylopyra* (Gootee, Bomb.), is used by shoemakers for blackening leather and for making blacking.

Description.—The dried fruit which comes from China, is from 1 to $1\frac{1}{2}$ in. long, and $\frac{3}{4}$ in. broad; skin red, much shrivelled; pulp adherent to the stone, spongy, sweet and yellow; stone $\frac{6}{10}$ in. long, very hard and rugose; apex sharp pointed, shell very thick; seed oblong, flat, of a chestnut colour, $\frac{4}{10}$ in. long, and $\frac{2}{10}$ broad. The fruit which comes from the Persian Gulf is somewhat smaller.

Commerce.—The Bombay market is supplied from China and the Persian Gulf ports. The Chinese fruit is preferred as it is larger and sweeter. Value, Chinese Rs. 8 per S. M. of $37\frac{1}{2}$ lbs.; Arabian Rs. 4—5.

CARDIOSPERMUM HALICACABUM, *Linn.*: SAPINDACEÆ. *The root and leaves. Vernacular*: LATAPHATKARI, NAYAPHATKI (Beng.); MOODA COTTAN (Tam.); KANPHOOTEE (Bomb.).

History, Uses, etc.—Sanskrit writers mention this plant under the name of jyautishmati, and describe the root as emetic, laxative, stomachic and rubefacient; they prescribe it in rheumatism, nervous diseases, piles, etc. The leaves are used in amenorrhœa. The following prescription is given in the Bhavaprakasha:—"Take the leaves of *C. Halicacabum*, impure carbonate of potash (sarjiká), *Acorus calamus* root, root bark of *Terminalia tomentosa*, of each equal parts and reduce to a paste with milk. About a drachm of this compound may be taken daily for three days in amenorrhœa." Rheede says that on the Malabar coast the leaves are administered in pulmonic complaints. According to Ainslie the root is considered aperient, and is given in decoction to the extent of half a tea-cupful twice daily. It would appear that in rheumatism the Hindus administer the leaves internally, rubbed up with castor oil, and also apply a paste made with them externally; a similar external application is used to reduce swellings and tumours of various kinds.

Description.—Annual, climbing; stem, petioles, and leaves nearly glabrous; leaves biternate; leaflets stalked, oblong, much acuminated, coarsely cut and serrated; flowers small, white or pink; fruit a membranous bladdery capsule, three-celled, three-valved; seeds globose, black, with a two-lobed white aril at the base; roots white and fibrous, with a rather disagreeable odour and an acrid nauseous and somewhat bitter taste.

SAPINDUS TRIFOLIATUS, *Linn.*: SAPINDACEÆ. *The Vernacular*: RITHA (Hind. and Bomb.); PENNAN KOTTAI (Tam.).

History, Uses, etc.—The soapnut, in Sanskrit phenila, has probably been in use among the Hindus from the earliest ages as a detergent. Both Hindus and Mahometans use it medicinally. The latter on their first arrival in the country gave it the name of bunduk or finduk-i-hindee (Indian filbert). The following account of its use is extracted from the Makhzan-ul-adwiya. The pulp of the fruit is at first sweetish to the taste, afterwards very bitter; it is hot and dry. Tonic and alexipharmic. A four-grain dose in wine and sherbet cures colic. One miskal rubbed in water until it soaps, and then strained, may be given to people who have been bitten by venemous reptiles and to those suffering from diarrhœa or cholera. Three or four grains may be given by the nose in all kinds of fits producing insensibility. Fumigations with it are useful in hysteria and melancholy. Externally it may be applied, made into a plaster with vinegar, to the bites of reptiles and to scrofulous swellings. The root is said to be useful as an expectorant. Pessaries made of the kernel of the seed are used to stimulate the uterus in childbirth and amenorrhœa.

One miskal of the pulp with one eighth of a miskal of scammony acts as a good brisk purgative. Ainslie mentions its use by the Vytians as an expectorant in asthma. In Bombay it is given successfully as an anthelmintic in four-grain doses.

Description.—Berries three, united, when ripe soft, and of a yellowish green colour; singly they are of the size of a cherry, somewhat uniform, with a heart-shaped scar on the attached side. When dry they are of the colour of a raisin; skin shrivelled, pulp translucent, absent on the attached side. The inner shell enclosing the seed is thin, tough and translucent like parchment, except at the scar, where it is woody. Seed the same shape as the fruit, black, smooth except at the hilum, where it is tomentose, size of a large pea; on the upper part of the dorsum of the seed are two shallow diverging furrows. The testa is double, the outer very thick and hard, the inner membranaceous. Kernel yellowish-green, oily; cotyledons unequal, thick, firm, and fleshy, spirally incurvate. Radicle inferior, linear, lodged at the base of the seed, pointing to the lower and inner angle. The pulp of the fruit smells like compound extract of colocynth; its taste is sweet at first, afterwards very bitter.

SEMECARPUS ANACARDIUM, *Linn.*: TEREBINTHACEÆ. *The fruit. Vernacular*: BHELA, BHILAWA (Hind.); BIBA (Bomb.); SHÉN-KOTTAI, SHÉRÁN-KOTTAI (Tam).

History, Uses, etc.—The marking nut, in Sanskrit Bhallataka and Arushkara, is regarded by the Hindus as acrid, heating, stimulant, digestive, nervine and escharotic, and is used in dyspepsia, piles, skin diseases and nervous debility. It is prepared for internal use by being boiled with cowdung and afterwards washed with cold water. The nut is also used to produce the appearance of a bruise in support of criminal charges preferred through enmity, and the juice is sometimes applied to the body out of revenge, the victim having first been made insensible by the administration of narcotics. In Sanskrit medicinal works, a section is often devoted to the treatment of ulcerations thus produced. When given internally the juice of the pericarp is always mixed with oil or melted butter. The Arabic name for the nut is Hab-ul-Kalb, an allusion to its heart-shaped form. Mahometan writers order the juice to be always mixed with oil, butter, or some oily seed, when used for internal administration. They consider it to be hot and dry, useful in all kinds of skin diseases, palsy, epilepsy and other affections of the nervous system, the dose being from ¼ to ½ a dirhem. Externally they apply it to cold swellings. When too large a quantity has been taken oily and mucilaginous remedies should be prescribed; 2 dirhems is considered a poisonous dose. Some persons are much more readily affected by the drug than others. Garcia d'Orta remarks that the poisonous properties of the marking nut have been much exaggerated by Serapion, and goes on to say that in Goa it is administered internally in asthma after having been steeped in butter-milk, and is also given as a vermifuge; and, moreover, says he, we (the Portuguese) salt the young green fruit and use them like olives. Ainslie gives the following account of its use in Southern India. "The Hindus give the juice in scrofulous, venereal and leprous affections in very small doses. An oil is also prepared with the nut by boiling, which is used externally in rheumatism and sprains; it is of a very stimulating nature. Undiluted it acts as a blister. The Telingoes have the following prescription:—Juice of marking nut and garlic of each one ounce, juice of fresh tamarind leaves, cocoa nut oil, and sugar, of each two ounces; mix and boil for a few minutes. Dose one table-spoonful twice daily in syphilis, aches, sprains, etc. Mixed with a little quicklime and water the juice is used all over India for marking linen and is far more durable than the marking inks of Europe. In the Pharmacopœia of India, the exaggerated notions of its injurious properties are revived."

Description.—The marking nut is well described by the Arabs as resembling the heart of an animal, the torus representing the auricles and the fruit the ventricles. In the dry commercial article the torus is seldom present, and the fruit is of the size and shape of a broad bean, of a black colour, and quite hard and dry externally; but upon breaking the outer skin with a knife the central cellular portion of the pericarp will be found full of a black oily acrid juice; inside the pericarp is a thin shell, conformed to it, and containing a large flat kernel, which has no acrid properties.

Commerce.—Marking nuts come from various parts of the country.

Value.—¾–1 R. per Surat maund of 37½ lbs.

MELILOTUS, Sp.?: LEGUMINOSÆ. *The fruit, Vernacular*: IKLEEL-UL-MALIK (Arab. and Bomb.)

History, Uses, etc.—The small crescent-shaped pods which are imported into Bombay from the Persian Gulf under this name are not those of *M. officinalis*, but are considered by Arabian writers to be the melilotus of Dioscorides. The author of the 'Makhzan-ul-Adwiya' gives maleelotus as the Greek name, and geeah-i-kaisar as the Persian. He goes on to say that there are two kinds of melilot, both plants are much alike, bu the fruit of one is crescent-shaped, with small roundish seeds, something like fenugreek, while the fruit of the other is much smaller, and only slightly curved; both have an odour like fenugreek. The best fruit for medicinal purposes is hard, yellowish-white, and aromatic, with yellow seeds. The Mahometans, following the Greeks, hold melilot in high esteem as a remedy in a great variety of disorders. It is considered to be suppurative and slightly astringent, and is much used as a poultice to dispel tumours and cold swellings. The diseases in which it is administered internally are of a widely different nature, and far too numerous for recapitulation here. For an account of them we must refer the reader to the 'Makhzan,' article "Ikleel-ul Malik." The Arabian drug appears to have the same properties as *M. officinalis*, at any rate it has the same peculiar coumarin odour. *Melilotus leucantha*, Koch., and *M. parviflora*, Desf., grow in the Bombay Presidency; the first species has the delicate odour of the European melilot. In the 'Makhzan' an Indian variety of melilot is mentioned which has very small fruit; it is called parang.

Description.—Small sickle-shaped greyish-yellow pods, with a beak slightly curved outwards; distance from base to apex half an inch; length of pod when straightened out about one inch. It is grooved on both sides, and divided by a central partition into two cells, each of which contains a single row of small greyish-yellow rhomboidal seeds, deeply notched on one side, and seen under the microscope to be marked with numerous black spots. The other kind, with very small slightly curved pods, mentioned by Mahometan writers, is not found in the shops; it is probably the *M. officinalis*, or *leucantha*, now *alba*.

(*To be continued*).

HYDROBROMIC ACID.*

BY DE WITT C. WADE.

I have read with much interest the paper on hydrobromic acid, presented by Dr. Squibb at the last annual meeting of the Medical Society of the State of New York, and published in the February number of *New Remedies*.† Some of the positions taken by the author are at variance with my views, and I therefore take the liberty of discussing them, with your permission, in your journal.

It is now generally admitted that the object of administering a bromine salt is to obtain the effects of bromine upon the system. Now, doubtless, to obtain this effect the salt must be decomposed by an acid, and the gastric acids are known to be capable, to a certain extent, of accomplishing this object. What is this extent? Its indefiniteness results from the variable amount of free acid present in the stomach at the time of the administration of the salt. If acids are entirely absent, the bromide will be absorbed and eliminated, and no effect of bromine will be obtained, for the effect always depends upon the amount of hydrobromic acid produced by the decomposition of the salt, and it is probable that generally a part of the salt becomes absorbed before being broken up, and the effect of the bromine of such part lost. This is the reason that hydrobromic acid was proposed as a medicine, thus avoiding the unreliability of the stomach as a laboratory. It is found, clinically as well as in theory, that a smaller amount of bromine in the form of hydrobromic acid, will produce the specific effects of this halogen upon the system, than when administered chemically united to a base. Hence, it is not necessary or proper that the relative amount of bromine in hydrobromic acid and in

* From *New Remedies*, April, 1878.

† See before, p. 727.

bromide of potassium should be considered in determining what the dose of the acid should be.

Dr. Squibb recommends a complicated method of preparing hydrobromic acid, in no particular like the one now almost universally used. The object of his method, which he minutely describes, is the production of a purer and stronger acid, to be accepted as a standard. I will first consider the question of purity. There can be no doubt that the method he proposes will produce a chemically pure acid, or nearly so, while the simple plan of decomposing bromide of potassium with tartaric acid will give us an article containing in solution bitartrate of potassium, and possibly free tartaric acid and bromide of potassium. If the proper proportion of the salt and acid is used, they can only remain as impurities, by failure of complete chemical union of the base and acid. It will be found that the amount of each unappropriated will be quite minute, and consequently entirely harmless and unobjectionable. The solubility of bitartrate of potassium (cream of tartar) is given in the U. S. 'Dispensatory' at 1 part to 180 of water. Therefore, half a fluid drachm of hydrobromic acid contains about one-sixth of a grain of this impurity, which, I am sure, is sufficiently free from serious contamination to be regarded as unobjectionable. But supposing one-half as much tartaric acid should be used, as provided for in the formula, resulting in the formation of the soluble tartrate, instead of the nearly insoluble bitartrate of potassium; the impurity could only be considered as entirely harmless, and the value of the acid, as a medicine, in no way detracted from. Indeed, when we administer bromide of potassium, the stomach is permitted to produce the hydrobromic acid, and retain all of the by-products we now seek to eliminate. Hydrobromic acid prepared by the tartaric acid method is a clear, strongly acid fluid, that clinically or by any other test, save chemical analysis, presents no suspicion of containing a trace of the harmless impurities I have described. That it is laudable to urge the use of pure drugs I admit, but taking into consideration that isolation of active principles is the exception in medicinal compounds, and that in this case the patient takes less of impurities than he does with his daily bread, and remembering that the tartaric acid formula can be accurately followed by any novice and without chemical appliances, while druggists can rarely be found in this country who have sufficient experience in chemical manipulations to correctly follow the method given by Dr. Squibb, even if in possession of the required apparatus, embracing also, as it does, the question of cost, I think I am safe in asserting that the tartaric acid plan will continue to be preferred by both physician and pharmacist.

Dr. Squibb advises that a standard for the strength of hydrobromic acid be adopted, one-half that of bromide of potassium; that is, containing by weight one-half as much bromine, and also, that it always be dispensed by weight. That this drug should have a standard strength is certainly desirable, but to me it is questionable if the proposal of still another formula, three or four times the strength of those in use, will accomplish the object. I can hear of only two formulas for the production of the acid, by means of bromide of potassium, tartaric acid, and water; one ascribed to Dr. Fothergill, and one furnished by myself. To explain the disparity between these formulas, will necessitate the rehearsal of a part of their history. In 1874, I determined to prescribe hydrobromic acid for the purpose of obtaining the effects of bromine. instead of using bromide of potassium. I prepared the acid by decomposing bromide of potassium with tartaric acid. I am not aware that previous to that time any person had ever prescribed this acid, or had prepared it by this formula. I therefore believe I have a right to claim to be the originator of the formula, as well as the idea of using the acid as a therapeutical agent. After having prescribed it sixty times, I wrote a paper, in the autumn of 1874, for the *Peninsular Journal of Medicine* (Detroit), which appeared in the February number, 1875, in which I gave my reasons for suggesting the acid as a medicine, the result of my clinical experience with it, and a theoretical formula, specifying that each fluid drachm of the finished preparation shall represent 10 grains of bromine. Undoubtedly this was the first that ever appeared in print, in regard to the use of hydrobromic acid as a medicine. Dr. Fothergill states, in the first paper he wrote on the subject, that he transcribed my paper for a British medical journal, and gave my formula to his hospital pharmacist with instruction to prepare the acid. He then gives his experience with it for twelve months, and finally the working formula. He does not allude to the fact that this formula provides for less than 10 grains of bromine to the fluid drachm. In it the bromide of potassium and tartaric acid are not given in the correct proportion for chemical combination. I therefore conclude that the working formula was furnished by the pharmacist, and that Dr. Fothergill did not critically examine it, but published it under the apprehension that it was correct and in conformity to my theoretical formula. Dr. Fothergill does not claim any originality in connection with the subject. I deem it unfortunate that the error occurred, as it has caused considerable inquiry as to what formula to adopt.

My standard of ten grains of bromine to the fluid drachm of the finished preparation is entirely an arbitrary one, but I have thought best not to advise a change of strength, because it is found that of this strength half a fluid drachm is a proper average dose for an adult, and is a convenient one in making combinations with other medicines, or with syrup. Of this strength it requires considerable dilution before it is swallowed. If it should be made more concentrated, it would only result in lessening the dose, so that, when properly diluted on swallowing, the strength would be unchanged, and the same amount of bromine would be taken in either case.

I can, therefore, see no reason why the tartaric acid formula should be discarded, nor do I believe it will. The Michigan Pharmaceutical Society has adopted what it is pleased to denomiate as my formula, and published it in the transactions for 1877. It is not improbable that the next edition of U. S. 'Pharmacopœia' will contain a formula for the preparation of hydrobromic acid, and the desirable strength be determined for Americans. If other than ten grains of bromine to the fluid drachm be adopted, the change in the formula will only be in reference to the amount of water to use.

My objection to the dispensing of hydrobromic acid by weight is, that fluid medicines are always administered by measure, and it is therefore more convenient for the prescriber to order by measure.

The following working formula provides for ten grains of bromine in each fluid drachm of the finished preparation. In my opinion it should be denominated dilute hydrobromic acid, in conformity to the rule applying to the other weaker mineral acids.

Bromide of Potassium	120 grains.
Crystallized Tartaric Acid . . .	153 „
Water	1 fluid ounce.

or

Bromide of Potassium . . .	11 avoir. ounces.
Crystallized Tartaric Acid . .	14 „ „
Water	40 fluid ounces.

Dissolve the bromide and then the acid in the water, and keep at a low temperature till precipitation ceases, and decant.

There are many physicians who not only use this acid almost to the exclusion of the bromine salts, but for many purposes where the latter would not produce similar results. I will close this paper with the statement that I have prescribed between one and two *barrels* of hydrobromic acid.

VOLATILE OIL OF THE LEAVES OF MYRCIA ACRIS.*

BY PROFESSOR GEORGE F. H. MARKOE.

During the past eight months I have been engaged in the distillation of bayberry leaf oil, or, as it is usually called, bay oil or oil of bay leaves.

About 7000 pounds of the leaves were consigned to me, packed in bales that varied in weight from 150 to 375 pounds. The quality of the leaves varied very much, some being rich in oil, others yielded a very small per cent., not enough to pay for the trouble and expense of their distillation. Some of the bales were filled with large full grown leaves, others with the leaves on the small branches or twigs on which they grew.

One lot of two bales, about 500 pounds, was received in a green condition, just as the twigs had been pulled off from the trees, without drying. The leaves, being tough and evergreen, had not been at all injured.

The sample which is being passed among the members will serve to give an idea of the appearance of the leaves in a dry condition. They have no odour until they are crushed, when the strong fragrant odour characteristic of the familiar bay rum will be at once recognized. The leaves have an agreeable, pungent, spicy taste, and may be used as a flavour for soups, gravies, etc. The dried unripe fruit or berries form a substitute for pimento or allspice; very few people would be able to tell the difference between the two, either by their appearance or by the taste.

The leaves received by me were mostly from the Island of St. Thomas. The apparatus used in distilling the oil from the leaves was a 200-gallon copper still, heated by steam, so arranged that either wet or dry steam could be used at pleasure.

From 200 to 300 pounds of leaves were used at each running of the still, and to work off this quantity required from eight to twelve hours, during which time from eighty to one hundred gallons of distillate would be obtained. The oil comes over in two portions. First a portion lighter than water, that comes over very rapidly, and then the heavy oil, that comes over very slowly and does not easily separate from the water, with which it forms a milky emulsion.

I will give the notes made of one of the runs with 200 pounds of the leaves. The distillate was collected in quantities of two and a half gallons, and the oil carefully separated from each portion, and then I took the specific gravity of each of the portions of the light and of the heavy oils:—

Light Oil.

No. 1.	Specific gravity	·870
No. 2.	„ „	·930
No. 3.	„ „	·946
No. 4.	„ „	·964
No. 5.	„ „	·982
No. 6.	„ „	·990

The total yield of the light oil coming over in the first fifteen gallons of distillate, from which it promptly separated, leaving the water quite clear. The distillation was then continued to obtain the heavy oil until sixty-five gallons more of distillate were obtained. The oil was divided into three portions, and then the specific gravity of each portion was taken.

Heavy Oil.

No. 1.	Specific gravity	1·023
No. 1.	„ „	1·035
No. 3.	„ „	1·037

The oil when first distilled is colourless, but by exposure to the air quickly acquires a yellowish tint, which deepens into a rich brown tint, and if the exposure is continued the oil becomes quite dark in colour just as does the oil of clove or the oil of pimento. The odour of the freshly distilled oil is rank, but in the course of from three to six months it becomes mellow and ripens into the agreeable fragrance so much liked in the best specimens of bay rum.

Wishing to study the light and the heavy bay oils, I made the following experiment, with a view of getting the two oils in a pure condition by a careful fractional distillation of the light and the heavy oils as obtained directly from the leaves:—

1. Twenty pounds of the crude heavy oil, which had been exposed to the air until it had acquired a deep brown colour, was put into a thirty-gallon jacketed steam still, together with twenty gallons of water. The distillation was begun very slowly, and the distillate collected in portions of two and a half gallons. The first and second portions contained about four pounds of light oil, then the water came over of a milk-white colour, and on being allowed to stand the heavy oil subsided to the bottom of the bottles.

The distillation was very tedious, requiring twenty hours to get all the oil over. When the oil had separated from the water the latter was returned to the still. Seventy-five gallons of distillate were required to complete the rectification. The twenty-six portions of heavy oil were divided into thirteen portions by mixing Nos. 1 and 2 together, 3 and 4, and so on through the series. The specific gravity of each portion was then taken, and is given in the following table, at 85° F., the temperature of the laboratory:—

Fractional Distillation of Heavy Bay Oil. Specific Gravity, taken at 85° F.

1.	Specific gravity	1·025
2.	„ „	1·030
3.	„ „	1·036
4.	„ „	1·040
5.	„ „	1·045
6.	„ „	1·045
7.	„ „	1·047
8.	„ „	1·048
9.	„ „	1·048
10.	„ „	1·048
11.	„ „	1·048
12.	„ „	1·042
13.	„ „	1·035

The first eight portions were nearly colourless. No. 8 had a light straw colour, 9 and 10 light brown, and 13 almost black.

Nos. 8, 9, 10, and 11, being all of the same specific gravity, were mixed together and taken to represent the pure heavy oil of bay. It had the following properties:—Colourless when first distilled, quickly acquiring a brown colour by exposure to the air; the odour recalls that of clove; the taste hot, pungent, aromatic, very like that of oil of cloves; it reddens the skin and produces a hot tingling sensation in the part to which it may be applied; the effect does not, however, last long. The oil is soluble in the 95 per cent. alcohol of the market in all proportions, also in ether and petroleum benzin. It is soluble in the officinal solutions of caustic potassa, forming after a short time a mass of crystals. I have not had time to push my investigations any further, but feel quite sure that the heavy oil of bay is identical with the eugenic acid common to the oil of clove and pimento.

The specific gravity was taken with much care, using a 500-gram flask in making the determinations at 77° F. and at 60° F.

Specific gravity of heavy oil of bay at 77° F.	1·052
„ „ „ „ „ 60° F.	1·055

I next took ten pounds of light oil of bay, as obtained from the leaves, having a sp. gr. of ·945, and slowly redistilled it, reserving the first portion for examination.

This was a clear, limpid, colourless liquid, having a sp. gr. of ·829 at 77° F., and of ·8356 at 60° F., perfectly

* From the Transactions of the American Pharmaceutical Association.

soluble in strong alcohol, ether, benzin, and chloroform. It is, I presume, the characteristic terpene of bay oil, but I have not had time to examine it fully.

When the residue in the still was examined about four ounces of a dark coloured very thick body was obtained from the sides and bottom of the still. This I think is the resin that is formed by the oxidation of the eugenic acid of the oil of bay, and is the peculiar colouring-matter of the oil. It is carried over, to some extent, during the last part of the distillation.

I offer the above notes simply as preliminary to more extensive study of the subject, which I hope to be able to make, and the results of which I will gladly present to this Association at some future time.

OPIUM AND ITS ANTIDOTE.*

BY CHARLES RICHET.

The alkaloids found in opium do not all affect in the same way the organic functions. Thus, narcotine possesses very little or no soporific power: two grams of it can be injected without perceptible effect, while a centigramme of morphine is quite sufficient to produce therapeutic and physiological results. Thebaine does not cause sleep, and in animals produces convulsions like those caused by strychnine, while morphine in the same dose produces deep comatose sleep. Another curious thing about these opium alkaloids is, that they do not act alike on man and animals, as has been demonstrated by Claude Bernard. Man is especially sensitive to the action of morphine, while thebaine is almost without effect upon his nervous system; animals, on the other hand, feel the effects of morphine only when it is given in large doses, while thebaine is for them a violent poison. So, too, with belladonna, and atropine, its active principle; they are a deadly poison for man, but almost without effect on rabbits: the dose of atropine that would suffice to kill ten men would hardly be enough to kill one rabbit. The difference is not so great with respect to morphine, yet morphine specially affects man; hence in this article we will consider only this one opium alkaloid.

It is not yet positively decided whether opium produces anæmia or whether it produces congestion of the brain; indeed, we know little more than that it sets one asleep. This sleep, however, is in some respects different from ordinary sleep. From thirty to sixty minutes after taking opium one feels a slight excitation; there is a general feeling of buoyancy and contentment, soon followed by drowsiness and a state of reverie rather than of dreaming. There is a pleasurable feeling of *abandon*, and an agreeable sense of torpor creeps over the whole frame; the thoughts are like the ever shifting scenes of a phantasmagoria, on which we passively gaze, without will or effort to alter the series. Still, so long as the intoxication is not deep, such effort is possible. One feels that he is falling asleep, and that if he would but bestir himself he might overcome his drowsiness. But little by little the legs grow heavy, the arms fall to the sides almost powerless, and the weighted eyelids refuse to remain open. A dreamy, rambling sort of thinking still goes on, and there is as yet no sleep; we are still conscious of the world around. We indistinctly hear the tic-tac of the clock and the rumble of passing vehicles, but it is as though, so to speak, another person were listening, and not we. The active, conscious *Me* exists no more, and another personality seems to have taken its place. Gradually everything becomes more and more indistinct, our thoughts are enveloped in a haze, we feel ourselves detached from matter, detached from our bodies, and transformed into thought, which flits about, so to speak, becoming more and more brilliant, but at the same time more and more confused. Then the outer world disappears, and there remains only an inner world, sometimes full of tumult and delirium, and producing feverish excitement, or, as is more frequently the case, calm and quiet, and full of delightful repose. This intoxication is purely physical, and far superior to the intoxication produced by alcohol or hasheesh, for, though hasheesh gives one a few hours of insanity, opium gives sleep, and with this boon there is nothing that can compare. One must have suffered from insomnia in order to appreciate the value of opium. It brings sleep, and it banishes pain.

It is one of the most powerful agents we possess for modifying the sensibility, but whether it does this by acting upon the sensor nerves or on the brain we know not with certainty. Even where it does not procure sleep, it has the singular power of calming the excitability of the nerves, and of subduing that morbid state of the sensibility called by physicians hyperæsthesia. It has been observed that when it reduces hyperæsthesia it does not cause sleep, all its force seemingly being spent in combating pain.

In China there is the same popular demand for opium that exists in Europe for alcohol and tobacco. The use of opium does not date very far back, and it is probably the only innovation that China has adopted from the West. The importation of opium from India into China amounted to 1798 to 300 tons, in 1863 to 3000 tons, in 1866 to 3903, and since then the increase has been still more rapid.*

Opium is chewed, or smoked in a pipe, the latter mode of using it being the more common. The bowl of a long-stemmed pipe is filled with the drug, and, as the opium swells and adheres to the pipe, a needle is in constant use to keep open an air-passage. As the drug burns with difficulty, the smoker must have a light ready at hand for use whenever his pipe goes out.

The number of opium-smokers is considerable, but the great majority of them use the drug only in moderation. The wealthiest mandarins, the most intelligent merchants, smoke opium, as do the humblest coolies. The use of opium is like the use of tobacco among ourselves; nor does it produce any greater mischief, at least among the well-to-do classes; but with the common people it is different. There are establishments specially devoted to opium—smoking-places where, for a trifling sum of money, one may gratify this appetite. Rarely does a smoker leave before he is fully under the influence of the drug, just as the drunkard does not quit the gin-shop until he is fuddled. So used, opium is certainly a dangerous poison, and, according to the testimony of all travellers, the wretches who daily commit such excesses speedily fall to a fearful state of degradation, both moral and physical. Pale, wan, gaunt, shambling along with difficulty, they must have recourse to artificial stimulation in order to regain a part of their wasted energy. Still the injurious effects of opium have in all probability been very much exaggerated; the number of deaths caused by the abuse of the drug is not very great, and many of those who smoke it, even in considerable quantity, retain unimpaired their mental faculties. True, the digestive functions rarely escape impairment. Dyspepsia and general emaciation are the results of this bad habit; but, however that may be, China is not yet by any means on the brink of ruin, and, if she is in a state of decadence, the blame does not attach to opium.

Opium has its antidote: just as we can produce sleep, so too can we produce sleeplessness, by the employment of a mind-poison whose effects are diametrically opposite to those of the other. The antidote of opium is coffee. One hundred years ago coffee was almost unknown, but now there is hardly another beverage that is so widely distributed. Every one has it in his power to judge of the effects of coffee. For some persons it is a stimulus necessary for the performance of intellectual work. In others it produces a painful state of insomnia: taken even

* From the *Revue des Deux Mondes*; in *The Druggists' Circular.*

* The native production of opium has of late years attained very considerable proportions.—*Trans.*

in weak doses it causes restlessness and anxiety, a sort of feverish activity altogether different from the indolent activity of opium. Under the action of opium the will seems to be lulled to sleep and the imagination runs riot. But under the influence of coffee the imagination is hardly stimulated at all; while there does appear to be excitation of the will. Did I not fear being suspected of having a theory to defend, I should say that the faculties of will and consciousness seemed to be super-excited; there is, as it were, a constant strain on attention and memory, whereas in the case of alcohol, hasheesh, and opium, there is a relaxing of attention. Hence coffee produces a true intoxication that fatigues one far more than does the somnolent intoxication of opium, but it leads to the same result. In striving to do too much, the mind does less: under stimulation the will is impaired; and the perfect equilibrium of the mental faculties is disturbed as well by excess as by defect of will.

Coffee is said to produce cerebral anæmia, while opium and alcohol cause congestion; but this theory still needs confirmation. Nevertheless, the part played by coffee in general nutrition is very well understood. It retards organic combustion, and hence it is an *aliment d'épargne*—a food-stuff that effects the saving of other food-stuffs. In the normal state there is always going on within our tissues a multitude of chemical actions, the final result of which is heat production and liberation of carbonic acid. This carbonic acid passes into the venous blood, and the venous blood, on reaching the lungs, parts with its carbonic acid. Thus the quantity of the carbonic acid is, to some extent, the expression of the nutritive activity. Now, on taking coffee, though no greater quantity of oxygen be inhaled, and without increasing the ratio of food, the quantity of the carbonic acid is reduced, and yet the amount of force is not lessened. As illustrating this doctrine, it is usual to cite a fact observed among Belgian miners, who can perform a considerable amount of work almost without food, their strength being maintained solely by the absorption of a large quantity of coffee. Hence coffee is a food-stuff which moderates nutrition by lessening the activity of the chemical transformations incessantly going on within the tissues.

A DEVICE FOR PERFORATING PLASTERS.*

BY JOSEPH P. REMINGTON.

Porous plasters have been used so extensively and their merits of furnishing external medication, whilst permitting the escape of exhalations from the skin, are so well known and appreciated that the notice of the expiration of the patent in the United States, which was circulated a few years ago, was to many pharmacists a welcome one. Since this time several manufacturers have been very industrious in increasing their lists of ready made plasters, and now the varieties are numbered not by tens but by hundreds.

The introduction of rubber into the basis of spread plasters marked an era, and the advantages soon grew to be appreciated. First, the plaster was rendered much more flexible and hence more comfortable to the wearer; the stiff, often brittle, combinations in use were rapidly replaced. Secondly, by a peculiar combination the plaster remained soft and could be applied to the skin without application of heat, and thus it was fair to presume that if a plaster was adhesive at ordinary temperature of the air it would be very apt to stick to the skin, which usually has a temperature of 98·6° F. Thirdly, when to the above valuable points was added perforation, or, as it is techically termed, "porousing," it was believed that perfection was attained.

One of the principal reasons for the decline in the demand for plasters spread by the apothecary has undoubtedly been the superiority of the porous plasters furnished by the manufacturers on a large scale and machine made; the patient recognized this fact and called for them; the apothecary was usually too glad to be relieved of what is almost always regarded as one of the most disagreeable duties of the shop, and hence the prosperity of the manufacturers.

But the same causes which undermine so many industries in our country (as in others) are actively at work among the plasters. Competition and the demand by apothecaries for cheaper products have resulted in depreciating the quality of the plasters furnished, until now in the case of belladonna plaster (probably the most used), the principal manufacturers of rubber combination plasters will each furnish a plaster labelled in bold type, "belladonna plaster," which they will admit contains no belladonna extract. They do sell a higher priced plaster which professedly contains the officinal proportion, but does not this policy tend to sow distrust in the minds of buyers? How can a conscientious pharmacist dispense them as standard goods when he knows that plasters stamped with a lie are sold, and that he has no means of knowing the true from the false without an investigation, which would not occur to every one to institute, and then the facts in the case are usually reluctantly admitted.

It is owing to the lack of medicinal effect in manufactured plasters that physicians in many sections prefer to undergo the inconvenience of the hand-made plaster, and prescribe it because they feel sure of getting what they want, and the writer has endeavoured to supply one deficiency in the hand made plaster by the following device, whereby any apothecary may porous the plaster which he has spread, irrespective of its size or shape or material upon which it is spread.

This device, or tool, consists of a brass cylindrical wheel, $\frac{3}{4}$ in. wide, $\frac{5}{8}$ in. in diameter, with two circular depressions turned out of each end, $\frac{1}{4}$ in. deep, leaving a hub on each end of wheel through which a steel axle passes into the prongs of steel handle, which is driven into an ordinary tool handle 9 inches long.

The cylindrical wheel is studded with 16 punches, arranged on either side $\frac{1}{2}$ in. apart alternately; these punches are of steel, tapered, and are $\frac{1}{4}$ in. long, and $\frac{1}{8}$ in. bore at the end, making a $\frac{1}{8}$ in. perforation.

To operate the tool all that is necessary is to dip it first in water, then having secured the plaster firmly by tacking it to several layers of old newspapers on a rather low counter, grasp the tool tightly with both hands and drive the punches with some force through the plaster, pushing it along, from the operator, the wheel revolving as it is pushed forward, the little disks of plaster collect in the punches, stick together and form a core, which falls towards the axle of the wheel and is driven out by the inclined hub.

A cheaper tool could be made with but one series of punches arranged on the wheel, but two series have the advantage of doing the work more quickly, and less skill is necessary to operate it.

Hand made plasters, spread on kid, may be perforated in this way by hand, and physicians may order any combination that they may desire and secure one of the advantages of the machine made plasters. The tool should be cleaned with cloth moistened with a little turpentine and kept in a box to prevent punches from being injured by coming in contact with hard objects.

OPIUM PRODUCTION IN AFRICA.

A new competitor for the enormous profits of the opium trade with China has arisen, and appears to have excited alarm in India. A company was established during the past year at Lisbon called the "Mozambique Opium Cultivating and Trading Company." From this it would appear that Portugal wishes to become the protector of free trade in opium, with the intention of competing with the opium producing districts of India. The promoter of the Lisbon company is Senhor Ignacio Jose de Paiva Raposo, who receives 50,000 acres of open, unappropriated, and cultivated land belonging to the State in Mozambique, and has preference in the choice of "such lands as are suitable for the cultivation of the poppy plant," and also "the exclusive right for twelve years to export opium free of duty through all the custom-houses of the province." The company has been formed with a capital of £178,000 in shares of £22 5*s.* each. A number of the opium cultivators who were taken from India to Mozambique by the promoters of the last company returned here by last mail. They describe the land taken by the company at Mozambique as well adapted for opium cultivators, and say that very large out-turns may be expected. Should Zambesi opium eventually become a formidable competitor of the Indian in the China market, Englishmen have no right to complain. If there is nothing wrong in the opium trade, then surely the Portuguese are as free as ourselves to embark in it. If there is something wrong in it, we who have carried it on for a century through scenes of illegality and bloodshed, are not in a position to taunt Portugal with the immorality. We opened China to opium, procuring its legal admission by a treaty, the benefits of which we cannot confine to ourselves.—*Leeds Mercury.*

A REACTION OF CITRIC ACID.*

BY A. SABANIN AND N. LASKOWSKY.

The authors refer to papers on this reaction by Sarandinaki (*Deut. Chem. Ges. Ber.*, v., 1100), and by Kämmerer, in the same Journal (viii., 736), and then proceed to describe the application to the testing for citric acid.

When citric acid and excess of ammonia (5 grams to 30 c.c.) are heated in sealed tubes at 120° for six hours, a yellow coloration is observed, and small crystals are formed. If the liquid on cooling be poured into a evaporating basin and allowed to stand for several hours, it becomes blue. The crystals disappear, and the colour becomes more intense the longer it stands. After several days the solution turns green, and ultimately becomes colourless again. The green solution appears blue by transmitted light, whilst the blue solution under the same circumstances exhibits great intensity of colour. If the solution be kept in the dark, the change in colour goes on slowly. In an atmosphere of carbonic acid there is no change. When the heating in the sealed tubes is continued for a long time, or the temperature raised to 150°, or when 10 grams of citric acid instead of 5 grams are added to the 30 c.c. of ammonia, the green product is produced directly. The coloration can be produced more quickly by placing the solution over the water-bath after it has been heated in the sealed tubes, but the resulting colour is not so deep.

If the citric acid and ammonia are heated above 160°, no coloration takes place. The authors have not yet separated the colouring matter.

The reaction occurs in the presence of oxalic, citric, and malic acids, even when these acids are present in the proportion of 10 to 1 of citric acid. The only condition necessary is that 10 milligrams of citric acid be present in the solution. In presence of itaconic acid the reaction failed.

For the testing of citric acid in fruit-juices, the following plan is proposed. The juice is mixed with alcohol, left for some hours, and then filtered. Lead acetate is added in excess, the precipitate collected and washed, and ammonia is added in excess. The solution is then evaporated to get rid of ammonia, and sulphuretted hydrogen is added. The lead sulphide is filtered off, and the solution warmed, to get rid of the sulphuretted hydrogen. Barium acetate is then added in excess, and the precipitate and the liquid are heated together; and the precipitate is collected on the filter, washed, and decomposed with sulphuric acid. The supernatant liquid is then heated with ammonia in sealed tubes, as above stated.

The authors remark that the barium salt is not $(C_{65}HO_7)_4Ba_6+7H_2O$, but $(C_6H_5O_7)_2Ba_3+5H_2O$. The former is precipitated only from nearly pure citric acid, so that the precipitation by barium is not a certain test of the presence of citric acid. By this test the authors found this acid in oranges, cranberries, and black currants.

* *Zeitschr. Anal. Chem.*, xvii., 73—76.—From the *Journal of the Chemical Society*, April, 1878.

CALADIUM SEGUINUM OR DUMB CANE.*

The arum family (*Aroideæ*) contains a plant indigenous to South America, the West Indies, and Southern United States, which is considered by some to be one of the most poisonous members of the vegetable kingdom, although it is sometimes even cultivated in gardens. It is the so-called Dumb Cane, or *Dieffenbachia seguina*, Schott (*Caladium seguinum* Vent., *Arum seguinum*, L.). Its stem attains a height of 3 to 7½ feet, the leaves being attached to its upper part in shape of a crest. The latter are oblong-ovate, pointed, and covered with white speckles. The spathe has a pale green colour and is shorter than the spadix, which bears flowers exhaling a cadaverous odour.

The juice of the fresh plant is exceedingly acrid and caustic, so that even very small quantities of it, carried into the digestive apparatus, produce inflammation and dangerous intoxication. It makes indelible stains upon linen, and might be used as indelible ink, if it were less poisonous. It is said that if cattle accidentally bite the leaves, their tongues swell up and their fauces become inflamed. It is therefore necessary to use proper caution in crushing the leaves or expressing the juice for pharmaceutical purposes. A single drop sprinkled upon the skin produces an intense itching and burning, and afterwards inflammation. Some persons are more susceptible to its effects than others, and one case is on record in which a drop, spattered on the cheek, although immediately wiped off, produced an erysipelatous inflammation of one side of the face, so as to seriously endanger the life of the individual. The attack was followed by a herpetic eruption.

The rhizome seems to contain a more diluted juice, and has been recommended by American physicians as a remedy in pruritus vaginæ, in form of lotion prepared by adding from 15 to 20 drops to teacupful of water.

It is, however, remarkable that the tincture exhibits the peculiar acridity of the fresh juice only in a faint degree. The reason of this is, that the fresh juice contains small microscopic crystals (raphides), perhaps an oxalate, which pierce the pores of the skin and set up an inflammation. Alcohol does not dissolve these crystals, and only a small proportion of them apparently pass through the filter. Hence, it follows, that by filtering the tincture through thick paper or through a multiple filter, these crystals are entirely removed, and with them all trace of acridity. This perhaps explains that some physicians have found it to render good service in pruritus, while others found it inert. It may also be that the original recommendation of its use in this complaint is due to the principle "similia similibus curantur," as the juice is intensely irritating. Scholz, who first used it, administered the tincture in doses from 2 to 6 drops. This tincture is prepared by macerating 10 parts of the fresh leaves and flowers, previously bruised with the greatest care, with 12 parts of alcohol of 90 per cent., and expressing. The maximum single dose would be about 0·6 gram or 15 drops, and the highest daily dose about 1·5 gram or about 40 drops. It may perhaps be best given in the form of the mixture, known as

Mistura Antipruritica, Scholz.

℞ Tinc. Caladii seguini . .	0·6–1·5 gm.	(16 to 40 gtt.)

POISONOUS VIOLET POWDER.

THE hearing of the summonses relating to this matter which was, as stated in last week's Journal, still progressing at the time of going to press, has now been concluded, and the result is that Mr. KING was committed for trial at the Chelmsford Assizes on the charge of manslaughter, so far as relates to the cases of the children MARTIN, SEARS, and HARRINGTON, all of whom, according to the medical evidence brought forward, died in consequence of the application of a powder sold by the defendant as violet powder and containing a large amount of arsenic. In addition to this the defendant was committed on the further charge of misdemeanour, and the magistrates required him to find bail in the amount of two hundred pounds himself, together with two sureties for the same amount.

In the reports which have appeared in the daily papers Mr. KING is described as a wholesale chemist, but this description is not borne out by reference to the London Directory, where no such name as HENRY GEORGE KING appears in the list of wholesale chemists, or, more properly, wholesale druggists. Neither is it to be found among the names of chemists and druggists or even those of drysalters. Indeed it appears that the shops where this arsenicated preparation was sold were not those of chemists and druggists, or such as are commonly supplied with goods by wholesale druggists, but rather of that order in which patent medicines and various drugs or preparations used as popular remedies are sold, together with oil shop goods, by persons whose chief idea is to supply a low priced article.

Violet powder, however, is one of those articles which constitute the miscellaneous stock of most chemists and druggists, and doubtless the sale of it by them has in many cases been interfered with by the alarm caused by the sensational reports we protested against some weeks since. It is satisfactory to find that the evidence brought forward in the case above referred to has shown that there is no ground for the apprehension too readily entertained by our contemporary, the *Lancet*, to the effect that the cases in which this arsenical powder had been sold were not exceptional, and that there was still less foundation for the assertion that "the powder commonly sold is not by any means innocuous." On the contrary, the poisonous powder appears in all the cases to have been traced to one source, which is, at any rate, other than the chemist and druggist or the wholesale druggist.

In speaking of this matter before we abstained from offering any remarks on the improbability that a chemist and druggist, or any person conversant with the nature of violet powder, could sell as such an article containing one-fourth its weight of white arsenic, and whatever may eventually prove to be the conditions under which this admixture was made in the cases now being investigated, it will not be out of place to remind purchasers of such articles, that when for the sake of a delusive cheapness they forego the advantage to be derived from the skill and experience of the qualified chemist and druggist, they not only incur serious risk to themselves, but act unfairly towards those on whom they might safely rely for being supplied with unadulterated goods.

THE PROPOSED ADMISSION OF WOMEN TO THE PHARMACEUTICAL SOCIETY.

LETTERS still continue to reach us in reference to the question whether women shall be admitted to membership of the Pharmaceutical Society; but since they, like those already published in this Journal, do not in any degree contribute to a settlement of the question or even to decide the difference of opinion prevailing as to the tendency of the vote taken at the late general meeting we do not think any useful purpose would be served by continuing to publish any more of these communications.

In referring to this matter, however, it may be pointed out that whichever of the two numbers of votes counted at the late meeting is to be regarded as representing the advocates of the admission of women into the Society as members, the balance of opinion appears to be so equal that it would be hazardous to say in which direction it really tends among the mass of those who are entitled to vote upon the question, or perhaps even among the still smaller number who would care to vote upon it.

We do not think that the suggestion made by Mr. VIZER in his letter in last week's Journal could be officially adopted for the purpose of ascertaining the general feeling of the Society. Still, the idea it conveys is not a bad one, and it might serve to put an end to a discussion which has somewhat of an acrimonious tendency if every member of the Society who is an advocate of the admission of women to membership were to send a post-card with his name and address to Mr. WADE, and everyone who is adverse to this step were to send one to Mr. VIZER. A non-official poll of the Society might thus be obtained which would express more correctly the feeling of the Society than the voting at any general meeting seems likely to do. So far as the latter is to be taken as a criterion it must be regarded as being virtually in accord with the action of the Council in respect of this question.

We hope, therefore, that all who are entitled to vote will take this mode of making their views known, or that at least those who have strong opinions one way or the other will do so.

DESTRUCTIVE FIRES.

On Saturday last, the whole of the building in Virginia Street, Glasgow, occupied by the Glasgow Apothecaries' Company, was destroyed by fire. Smoke was observed issuing from the windows of the "Hall" at three o'clock in the morning. The alarm was at once given, and the fire brigade was soon in attendance, but the flames had obtained such a hold as to preclude more being done than to confine the conflagration to the company's premises. The damage, including the stock, fixtures and buildings, is estimated at £30,000, of which £27,000 is covered by insurance.

On Wednesday a fire broke out on the premises of Messrs. May and Baker, manufacturing chemists, Battersea, which resulted in the destruction of the camphor refinery and other parts of the establishment. The accident is attributed to the over-heating of a flue.

At Ilfracombe, also, last week, while an assistant in the shop of Mr. Moon, pharmaceutical chemist, was melting the ingredients of an ointment over a gas stove, the mixture boiled over and ignited, and the flames spread so rapidly that, although extinguished in a few minutes, the damage has been estimated at £200.

HYPODERMIC STRYCHNIA POISONING.

The last published report of the Berlin University Surgical Clinique, in the Archiv für Klinische Chirurgie, contains the case of a child three and half months old, which died after a subcutaneous injection of 0·0006 gram ($=\frac{1}{100}$ grain) of nitrate of strychnia administered for prolapsus ani.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association will be held at 17, Bloomsbury Square, on Thursday evening, June 27, when a paper by Mr. Walton will be read on the "Form of Leaves."

German Chemical literature has, according to *Nature*, just been enriched by a new text-book on inorganic chemistry, by Professor Kolbe, who justifies its production by his opinion that the existing works in that language with the exception of the translation of Roscoe's 'Chemistry,' contain far too much matter for elementary treatises. Professor Wislicenus, also, is said to be engaged on a new German edition of Regnault's 'Chemistry,' which will be the ninth that has appeared in that language.

Provincial Transactions.

THE LEICESTER CHEMISTS' ASSISTANTS AND APPRENTICES' ASSOCIATION.

On Tuesday, June 4th, a lecture was delivered in the rooms of the above Association, No. 4, Halford Street, by Mr. W. B. Clark. Subject, Opium and some of its preparations.

The lecturer began by stating what knowledge the ancients had of this important drug, the derivation of its name and the plant yielding it. The time and manner of cutting the capsules were explained, also the effect of rain or heavy dew upon the juice. In exhibiting some specimens of opium, the audience was shown the various points to be noticed in its selection. The various tests for the per-centage of morphia were explained and commented upon. In describing the extract, Mr. Clark called attention to the fact that though the extract is about twice as strong as the opium, yet according to the B.P. the doses are the same, viz., $\frac{1}{2}$ to 2 grs. Allusion was also made to the common practice of making the tincture from moist opium, instead of the dried, without allowing for the water it contains; also, to the more uniform amount of morphia contained in the tincture made in large quantities than in that made in small quantities. In the latter case one piece only of opium may be used, which may be rich or poor in morphia, and thus affecting the tincture. The antidotes used in cases of poisoning were enumerated.

When the lecture was concluded a hearty vote of thanks was given to the lecturer.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

The annual meeting of this Association was held on Friday, May 31, the chair being occupied by the Vice-President, Mr. R. Fitz-Hugh, F.C.S.; there was a moderate attendance of members. After the minutes had been read and confirmed the honorary secretary (Mr. R. Jackson) read the annual report of Council:—

"In presenting their Annual Report the Council have great pleasure in being able to congratulate the members of the Nottingham and Notts Chemists' Association on the improved position of the society. Both numerically and financially it is in a better position than last year, and what is more gratifying still greater personal interest and sympathy have been shown by the members.

"Five general meetings have been held. At the first, the attendance was so meagre that the President declined to give his inaugural address and the meeting was adjourned and a committee appointed to wait on the absentees to ask them to attend the next meeting and decide as to the future of the Association. At the adjourned meeting, which was the largest assemblage of Nottingham chemists ever held, the President delivered an able address, and after clearly showing the value of such associations and the work that had been done in the past here and alluding to the apathy which existed, he put the question to the meeting, Shall the Association be carried on or not? and if so, in what way?

"The answer to the first part of the question was unanimously in the affirmative; to the second part various suggestions were offered, it being thought that the meetings were scarcely attractive enough, and after considerable discussion it was ultimately decided that meetings should be held at the rooms, when papers should be read and lectures given, alternately with social meetings for members only. This arrangement appears so far as experience has yet shown to have produced a better attendance. and the Council would earnestly echo a remark of the President that every member who attended the social meetings should make it a point of honour to attend the educational ones also.

"Three meetings were held subsequently, one a social one, to discuss trade questions introduced into President's address and two others at the rooms of the Association when most interesting and instructive lectures were given, on 'Germs' by Mr. H. Major, B.A., F.R.G.S., and 'Electricity' by Mr. F. H. Spenser, at all of which there was a good attendance.

"The annual supper was held in January and was as usual a success.

"Your Council were not able to arrange for a special class for the associates during the past session, they therefore thought it desirable that the associates should attend either the course on Botany or Inorganic Chemistry at the Mechanics' Institute, and as an inducement have promised prizes in each subject to the two highest of our associates on the pass list of the Science and Art Department.

"Professor Attfield adjudicated on the examination papers of associates at end of last session and the prizes were awarded to Mr. J. Clower and Mr. J. Cox for exceptionally good papers.

"At the early part of the session three members (Messrs. Reuben Widdowson, William Widdowson and James Beardsley), who were formerly students, generously offered to assist the associates in their studies at the weekly meetings for mutual improvement. Unfortunately, through illness, Mr. Beardsley was not able to take an active part, but the other gentlemen assisted the students on alternate weeks the one in Chemistry and the other in Botany; they report an average attendance of ten at the meetings, with great attention and perseverance. The Council are very pleased that the kind offer of those gentlemen has been so well appreciated as evidenced by the good attendance, and they think the warmest thanks of the Association are due to Messrs. Reuben and William Widdowson for their exertions on behalf of the associates.

"Mr. William Widdowson kindly offers to continue his services during the summer by taking the associates on a botanizing excursion every other Tuesday afternoon from 2·30 till 5 and the Council hope that every member will give all possible facilities for his apprentices to join that class and that every student will make an effort to attend regularly, as such an opportunity of gaining a practical knowledge of botany is seldom offered.

"The Council have to acknowledge, with gratitude, the receipt of the following handsome donations which have materially swelled the balance in Treasurer's hands:—£5 from Mr. Edward Harvey, of London; £5 5*s.* from Messrs. Langton, Harker and Stagg, London; £5 5*s.* from Messrs. Hearon, Squire and Francis, London; and also the gift of the following books:—'Pharmacographia' and 'Science Papers,' from Mr. Thomas Hanbury, in memory of his brother, the late Mr. Daniel Hanbury; Wills's 'Elements of Pharmacy,' from Mr. James Beardsley; the 'Year-Book of Pharmacy,' from the Pharmaceutical Conference; the 'Calendar of the Pharmaceutical Society;' and 'Catalogue of Collections in Museum;' and *Pharmaceutical Journal*, regularly every week, from the Pharmaceutical Society, and your Council would be glad to see such good examples followed by other donors.

"The Council have made the following additions to the library: — Bentley's 'Botany,' Valentin's 'Qualitative Analysis,' Thorogood's 'Guide to Materia Medica,' Buckmaster's 'Advanced Chemistry,' Cook's 'Botany,' and Smith's 'Pharmaceutical Guide to 1st and 2nd Examinations;' and finding from the report of the Sub-Librarian that the specimens in materia medica cases are not in such good order as could be wished, recommend their successors to replace such specimens as may be necessary.

"The library, which has been well used by the students, now contains seventy-one books.

"The balance in Treasurer's hands amounts to the magnificent sum of £48 7*s.* 2*d.*

"The Association now numbers fifty-eight members (four country), and twenty-two associates; last year the numbers were fifty-four and twenty-one, the increase is satisfactory as regards members, but the Council think in so large a town as Nottingham, and with such a list of members, there should be more than twenty-two associates, and would earnestly urge the members to use their influence with the young men in their employ to avail themselves of the advantages offered by the Association.

"The Council have to regret the loss of the President, Mr. J. H. Atherton, F.C.S., who has left Nottingham. As the members are aware, he was a gentleman who took a most active part in the work of the Association since its commencement, more than nine years ago, and during the greater part of that time he filled the Presidential chair to the satisfaction of the members and with credit to himself. The Council could not allow him to leave without giving him some token that his services had been appreciated, they therefore presented him with an illuminated address, and they take this opportunity of recording their deep sense of the loss the Association has sustained and their personal regret at losing a colleague with whom they had worked so harmoniously and whose good judgment and energy were so conspicuous in all that concerned the welfare of the society."

The Treasurer (Mr. J. Rayner) then presented his report showing a balance in hand of £48 7*s.* 2*d.*

Mr. Ward proposed, and Mr. Wilson seconded, that both reports be received and adopted. The chairman in supporting the motion recommended the incoming Council to increase the museum and library, and referred to the offer of Mr. Widdowson to take the associates on a botanizing excursion every alternate Tuesday, and urged the members to give every facility for their apprentices to join that class. Mr. Warriner thought a set of drawers for specimens similar to those in the Museum of the Pharmaceutical Society would be very useful for the students and also a book of autograph prescriptions, and offered, if members would send him any prescriptions to mount them and have them bound for the use of the Association. After a few remarks from other gentlemen, the reports were passed and the various recommendations left in the hands of the incoming Council.

The following officers were then appointed for the ensuing year:—President, Mr. R. FitzHugh, F.C.S.; Vice-President, Mr. Frank White; Treasurer, Mr. J. Rayner (re-elected); Honorary Secretary, Mr. R. Jackson (re-elected); Auditors, Messrs. J. Lomas and M. H. Humphreys; Council, Messrs. C. A. Bolton, T. B. Fletcher, Jenkins, Lewis, Smith, Warriner, W. Widdowson and Wilford.

The President then proposed a hearty vote of thanks to Messrs. W. Widdowson, R. Widdowson and James Beardsley for their exertions on behalf of the associates and the valuable assistance they had rendered to the class. This was seconded by Mr. Smith and supported by Messrs. Ward, Lewis and White, and carried unanimously. Mr. W. Widdowson suitably responded.

Mr. Ward, Mr. Smith and Mr. Wilford each offered prizes for competition amongst the associates next session, in Pharmacy, Botany and Chemistry.

A vote of thanks to the Executive and Council for their past services brought the meeting to a close.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, June 6; Dr. Gladstone, President, in the chair.

After the confirmation of the minutes of the preceding meeting, the following certificates were read for the first time: J. J. Watt, J. Treharne, E. W. Napper, and P. H. Walsh.

The first paper was read by Dr. Gladstone; it was entitled—

Analogies between the Action of the Copper Zinc Couple and Occluded and Nascent Hydrogen. By J. H. GLAD-

STONE, F.R.S., and ALFRED TRIBE.—The authors have recently shown that finely divided copper charged with hydrogen converts nitre into potassium nitrite and ammonia; they have since found that hydrogen in association with the same metal reduces potassium chlorate to the chloride. They have observed that the copper zinc couple in the presence of water converts nitrobenzol into aniline, a reaction which the authors have utilized for the detection of small quantities of nitrobenzol as follows:—"Add some twelve drops of strong copper sulphate solution to three or four pieces of zinc foil ($1'' \times \frac{1}{2}$) in about 5 c.c. of water, wait till the liquid is completely decolorized, pour off the zinc sulphate solution, and wash the conjoined metals three or four times with water. Now add to this couple the nitrobenzol in solution, or in suspension in water, heat nearly to boiling for about two minutes, filter, cool, and add, drop by drop, a solution of bleaching powder. The nitrobenzol in 5 c.c. of an 0·05 per cent. solution in water can thus be detected." The present paper contains chiefly the results of the authors as to the actions of palladium hydrogen, platinum hydrogen, and carbon (cocoa nut charcoal) hydrogen, on the substances enumerated in the table appended, which gives the principal reactions observed:—

Substances employed in Aqueous Solutions.	Substances produced by—				
	Copper Zinc Couple.	Palladium Hydrogen.	Platinum Hydrogen.	Copper Hydrogen.	Carbon Hydrogen.
Potassium Chlorate	Chloride.	Chloride.	Chloride.	Chloride.	Chloride.
„ Nitrate	Nitrite and Ammonia.*	Nitrite and Ammonia.*	Nitrite (?) and Ammonia.	Nitrite and Ammonia.	No Action.
„ Ferricyanide	Ferrocyanide.	Ferrocyanide.*	Ferrocyanide.		Ferrocyanide.
Nitrobenzol	Anilin.	Anilin.	Azobenzene.		
Indigo (in the presence of weak potash)	White Indigo.	White Indigo.			
Sulphurous Acid	Sulphur.	Sulphuretted Hydrogen.	Sulphur.		
Arsenious Acid	Arseniuretted Hydrogen.	Arsenic.	Arsenic.		

The results marked * have been obtained by previous observers.

In conclusion, the authors draw attention to the close analogy between the action of the copper zinc couple, of occluded, and of nascent hydrogen in some cases, and point out that the results corroborate their previous view that the power of the copper zinc couple depends to a great extent on the hydrogen absorbed by the finely divided metal. They also discuss the various explanations of the above reactions. The paper was illustrated by some experiments, which were performed by Mr. Tribe.

Dr. Russell took the chair during the reading of the above paper.

The next paper was read by Dr. Wright—

On the Alkaloids of the Aconites. Part III. By C. R. A. WRIGHT and A. P. LUFF.—The authors find that aconitine is readily dehydrated by heating in contact with acids (preferably tartaric) forming apo-aconitine $C_{33}H_{43}NO_{12} = H_2O + C_{33}H_{41}NO_{11}$. The new base closely resembles the parent alkaloid and is formed from it during extraction to some extent; its hydrobromide appears to be more soluble than aconitine hydrobromide, as the mixture of bases yields pure aconitine on conversion into hydrobromide, recrystallization and regeneration of the alkaloid. By saponification aconitine splits up in $C_{33}H_{43}NO_{12} + H_2O = C_7H_6O_2 + C_{26}H_{39}NO_{11}$ forming benzoic acid and a new alkaloid, aconine, readily soluble in water and chloroform, insoluble in ether. Probably the substances described as napelline and acolyctine by Hübschmann are aconine more or less pure. On treating aconitine with acetic or benzoic anhydrides it loses water and forms a derivative in which H is replaced by an acid radical; thus acetylapoaconitine $C_{33}H_{40}(C_2H_3O)NO_{11}$ and benzoylapoaconitine $C_{33}H_{40}(C_7H_5O)NO_{11}$ are obtained. On treating aconine with benzoic anhydride it gives the same product as that formed by aconitine, so the formula of aconitine is indicated as $\left(C_{26}H_{35}NO_7\right)\begin{cases}OH\\OH\\OH.\\OCOC_6H_5\end{cases}$ Apoaconitine being $\left(C_{26}H_{35}NO_7\right)\begin{cases}=O\\-OH\\-OCOC_6H_5\end{cases}$ and aconine being $C_{26}H_{35}NO_7\begin{cases}OH\\OH\\OH\\OH\end{cases}$ Dibenzoyl apoaconine or benzoyl apoaconitine has the formula $C_{26}H_{35}NO_7\begin{cases}=O\\-OCOC_6H_5.\\-OCOC_6H_5\end{cases}$ Similarly pseudaconine gives rise to analogous derivatives, the dibenzoyl and diacetyl bodies having been prepared. Picraconitine splits up on saponification into benzoic acid and a new base, picraconine (much resembling aconine), $C_{31}H_{45}NO_{10} + H_2O = C_7H_6O_2 + C_{24}H_{41}NO_9$. Besides crystallizable aconitine, *A. Napellus* yields a considerable quantity of non-crystalline alkaloids which contain more carbon and are of lower molecular weight than aconitine; these are probably formed from aconitine by alteration during extraction. One conclusion, to which the authors call special attention, drawn from the above research is, that no practical difficulty exists in preparing from *A. ferox* and *A. Napellus*, well crystallized salts or alkaloids of constant composition and high physiological activity, whence it is evident that the amorphous preparations now sold as aconitine, which vary immensely, should be replaced by pure crystallized alkaloids. The commercial product often contains 40 and even 80-90 per cent. of uncrystallizable bases more or less inert.

The next paper was *On the Alkaloids of the Veratrums.* Part I. *Alkaloids of Veratrum Sabadilla* (*Assagræa officinalis*). By C. R. A. WRIGHT and A. P. LUFF. The authors discussed the results obtained by previous observers, Couerbe, Merck, Weigelin, Schmidt and Köppen. The discrepancies observed between the results of these chemists are due to the alteration and decomposition of the original bases during the processes of extraction and purification. The authors have examined the alkaloids obtained from *V. sabadilla* seeds by percolating the crushed seeds with alcoholic tartaric acid, evaporation, separation from resin and extraction by numerous and prolonged shakings with ether. The alkaloids obtained were three: (1) Veratrine (Couerbe) $C_{37}H_{53}NO_{11}$. On saponification it splits up $C_{37}H_{53}NO_{11}+H_2O=C_9H_{10}O_4+C_{28}H_{45}NO_8$ (dimethylprotocatechuic acid being formed; this acid is identical with Merck's veratric acid and the acid obtained by similar treatment from pseudaconitin) and a new base verine. The authors propose to restrict the name "veratrine" to the above alkaloid; it does not crystallize, but its sulphate and hydrochloride can be obtained in the crystalline state. (2) Cevadine (veratrine of Merck) $C_{32}H_{49}NO_9$. This alkaloid was obtained by Merck, Schmidt and Köppen, who assigned to it slightly different formulæ. Weigelin also obtained this substance in a very impure condition. On saponification it splits up $C_{32}H_{49}NO_9+H_2O=C_5H_8O_2+C_{27}H_{43}NO_8$, forming a new base, cevine, and an acid identified as methylcrotonic acid, and with the cevadic acid of Pelletier and Caventou; the benzoyl compound is beautifully crystalline. The formula of cevadine is probably $(C_{27}H_{41}NO_6)\begin{matrix}-OH\\-O{\cdot}COC(CH_3)=C_2H.\end{matrix}$ It is probably closely connected with the aconite alkaloids. (3) A new base, amorphous, yielding no crystallizable salts and forming cevadic acid on saponification, having a formula $C_{34}H_{53}NO_8$. This body resembles to a certain extent Weigelin's sabadilline, but in other respects is quite dissimilar. The authors propose to call it *Cevadilline.* No trace of anything like Weigelin's sabadillin could be detected; a commercial product sold as "sabadillin" consisted chiefly of cevadilline. Both the above contain the details of 40–50 analyses and quantitative determinations.

Dr. Gladstone said the Society had to thank the authors for the large amount of labour which they had bestowed on a subject of much difficulty, and for the positive knowledge which was now gained of substances, most undesirable to work with, in place of the varying statements hitherto published.

In answer to Mr. Maxwell Lyte, Dr. Wright said that the above alkaloids gave for the most part colour reactions with sulphuric acid, but it was difficult to distinguish the colours when a small quantity of the alkaloid was present with much organic matter.

The next paper was by J. W. Thomas, *On the Action of Hydrochloric Acid upon Chemical Compounds.* It was read by the Secretary. The author has studied the action of hydrochloric acid on various substances in three ways:—(1) Chemical compounds were introduced into tubes containing hydrochloric acid gas standing over mercury; (2) A current of dry hydrochloric acid was passed over chemical compounds placed in a glass tube; (3) Chemical compounds were dissolved in water and different proportions of hydrochloric acid added and then distilled over a water-bath at 100° and in a vacuum at 15° or 30°. By these methods the action of hydrochloric acid on many salts has been examined; the list includes various nitrates, tartrates, citrates, chromates, antimoniates, hypochlorites, sulphates, permanganates, ferrocyanides, oxalates, etc., in all about thirty salts.

The next paper was *On the Action of Oxides on Salts.* Part I. By E. J. Mills, D.Sc., and D. Wilson. It was read by the Secretary. The object of the present research is to determine the law in consequence of which the action of oxides on salts leads, in general, to the formation of other oxides derived from the salts in question. The authors have investigated at present the action of tungstic, silicic and titanic oxides on potassic carbonate, at a high temperature, by determining the loss of weight (from the escape of CO_2) during ignition. The reactions have been studied with great care, and corrections for various errors carefully made: the authors give several formulæ deduced from their experimental results. One of the results arrived at is that the chemical effect of an oxide and a carbonate acting on one another under the conditions specified is directly proportional to the product of their active masses and inversely proportional to the sum of their residues. The authors conclude their paper with the following inference: "That Brodie's fundamental equation represents the mutual action of two bodies under unit conditions, apart from change of weight, and with the unit of chemical effect."

The next paper was read by Dr. Senier, *On a New Test for Glycerine*, by A. Senier, M.D., and A. J. G. Lowe. This test is founded on the fact observed by Iles, that borax when treated with glycerine gives to a Bunsen flame the green colour characteristic of boracic acid. The test is applied by the authors, and the solution is rendered slightly alkaline by dilute soda, and a borax bead placed in it for a short time. The bead is then held in a Bunsen flame, if the solution contains 1 per cent. of glycerine a distinct reaction is observed. Erythrite and glycol give the same colour, or a little of the solution is mixed with same powdered borax, and some of the mixture placed on a platinum loop and heated as before. By means of this test, after concentration, etc., $\frac{1}{10}$ of a per cent. of glycerine was detected in beer, 1 per cent. in sherry, 1 per cent. in milk, 5 per cent. in treacle.

During the reading of the last papers Mr. Warington occupied the chair.

The last paper was read by G. S. Johnson, *On Ammonium Triiodide.*—The author has prepared this substance by dissolving iodine to saturation in a strong aqueous solution of ammonium iodide, and (2) by stirring crystals of ammonium iodide and iodine with a small quantity of water till the resulting black liquid refused to dissolve more of either ingredient. The liquid was evaporated over sulphuric acid, and in a few days crystallized. No iodide of nitrogen was formed. This substance is more stable than the corresponding potassium salt. NH_4I_3, crystallizes in dark blue prisms, usually tabular and isolated. It is soluble in a small, but decomposed (with deposition of iodine) by a large quantity of water, and is slightly deliquescent; when heated it loses iodine and becomes coated with NH_4I, without fusing. Sp. gr. of crystals 3·749: at. vol. 103·07.

Specimens of the alkaloids obtained by Wright and Luff, and of ammonium triiodide, were exhibited; also some combustion furnaces from Messrs. Bel.

After the thanks of the meeting had been given to the authors for their respective papers, the Society adjourned to June 20, when the following papers will be read:—

1. Contributions to the History of Naphthalene. II. β Naphthaquinone Derivatives, by T. Stenhouse and C. E. Groves; 2. On Pyrotritartaric and Carbopyrotritartaric Acids, by G. Harrow; 3. Laboratory Notes, by H. E. Armstrong; 4. Octylic Alcohol and its Derivatives, by E. Neison.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of the above Association was held on Wednesday evening, May 22, at its room, 29, Brewer Street, when Mr. A. Sawden read a paper on "Water Analysis in connection with Pharmacy." The author thinking that water analysis might in future form a more important branch of the pharmacist's duty than it does at present proceeded to sketch out the chief points in the methods of determining the quality of a sample. After a discussion, in which Messrs. Princep, Wallis, Branson, and Glover took part, a vote of thanks was accorded to Mr. Sawden. The secretary then read several queries put by members, and an answer to a former one.

On Wednesday evening, June 5, at a meeting of the above Association, Mr. Wallis, President, in the chair, a paper on 'Internal Parasites' was read by Mr. Smart, of the Queckett Microscopical Society. The attendance of members was numerous, and the paper, which was illustrated by diagrams and specimens, was heartily applauded. After a short discussion, the usual vote of thanks was passed to the reader, and the many and beautiful microscopic specimens illustrating the paper were then examined and described. The next meeting was announced for July 3rd

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A meeting of the above Association was held at 17 Bloomsbury Square, on Friday evening, June 7, Mr. W. R. Atkins in the chair. In consequence of the resignation of Mr. Savory, Mr. Parker was elected Vice-President and Mr. Thompson member of committee. Mr. Naylor then read a paper on "Soap" in which the composition and manufacture of the various kinds of soap were fully discussed. The microphone was then exhibited by Dr. Senier, accompanied by the following explanation:—

THE MICROPHONE.

BY DR. A. SENIER, F.C.S.,

Demonstrator in Laboratories of the Pharmaceutical Society.

"At a previous meeting of this Association my brother, Mr. Harold Senier, exhibited and described the then recently discovered telephone. It was thought at the time that so rapid a stride had been made in acoustic science that there must surely come a lull. Ere a few weeks, however, had passed away another instrument, the phonograph, was announced by Mr. Edison, which like the telephone of Professor Graham Bell originated in the United States. The public thus accustomed to announcements of great discoveries in acoustic science were not so much surprised as otherwise they would have been when the microphone was announced by Professor Hughes in a paper read before the Royal Society* scarcely a month since. The microphone is in itself a discovery at least as important as the telephone or phonograph, but the three taken together mark an era in acoustic science.

"I desire to show you this evening the microphone and some of its applications. So far as the newness of the subject will permit I will endeavour also to explain the reason assigned for its action. Here is a simple form of telephonic circuit. In the circuit of a single insulated wire are fixed two Graham Bell telephones. If one of these be held near the ear you know that sounds produced near the other are transmitted both as regards loudness, pitch, and timbre. I now introduce into the circuit a weak constant battery, in this instance composed of two manganese cells. If you now listen at one of the handles you will hear sounds produced near the other with greater distinctness but not otherwise different. You will remember that it is supposed that when a sound wave strikes the iron disc of the transmitting telephone corresponding waves or impulses of electricity are induced and conveyed along the wire to the receiving telephone where they cause the disc to vibrate and reproduce the same wave motion of the air, or the same sound.

"Professor Hughes, in view of previous researches upon the action of strain and of heat and light upon the conductivity of metals, "believed that the wire would vary in its resistance when it was used to convey sound." In order to investigate this he constructed a telephonic circuit similar to the one we have here. One part of the wire he stretched so that it might be vibrated sonorously. If the resistance varied in the wire waves would be formed and sounds would be produced in the telephone. The stretched portion of the wire was stretched more and more and at the same time made to vibrate to its note, but nothing was heard from the telephone until the breaking point was reached. At that point a peculiar rushing sound was always heard. In trying to imitate this breaking condition he found that "if the broken ends rested upon one another with a slight pressure of not more than one ounce to the square inch on the joints, sounds were distinctly reproduced, although the effects were very imperfect." Now I have here broken the circuit by removing one of the telephones and hold in my hands the two terminal wires. I cannot in this room show you that sounds produced in the neighbourhood of these wires when pressed together are reproduced by the telephone, but you observe that when the two wires are rubbed together sounds are produced, which I think you can hear all over the room. It may be useful here to point out that the production of these sounds furnishes an easy test of the completeness of the circuit. If no sound is heard from the telephone, when the terminals are rubbed together, successive portions of the circuit should be tested in the same way, including always a telephone, and at least one cell of the battery. In this way the fault may be readily localized. The occurrence of these sounds was known, I believe, before the discovery of Professor Hughes, which is, that sounds and articulations are transmitted by the pressed wires. For this purpose they constitute a very imperfect instrument, and even with the crudest materials Professor Hughes soon much improved upon it. Finally by the use of gas carbon terminals, he succeeded in constructing the instrument, a copy of which I hold in my hand. This not only transmits sound, as regards pitch and timbre, but greatly increases the loudness. It is a magnifier of sound, a microphone.

"This instrument is one of the best forms of microphone. A flat piece of wood, insulated from the table by pieces of rubber tubing, acts as a sounding board, another piece nailed perpendicularly to it supports the carbon terminals. Gas carbon is a good conductor and does not oxidize. On the inside of this support are attached two little cubes of gas carbon, each with a deeply concave face to hold very loosely a small cylinder of the same material. This cylinder is about two inches long and one eighth or one quarter of an inch in diameter; it is made conical at the bottom and reduced to a cylinder half the size at the top. The cubes of gas carbon are each connected by a copper wire with a binding screw, by which screws the microphone can be introduced into the circuit. In the case of the two wires, there was but one place where molecular continuity was broken, but where electrical continuity remained. In this instrument there are two such places, one at each end of the gas carbon cylinder. Here is another form of microphone less sensitive than the one just described; it is therefore better for loud sounds. It has a gas carbon cylinder arranged as an unequal beam, the long arm resting on a wedged shaped piece of carbon. The whole is attached to a flat piece of wood which acts as a sounding board. There are two binding screws, one attached to the cylinder the other to the wedged shaped piece of carbon. For many purposes this even is too delicate. When that is the case the long arm of the cylinder should be weighed, or an elastic band stretched over it.

"Notice that I have now introduced into our short circuit the more sensitive microphone; the circuit already contains a telephone and the battery. You will now listen to the telephone, while I drop fragments of paper on the sounding board of the microphone. The sound which is scarcely audible to the unaided ear, by means of the microphone you hear loudly and clearly. Likewise, if I touch, however lightly, the sounding board, the telephone emits a distinct sound. This green covered wire is double, and extends some fifty yards to a distant part of the building. It is kindly lent to us this evening by Mr. Yeates, of Covent Garden, by whom most of the apparatus exhibited to-night has also been constructed. Mr. Dunstan and Mr. Graham are at the other end of this long circuit, and tell me through the telephone that they have the horizontal microphone in the circuit there. I will now ask them to speak to the microphone. The sound is not so clear as it would be if the rooms were quieter. The microphone is not yet under such control as the telephone, and has a habit of making too much noise. Well, I cannot show you that speech is transmitted, but you must take my word for it, that in perfectly quiet rooms I have distinctly heard my brother read at a distance of some eight yards from this more sensitive microphone, and through a long circuit of wire. A small musical box has been placed near the microphone. You hear it distinctly when the telephone is placed near the ear. The loud ticking which you now hear is that of a watch. These somewhat crude experiments

* *Chemical News*, xxxvii., 197.

serve at least to indicate the leading action of the microphone as a transmitter and magnifier of sound.

"Now that we have heardsounds transmitted and magnified by the microphone, let us examine wherein it differs essentially from the telephone, and also the theories assigned for its action. In the case of the telephone we speak to a diaphragm, the vibrations of which affect the circuit, while in that of the microphone we speak to a part of the circuit itself, to the terminals where molecular continuity is broken, but where electrical continuity, more or less complete, remains. In the case of the telephone, pulsations of the current are caused by vibrations of the disc, in that of the microphone by pulsatory pressure at the terminals, of whatever material they may be composed. In the case of this horizontal microphone, pulsatory pressure occurs where the heavy arm of the carbon beam touches the wedge-shaped piece of carbon. We quite well understand that corresponding pulsations are reproduced by the receiving telephone. The microphone does not replace the receiving telephone, so that if any of you purchase the microphones, now so much lauded in advertisement columns, remember that they are of no use without a battery, and, at least, one telephone. Now, if Professor Hughes would allow us to say that the carbon cylinder causes the variations in pressure which I have just described, by vibrating as a mass to the sounds produced in its vicinity we should think the theory of the microphone easy. The result of many experiments, however, leads him to think that this is not the case. In order to account for the variation of pressure he proposes the following theory:—"If we assume a line of molecules, we know that a sonorous wave is accompanied by alternate compressions and rarefactions. If we isolate the part under compression from the part under dilation we vary the dimensions of the mass, and we alter its electrical resistance. In any homogeneous conductor of finite dimensions the effect of the one will exactly compensate for the effect of the other, and we get no variation of current; but if we break up this homogeneous conductor into a series of minute subdivisions, without actually breaking their electrical continuity, we destroy its neutralizing influence, and we render evident the effect of sonorous vibrations in varying the dimensions of the mass of the conductor, and therefore in varying its electrical resistance, for we reduce the length of a portion of the conductor to a fraction of a length of a sonorous wave." Again, he says, "I regard the action as follows:—If we have two separate conductors joined simply by contact this contact offers a certain resistance. Now we can vary or lessen the resistance by increasing the pressure, thus bringing more points in contact or closer proximity. Now as I employ a constant pressure on the contact, which is exactly under the same influence of the vibrations as the points of contact, more points or closer proximity can only be obtained through the molecular swelling or movement of the contact points."

"We have seen the application of the microphone as a substitute for the transmitting telephone. In this way it may possibly be the means of reporting at a distance speeches or music occurring in its vicinity. In surgery it has been tried, but so far with little success. We must remember that it is only some three weeks old, and considering what the microscope has done for research as an aid to sight certainly great possibilities are open to the microphone as an aid to hearing."

Votes of thanks were unanimously awarded to Mr. Naylor and Dr. Senier for their interesting communications.

Parliamentary and Law Proceedings.

Arsenical Violet Powders.

Henry George King, wholesale chemist, of 14, Abbott Street, Kingsland Green, appeared on Friday, the 7th inst., on remand, at the Epping Petty Sessions, to answer the charge of having, on February 18 last, in the parish of Loughton, in the county of Essex, killed one Eliza Sear. A second summons charged him with having, on Jan. 1, 1877, and on divers other days, unlawfully, falsely, fraudulently, and deceitfully sold and delivered, and caused and procured to be sold and delivered, to divers persons residing in the said parish, to wit, to Isabella Martin, Sarah Mead, Elizabeth Sear, Mary Harrington, and others, quantities of violet powder, containing large proportions of a poison called white arsenic, and other ingredients, for the purpose, and with the intent, that the said poisonous powder should be applied to the bodies of children of tender years, and that he caused and procured the said poisonous powder to be so applied to Florence Sarah Martin, William Ernest Mead, Eliza Sear, Alfred Harrington, and other children, and that he, well knowing the said violet powder to be poisonous, and to contain large quantities of white arsenic, caused it to be applied, whereby their bodies became distempered and their healths injured and endangered.

Mr. Poland (instructed by Mr. Barnard Thomas, of the Treasury) conducted the prosecution; the defendant was not represented by counsel.

Mr. Byfield appeared for several wholesale druggists.

Mrs. Emma Jerrett, whose child died, Mrs. Sarah Clarke, whose child also died, and Mrs. Lucy Wade, whose child became ill from, it was alleged, the use of the violet powder, gave evidence similar in character to that adduced at the two previous inquiries. Mrs. Clarke said that her child "swelled up like a bladder of water" before it died.

Mrs. a'Court, 264, Cambridge Road, Hackney, said she purchased from one of the defendant's travellers a quarter gross of violet powders, but suspecting that the powder was not right, she sold very little of it, and handed the remainder to Sergeant Roots.

The defendant said that had the witness told him her suspicions he would have been enabled to correct an error which no one regretted more than he did.

Mr. W. H. Power, M.R.C.S., Medical Inspector to the Local Government Board, and others, gave formal evidence.

Dr. Fowler, Epping, described the appearances of several children which he had attended, and on which the powder had been used. He found inflammation and ulceration about the groin.

Defendant: How many children have died?—Witness: Thirteen; but only four who were under my treatment.

Defendant: You believe they died under the use of the powder?—Witness: Decidedly.

Mr. W. Lewis, surgeon, gave similar evidence. He attended Mrs. Martin in her confinement in November, 1877. The child was born on the 21st and died on the 29th of that month. His attention was drawn to blue lines in the groin, and they gave way to ulcers. These appearances would be accounted for by the outward application of a powder containing arsenic.

What, in your judgment, was the cause of death?—Arsenical poison. I certified the cause of death to be inflammation, and there was inflammation, but I did not know the cause of it. Witness attended Mrs. Harrington whose child was born on March 13 last, and died on the 19th of the same month. He saw the child every day. Its condition was exactly the same as the other, and he certified the cause of death to be erysipelas. The outward application of powder containing arsenic would account for death. He also saw the children of Henry Brown, born on June 4 last, and died June 8; Thomas Clark, born August 15 last, and died on August 31; Charles Lawndy, born October 25, and died October 30 last; and Morris Jerrett, born February 17 last, and died on the 26th. Mr. Deacon's child was born on January 2, and he saw it.

The Clerk: That child did not die?—Witness said it did not. The symptoms of the children which died were all alike. Arsenical poisoning was the cause of all their deaths. The face of the child Jerrett was very much swollen, which was not the case with any of the others. Lawndy's child vomited.

The Defendant: How many children died?—Witness: Five.

The Defendant: And you think they died from my powder?—Witness: Yes.

The Defendant: Did you express that opinion on the certificates?—Witness: No. I described the symptoms.

Mr. Poland: The certificates will be produced at the trial.

Dr. Roberts, Buckhurst Hill, said from June 21 to July 22 last he attended the child of Mrs. Wade. There was deep discoloration in the groins, retention of urine, sickness, and diarrhœa. The child recovered. In his judgment the outward application of violet powder containing arsenic would produce the symptoms which he saw. He also attended Mrs. Nottage's baby, born November 7, 1877. He first saw the child on January 2, 1878, and he continued to attend it till February 11, when it was better. Arsenical powder would cause the symptoms.

Mr. Poland asked for the defendant to be committed for trial for manslaughter. He thought it would be sufficient to have the committal on the three cases of Martin, Sear, and Harrington. It might be that bills would be presented at the assizes with reference to the same charge in other cases. But, so far as that day was concerned, he would ask the magistrates to commit the defendant on those three cases if they thought the evidence justified that course. He would also ask the magistrates to commit the defendant for the common law misdemeanour of selling and delivering powders containing arsenic to Mr. Nottage and Miss Grout and other persons, knowing them to contain arsenic, and thereby damaging the public health.

The Defendant: I wish to understand what position I am in on this platform. Do you mean to say that you are going to commit me for trial?

The Chairman: Yes.

The depositions were then read over to the witnesses, a proceeding which occupied two hours.

In answer to the usual caution,

The Defendant said: I am innocent of this charge. As I am going to be committed for trial I reserve my defence.

The Clerk: Do you desire to call any witnesses?

Defendant: No.

The defendant was then committed for trial at the next Chelmsford Assizes, on the charges both of manslaughter and misdemeanour. He applied that he might be tried at the Old Bailey, but he was informed that the bills must be preferred at the assizes.

The magistrates said they would admit him to bail—himself in £200 and two sureties in £100 each.

The defendant said he had telegraphed to London, but he was afraid that one of sureties could not be present till Saturday.

The proceedings then terminated, and it was understood that the defendant would be locked up all night—*Daily Telegraph.*

Poisoning by Strychnine.

On Saturday Dr. Diplock resumed an inquiry at the Mail Coach Tavern, Uxbridge Road, Shepherd's Bush, concerning the death of Mr. George Turner, 63 years of age, the landlord. From the evidence taken on the former occasion, it appeared that on Thursday morning, the 30th ult., Mrs. Turner left deceased in his bed room at 8 o'clock. At about 20 minutes to 10 she sent William Higgs, deceased's stepson, up to the room, and he returned saying that deceased wanted some brandy and water. This was given him. and upon another visit shortly after, a glass with a sediment in it was found on deceased's table. A medical gentleman was sent for, and upon being repeatedly questioned, deceased adhered to a statement that he had only taken a seidlitz powder. It was found, however, that the glass contained strychnine, and that deceased died from that poison. Mr. Baker, a chemist of Notting Hill, said that deceased recently purchased about six grains of strychnine for the purpose, as he stated, of killing rats. Evidence was now given that deceased had been called upon to resign the treasurership of an Oddfellows' society, and that he had written to some relatives of his intention to commit suicide. After a protracted inquiry the jury returned an open verdict.—*Times.*

Poisoning by Oxalic Acid.

Two deaths from poisoning by oxalic acid have been recorded during the last few days. One case was that of a lance-sergeant in the Scots Fusilier Guards, stationed at Windsor, who appeared to have swallowed about two drachms. The other was that of a married woman living at Bethnal Green. In both cases the poison was self-administered.

Review.

A Botanical Note-Book, or Practical Guide to a Knowledge of Botany. By E. M. Holmes, F.L.S., etc. London: Christy and Co. 1878.

These bright May days seem provocative to a study of nature, for, passing by a *slow* express through the fen country, we could not but notice the hottonia brightening up the reed-dike in a hundred places; the hydrocharis and water lilies rising up out of their winter rest in the dark mud, the sedges and other aquatic plants rapidly approaching summer growth, every roadside station with more or less of floral decoration, the fruit trees never so full of autumn promise of produce, that we could not help feeling that whatever nature might be in her serious moods, at least she was very beautiful in the spring of the year; and that with all this flower-growth of loveliness we could not help feeling how much God too must love beauty. By the way what a pity it is that artists are not more of botanists; in the Academy this year there is a splendid figure of "The Mother of Moses" looking into a fine growth of *Arundo phragmites*, hardly found in Egypt, but such as you would see on the Thames bank or the edge of a Norfolk broad; surely the "Paper reeds by the brooks" would have been a much more appropriate vegetation. But our duty to-day is rather to praise than to cavil; indeed, in the present instance and with the book before us there seems but little need of praise. All those who have seen the most admirable and exhaustive Catalogue of the collections in the Museum of the Pharmaceutical Society, 1878, by E. M. Holmes, must have felt that it was the work of one who not only had studied his subject well, but what is also of no mean requirement to success, that he also has taken it up because his heart was in it.

The work before us is what the author professes it to be, a botanical note-book; it has a number of blank leaves between the printed matter for notes, and with two good charts which will be found of great assistance to the students. It must not be supposed that this, more than any other, is an easy and royal road to learning; happily the royal road means work, so that whilst the ten talents may be sure to succeed, the one talent *well* employed will ever command success. With the many books such as the present at hand the advantage is surely with the student, and although the difficulties of examination may increase, yet the means at the command of the student more than compensate.

This book is so tabulated and so simplified that he who runs may read and read almost as he runs. Mr. Holmes well advises that where possible wild plants and not cultivated should always be chosen for botanical examination, the growth under garden treatment is so frequently abnormal in its various parts, nature very often runs astray and so misleads by her "sports."

The work is illustrated with several well-executed woodcuts which do more to give a knowledge of the subject than many pages of letter press, the several figures are so correctly drawn that we could wish the author had more profusely illustrated his pages. In conclusion we can heartily recommend this handbook to the student as being concise yet comprehensive, and above all *correct*.

Dispensing Memoranda.

[107]. Hoffman's Anodyne.—If you have not closed your remarks upon Hoffman's Anodyne permit me to refer your readers to authorities approaching nearer the time of its introduction as a quack medicine by Hoffman, and although two of them may differ, yet there is no doubt but that the original anodyne contained a portion of ethereal oil drawn over with the last portion of the ether, and that the advance of chemical knowledge was the means of producing a purer ether. Then came the introduction of the ethereal oil in definite proportions with the spirit and ether to produce a standard for the guidance of the medical man.

My first extract is from Macquer's 'Chem. Dic.,' Paris, 1778, under the article "Ether":—"Frederic Hoffmann est un des premiers médecins, qui, sans pourtant connoitre precisement l'éther, l'ont employé comme calmant et anti-spasmodique : la fameuse liqueur minérale anodine de ce médecin, n'est-que de l'esprit de vin qui tient en dissolution une certaine quantité d'éther et d'huile douce de vitriol, et c'est à l'éther qu'elle doit toute sa vertu."

Klaproth, 'Dic. de Chemie,' Lagrange and Vogel's translation, Paris, 1810:—"Lorsque on dissout une partie d'éther dans trois parties d'alcool, on obtient la liqueur anodine. Hoffmann n'est cependent pas l'inventeur de ce medicament : la recette lui fut envoyée par un pharmacien nommé Mortmeyer. On prepare aussi la liqueur de'Hoffmann en distillant de l'acide sulphurique avec 3 à 4 parties d'alcool."

Marat and de Lens refer to the subject likewise in the article on "Ether":—"Uni à l'alcool, l'éther constitue l'esprit doux de vitriol, ou acide vineux de vitriol de quelques pharmacopées, analogue à la liqueur minérale anodyne d'Hoffman, véritable éther alcoolisé assez faible, qu'il préparait en distillant six parties d'alcool sur une d'acide sulphurique. Depuis, on a donné le nom de liqueur d'Hoffman au dernier produit de la déstillation de l'éther, préscrivant même d'y ajouter un peu d'huile douce de vin.

B. M. Atkinson.

Leeds, June 10, 1878.

[107]. Hoffman's Anodyne.—Confirmatory of Messrs. Hucklebridge and Brown's opinions, I find in Forsyth's 'Medical Dictionary' (1826), under the heading, "Sp. Ætheris Sulph. Comp.,' "A stimulating anodyne, supposed to be similar to the celebrated liquor mineralis anodynus of Hoffman." Also in Duncan's 'Edinburgh New Dispensatory' (1804), under the general heading "Sp. Æther. Vitriolici Comp." (London), the formulæ—

(1) "Take of—
Spirit of Vitriolic Ether, two pounds.
Oil of Wine, three drachms.
Mix them."

(2) "Liquor. Æthereus Oleosus; olim, Liquor Hoffmanni Anodynus, Dub.—(Oily Ethereal Liquor, formerly Anodyne Liquor of Hoffmann.)

"Take what remains in the retort after the distillation of the vitriolic ether. Distil to one-half with a moderate heat."

In Lewis's Pharmacopœia (1748) the author, after describing the mode of obtaining ether, or, as he calls it, "dulcified spirit of vitriol," advises his readers, who desire further satisfaction with regard to this affair, to consult "Hoffman's Observ. Physico-Chem., Lib. 2, Obs. 13," but he does not identify Hoffman's name with any particular preparation of Ether. Sulph. Perhaps some possessor of Hoffman's work will be able to inform us what preparation he specially recommends, but till we have evidence to the contrary I think most persons will be inclined to support the use of Sp. Æther. Sulph. Comp. instead of Sp. Æther. Sulph. when "Hoffman's Anodyne" is prescribed.

Edward H. Storey.

42, *Castle Street East, W.*

[116]. Ol. Santal. Flav.—In a pamphlet issued by Messrs. Clarke, Bleasdale, Bell and Tollington, of York, entitled 'Notes on New Remedies,' two formulæ are given for exhibiting Ol. Santal. Flav. They are extracted from the 'Medical Mirror' of 1866, Dr. H. S. Purdon:—

℞ Ol. Santal Flav. . . . . . . ℨiii.
Ess. Cinnamomi . . . . . . ℨj.
Spt. Rectif., ad. . . . . . . ℥ii.

Dose.—One teaspoonful three times a day in wineglassful of water after food.

℞ Ol. Santal. Flav. . . . . . . ℨj.
Ol. Sabinæ . . . . ℨj.
Ol. Cubebæ . . . . ℨiv.
Ol. Copaibæ . . . . ℨj.
Ess. Cinnamomi . . . . . . ℨj.

Dose as above.

John Frederick Roger.

Stockport.

[116]. Ol. Santal. Flav.—In reply to Mr. Goodwin's question as to the dose of ol. santal. flav., it may be given in from ♏15 to ♏30 on sugar, or made into a mixture, using a little mucilage and syrup with some flavouring agent, such as tr. card. co. Liquor. potassæ may be added, but it is not essential, unless indicated by the state of the bladder and urine. The oil has succeeded in some cases of gonorrhœa after cubebs and copaiba have completely failed. He might consult, with benefit, Dr. Henderson's paper in the *Glasgow Medical Journal* for April, 1865.

Henry Brown.

[117]. Tinct. Cardamomi.—When tinct. cardamomi is ordered, which is correct, to give tinct. card. sinip. or tinct. card. co. (not knowing the doctor's intention)? I should have used the simple tincture, but was previously informed that the last mixture had been of a red colour.

J. W. Barnes.

Notes and Queries.

[505]. GLUCOSE IN HONEY.—Honey consists of crystallizable (grape sugar) and uncrystallizable (fruit sugar) sugar, the latter of which changes slowly into the former. Both can be perfectly separated by treating honey with rectified spirit in which the uncrystallizable is readily dissolved. If natural honey is incinerated it yields a minimum of ash (0·01—0·05 per cent.); if glucose is admixed ash will be obtained consisting mostly of sulphate of lime, originating from the chemical agents used in manufacturing glucose, that is sulphuric acid and carbonate of lime. Of twelve samples of glucose, analysed in my laboratory, the amount of ash was 1·18 per cent.

H. W. Langbeck.

[506]. CHRYSOPHANIC ACID STAINS,—Messrs. Ferries and Co., of Bristol, send, as in answer to H. B., the following quotation from a pamphlet issued by them:—"The linen of patients who are under treatment by the ointment becomes dyed in patches of a dark purple brown colour, but does not become corroded. An old suit or two of linen should therefore be set aside for wear during the treatment. The stains may be completely removed from the linen by boiling it in a dilute solution of bleaching powder, but this of course is apt to corrode the linen more or less. The stains on the skin speedily wear off completely, so that the patient in cases where the remedy has proved successful, is soon left without trace either of his disease or of the remedy that he has employed against it."

[506]. CHRYSOPHANIC ACID STAINS can be removed from linen by using a solution of chlorinated lime.

HENRY WALDEMAR LANGBECK.

[506]. CHRYSOPHANIC ACID STAINS.—The stains produced in linen by chrysophanic acid ointment are very difficult to remove. I have tried many things but find that a solution of chlorinated lime will effect complete removal, and bleach the linen perfectly white. I enclose a small piece of stained and bleached linen. The process requires caution as to the strength of the solution used. The bleached piece enclosed is almost destroyed, and the fabric useless, owing to its friable condition. The linen was immersed for twenty-four hours in a very strong solution of chlorinated lime before the last trace was removed.

In treating stained linen all traces of grease or vaseline should be removed by washing with soap, and thoroughly rinsing the articles in clean water; then immerse them in a weak solution of chlorinated lime. The process may require a day or two, but it is better to allow plenty of time than to hurry the process, and ultimately find the articles rotten and useless, as the piece enclosed demonstrates.

HENRY BROWN.

Northallerton, June 12, 1878.

[508]. INSECTICIDE POWDER.—Can any correspondent inform me of a thoroughly good powder for destroying beetles, fleas, etc., and not injurious to animals?

G. H. D.

Correspondence.

THE PORPOSED ADMISSION OF WOMEN TO THE SOCIETY.

Sir,—Although I heartily sympathize with Mr. Hampson in his efforts to admit women as members of the Pharmaceutical Society, I do not think that the last election of Council afforded much evidence of the opinion of the voters, as on account of the extraordinary reticence of the candidates many of us who have not time to consult back numbers of the Journal really know but little of their opinions, and have to vote haphazard.

Last year I voted for most of the former members, this year for most of the new candidates, and possibly gave as intelligent a vote as others, but I cannot understand why it seems to be considered undignified for the candidates to express their views on matters pertaining to pharmacy, while in all other elections the greatest publicity is given to the views of the candidates.

I trust, however, that neither Messrs. Hampson or Wade will relax their efforts in this matter, but on all suitable occasions will introduce it until the desired end is attained, and that the unseemly haste in which the vote was taken at the last annual meeting will be carefully avoided in future. It seems to be forgotten that when the numbers were announced that those who were in favour of the admission of women, believing that a mistake had been made, called eagerly for another count, but the hasty manner in which many left prevented its being done.

I must protest against the imputations made against the women seeking admission, such as a "hankering after notoriety," an insinuation which it is to be hoped will not be repeated; the discussion ought to be confined to the merits of the case. Women have to bear insinuations enough. If her maternal instincts and the hope of a happy home lead to a frankness of conduct with young men she is a forward hussey, angling for a husband, and if she seeks to gain a honest livelihood by fairly and honourably using the talents with which God has endowed her in the sphere her own judgment approves, unless she also moves in the special sphere Mrs. Grundy deems suitable, she is "hankering after notoriety" and moving out of her place.

But Mr. Groves says it is a "cruel kindness" to "give them what they ask for." Let me remind Mr. Groves that these ladies ask no gift at the hands of the Pharmaceutical Society; they are not children, but have fairly passed the examinations of the Pharmaceutical Society, and as such are entitled as a mere matter of justice to be elected as members. Mr. Groves reminds me of a man who said that he would tolerate all men's religious views. "Toleration," I said, "I want no toleration, but claim to the fullest extent the right to think and act for myself, subject only to my maker," and I wonder the women do not ask, "Who made thee a judge and a ruler over us?" What right have we to dictate to any one, whether man or woman, how they should use the talents with which they are endowed? The question is one simply between the ladies and the public. If the ladies adopt the business of a chemist and the public buy of them, the only duty devolving upon the Pharmaceutical Society is to see that they have passed the examinations, and, having done so, it is a mean and unworthy thing to refuse them admission as members because of their sex.

But Mr. Jones says that while there are such advertisements as "Wanted a man cook, etc.," women may well wait for first openings, so that to cook, to sew, to wash, to teach, is for the present to be the end of woman's ambition. Well, these are all honourable employments, as indeed all honest work is honourable.

"Honour and shame from no condition rise,
Act well thy part, there all the honour lies,"

and when women possess the physical strength that men possess, which is evidently one requirement of the advertisers, and have the same facilities for obtaining the highest university degrees that men possess, the advice will come with a little better grace; in the meantime, those who advocate such views ought to agitate for laws to be passed compelling men to seek employment elsewhere, as they will, I am sure, be ready to acknowledge that it would be most unrighteous that women should only be allowed to work in special spheres, whilst men could compete in all. But unfair though it is, such has been men's actions in the past: they have grasped all they could, and the weaker sex has often had to struggle on amid difficulties sufficient to overmaster the strongest heart.

JAMES S. HICKS.

Looe, June 11, 1878.

THE ADVENTURES OF A LADY PHARMACIST.

Sir,—It gives me great pleasure to see how we ladies are being taken into consideration by the Council of such a Society as the Pharmaceutical. George (my husband) thinks if you succeed in putting us on an equal footing with gentlemen, it will really be the best thing either you or any other professional body has yet done for the good of the public and the elevation of the status of the Society. We tried some time ago to be doctors unfortunately, however, that was soon settled. Since I am a lady pharmacist by qualification no doubt you will like to know a little of my experience in the use of that qualification. Well, sir, after passing my examinations I took a situation with a married pharmacist; this was my first experience in the trade. Everything seemed to go on delightfully for a while, but, alas, the old story, everything must fade, and as somebody says, the brightest yet the fleetest. Such was the experience I was doomed to encounter. Whenever my employer, who was very good to me, took me out for a little recreation, such as an evening ramble; a friendly party, or country ball, there was sure to be a row with his wife; in fact such a serious affray took place on one occasion, that I had to dress his poor little head and take him to my lodgings for safety. The ultimate sequel to this state of things was, so uncomfortable had my good master's domestic affairs become through his wife making so much "fuss" about morality, that I was at last compelled to leave his hospitable roof. My second and third situations were little more favourable in their results; as usual, I managed well enough with the proprietor, but "the better half" never seemed to like me, notwithstanding the generous manner in which the remainder was continually extolling my virtues. It was about this time there was a grand ball; of course *I* was there (I often used to go with the young men at the College where I studied), so was George Lovesick, the grocer, dear fellow; I could not help admiring his gaiety; you see his mind not having been cramped by the dreary routine of a chemist's education, his spirits seemed constantly on the alert. As we were coming home together he told me what a good business he had and what exertions were being made in favour of *lady* pharmacists, so we both thought how nice it would be if I could introduce pharmacy into his other business without him being compelled to pass examinations like other people, he would be very willing (?) to nurse the children, in fact, bear them if he could, and attend to the house while I managed the pharmacy department. George also thinks that by selling patents at a little sacrifice and dispensing prescriptions at the cost of the ingredients we should be sure to do a "roaring" trade; this would be a grand elevation of the status of the Society. He of course, desires me to thank you very much for your exertions in our behalf. Now, sir, having told you a little of my history, allow me to be, Yours, etc.,

ANNIE, M.P.S., GROCER, ETC.

Prescribing Over the Counter.

Sir,—As a chemist who "prescribes over the counter" perhaps you will kindly allow me space for a few remarks on this vexed question.

I would ask those who say that a chemist should not prescribe, what they would do in a case like the following (and such case is by no means uncommon)?

On a stormy night a poor woman, whose husband perhaps has only earned seven or eight shillings during the past week, brings her child suffering, say, from inflamation of the lungs, to a chemist for advice and medicine. Two pence is, at the most, the amount of money she has available; the parish doctor cannot attend the case without a note from the relieving officer, who lives at a considerable distance, and the workhouse is about two miles from the town. Is this poor creature to be told that she must go to a surgeon, and when she says she cannot afford to do so is she to be referred to the relieving officer? Must she toil through the wet streets with her sick child in her arms, increasing its malady by the exposure, and perhaps hastening its death, because of the notion that only a surgeon must prescribe?

Should her child die, the chemist who refused his aid would be morally responsible for its death, and I question if an inquest were to be held whether he would escape censure.

Numbers of people quite as poor as the one mentioned come to me for advice and medicine, also domestic servants, who as a rule much prefer consulting a chemist to a surgeon. There are thousands of commercial clerks with large families and small incomes, who cannot afford to call in a medical man. Are all these to be refused attention?

It is all very well for a chemist, perhaps a M.P.S. by examination, who has a "West-End connection" or whose "establishment" is in same fashionable locality, to say that he will not prescribe, but hundreds of chemists in the manufacturing districts, and hundreds of surgeons also, admit that many of the poorer of the working class are entirely dependent upon chemists for medical aid.

I may say in conclusion that I have "prescribed over the counter" for the past fifty years (and that too with the knowledge and approval of the medical men in the district) and although doubtless many of your readers will put down this letter with the remark "Oh, he's one of the old school," I maintain that there is more real dignity in "using the mighty art of healing" for the benefit of those whose circumstances are needy, than in shirking the trouble of it under the plea that "to prescribe over the counter" would interfere with the medical profession. I had far rather be "one of the old school" than a "carpet-knight" presiding over a "dispensing establishment" where "no prescribing over the counter" is allowed.

M. P. S.

Adulterated Violet Powder.

Sir,—Considerable anxiety exists in the public mind at present regarding the composition of that much used article known as violet powder, caused by the disclosure of no less than thirteen deaths, alleged to be due to the use of a compound of that name, containing a large proportion of arsenic, made and sold by a Mr. King, now committed for trial.

A few days ago a box, labelled "Superior Violet Powder, for the Nursery and Toilet," was handed to me to test for arsenic. Several dozen packets had been purchased from a chemists' sundriesman here, who, I have since been informed, had them specially put up for him by a London house of respectability. When analysed it proved to be gypsum ground to a very fine powder and perfumed. It contained no trace of arsenic. I have no reason to believe that such violet powder is generally supplied throughout the country; in fact the packets bearing the name of the house in question are very different, being of the usual composition, but I know that a large quantity of this substitution has been sold here.

I have written this as there may be some doubt whether calcic sulphate can be legally sold as violet powder.

The Production of the Poison Register.

Sir,—As no reply has been published in your columns to the question (as to under what circumstances we are compelled to produce our Sale of Poisons Register), which appeared in connection with the recent letters upon the alleged sale of strychnine at Penzance, and as it would be worth while for us to know our exact legal position, I venture with your permission, to revive the subject.

I think I am correct in saying that the Act does not state under what circumstances it must be produced, nor in whom the authority is vested to make such a request, neither does it specify that the poisons mentioned must not be given away.

Some time since, some "blue powder" I sold accidentally came in contact with a cat, whose owner came to me, and requested a sight of my poison book; his request was refused, when he stated he would make me show it. My reply to this strong remark was, "Then I'll wait till you make me." He soon after reappeared with a gentleman in all the glory of a blue uniform, who said, "The superintendents of police had sent him to look at my poison-book." I again refused to produce it, when he said, "They would apply to the magistrates for an order to compel me to comply with their request." I afterwards heard they did so, but the magistrates declined to do so. My opinion is they had not power to make such an order.

Remedy for the Attack of Drapers and Others upon the Patent Medicine Trade.

Sir,—Since the inroad made on this district by drapers and others selling at the ordinary cost prices, or nearly so, I have, although contrary to all my former practice, adopted the plan of putting up more patent medicines (so-called) of my own, and in every case possible, of recommending some of these in the place of the ordinary going patents, especially on the ground that I well know the contents of my own, whilst the composition of the others was not known, and some of them at least contained dangerous materials. My experience is short, but it is sufficiently satisfactory, much more than expectation, fully to convince me that if the proprietors of the ordinary going remedies will not come to some reasonable understanding with the trade not to supply these articles to persons entirely outside the business, or else, only to supply them, at, say, 10 per cent. above the trade prices; the remedy is very largely in our own hands.

Of course, a united effort will be necessary, and I would suggest, if necessary, the publication of a correct analysis of all the leading patent remedies and counter preparations being offered to the public on this basis, attested by some of the most eminent analytical chemists, omitting any objectionable ingredient. This may be done by each individual chemist, but would be more effective if these preparations were issued by a joint company of chemists, and, of course, with sufficient and legal distinction from those of present proprietors.

We should be in a position then fairly to compete with drapers, co-operatives, and others who have made inroads upon our proper business.

I presume it is well known that the object of these parties (drapers) is not really to sell for a less price than ourselves; it is, in fact, to palm a mean lie upon the public, that is, that all their other stock is sold at equally ruinous prices. They seize upon such articles of other tradesmen as have a fixed and well-known price, sell these at cost, or nearly so, and publish their own stock as selling at the same rates. This is really a dishonest way of conducting business, and any one acquainted with the value of drapery stock may easily discover that in the long run, taking one article with another, these puffing establishments get as much profit as other tradesmen, and on much of their stock, such as the public are not competent to judge of, a very much higher profit than is usually charged.

JOSEPH BALL.

Oxton.

"PATENTS."

Sir,—The letter of your correspondent "Ictus Equi' deserves to be read and studied by every chemist on the register. He strikes at the root of the evil in the course he recommends as regards the thousand and one quack nostrums with which the trade abounds, and for the existence of which it is largely responsible, in the countenance it has lent and the publicity it has helped to give to them. We as chemists have too long tolerated them, and have thereby seriously impaired our legitimate influence with the public, who might, in many cases, have been supplied with useful preparations of our own, to the advantage of both parties. The evil is, however, rapidly working its own cure, and "Patents," as a source of profit, will soon have become "a proverb and a bye-word."

The present seems a transition period, and the retailer now suffers, but the loss will ultimately fall upon the makers, who do not appear to see, that, by allowing the present unscrupulous cutting of their published prices to go on they are assiduously "working out their own extinction." However, as matters now stand, this is "a consummation devoutly to be wished," and is their own affair and not ours. We, as a body, can (if we will) sufficiently protect ourselves by at once discountenancing, in every legitimate way, the sale of these, in too many instances, useless, and now almost profitless articles, replacing them by good and sterling preparations of our own.

Given the indifference, or open hostility, of the chemists throughout the country, it becomes an interesting question how long the great majority of "Patents" would survive the shock.

EXPERIENTIA DOCET.

Sir,—As patent medicines are a familiar topic just now, it may interest other members of the trade to know what experience I have had with one.

Six months since it came to my knowledge, that a medicine was being sold in this neighbourhood by a hawker who had not a patent medicine licence. I thought at the time it was not worth while to notice this, but about a month since, as I learned that dozens were being sold weekly about here by three and unlicensed people, I wrote to the proprietor asking terms, stating there was no other licensed vendor within seven miles. In reply, I had a printed intimation that a baker and grocer in a small village two miles off was district agent, and that I was to apply to him for a sub-agency. On the following day this man called and offered to serve me. I declined on the ground of his being unlicensed, and at the same time told him his liability for breach of law. As he was very positive on the matter, and appointed another person in the place to sell for him, I wrote to the excise officer of the district, informing him of the case, gave the names of three who were selling here, and also told him that there were about 1200 (agents of an insurance company) people who were selling this medicine without a licence.

A few days after, I learned that these three had been requested to take out a patent medicine licence.

About a week since another of these three called, and asked me to lend him four bottles (I had got a supply through a London house). As he was a good customer I did so. Two days later he sent me back four bottles, but not one of them had a patent label on. I again wrote to the excise telling them that as this person had just received a 12 dozen case, there was a good opportunity to get at the wholesale vendor, who, I consider, is the most culpable, most of the retailers being ignorant of the law. I have heard no more of the matter, but presume the proprietor has been complimented by the excise for having done the revenue out of some hundreds of pounds.

Need I add it will be some time before I again acquaint the excise with what it is their duty to know.

RUSTIC.

May 20, 1878.

Sir,—I have read several of the letters which have appeared in your Journal upon the sale of Patent Medicines. Legislate as we will, when all the "trade" are not agreed it will be impossible to give universal satisfaction. I am interested in this question in more ways than one, and I see many chemists clamouring to have these patents entirely in their own hands, and I see others refusing to sell stamped or proprietary articles other then their own compounding, unless under great pressure; indeed, I came across a case the other day where a solitary chemist who had all the town to himself absolutely refused to order an article prepared by me which a friend of mine wanted. Are these the persons who are to have the sale of patents entirely in their own hands?

Chemists have the first offer of my preparations, but in all cases where they refuse to sell them, I shall whenever possible appoint a grocer or stationer as my agent, and who can blame me? People will have patent medicines. I suppose they think them safer, cheaper and better than what a prescribing chemist supplies them with, and undoubtedly many of them have those three virtues to commend them to their use.

I hope no law will be passed to check the sale of many valuable remedies; at the same time I think government should be in possession of all the recipes of these patents as a guarantee that nothing injurious is supplied to the public.

I have found patent medicines a great acquisition to a chemists' business, and I am sure they have a good profit for all the trouble they have with them. It is only a small proportion of the manufacturers who make anything handsome out of them and these have to invest a large amount of capital.

NORTHUMBRIA.

May 15, 1878.

"*Phenic.*"—We cannot supply you with the information. But see Dr. Koppeschaar's paper on the Volumetric Estimation of Carbolic Acid, in *Pharm. Journ.* for April 15, 1876, p. 821, and other papers that have appeared on the subject.

"*Minor.*"—Apply to the Secretary, 17, Bloomsbury Square, for a copy of the Regulations of the Board of Examiners.

T. Hope.—(1) Probably *Salix alba*; (2) *Rhinanthus Crista-galli.*

E. J. Wood.—It will depend upon the provision made in the Act, if it passes.

Y. J. T.—We should think so.

J. Wearing.—You would find the addresses of surgical instrument makers in the Directory, but we are not able to say which or whether any of them buy secondhand instruments.

J. Sumner.—The original document should be used.

Blaquart, Messrs. Wilson and Co., Mr. Blackett, Mr. Burt, M. Baron-Barthelemy, M. Chapellier, Mr. Best, Mr. Clifford, M. Loret, Messrs. Carruthers and Allen, Dispenser, Vigil, G., W. F. C., J. McK.

A NEW CHEMICAL TEST FOR CARBOLIC ACID, AND ITS USEFUL APPLICATIONS.*

BY EDMUND W. DAVY., A.M., M.D., M.R.I.A.,

Professor of Forensic Medicine in the Royal College of Surgeons, Ireland.

I had the honour, a short time ago, of bringing under the notice of the Academy, and of publishing in its 'Proceedings,' a new and exceedingly delicate chemical test for alcohol, I had at the time discovered; and I pointed out some practical applications which might be made of that test. I subsequently directed attention to some further useful objects which may be obtained by the employment of that alcoholic test, which latter have appeared in the London *Pharmaceutical Journal* for last year.† I have recently discovered that the reagent which I employed for the detection of alcohol in the test referred to, viz., a solution of molybdic acid or molybdic anhydride in strong sulphuric acid, is a very delicate test likewise for carbolic, or as it is otherwise termed, phenic acid, a substance which is now one of considerable industrial importance, admitting as it does, of so many useful applications; and one for which it is desirable to have a ready, and at the same time a delicate test, for the detection of its presence under different circumstances.

I have observed that when a drop or two of a dilute aqueous solution of carbolic acid is brought in contact with a few drops of the molybdic solution stated, there is immediately produced a light yellow or yellowish brown tint which, passing to a maroon or reddish brown, soon develops a beautiful purple coloration, which latter remains without further change for a considerable time. I should here observe, that the application of a gentle heat will hasten the development of the purple reaction, though it will take place, but more slowly, at the ordinary temperature; and it is the production of this purple under the circumstances stated, that constitutes the test for carbolic acid.

The molybdic solution which I have chiefly used for this purpose is similar to the one I have employed for the detection of alcohol, and is made by dissolving, with the assistance of a gentle heat, one part of molybdic acid in ten parts by weight of pure and concentrated sulphuric acid; but the exact amount of molybdic acid dissolved appears to be a matter of indifference, as I have used other proportions with success, and in some recent experiments I found that a solution where there was only one part of molybdic acid in a hundred parts of sulphuric acid acted very well.

The mode of using this reagent is simply to add three or four drops of it to one or two of the liquid under examination, placed on any white porcelain or delf surface, when the effects already noticed will be produced if carbolic acid is present. In carrying out this test it will, however, be found the most convenient to use a small white procelain capsule furnished with a handle, which will admit of the application of heat when it may be desirable to hasten the reaction by that agent.

This test is one of great delicacy, for I have found that one small drop of an aqueous solution of carbolic acid, containing a thousandth part of its weight of that acid, and only absolutely about the one seventy-thousandth part of a grain, when mixed with three or four drops of the molybdic solution, produced immediately the yellowish brown effect, which after a few minutes passed into a very distinct and beautiful purple coloration, and this colour remained quite perceptible on the fourth day afterwards, though it had each day become fainter from exposure to the air, and its consequent absorption of moisture. But this is not the limit of its delicacy, for I have detected by its means the carbolic acid in one drop of an aqueous solution five times more dilute, or where it contained the one five-thousandth part of its weight of that acid, and in which there was only about the one three-hundred and fifty-thousandth part of a grain present.

For the success of this test it is necessary to attend to a few particulars, one of the most important being that only a drop or two of the liquid under examination should be employed, for if much more be used the reagent will be diluted too much, and the characteristic reaction will not take place; for so great an effect has water on it, that even when the purple coloration is fully developed, the addition of that substance will cause either the coloration to disappear almost entirely if the quantity of carbolic acid present be exceedingly minute, or if more abundant, it first changes the purple to red and then into a light reddish brown, which becomes more and more faint on further dilution; but the addition of a few drops of the test solution, or even of strong sulphuric acid, again reproduces the purple, though of course fainter in its colour in proportion to the previous degree of dilution; thus showing that the mixture must be very strongly acid for the production and continuance of this purple effect. Another point to bear in mind is this, that where carbolic acid itself, and not an aqueous solution of it, is acted on by the molybdic reagent, a dark olive, quickly changing to a very deep blue, will be produced, but not the purple coloration. A saturated cold aqueous solution, however, of carbolic acid when so treated will yield the purple reaction; but even here there will be a tendency to develop the olive or blue effect, especially where the reagent employed contains a large proportion of molybdic acid; and I may observe that weaker solutions of carbolic acid give more satisfactory results, as the action appears to be too energetic when the acid itself or very strong solutions are employed.

The last precaution I wish to direct attention to, for the successful performance of the test, is this, that in applying heat to hasten the reaction it should be limited to a gentle one that the hand can bear when applied to the bottom of the capsule, this being about from 120° to 130° F., which is quite sufficient for this purpose, besides not exercising any destructive effect on the purple reaction; for I may observe that if the heat be raised even to 212° F., and continued for some time, the purple coloration will be destroyed, and a blue produced. Moreover, where organic matters are present along with the carbolic acid, many of them will likewise when heated with the molybdic reagent to that latter temperature, or even much below it, develop a deep blue colour, which would mask, more or less completely, the purple effect of the carbolic acid; consequently it is better in most cases, to let the test act on the liquid at the ordinary temperature, though the reaction may be somewhat slower in developing itself.

I have made a number of comparative experiments with this test, and with the principal ones hitherto employed for the detection of carbolic acid, and I find in point of delicacy it seems only to be sur-

* Read before the Royal Irish Academy, May 13, 1878.

† *Pharmaceutical Journal*, September 15, 1877.

passed by the bromine test of Dr. Landolt, which depends on the circumstance that when an aqueous solution of bromine is brought in contact with carbolic acid, there is immediately formed the tribromophenol ($C_6H_3Br_3O$), a sparingly soluble white substance; but that test could not be successfully employed, at least immediately, in many cases where the test just described might be still available; as, for example, in the case of different organic mixtures, where the presence of the tribromophenol formed would be concealed. It possesses likewise the great advantage of being apparently not interfered with, to any extent by the presence of a number of organic substances which obscure or prevent the reactions of many of the other tests.

As to what is the exact nature or composition of the purple compound which is formed in carrying out this test, I have not yet been able to determine, owing to the difficulty of isolating it, or of obtaining it in a condition suitable for analysis; but I am inclined to think that it is not so much an oxidation product of carbolic acid, as a deoxidation one of molybdic acid, and that it is a combination of one of the oxides of molybdenum, containing perhaps more oxygen than the blue compound which is formed where the molybdic reagent acts on alcohol, and on some other substances; and one circumstance, amongst others, which seems to support this view, is this, that I have failed to obtain by the action of other oxidizing agents on carbolic acid a similar purple reaction.

Be this, however, as it may, I have satisfied myself that the purple compound formed in my test is a totally different substance from the red or crimson dye, termed coralline, which is obtained by the united action of oxalic and sulphuric acids on carbolic acid, and is now largely used as a dyeing material, for the red colour of the latter substance is not affected by the caustic alkalies, and strong sulphuric acid changes it to a reddish-yellow; whereas the purple developed in the new test is changed to green by caustic alkalies, and the purple again restored by strong sulphuric acid. I am, however, still engaged in this inquiry, and hope to be able yet to determine the exact nature of this purple compound, and of the changes which occur in this new reaction.

I shall now briefly notice some of the useful applications which may be made of this test.

It is well known that carbolic acid is a powerful poison, and many instances are now on record where it has been the cause of death, such being generally either cases of suicide or those where it has been accidentally taken by mistake for some other substance, as its odour and taste would render its administration, at least to an adult, by the assassin for the criminal destruction of life a matter of some difficulty. The occurrence, however, from time to time of the cases referred to, obviously renders it very desirable to be able readily to detect the presence of carbolic acid, where it has been so used, either in the articles of food, drink, or medicine, which have been taken, or in the ejecta, or contents of the stomach; and this test affords a very easy and ready means of so doing, and of confirming the indications of other tests. According to my observations it will detect the presence of carbolic acid in different complex organic mixtures, even when the odour of that substance may be quite imperceptible; and I may observe, that this test of odour, has hitherto been regarded as the most delicate for carbolic acid in such cases. The great advantage this test possesses, especially for such applications, is this, that it does not appear to be much affected or interfered with, as already stated, by the presence of a number of organic substances which are likely to be present in such cases. Thus as regards different articles of food, I have readily detected, by means of this test, the presence of carbolic acid when a small quantity of its aqueous solution had been added to the following articles, viz:—tea and coffee mixed with sugar and milk, porter*, ale, wine, a solution of Liebig's extract of meat, and albumen; also where it had been added to blood, olive oil, gum, and soap, the very diverse substances in the articles mentioned not preventing the indications of the test.

It will also afford a ready means of detecting the elimination of carbolic acid in urine, when that substance has been taken internally, for the compounds present in human urine naturally do not appear to affect to any extent this test. I may also observe that with it I was at once able to detect the presence of carbolic acid occurring in the urine of a cow without any previous treatment of that secretion, and thus to confirm the correctness of the statement as to the occurrence of that acid as a normal substance in the urinary secretion of that animal. This ready means, therefore, of discovering carbolic acid in different animal fluids where it may exist, will render the test useful to the physiologist and physician.

Another useful application of this test, is that it affords a very ready means of distinguishing creasote from carbolic acid, which is a matter of some commercial importance, for much of what is sold as creasote is, as is well known to chemists and those in the drug trade, little else than carbolic acid; for those two substances, though obtained from different sources,—true creasote being procured from the distillation of wood tar, whilst carbolic acid is got from that of coal tar, and though they differ likewise from each other in chemical composition—still so closely do they resemble each other in several of their properties that the cheaper substance, impure carbolic acid, is in whole or in part frequently sold to the public for the dearer article, creasote. If, however, we take a drop or two of each and agitate them well with about a quarter of a fluid ounce of distilled water, and having filtered the liquid, test a drop or two with the molybdic solution as already described, we shall get in the case of pure creasote only a brown or reddish brown reaction, which on standing, or warming slightly, becomes fainter, passing to a light yellowish brown, whereas in the case of carbolic acid, the brown passing to a maroon soon develops a more or less intense purple colour. This treatment will be sufficient to distinguish creasote from carbolic acid,

* As alcohol acts on the molybdic solution producing an intense blue coloration, the presence of that substance, at least in any quantity, would mask more or less completely the reaction of carbolic acid; in examining, therefore, alcoholic liquors for that acid, it is better to submit them to distillation to separate the alcohol, and then to test the later portions of the distillate or the residue for carbolic acid; or what answers even still better in such cases, is to render the liquid alkaline by the addition of either caustic potash or soda, to combine with and fix the carbolic acid, and then distil; and when all the spirit has been removed, to add diluted sulphuric acid to slight acid reaction to liberate the carbolic acid, and after this distil again, when that acid will come over unmixed with any spirit, and give its characteristic reaction.

and also to detect the presence of that acid in creasote, where it occurs in considerable proportions; for if on the addition of the molybdic test solution, the mixture instead of fading away to a light yellowish brown on standing a short time, or on gently heating passes to a reddish-brown or to a maroon, it is an indication that carbolic acid is present. But I have found that the following very simple proceeding gave more satisfactory results, especially where small quantities of carbolic acid had been added to a large proportion of creasote. From five to ten drops of the liquid under examination are taken and agitated briskly with about half an ounce of distilled water for a few minutes, so as to dissolve out the carbolic acid; the mixture is then filtered and the filtrate is put into a little flask furnished with a close fitting cork, through which passes a small glass tube about ten or twelve inches long and bent above the cork at a little more than a right angle. The contents of the flask are then heated, and when the liquid boils, the first portions which distil over will be found to present a more or less turbid appearance as they pass down the tube, from their containing minute globules of creasote, and a drop or two having been collected and tested with the molybdic reagent will give only the brown reaction of creasote; but by continuing the boiling that substance will be more or less completely expelled, and then it will be found that a drop or two of the later portions of the liquid which distil over will give the purple reaction of carbolic acid. I may here observe that as it is only a drop or two of the distillate which is required each time for testing, it is not necessary to use any condensing arrangement, for the vapour, passing through the tube itself, is cooled sufficiently to furnish the small quantity required for each trial; but when it is desirable to collect in larger quantities the different portions of the distillation, a very small Liebig's condenser in which the delivery tube can be inserted will be found the most convenient arrangement to employ. In this way by distillation I was enabled to detect the presence of carbolic acid in creasote, where I had mixed only one part of the former with a hundred parts of the latter, which would be more than sufficiently delicate for any case likely to occur in commerce, for where such adulteration was practised it is probable that a much larger proportion of carbolic acid would be used to render the fraud sufficiently remunerative. In the same way I have readily succeeded in detecting the presence of carbolic acid in the oil of cloves, where I had purposely added a small proportion of that acid, as it is stated that this very objectionable fraud is occasionally practised of adulterating the essential oil of cloves with carbolic acid.

Those few applications that I have referred to are, I should trust, sufficient to indicate the practical utility of this test, which, being at the same time so simple and easily performed, will be found, I have no doubt, useful for the objects stated, as well as for others to which it may be applied.

PELLETIERINE, AN ALKALOID OF POMEGRANATE BARK.*

BY M. TANRET.

It is usually recognized that the bark of the pomegranate, both stem and root, is active as a febrifuge in the fresh state, whilst that after drying and being kept some time it loses part of its virtue. The most natural explanation of this difference of action would perhaps be that the active principle of this bark is very liable to alteration. In previous researches, however, no such body had been met with, but the author has been successful in discovering in the bark a volatile alkaloid, which he has recently brought under the notice of the Academy of Sciences. This alkaloid he proposes to call "pelletierine," in honour of the learned man who contributed so largely to the history of the alkaloids.

In preparing pelletierine pomegranate bark (from the stem and roots) is reduced to a coarse powder; this is moistened with tolerably thick milk of lime, and afterwards lixiviated with water, and the liquor vigorously shaken up several times with chloroform. The chloroform is then separated by means of a funnel having a stop-cock and shaken with sufficient acid to render it neutral or slightly acid. In this way solutions of sulphate, hydrochlorate, nitrate, etc., of pelletierine can be obtained, which may be crystallized by evaporation in a vacuum over sulphuric acid. To isolate the alkaloid it may be set free by treating the saline solutions with carbonate of potash and agitating with ether or, better still, chloroform. The ethereal or chloroform solution then being distilled at a gentle heat the alkali is left as a residue.

One kilogram of dry commercial bark yielded to the author by this process four grams of crystallized pelletierine sulphate. With fresh bark the yield would probably be greater.

Pelletierine is of an oleaginous consistence and is colourless when obtained by evaporation of its ethereal or chloroformic solution in a vacuum, but when the solution is distilled in the open air the alkaloid becomes slightly yellow. A match dipped in pelletierine burns like one saturated with an essential oil.

Pelletierine is volatile, and has a slightly stupefying aromatic odour. It gives off vapour at the ordinary temperature, and the oil spots that it forms on paper disappear after exposure to the air for a short time. It boils at about 180° C., becoming strongly coloured in the air, but it commences to distil at a much lower point. The alkaloid is very soluble in water, alcohol, ether, and especially in chloroform, which readily removes it from aqueous solutions.

Pelletierine is a powerful alkali, saturating acids to form salts. Upon bringing near to it a rod dipped in hydrochloric acid white fumes are formed as with ammonia. It does not precipitate solutions of the metals of the earths and alkaline earths, but it does precipitate solutions of most of the true metals. Thus it gives a white precipitate with salts of lead, mercury, zinc, and silver, the last two being redissolved in excess of pelletierine. With nitrate of cobalt and with sulphate of copper it gives blue precipitates which are not redissolved in excess. It does not precipitate chloride of platinum, but it precipitates the chlorides of palladium and of gold, the last precipitate being reduced by heat. Further, like other alkaloids, it is precipitated by tannin, bromine water, iodo-iodide of potassium, iodide of mercury and potassium, iodide of potassium and cadmium and phosphomolybdic acid. The precipitate formed with tannin is soluble in an excess of the reagent; that formed with bromine water is soluble in an excess of pelletierine.

The author has prepared the sulphate, hydrochlorate and nitrate of pelletierine in crystals. These

* *Comptes Rendus*, vol. xxxvi., p. 1270.

salts are extremely hygroscopic. Obtained by evaporation of their solutions in a dry vacuum they are colourless. If the neutral solutions are evaporated in a stove they become coloured yellow, and at the same time by loss of part of the base they acquire an acid reaction. The salts have a slight odour, and their taste is bitter and aromatic.

THE TURPENTINES AND RESINOUS PRODUCTS OF THE CONIFERÆ.

BY DR. JULIUS MOREL,

Professor of Chemistry in the Industrial School, Ghent.

Formerly it was alleged that sandarach was yielded by a large variety of the common juniper (*Juniperus communis*) or oxycedrus (*Juniper oxycedrus*); but Schæsbœ, a Danish traveller, asserts that the common uniper does not grow in Africa. The error can only be explained by supposing that the *Callitris quadrivalvis* had been mistaken for a juniper.

The *Callitris quadrivalvis* is a plant that does not attain a large size. It is met with abundantly in the mountains of North-West Africa, in Algeria and the Atlas region. The product comes to us principally from Morocco, by way of Mogador and Cairo.

Extraction.—Sandarach exudes naturally through the bark of the stem. Nevertheless in every place where the collection of the resin is now carried on incisions are made in the stem and especially in the lower part of it. The proportion of resinous juice exuding under these conditions is much larger. The juice hardens rapidly upon the plant.

Characters.—Sandarach occurs in commerce under the form of grains or tears, the tears being generally much elongated. Some pieces have a length of 2 to 3·5 centimetres, but the greater part do not exceed 0·5 to 1·5 centimetre. The tears are usually cylindrical, rarely pyriform, most frequently separated, but sometimes agglutinated together to form a plaited mass. In colour the resin varies from pale yellow to pale red-brown. The best sorts consist of picked tears having a beautiful yellowish tint, and very clear and transparent. The surface of the tears appears to be covered more or less with powder, but this character is not to be attributed, as alleged by Herlant,* to the friction of the fragments one against another, but as has been ascertained by a microscopical examination by Dr. Julius Wiesner,† to the unequal contraction of the resin while drying, resulting in a mass of fissures that form, as in the case of several kinds of copal, facets that gradually separate from the mass and constitute the "powder" of many authors.

Sandarach is slightly harder than mastic (the resin of *Pistacia lentiscus*); it scratches that substance, as well as mica. Its hardness corresponds to that of copal kauri. At the ordinary temperature it remains hard, but at 100° C. it softens, and about 150° C. it melts and swells.

According to Brisson the specific gravity of sandarach is 1·092; Pfaff gives it as 1·09, and Flückiger as 1·066. Its fracture is clean or slightly curved, and the surface of the fracture is always shiny. At the ordinary temperature the odour is very weak, aromatic, and terebinthinate; but it becomes more pronounced upon heating the resin.

This resin does not soften in boiling water. It is completely soluble in alcohol and in ether, and the ethereal solution treated with alcohol does not become turbid. The alcoholic solution treated with acetate of lead gives a precipitate that is not completely redissolved at the boiling temperature. The same alcoholic solution treated with ammonia remains clear. Sandarach is slightly soluble in chloroform. A saturated alcoholic solution of hydrochloric acid and also sulphuric acid colour the resin dark brown; nitric acid colours it pale brown. Further, sandarach is partially soluble in benzol, rectified petroleum, and oil of turpentine; caustic soda and acetic acid do not exercise any action upon it; it is very slightly in carbon bisulphide and boiling linseed oil; and under the action of ammonia it swells and afterwards dissolves.

Alcohol, ether containing alcohol, and ether dissolve sandarach completely, the solution giving with acetate of lead a voluminous precipitate, which is not dissolved by boiling. Ferric chloride colours the alcoholic solution greenish-brown; ammonia gives with the same solution a clear liquid. It is slightly soluble in chloroform, and the bromine test is decolorized by the chloroformic extract. A saturated alcoholic solution of hydrochloric acid dissolves it with a brown colour; concentrated sulphuric acid dissolves it with a yellow-brown colour, the solution becoming turbid upon the addition of alcohol or water. Solution of carbonate of soda colours it yellow at the ordinary temperature; when heated to boiling it dissolves a great part of the resin. If this solution be treated with acetic acid the resin separates in the form of flocks. With chloride of calcium no reaction is obtained. Hirschsohn failed to detect in sandarach the presence of nitrogen, sulphur, cinnamic acid or umbelliferon. The solution in petroleum spirit was colourless; it coloured solution of iodine violet-red without producing the least turbidity. The residue from the evaporation of the solution in petroleum spirit presented no reaction with chloral hydrate. Sulphuric acid and Fröhde's reagent dissolved this residue with a citron yellow colour, the edge of the solution becoming rose.

Sandarach occurs in commerce under two forms:

* Herlant states that according to Dodonæus the name "Sandarach" was applied by the ancients to three different substances: one the subject of this notice; the second realgar; the third, known under the names "cerinthus" and "erithæa," was used to feed bees whilst working. The cerinthus was the plant now known as *Cerynthus major*, L.

* 'Etude sur les Produits Résineux de la Famille des Conifères,' p. 38.

† 'Die chemisch-technisch verwendte Gummiarten, Harze und Balsame,' 1869, p. 129.

the first, presenting all the characters above described, is sold as "picked sandarach" (*sandaraca electa*); the second, common sandarach (*sandaraca in sortis seu naturalis*) is met with as dark coloured but transparent tears, mixed with much impurity, such as earthy and ligneous particles.

Chemical Composition.—Sandarach is composed of three different resins. Resin α ($C_{40}H_{62}O_5$) is soluble in 60 per cent. alcohol, in ether, and in oil of turpentine; the alcoholic solution reddens blue litmus. Resin β ($C_{20}H_{31}O_3$) is soluble in absolute alcohol, in ether, and in oil of cumin; it is insoluble in rectified petroleum and in oil of turpentine. Resin γ ($C_{20}H_{30}O_3$) dissolves in absolute alcohol, and in ether of 87 per cent., but is insoluble in volatile oils. Undervorben has isolated these three resins in the following manner. Sandarach was dissolved in absolute alcohol and the solution treated with caustic potash; a precipitate was formed which was a combination of resin γ with the potash. The supernatant liquid separated by filtration was treated with hydrochloric acid, which caused a precipitation of two other resins. These were washed and dried and then treated with boiling 67 per cent. alcohol, which dissolved the resin α and left the resin β intact. The potassic combination of resin γ, treated with hydrochloric acid, yielded a precipitate of the pure resin. It has not yet been demonstrated that the odour of sandarach resin should be attributed to a particular essential oil; such an oil is believed to exist in fresh sandarach, but the product occurring in the drug warehouses certainly does not contain it. Submitted to distillation sandarach yields an empyreumatic liquid, resembling the product of the distillation of amber, and the aqueous portion of which contains acetic acid and succinic acid.

Adulterations.—Sandarach is frequently substituted for mastic, but they may be distinguished by the mastic crackling and softening under the teeth, whilst the sandarach fractures clean. Further, mastic occurs in rounded and transparent tears, and dissolves completely in ether and oil of turpentine, and incompletely in cold alcohol; whilst sandarach resin is completely soluble in alcohol, and incompletely soluble in ether and oil of turpentine.

It has also been alleged that sandarach has been often adulterated with pieces of gum arabic; but Wiesner, who has devoted considerable attention to the examination of this product, has never met with any traces of such admixture.

Uses.—According to Gubler the Arabs used sandarach resin as a remedy against diarrhœa, and to lull pain in hæmorrhoids. The Chinese* employed it as a stimulant in the treatment of ulcers (as promoting the growth of flesh), as a deodorizer, and to preserve clothes from the attacks of insects. In Europe it is used very little in medicine. It is most frequently employed as an ingredient in varnish, to increase its hardness and glossiness. It is used also as a fumigant, and in powder to dust over paper of which the surface has been scraped, in order to prevent the ink from running. Rarely it enters into the composition of plasters.

With sandarach resin may be connected another resinous substance that was exhibited in the Paris exhibition of 1867, from South Australia, under the name of "pine gum."* It is the resin of *Callitris Reissii*, Miq. (*C. robusta*, R. Br.; *Frenella robusta*, Cunningh.) This product resembles sandarach, and might become an important article of commerce. Mitchell states that the plant is met with in the sub-tropical parts of New Holland. Reiss has met with it at Rocky Bay and Woodman's Point, and Baxter has found it in King George's Sound. This resinous substance occurs under the form of slightly yellowish tears, thicker and longer than those of ordinary sandarach. In consequence of unequal contraction it presents, like sandarach, numerous facets, and consequently the surface appears to be covered with a white powder. By examining this resin under the microscope Wiesner ascertained that the finer fissures were derived from the larger ones. In its transparency and hardness the resin of *Callitris Ressii* corresponds to sandarach. Its odour is very agreeable and balsamic, and its taste is bitter and aromatic.

(*To be continued*).

* According to Soubeiran, 'La Matière Médicale chez les Chinois,' 1874, p. 134, "This sandarach would be yielded by the *Callitris sinensis*."

THE CITRIC ACID MANUFACTURE IN THE UNITED STATES.†

BY A. C. WEHRLI, PH.G.

The use of citric acid in medicine and pharmacy is well established; although there are not many salts and preparations of citric acid officinal, some of them are very extensively used. The use of this acid at present as a refrigerant is indicative of the time when the acid in the free state was not known, and man used it as nature gave it for a refreshing drink from the juices of fruits, in which condition only was it known till the knowledge of chemistry liberated it to enjoy a wider range of usefulness. Citric acid takes precedence over many others for the introduction of inorganic substances to the human system, such as iron, bismuth, magnesia, etc., because of its vegetable origin, and easy assimilation by the system, and thus do vegetable substances become mediators between the animal and mineral kingdoms, a process pre-eminently employed by nature in the elaboration of animal tissue in which inorganic elements enter, a process man is not slow to imitate in the administration of medicines. Being of vegetable origin, and so extensively used, the possibility of its being poisonous is seldom considered by many; that such is the case is held by high authority, when taken in large quantities, its effects then being similar to oxalic acid, it causing a softening of the tissue with which it comes in contact, although no conclusive evidence exists regarding such an action on the human system. We are led, however, to believe that such might be the case, when we observe the peculiar effect that even a small quantity has on some persons, causing severe headache, etc. Its distribution in the vegetable kingdom is very extensive, so much so that we are surprised at the comparative high price of the manufactured article, when it is known that annually tons of the fruits, such as limes, lemons, and sour oranges, go to waste in the countries which produce them, not only in Italy and Sicily, but in the southern part of the United States, where they are now so extensively cultivated, as in Florida and Mexico. It was probably from this fact that the manufacturing firm of Powers and Weightman have of late availed themselves of the opportunity to utilize the damaged fruits (the result of windfalls, etc.) which are grown in that country, thereby stimulating a new enterprise in the South, for which they received a medal, which was awarded May 12, 1875, by the Franklin Institute of Philadelphia—"For the introduction of an industry new in the United States, and perfection of result in product obtained in the manufacture of citric acid."

† An Inaugural Essay presented to the Chicago College of Pharmacy. From the *Pharmacist*, May, 1878.

Although citric acid is not made exclusively from fruits grown in this country, its manufacture from this source seems to compare favourably with that from Italy and Sicily. At the Centennial Exposition of 1876, at Philadelphia, were exhibited lime, lemon and sour orange juices, both from this country and Europe. The juice is prepared by pressing the fruit in the same way as apples for cider, and then concentrated in copper boilers to one-sixth its original volume, and shipped in vessels containing about 120 gallons. As thus shipped, they are dark brown, syrupy liquids, with specific gravities ranging from 123 to 128, containing from 28 to 32 per cent. by weight of acid. The object of concentrating the liquid is obvious, not only to lessen the cost of shipping, but to prevent decomposition, which a dilute solution is prone to. The source of citric acid then is almost exclusively from the juice of the lime, lemon and sour orange. Some other fruits contain it also in large quantities, but still not in paying ones. The fruit of *Sambucus racemosa rubra*, or red elder berry, growing sparingly in this country, has been proposed in France as a source for this acid. One hundred pounds of currants or gooseberries yielding one pound of citric acid, being just one per cent., its production from this source could never be feasible, as its abstraction from these would entail the use of more complicated processes and apparatus, on account of containing other acids. The fruit of *Viburnum macrocarpon*, or large American cranberry, is probably consumed to a greater extent in this country than any other acid fruit. On account of its flavour, agreeable acidity, and property of forming jellies, its cultivation in this country has assumed large proportions, an interest rather monopolized by the North-west, especially Wisconsin and Minnesota, where vast marshes are literally covered with it. Requiring no care or attention, it grows spontaneously, and yearly the picking affords employment to a large number of people. There are two species of this genus yielding acid fruits, *Vaccinium oxycoccus*, or small cranberry, and the *V. macrocarpon*, or large American cranberry; both are perennial trailing herbs. The fruit of the former is never used, that of the latter is, and is distinguished in the market by names suggested by its shape, as bell, bugle and cherry cranberry. That its fruit can be developed on soil where nothing else can is explained by the fact that the berries contain, according to Prof. Horsford, besides 88 per cent. of water and 11 per cent. of woody fibre and acids, only 17-100 per cent. of inorganic material; requiring, therefore, little for their development but air and water. Although requiring little or no care in their production, it would still not pay to use them as a source for this acid, because commanding such a high price as an article of food. Judging from some reports, it would require but the shadow of a cranberry marsh to become wealthy. For the sake, however, of determining the amount of citric acid in these, as compared with an equal quantity of limes, lemons, and sour oranges, they were subjected to the following examination. Of course, the amount of citric acid in the limes, lemons, and sour oranges, as found in this market, and indeed everywhere, is never constant. Especially is this the case with sour oranges, which gradually lose their sour taste, becoming sweet. Lemon juice enters into several officinal preparations as mistura potassa citratis and syrupus limonis. The small deviation in strength is of no importance:

Table of Results.

	Citric Acid in 1 f. ounce.	Citrate of Calcium, 1 pound.	Represents Citric Acid.	
Cranberries .		72 gr.	56·6 gr. =	0·80 per ct. of fruit.
Lemons . .	34·74 gr.	300 ,,	236 ,, =	3·37 ,, ,,
Limes . . .	30 ,,	326 ,,	256 ,, =	3·65 ,, ,,
Sour Oranges.	10 ,,	128 ,,	100 ,, =	1·43 ,, ,,

To determine the amount of acid in cranberries, the acidity of one pound was exhausted with water evaporated to a low bulk and pectinaceous matter precipitated with alcohol, the filtrate freed from alcohol by evaporation, and then diluted with water, and exactly neutralized with sodic hydrate, to this was added an aqueous solution, chloride of calcium, giving no precipitate in the cold, indicating the absence of tartrates; on boiling, however, the characteristic precipitate for citrates was obtained; the resulting citrate of calcium was collected on a filter, and to the filtrate was added strong alcohol and a little calcium chloride, giving no precipitate, indicating the absence of malates, malate of calcium being soluble in water, but not in even a very dilute alcoholic liquid; the precipitate of calcium citrate, purified by dissolving in solution chloride of ammonium, from which it is precipitated on boiling, dried, and weighing 72 grains. On consulting the chemical formula of calcium citrate ($Ca_3\,2C_6H_5O_7\,2H_2O = 534$) it is found that 72 grains will yield 56·6 grains citric acid, being 0·8 per cent. of the weight of fruit used.

The absence of every other acid but this was surprising, especially the absence of malic, which is seldom absent from acid fruits; therefore this acid was separately tested for by other processes, with the same result.

From this it would seem that the cranberry, like the lemon, is one of the few acid fruits containing only citric acid. The amount of citric acid in the other fruits was determined as above; an equal weight of lemons, yielding 300 grains of calcium citrate, equivalent to 236 grains of citric acid, being 3·37 per cent. of the weight of the fruit. The same weight of limes yielding 326 grains of calcium citrate, equivalent to 256 grains of citric acid, or 3·65 per cent. of the weight of the fruit. Sour oranges yielding 128 grains calcium citrate, equivalent to 100 grains of citric acid, or 1·43 per cent. of the weight of fruit. Although limes, as a general thing, contain the largest amount of citric acid, when equal weights of the fruits are taken, still in equal bulks of the juice it contains less than lemons, as was found when tested by acidemetry. Using the volumetric solution of hydrate of sodium, limes, lemons, and sour oranges were found to contain, respectively, 30, 34·74 and 15 grains of citric acid to the fluid ounce of juice.

The process employed for the manufacture of citric acid is essentially that used by Scheele, its discoverer, almost a century ago, *i. e.*, that of throwing down the citric acid as insoluble calcium citrate, and decomposing this with sulphuric acid, liberating citric acid, which is filtered off from the insoluble calcium sulphate, evaporated and crystallized. When made on a large scale, leaden vacuum pans are used for concentrating the acid solution, thus avoiding the high heat to which the acid would otherwise be subjected, which would result in the decomposition of some acid into other products.

Up to within two or three years the American market was wholly supplied from English manufacturers, who manufactured it exclusively from Sicilian lemon juice. At present the home product is fast superseding the English acid in this market, and has had the effect of considerably reducing the price from an average price of 1·15 dollar, as it was five years ago, to 70c., as it is to-day. Both the English and American acids being made by the same process, little difference could exist as to their purity; but as the acid, in different states of purity, is extensively used in calico printing, some of this might easily find its way into the drug market.

The comparative purity of citric acid is seldom doubted, yet the British Pharmacopœia includes a number of tests for its purity, the impurities, if any, being tartaric acid, sulphuric acid, slight traces of copper and lead, the tartaric acid being an intentional adulteration; the sulphuric acid being that retained by the citric acid in process of manufacture, which causes the crystals to absorb moisture on exposure to air, by which fact its presence can be recognized; the slight traces of copper or lead being from the vessels in which it is evaporated. Although not attacking these metals at ordinary temperatures, at elevated temperatures a small portion is liable to contaminate them.

To determine if these impurities are present, six samples of both English and American manufacture were subjected to the following tests: One ounce of each of the acids was separately dissolved in four fluid ounces of water, then made nearly neutral with solution of sodic hydrate, the solution concentrated, a small quantity of alcohol added, and then a concentrated solution of acetate of potassium. Tartaric acid, if present, would then have been precipitated as acid tartrate of potassium (cream of tartar), but from no solution was a precipitate obtained, indicating the absence of tartaric acid. 240 grains of each were then separately dissolved in four fluid ounces of water, neutralized, and the solution treated with neutral acetate of lead so long as a precipitate was formed, the supernatant liquid poured off, and the precipitate boiled with dilute nitric acid, in which it was soluble, with the exception of the faintest trace, proving the absence of sulphate. For the detection of lead, the aqueous solution was treated with H_2S. In every case a black discoloration was produced, which on standing produced a black precipitate; this, when treated with nitric and then sulphuric acid yielded, on evaporation, after heating thoroughly, a white precipitate, insoluble in acids, weighing but the fraction of a grain, being the sulphate of lead from eight troy ounces of citric acid.

This proves to my mind that citric acid is quite pure; that it is so will be more satisfaction to some, probably, than had many impurities been found.

MATÉ, OR PARAGUAY TEA.*

BY ALONZO ROBBINS, PH.G.

Ilex Paraguayensis, Yerba Maté, or Paraguay tea, is a small tree belonging to the family of the Celastrineæ. Under the name of maté the prepared leaves of this tree have been employed as a beverage in South America from the earliest period, and in some portions of that country even now, to the almost entire exclusion of China tea. Maté having attracted considerable attention in Europe within the last few years, the writer embraced the opportunity afforded by the Centennial Exhibition to obtain authentic specimens, which were exhibited by the government of the Argentine Republic, and furnished by the provincial commission and private individuals of the province of Corrientes and the adjoining territory of the Missions in that republic. Although maté is but little known and of comparatively small importance in the United States, its immense production and use in South America render it deserving of greater attention that has been hitherto given to it. As several papers more particularly referring to its general use and commercial importance have been recently published, the direction of this paper will be principally confined to its proximate composition and the difference therein which the several samples mays how.

According to Dr. Mantegazza, maté is prepared as follows: The entire trees are cut down, and the small branches and shoots are taken with the leaves and placed in the tatacúa, a plot of earth about six feet square, surrounded by a fire, where the plant undergoes its first roasting. From thence it is taken to the barbacúa, which is a grating supported by a strong arch, underneath which burns a large fire; here it is submitted to a particular torrefaction, determined by experience, which develops the aromatic principle. Then it is reduced to a coarse powder in mortars formed of pits dug in the earth and well rammed. It is next put into fresh bullock skins, well pressed, and placed in the sun to dry. Other writers have given accounts of its preparation differing in the minor points, but all agreeing in the main.

The following is a description of the samples and their history so far as it was possible to ascertain it:

No. 1. Exhibited by M. Vera; packed in bag made of wolf skin, weight about 4 kilos, colour bright greenish-yellow, odour not as aromatic as some of the other samples, almost entirely free of twigs, and appears to have been prepared from very young leaves dried with little if any artificial heat.

No. 2. Exhibited by T. B. Appleyard; size of package and general appearance and character of this sample very much like No. 1.

No. 3. Exhibited by I. Arrillaga; weight about 8 kilos, packed in the entire skin of a tapir; this maté was rather coarse, containing many twigs, some of which were charred slightly; colour a dull browish-green, odour very aromatic and balsamic. This sample is believed to have been prepared by the Guarani Indians of the northern part of the Missions.

No. 4. Exhibited by the Provincial Commission; weight 15 kilos, packed in the entire skin of a tapir, general appearance and character of this sample like No. 3.

No. 5. Exhibited by the Provincial Commission; weight 10 kilos, packed in the entire skin of an animal. This sample was very unevenly powdered, and much of it quite coarse; it also contained a large proportion of twigs somewhat charred, and much sand; in colour it resembled No. 4; the odour was also similar to that sample, but much weaker; its general appearance indicated the most primitive mode of preparation. This sample was from the department of Itaty on the Parana.

No. 6. Exhibited by the Provincial Commission; packed in small skin bag, weighing 3 kilos. This maté was coarsely powdered, very dark in colour, odour quite aromatic and balsamic, and contained many fruits and twigs. It was also from Itaty.

No. 7. Exhibited by the Provincial Commission; packed in skin bag, weighing 65 kilos. This maté was finely powdered, of a bright colour, aromatic odour, and contained only a small proportion of twigs. This sample was from the northern part of the territory of the Missions, which furnishes the most celebrated maté. This territory is formed by that part of the extinct empire of the Jesuits, which was inherited by the Argentine Republic. Among the forest trees which grow admirably in the Missions that which produces the Yerba Maté merits a special mention. Near the river Uruguay it forms extensive forests, which are the source of a most important industry, whose principal centre is in the Villa de San Xavier.

The appearance and character of the samples indicate that there are at least three sorts of powdered maté. First, that made from the young leaves; samples Nos. 1 and 2 appear to be of this sort. Second, that prepared by the original primitive method of the natives, and which exceeds both of the other kinds in aromatic properties; of this sort Nos. 3, 4, 5, and 6 appear to be samples. Third, that prepared with more care and with the aid of modern furnaces for its torrefaction, and mills for its pulverization; of this sort No. 7 appears to be a sample.

The following experiments were all performed with the utmost care, the method of examination adopted was uniformly applied to all the samples, the air-dried maté was in each case powdered and kept in a well stoppered bottle, to be drawn from as required. The results shown by the first table were obtained by subjecting ten grams of maté to the separate action of each of the different solvents and processes as there shown. The results shown by the second and third tables were obtained by treating ten grams of maté successively with the solvents in the order there given, the difference being that in the second table the maté is last treated with boiling water, and in the third table that solvent is the first to which it is subjected.

* From the *American Journal of Pharmacy*, June 1878. Read at the Pharmaceutical Meeting, April 16, 1878.

Treatment with Boiling Water, Table No. I.—10 grams of powdered maté were boiled half an hour with 100 c.c. of water, the decoction poured off, and the process repeated four times with the same quantity of water; the decoctions were mixed, filtered, and evaporated on a water-bath to dryness. The extract obtained was of a brown colour in mass, yellow in powder, of slight odour and mild bitter taste. It contained caffeina, tannin, gum, starch, and pectin.

The extract yielded to boiling water by 10 grams of maté after treatment as in Table No. II., was, when powdered, of the colour of unburnt umber, inodorous and tasteless; it consisted principally of starch and pectin.

Treatment with Petroleum Benzin, Table No. I.—10 grams of powdered maté were exhausted by percolation with petroleum benzin, and the benzin allowed to evaporate spontaneously; the result was a thick greenish-black oily extract; the exhausted maté after drying was free of the benzin odour, and retained but little of its own natural odour; the extract after a long time was not entirely free of the odour of the benzin. This extract was found to contain chlorophyll, resin, wax, and fatty matter, and probably a small quantity of volatile oil, though none could be separated; it contained no tannin or caffeina.

After the preparation of a fluid extract of maté by percolation with alcohol, sp. gr. ·941, the residue was dried and 1000 grams of it exhausted by percolation with petroleum benzin; upon spontaneous evaporation of the percolate 43 grams of dark green extract remained; a portion of this having the consistence of castor oil was separated, and a thicker portion, which adhered to the bottom of the dish, was washed with aqua ammoniæ as long as it removed anything, and then washed with dilute hydrochloric acid. There now remained 3·70 grams of a black mass, very adhesive and elastic, and burning with the well-known odour of caoutchouc. This experiment proves that the substances soluble in petroleum benzin are not removed from maté by alcohol of the specific gravity ·941, and a comparison of the figures in the petroleum benzin line in the tables also shows that boiling water fails to remove the same substances.

Treatment with Chloroform, Table No. I.—10 grams of powdered maté were percolated with chloroform until exhausted, and the chloroform evaporated spontaneously; the extract obtained was of a soft waxy consistence, fragrant odour and dark green colour: it contained wax and fatty matter, chlorophyll, resin and caffeina, but no tannin.

The extract obtained by chloroform from 10 grams of maté after treatment as in Table No. II., was pulverulent, of a dark green colour and slight fragrant odour; it contained resin and caffeina, but no tannin.

The extract yielded to chloroform by 10 grams of maté after treatment as in Table No. III., was pulverulent, of a greyish olive colour, and almost odourless; it contained resin and chlorophyll, but no tannin or caffeina.

Treatment with Alcohol, sp. gr. ·822, Table No. I.—10 grams of powdered maté were exhausted by percolation with alcohol, and the alcohol driven off on a water-bath. The extract obtained was of a soft consistence, heavy narcotic odour, and deep green colour; it contained fatty matter, chlorophyll, resin, tannin, and caffeina. A portion of the residue of the maté, after percolation with alcohol, was dried and percolated with petroleum benzin; the percolate was colourless, and upon evaporation no extract whatever was obtained, proving that alcohol of sp.gr. ·822 dissolves all the constituents of maté which are soluble in petroleum benzin. Another portion of the residue from percolation with alcohol was percolated with chloroform; a brownish-green percolate was obtained, which upon evaporation yielded a small quantity of hard, green, wax-like matter, readily fusible, and when burnt giving off the odour of caoutchouc.

The extract yielded to alcohol by 10 grams of maté after treatment with petroleum benzin and chloroform as in Table No. II., was of a soft consistence, greenish-brown colour in mass, and transparent bright yellow colour in thin layers, the odour fragrant and very agreeable, the taste bitter and acrid; it contained resin and tannin, but no caffeina.

The extract obtained by alcohol from 10 grams of maté after treatment with boiling water, petroleum benzin and chloroform, as in Table No. III., was of a dark green, almost black, colour, easily powdered, yielding a pale greyish-green powder, nearly inodorous, and of a slight bitter taste; it contained tannin, but was entirely free from caffeina.

Treatment with Dilute Alcohol, sp. gr. ·941, Table No. I.—10 grams of powdered maté were exhausted by percolation with dilute alcohol and the resulting tincture evaporated to dryness on a water-bath. The extract obtained was of a brown colour, readily powdered, yielding a light yellow powder, of slight odour, and bitter astringent taste; it contained resin, caffeina, and tannin.

The extract yielded to dilute alcohol by 10 grams of maté after treatment as in Table No. II., was of a dark brown colour, readily powdered, yielding a brownish-yellow inodorous powder, of slight bitter, astringent taste; it contained tannin and gum, but no caffeina.

The extract obtained by dilute alcohol from 10 grams of maté, after treatment as in Table No. III., was of a light brown colour in mass, dull yellow when powdered, inodorous and almost tasteless, the presence of tannin shown, but it was entirely free of caffeina and resin.

Tannin.—For the estimation of the tannin the following process was employed (for additional details of similar process, see 'Proceedings of the American Pharmaceutical Association,' 1876, page 513, and *American Journal of Pharmacy*, 1877, page 388). Of each sample of maté, finely powdered, 10 grams were taken and separately treated; first by percolation with petroleum benzin; this removed most of the green colouring matter and none of the tannin, as the percolate upon evaporation and treatment with water failed to give to the proper reagents any indication of the presence of tannic acid. The maté was removed from the percolator, and after drying repacked and treated with alcohol of seventy-five per cent. until the percolate passed free of colour; then the residue was removed to a flask and boiled with several successive portions of alcohol of the same strength, the several tinctures mixed, when cold filtered and the filter washed with alcohol. The alcohol was then driven off on a water-bath, and the solution made up to the previous measure with distilled water, and a slight excess of basic acetate of lead added, which threw down an abundant bright yellow precipitate. This was well washed with distilled water, decomposed by sulphuretted hydrogen, and after heating on a water-bath to remove excess of the sulphuretted hydrogen, the sulphide of lead was removed by filtration and the filter well washed with distilled water. The filtrate was a clear solution of an intense yellow colour, and upon being evaporated on a water-bath to dryness yielded a light-brown amorphous mass, fusible by heat, and which, when powdered, was of a buff colour; its solution strongly reddens litmus paper. The quantity obtained from each sample is shown in Table No. I. It will also be observed that those samples containing the most tannin contained the least caffeina. The following is a description of the behaviour of this peculiar tannic acid with different reagents:—

With ferric salt it gives a bright green at first, turning to brown on standing, and a brown precipitate; with ferrous salts no change at first, becomes green on standing and deposits very dark olive precipitate; with fixed alkalies transparent dark yellow colour unchanged by heat, no precipitate; lime water gives a transparent pure yellow, and on standing a greyish-brown precipitate; aqua ammoniæ gives a transparent intense yellow, almost brown, no precipitate; acetate of copper gives a light green precipitate, not soluble in excess of precipitant; sulphate of copper gives no precipitate in the cold, but when heated a brown precipitate is given; ammonio-sulphate of copper slowly precipitates in the cold, and at once if heated; nitrate of silver is reduced by the aid of heat to the specular form; auric chloride is decomposed in the cold; barium nitrate gives a faint but immediate yellowish-white precipitate; stannous chloride gives a white precipitate; tartrate of antimony and potassium produces no precipitate; sulphate of quinia and sulphate of cinchonia both produce white precipitates; gelatin gives no precipitatate; acetate of lead gives a yellowish-white precipitate; permanganate of potassium in solution is immediately decolorized; molybdate of ammonium produces a brownish-red, which is changed to yellow by oxalic acid; morphia gives a slight precipitate on standing; strychnia gives a white precipitate; aconitia gives no precipitate; veratria with hydrochloric acid gives a white precipitate; salicin and santonin give no precipitate; piperina with hydrochloric acid, colour lightened but no precipitate; sulphuric acid, aided by heat, changes a concentrated solution to a deep red.

Caffeina.—The following process was employed for the determination of the quantity of caffeina: 10 grams of powdered maté and 4 grams calcined magnesia were boiled for half an hour with 500 c.c. distilled water, and filtered while hot, the residue and the filter returned to the flask, 500 c.c. water added, and again boiled for twenty minutes; then filtered and boiling water poured on the filter until the filtrate passed colourless and tasteless. The filtrate was then evaporated at a moderate heat over a naked fire until reduced to 200 c.c., and then 10 grams of powdered glass and 1 gram calcined magnesia were added, and the evaporation continued on a water-bath to dryness. The dry residue was then finely powdered and placed in a small flask with 30 grams chloroform and boiled for a few minutes, and then filtered through a funnel, the neck of which was closed with cotton, and over this was placed a layer of powdered glass. The residue in the flask was treated with fresh portions of chloroform until the caffeina was all dissolved out. The chloroform was then allowed to evaporate spontaneously in a weighed capsule, yielding the caffeina in fine silky form on the bottom and sides of the capsule—perfectly white if the chloroform solution had been allowed to cool before filtration, but if filtered hot the caffeina was very slightly tinted of a greenish colour. The amount of caffeina obtained from each sample will be found in Table No. I.

The Ash.—The determination of the total, the soluble and the insoluble ash was made as follows: 10 grams of maté were burned and the resulting ash weighed, then boiled in a little distilled water, and filtered while hot through a weighed filter, and the filter washed with boiling distilled water. The filtrate, upon evaporation and ignition, gave the weight of the soluble ash, which was verified by drying the filter and its contents, and subtracting the weight of the filter from the total weight. The insoluble ash was then treated with hydrochloric acid, and after washing by decantation, the insoluble portion was dried, ignited, and then weighed, the loss in the weight being taken as the quantity soluble in the acid. The portion insoluble in the hydrochloric acid was principally sand.

Owing to the usual mode of preparing maté, it is rendered certain that the ash is not all from the constituents of the leaves themselves, but partly from earthy matter introduced during the process of preparation.

Pharmaceutical Preparations.—The following preparations of maté are suggested: The simple infusion which is the form in which it is always used in South America; a solid extract prepared with alcohol of sp. gr. ·822, and a fluid extract prepared with alcohol of sp. gr. ·941, in such proportion that when finished its weight will be equal to the weight of maté used in its preparation. A considerable quantity of fluid extract prepared by this formula has been used in debility and in various derangements of the nervous system, generally with satisfactory results.

The reputed therapeutical properties of maté have been fully stated in a number of previously published papers, some attributing the most deleterious effects to its continued use, and others lauding it to the utmost limit of credibility, almost equalling the marvellous statements made of the action of the somewhat similar substance, coca. In regard to maté, however, the writer is fully convinced that it does really possess properties which render it worthy of careful therapeutical investigation.

The thorough desiccation it undergoes in its preparation, and the compact and hermetical character of the packages in which it is contained, tend greatly to the preservation of whatever virtues it may have originally possessed.

SULPHOSALICYLATE OF QUINIA *

Cahours in 1843 recognized the fact that salicylic acid combined with the vapour of sulphuric anhydride. Mendius in 1857 studied this combination, and named it sulphosalicylic acid. Recently Schiff and Remsen have also found that this compound may be prepared by the action of concentrated sulphuric upon salicylic acid. Equivalent quantities of sulphuric acid (98 parts) and of salicylic acid (138 parts) are gently heated together,† producing the new compound in form of a solid deliquescent mass, soluble in water, alcohol, and ether, from which solutions it is deposited on evaporation in long, prismatic needles. Ferric chloride imparts to the solution an intense red-wine colour, differing in this from salicylic acid, which strikes an intense violet.

The best starting point for the preparation of sulphosalicylates of definite composition is the barium salt, which is easily obtained by saturating the hot compound

* From *New Remedies*, April, 1878.

† $C_7H_6O_3 + H_2SO_4 = C_7H_6SO_6 + H_2O$
Salicylic acid + sulphuric acid = sulphosalicylic acid + water

acid with barium carbonate, filtering and—if the salt is desired in a solid condition—cooling or evaporating the solution, when barium sulphosalicylate will crystallize out in hard, shining monoclinic prisms, but little soluble in cold, quite soluble in hot water, and insoluble in alcohol. Its formula is $C_7H_4BaSO_6+3H_2O$; but by varying the temperature, or by concentrating the mother waters left after the first crystallization, two other modifications of barium sulphosalicylate may be obtained, differing in crystalline shape, and probably in water of crystallization.

To prepare sulphosalicylate of quinia, a boiling hot solution of barium sulphosalicylate is exactly decomposed with a boiling solution of neutral quinia sulphate, whereby barium sulphate is precipitated. This is filtered off, and the filtrate (which generally has a roseate tint) cooled, when it becomes covered with a crust of crystals of the new quinia salt. By evaporating the mother waters and cooling, successive crops of crystals may be obtained.

Quinia sulphosalicylate is but little soluble in cold water, although, after having been in contact with it or some time, it dissolves completely. In boiling water it is much more soluble, insoluble in absolute alcohol or ether, but soluble in ordinary alcohol and in chloroform.

INDICATORS IN ALKALIMETRY.*

BY J. T. DUNN, B.SC.

The substance which is almost universally used as an indicator in alkalimetrical and acidimetrical work is litmus. Litmus, however, is by no means free from imperfections, and from time to time different substances have been proposed as substitutes for it. I have thought that a comparison of the principal of these substitutes might not be altogether uninteresting.

The chief requirements in an indicator for alkalimetry are, that the change in colour or other physical character accompanying the passage from the alkaline to the acid condition, or *vice versâ*, shall be easily distinguishable and well marked; that the indications shall be delicate, and shall not be interfered with by boiling, or by the presence of alkaline salts. It would also be desirable if the indicator were unaffected by carbonic acid, and the change could be seen by artificial light.

The indicators which I have examined besides litmus are aurin (rosolic acid, or corallin), phenol-phthalein, fluorescein, cochineal, logwood, hæmatoxylin, alizarin, ferric salicylate, potassic sulphindigotate, and Prussian blue broken up by caustic potash.

This last was suggested at a meeting of this society, some years ago, by Dr. Wright, as a test for free acid, since the brown fluid which is got by suspending a little of the mixture in water turns blue on addition of acid; and it certainly is a very delicate test for acid; but on attempting, at Professor Marreco's suggestion, to use it as an indicator, I found that at each successive alternate drop of acid and alkali the reaction became less and less delicate and sharp. This was found to be due to the presence of sodic sulphate, for when the indicator was heated with a large excess of sodic sulphate in a faintly acid solution the blue colour gradually changed to brownish-black from the precipitation of ferrous and ferric hydrates, and the fluid filtered from these was found to contain sodic ferricyanide. This, of course, totally unfits it for use in alkalimetric work, but the reaction is so curious as to be worth mentioning.

As to the nature of the changes in the various indicators produced by acid and alkali:—Aurin is, in neutral or alkaline solution, a deep red colour, and is changed by acid to a light yellow or nearly colourless fluid. Phenol-phthalein in neutral or acid solution is colourless, and is changed to a deep purple-red on addition of alkali. Fluorescein possesses in alkaline solution a splendid yellow-green fluorescence, which is destroyed by acid. The changes experienced by cochineal and logwood are well known. Hæmatoxylin is almost exactly the same as aurin in its indications, and so also is alizarin. The deep blue ferric salicylate is broken up by alkali, giving a brownish fluid containing suspended ferric oxide; acid, however, does not always restore the blue colour, so I proceeded no further with this one. The last on the list, the sulphindigotate, was also discarded, because the change from blue to green which accompanies the passage from alkaline to acid is by no means so distinct as is desirable.

Next as to the delicacy of the indications. Aurin, hæmatoxylin, logwood, and cochineal are about equally delicate, 200 c.c. of water tinged with each being changed in tint by a single drop of decinormal acid or alkali. Fluorescein and phenol-phthalein are a little less delicate, two drops being required in each case, while alizarin took three drops and litmus required five drops to change it from distinct red to distinct blue.

To test the action of boiling and sulphate of soda on the indications, I dissolved 50 grams of soda ash in a litre of water, took successive portions of 25 c.c., and titrated them with standard acid in the usual way, using the different indicators. Aurin and hæmatoxylin were unaffected, save that the aurin red colour became a little more pink in tint, rendering the change even more conspicuous than in water alone. With phenol-phthalein the final point of the reaction was very difficult to determine, as the pink colour when first produced rapidly fades away, and even when a permanent coloration is reached it is deepened by addition of more alkali, the deepening going on until four or five drops of normal alkali have been added in excess. The changes with fluorescein, cochineal, and alizarin are rendered very much less sharp and distinct, and the logwood assumes a yellowish-brown colour which requires a large amount of acid or alkali to produce any effect on it.

In the case of phenol-phthalein and logwood, to ascertain whether the indistinctness of the reaction was due simply to the presence of sodic sulphate or to the boiling of the solution, portions of the solution of soda ash were taken, an excess of acid added, the liquid boiled to expel CO_2, and allowed to cool; then the indicator was added; and the excess of acid determined by standard caustic soda. In the case of phenol-phthalein, the end of the reaction was just as indeterminate as before, but with logwood it was sharp and distinct, showing that only boiling the solution affects the logwood reaction.

All these indicators are more or less affected by carbonic acid, most of them quite as much so as litmus. Cochineal is perhaps least of all affected, and next to that fluorescein; but both of them are quite sufficiently affected to prevent the use of carbonate instead of caustic alkali in acidimetric work where we wish from any cause to avoid boiling.

On the whole, the only one of these indicators which seems to possess much advantage over litmus is aurin. Hæmatoxylin might be added, but it is no better than aurin, and much more expensive. Aurin is quite as conspicuous in its indications as litmus, or even more so. It is much more delicate; it shares with litmus the disadvantage of being affected by carbonic acid, but it possesses one great advantage over litmus in that it can be worked in gaslight quite as well as in daylight. Litmus, it is well known, can scarcely be used in gaslight, as the change of colour is rendered very indistinct. This can be got over to a certain extent by using sodium light, viewed in which the red litmus looks perfectly colourless and transparent, while the blue appears black and inky looking. But even this is not very sharp, and the trouble of conducting the process in a place where there shall be no other illumination but that of a sodium flame is very great, so that on this account aurin is distinctly preferable to litmus.

A good many preparations of slightly varying composition are sold under the various names of spirit aurin, soluble aurin, corallin, rosalic acid, etc. There is not much difference amongst them, but on the whole I think the "soluble aurin" gives the best indications.

* Paper read before the Newcastle-upon-Tyne Chemical Society.

The Pharmaceutical Journal.

SATURDAY, JUNE 22, 1878.

Communications for the Editorial department of this Journal, books for review, etc., should be addressed to the EDITOR, 17, *Bloomsbury Square.*

Instructions from Members and Associates respecting the transmission of the Journal should be sent to MR. ELIAS BREMRIDGE, *Secretary,* 17, *Bloomsbury Square, W.C.*

Advertisements, and payments for Copies of the Journal, MESSRS. CHURCHILL, *New Burlington Street, London, W.* *Envelopes indorsed "Pharm. Journ."*

ADVANCE OF THE METRIC SYSTEM.

THE mail has this week brought evidence of decided, if but small, progress made on the other side of the Atlantic by the advocates of the Metric System, in a copy of an order issued under the sanction of the Secretary of the Treasury at Washington, for the adoption by the Medical Officers of the United States' Marine Hospital Service of the Metric System of Weights and Measures for purveying medicines, and for other medical and pharmaceutical purposes. Already, for several years past, the metric system seems to have been partially used in this department, in the purveying of drugs, but in future it is to extend to prescribing and dispensing, the order providing that hereafter "in expressing quantities by weight the terms gramme and centigramme only will be used, and in expressing quantities by measure the term cubic centimetre."

The news will, we believe, be acceptable to a large number of our readers, who would gladly see a little more favour shown to the metric system by the authorities in this country, and the way thus prepared more rapidly for a reform in the present anomalous state of the law, which is held to allow a person to keep the weight and measures current throughout the European continent but not to allow their use for business purposes. It will be interesting, therefore, to watch and learn at some future time, say after twelve months, the amount of obedience that this order obtains from the medical gentleman and pharmacists to whom it is addressed; for it is generally admitted that one great obstacle to the wider acceptation and adoption of the metric system is the reluctance to incur the initiatory trouble involved in the expression of weights and measures in the terms of an unfamiliar system, instead of those of one which, although more complicated, has become familiar by long usage. With every desire to see the object of the order attained, we cannot ignore the fact that public opinion is still far from being ripe for compulsory legislation on the question either in this country or in the States, and it remains to be proved how far the compulsion involved in the expression of the wish of the heads of a department will be successful in overcoming the prejudices, or convictions, which may be held by some of the professional gentlemen under their superintendence.

An appendix issued with the order will, however materially facilitate its working. It contains first a series of simple rules, drawn up by Dr. OSCAR OLDBERG, Chief Clerk and Acting Medical Purveyor of the Marine Hospital Service, for converting apothecaries' weights and measures (official in the United States' Pharmacopœia) into their respective equivalents in metric terms. In these the gramme is for convenience taken to be equivalent to 15 grains, and the cubic centimetre to 15 minims, the fraction, amounting in one case to 2·9 per cent., and in the other to 8·2 per cent., being ignored as unimportant in all ordinary cases. In writing prescriptions, also, it is recommended that the metric quantities obtained by the application of these rules should be expressed in as simple decimal terms as may be practicable without materially changing the dose or the character of the formula.

There are also tables of approximate equivalents of apothecaries' weights and measures in metric terms, running from one sixty-fourth of a grain and one sixty-fourth of a minim to sixteen ounces and sixteen fluid ounces respectively, and a Posological Table in which the doses of all the official medicines are expressed in the terms of both systems.

For transactions on a larger scale, such as preparing requisitions for medical supplies, it is suggested that convenient "round numbers" might be found in 500 grammes (= $17\frac{1}{2}$ oz.) instead of the avoirdupois pound; 30 grammes (or about 20 grains less) instead of one ounce; 500 cubic centimetres (or about 17 fluid ounces) for 16 fluid ounces (the U. S. P. pint); and 30 cubic centimetres for one fluid ounce. The undeniable possibility that, especially during a time of transition, the terms of gramme and grain may be mistaken one for the other through careless writing is acknowledged. It is therefore recommended that in prescribing by gramme the quantity should be indicated by prefixing the common Arabic numeral, and that if abreviated the underscored form Gm. should be used. Thus while ten grains is written "gr. x.," using the Roman numerals, ten grammes would be represented by "10 Gm." When it is desired to use the word centigramme it is recommended to write it in full, but it is obvious that the more simple way would be to represent 10 centigrammes by "0·10 gramme."

ALLEGED DANGER OF CARBOLIC ACID DRESSINGS.

IN the last report of the Berlin University Surgical Clinique there is an account of a child three years old, which died from an acute carbolism after the application of carbolic "antiseptic" dressings consequent upon an osteotomy on the leg. The use of carbolic acid dressings, however, has now been altogether discontinued with children at the Berlin Surgical Clinique.

At the late meeting also of the German Surgeons Congress in Berlin Dr. KUESTER delivered an address on the toxic effects of carbolic acid dressings, in which he stated that within the last three years he had seen five cases of such poisoning, four of them terminating fatally. He expressed his belief that, from the uncertainty of the symptoms shown in such cases, many might have been mistaken as cases of collapse or shock. From experiments made on dogs he found that 0·076 per cent. of the body weight constituted a lethal dose of carbolic acid. But small animals and persons in weak health or faint from loss of blood were liable to be affected by smaller doses. Dr. Kuester found the antidote of Sonnenburg, sulphate of soda, to be of value only in lighter cases, and such as were of a less acute character. In Germany where the antiseptic method of Professor Lister has been followed much more extensively than in England, especially in the London Hospitals, the Germans themselves say that it is the lower sanitary standard of their hospitals which compels them to cling to it and seek a compensation in it for other drawbacks. A sort of reaction against the use of carbolic acid seems to be imminent, like that which has set in against excessive use of chloroform in the London hospitals. Professor Koenig, of Goettingen who advocated at the same meeting permanent irrigation in all cases of an already established sepsis of wounds, recommends exclusively a solution of salicylic instead of carbolic acid.

ANTISEPTIC SOLUTION OF BENZOIC ACID.

A handy preparation for dressing and disinfecting wounds, suggested by the experiments of Professor Salkowski, of Berlin, on the strongly antiseptic properties of benzoic acid, has been found very valuable and pleasant for its deodorizing effects in practice on shipboard by Dr. Senftleben. It is a solution of half an ounce of pure acidum benzoicum e resina in ten ounces of rectified spirit. This preparation may be used like the alcohol phéniqué of the French, but it is of far more agreeable smell and taste. It may be mixed with water for making lotions, gargles, mixtures, and will probably be found very effectual in naval and military practice. It may also become an article of the toilet, for like salicylic acid benzoic acid is innocuous, but its antiseptic action is by some considered to be stronger, and it volatilizes practically almost as readily as carbolic acid, but with a very different odour.

MEDICINE CHESTS OF AMERICAN SHIPS.

The United States enjoy the advantage of having a medical superintendent or "supervising surgeon-general" of the mercantile marine hospital service, who is an officer immediately subordinate to the minister, the Secretary of the Treasury at Washington. In his last yearly report for 1875, this active and zealous officer says, "The medicine chests used by vessels contain many medicines which are obsolete, such medicines having been susperseded in the healing art by others of more definite applicability; and in cases where more modern remedies have been introduced into medicine chests, they are for the most part of no use, or harmful in inexperienced hands, for the reason that the printed directions furnished to vessels have not been revised, and are consequently below the present standard of medical knowledge." Without going further into the matter of ships' medicine chests, or criticizing the "scale" for them prescribed by the British Board of Trade we may venture to point out the absence of some of the more modern available preparations, as salicylic acid, magnesia citrate, etc., which might be entrusted to the judgment of captains for administration at least as well as bichloride of mercury, calomel, or antimonium tartaratum.

THE MEDICAL ACTS AMENDMENT BILLS.

The second reading of the Government Medical Acts Amendment Bill in the House of Commons is fixed for Monday next, to which date the second reading of the other Bills on the same subject has been deferred. It is understood that all four of them will then be referred together to a Select Committee.

THE ANTAGONISM OF DIGITALIS AND ACONITE

In the *British Medical Journal* Dr. Milner Fothergill's report upon the antagonism of digitalis and aconite has been concluded, the following results being arrived at :—Digitaline and aconitine simultaneously administered exhibit no antidotal power, but if the digitaline be administered for five to nine hours before the aconitine, a distinct protection is afforded; if given at less than five hours beforehand, digitaline only intensifies the poisonous action of aconitine. Other conclusions arrived at are that atropine in four grain doses administered up to sixteen minutes after a poisonous dose of aconitine effectually antagonizes the action of the latter, but that small doses of aconitine do not appear to exercise any influence over poisonous doses of atropine. A recent instance of poisoning near Kidderminster, in which a man died from the effects of drinking a liniment composed of linimentum aconiti and linimentum belladonnæ, fully endorses these experiments. Atropine does not, however, exercise any antagonistic influence over poisonous doses of chloral.

The report upon the physiological action of the chinoline and pyridine series of compounds contains some very interesting conclusions, so far as the experiments have gone, but since some of them are merely tentative and may require to be modified on further investigation, it will be best not to allude to them at present. It is satisfactory to find, however, that the tendency of the present day is to apply scientific investigation to medicine, and no longer to rely solely upon empirical treatment. The number of substances whose medical properties are being examined is increasing year by year, although the experiments are often conducted at considerable risk to the investigators; thus last year the properties of casca bark, and more recently those of the Jamaica nightshade (*Urechites suberecta*) and duboisia have been experimented upon, all of them being extremely active poisons.

Provincial Transactions.

CHEMISTS AND DRUGGISTS' TRADE ASSOCIATION OF GREAT BRITAIN.

A meeting of the Law Committee of this Association was held at the office, 23, Burlington Chambers, New Street, Birmingham, on June 14, 1878, at 1 p.m.: Mr. S. U. Jones, President, in the chair.

After the Medical Act, 1858, Amendment Bill and the Medical Act, 1858, Amendment, No. 2, Bill had been carefully considered, it was moved by Mr. Holdsworth, seconded by Mr. Southall, and unanimously resolved:—"That the President be requested to address a communication to his Grace the Duke of Richmond and Gordon requesting him to receive a deputation from the Chemists and Druggists' Trade Association of Great Britain, with a view to submit to his Grace's consideration some alterations in the Medical Act, 1858, Amendment Bill as amended in committee on re-commitment."

It was also moved by Mr. Jervis, seconded by Mr. Holdsworth, and unanimously resolved:—"That the President, together with Messrs. Greenish and Hampson, and the Solicitor of the Association, be appointed to wait on his Grace the Duke of Richmond and Gordon, and on the member of the House of Commons who has charge of the Medical Act, 1858, Amendment Bill, and failing a satisfactory answer from them, the members of the deputation be empowered to take such steps as they deem advisable."

Communications were read from several members asking for legal advice in various matters, and the Secretary was instructed to forward the information requested.

LEICESTER CHEMISTS' ASSOCIATION.

At a meeting of the chemists of the town of Leicester, held at the rooms, 4, Halford Street, on Thursday, June 13, 1878, Mr. Henry Cooper, Ph.C., in the chair:—

It was proposed by Mr. Berridge, seconded by Mr. E. H. Butler, and carried:—That this meeting fully approves of the resolution of the Council of the Pharmaceutical Society passed as its meeting on June 5, 'To appeal against the decision of the Judge of the Bloomsbury County Court in the case of the Society *v.* The London and Provincial Supply Association,' and trusts that no effort will be spared to bring the appeal to a successful issue."

Proposed by Mr. E. H. Butler, seconded by Mr. Thirlby, and carried:—"That this meeting desires to support the Executive Committee of the Trade Defence Association in their endeavour to obtain, in the Duke of Richmond's Medical Acts Amendment Bill, the repeal of clause 20 of the Apothecaries Act."

Proposed by Mr. W. B. Clark, seconded by Mr. Hodgson, and carried:—"That this meeting approves of the action of the Trade Association in defending the interests of chemists in prescribing, and will support the Defence Fund."

A vote of thanks to the chairman, and his reply thereto, concluded the meeting.

PHARMACEUTICAL SOCIETY OF VICTORIA.

The twenty-first annual meeting of the Pharmaceutical Society of Victoria was held on Wednesday, March 13, in the hall of the Royal Society. Mr. William Johnson, the president of the Society, occupied the chair. In his opening address the chairman alluded to the efforts made by the council of the society to pass a Pharmacy Bill through the Legislature, and the anticipation that it would have to be brought forward as a private bill had made them very careful of the society's funds. Having in view the examinations required by the present Act, the council had some thought of establishing a pharmacy school, but the number of members was at present too few to render it practicable. They had then endeavoured to come to an understanding with the University, and had been met in a very fair spirit.

The honorary secretary read the annual report, which congratulated the society on its continued progress. During the past year the Society had lost its President, Mr. W. F. D'Arcy Irvine, and Mr. C. A. Atkin having declined the post, Mr. W. Johnson was unanimously elected president. The library had been enriched by the addition of many new and valuable works on materia medica, chemistry, and pharmacy. Since the last annual meeting 40 new members had been elected. The balance-sheet showed that the receipts amounted to £181 3*s.*, and there was the sum of £379 19*s.* 2*d.* in the bank to the credit of the society.

On the motion of Mr. Holdsworth the report and balance-sheet were adopted.

Mr. Brind suggested that the council of the Society should devise some means whereby the law relating to the sale of poisons should be carried into effect.

Mr. Bosisto brought up the report of the sub-committee appointed to consider the subject of a school of pharmacy, which showed the expenses attendant on such a school would be much greater than was anticipated, and that the number of apprentices was not sufficient to warrant the expenditure. It was understood that the University contemplated making arrangements for instruction in pharmacy, in connection with the medical school. The sub-committee recommended that a deputation should wait upon the vice-chancellor and Professor Halford with the view of obtaining a conference between the council of the society and the University. The report was adopted unanimously.

On the motion of Mr. Best it was resolved that in future the legal age of 21 years adopted by the Pharmacy Bill, as required for full membership, be adopted by the Pharmaceutical Society, in lieu of 25 years as heretofore.

Messrs. Blackett, Baker, Rocke, and Fullwood were elected members of council. Messrs. Kingsland and Rawle were re-elected as auditors.

Proceedings of Scientific Societies.

ROYAL INSTITUTION OF GREAT BRITAIN.

The Deterioration of Oil Paintings.*

BY R. LIEBREICH, M.D., M.R.C.S., M.R.I.

Oil paintings are subject to various kinds of changes, which may be considered as diseases, requiring different treatment according to their different nature. A science needs to be formed, a pathology and therapeutics of oil paintings. The pathology would have to describe and explain those diseases and their progress, and to develop the methods by which a correct diagnosis could be arrived at in each individual case. The therapeutics would teach the remedies which might be applied either to cure or to alleviate the disease, or at least to stop its progress. A hygiene would follow, which would have to teach how to avoid pernicious influences, and which, besides, while giving precepts for the technical process of painting, would have to forestall those constitutional diseases which, even in cases where no noxious influences can be traced, are the causes of decay, after a comparatively short period of existence. As medical science is above all things based on anatomy and physiology, so the exact knowledge of the structure of a picture would have to be acquired previously to any study of its disease. Unfortunately, direct investigation alone can procure no such exact knowledge; on the contrary, we are obliged to

* Lecture delivered at the Royal Institution of Great Britain, Friday, March 1, 1878.

enter upon a minute historical investigation of the material as well as of the technical methods adopted by artists of different schools and different periods.

The excellent works of Cennino Cennini, Mérimée, Sir Charles Eastlake, Mrs. Merrifield, and others, have already furnished most valuable material; but still the field for investigation remains unlimited; for, in order to enable us to secure the conservation of each valuable painting, we ought to know exactly how it was made. The artists of the present time would spare infinite trouble to the investigators of future times if, along with their works, they would leave the account of their practice in the case of each picture. A treatment without exact knowledge of the normal condition, as well as of the nature of the disease, is, as we shall see, as dangerous for the picture as it would be in the case of living beings.

Professional restorers of pictures admit this danger in a general way; each of them, however, is convinced that he himself, by his personal knowlege, skill, and care knows how to avoid it. The public pays too little attention to the subject, and therefore it occurred to me that it might be useful to give a short account of what we know about this question, of the changes to which oil paintings are exposed, as well as of the means either to avoid or to cure them.

We have to consider, first, the material on which the artist has painted, that is, as far as oil painting is concerned, principally wood and canvas.

Secondly, the priming, that is, the substance with which the surface was prepared in order to be made fit for painting.

Thirdly, the painting itself, that is, the pigments and vehicles used for it, and the liquids that were added during the painting, the mediums, meguilp, siccative, varnish, essential oils, etc.

Fourthly, the coat or coats of varnish spread over the picture.

The wood on which a picture has been painted may either warp, or get chinks in it, or become worm-eaten, or even altogether rotten. Against warping, the remedy usually applied is moisture. If the panel is very thick it is first made somewhat thinner; then the back is moistened and the picture is left to lie on its back for twelve to twenty-four hours, after which time it will be found to have bent straight. Of course this must not be continued longer than necessary, otherwise the convex surface, instead of becoming plane, would become concave. When straight, the picture is kept so by beads which have to be adapted in a particular way, a certain degree of shifting being allowed for the expansion and contraction of the wood.

Cracks in the wood are drawn together by inserting pieces of wood of a special shape.

Sublimate solutions are employed to destroy worms.

Trifling losses of substance are replaced by cement. Small portions of rotten wood, not extending too near the painting, are cut out and replaced by wedge-shaped pieces. If, however, the greater part, or the whole substance of the panel, is rotten, the picture must be separated from it and transferred to new wood, or rather to canvas.

This was first tried by Hacquin in Paris, and was performed successfully upon many pictures, and, among others, upon one of Raphael's Madonnas, in the Gallery du Louvre, and upon Sebastian del Piombo's "Resurrection of Lazarus," now in the National Gallery. The process no longer appears so very marvellous; it is generally executed in the following way:—

First of all the surface of the picture is pasted over with gauze and paper; after that the wood is made straight by moistening, or, if necessary, by making incisions with the saw, into which cuneiform pieces of wood are driven. By means of a tenon-saw the panel is to be sawn into little squares, which must be removed by a chisel, and in this way the thickness of the wood is reduced to half an inch; it is then planed until it becomes no thicker than paper, and the rest is removed by means of a knife and with the fingers. The painting being thus severed from its basis, it can be fixed on canvas, if the priming is sufficiently preserved. In the opposite case, a mixture made of chalk and glue, or something of the kind, must be put on first, and very evenly smoothed after being dry. This done, the new canvas has to be fixed upon it by means of a mixture of glue, varnish, and turpentine, and the substance of the picture pressed tightly and evenly against it by means of warm irons.

In order to avoid deterioration, the most minute precepts have been given for preparing the panel. It has to be taken from the best oak, or nut-trees, or cedars. The wood is to be cut into boards during winter-time, and kept till autumn before being dried; it can then be prepared only in the following spring, etc. It would certainly be preferable to give up wood panels altogether for large pictures, and only to think of means to make the canvas stronger. For small pictures, panels offer certain advantages, and can be more easily preserved from decay.

In the canvas we meet with the results of injuries or spontaneous decay. A rent may be mended by rags of linen stuck at the back of the picture. Even a hole may be filled up by pieces taken from other decayed paintings. If the picture is considerably damaged, it will be best to line it. But if the whole canvas is rotten and tattered, it will be preferable to sacrifice it by pulling off the threads one by one, after having secured the painting itself by pasting paper on the front of it. This done, the painting is transferred to another canvas in the same way as those removed from wood.

There are different modes of priming, which may be brought under two principal heads: the distemper and the oil priming.

1. The canvas is distempered by a mixture of chalk or plaster and paste, or glue, which may be laid on raw, unbleached canvas, or this latter may be beforehand prepared with glue or paste. Several coats of this mixture must be put on in succession, one being perfectly dry before the next can be applied. Many of the older oil paintings are painted on such ground. It has the advantage of being quicker prepared, of absorbing the excess of oil, of permitting the colour to enter into the priming, and to dry quicker, and, moreover, of containing a white absolutely innocuous to the other colours.

The inconveniences, on the other hand, are: that it more easily breaks, and under the influence of humidity separates from the canvas.

2. The oil priming consists of several coats of oil colours. As each of these must be perfectly dry before the next is laid on, and as, moreover, time must be given to the whole to dry completely before painting upon, in order to avoid the sinking in of the colours, the whole preparation is much slower than the distemper. Nevertheless it is now generally adopted.

Rey, in France, has pointed out a process which is a compromise between the two methods; he begins by distempering, and after several coats of distemper, having dried one after the other, he puts a coat of oil which, as it were, changes the distempered ground into an oil-colour ground.

With oil priming it is of importance that the principal colour be white-lead, to which are added comparatively small quantities of yellow, black, or other colours. For a whole century a school, that of Bologna, predominated in Italy, which abandoned this principle. During the second half of the 17th and the first half of the 18th century, most of the Italian masters of other schools followed its example. Probably for the purpose of obtaining more easily the desired effect of the chiaroscuro they painted on a brownish-red priming, which consisted of bolus mixed with umber. Not one of those pictures has kept its original colouring. Not only has the priming caused all the dark parts to grow much darker, but it has destroyed, or nearly so, all the glazing, so that only those colours can be recognized which either contain white, or are glazed on white. I can show you numerous instances of this, for, on account of the extreme fertility of this school, there is little difficulty in procuring pictures of masters of that time or of their pupils.

Wood priming does not require the same elasticity as that of the canvas, which ought to be capable of being rolled. Therefore the priming of the wood shows less variations. It is generally composed of chalk or plaster, tempered with starch, paste, size, or glue, and more or less thickly laid on. In some pictures of different centuries we find, either between the wood and the priming, or between the priming and the painting, canvas, and exceptionally even paper.

The diseases of the priming are not of a very complicated nature. They manifest themselves principally in three different ways: 1, by cracks in the priming itself; 2, by the severance of the priming from the painting; 3, by the severance of the priming from the wood or the canvas. The third disease is by far the most frequent, especially among pictures on canvas distempered with paste. If small pieces only are scaling off or blistering, they are fixed again to the ground by letting a solution of size pass between the detached part and the canvas, and pressing both gently together. If the deterioration extends over a considerable surface, the picture has to be lined. While this is being done, and while the gluing substance penetrates into the picture, the detached parts are pressed on again with slightly heated irons. If the whole priming threatens to come off, it will be better to take the picture entirely from the panel or canvas, and to transfer it to a new canvas.

I shall show you examples illustrating the before mentioned points, and among them two pictures; one in oil, taken off from canvas, the other in tempera, taken off from wood. Both of them, strange to say, have escaped destruction without having been transferred to a new canvas, and without being covered with paper, as is usually done, before taking them off. They show you the painting by itself from both sides. I have, of course, used every precaution in bringing them safely over from Florence, where I happened to discover them carefully stowed away among heaps of old pictures.

We come now to the most important part of the picture, the painting itself. We meet very often with the idea that the old masters had been in possession of colours, that is pigments, the knowledge of which has been lost, and that this accounts principally for the difference between the oil painting of the 15th and 16th centuries, on the one hand, and that of the 18th and 19th on the other. But this is a great mistake. We know perfectly well the pigments used by the old masters; we possess the same, and a considerable number of new ones, good as well as bad, in addition. In using the expression of good and bad, I am principally thinking of their durability. From this point of view the pigments can be placed under three headings:—

1. Those that are durable in themselves, and also agree well with the other pigments with which they have to be mixed.

2. Such as when sufficiently isolated remain unaltered; but when in contact with certain other pigments change colour, or alter the others, or produce a reciprocal modification.

3. Those which are so little durable that, even when isolated from other pigments, the mere contact of the vehicle, the air, or the light, makes them in time fade, darken, or disappear altogether.

The old masters used, without reserve, only those belonging to the first of these three categories. For those belonging to the second they imposed on themselves certain limits and precautions. Those belonging to the third they did not use at all.

That some of the modern masters have not followed these principles, is not owing to a lost secret, but to the fact that they disregarded those well-known principles, and even consciously acted against them. In Sir Joshua Reynolds's diary, for instance, we read that in order to produce certain tints of flest, he mixed orpiment, carmine-lake, and blue-black together. Now, orpiment is one of the colours of the second category, carmine-lake one of the third. That is to say: orpiment, as long as it remains isolated, keeps its brilliant yellow or reddish-orange colour; but when mixed with white-lead it decomposes, because it consists of sulphur and arsenic, and it, moreover, blackens the white-lead, because the sulphur combines with it. Carmine-lake, even if left isolated, does not stand as an oil colour, and therefore has been superseded by madder-lake.

Unfortunately some of the most brilliant colours are perishable to such a degree that they ought never to be used; yet, it seems to me, that just in one branch of art in which of late remarkable progress has been made, I mean landscape painting, the artists, in order to obtain certain effects of colour not easily to be realized, do not always resist the temptation to make use of a number of pigments the non-durability of which is proved beyond doubt. However that may be, I think it pretty certain that the pigments in themselves play only a subordinate part in the deterioration of oil paintings, and that the principal part belongs to the vehicle with which the colours are ground, and to the liquids which are added during the painting. I hope, therefore, you will excuse my making some elementary explanations about these liquids.

(To be continued.)

Parliamentary and Law Proceedings.

Poisoning by Strychnia.

An inquest was held on May 29, at West Barkwith, before Dr. Mitchinson, coroner, on the body of Charles Pacey, aged two years. On the previous Monday, the child drank from a medicine bottle on the table, which the mother believed to contain a solution of quinine. This had been given to her some time previously by the clergyman's wife (Mrs. Thompson), when she was suffering from debility. The child became ill and died. Dr. Harrison, who was called in, took possession of the bottle from which the child was supposed to have taken the poison, and telegraphed to the London chemists (Messrs. Keene and Ashwell of New Bond Street) who had prepared the medicine for Mrs. Thompson. In reply, they informed him that it was a solution of strychnine which had been furnished to a lady six or seven years ago. The jury returned a verdict that the child died from the effects of strichnine poisoning taken accidentally, and that no blame was to be attributed to the mother; but at the same time they wished to express their strong dissatisfaction that the chemists should have sent out so strong a poison without putting a poison-label upon the bottle. Mrs. Thompson was under the impression that it was simply a solution of quinine.

The *British Medical Journal* commenting on this case says:—"Several persons appear here to be in fault. The practice of handing about medicine from one person to another, without any adequate knowledge of the contents of the solution or its suitability for the individual, is in itself reprehensible. On the other hand, it is wrong to dispense such a medicine as that described in the present case without a very strong indication of its poisonous character; and, in our opinion, not only should the word "poison" always be very clearly inscribed, but such solutions should only be dispensed in coloured fluted bottles."

Poisoning by Colocynth.

On Thursday, June 13, W. Buckle, Esq., deputy coroner, opened an inquest, at Peterborough, on the body of a young woman named Mary Ann Everitt, aged 22 who died suddenly on the previous day, after having taken a quantity of colocynth.

Evidence having been given as to the deceased taking the drug, a boy named Smith, seven years of age, not sworn, said: Mary Ann Everitt sent me to a chemist's, next to the Cathedral Yard. I brought some scent back, and gave it to her. She sent me for some scent first, and then wrote a letter. I went to a place against Nichols' first, but they said they could not let a little boy have it, and she must come for it herself. I then went somewhere else. No one else was present when I gave it to her.

Henry Noble, assistant to Mr. Pearson, chemist, Market Place, said: The little boy came to the shop yesterday for threepennyworth of bitter apple. I gave it to him, as it is generally used for putting in furs to keep the moths away. (Mr. Pearson here explained that it was not in the schedule of poisons that was printed and posted up in the shop to guide the apprentices.) The written ord·r was put in, and Sarah Jane Everitt recognized it as her sister's writing. The order was: "Will you oblige me by sending me 3*d*. of bitter apple."

Dr. Thomson said: When called in I found Mary Ann Everitt on a sofa upstairs, apparently suffering from a powerful dose of some irritant poison. She had violent spasms of the stomach, abdominal muscles, and heart. I at once said she had taken poison. Her sister said, "Yes, she has taken something." The deceased called to me: "Oh, do give me something, do hold me, I shall die." I asked her to tell me what she had taken or she would die. She said she must not. I asked her to tell me who had given it to her, but she said she could not tell me who told her to take it. I ordered applications and drove off for the stomach pump and other antidotes. When I returned I saw it would be fruitless and she died about two minutes after I got back. Her sister gave me a powder, which I believe to be the powder of colocynth, a drastic purgative commonly called bitter apple, ignorantly resorted to for producing criminal abortion. If the stomach was empty the powder would act very quickly and very violently. From what I have seen and heard I believe powdered colocynth to be the cause of death, but to speak with certainty a *post mortem* examination would be necessary, when it would probably be shown the cause for taking the drug. She looked like a woman in perfect health, robust and strong. A neighbour named Bellamy, who was present at the time, told me that she had reason to believe that the deceased might be pregnant. My opinion, from the symptoms, is that death was caused by colocynth, but to speak positively either to that or pregnancy, a *post mortem* examination would be necessary.

At an adjourned inquest, Dr. T. J. Walker said that with Dr. Thomson he had made a *post mortem* examination of the body of deceased, and confirmed the suspicion of pregnancy. Having heard Dr. Thomson's evidence and a description of the symptoms during life, and having examined the body, he thought the deceased died from a narcotico-irritant poison. A less quantity than 2 drs. of colocynth has caused death. Very few medical men have experience of death from poisoning by colocynth. He was not aware that colocynth is ever used as a means of producing criminal abortion.

The jury returned a verdict of "Accidental death," the deceased having died from taking an overdose of narcotico-irritant poison.—*Peterborough Advertiser*.

Another Violet Powder Case.

On Thursday, the 13th inst., Mr. Humphreys held an inquiry at the Marquis of Lansdowne Tavern, High Street, Kingsland, as to the death of a child, aged ten days, the daughter of a costermonger, living at 6, Wellington Street.

Elizabeth Branch, 18, Brown Place, Shacklewell, deposed that she nursed the mother of the deceased, who was too ill to come out. Shortly after the birth of the child she used some violet powder upon it which she was told to use by the mother. The following day she noticed a redness all over the child's body, and on the third day sores. She then thought of the violet powder poisoning case that she had read in the papers, and at once discontinued it, using powdered starch. She asked Dr. Brown to look at the child, and he said she had done quite right in not using the violet powder, and took a packet away with him.

The mother of the child said she bought the powder of Mr. Read, chemist, at the corner of the street.

Dr. Henry Brown stated that the deceased when born was a very fine healthy child. On the third day he found her covered with sores all over the body, and on the previous Friday the child died. He had since made a *post-mortem* examination, and found all the organs healthy. Death was due to inflammation of the stomach and body caused by the use of the violet powder.

The coroner said the case was one of extreme importance, especially to the people who sold the powder. He would send the powder to Dr. Tidy for analysis; and in the meantime the inquest would stand adjourned.—*Times*.

Poisoning by Carbolic Acid.

An inquest was held by Mr. Coroner Harrison, at Belgrave, near Leicester, on Saturday last, on the body of an elderly man, named Thomas Warner. He was in the employment of Mr. Frederick Hawkes, living in the Loughborough Road, Belgrave, and on Friday was ordered to clean out the wine cellar at his master's house. While in the cellar he found a bottle, which he fancied contained brandy. He drank some of it hastily, and had swallowed a considerable quantity before he discovered that it was carbolic acid and not brandy. He was found in great pain, and notwithstanding that medical aid was at once called in he died shortly afterwards in the Leicester Infirmary, where he had been removed. The jury returned a verdict of "Death from misadventure."

Indictment of a Chemical Manufacturer for Nuisance.

In the Queen's Bench Division of the High Court of Justice on Wednesday, before the Lord Chief Justice and Justices Mellor and Lush, the case of the Queen *v.* Wallis and another was heard. This was an indictment for a nuisance. The defendants were chemical manufacturers in the Wandsworth Road, and in consequence of the nuisance to the neghbourhood arising from the manufacture they were indicted. When the case came on first for trial the jury were unable to agree to a verdict, and they were discharged. On the second trial the defendants pleaded guilty, relying, when they came up for judgment, on their having abated the nuisance.

Mr. M. Howard, Q.C., with whom was Mr. Smith, now prayed judgment on the affidavits that had been filed for the prosecution.

Mr. Grantham, Q.C., appeared for the defendants.

The plaintiffs (the Local Board of Works) had filed upwards of eighty affidavits to show that the nuisance had not been abated, but continued up to within the last few weeks. The nature of that nuisance was to be inferred from the fact that 250,000 gallons of gas liquor were brought upon the premises weekly to be used in the manufacture, and that the works were going on continuously, Sundays included. The gases evolved in the manufacture were stated by numerous medical men practising in the neighbourhood to be of the most poisonous character, and that they were continually being called in to treat persons suffering from their effect.

Mr. Grantham, Q.C., for the defendants, said he had filed eighty-two affidavits (some of them by the plaintiff's witnesses) showing that the nuisance had been abated. The defendants had expended over £6000 within the last twelve months to effect that object.

The Lord Chief Justice, in giving judgment, said the Court were not satisfied one way or the other whether this nuisance, which undoubtedly was of a serious character, was at that moment abated. The defendants must pay the costs up to the present time immediately, and then the Court, not being thoroughly satisfied as to the fact that the nuisance had been abated, were disposed to give some further time to the defendants to prevent its continuance. The matter would therefore stand over until the fifth day of next November sittings.

Dispensing Memoranda.

[107]. Hoffman's Anodyne.—The following extract from 'First Lines of the Theory and Practice of Philosophical Chemistry,' by John Berkenhont, M.D. (London, 1788), may be of interest to your readers :—

"*Liquor (Mineral-Anodyne) of Hoffman.*—This German physician not having left behind him his receipt for making this famous anodyne liquor, which is not in the smallest degree anodyne, we know nothing certain either of the ingredients or their proportion. Some writers tell us it was made by distilling nitrous acid with spirit of wine, and adding to the liquor thus obtained a small portion of oil of cloves. If this be true, it was a kind of nitrous ether, or rather sweet spirit of nitre; but in the 'Chemical Dictionary,'* we are told that it is made by mixing an ounce of the spirit which rises first in the distillation of vitriolic ether, with the same quantity of the ether which follows, and twelve drops of the oil which rises after the ether has passed. If this be the proper receipt this anodyne liquor is no more than the spiritus vitrioli dulcis of the shops."

Kingston-on-Thames. Edward Whaley.

[115]. Raisins, B.P.—The sultanas are generally used, as they are free from seeds. Raisins are ordered in B.P., "to be freed from seeds," the reason of which is that the seeds contain an acid (? astringent) principle.

"Tenens."

[117]. Tinct. Cardamomi.—In answer to J. W. Barnes, I should certainly use tr. card. simp. when tinct. cardam. is prescribed if I did not know the prescriber to mean tr. card. co. I should say that the party that used tr. card. co. could not understand much about dispensing.

G. T. Stephens,

[117]. Tinct. Cardamomi.—If J. W. Barnes had Tinct. Cardomomi ordered in a prescription he would be justified in using the official preparation. Generally when the prescriber means the non-official preparation he writes Tinct. Cardam. *Simp.*

"Tenens."

[118]. Pulv. Scammony.—When pulv. scammony is ordered, what should be dispensed—pulv. radicis scammon. or pulv. gum. scammon?

Borgue.

[119]. In the B.P., under Acid. Sulph. Aromat., Acetum Scillæ, and Infusum Cinchonæ, after macerating or infusing for a certain time, the directions are, filter or strain, but it does not say anything about making up to any particular quantity, like it does the tincture. I want to know whether they should be made up or not. I have asked several in the trade; some say they should and others say not, therefore I shall feel extremely obliged if some one will give me a positive answer.

T. J. Rayson.

* He does not state whose dictionary he quotes.

[120]. Will any reader say if the following prescription should be clear when sent out, and how should it be prepared?—

℞ Ferri Citrat. . . . . ℈ij.
Tr. Nucis Vom. . . . . ʒss.
Tr. Quinæ . . . . ad ℥ii.

W. F. C.

Highgate, N.

[121]. Tinct. Eucalyptus Globulus.—What is the best formula for tincture of *Eucalyptus globulus*? Some tinctures that I have had mix perfectly clear with water and others again form quite opaque solutions, owing, I suppose, to difference in the strength of the spirit used.

E. Coates.

Obituary.

Notice has been received of the death of the following:—

On the 5th of February, 1878, Mr. Henry John Lutwyche, Chemist and Druggist, Cardiff. Aged 35 years.

On the 13th of February, 1878, Mr. Thomas Siddall, Chemist and Druggist, Easingwold, Yorks. Aged 59 years.

On the 10th of March, 1878, Mr. Thomas Kirby, Chemist and Druggist, Liverpool. Aged 47 years.

On the 19th of March, 1878, Mr. Matthew Redhead, jun., Chemist and Druggist, George Street, Liverpool. Aged 33 years.

On the 4th of April, 1878, Mr. Charles Isaac Farmer, Chemist and Druggist, Ashford, Kent. Aged 49 years.

On the 25th of April, 1878, Mr. Evan Jones, Chemist and Druggist, Bangor. Aged 58 years.

On the 30th of April, 1878, Mr. Edward Rainey Pharmaceutical Chemist, Spilsby. Aged 46 years. Mr. Rainey had been a Member of the Pharmaceutical Society since 1854.

On the 5th of May, 1878, Mr. William Iverach, Pharmaceutical Chemist, Kirkwall, Orkney. Aged 67 years. Mr. Iverach had been a Member of the Pharmaceutical Society since 1852.

On the 6th of May, 1878, Mr. Alfred John Orme, Chemist and Druggist, Birmingham. Aged 30 years. Mr. Orme had been an Associate of the Pharmaceutical Society since 1870.

On the 7th of May, 1878, Mr. Charles Wicker, Chemist and Druggist, Frimley, Surrey. Aged 69 years.

On the 11th of May, 1878, Mr. Edwin Paul Evans, Pharmaceutical Chemist, Cleobury Mortimer. Aged 66 years. Mr. Evans had been a Member of the Pharmaceutical Society since 1842.

On the 13th of May, 1878, Mr. George Jolly, Chemist and Druggist, Poulton-le-Fylde, Lancs. Aged 41 years.

On the 16th of May, 1878, Mr. George Cowl, Chemist and Druggist, Blackpool. Aged 49 years.

On the 19th of May, 1878, Mr. Conrad William Wright, Chemist and Druggist, Bristol. Aged 24 years. Mr. Wright had been an Associate of the Society since 1874.

On the 23rd of May, 1878, Mr. Thomas Wells, Chemist and Druggist, Pimlico. Aged 41 years. Mr. Wells had been a Member of the Pharmaceutical Society since 1871.

On the 16th of June, 1878, Mr. Daniel Gillett, Chemist and Druggist, Seacombe. Aged 33 years.

On the 13th of June, Mr. Edmund Roberts, Chemist and Druggist, Newnham. Aged 27 years.

Correspondence.

*** *No notice can be taken of anonymous communications. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guarantee of good faith.*

Proposed Admission of Women to the Society.

Sir,—In your editorial columns to-day you propose the acceptance of Mr. Vizer's idea of an informal poll of the members on the question of admitting women to the membership of the Pharmaceutical Society. I hope if this course is carried out that some pains will be taken to put the true issue before the members, as nine out of ten of the writers argue as if the question was whether women ought to be admitted to practise pharmacy as assistants, or on their own account. The pleasant little skit in your correspondence columns bears only on the same point, as "Annie, M.P.S.," need not be a member to do all she speaks of doing. The question of the right of women to pass the examinations and open shops is not in our hands to decide. The Legislature has decided that for us, and the question is simply: Certain ladies have passed and are registered as pharmaceutical chemists: is it right, just, or expedient that they be admitted as members of the Society? Whether they be admitted or not will not influence their position in any way; nor, I believe, will it influence in the least degree the small number who are likely to present themselves.

The question is: Is their demand just, and if so, is it expedient to refuse it? My only desire in writing is to get the true issue put plainly before the members. As many members do not know the address either of Mr. Wade or Mr. Vizer, they should be published with the question to be answered.*

JOHN S. LINFORD

Sir,—Will you permit a non-pharmaceutical reader to enter an indignant protest against the letter in your last number headed "The Adventures of a Lady Pharmacist"? The honourable and hard-working women who are endeavouring to earn a livelihood as pharmacists might surely have been spared the insults scarcely veiled beneath the sarcasm of the writer who, whatever he is, is certainly no gentleman. Surely he cannot have been silly enough to imagine that his letter would be taken by your readers as a serious production. The opponents of the admission of women must resort to better arguments than the covert sneers of this letter, which, I doubt not, would be disowned by all the best on their own side. The impression produced on one who contemplates the affray from without is simply that such unfair weapons would not be taken from the armoury unless it were found that the legitimate ones had lost their power, and that those who use them know that they are fighting a losing battle.

AN OUTSIDER.

Counter Prescribing.

Sir,—As there is a great deal of discussion at the present time regarding the right a chemist has of prescribing, I should like to say a few words regarding the difficulties which beset chemists trying to do without it.

I opened a business in a populous neighbourhood some four years ago, and one day had a prescription brought to me to dispense written by an M.R.C.S., L.S.A., M.B., containing an ingredient I had never heard of, so I accordingly wrote to the medical man asking him in what book or pharmacopœia I should find it. He kindly replied, and sent me the formula, being a private one, and told me that the mistake had been the person had gone to the wrong shop.

Shortly afterwards another of my customers called in and informed me that he should have all he wanted from me, except physic, which his doctor, an M.D., M.R.C.S., L.M., L.S.A., had particularly requested him to go to a chemist about half a mile off for.

I also lost the dispensing for several other customers by another practitioner, an M.D., making up his own own medicine at a private surgery. Now I think if chemists are deprived of prescribing altogether that there will only be two things open to them, viz., to leave the business or with very great inconvenience to themselves begin their studies afresh and go in for the examinations of apothecaries, which with many, especially the older members of the trade, would be very hard.

H. H.

The Victoria Pharmacy Act.

Sir,—In the January number of your valuable journal you devoted an article to our Pharmacy and Poison Acts. Your summary is remarkably good and gives a very clear outline of these enactments, but there are one or two points which it would seem are a little misunderstood. As one of those who had a principal part in elaborating the regulations for the examinations, etc., I would ask to be allowed to make a few observations. With respect to the preliminary examination, I wished to adopt that of the Pharmaceutical Society of Great Britain in its entirety, but was overruled; indeed I strenously urged that apprentices should pass the matriculation examinations of our University before being indentured and I still think that course would have been better than the one decided upon. However, I do not think that in practice we shall find the omission to which you draw attention productive of much harm, as the schools of the colony are so excellent that youths who have been sufficiently educated in the subjects included in a liberal education would not be likely to be ignorant of "simple and compound proportion."

The Board of Pharmacy will, until some school of pharmacy is established similar to and emulating that at Bloomsbury Square, demand that candidates attend lectures and pass the examinations at the University, which are very stringent and well-conducted; we considered that these examinations and the subsequent examination before the Board would make our examination equivalent to your "Major." You mention, as if with emphasis, that it is especially mentioned that "the candidate must be able to spread plaster with neatness and dexterity," that part of the regulations was copied from those of the Pharmaceutical Society of Great Britain as given in the Calendar for 1877, which I have not at hand. You express your regret that the title of Pharmaceutical Chemist has been "again appropriated for use by persons passing an examination which will be a test of the lowest measure of qualification considered consistent with the public safety." I think you underestimate the value of our examinations. However, the reason why we did not adopt two grades was because we considered, after much discussion, that the title chemist and druggist was vague, not sufficiently defining what was meant by a chemist as distinguished from an analytical or pure chemist, but we certainly intended that our curriculum, which can be improved and extended without the necessity for fresh legislation, should be such that the title of pharmaceutical chemist would be obtained only by those who are worthy of it. In the early days of the Pharmaceutical Society of Great Britain, the Major examination was very different from what it is now, and we do not doubt but that, as experience is gained, we shall remedy any shortcomings and, if need be, make our examinations more severe, certainly not forgetting the "Major" as a model, which it will behove us to keep before us, if we find that ours falls short of that standard. I may mention that the Council of our admirable University intend to establish a chair of Pharmacy. When all arrangements are settled I shall have much pleasure in forwarding you full particulars.

C. R. BLACKETT,
President of the Pharmaceutical Society, Victoria, and Member of the Board of Pharmacy, etc.

Melbourne, April 15, 1878.

The Sale of Patent Medicines.

Sir,—I think the practical suggestion offered by "W. T. R." "that the trade demand of the makers of patents that they should not supply their preparations to any of those people who notoriously undersell us" is hardly practicable, owing to the following considerations. The makers of the numerous proprietary articles are not all chemists, hence they have not all an interest in the trade. It is of very little moment to the proprietors who retails their medicines, whether he be a chemist, bookseller, or tea dealer, so long as they get the same price wholesale from each.

Would not the concession, if made, be prejudicial to their own interests, as their preparations would be less within the reach of the public than at present, which with a return to the original and proper retail prices might retard in some measure the sale?

A. J. S.

Future of the Stamped Nostrum Trade.

Sir,—Your correspondent, "Northumbria," announces his intention to appoint a grocer or stationer as his agent in all cases where chemists refuse to sell his preparations.

All very well; indeed I should not be surprised were he to utilize the peregrinations of old Middensquint, ragman and bone merchant.

To this course there is, so far as I know, but one objection, and that is his look out.

Grocers, stationers, hawkers, and ragmen in their anxiety to give nothing for something, may on their own account start as proprietors, and then we shall have back door visitors offering new remedies for old clothes.

Just think of it: Middensquint's balsam for a threadbare coat; box of headache pills for a bulged hat; "pick-me-up" for a petticoat; court plaster for a gent's trousers; strapping ditto for a boy's; fly-papers for stays; and a brace of amadou corn discs for a pair of well worn boots!

Ictus Equi.

York, June 18, 1878.

The State of the Drug Trade.

Sir,—Like every well wisher of our business, I have perused with great interest and pleasure the letter in last week's Journal from the pen of Mr. J. Wade: and its influence has been the more refreshing from its having appeared at a most critical time, just when we are experiencing the greatest depression in trade.

In January last I addressed some words to you on the subject of "low prices." A few letters have since that time appeared in the Journal, and several private communications have reached me in reference to it. Some of those were accompanied by price lists, to show me how cruelly were my correspondents suffering from the circulation of these degrading periodicals.

It was hoped that at the annual meeting something practical would have been done; that some promise would have proceeded from the Council, to the effect that the business should not be allowed to go to ruin, whilst there was such mental power and such ample pecuniary means to prevent it. But we were doomed to disappointment: no promise of help came. In London, as in many parts of the country, there are a few—alas how few!—of us maintaining the original and proper prices of the patent medicines and other articles: but at a severe strain and loss, we are clinging to the wreck, hoping ere it is to late, aid will surely come.

I think with Mr. Wade, that if the Council would but give its time and attention for the next twelve months to the welfare of our business—leaving education—we should not have at the next May meeting the general and piteous cry, "What has the Society done for us?"

A plan has been proposed, which if taken up earnestly would be very serviceable. It is simply for the Council to issue price lists, suited to various localities, so that if a chemist having agreed to conform to certain prices was known to undersell, on his failing to give a satisfactory explanation thereof, he would be known as one who had broken faith with his neighbours.

Of course it is well understood, we have in our ranks those whose tendency has been, and is likely to be, devoid of that principle which actuates the man "who loves his neighbour as himself." It will be hard to deal with these persons: nothing can at present be done with them but to leave them to their own unhappy unsatisfying reflections.

In conclusion, let me remind those on whom rests the responsibility of having well nigh ruined our business, that they cannot console themselves with the feeling that what they have done has been called for by the public. My own experience has taught me, that all our customers require of us is, not to be supplied with medicines and other articles at reduced prices, but fair and honorable dealing.

J. R. Summers.

86, *Curtain Road, London, E.C., May* 28, 1878.

Production of the Poison Register.

Sir,—I trust every chemist will keep his poison register to himself, answering only such necessary preliminary inquiries as a coroner's officer or any authorized official may make for the purpose of elucidating any mysterious death by poison, and giving full information only after receiving a summons from a coroner or magistrate.

While upon the poison subject, I wish to say that I regret very much to see from time to time reports of cases of deaths from poisons sold by registered chemists without a proper register of the sales. I think it is especially incumbent upon all chemists to observe rigidly the regulations of the Poisons Act, that being as far as I know the only Act of Parliament that acknowledges the legal existence of chemists.

It is very much the habit of many of our trade to say of this Act, "Thank you for nothing," but I have no sympathy with this feeling.

If we are at any future time to ask for further legislation acknowledging our status as pharmacists, questions will very naturally be asked as to how we carried out this our only Act, and if chemists are negligent in this matter how can they be trusted with higher and greater privileges?

I find no difficulty in getting compliance with the regulations; I explain the penalty of non-registration, and positively decline to sell except the regulations are observed. With a fresh customer it takes two minutes, with an old one not half a minute to register a sale, and as my entries average from 600 to 800 per annum I think I know something about the trouble of the matter.

James Slipper.

London, June 19, 1878.

Dispensing Charges.

Sir,—Whilst deploring the sale of patent medicines, proprietary articles, and "Easton's Syrup" by drapers, which last act is certainly amenable to the law, I cannot help thinking more has to be laid to the charge of our own brethren than even these. The following case will, I think bear out what I say.

A prescription was brought to me last Wednesday night, of which the following is a correct copy:—

℞	Ferri et Quin. Cit.	℥j
	Tr. Nucis Vom.	℥ij
	Sp. Chlorof.	℥iij
	Aq.	ad ℥viij

Whilst preparing it, the gentleman remarked that he usually got it nearer the Marble Arch, and paid "one shilling," as he said, not expecting for a moment I should do it at the price. Some of your readers will say he perverted the truth to a considerable extent to save a few pence. Such was not the case however. I know it as a fact that that is the usual price for an 8oz. mixture, no matter how taken, and not by an outsider, but judging from the medals with which the prescription wrappers are studded, one who has earned high distinction at the hands of the Pharmaceutical Society. Now at that rate, I think the profit is about proportionate to selling a patent at $10\frac{1}{2}d.$,—treating the labour as one of love, and not charging for it.

A Kilburn Chemist.

Arsenical Fly-Papers.

Sir,—Some little time ago, a boy, eight years of age, was admitted into St. Thomas's Hospital with marked symptoms of belladonna poisoning. On being questioned he stated that he had swallowed the liquid in which an ordinary fly paper had been steeped. As, however, he had been forbidden under severe penalties to touch a lotion which was in the house at the time, and as it was extremely unlikely that any preparation of belladonna existed in the fly paper, it was considered that he had swallowed a portion of the lotion, and endeavoured to conceal his disobedience by stating that he had drunk the fly paper liquid. Extract of physostigma was administered to the boy, who finally recovered.

The lotion and the paper were placed in my hands for analysis. I succeeded in detecting atropine in the lotion, which was apparently the green extract of belladonna rubbed down with water, and to my surprise found a considerable quantity of arsenic in the fly paper.

My particular object in writing this letter is to call attention to the fact that fly papers commonly contain arsenic. This may be well known to the majority of your readers, but it was certainly unknown to myself and to several to whom I have spoken on the subject. In fact, one stated that he had last week informed a lady customer that fly papers were only fatal to insect life. In order to ascertain whether fly papers generally contain arsenic, and if so to what extent, I procured six samples, bearing the name of six different makers. In five of the six I found arsenic, and on estimating the amount obtained the following results, being in each case the mean of two experiments:—

No.	Amount of Arsenic As_2O_3 in each Paper.
1	1·92 grains.
2	2· ,,
3	2·95 ,,
4	6·25 ,,
5	5·36 ,,

The sixth kind examined was Papier Moure. This contained no arsenicum in any form whatever, although it is stated in Beasley's 'Druggist's Receipt Book' and in Cooley's 'Encyclopædia' to be largely impregnated with arsenic. It was very bitter to the taste and as it contained no strychnia I inferred that it contained some preparation of quassia. I endeavoured to isolate quassiin from a number of the papers, but towards the end of process lost the whole and I have not had time to repeat the operation.

In all the arsenical fly papers the arsenic existed chiefly as free arsenic As_2O_3, for the aqueous solutions were faintly but distinctly acid, and though nitrate of silver gave reactions for arsenites, ammonio-nitrate of silver gave very much more decided reactions.

Now according to the strict letter of the law, it is unlawful for any but registered chemists and druggists or pharmaceutical chemists to sell this preparation of arsenic, and even the registered chemist is acting illegally who sells an arsenical fly paper without labelling it poison, placing his own name and address upon it, registering the sale, taking care that the purchaser is known to him, and if not, insisting that he (the purchaser) be introduced by some one known to both.

I have no wish to cause additional restrictions to be imposed on the chemist in the carrying on of his business, but supposing that a chemist sold some of No. 4 paper without registering the sale, etc., and further, supposing that a child swallowed the liquid with fatal results, and that an inquest was held, there is much probability that the coroner would severely censure the seller, although he (the seller) might be perfectly ignorant of the poisonous nature of the fly-paper. Independently of this consideration I think that there are few men who would wittingly take the responsibility of selling a number of sheets, some of them containing over six grains of arsenic, to be moistened with water and distributed in open plates and dishes throughout dwelling houses.

I consider, therefore, that it behoves all chemists in business to ascertain the nature of the fly-papers which they sell, and to cease retailing those which may be found on examination to contain a poison which might be fatal to human life.

SYDNEY PLOWMAN.

St. Thomas's Hospital, June 19, 1878.

THE NEW PRONUNCIATION OF LATIN.

Sir,—De Quincey, in one of those amusing essays of his, in which wisdom and high philosophy are so admirably combined with humour, describes in serio-comic style the indignation he felt when, as he passed along country roads, he was assailed by the barking of the miscellaneous curs that issued from the various farms. He, a man who knew Latin well, and could write it purely, to be insulted by mongrel brutes, whose reputed acquaintance with the Latin tongue had become a current phrase! Sundry authors, more straightforward than complimentary, have asserted that the Latin that chiefly flourishes amongst chemists is of the dog Latin sort, and possibly the chemist might point to the medical man, and say, "Arcades ambo," for the percentage of medical men who could frame a good Latin sentence, or even write out in full the terminations of words in ordinary prescriptions is not considerable. Latin, however, is not everything, though it has been lauded as the language of "humanity," yet I would fain see a wider appreciation of the merits of this noble language among pharmaceutists; it might be a relief from the toils of the counter to turn the pages of Virgil, Horace or Ovid. But in saying this I am not professing admiration of those purists (or quibblers shall we say?) who object to hear abbreviations of familiar Latin words, and would wish their students to ask in full for Unguentum Antimonii Potassio-Tartratis, instead of shortening this to Ung. Antim. Pot. Tart., and so on. But it affords matter for some speculation what attitude the chemists who are to form the next generation will assume with regard to the new Latin pronunciation which is vexing the souls of professors, as well as pupils in schools and colleges. Apprentices are entering our businesses who have been initiated in the new method, and I can fancy that in some instances they must feel a little awkward, seeing that the estimable principal of the establishment pronounces Latin as he was taught to do in his boyhood, that is to say, almost exactly as English is pronounced in England. The advocates of the old mode can certainly plead that long usage sanctions their way, but on the other hand it must be granted that the Continental mode, which is supported by the best authorities (for even abroad opinions differ), is likely to be the nearest to the utterance of the ancient Romans. Ultimately, as I presume, whether few or many Latin words are uttered behind our counters, they will be pronounced in the way that is presumed to be correct. The characteristics of this new style make it seem strange to English ears. "C" is generally as "k," and "g" is hard as in "get"; "j" or "i" (where that vowel has the power of a consonant) as "y" in "yard," and "v" like "w," though this is debateable. "A" has mostly the broad sound of "a" in "father." We ought all at least to understand what this new pronunciation is, even if we decline to follow it.

J. R. S. CLIFFORD.

THE EFFECT OF CHLORAL HYDRATE ON A HEN.

Sir,—The following facts may amuse if not interest your readers. A carrier taking some syrup of chloral to a customer, broke the bottle, the contents falling on some bread. On arriving at home he thoughtlessly threw the bread to a fowl (a laying hen), shortly afterwards he found it asleep, or, as he thought dead, he however took it into his house and placed it near the fire where it remained perfectly still, to all appearances dead, for rather over forty-eight hours, during which time it layed two ordinary eggs, one each day and appeared not to have suffered at all from its long sleep beyond a slight awkwardness in the movement of its legs for about fifteen minutes. I cannot say the quantity of chloral taken, the syrup contained a dram of chloral to each fluid ounce, the quantity of bread consumed by the fowl was about three ounces, which was completely saturated with the chloral. I can vouch for the truthfulness of these statements.

J. L.

May 31, 1878.

TO THE BENEVOLENT.

Sir,—Kindly allow me to acknowledge in your columns, that in addition to subscriptions amounting to £37 12*s.* 6*d.* already acknowledged in the Journal, I have received on behalf of Mrs. Dixon the following:—Brother, Berwick-on-Tweed, 2*s.* 6*d.*; R. G. Parnell, £1 1*s.*

Southampton. ROBERT CHIPPERFIELD.

"*Druggist.*"—Section 16 of the Act provides that the provisions respecting examination shall not extend to or interfere with the business of wholesale dealers in supplying poisons in the ordinary course of wholesale dealing.

"*Inquirer.*"—Consult the Calendar of the London University.

E. H. Orange.—Dr. Dymock's paper on Chaulmogra Oil appeared in the *Pharmaceutical Journal* for March 25, 1876, p. 761.

G. W. J.—No licence is required for the sale of quinine wine if made according to the B.P., and not sold as a proprietary or patent medicine. Otherwise a licence is necessary corresponding with the conditions under which the wine is sold.

J. G.—(1) Strictly speaking the preparation is subject to the regulations. (2) Lockyer's 'Science Primer of Astronomy,' 1*s.*, published by Macmillan.

"*Devonia.*"—*Lathyrus Nissolia.*

Associate, G. F.—(1) See *Pharm. Journ.* [3], vol. v., p. 401. (2) You will find recipes in Cooley's or Beasley's 'Receipt Books.' (3) The fact should be communicated to the Secretary.

COMMUNICATIONS, LETTERS, etc., have been received from Messrs. Jolly, Crook, Fisher, Romans, Whaley, Ferguson, Jackson, Atkinson, Baiss Bros., Perry, Griffith, Leigh, Young's Paraffin Company, Aggrieved A.P.S., W.P.

"THE MONTH."

Of all the months in the year June and July are most prolific in medicinal plants, and the pharmacist's botanical harvest may then be said to commence. Belladonna, dulcamara, digitalis, red poppy, valerian, aconite, hemlock, white horehound, and elder are all in blossom and ready to be gathered. Biennial henbane, too, is now in excellent condition, judging from a magnificent specimen recently forwarded to the museum of the Society by Mr. Chapman, of Ipswich. This specimen is no less than four and a half feet high, about three feet in diameter, and branched all round the stem. "It grew about fifty yards from the sea, among thistles and sea poppies, in a mixture of sand and shingle and without any tree or other shelter."

Matricaria chamomilla, *Linum catharticum*, *L. usitatissimum*, horseradish, fool's parsley, masterwort, lovage, angelica, alkanet, *Acorus calamus*, *Ptelea trifoliata*, and *Pyrethrum roseum* are all now to be seen in blossom. An account of most of these was given last year.

At Kew, in addition to these, the indigo plant (*Indigofera tinctoria*), *Capsicum annuum*, *Theobroma Cacao*, the niger seed plant (*Guizotia oleifera*). *Dorstenia Contrayerva*, *Ricinus communis*, and *Coriandrum sativum* are also in blossom. At Regent's Park the coca plant and *Asclepias curassavica* are still in flower. In this garden, as also at Edinburgh, the *Rheum officinale* has been flowering freely, its pale gracefully drooping spikes of flowers contrasting well with the red ones of *Rheum Emodi*. Close by, *Veratrum viride* is also now to be seen in blossom; its green flowers appear at first sight to have no pistil, but upon opening the group of stamens three minute carpels, almost distinct from each other, may be found hidden beneath them.

In the country there may now be found in blossom two or three singular plants, belonging to the umbelliferæ, which are worthy of examination.

One of these, the wood sanicle, is a sad puzzle to young botanists. Growing in damp shady woods, and with a habit something like that of the wood anemone, but with more rigid glossy almost evergreen palmate leaves, and with small heads of flowers arranged in an irregular scanty umbel, the relationship of the plant is by no means obvious at first sight. The small umbels look like capitula, but on closer examination it will be found that a few of the outer flowers in each head are shortly stalked and contain only stamens, while the inner flowers are quite sessile and have both stamens and pistils. The fruit when cut across is seen to be a cremocarp, which at once points out to what family the plant belongs. The cremocarp is covered with small hooked bristles, which are curved inwards. This plant was formerly in high repute as a vulnerary. In fact its properties passed into a proverb in France:—"He who keeps sanicle has no business with a doctor." Nevertheless, according to Dr. Prior, the name is not derived from the Latin for health, but is a corruption of the German for Saint Nicholas, a saint who, according to the legend, obtained by his prayers the restoration to life of two children who had been murdered and pickled in a pork tub by an innkeeper. The plant is still used by herbalists, particularly of the American school, as an outward application to wounds and ulcers, and is also taken internally, together with decoction of comfrey root, for healing internal ulcers or stopping hæmorrhage.

Another curious little plant, the marsh pennywort (*Hydrocotyle vulgaris*), has leaves bearing considerable resemblance in shape and size to those of the navel wort (*Cotyledon umbilicus*). It grows on wet boggy pasture land and creeps along the ground. It is one of the few British plants which have peltate leaves; the margin of these is doubly crenate. The umbels are hidden among the leaves and consist of from 2—5 flowers, which are sessile, or on a short peduncle, and were it not for the fruit being a cremocarp there would be but little to indicate that the plant bears any relation to the umbelliferæ. The limb of the calyx is not developed, and the petals are ovate and entire and valvate in æstivation, on which account the late Dr. Seemann placed the plant in araliaceæ; and the fruit has no vittæ. The plant derives its name of "sheep-rot" from the supposition that it causes the rot in sheep, a fact which has been denied. That it is poisonous to sheep is, however, not improbable. Not long since specimens of this plant and of *Ranunculus flammula* were received from a farmer in the provinces, who alleged that whenever sheep were turned into the field where the specimens grew, they ate these plants and were sure to die.

Gerarde too says there "is a kind of navel-wort that groweth in watery places which is called the husbandman's sheeps-bane, because it killeth sheep that do eat thereof," and adds "that the plant is of a hot and ulcerating quality like to the crowfeet (buttercups), whereof it is a kind." Whether the plant be really poisonous, or whether the sheep die of disease engendered by the boggy soil in which it grows, is open to experiment. It would be interesting to ascertain if a sheep kept in a dry place and fed on the fresh plant would be affected by it. Possibly only some of the sheep will eat it, for Dr. Bancroft speaks of a plant in Australia of which when a sheep has once tasted it, it separates itself from the flock and will eat nothing else, remaining for some days in a kind of intoxication until it dies.

A nearly allied species, *Hydrocotyle asiatica*, L., which may be seen in the Botanical Gardens at Regent's Park, is official in the Indian Pharmacopœia in the form of powder as a stimulant application to ulcers. The properties of our native species seem therefore to demand investigation.

Another interesting plant is the sea holly, *Eryngium maritimum*, which at first sight might easily be taken for a composite plant, the flowers being sessile and forming a kind of capitulum, while its prickly appearance by no means tempts close examination. The plant is easily recognized by its pale bluish glaucous leaves and prickly habit and may be found on almost any sandy place near the seashore. The stamens being incurved and the petals shorter than the spiny calyx teeth, it requires some little trouble to make out the structure of the flower. When examined carefully the separate anthers and fruit (evidently a cremocarp) point out that the plant belongs to the umbelliferæ. The roots were recommended by Dioscorides for flatulence and are still considered to be restorative by the Arabs. The "kissing comfits," spoken of by Falstaff, were supposed to be made of the roots of this plant. According to Culpepper sea holly possesses powerful aphrodisaic properties, and wonderful healing and alterative powers. The other British species of this genus, *Eryngium campestre*, is very rare and local in this country, and has leaves much resembling those of a thistle.

The collection of the roots of the sea holly must have been a somewhat tedious affair, for Culpepper remarks "The root groweth wonderful long, even to eight or ten feet in length." Candied eringo root even now is not altogether an obsolete article.

At the Regent's Park Botanical Gardens a curious variety of the plantain, *Plantago lanceolata*, may now be seen, in which the bracts are developed in the form of a rosette of leaves at the top of the flower stalk, the flowers themselves not being produced. A somewhat similar monstrosity of the *Plantago coronopus* was lately found by Mr. W. W. Reeves in Sussex, and is figured in the *Gardeners' Chronicle* of June 1, page 699, and figures of others similar in character may be found in Gerarde's 'Herbal,' p. 420.

By far the prettiest British species of this family is the *Plantago media*, which although not generally abundant is very common on chalky or calcareous soils. The leaves are smaller than those of the *Plantago major*, and are pressed close to the ground, destroying the grass underneath them, so that in lawns, etc., where it occurs in any quantity it becomes a nuisance. The pretty appearance of the spikes when in full flower is owing to the contrast between the white anthers and the very long lilac-coloured extended filaments. The plantains, more especially the larger species (*Plantago major*), had once a high repute for healing wounds, sores, and swellings, etc.; hence Romeo, speaking of a broken shin, is made to say:—

"Your plantain leaf is excellent for that."

It is very curious how properties of plants become lost sight of, and are brought to light again after many years. The *Medical Press and Circular* quotes the statement of an American homœopathic practitioner to the effect that the common plantain (*Plantago major*) is a sure remedy for toothache. When the plant is in flower, the leaves are gathered, chopped finely, and packed closely in a bottle, and covered with alcohol for a week, a piece of cotton wool is saturated with the tincture, and inserted in the cavity, and four drops of the tincture are put in half a glass of water, of which a teaspoonful is taken. It is also used to alleviate pain in the process of teething, for which purpose it is rubbed on the gums. When inserted in the ear it is said to be equally effectual in earache. This reads almost like an extract from Culpepper, who says: "The roots of plantain and pellitory of Spain, beaten into powder, and put into the hollow teeth, taketh away the pains of them. The clarified juice or distilled water, dropped into the eyes, cooleth the inflammation in them, and taketh away the pin and web, and dropped into the ears, easeth the pains in them, and helpeth and removeth the heat." The small seeds of an allied species, *Plantago Psyllium*, formerly known as flea seed, from its form and colour, are highly mucilaginous, and when swallowed whole form a valuable demulcent, in consequence of the mucilage being gradually liberated. Spogel seeds, from *Plantago Isphagula*, possess similar properties, and are still official in the Indian Pharmacopœia in catarrhal and renal affections, as well as in diarrhœa and dysentery.

The lemon-scented verbena (*Aloysia citriodora*) is well known in this country as a fragrant garden favourite, but few perhaps know to what practical use it can be turned. In a recent work entitled 'Among the Spanish People' it is described as being systematically collected in Spain, where it is considered to be a fine stomachic and cordial. It is used either in the form of cold decoction, sweetened, or five or six leaves are put into a teacup, and hot tea poured upon it. To quote the words of the author, "the flavour is simply delicious, no one who has drunk his pekoe with it will ever again drink it without a sprig of lemon verbena." But not only so, those who use it are promised, "You will never suffer from flatulence, never be made nervous and old maidish, never have cholera, diarrhœa, or loss of appetite."

The flower show at the Botanical Gardens at Regent's Park on the 12th of June, was very rich in orchids, such a grand bank of plants not having been seen for a long time. The pelargoniums also formed a very effective group. Fine foliaged plants, new plants and varieties, a fine series of annuals in pots, heaths, and especially the rhododendrons, were the chief groups in the display. Only fine weather was wanting to make the day a great success.

'Medicinal Plants' for June contains figures of the following plants, *Gossypium barbadense*, *Citrus vulgaris*, *Citrus medica*, *Prunus serotina*, *Citrullus Colocynthis*, *Dorema ammoniacum*, and *Statice Caroliniana*. Of these *Prunus serotina* is perhaps better known under its commercial name of *Prunus Virginiana*, and *Statice Caroliniana* under the name of *Marsh Rosemary*, although the latter is almost unknown in this country. In New England it is considered to be a valuable astringent. The plates are good, with the exception of *Citrus vulgaris*, in which beauty is certainly sacrificed to "perspective." The matter is up to the most recent date. Those who study materia medica will find in this work many remarks worthy of perusal, not to be found in the most recent works on that subject.

In the drug market a few unusual articles have been offered for sale. Among these are the bark of *Pterocarpus flavus*, the roots of *Coptis Teeta*, *Pæonia Moutan* and Indian Jalap; the leaves of *Caroba* and *Cnicus benedictus*. The bark of *Pterocarpus flavus* occurs in long thin flat pieces, minutely striated externally and smooth on the inner surface, with a light yellow, flaky fracture and a bitter taste. In China it is used, according to Porter Smith, as a tonic, diuretic and antirheumatic. It is also used to dye silk of a yellow colour. The root bark of the Moutan peony occurs in reddish-brown or blackish quilled pieces two or three inches long, with small scattered warts, rough scars here and there, and a radiated, starchy, pinkish, short fracture. It has a powerful odour, resembling that of *Hemidesmus Indicus*. The taste is astringent and slightly pungent. In China it is largely prescribed in congestions, menstrual disorders, hæmorrhages, and for worms. *Coptis Teeta* is official as a tonic in the Pharmacopœia of India, and is remarkable for the quantity of berberine (8½ p. c.) which it contains.

In the *British Medical Journal*, Dr. J. A. Francis, of Southsea, points out that the proper spelling of the plant already mentioned in this and other journals under the name of Roromiko, is Koroniko. He fully endorses all that was stated about it in the *Evening Standard* of May 10, and states that the drug is more certain in its effect than the ordinary astringent mixture. It is used in the form of a strong infusion of the leaves. The plant has some resemblance to the common broom.

In the *Philadelphia Medical Times*, Dr. Keen recommends a new form of lint known as paper lint. It is prepared by Messrs. Wyeth and Co., of Philadelphia, in sheets eighteen inches long by twelve inches wide, which are as thick as patent lint, and consist of pure paper felt. It has, however, the disadvantages of being easily torn and not fitting very closely to very uneven surfaces. These defects Dr. Keen thinks can be remedied by adding a number of cotton threads to it in the manufacture, and coating the outer surface of the lint with India-rubber. At present when saturated with solution of carbolic or salicylic acids, waxed paper is used to cover it. Its absorbent power is stated to be greater than ordinary lint, while it costs only one quarter the sum. As a cheap substitute for lint, this new article seems worthy of the attention of institutions where cost of material has to be taken into account.

Some valuable remarks by Dr. Buch, concerning the injurious effect of salicylic acid upon the teeth, have appeared in the *St. Petersburg Medicinische Wochenschrift*. He states that having been in the habit of brushing his teeth with a solution of 1 part of the acid in 1000 parts of water, he found that in a few weeks his teeth felt softer than usual and seemed as if there were grit or sand between them. On examination he discovered that the surface of the teeth was rendered soft and granular by the action of the acid. He therefore strongly cautions the public against the use of salicylic acid as a wash for the mouth and teeth.

After these results it becomes almost necessary to inquire whether salicylate of sodium possesses the same property, so that those who have to take either the acid or its salts may be cautioned to rinse the mouth after taking each dose.

A fresh application of salicylic acid has been made known by Dr. Fergus of Marlborough College. He finds it very useful as a topical application in diphtheria and gives in the *Lancet* the following formula for its use:—Salicylic acid, 50 grains, rub it with six grains of glycerine, and two drachms of a concentrated solution of acetate of liquor (*sic*) ammoniæ. The liquid is perfectly clear and the application causes neither pain nor irritation.

Dr. R. H. Goolden, writing to the same journal, calls attention to the valuable cholagogue properties of the sulphate of manganese, and points out that although its properties were described some years ago in Dr. Pereira's work on materia medica, the remedy is by no means so well known as it deserves.

In the Lombardy *Medical Gazette* an account is given of a case in which hydrophobia was cured by two Russian doctors by the use of oxygen gas. After the patient had consumed three cubic feet of gas the spasms were subdued, and although they returned the next day a second administration for the space of forty-five minutes caused the symptoms to disappear altogether.

The recent researches of Bert show that oxygen under a pressure of five or six atmospheres becomes diffused through the tissues and the organic oxidations are diminished, leading to an immediate reduction of the temperature of the body. Thus it becomes evident that the therapeutical properties of oxygen under varying conditions are by no means fully known. Had Jules Verne been aware of the facts now related his fertile fancy might perhaps have made still more amusing the delightful story of 'Dr. Ox's Experiment.'

In this age of discovery we need perhaps to be reminded that there is nothing new under the sun. According to the *Medical Examiner*, Dr. Huillet, late of Pondicherry, after perusing some Hindoo manuscripts preserved in that city, has come to the conclusion that a certain Dahwantori, who flourished several thousand (!) years before Hippocrates, was well acquainted with vaccination. In the manuscripts alluded to the effects produced by inoculation with the matter taken from a man or a cow are described, and the secondary disease so produced is stated to be identical, except in being harmless.

Dr. Sherwell, of Brooklyn, finds linseed taken internally a useful remedy in various affections of the skin, as *Pemphigus foliaceus*, *Pityriasis rubra*, *Lichen planus*, and *Lichen ruber*. He directs his patients to carry some in their pockets, and from time to time to take a little in the mouth, and chew it thoroughly before swallowing. He states that the general condition of the patient improves almost as much as if cod liver oil had been taken, and that the state of the skin becomes ameliorated.

Coloured photographs are no longer a dream but an actual fact. M. J. Albert, photographer to the Court at Vienna, has invented a method of photographing in natural colours. The process depends upon analysing white light with the three primary colours, yellow, blue, and red, and in the recovery of the colours ready for the press. A plate is chemically prepared so as to receive only the yellow light and the tones of the colours of the object to be reflected, and the first photograph is taken on this and a negative of that plate is put under the press, the cylinder of which is covered with yellow paint, so that none but the tones of the yellow colours are seen in the impression. After that the object is photographed on a plate made to reflect only the blue tints. This plate is treated in the same way as the first, except that the cylinder is covered with blue paint. In the same manner the tones of the red colours are received on a third plate. By printing the individual colours of yellow, blue, and red over each other a picture is produced true to nature, the colours affording the natural tints by being printed over each other. Already this new discovery has been proposed to be turned to account in works on surgery for photographing skin diseases.

A new application of the telephone has been suggested by Sir Henry Thomson. It is well known that in operation for stone it is very necessary not to leave even a small piece of it in the bladder. It is proposed to use the microphone to ascertain the presence of fragments in the bladder. There are, however, difficulties in the way of its application at present, which possibly a better knowledge of the powers of the instrument may hereafter overcome.

Captain N. J. Holmes has filed a specification* setting forth the merits of a new signalling and rescue light for maritime purposes. He prepares crude phosphide of calcium by heating phosphorus with finely divided chalk, thus obtaining a mixture of the phosphide with some phosphate of calcium, which generates phosphoretted hydrogen when treated with water. The phosphide is enclosed in certain metallic drums so constructed that water is automatically allowed to flow in, proper escape being allowed for the gas which is liberated and which immediately ignites on issuing into contact with the air. One advantage of this light for signalling and other purposes is that it is inextinguishable by wind or rain. Moreover, inasmuch as the water

* No. 3142, 1877. Filed February 16, 1878.

allowed into the apparatus admits of measurement, known volumes of gas are obtainable and may be adapted according to the purpose intended.

G. Brügelmann* states that when the nitrates of calcium, strontium, and barium are heated in porcelain flasks to a temperature beyond that at which decomposition occurs, the corresponding oxides are obtained in a crystalline form (of the regular system). The crystals of lime are cubes and take up water and carbonic anhydride much less readily than amorphous quicklime.

The current number of Virchow's *Archiv* contains a paper by Guttmann and Fraenkel concerning the antiseptic properties of peroxide of hydrogen. They observe that it preserves urine and meat infusions from putrefaction, keeping them free from bacteria for months, and further that it prevents the fermentation of grape sugar solutions. These observations allow of but one critical remark: they are correct, but they are not original. In a report read by Mr. Kingzett at the Pharmaceutical Conference of 1876, he described† similar experiments in explanation of the disinfectant and antiseptic properties of the products of the limited oxidation of essential oils. The *Lancet*, however, seems to have been unaware of this fact, and in a long leader does honour to Guttmann and Fraenkel for their originality of conception and capability of research. This is but a common instance of the manner in which all chemical work done at home is neglected by the medical journals of this country, but it would be better for chemistry, and medicine too, if our contemporaries condescended to do credit to English scientific workers and their labours.

In a paper on the proximate composition of certain volatile oils,‡ by G. Bruylants, it is shown that oil of tansy contains 1 per cent of terpene ($C_{10}H_{16}$), boiling at 155° to 160°; 70 per cent of aldehyde ($C_{10}H_{16}O$), isomeric with laurel-camphor; and 26 per cent. of an alcohol ($C_{10}H_{18}O$) boiling at 203° to 235°.

Valerian oil also contains a terpene and a similar alcohol, together with its formic, acetic, and valeric ethereal salts, and the ether $(C_{10}H_{17})_2O$. The compound $C_{10}H_{18}O$ is isomeric with borneol, and by suitable treatment gives a terpene, which, when oxidized with chromic mixture, yields camphor, $C_{10}H_{16}O$.

R. Hennig§ describes a preparation of artificial champagne as follows:—A wine of the Rheinpfalz, Rheingau, or Neckar, is freed from albuminoids by tannic acid, excess of which is then removed by precipitation with gelatin, after which the wine is left at rest for eight days. It is then filtered through kaolin and charcoal, and flavoured by the addition of sugar, tartaric acid, glycerine, and cognac or spirits of wine. An agreeable aroma may be imparted to the wine by the use of some extract, such as extract of violet or orange-blossom water. The flavoured wine is again filtered and saturated with carbonic acid, under a pressure of five atmospheres. The same author states that genuine French champagne contains 0·6 free acids, 8·5 alcohol, 8·5 sugar, 0·8 to 1·0 glycerine, and 12·5 per cent. of extractive matters.

The poisonous influence of cashew seeds exhibited on horses in the wet season of Jamaica is said to be due not to any specific poison contained in them, but to the state of fermentation to which the seeds are subject. This process continues in the horses' stomach, producing tympanitis and its consequences.*

E. Schmidt† has re-examined the alkaloids of the seeds of the *Veratrum Sabadilla* and has obtained a crystalline base, together with a second resinous one, which he supposes to yield a third base which is amorphous. The crystalline substance he regards as the principal constituent, and he assigns to it the formula $C_{32}H_{50}NO_9$. This substance melts at 205° and yields amorphous salts. He supports his formula by analyses of the sulphate, hydrochloride, a gold salt, and a platinochloride.

In a paper recently read before the Manchester Literary and Philosophical Society, by Mr. Schunck, "On Indigo-blue from *Polygonum tinctorium* and other plants," the author mentioned a fact of great interest to physiological chemists. He had prepared an alcoholic extract of dried woad leaves in which the indican (the principle which yields indigo-blue and a kind of glucose on hydration) had, on long standing, become partially decomposed, and on evaporation of the extract a quantity of tyrosine was obtained. On a previous occasion the author had met with leucine, and he is of opinion that both are products of decomposition of indican under conditions yet to be ascertained. Of course it may be that the tyrosine was pre-existent in the plant, or what is not more unlikely that both the indican and the tyrosine had been produced by the breaking up of some albuminous substance by hydration and oxidation. Tyrosine and leucine are both known to be produced in such decompositions and are accompanied by indol (as shown by Nencki), a substance related to indican.

It may be of interest to those readers of these columns who smoke, to learn that the annual consumption of tobacco now amounts to 2,000,000,000 lbs., and *Cope's Tobacco Plant* remarks that if the leaves were made into a roll two inches in diameter, the tobacco-serpent following the direction of the equator, would wind around the earth thirty times. Truly this world of ours is under a cloud, but it is getting in years too, and it may be that tobacco is balm to its old age. The world *is* getting old, for Sir William Thomson has said so. He estimated that probably not more than one hundred millions of years have passed since the surface of this earth was habitable, and yet the age of man is but threescore years and ten! However, a critic (Mr. T. Mellard Reade) has characterized‡ Sir William's estimate as a "tremendous superstructure of inference."

The *Lancet* of the 22nd inst., calls attention to an outbreak of trichinosis in Vienna, caused by the consumption of some American hams recently imported into that city, and infested with trichinæ. Now, as such hams are being largely used in this country it is most important that such a danger should be emphatically pointed out. Better still would it be to devise some process for turning out the trichinæ or destroying them in their very habitation.

Under the title of *The Electrician* a new paper has recently made its appearance as a weekly journal of electricity and chemical physics. However worthy of success it may be, one is reminded of the fact that there is a *late* electrician. Still it starts with the

advantages incident to the introduction of the telephone, the microphone and electric street-lamp lighting and that is something!

Speaking of the microphone reminds us of Mr. Seabroke's letter recently published in *Nature*, in which he writes "I doubt whether 'microphone' is a proper term for describing the instrument. In gently brushing the stand of the instrument, sound is heard in the telephone, but it does not at all follow that what we hear is a magnified reproduction of the brushing sound; for if the rapidity of the vibration or motion produced by brushing is insufficient to produce sounds, still they may move the charcoal sufficiently to produce articulations of current, each of which may be able to set up vibrations in the telephone plate in its own period, or a modification of it giving what I call the jarring sound. If therefore we have this sound, we know that either the microphone is exposed to sounds so loud as to produce complete breaks of contact or there is a motion going on affecting it of sufficient rapidity to be audible."

Students of the microphone might perhaps make something out of the following fact, which must have been observed by many. If when stretched at length in a bath, one throws back the head far enough to allow the ears to be submersed in the water, keeping the mouth above it, then each expiration in breathing is heard with the distinctness and roar of thunder. In such case it appears every man is his own microphone, and science has at last very properly gone in for a bath. It has taken such rapid strides of late years that in its haste it has become heated and unclean! It is curious to remark that man is microphonetic by nature, his words and deeds invariably sounding greater to his own ears than to those of others.

With reference to a mixture of citrate of iron and quinine with aromatic sp. of ammonia, No. 78, commented on very recently in "The Month," a correspondent, again brings the subject under discussion by stating that if the citrate of iron and quinine be dissolved in the aromatic sp. of ammonia, and the bromide of potassium previously dissolved in the water be gradually added, the mixture can be dispensed without a separation of the quinine. It is only necessary to repeat here that if the ferri cit. c. quin. be of the B.P. standard and the sp. am. arom. of the proper strength, a separation of the quinine will take place, and when this does not occur the quality of the preparations or the accuracy of the dispenser should be doubted.

A remedy for the insolubility of salicylic acid in water, No. 108, has been suggested since the remarks in the last month; that is, the addition of borax in the proportion of two grains to each ounce of the solution. But this addition, although it results in the formation of a clear solution, cannot be recommended for adoption by the dispenser; still it may very properly be brought under the notice of the writer with the view to obtain his sanction to such an addition. It is extremely desirable that the ingredients of a prescription should be so arranged as to result in an elegant combination. Any suggestion in this direction is of value, and may very properly be brought under the notice of the medical profession, but the prescription as written must not be tampered with for the sake of elegance, excepting with the concurrence of the writer, and the addition of borax to a solution of salicylic acid in order to make the combination an elegant one should not be adopted without medical sanction. At the same time such suggestions in the pages of the dispensing memoranda appear in their proper places, are not without value, and may bear fruit in the future of pharmacy.

Reference has also been made by a correspondent to the remarks on syr. ferri superphosph. co. Inquiry has since been directed to the author of that paper with this result. Syr. ferri superphosph. was exhibited as a new remedial agent in the exhibition of 1851, and has been since that time in constant use, and also largely exported to the United States. On it was founded Parrish's preparation which has since aquired European celebrity, but no preparation save the one alluded to has ever been called syr. ferri superphosph. That which the writer of the prescription has written is commented on; what he intended, if there is reason to believe that it is different to that which he has written, should be ascertained from him personally. The object of the remarks in "The Month" on dispensing is to embody in its pages *general principles* for the guidance of dispensers. The preparation alluded to appears to be by no means so obscure as might be concluded from the correspondents' observations.

The first prescription calling for notice is that of No. 112, containing iodide of iron and iodide of potassium; for this an excipient capable of making a plastic mass is required. Crumb of bread will make this very readily into a satisfactory mass, which may then be rolled into pills. If the bread be too new the mass may be rather soft. It should be chosen firm, if not disposed to be crumbly. About 20 grains will be sufficient for the sixty pills. Glycerine of tragacanth, so generally useful, if employed here will make the mass too soft. Crumb of bread is readily obtainable and a very valuable excipient in cases of compounds otherwise very intractable.

Formerly when there existed three pharmacopœias in the United Kingdom, prescriptions were frequently met with such as that of No. 113, pil. rhei co. xij, without the size of each pill being indicated, all the pill masses of the Edinburgh Pharmacopœia being made into certain sized pills, for instance that of pil. rhei co. into 5 grain pills. From this circumstance originated a practice, at one time very common but now rarely met with in England, of ordering a pill without giving the size.

The prescription No. 114 may be dispensed perfectly transparent and without deposit, but of a dark colour, by dissolving the sulphate of iron in the inf. cascarillæ, adding the sp. æther. nit. and subsequently the acid. hydrocy. dil. The mixture is darker than the infus. cascarillæ would be, from the action of the tannin of the inf. cascarillæ on the ferri sulph., but there is no deposit. It is presumed that fresh infusion which has stood long enough to become clear will be used in the preparation of this prescription. There is a certain amount of deposit from inf. cascarillæ after being made, and if the mixture be prepared previously to this being deposited a flocculent matter will necessarily subside from the infusion itself.

Inquiry No. 115 refers to B.P. raisins. What kind of raisins is it correct to use in those B.P. preparations where raisins are ordered? Referring to the botanical description in the B.P., the raisins are thus described, "The ripe fruit of *Vitis vinifera*, Linn. —the grape vine. Dried in the sun or with artificial heat; imported from Spain." In commerce there are four kinds of raisins commonly met with—Muscatel, Valencia, Elemi, and Sultana; the two latter are from Smyrna, and this circumstance at once excludes them. The choice now lies between Muscatel and Valencia. Either may be used, but the Valencia are generally employed. As raisins have no medicinal properties and are only required for the saccharine matter they contain, it may be questioned if the Elemi raisins from Smyrna are not the best suited for pharmacy. These raisins are specially prepared and are sent to this country chiefly for export to Australia and other colonies. They are more luscious than the Valencia raisins and are generally met with in a better condition, being subjected to a special process before being dried, which preserves them during a sea passage of many months on their way to Australia. The Elemi raisins are very like Valencias; they have seeds about the same size; but the B.P. instructions if rigidly adhered to exclude them from use. It is not correct to say that sultanas have no seeds, but as compared with those of other raisins they are very small.

No. 116 refers to the dose of Ol. Santal. Flav. It is usually given in doses of ten to fifteen minims, but on this subject little need to be added to the practical remarks of Mr. Henry Brown. In whatever dose the ol. santal. flav. is prescribed it is not for the dispenser to use liq. potassæ to form an emulsion. The suggestion of liq. potassæ intrudes a medical opinion which the pharmacist is not competent to give. He may use mucilage and syrup for the suspension of the oil and suggest liq. potassæ to the writer of the prescription.

No. 117 contains the question, When tr. cardamoms is ordered in a prescription, which is correct to dispense, tr. card. simp., or tinct. cardam. comp., not knowing the prescriber's intention? The tr. cardam. (simp.) occupied a place in the Ph. Lond. 1836, and the Ph. Edin. 1841, but was omitted in the B.P. 1867. When it did occupy a place in the pharmacopœia it was not such a favourite as the compound tincture, and ten years having now elapsed since the B.P. 1867 was issued omitting the simple tincture, there is fair presumption that when tr. cardam. is written that the compound tincture is intended; at the same time it would be more satisfactory to determine the point definitely by reference to the writer, a procedure which would remind him to add the "co." in future prescriptions if he intends the compound tincture to be used. It will be a red-letter day for pharmacy when simple and compound tinctures of the same drug, with little save colour to distinguish one from the other, cease to exist, and when the preparations allowed to remain are invigorated by an occasional judicious pruning.

The question is asked in No. 118. When pulv. scammonii is ordered, what should be dispensed, pulv. rad. scammon., or pulv. gum. scammon.? Referring the inquirer to his pharmacopœia he will there find that scammony is a gum-resin obtained by incision from the living root of *Convolvulus Scammonia*, chiefly from Smyrna and Asia Minor. The juice collected in shells is suffered to concrete; this is scammony, and it only requires to be reduced to powder to form what, by-the-bye, should be written for the sake of consistency either pulv. scammonii or powdered scammony. The rad. scammoniæ is only employed for the production of resin. scammon. Scammony enters into four preparations of the British Pharmacopœia, whilst the resin has a place in two and in one in the appendix. The scammony root is official in the B.P., but only for the preparation of the resin.

Question No. 119 has reference to certain B.P. preparations, whether they should, when prepared, be made up to a particular quantity or otherwise. When directed, as in all tinctures, the yield should be made up to the prescribed quantity, but in some other preparations and in all infusions it is not so ordered, the directions are to strain or filter, and in no case should the product be made up to a given quantity unless specially ordered and when such directions are appended to the preparations. On this point the pharmacopœia instructions are quite clear. It is an important point, and it is difficult to understand how those instructions could have been so misunderstood as to occasion a doubt in the mind of any one whose attention had been directed to the subject.

The prescription No. 120 should be prepared by dissolving the ferri citras in about the same quantity of water and then mixing it with the tinct. quinæ, to this mixture the tr. nuc. vom. should be added. The result will be an opaque mixture which on standing separates into two nearly equal portions, the upper clear and dark, the lower turbid. It should have a label to shake the bottle previous to taking each dose; if taken in water it becomes clear. In its present form it is not an elegant mixture. If made with an equal quantity of water into a 4-oz. mixture it could be sent out more clear, tolerably stable, and more elegant; but this alternative must receive the sanction of the writer.

In No. 121 the best form is required for tr. eucalyp. glob. Squire gives a formula supplied by Savory and Moore—leaves 1, bark 1, proof spirit 10. Dose 1 to 4 drachms. In a lecture on Eucalyptus Globulus (*Pharm. Journ.*, May 4, 1878), Professor Bentley, in alluding to preparations of different parts of the plant, says:—"The bark is also said to possess similar properties in this respect to the leaves. Several preparations, such as tinctures, etc., of the bark and leaves are now exhibited, but the best form of administration is probably the alcoholic tincture." It will be observed that the alcoholic tincture is recommended by the lecturer, whilst in the formula quoted proof spirit is given as the menstruum; this difference is sufficient to account for the more or less opacity of a tincture when mixed with water. If the leaf of the eucalyptus be held up to the light, its numerous glands charged with oil will be readily observed, and the presence of so much volatile oil in the leaf would indicate rectified spirit as the best menstruum for the tincture.

When the medicinal agent is an essential oil or resin, whether in leaves or bark, rectified spirit is a more suitable solvent than proof spirit, and when one tincture of such a drug on being mixed with water becomes more milky than a second sample, the probability is that the one is made with rectified the other with proof spirit. The time will probably arrive when the hard and fast line between rectified and proof spirit will give way to relative proportions of each suited to the drug the active principles of which it is employed to eliminate. Our present practice may be the more convenient but it is the less scientific, and a step in this direction is already anticipated by the authors of the Homœopathic Pharmacopœia.

NOTE ON THE ALKALOID SOPHORIA.*

BY H. C. WOOD, M.D.

Some months since I gave notice† of the finding of an alkaloid having toxic properties in the bean of *Sophora speciosa* of Texas. During the past winter I have made some further study of the bean, which, although it does not exhaust the subject, has led to results worthy of publication. Other pressing engagements will prevent my giving more time to the matter, and it affords me pleasure to turn it over to the far abler hands of Professor Wormley, who hopes to make a thorough investigation. This much of apology. In the present state in which it was obtained sophoria is a transparent liquid having a highly alkaline reaction, freely soluble in water, somewhat so in ether, and very freely so in chloroform. When quite pure it is probably colourless, but, like other liquid alkaloids, it is very prone to undergo change, and I have never seen it free from a brownish tint. Its chloride crystallizes very readily, and appears to be a stable salt. With chloride of platinum it gives beautiful and peculiar crystals. When an acid is added to its watery solution drop by drop, very marked turbidity is produced, clearing up as more of the acid is put in. Crystallization is favoured by not allowing the reaction of the solution to become distinctly acid; and there is reason for believing that the crystalline salt is basic, although I cannot speak positively upon this point. The most characteristic test is that with the tincture of the chloride of iron, a deep blood-red colour being produced.

I have tried various processes for preparing this alkaloid, but the only one which has yielded me any results is as follows: The powdered beans are first well moistened with strong alcohol and allowed to stand for two hours, the object being to coagulate the albuminous and gummy principles of the bean as much as possible. In order to avoid the extraction of the very abundant colouring matter of the shell, water not too strongly acidulated with muriatic acid is added in considerable quantity after the second hour, and maceration allowed to continue for a week. The expressed liquid is concentrated on a water-bath, and when cold rendered decidedly alkaline with carbonate of sodium, and agitated with an equal bulk of chloroform. On standing, the mixture separates into two layers, the lower being an emulsion of chloroform. This, after twenty-four hours, is removed by decantation, or with a pipette, and the supernatant liquid treated with chloroform, as before.

The two emulsions of chloroform having being mixed, are thoroughly agitated with a half bulk of water acidulated with muriatic acid. By this procedure the alkaloid is more or less perfectly reconverted into the stable chloride. The chloroform is then by distillation recovered, and the mixture evaporated at a low temperature to the consistency of a thick syrup, care being exercised that the reaction be at all times decidedly acid. To the syrupy liquid strong alcohol is added, and the precipitated gum separated by filtration. The clear liquid is then evaporated upon a water-bath until all the alcohol is driven off and an impure solution of the chloride obtained. This is rendered strongly alkaline with carbonate of sodium, and extracted twice with an equal bulk of chloroform. The chloroform now separates readily, or by means of some of the manœuvres known to every worker in alkaloids, can readily be coaxed into doing so. It is then allowed to evaporate spontaneously. The impure alkaloid left behind is to be purified by solution in a small quantity of water acidulated with muriatic acid, filtering, rendering strongly alkaline with carbonate of sodium and extracting with chloroform. It is probable that this process would be not only simplified but also improved by extracting the first concentrated infusion with strong alcohol, and thereby avoiding the first use of chloroform. The process is, however, here given as it was practised.

When given to frogs this alkaloid produced the symptoms which I detailed in my previous note. I found it to act much less powerfully upon mammals than I expected. Three grains of it hypodermically failed to very seriously affect a dog, but killed a cat in a short time.

A POISONOUS AUSTRALIAN LAKE.*

BY GEORGE FRANCIS.

This year the lakes forming the estuary of the Murray have been very low and the water unusually warm. The river is very low and the inflow to the lakes very slight and having a temperature of 74° F. Lake Alexandrina—on calm days surface 76° depth 73°—during breezy temperature is 72°. A conferva that is indigenous and confined to the lakes has been produced in excessive quantities, so much so as to render the water unwholesome.

It is, I believe, *Nodularia spumigera*, allied to protococcus. Being very light, it floats on the water except during breezes, when it becomes diffused. Thus floating, it is wafted to the lee shores, and forming a thick scum like green oil paint, some two to six inches thick, and as thick and pasty as porridge, it is swallowed by cattle when drinking, especially such as suck their drink at the surface like horses. This acts poisonously, and rapidly causes death; symptoms—stupor and unconsciousness, falling and remaining quiet, as if asleep, unless touched, when convulsions come on, with head and neck drawn back by rigid spasm, which subsides before death. Time—sheep, from one to six or eight hours; horses, eight to twenty-four hours; dogs, four to five hours; pigs three or four hours.

A *post mortem* was made on a sheep that had thirty ounces of fresh scum administered by the mouth: death was long coming on—about fifteen hours; examination made six hours after. Stomachs: none of the green scum left, all absorbed; dry grass food in stomachs. Abdominal cavity contained two pints of yellow serum; heart flaccid, but not pale; great effusion of serum around it. Lungs, liver, kidneys, and substance of brain healthy and normal, but the dura mater congested. Blood throughout veins and arteries and in both ventricles black and uncoagulable, neither did it become scarlet on exposure to the air. Many sheep that died, on being opened, presented the same appearances, all being without any sign of its presence in the stomachs.

This shows that the plant is rapidly absorbed into the circulation, where it must act as a ferment and cause disorganization. The cattle will not touch the puddles where the scum has collected and gone putrid. Thus all they take is quite fresh, and the poisoning is not caused by drinking a putrescent fluid full of bacteria as at first supposed. When this scum collects on the banks and is as rapidly left dry, it forms crusts of a green colour. This has gone out of the Murray mouth into the ocean and been wafted ashore, forming thick beds of green stuff from a few inches to twelve inches thick. When, however, this scum is left in wet pools and puddles it rapidly decomposes, giving off a most horrid stench like putrid urine, or archil in process of manufacture; but previous to its getting into that state it emits the smell of butyric acid, smelling like very rancid butter.

There exudes from this decomposing matter a blue pigment which has remarkable properties. Sample tube 1 contains the fluid as strained off from the scum and will be found full of bacteria. No. 2 is the same with glycerine, and filtered to separate the bacteria.

This fluid is remarkably fluorescent, being red by reflected light and blue by transmitted light. Spectrum a broad and deep band total at top in the red, but shading off to green, quite cutting off orange and yellow.

* From *Nature*, May 2, 1878.

Chemical properties:—Heat destroys colour; sulphuric acid no action; nitric acid reddens; hydrochloric acid, the alkalies, and ammonia, destroy colour; chlorine and ozone bleach; light but little action, yet sunlight gradually bleaches; dries to a mass, retaining colour; soluble in water, glycerine, and weak alcohol. I think this is allied to the colouring matter of some lichens, is a product of decomposition, and not pre-existing in fresh plants. Its fluorescent powers are remarkable, and the most powerful I have ever met with.

THE BOTANICAL SOURCE OF ARAROBA.*

The following information respecting the tree which yields araroba, and the manner in which that substance is obtained from it, is from some notes supplied to the *Journal de Thérapeutique* by Dr. Rameiro A. Monteiro, who has recently visited the district in which the tree is met with.

The tree from which araroba is extracted is known in all the places where the industry is carried on under the name "*angelim amargoso*," or "bitter angelim." Why it is called "angelim" is unknown. It is a neighbour of another tree which yields a product having vermifuge properties, the *Andira anthelmintica*, Benth. (*Geoffræa vermifuga*, St.-Hil.), from which, however, it differs in appearance, although both belong to the Leguminosæ. The term bitter is applied to it because its wood is bitter, like cinchona, and persons who cut down the trees are sensible of a bitter taste which is due to particles which become detached from the inner layers of the wood. There is also an "*angelim doce*" (*Andira vermifuga*, Martius) and an "*angelim pedra*" (*Andira spectabilis*, Sald.), which also belong to the Leguminosæ. The powder obtained from the bitter angelim is invariably called "araroba."

The tree is met with in great abundance in the forests of Camamu, Igrapiuna, Santarem, Taperoa, and Valença in the province of Bahia. It appears to prefer low and humid spots, but it is also met with in the more elevated regions when these are not very arid.

At whatever season the tree is cut, provided it be of the necessary age, araroba is found; no particular time of the year is preferred for the operation, which is carried on without regularity or method. The tree is one of the tallest in the forests in the south of the province; in fact there is only one, popularly called the "oleo" (*Microspermum erythroxylum*) which rivals it in height, and this belongs to the same family. The bitter angelim is erect, smooth, and when it attains its full development it measures 1 to 2 metres in diameter, and 20 to 30 metres from the ground to the small branches. The tree from which Dr. Rameiro cut a section at a height of 2 metres from the ground measured 24 metres 20 centimetres up to the first branches. The bitter angelim has no other known use than to furnish araroba; the old trees are preferred because of their greater richness.

The araroba is contained in clefts or cavities, more or less narrow, in the wood. The clefts traverse the wood in the direction of the diameter, and are prolonged through the whole extent of the trunk, becoming narrower towards the upper part. Sometimes small clefts also occur parallel with the primary ones. In order to extract the araroba it is the practice to hew down the tree, cut it across into small sections, and split these longitudinally, which is favoured by the fibre of the wood and the large clefts, upon the surfaces of which the araroba is deposited.

The araroba is of a yellow colour, comparable to powdered sulphur, though a little darker and devoid of lustre. By the action of the atmosphere it loses little by little its fine colour, so as sometimes to resemble aloes and at others rhubarb, and finally takes a deep purple colour. The powder is found upon both sides of the clefts, and the workmen scrape it off with the sharp edge of an axe. Commercial araroba is therefore very impure, as it is always mixed with a considerable quantity of ligneous particles, which in the green state are easily removed with the araroba. Some that Dr. Ramiero himself removed carefully was found to be free from woody particles.

The workmen employed in the extraction of araroba suffer from irritation of the conjunctiva, which sometimes passes into inflammation of that membrane, and the face will remain swollen and erythematous for some time; but for the irritation caused by araroba to produce these effects it requires that its action shall be prolonged during a day or more.

It is quite certain that araroba is not found in the medulla, as has been generally supposed, but is deposited as a concretion in the clefts before mentioned.

Araroba has long been employed in the treatment of ringworm (*Herpes circinatus* and *Herpes tropicus*), but how long is not known. It is also said to be employed in killing fish, by throwing it into the lakes and rivers.

Dr. Rameiro did not ascertain the exact period of the year when the bitter angelim flowers, but he learned that the flower is dark purple and the fruit is a pod. The tree is not cultivated.

STRYCHNIA INCOMPATIBLE WITH BROMIDE OF POTASSIUM AND CERTAIN OTHER SALTS.*

BY A. B. LYONS, M.D.

Having occasion recently to dispense a mixture in which strychnia was combined with bromide of potassium, I observed that when the bromide was dissolved in a clear neutral solution of the strychnine the fluid at once became turbid from the separation of a bulky precipitate, which failed to redissolve on the addition of a few drops of dilute acid. The precipitate, which under the microscope was seen to consist of minute acicular crystals, proved to be a salt—doubtless bromide—of strychnia.

When the proportion of strychnine did not exceed one in two thousand the crystals separated from the solution only after some time, unless enough of the bromide were added to make a nearly saturated solution. It is easy to see what danger might arise from this behaviour of a solution containing any considerable quantity of strychnia.

In fact my attention was called to the subject by a case of serious poisoning by the last dose in a bottle prepared after the following prescription:—

℞	Strychnine	grs. ij.
	Bromide of Potassium . . .	ʒij.
	Syrup, Water, āā	℥iv.
M.		

This prescription, when first prepared *secundem artem*, forms a clear mixture, which, however, in a short time becomes turbid and eventually deposits a considerable portion of the strychnia. Hence, if the mixture were not well shaken whenever used the last dose might well be a dangerous one. I found by experiment that bromide of sodium, iodide of potassium, and even chloride of sodium would cause a separation of strychnia from its solutions. Even so small a quantity of common salt as 10 per cent. produced a decided precipitation in a solution of strychnine containing one grain to the ounce.

Nitrate of potassium and sulphate of sodium seemed to have no effect when dissolved to saturation in strychnine solutions of this strength.

The practical conclusion to the physician will take shape in a rule something like this: Never prescribe strychnine in solution in combination with any considerable quantity of iodide, bromide or chloride, and if such a combination is prescribed at all be sure to direct the patient always to shake the vial well before taking a dose of the mixture.

* *Detroit Medical Journal.* From the *Canadian Pharmaceutical Journal*, April, 1878.

EMULSIONES OLEOSÆ.*

BY LOUIS VON COTZHAUSEN, PH.G.

In oil emulsions oil and water are mixed uniformly by means of gum, a mixture of gum and sugar, the yolk of eggs or alkalies. If properly made, there is neither any uncombined oil nor a separation into layers perceptible. They are universally considered more palatable, more acceptable to the stomach, and of a nicer appearance than shake-mixtures, and thus combine the virtues of efficacy and elegance. There are few preparations to which as little attention is devoted by the average druggist, in which he is less particular and skilled, and which he considers of minor importance, not considering that a poorly-made emulsion will certainly injure his reputation considerably, showing either his incompetency or his carelessness, or a little of both; while, on the other hand, if properly made) an oil emulsion will prove a splendid card for the pharmaceutist who dispenses it. We should always endeavour to give our preparations an elegant appearance, as long as it will not interfere with their therapeutical effects, but never follow the example of those who (for instance by filtering cloudy solutions containing insoluble ingredients) sacrifice the medicinal virtues rather than dispense an unsightly preparation. Physicians quite frequently objecting to the presence of acids in solutions, or of gum or any other emulsionizer in mixtures containing oil and water, prescribe shake mixtures. In such cases, of course, we are not authorized under any consideration to endeavour to improve upon their recipe by additions of our own; while on the other hand, when the practitioner desires an elegant and effective medicine it is our duty to try our best to furnish a perfect preparation. Looking over a prescription file we often notice that the doctor leaves it for us to decide how much of some ingredients is necessary to obtain a certain result, and particularly how much gum or other emulsionizer is required to prevent a separation of oil in a mixture. I happened to be present during a discussion between two druggists, one of whom claimed that an emulsion could be made by triturating the whole amount of oil prescribed, gum arabic and a certain portion of water, thrown together into a mortar at once; while the other considered this ridiculous, stating that every apprentice knew that it was necessary to form a mucilage first with gum arabic, sugar, and some water, and then add the oil and balance of the water gradually. The particular oil they had reference to was Oleum Morrhuæ. This induced me to make the following experiments, emulsionizing cod liver oil, copaiva, castor oil, and oil of turpentine, respectively.

1. In making 5 ozs. of emulsion of cod liver oil, let us follow the directions of the 'Pharmacopœa Germanica,' which orders emulsiones oleosæ to be made with 2 parts of oil, 1 of pulverized gum arabic, and 17 (seventeen) parts of water, unless otherwise directed by the physician. I took ol. morrhuæ, f℥iv; pulv. gum acaciæ, ʒii; aqu. dest., f℥iv, poured the oil and water on the gum in a mortar, triturated them well for a few minutes, when a good emulsion was formed, and then added sufficient water to make f℥v. This emulsion remains unchanged after keeping it six weeks at a constant temperature of 70° F.

2. I then reduced the quantity of water one-fourth, mixing at once—ol. morrhuæ, f℥iv; powd. gum arabic, ʒii; aqu. dest., f℥iii, and then diluted with the balance of water; the result was the same. This is the favourite method of most German apothecaries, and is considered by them better and surer to bring success than the first. I have made very many emulsions by it with various oils during a number of years, and never failed. There are now on hand four emulsions containing 50 per cent. of cod liver oil, castor oil, turpentine and copaiva, respectively, made by the second method about four weeks ago. So far they are still, as in the beginning, elegant in appearance, and show no inclination of spoiling or separating although kept at a constant temperature of 70° F. Emulsions containing 50 per cent. of oil, made by the first method about two weeks ago, likewise appear unchanged so far.

3. A large proportion of gum is not objectionable in most emulsions, as in copaiva emulsions, preventing the latter from having a too strong purgative effect; in others, however (as castor oil emulsion), care must be taken, as a large proportion of gum would counteract the effect of the oil to a certain extent. I therefore reduced the quantity of gum arabic to one-half of its former quantity, thus making the proportions, oil 4 parts, gum arabic 1 part, water 3 parts. Emulsions of cod liver oil, castor oil, copaiva, and oil of turpentine, made in this proportion, at first presented as elegant an appearance as those containing double the quantity of gum, and remained unchanged for three days, then the emulsion of copaiva began to separate into two layers, the lower one being only about one-fifth of the whole mixture; on being shaken they readily reunited, again forming, apparently, a perfect emulsion, which, however, began to separate again in the course of twenty-four hours. The emulsion of cod liver oil began to separate a little at the end of four days, that of castor oil after six weeks, while the turpentine emulsion is still unchanged.

4. An attempt to reduce the amount of gum to one-fourth the original quantity, so as to bring the proportions—oil 8 parts, water 6 parts, and powd. gum arabic 1 part, proved successful with cod liver oil, turpentine, and castor oil, but gave an unsatisfactory result with copaiva, even after considerable constant trituration. The emulsions of cod liver oil, turpentine, and castor oil separated on standing for twelve hours, not showing any separated oil globules floating on top, but two distinct layers, the upper one of which still retained the appearance of a perfect emulson, while the lower one was thinner and lighter in colour; shaking slightly again mixed them perfectly. This proves that ʒi of gum arabic to the ounce of oil will only answer satisfactorily when the emulsion is to be used in a short space of time.

5. An emulsion made by shaking together in a bottle equal parts of cod liver oil and of the officinal mucilage of gum arabic was a perfect success, not separating in the least. After standing for three weeks and two days, a separation into layers slowly commenced.

6. Cod liver oil, f℥i, the yolk of one egg, and f℥vi of aq. dest., mixed intimately by trituration, yielded a yellowish-white perfect emulsion, which could be diluted without separation, and remained unchanged for seven hours. It then separated into two layers, which reunited on shaking. Oil emulsions made by any of the mentioned processes will bear dilution with water, and the addition of syrups or tinctures after being perfectly combined.

7. Parrish's formula for cod liver oil mixture reads as follows: Take of cod liver oil f℥vi, lime-water ℥ix. To the lime-water in a pint bottle add the oil, and shake, etc. I mixed f℥vi of cod liver oil and f℥ix of lime-water, and, after considerable incessant shaking, obtained a very satisfactory emulsion, containing 40 per cent. of cod liver oil, which remained unaltered for five days. It then commenced to separate into two layers, the upper one in this case consisting of a small amount of oil, while the lower one, which was at least $\frac{1}{12}$ of the whole mixture, still appeared to be a perfect emulsion. But very little shaking was required to reunite them.

8. Experiments made with different formulas for "Emulsion of cod liver oil and lactophosphate of lime" gave me the following results: By following the directions of the formula published by Mr. Shinn (*Amer. Jour. of Pharm.*, March, 1873, p. 135) I obtained a nicely flavoured emulsion. An attempt to mix the oil, water, and gum in his proportions by throwing them together into a mortar and triturating them well, proved equally successful; the emulsion in this case, however, separated after standing twenty-four hours, there being a narrow

* From the *American Journal of Pharmacy*, June, 1878. Read at the Pharmaceutical Meeting, April 16, 1878.

layer of oil visible floating on the top of the emulsion. Shaking in this case also reunited them.

Mr. Chiles' formula (*Amer. Journ. of Pharm.*, March, 1873, p. 104) also deserves mention, furnishing if properly adhered to, a very satisfactory result. There is another formula for this preparation, usually used by me, which seems to be preferred by many physicians. It is pleasant, acceptable to the most delicate stomach, and will not separate, if properly made.

The recipe is as follows:

℞ Ol. Morrhuæ . . . . f℥iv.
Pulv. Sacchari albi,
„ Gum Acaciæ . . . . . āā ʒss.
Ol. Gaultheriæ . . . . gttxxvi.
„ Menth. Pip. . . . . . . gttvi.
Aq. Dest. . . . . f℥iv.
Misce, fiat emulsio, cui adde,
Syr. Lactophosphatis Calcii . . . f℥ii.

Mix the ethereal oils with the cod liver oil; make a thick mucilage with the gum, sugar and a small quantity of distilled water; gradually and carefully, with constant trituration, add the oil and the balance of the water alternately.

The syrup of lactophosphate of lime is kept by me in a separate bottle, and added in the proper proportion before dispensing. I have never found any trouble in keeping it on hand during the warm season, except in one case, when the emulsion separated, which was, however, due to imperfect manipulation and too great haste when preparing it, as was proved by later experiments. This emulsion can be flavoured differently, of course, by substituting oil of bitter almonds or any other desirable flavour for the oils of wintergreen and peppermint. The syrup of lactophosphate of lime used by me was made according to the formula published by Mr. Chiles (*Amer. Jour. of Phar.*, 1873, p. 105), and seems very satisfactory.

9. A preparation prescribed much lately is "Emulsion of cod liver oil with hypophosphites." It can be easily made by substituting the proper syrup in the formula given above.

HANBURY MEMORIAL FUND.

Subscriptions Received.

Since the last list of subscriptions was published the Hanbury Memorial Fund has been brought under the notice of the foreign pharmaceutical central bodies. From nearly all of these replies have now been received, and the list will very shortly be closed. Remittances may be sent to 17, Bloomsbury Square, London, W.C., addressed either to Professor John Attfield, Mr. Michael Carteighe, or Mr. Elias Bremridge.

WHAT IS VIOLET POWDER?

THIS is a question which has probably presented itself to many persons within the last few weeks, in consequence of the extraordinary disclosures respecting the presence of arsenic in a preparation sold under this name, by the use of which it appears that a number of infant children have come to an untimely end. Whatever may have been the circumstances under which this lamentable result has been brought about, and however little reason there may be to suspect that the admixture of white arsenic was intentional, there can be no question that the occurrence has excited considerable alarm in the minds of those who are accustomed to use the article commonly known as violet powder, and this has induced the makers of violet powder to announce in various ways that their make of this article is to be accepted without distrust.

At the same time retail dealers have naturally been constrained to inquire and in some instances to examine for themselves what was the nature of the article they sold. This question has also been forced upon our consideration partly by a letter which appears in this week's Journal, partly in consequence of other communications; and it is with no small surprise that we find there is room for some considerable difference in the answer to be given to the question, What is violet powder?

We venture to believe that most members of the trade to whom this question was put would at once have said that violet powder was almost identical with the hair powder of olden times in being merely starch powder containing a little orris root powder as a perfume, or in place of this some essence of violets, and that it was on account of this scenting that the name of violet powder was used. This at any rate is the reply that we should have expected not only from those who are entitled to be called old fashioned, but also from the present students of pharmacy, and we should not have been surprised to find that a candidate who did not give that answer to the question in the examination room was regarded as not being very well acquainted with his business.

But in forming this opinion we should have been entirely in error, and it appears that in answering the question, What is violet powder? we should go wrong altogether if we allowed ourselves to be guided by old-fashioned authorities. It turns out that there is violet powder and violet powder—one kind being what we should have supposed it ought to be, viz., starch powder scented, another kind containing no starch at all, and consisting either of hydrated calcium sulphate or of a mixture of this substance with magnesia or French chalk or both.

In speaking of violet powder as being properly starch powder we refer especially to its application for nursery purposes, and do not lose sight of the fact that when this kind of violet powder is used as a cosmetic or face powder it is found to answer its purpose more satisfactorily when it contains an admixture of about 10 per cent. of powdered French chalk. Neither do we forget that some of the most expensive and highly favoured cosmetic powders employed by actresses and amateurs of the art of being "beautiful for ever" consist wholly or for the most part of hydrated calcium sulphate. No doubt there are good reasons for the use of this substance in the preparation of these artifices for the embellishment of ladies who think they might be fairer than they are naturally, and so far we have nothing to urge against its application.

These facts, however, have not in our opinion anything to do with the question now raised as to the proper composition of the violet powder used for nursery purposes.

Probably much the larger part of the "violet powder" sold is sold in penny packets, and is bought for use in the nursery. Most of this we are informed is of the kind referred to by Mr. KEITH in the Journal of the 15th inst., consisting of hydrated calcium sulphate, and, contrary to the opinion expressed by him, we have reason to believe that such violet powder is being very generally supplied throughout the country. The character of this powder is such as to justify a doubt whether it is so suitable as starch powder for use as a dusting powder to prevent excoriation. When examined under the microscope, with no very high power, it is found to consist of minute angular crystalline fragments, which certainly do not appear to promise a very soothing influence upon an already excoriated skin.

But there is another objection to the sale of this kind of violet powder—for under the light of the recent disclosures we must now recognize the fact that there are two different articles sold under that name. Whatever may be its merit, the buyer has no knowledge that what he is buying is not the same article that was formerly sold under the name of violet powder, and even the retail vendor in most instances is equally in the dark. The penny packets of this violet powder are labelled "Superior Violet Powder for the Nursery, for the Toilet," but they are not described as containing a material different from what was formerly known as violet powder, and generally they do not bear the name of the maker or any other indication of the source from which they are obtained. Most probably they are in many cases specially put up for wholesale houses to meet particular requirements.

We think it desirable that the trade no less than the public generally should be informed of these facts, that they may be in a position to decide for themselves which article they will have, the mineral powder—which appears to have become a considerable article of trade without many people knowing anything of the fact—or the preparation consisting of starch powder, which most people have known by the name of violet powder. If the former has the advantage of being cheaper or in any other way preferable to the scented starch powder to which the name of violet powder properly belongs we think it would be an injustice to prevent its being used or to throw any obstacle in the way of its sale. But let it be sold under its true designation and used with a knowledge of its nature, not under a name which has hitherto always been applied to another material and under a belief that it is something different to what it really is.

This view of the matter is one which we think the members of the drug trade should unreservedly adopt, for in no business is it so specially desirable to prevent any suspicion of the surreptitious substitution of one thing for another under circumstances which do not permit the public to judge for themselves whether they are being supplied with what they ask for or not. In this respect we are glad to see that Messrs. SIDNEY BROWN and CORY are adopting a course that leaves them free from all reproach, by guaranteeing that the penny packets of violet powder bearing their name contain only pure starch scented in the usual manner. By this means the small purchaser will be as well protected as those who are able to purchase the higher priced packets and take care that they are supplied with an article bearing the name of a maker they believe in.

It is not by any means to be wondered at that the services of the public analyst should have been brought into requisition in reference to the sale of the kind of violet powder above referred to, but if the Adulteration Act be of any practical value, we cannot conceive how the cases that have been tried this week near Manchester should have fallen through in the way they have. The uncertainty of the magisterial mind, however, affords even greater chances than the proverbial uncertainty of the law, and the dismissal of the cases brought before the Hyde Petty Sessions last Monday is not an inapt illustration of this fact. We may remark, for the information of some of our readers, that Dr. NEWTON, the Chairman of the Bench, is the same magistrate who became distinguished in connection with some milk of sulphur cases a year and a-half ago. Since that time, however, he may have learnt to look more kindly on hydrated calcium sulphate than he was then disposed to do, but we fear that there is not much improvement in the decisions arrived at under his presidence.

Transactions of the Pharmaceutical Society.

EXAMINATIONS IN LONDON.

June 19, 1878.

Present—Mr. Williams, President; Messrs. Allchin, Benger, Brady, Carteighe, Corder, Gale, Hanbury, Linford, Martindale, Moss, Taylor and Umney.

Messrs. Gilmour, Mackay and Stephenson were present as a deputation from the Board in Scotland.

Dr. Greenhow attended on behalf of the Privy Council.

MAJOR EXAMINATION.

Five candidates were examined. *Two* failed. The following *three* passed, and were declared qualified to be registered as Pharmaceutical Chemists :—

Hall, Richard Arthur ....Leigh, Lancashire.
Hugill, John Howden ....Edmonton.
Tharle, Charles Albert............Ventnor.

MINOR EXAMINATION.

Sixteen candidates were examined. *Seven* failed. The following *nine* passed, and were declared qualified to be registered as Chemists and Druggists :—

Bignold, Walter ....King's Lynn.
Brown, Thomas ....Hull.
Brown, Thomas Land............Ripon.
Gulliver, George Ekins ....Holdenby.
Hayllar, James.....................Luton.
Mason, William Drury ....Louth.
Smailes, Robert ....Grantham.
Taylor, John........................Bolton.
Williams, Robert Edwin..... ...Cheltenham.

MODIFIED EXAMINATION.

Two candidates were examined. *Both* failed.

June 20, 1878.

Present—Mr. Williams, President; Messrs. Allchin, Benger, Brady, Carteighe, Corder, Gale, Hanbury, Linford, Martindale, Moss, Taylor and Umney.

Messrs. Gilmour, Mackay and Stephenson were also present.

MINOR EXAMINATION.

Twenty-two candidates were examined. *Fourteen* failed. The following *eight* passed, and were declared qualified to be registered as Chemists and Druggists :—

Allen, Henry.......... ....London.
Booth, Charles William ....Brighouse.
Clough, Alfred ....Northwich.
Crowther, William Charles......Tickhill.
Evans, David ....Porth.
Naylor, Thomas Hamilton......Newcastle-on-Tyne.
Smith, Frederick Adolphus......Macclesfield.
West, William Painter............Liskeard.

June 21, 1878.

Present—Mr. Savage, Vice-President; Messrs. Allchin, Benger, Brady, Carteighe, Corder, Gale, Hanbury, Linford, Martindale, Moss, Taylor and Umney.

MINOR EXAMINATION.

Twenty candidates were examined. *Seventeen* failed. The following *three* passed, and were declared qualified to be registered as Chemists and Druggists :—

Higgs, Alfred Henry ....Bristol.
James, Joshua ....Cardigan.
Place, Thomas ....York.

PRELIMINARY EXAMINATION.

The undermentioned certificates were received in lieu of the Society's Examination:—

Certificates of the College of Preceptors.

Egg, George Frederick............London.
Elkins, Frank Ashby ....Northampton.
Scott, Walter H. ....Beverley.

Certificate of the Royal College of Surgeons of England.

Dawson, William ....Kennington.

Certificates of the University of Cambridge.

Griffith, Matthew Henry........Weston-super-Mare.
Harrison, James Hughes..........Sheffield.

Certificates of the University of London.

Randall, Frank William...........Southampton.
Ransom, Francis ....Hitchin.

Certificate of the University of Oxford.

Drew, Henry William ....Southwark.

Proceedings of Scientific Societies.

CHEMICAL SOCIETY.

A meeting of this Society was held on Thursday, June 20; Dr. Gladstone, President, in the chair.

The minutes of the preceding meeting were read and confirmed. The following gentlemen were duly elected Fellows of the Society:—E. R. Budden, C. T. Macadam, W. R. Criper.

The eleven following papers were read—

Contributions to the History of the Naphthalene Series. No. II. β-naphthaquinone. By J. STENHOUSE and C. E. GROVES. In a previous paper the authors mentioned that nitroso-β-naphthol when converted into the corresponding amido-naphthol and then submitted to oxidation, yielded a crystalline compound of the nature of a quinone; this substance was named β-naphtha-quinone. The authors have obtained by acting on this body in a state of purity with nitric acid sp. gr. 1·2, red crystals melting at 158°. This crystalline substance has the composition $C_{10}H_5(NO_2)O_2$, mononitric β-naphthaquinone; it is reduced by hydriodic or sulphurous acid, forming two new substances probably the corresponding nitrohydroquinone and the amidohydroquinone. By treating β-naphthaquinone with dilute sulphuric acid a dark coloured compound was obtained, which on reduction yielded white acicular crystals, and on oxidation orange-coloured prisms, the three substances evidently standing in the same relations with one another as green quinhydrone, quinol or hydroquinone and quinone in the benzene series. The new quinone has the formula $C_{20}H_{10}O_4$, which the authors substantiated by analysis and quantitative experiment; it is very stable. The hydroquinone obtained by reducing the quinone forms colourless needles, oxidizing with comparative ease, and becoming dark coloured on exposure to the air, its formula is $C_{20}H_{10}(OH)_4$; it may be regarded as a tetrahydric alcohol of the hydroquinone or quinol species derived from α-dinaphthyl, $C_{10}H_7C_{10}H_7$, by the displacement of four hydrogen atoms and four OH groups and is a member of a new class of bodies, the diquinols. The authors propose to call it dinaphthyldiquinol and its quinone dinaphthyldiquinone. Benzoquinone and α-naphthaquinone also yield diquinones and diquinols, which the authors are studying.

On Pyrotritartaric and Carbopyrotritartaric Acids. By G. HARROW. The author has saponified diacetosuccinic ether with dilute sulphuric acid; he obtained a crystalline substance mixed with an oil. The oil was separated by distillation and dried; it boiled 208—209°, had the formula $C_9H_{12}O_3$, and was decomposed by dilute soda into alcohol, and an acid $C_7H_8O_3$ melting at 135°; this acid proved to be the pyrotritartaric acid of Wislicenus and Stadnicki (uvic acid of Böttinger). The silver and sodium salts were prepared and studied. The crystalline substance consisted of an acid melting at 230° C., crystallizing from hot water in long needles and having the formula $C_8H_8O_5$, and an ether of this acid, crystallizing in silky plates, which melts at 81°—82°. The monobasic and dibasic silver and sodium salts of this acid were prepared, it proved to be carbouvic or carbopyrotritartaric acid. On heating dry carbouvic acid CO_2 was evolved, uvic acid being left. The reactions which occur on saponifying diacetosuccinic acid are then—

(1) $C_{12}H_{18}O_6+H_2O=C_8H_8O_5+2C_2H_5HO$;
(2) $C_{12}H_{18}O_6+H_2O=C_9H_{12}O_3+CO_2+C_2H_5HO+H_2O.$

In conclusion the author discusses the constitution of carbouvic and uvic acids.

On the Action of Alkaline Hypobromite on Ammonium Salts, Urea and Oxamide. By W. FOSTER. In the first part of the paper the author gives a *résumé* of our knowledge as to the action of hypobromite on ammonium salts and urea, detailing some experiments of his own which, in the main, confirm the results of previous observers, the reactions varying to a certain extent with the strength of the hypobromite solution; he then proceeds to investigate the action of alkaline hypobromite on oxamide. As a mean result, he finds that oxamide gives off 74·87 per cent. of its total nitrogen when it is acted on by the ordinary hypobromite solution. He then endeavoured to ascertain the precise condition of the suppressed nitrogen, but without complete success; the experimental evidence is in favour of the nitrogen remaining as a nitrate, whilst general considerations point to the formation of cyanate. The author suggests as the formula of oxamide

$$C_4\left\{\begin{array}{l}(NH)_3\\ NHHO.\\ (HO)_3\end{array}\right.$$

Action of the Halogens at High Temperatures on Metallic Oxides. By C. F. CROSS and S. SEGUIRA. The authors have investigated the action of the halogens on lead oxides by heating these bodies (1) in a mixture of the halogen and air; (2) in the pure halogen. The products with bromine and chlorine were mostly liquid at the temperature employed; with iodine heavy infusible powders were formed. The authors draw attention to the constancy of the percentage of residual oxygen in the product of each series of reactions, thus:—

	Pure Halogen.		Halogen and Air.	Ratio.
I compounds .	4·12	% of	5·63 %	1 : 1·3
Br ,, .	1·43	residual	2·14	1 : 1·5
Cl ,, .	0·76	oxygen.	1·28	1 : 1·8

The action of iodine in the presence of oxygen upon oxides and carbonates of the alkaline earth-metals is interesting, as instead of (as with lead) oxyiodides being formed periodates are produced; thus calcium and barium periodates were obtained. In the absence of oxygen this fixation of iodine by the alkaline earths does not take place.

On Manganese Tetrachloride. By W. W. FISHER. The author has studied the chlorides formed when binoxide of manganese is dissolved in strong hydrochloric acid at the ordinary temperature, also the action of hydrochloric acid on red oxide of manganese. The results point to the conclusion that the oxides of manganese higher in degree than the protoxide when treated with an excess of strong hydrochloric acid give brown liquids containing a highly chlorinated manganese compound, probably $MnCl_4$, which is readily resolved into manganous chloride and free chlorine, and that on dilution with water hydrated manganese binoxide is precipitated in each instance. Since a large excess of hydrochloric acid or alkaline chlorides seems to render $MnCl_4$ more stable it is probable that this body only exists in a combination analogous to chloroplatinic acid.

On Salts of Nitrous Oxide. By A. E. MENKE.—The author has prepared the sodium salt of nitrous oxide by fusing nitrate of soda with iron filings. Zinc was substituted for iron, but the salt was not formed. The sodium salt is very soluble in water, and crystallizes in white needles; it has the composition $NaNO, 3H_2O$. The silver salt previously obtained by Divers was prepared, and its composition confirmed. Details of the preparation and the reaction of the sodium salt are given.

Notes on Madder Colouring Matters. By E. SCHUNCK and H. ROEMER.—The authors have prepared some quantity of munjistin from 100 lbs. of munjeet. In order to remove any doubt as to the identity of the colouring matter obtained from commercial purpurin with munjistin, they have examined the latter substance with great care. It was obtained in golden yellow scales, melting at 231° C.; it had the same properties and composition as purpuroxanthic acid. Acetic anhydride forms when boiled with munjistin an unstable compound, melting at about 160°. Bromine forms orange-yellow needles, melting at 231°; its composition was that of dibrompurpuroxanthin, the carboxyl group having been eliminated. Boiling potash forms with munjistin purpurin, and ammonia converts it into purpurinamide. By the action of fuming nitric acid orange coloured needles, melting at 251°, very similar to but readily distinguished by their behaviour to ammonium acetate from dinitropurpuroxanthin.

On the Occlusion of Hydrogen by Copper. By G. S. JOHNSON.—The author has made an elaborate series of experiments to determine the causes of the discrepant results obtained by previous experimenters, Graham, Thudichum, etc. The principal facts established are the following: when metallic copper is repeatedly oxidized and reduced by hydrogen in the same tube, progressively decreasing quantities of hydrogen are occluded. Thus, 37 grm. of copper wire gave, at first, 0·010 grm. water, finally, ·004, until a constant minimum is reached. The variation in the quantity occluded does not depend altogether on the physical condition of the surface of the metal. At a red heat copper oxide occludes carbonic anhydride, and will not part with that gas in air at the temperature of occlusion, or when reduced at a red heat by hydrogen. By fusion of the oxide the carbonic anhydride is evolved. In conclusion, the author states that the discrepancy between the results obtained by different experimenters is explained: 1st. By the fact that hydrogenized copper retains nearly all its hydrogen in vacuo at a red heat; 2nd. That the same metal occludes varying quantities of hydrogen under different conditions. The amount occluded is, however, in most cases sufficient to introduce a serious error in organic analysis. The author recommends the plan of Dr. Thudichum for obviating this error, viz., ignition of the reduced metal in CO_2 for some time before use. The pure spongy metal reduced from precipitated oxide might be substituted for the commercial copper.

On the Role played by Carbon in Reducing the Sulphates of the Alkalies. By J. MACTEAR. In 1839, Liebig suggested a process for the manufacture of carbonates founded on a discovery of Gay Lussac, that caustic potash heated with sawdust evolves pure hydrogen, potassic oxalate and acetate being formed; by heating to redness these two salts are converted into carbonates. Liebig substituted sodium sulphide for caustic potash, and found that a similar reaction took place. The process, however, failed commercially. The author has investigated in detail the action of various quantities of carbon on the alkaline sulphates at various temperatures. When sulphate of soda is mixed with an excess of carbon and exposed to a temperature considerably above red heat, out of contact with air, the reaction is:—

$$Na_2SO_4 + 4C = Na_2S + 4CO.$$

When a temperature of dull redness, 1150°–1300° F. is used, the action is—

$$3Na_2SO_4 + 6C = Na_2CO_3 + Na_2S_2 + Na_2S + 4CO_2 + CO.$$

The decomposition of sulphate of potash is similar, but takes place at a lower temperature.

On the Action of Ethyl Chlorcarbonate on some Oxygenated Haloid Compounds of the Fatty Series. By O'NEILL F. KELLY.—Some years ago Wurtz effected the synthesis of several aromatic monobasic acids by submitting a mixture of a monochlor- or monobrominated hydrocarbon and ethylchlor-carbonate to the action of sodium amalgam, $CO·OC_2H_5$ being substituted for the haloid element. The author endeavoured to effect this substitution in di- and tri-substituted haloid hydrocarbons in the fatty series with the following results:—55 grm. of ethylchlorcarbonate and 54 grm. of allylalcoholdibromide were heated with 2·4 kilos. of sodium amalgam for five hours, in a flask to which a reversed condenser was attached. The evolved gases after passing through bromine, were collected over water, and found to consist, at first, of CO and CO_2, but finally of CO_2. Ethylcarbonate, propylenedibromide, and a trace of allyl alcohol were the products of this reaction. Glycerindichlorhydrin and ethylchlorcarbonate were the next substances experimented with. After heating twelve hours with sodium amalgam, the flask was cooled and water added, and the oil which separated washed and dried. On distillation one-third came over between 100°–190°, and consisted of $CO\left\{\begin{matrix}Cl\\OC_2H_5\end{matrix}\right\}, CO\left\{OC_2H_5\right\}_2$, and $C_3H_5OHCl_2$. The portion which came over between 190°–240° after repeated fractionation boiled 225°–230°. It consisted of $C_6H_{10}Cl_2O_3$; some $C_2H_4Br_2$ was also obtained. No allylalcohol was formed. The author has confirmed the results of Hübner and Müller that dichlorhydrin is converted by sodium amalgam, at 100° C., into allylalcohol, epichlorhydrin and ethylchlorcarbonate. These substances when heated with sodium amalgam yielded $CO(OC_2H_5)_2$, boiling at 126°, and a mobile liquid, with a bitter pungent taste, boiling 145°–150°, having the composition, $C_6H_{10}N_3$, yielding, on saponification, allylalcohol.

Laboratory Notes. By H. E. ARMSTRONG.

The Society then adjourned over the recess.

ROYAL INSTITUTION OF GREAT BRITAIN.

THE DETERIORATION OF OIL PAINTINGS.*

BY R. LIEBREICH, M.D., M.R.C.S., M.R.I.

(*Concluded from page* 1035).

Oil and fat are bodies consisting of carbon, hydrogen and oxygen. They may be considered as salts in which glycerine, as a basis, is combined with different acids, stearic acid, palmic acid, oleic acid. If oil is exposed to the air, it changes; certain kinds of oil remain liquid; others become thicker and darker, and are gradually transformed into hard and opaque bodies. The drying of oils is based upon a chemical process, during which the oil oxidizes by absorbing oxygen from the air, and combining a part of it with carbon to form carbonic acid, and another part with hydrogen to form water. The different oils dry with different rapidity, but this rapidity may be modified by the presence of certain substances, or by certain treatment. Linseed oil, for instance, according to the way in which it has been pressed out of the seed, contains more or less mucilaginous substances. These latter impede the drying of the oil, and have therefore to be removed by a refining process. If linseed oil in a shallow vessel is exposed to the air and light, especially to a green light, it soon begins to dry, and is transformed first into a kind of varnish and gradually into a solid opaque substance. The drying may be quickened by boiling, and more particularly by the addition of lead, zinc, or manganese. In this way a quick-drying oil varnish may be prepared and used as a siccative. It follows that there are certain substances which impede the drying of oils, and others which facilitate it. Amongst the pigments are some which belong to this category of bodies, white-lead, zinc-white, minium, vermilion, for instance, facilitate the drying; others, such as ivory-black, bitumen, madder-lake, will impede it. Supposing now we should add to each of the different pigments the same quantity of oil, the drying of it would progress at different rates. But in reality

* Lecture delivered at the Royal Institution of Great Britain, Friday March 1, 1878.

this difference is very greatly increased by the fact that the different pigments require very different quantities of oil, in order to be ground to the consistency requisite for painting.

Pettenkofer quotes the following figures, given to him by one of the colour manufacturers :—

100 parts (weight)	White-lead .	require	12	parts of oil.
" "	Zinc-white .	"	14	"
" "	Green chrome	"	15	"
" "	Chrome-yellow	"	19	"
" "	Vermilion .	"	25	"
" "	Light red .	"	31	"
" "	Madder-lake .	"	62	"
" "	Yellow ochre.	"	66	"
" "	Light ochre .	"	72	"
" "	Camel's brown	"	75	"
" "	Brown manganese	"	87	"
" "	Terre verte .	"	100	"
" "	Parisian-blue.	"	106	"
" "	Burnt terre verte	"	112	"
" "	Berlin-blue .	"	112	"
" "	Ivory-black .	"	112	"
" "	Cobalt . . .	"	125	"
" "	Florentine-brown	"	150	"
" "	Burnt terra sienna	"	181	"
" "	Raw terra sienna	"	240	"

According to this table a hundred parts of the quick-drying white-lead are ground with twelve parts of oil, and on the other hand, the slow-drying ivory-black requires one hundred and twelve parts of oil.

It is very important that artists should have an exact knowledge of these matters. But it seems to me that they are insufficiently known to most of them. All, of course, know perfectly how different the drying quality of different colours is. But that these different colours introduce into the picture so different a quantity of oil, and how large this quantity is in the colours they buy, and further, that the oil as well as the mediums or siccatives they add to dry the colours are gradually transformed into a caoutchouc-like opaque substance, which envelops and darkens the pigments; and moreover, that the oil undergoes—not in the beginning, but much later on when it is already completely dry—changes of volume, and so impairs the continuity of the picture,—all this is not sufficiently known. Otherwise, the custom of painting with the ordinary oil colours to be bought at any colourman's, would not have been going on for nearly a hundred years in spite of all the clearly shown evil results; results due, chiefly, to the principal enemy of oil painting, that is to say, the oil.

That the masters of the 15th and 16th centuries did not use colours prepared in this way, you may consider as absolutely certain; and if we hear the lost secret spoken of, and if we read that the pupils of the old masters had to pledge themselves to keep the secret, we may be sure that it is neither the method of painting nor the pigment used for it which is concerned in that secret, but exclusively the way of preparing the colours. The preparation was a very complicated one, varying with the different pigments; and we know that the pupils passed six years, that is half of the apprenticeship, in grinding the colours for the master.

And therefore it is to this very point that everyone who wishes to study the method of the old masters must first of all direct his attention. I too, was led, by the study of this question, to analyse and restore old pictures. The possibility of making such analysis we owe to the relation between the old masters and their pupils. Of course we could not dissect or chemically analyse works of Titian or Raphael. But fortunately the pupils painted with the same material and by the same method as the masters, and thousands of pictures by the pupils, well preserved or in different stages of decay, may be easily procured.

I have myself from among a very great number of such pictures, selected about one hundred specimens, part of which I have brought before you. As their artistic value is not, as you perceive, of the highest description, we need not feel any scruple in experimenting upon or even destroying them, if we can thereby gain any valuable information.

If we compare the pictures of the Italian and Dutch schools of the 15th, 16th, and 17th centuries, with those of the French and English schools of the last hundred years, we are struck by the great difference in the nature of their diseases. We may divide those diseases into constitutional ones—that is to say, such as are based on the method and the material used for painting, and into those produced by external influences.

The Dutch pictures of the 15th, 16th, and 17th centuries, and the Italian pictures of the 15th and 16th centuries, seem to me perfectly free from constitutional diseases. It is only in the 17th century that the Italian pictures show a special constitutional alteration, caused by the practice of the Bologna school.

The pictures of the last hundred years of the French school, of a part of the English school, and some painters of other schools, have been attacked by a constitutional disease perfectly defined and characteristic of this period.

Among external influences injurious to oil painting, we have to consider dampness, heat, bad air, dust, smoke, mechanical injuries, and last, not least, the destructive, or "altering" hand of the picture-restorer.

Pettenkofer's scientific researches first clearly defined the influence of humidity on oil paintings, showing that it produced a discontinuity of the molecules of the vehicle and the resinous substances. As glass, when pulverized and thereby mixed with air, loses its transparency, and water, when mixed with oil, becomes of a milky aspect, so the oily and resinous substances contained in paintings, will become dim as soon as air penetrates between their particles. The picture thus assumes a greyish dim appearance, and the pigments seem to have been fading. That this is not really the case has been proved by the influence of a process invented by Pettenkofer, which he calls regeneration. In a flat box the picture is exposed to air impregnated with alcohol. Of this latter, the resinous elements of the picture absorb a certain quantity, swell and fill up the interstices between the separated particles so as to reunite them into an optically homogeneous, transparent substance.

The alcohol does not affect in the same way the hardened oil. If the interstices between its particles are not filled up by the swelling resin, it becomes necessary to introduce a new substance into the picture, and this is called nourishing a picture.

Pettenkofer has the great merit of having clearly proved that the nourishing of a picture with oils, as the custom was formerly, and still is to some degree, is a very objectionable proceeding, as it has the effect of darkening the colours for ever. He recommends, instead of oil, balsam of copaiva, which has become since an invaluable means for preserving and restoring oil paintings, and will be more and more extensively used.

I have frequently applied Pettenkofer's method, and with very beneficial effect; but whenever I mentioned it to professional picture-restorers, here as well as on the Continent, I always found them to reject it, either *à priori*, or after experiments incorrectly made.

In Munich, it seems, the pictures of all periods and of all schools have had to suffer under local influences and through the changes in the humidity of the air. This accounts for Pettenkofer having principally described this, so to say, endemical disease. In other galleries this affection does not appear so frequently, and Pettenkofer's method, therefore, will not find everywhere the same extensive application as at Munich. I think, however, that with some modifications it may be employed against some other alterations. I have, for instance, found it efficacious with paintings which had been injured by exposure to great heat. I shall show you a small picture which had been hanging for a long time so near a gas flame that it was almost completely scaling off, and so entirely faded that it scarcely looked like an oil painting at all. In that state it was exposed to alcoholized air, then nourished with balsam, and its back slightly varnished; and the scales starting from the canvas were refixed by pressure. And now it appears fresh in colour, firm in substance, and perfectly smooth on its surface. The old, cracked varnish, melted together by the alcohol, looks as if fresh laid on.

Humidity sometimes favours the development of fungus. The round, black, small spots which pass through the canvas and the painting of these two pictures are produced by the same little plant which Professor Tyndall showed you when he spoke on the highly interesting subject of spontaneous generation.

Oil and water, so injurious to oil paintings, enter both into the material used for lining. Anxious to exclude these sources of danger, and to simplify the whole process, I have endeavoured to replace it by a new method which I shall submit to you this evening.

How paintings may be disfigured by restorers you see in this picture, which was renovated with oil colours according to the practice only abandoned about thirty years ago, when it was advantageously replaced by the use of varnish colours.

The amount of external injury oil paintings sometimes endure and stand is perfectly amazing. Pictures in the course of centuries, during the destructive fury of wars and revolutions, may have been torn out of their frames, rescued from below the ruins of burned monasteries, may subsequently have passed from one bric-à-brac shop to another, where they have been piled up, to be pulled about at each new inspection, and literally trodden under foot, whereby they have finally been reduced to a state of colourless, greyish, or black rags. Still such pictures may not unfrequently be awakened, as it were, to new life, to their original brilliancy of colour; if, with all necessary care, their injured limbs are put together again, their wounds are healed, and fresh nourishment, air, and thorough cleansing, are administered to their lacerated bodies.

A sound constitution is, of course, a necessary condition for obtaining any such result, without it we can only obtain a partial cure. We see this with reference to the Bologna school of the 17th century. The pictures which you see here are instances of this. From the state of rags to which they were reduced they have passed, by appropriate treatment, into the state of firm, even, well-conditioned, and clean pictures. The constitutional alteration characteristic of their time and school, however, could not be cured. You will, therefore, perceive that the contrast is too great between light and shade, that the half tones are too weak and that the glazings spread on dark ground, which certainly existed formerly, have been destroyed by the growing of bolus and umber of the priming. That this is not the fault of the method of restoration is clearly proved by the state in which you will find all the pictures of this school, even those best preserved in the best galleries of all countries.

The constitutional diseases of pictures belonging to the French and to the English school of the last hundred years are of still more serious nature, and much more difficult to cure. Many of them, though they were never exposed to any injury whatever, nor are likely ever to be so in our present state of civilization, cannot be guarded from premature decay in spite of all possible care with which they are kept.

The principal symptoms of their bad constitution are:—

1. Darkening of the opaque bright colours.
2. Fading of the transparent brilliant colours.
3. Darkening, and above all, cracking of the transparent dark colours.

The best opportunity to study these several appearances is given us in the Museum of the Louvre, which contains a great number of such pictures in the section occupied by the French school. I have paid particular attention to the cracks in these pictures, as I find that in shape, in size, in position, as well as in relation to the various colours, they differ distinctly from the cracks in older pictures and in those of other schools. This, of course, is of importance, not only for the explanation of the reasons which produced them, but as a symptom which, in a given case, might determine the diagnosis, whether a picture be an original or only a copy. The special characteristics of these cracks are the following:—

They are all but exclusively found in the thickly laid on transparent dark colours, and they are the deeper and the more gaping in proportion to the thickness of the layer of the colour and the extent of the dark surface. The chief cracks run parallel to the outlines of surfaces painted with bright opaque colours, such, for instance, as are used for the flesh tints, and which are more or less thickly laid on. But there is generally a slight distance between the bright colours and the cracks.

Lateral branches of these cracks pass into the white, but they do not gape, provided the white colours had been laid on directly upon the priming, and not upon a layer of dark transparent and not sufficiently dried colour.

This examination of the cracks of pictures has sometimes afforded me a peculiar insight into the practice used for the picture. In the well-known picture, for instance, by Guéricault, of "The Wreck of the Medusa," in the Gallery of the Louvre, the cracks follow exactly the outlines of the bright flesh-tints. The arm of one of the dead bodies hanging in the water is so covered by planks and water that nothing of the forearm is to be seen. It is, however, very easy to prove that originally that arm was painted in all its length, for the cracks do not only follow the outline of the visible upper arm, but also the no longer visible forearm, and all the five fingers. This proves that the fore-part of the arm and the hand were originally painted in flesh tints before they were covered over by the planks and the water painted afterwards. In Ingres's portrait of Cherubini, the face of the latter is beautifully preserved, whilst that of the Muse, as well as her drapery, is covered with cracks. In the depth of the cracks of the white drapery, an intense blue tint is to be seen. Mr. Henri Lehmann, of Paris, the favourite pupil of Ingres, who knows the history of this picture as an eye-witness, and whom I consulted about this very striking appearance, gave me the following information:—Ingres painted the head of Cherubini in Paris, and then took it with him to Rome. There it was pieced into a new canvas and lined. Then the Muse was painted, and before the colours were perfectly dry, another model was chosen, and a new Muse painted over the old one. The colour of the drapery was likewise altered, and this explains the cracks in the white colour, and explains also why the blue appears in the depth of the cracks of the drapery.

Among the English artists of the last hundred years, some have painted with the same material and by the same process as their French contemporaries, and consequently with the same unfortunate results. Others avoided these by using the same material with more precautions. Others, again, and among them Sir Joshua Reynolds, have in their different works followed various practices, and consequently had varied results. Thus some of Sir Joshua's pictures have kept perfectly sound. Others are cracked in the characteristic way just mentioned Others, again, are cracked in an absolutely irregular way. We can easily form an idea of it, if we read in his 'Diary Notes,' for instance, the way in which he painted the portrait of Miss Kirkman, which he began with whiting and gum tragacanth, then covered it successively with wax, then white of eggs, and then varnished it.

The study of the alterations already fully developed in pictures painted within the last hundred years only, and their comparison with the works of the old masters, would suggest the following rules for the process of painting:—

1. The oil should in all colours be reduced to a minimum

and under no form should more of it than absolutely necessary be introduced into a picture.

2. All transparent colours which dry very slowly, should be ground not with oil at all, but with a resinous vehicle.

3. No colour should be put on any part of a picture which is not yet perfectly dry; and, above all, never a quick-drying colour upon a slowly drying one, which is not yet perfectly dry.

4. White and other quick-drying opaque colours may be put on thickly. On the contrary, transparent and slowly drying colours should always be put on in thin layers.

If the effect of a thick layer of these latter is required, it must be produced by laying one thin layer over another, taking care to have one completely dry before the next is laid on. If transparent colours are mixed with sufficient quantity of white-lead, they may be treated like opaque ones.

We come now to the last layer of the picture, to that one which is spread over its surface in order to equalize optical irregularities, and to protect it at the same time from the air. I mean the varnish.

The varnish may crack or get dim, then it should be treated by Pettenkofer's method; but it may become dark yellow, brown and dirty, and so hide the picture that it becomes necessary to take it off and to replace it by a thin layer of new varnish. It is here that picture restorers, or we may say picture cleaners, display their beneficial skill, and also their very destructive activity.

If a picture is throughout painted in oil, if its substance has remained sound and even, and varnished with an easily soluble mastich or dammar varnish, then there will be neither difficulty nor danger in removing the varnish. This can, in such a case, be done either by a dry process, that is, by rubbing the surface with the tips of the fingers, and thus reducing the varnish by degrees to a fine dust, or by dissolving the varnish by application of liquids, which, when brought only for a short time into contact with the oil painting, will not endanger it. We have, however, seen that the works of the old masters are not painted with oil colours like those used by modern painters, but, on the contrary, that certain pigments, and especially the transparent colours used for glazing, were ground only with resinous substances. These latter have, in the course of time, been so thoroughly united with the layer of varnish spread over the surface of the picture, that there no longer exists any decided limit between the picture and the varnish. It is in such pictures that a great amount of experience, and knowledge of the process used for the picture, as well as precaution, are required in order to take away from the varnish as much only as is indispensable, and without interfering with the picture itself. Numberless works of art have been irreparably injured by restorers, who, in their eagerness to remove dirt and varnish, attacked the painting itself. They then destroyed just that last finishing touch of the painting, without which it is no longer a masterpiece.

The difficulty and danger are much greater in cleaning those pictures which have not been varnished with the ordinary easily-dissolved mastic or dammar varnish, but have been painted over with oil, oil-varnish, or oleo-resinous varnish. It seems incredible that these substances should ever be used for such purposes; it is, however, a fact that there are still people who fancy that it will contribute to the good preservation of their pictures to brush from time to time a little of those liquids over their surface. They recognize too late that the varnish becomes more and more dark, of a brownish colour, and opaque. If such varnish has afterwards to be removed, then we meet with the great difficulty, that this can be done only with substances which would just as easily dissolve the whole picture as the hardened layers spread over it.

This shows what can be the value of those universal remedies which from time to time appear, and are praised for the innocuous way in which pictures by their means may be cleaned.

There is at this moment a great discussion going on in Italy about Luporini's method. Luporini is a painter and picture restorer in Pisa, who believes himself to have invented a new means of cleaning pictures without any danger. Some months ago, in Florence, I examined a large number of pictures cleaned by him. Those of the Gallery of St. Donato, belonging to Prince Demidoff, mostly Flemish and Dutch landscapes, are cleaned very well and without any injury to the painting. On the contrary, the St. John, by Andrea del Sarto, one of the finest pictures of the Palazzo Pitti, I found very much altered by the restoration of Luporini. I had studied that picture very closely the year before, and should now sooner believe it to be a modern copy than the cleaned original. It has lost all softness of outline, and the characteristic expression of the face. The change in the flesh tints can scarcely be explained otherwise but by an entire removal of the glazing.

I think it is taking a heavy responsibility to allow a new experiment to be tried upon such an invaluable work of art. Even private persons, who are fortunate enough to be in possession of such treasures, ought to feel responsible for the good preservation of masterpieces, which are, it is true, their material property, but which intellectually belong to the whole civilized world of the present and of the future.

Parliamentary and Law Proceedings.

Arsenical Violet Powder.

On Thursday, June 20, Mr. Humphreys, coroner for the Eastern Division of Middlesex, resumed an inquiry as to the cause of the death of the infant child of Francis and Mary Ann Ringrose, which was alleged to have been caused by the use of violet powder containing arsenic. Mr. Poland watched the case on behalf of the Treasury; and Mr. H. H. Wells appeared for Mr. King.

The first witness called was Mrs. Ringrose, the mother of the child, who deposed to having purchased some violet powder of Mr. Kidd, a general shopkeeper, of Wellington Street, Kingsland, three months before her confinement. She saw the powder applied to the child the day after its birth; but in consequence of the nurse having read of the case of poisoning at Loughton, it was then discontinued. The child's flesh turned very red, and on the second day sores broke out all over it. Her second child had died in the same way; this was her third.

Mr. Kidd, from whom the powder had been purchased, identified a similar packet as supplied by Mr. King, the manufacturer of the powder which is alleged to have caused the deaths at Epping. Mr. King's traveller had called soon after the Epping case and taken away the remainder of the stock, and said that Mr. King would replace it.

Thomas Walton, traveller for Mr. King, said that in consequence of a letter received from the Solicitor of the Treasury his employer had directed him to bring in all the powder now held in stock by his customers. He had been in Mr. King's employment for eight years, and had gone through every department in the factory. The violet powder used to be composed of starch, flour, orris root, violet perfume, and essence of roses; but, in consequence of a subsequent increase in the market value of the article, two qualities had been made, and in the poorer quality half proportions of starch, flour, and terra alba were used as the substance of the powder. All the ingredients came in packages from the wholesale druggists, and were duly labelled. He had never seen any white arsenic in the establishment, and knew that during the time he had been employed there it had never been used for anything manufactured on the premises. Indeed, Mr. King, in speaking of the circumstance, said he had never seen white arsenic in his life, and did not know what it was like. At this point the inquest was adjourned, the analysis not having been completed.

On the same day in the Queen's Bench Division of the High Court of Justice (Sittings in Banco before the Lord Chief Justice and Justices Mellor and Lush), Mr. F. Turner applied on behalf of the defendant for a rule *nisi*, under what is known as Palmer's Act, to remove the indictment found against the defendant for manslaughter from Chelmsford to the Central Criminal Court for trial. The case was known as "the violet powder" case, and he moved for the removal of the trial on the ground of prejudice which prevailed against the defendant throughout the whole of Essex and that expense would be saved by a trial in London, where nearly all of the witnesses to be examined reside. The defendant, in his affidavits swore that for the last fifteen years he had been a manufacturer of violet powder, and that he was altogether ignorant of the fact that arsenic got mixed up with the violet powder recently manufactured by him until he received a letter from the Treasury to that effect, whereupon he withdrew from his customers all the powder they had in stock. He also positively swore that he had never dealt in arsenic, and that he was wholly ignorant that arsenic was ever on his premises. He was only able to account for the presence of arsenic in the violet powder in question by supposing that one of the wholesale houses with which he dealt had sent him arsenic in mistake for white starch powder.

The Court granted a rule *nisi*.

VIOLET POWDER.—PROSECUTIONS UNDER THE SALE OF FOOD AND DRUGS ACT.

Before the Hyde magistrates on the 24th inst., Alfred Bird and Sons, manufacturing chemists, of Birmingham, were charged with selling adulterated violet powder. The case was brought forward by Major Edwards, deputy chief constable of Cheshire, who had caused samples of violet powder to be purchased from various shopkeepers in the Hyde petty sessional division. One sample was procured from Dukinfield, which had been supplied by the defendants, and on being analysed by Mr. Carter Bell, of Manchester, it was found to contain 8 per cent. of mineral matter. Five other samples examined at the same time were found to be pure. Mr. Tanner, of Birmingham, appeared for the defendants, and the firm produced a certificate from Professor Redwood, of London, professor of chemistry of the Pharmaceutical Society of Great Britain, stating that he had analysed the violet powder manufactured by Messrs. Bird and Sons, and it was perfectly pure and harmless. It was contended that there were as many kinds of violet powder as there were makers, and that the magistrates could not say that all should be made of the same constituents; it was only necessary that it should be harmless. The Bench took this view, and dismissed the case.—From the *Manchester Guardian*.

Dispensing Memoranda.

[117]. TINCT. CARDAMOMI.—I see in last week's Journal two answers to Mr. Barnes's query concerning Tinct. Cardamomi. I fail to see the force of G. T. Stephens's remark, that the person who uses Tinct. Cardam. *Co.* knows very little of dispensing. As far as my little knowledge of dispensing and pharmacy serves me, I know of no such preparation in use as Tinct. Cardam. *Simp.*; nor has there been such a preparation, either in the B.P. or P.L. since about 1851. I guess Mr. G. T. Stephens looks to Beasley for his authority; there he will find a preparation of that kind dated 1836, P.L., but we have placed that antiquated Pharmacopœia on the shelf long ago, and never refer to it, unless our attention is directed to it by the initial letters P.L. Now I will ask Mr. G. T. Stephens a question. When Tinct. Rhei *Co.* is ordered, what does he give in that instance? I presume he runs back to the London Pharmacopœia, or makes an egregious mistake (?) by putting in Tinct. Rhei of the present B.P. Again, Pil. Rhei and Tinct. Gentianæ, I find no mention of whatever, but am frequently called upon to dispense them. Certainly Mr. Tenens's suggestion will be approved by all who understand anything at all of dispensing.

"Οχθαί."

[117]. TINCT. CARDAM.—In answer to J. W. Barnes, I should treat Tinct. Card. in the same way that I have treated Ferri Cit. I am inclined to think that although some medical men intend Tinct. Card. Simp. and Ferri Cit., etc., many, if asked, would say they intended Tinct. Card. Co. and Ferri Am. Cit. In these and similar cases the only plan which I can suggest, and the one which I follow, is to translate the prescription literally. By so doing many small doubts will be at once decided. Of course a dispenser must always use a certain amount of discretion.

F. D.

[118]. PULV. SCAMMON.—In answer to "Borgue" Pulv. Gum. Scammon. should undoubtedly be used when Pulv. Scam. is ordered. F. D.

[118]. PULV. SCAMMONII.—I think "Borgue" may satisfy his curiosity by referring to his B. P. for Scammonium.

GEO. F. H. BARTLETT.

[120]. W. F. C. I should use the Ferri Am. Cit. and dissolve by gently warming. The mixture will not be clear. F. D.

[122]. Will any reader tell me how to dispense the following, and what are the chemical changes produced?—

℞ Ferri et Quin. Cit. . . . . . ʒiss.
Lithiæ Citrat. . . . . . . ʒiij.
Pot. Iodid. . . . . ʒij.
Sp. Chlorof. . . . . ʒvi.
Aq. Puræ. . . . . . . ad ℥viii.
Misce. B. SAWYER.

[123]. Does the Oil of Bay Leaf, from the sweet bay (*Laurus nobilis*), contain traces of hydrocyanic acid? I am told that it does. As I am unable to confirm the assertion, I shall be glad of your opinion.

J. BURT.

[124]. The following prescription was brought to me to be dispensed a few days since; perhaps some one may suggest the best method of mixing; also if they do not consider it a large dose of phosphorus.

℞ Phosphori Pur. . . . . gr. ¼.
Ext. Hyoscyam. . . . . gr. ij.
M. ft. pil. Misce ix.
Capt. j. ter die.
Weston-super-Mare. C. GRIFFITH.

[125]. Will any reader say how the following prescription should be sent out?—

℞ Aloin . . . . gr. vj
Jalapin . . . . gr. vj.
Hyd. Subchlor. . . . . . . gr. vj.
Pil. Rhei Co. . . . . gr. xxx.
Div. in pil. argent. involut. quarum duo p. s. p. r. n.
Canterbury. A. W. G.

[126]. Will any reader give the best way of making the following pessaries?—

℞ Ergotina,
Acid. Tannici . . . . āā gr. x.
Ol. Theobroma, q. s.
Ut fiat pessaria. Mitte xii.

I always use a little wax and lard in the preparation of pessaries, and should like to know if it is objectionable. DISPENSER.

Correspondence.

INJURIOUS (?) VIOLET POWDER.

Sir,—A sample of violet powder bearing the trade mark, "A steamer over a globe" has been placed in my hands for analysis. Seeing an advertisement in your last week's issue containing a certificate from Professor Redwood which certifies that a violet powder analysed by him, bearing the same trade mark, does not contain anything injurious to the skin or unsuited for the purpose for which it is intended to be used, viz., as an absorbent powder, I cannot help thinking there must be two preparations with the same trade mark; I therefore append the analysis of my sample for the benefit of the trade generally, as I fear such a preparation must be injurious to the tender skin of young infants, and especially to excoriated surfaces—

	Per cent.
Hydrated Sulphate of Calcium . . .	83·9
Silicate of Magnesium (French Chalk) .	13·78
Perfume, Moisture, &c.	2·32
	100·00

I enclose part of cover bearing the trade mark.

JAS. BAYNES, Jun., F.C.S., F.R.M.S.
Borough Analyst for Hull.

Analytical Laboratory, Royal Chambers,
Scale Lane, Hull, June 12, 1878.

[*** The publication of Mr. Baynes's letter has been postponed for the purpose of inquiry, and in order that no injustice should be done to those interested in the article referred to.—ED. PHARM. JOURN.]

THE ADMISSION OF WOMEN TO MEMBERSHIP.

Sir,—I quite agree with Mr. Vizer, that all the members of the Society should be consulted, and that at once, on this important matter, for if the new council had admitted the two ladies last Wednesday I certainly should have considered the action very unjust to the members. The council does not consist of delegates, but when a very important question is referred by them to the general meeting for decision it should be morally binding on the new council. The dispute about the numbers shows what a strong feeling there is when wishes are worked into facts and honestly believed.

History repeats itself. Two or three women have danced before us and are promised the half of our kingdom.

It is a great pity the question has ever been raised, but medical men and chemists should be specially careful to what extent they encourage the higher education of women.

It is, I believe, pretty generally conceded the very important part women are called upon to take in continuing the species is but too often of itself more than their constitutions will bear, and if to that be added a highly cultured brain, voracious as it is for blood, few constitutions would bear the double strain.

I tremble for the future of our race when our placid mothers with high moral sense and equable minds shall give place to the blue stocking variety, or the weakly physique of the learned prude.

I may be wrong; woman may have a potential energy unknown to me; but I have seen enough at least to say, we must move in these matters with extreme caution.

I do hope, for the women's sake, the Society will not encourage them by admission to membership; the question has divided a fairly united society, and the sooner it is finally settled the better it will be for us all.

GEORGE MEE.

79, *Grosvenor Road, Highbury New Park, N.*
June 8, 1878.

Sir,—I must ask the favour of a few lines' space to correct the statement of Mr. Linford in last week's Journal, in which he says that "you propose the acceptance of Mr. Vizer's idea of an informal vote of the members on the question of admitting women to the membership of the Pharmaceutical Society."

Had Mr. Linford read your remarks carefully, or had he referred to my letter on page 999, he would have clearly seen that my proposal was, as understood by yourself, for a strictly formal vote to be given by members in reply to an official polling paper issued under the order of the Council. That such is the only practicable manner of ascertaining the real feeling of the Society I am convinced; anything short of such would be incomplete, unsatisfactory, and valueless.

EDWIN B. VIZER.

Belgrave House, Cliftonville, Brighton,
June 24, 1878.

"AURI SACRA FAMES!"

Sir,—I suppose the Americans would translate the above thus: "The Power of the Almighty Dollar." With regard to pharmacy I consider myself an outsider, retired, and out of date; but with regard to charges the same grievances now exist which I have known all my life when in business.

It appears to me that prices must always remain an open question. For the young pharmacist, just commencing business, to be required to maintain the high charges which are obtained by the old established chemists is absurd; indeed, I consider that our rising pharmacists ought to be a match for all the co-operative stores.

I can sympathize with Mr. G. H. Wright (see p. 918) in his customer obtaining for 8*d*. what he had charged 2*s*. 6*d*., but in this hard world such things may happen. On the same page, 918, Mr. Humpage alludes to the barber offering "to shave you for nothing," and the French proverb says, "the barber's apprentice learns to shave on the chin of a fool," but the barber would not trust his best customers to his inexperienced apprentice.

Uniformity of price is impossible. The public look shy on the young beginner, and he must wait until he obtains reputation before he can grow rich.

The late George Edwards, when he was a member of the Council of our Society, told the students that in these days of free trade they might as soon expect a slice of the moon as protection.

Your correspondent, "Hampshire," p. 863, advises chemists to put their shoulders to the wheel and not grumble, but "Sussex," p. 884, although he says pharmacy is going to grief, is so fond of his business that he would not retire on £10,000! The fox said the grapes he could not reach were sour. Yet I have heard of a retired tallow chandler on whom time hung so heavy that he offered his services to his successor, on melting days, gratuitously.

JOSEPH LEAY.

Chilcompton, Bath,
June 22, 1878.

SALE OF PATENT MEDICINES.

Sir,—I am sure that you and your readers must be almost tired of hearing the patent medicine question discussed particularly as many of the suggestions are impracticable, in fact, almost absurd.

Although I am a strong advocate for keeping up the old-fashioned prices, I do not think any benefit can be derived (possibly harm might be done) by making a stir (petitioning, as some of your correspondents have suggested). In a free country like this every man has a right to, and will, sell his goods at any price he pleases. What seems to me to be the only practicable remedy with regard to patent medicines is that which one of your correspondents suggested a short time ago, viz., not to push them by circulating counter bills, exhibiting show cards, disfiguring our windows with transparencies and letterings, but endeavour, as far as possible, to dissuade the public from patents. I have frequently found that when some customers come for a box of Professor Pillaway's pills, Chowell's balsam, and patents of that class, you can persuade them to have a bottle of mixture or box of pills, made specially to suit their individual case; and, I think, if chemists were to take a little more trouble in this respect they would do themselves—in fact, the chemists as a body—much benefit. I have also noticed that some who buy patents do so because they cannot or will not consult a medical man, and have not sufficient courage to ask a chemist's advice in an open shop, when perhaps an assistant or apprentice is present, but have only heard or read of So and So's pills being excellent; to such a word from the retailer is received with twofold delight, and they depart from your shop with a bottle of mixture or box of pills, of your own manufacture, with indeed much more satisfaction and confidence than if you had served them with the 1*s*. 1½*d*. article inquired for.

Perhaps it will not be out of place to mention here that a great many of the popular patents are prepared by non-registered chemists, and to encourage, or rather push, their sale seems to me contrary to all reasoning. Why should we, who have to work hard, diligently, and not without expense to pass the Society's examinations, help to make the bread for quacks or their heirs, who perhaps know no more about physic than the man in the moon, and who doubtless would be more at home in drawing up a puffing counter bill or advertisement? And yet these are the very men who make special terms to co-operative societies and cutting men, and are thus enabled to offer the goods at prices which the ordinary and honest chemist cannot compete with.

In conclusion, I hope some of our brethren will try the plan here suggested (although I do not suppose that they will succeed in every case), yet at the year's end should their returns not have increased their profits will most decidedly have done so.

A. H.

Croydon,
June 23, 1878.

THE BENGAL CINCHONA FEBRIFUGE.

Sir,—I beg to forward, for insertion in the *Pharmaceutical Journal*, the enclosed extract from a letter which I have received from Dr. King, the Superintendent of the Botanical Gardens at Calcutta, on the subject of the febrifuge manufactured by Mr. Wood from the cinchona bark grown in British Sikkim:—

"You will be glad to hear that the prejudices which at one time were rather strong in some quarters against the febrifuge are being rapidly overcome, and that by the Bengal doctors it is being cordially accepted as a substitute for quinine. During the financial year which ended on March 31, 1878, I disposed of 5107 lbs. of it in Bengal and of 400 lbs. in Bombay, and in view of our increased demand this year I have taken a crop of 320,000 lbs. of dry bark from the plantation during the past cold weather. There is no doubt that, in the same doses as quinine, the febrifuge is quite as efficient as quinine in the cure of fever. One great cause of the prejudice that one time existed against the medicine was that (assuming it to be weaker than quinine) it was given in very large doses, and in large doses it causes nausea just as an overdose of quinine does. In a short time I hope the febrifuge will be sold at about 12 annas (1*s*. 6*d*.) an ounce. At present it is sold at Rs. 16 *Sa*. per lb. to Government offices, and for Rs. 23 to the public."

Dr. King's letter is dated April 4, 1878, from Calcutta.

CLEMENTS R. MARKHAM.

21, *Eccleston Square, S.W.*

THE PRONUNCIATION OF LATIN.

Sir,—Every change of system is accompanied with some little confusion, and the new pronunciation of Latin entails its share of inconvenience. I suppose the schoolmaster will arrange that matter for us, and the newspaper jokes of such translations as "we kiss him (*vicissim*) in turn" will help to familiarize the mind with the change. I am afraid that schoolmasters are too much inclined to take the change piecemeal, and so students come to us, with their "c's" very properly all "k's;" but ignoring all change in the vowels. Mr. Clifford's list would be more complete with the additions that "t" is never according to the new system (and indeed according to the highest authorities in the old) pronounced like "sh," that ē, æ, and œ, are sounded like "ai" in pain, i like ee, in see, ū, as in all classic languages, like ōō in tool, and "au" as "ow" in power. We shall come round to fashion, and in this instance I believe it will be to reason as well. So far I am quite in accord with Mr. Clifford. But when he calls us who desire our students to ask for preparations in their full terms "purists" and almost sneers at us as "quibblers," am I not scientific in asking why? The reason for labelling in contractions is obvious. Either labels would be unduly enlarged, or type would be unduly contracted if it were otherwise. To take the instance given, "unguentum antimonii potassio-tartratis," would sprawl all over the jar, as it would over a prescription, where saving of time is added to economy of space, and in too many instances, as Mr. Clifford would admit, the system of contraction spares the same amount of "courage" on the part of the prescriber that is credited to the Duke of Wellington when he ventured to speak his French. All who are in any way connected with the press, or who have read advertisements of pens manufactured by a northern house, know how many the contractions are which journalists employ for the sake of economizing time and space, and in writing and printing the reasons are valid. But as a matter of speech I believe such economy, except in dog-latin, is purely a Yankee innovation, and I certainly should object to such parsimony of syllables on the part of a student. For a lesson taught very correctly, but not to be used in ordinary, would become very much like John Gilpin's belt, and might prove very inconvenient about the time of the twentieth wedding day. Knowledge that is to remain a possession must be first of all well taught, and then well drilled. But if economy of speech is to be effected, why should it be always at the expense of the "noble language"? Why not try contractions in English? We should have pot. tart. ant. oint., merc. oint., dist. wat., etc., etc. We should save four syllables by meth. sprite., and could reserve the more dignified "spirit" for the rectified article. Indeed I have asked young men to try the experiment for a day, and have generally found that they considered it preferable to give full terminations to both languages. There are too many short cuts already, which are calculated (or are so supposed) to ease the sore travail of oppressed students, and relieve them of the tedium of learning. If we teach them at the commencement that ordinary words are too long to be uttered in full, we must not be surprised if they arrive at the conclusion that the whole curriculum of a pharmacist ought to be curtailed by "cram" or any other shears available.

Mr. Clifford's letter marks progress in one direction. With greater attention to the sounds of letters, we may hope for improvement in quantity, and that if crammers are to teach the rising chemists that only a nominative and genitive case are necessary, at least all nouns will not necessarily "increase long in the genitive"; that felix and filix will not always travel *pari passu*, and that the old musty "Gradus ad Parnassum" will yet see the light of a renascence.

HENRY H. POLLARD.

Ryde, June 24, 1878.

"*Syrupus*."—*Spergula arvensis*; *Matricaria Chamomilla*; *Polygonum aviculare*, var.

T. Romans.—*Atropa Belladonna* and *Carex divulsa*.
