MAY 1941

PEACHES: PRODUCTION AND PRICE RECEIVED BY GROWERS IN 10 SOUTHERN STATES, AND PRICE AT NEW YORK, 1921-41

THE SIZE OF THE SOUTHERN PEACH CROP IS AN IMPORTANT FACTOR AFFECTING PRICES OF SOUTHERN PEACHES. EXAMINATION OF THE YEAR-TO-YEAR VARIATIONS, HOWEVER, SHOWS THAT CONSUMER PURCHASING POWER AND THE SIZE OF THE PEACH CROP IN COMPETING AREAS ALSO AFFECT THE PRICE OF SOUTHERN PEACHES.

APPLES, WASHINGTON EXTRA FANCY: WEIGHTED AVERAGE AUCTION PRICES, 1939-40

FIGURE 1

T H E F R U I T S I T U A T I O N

Summary

As of May 1, the indicated peach crop in the 10 Southern peach States totaled 22.0 million bushels, the largest crop since 1931. Last year only 13.9 million bushels were produced in these States, but the price received by southern peach growers was adversely affected by a shorter than normal marketing season for the major part of the crop, coupled with increased competition from the late crop States. If the 1941 marketing season is normal, increased consumer purchasing power probably will more than offset the price effect of increased supplies, and prices should average slightly higher than a year ago.

On the basis of the May 1 condition and the estimated damage to trees in the Sacramento Valley due to excessive rain, the clingstone crop in California this year is likely to be about 68,000 tons smaller than the crop last year, and the smallest since 1929. The carry-over of canned clingstones and freestones is roughly estimated to be about 1.6 million cases. This would be the smallest carry-over since 1937. The price paid by canners for clingstones this year also will be favorably affected by the improved demand situation for canned goods.

On the basis of May 1 condition and the estimated slight damage to trees by the excessive spring rain, the crop of freestone peaches in California this year will total roughly 12,000 tons less than the 1940 production of 198,000 tons. The 5-year (1935-39) average is 179,000 tons. The relatively small crop of clingstones will result in an increased demand for freestones for canning this year over last.

Production of second early strawberries is indicated to total 4.3 million crates compared with 3.1 million in 1940. Prices of North Carolina strawberries at New York averaged 14 cents per quart in the week ended May 10 compared with 23 cents in the comparable week last year. The increase in consumer purchasing power this year has not been great enough to offset the depressing effect on prices of increased strawberry marketings. Strawberry production in the intermediate States is indicated to total 4.0 million crates this season compared with 3.5 million in 1940. Market supplies of strawberries during the remainder of May and in June will be larger than a year earlier.

Cold storage holdings of apples on May 1 totaled approximately 6 million bushels. These were the largest May 1 holdings in the last 10 years, 2.3 million bushels greater than on May 1, 1940. Prices of Washington apples in April remained above those of a year earlier, but in the first 2 weeks of May they fell slightly below comparable prices in 1940.

Orange production in 1940-41 is now indicated to total 2.8 million boxes more than in 1939-40, and grapefruit production is indicated to total 7.8 million boxes more. Auction prices of California oranges at New York in April averaged 6 cents per box higher than in the corresponding month in 1940. Prices of Florida and Texas grapefruit in April averaged lower than comparable prices last year.

— May 21, 1941

DEMAND

Consumer purchasing power will continue to improve in the remainder of 1941 under the stimulus of the national defense program. Production of durable goods for civilian use probably will not expand proportionately, and a greater than usual portion of consumer buying power will be available for food, clothing, and other nondurable items. This will be particularly true if the Government's attempt to hold down prices of industrial products is successful. Increased taxes and purchasing of defense bonds probably will

not be great enough to defeat this tendency. Thus, the demand for farm products may be increased to a greater extent than the usual indices of demand, such as incomes of industrial workers and nonagricultural income, would indicate.

PEACHES

BACKGROUND.-- Peach production increased at a moderate rate from 1933-40. Prices received by growers also increased during this period. The upward trend in prices which occurred while production was also trending upward was due largely to increasing consumer purchasing power during this period.

The increase in production from 1933-40 took place largely in the late peach-producing States, and in California. Production in the early States fluctuated about a constant level. Growers in the areas that produce peaches for market as fresh fruit have been generally optimistic, and a large number of trees have been planted in recent years. The May 1 estimate of peach production this year in the 10 Southern States indicates that production in these early States may be greater in the next few years than it was from 1933-40.

From June to early August, 10 Southern States 1/ are the principal source of market supplies of fresh peaches. In the 5-year period 1936-40, approximately 45 percent of the United States peach crop, excluding production in California, was produced in these States. In 1940 the peach crop in these 10 Southern States was 8 percent smaller than the crop of 1939, production in competing areas was smaller, and consumer purchasing power was greater. Despite these relatively favorable factors, the average price received by southern peach growers for their 1940 crop was 8 percent below that received for the 1939 crop. The 1940 marketing season got into full swing much later than did that of 1939. Indications are that the major portion of the 1940 crop was marketed in a much shorter period of time than was the major part of the 1939 crop. Considerable quantities of late crop peaches came on to the market in 1940 while large marketings of early peaches were still being made. The year before only a small quantity of early peaches remained to be marketed when the late peach season got into full swing. Thus, it appears that the shorter marketing season in 1940 for the major portion of the crop, coupled with increased competition from the late crop States, resulted in prices in 1940 averaging below those in 1939.

In California the production of both freestone and clingstone varieties increased from 1933-40. The clingstone variety is used primarily for canning, and the freestone variety for drying. A considerable portion of the freestone crop is also sold for fresh consumption. In 1934-38, 81 percent of the

1/ North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas.

harvested clingstone tonnage was canned, 12 percent was dried, and 5 percent was sold fresh. In the same period 7 percent of the harvested freestone tonnage was canned, 59 percent was dried, and 34 percent was sold for fresh consumption. The demand for canned freestones has been increasing in recent years, and last year 14 percent of the freestone crop was canned. The disposition of the total California crop depends on the size of the crop, the carry-over of canned and dried peaches, the demand for fresh peaches, and the market prospect for canned and dried packs.

In the 5-year period 1934-38, 20 percent of the dried peach pack and 15 percent of the canned peach pack were exported. Hostilities in Europe did not materially reduce dried and canned peach exports until May 1940. It is estimated that less than 4 percent of the 1940 dried peach pack, and less than 1 percent of the canned pack, will be exported during the 1940-41 marketing season.

Early peach crop likely to be
largest since 1931

It is indicated, as of May 1, that the peach crop in the 10 Southern peach States will total 22.0 million bushels, the largest crop since 1931. Last year 13.9 million bushels were produced in these States. The marketing season for early peaches usually begins the latter part of May.

The price of southern peaches is dependent upon a number of factors. The most important of these are the size of the southern crop, the purchasing power of consumers, and supplies in competing areas. Other factors influencing price are the length of the marketing season and the quality of the crop. The year 1940 furnished a good example of what happens to the price of peaches when the marketing season is late and the bulk of the crop is marketed in an unusually short period of time. (This abnormal situation is discussed in detail in the background statement.)

If the marketing season is normal this year, increased purchasing power of consumers probably will more than offset the adverse effect on prices of increased supplies. Incomes of industrial workers (a measure of consumer money demand) are currently running about 30 percent higher this year than last, but it is too early to make an estimate of the production of peaches in the major competing late States. ^{2/} In the past, however, the production of peaches in the late States has been fairly closely related to that in the 10 Southern States. This relationship may be somewhat distorted this year because of the severe cold wave last November which killed many peach trees in Kansas, Nebraska, Missouri, and western Illinois, and seriously damaged many others.

^{2/} Pennsylvania, New Jersey, Delaware, Maryland, Virginia, West Virginia, Illinois, Indiana, Missouri, Colorado, Utah, Idaho, Washington, and Oregon.

California crop estimated to be
smaller this year

May 1 indications point to somewhat lighter crops than those of last season for both clingstone and freestone varieties. The May 1 condition of all peaches in California, as reported by the Agricultural Marketing Service, was 67 percent compared with 78 percent on May 1, 1940. In the Sacramento Valley clingstone area, a considerable number of trees have been, or probably will be, lost because of the high water tables resulting from excessive spring rain. It is roughly estimated that the California crop will total 458,000 tons compared with 538,000 last year.

Clingstone crop likely to be much
smaller this year

On the basis of May 1 condition of clingstones, and estimated damage to trees in the Sacramento Valley due to excessive rain, the clingstone crop this year is likely to total not more than 272,000 tons. This would be 68,000 tons smaller than the crop last year, and the smallest since 1929.

The carry-over of canned clingstones and freestones will be comparatively small, probably about 1.6 million cases. This would be the smallest carry-over since 1937. The supply of canned peaches at the beginning of the 1940-41 marketing season was 300,000 cases smaller than a year earlier. Thus, 600,000 more cases of canned peaches probably will be moved into consumption in 1940-41 than in 1939-40. Since only a negligible quantity of canned peaches was exported this season, the increased movement into domestic consumption was greater than 600,000 cases. This greater movement took place at slightly lower prices than in 1939-40.

If the unusually small production now indicated materializes, the disposition of the clingstone crop will be changed drastically from that of previous year. Table 1 shows the estimated disposition of the 1941 crop, the disposition in 1940, and the average disposition in the 5-year period 1935-39. Of course, any change in the crop prospect would alter the situation.

Table 1.- Estimated disposition of 1941 California clingstone crop, fresh-equivalent weight, 1940 disposition, and average disposition 1935-39

Year begin- ning June 1	Production			Canned	Dried	Used fresh
	Total	Unharvested	Harvested			
	Short tons	Short tons	Short tons	Short tons	Short tons	Short tons
1941	272,000	0	272,000	262,000	0	10,000
1940	340,000	15,000	325,000	283,000	27,000	15,000
Average 1935-39	336,000	7,000	329,000	274,000	35,000	20,000

It appears that total production of clingstone peaches will be less than the amount used last year for canning alone. The price paid by canners this year also will be favorably affected by the improved demand situation for canned goods.

Freestone crop likely to be smaller
this year

On the basis of May 1 condition of freestone peaches and the estimated slight damage to trees by the excessive spring rain, the crop this year may total roughly 186,000 tons. This compares with the 1940 production of 198,000 tons, and the 5-year (1935-39) average of 179,000 tons.

The outlook for freestone peaches is comparatively favorable. The relatively small crop of clingstones will result in an increased demand for freestones for canning. Also, the demand for dried peaches will be increased over a year ago as a result of increased consumer purchasing power. It is anticipated that the amount of freestones canned from the 1941 crop will be considerably greater this year than last. Table 2 shows the estimated disposition of the 1941 crop, the disposition in 1940, and the average disposition in the 5-year period 1935-39.

Table 2.- Estimated disposition of 1941 California freestone crop, fresh-equivalent weight, 1940 disposition, and average disposition 1935-39

Year begin- ning June 1:	Production			Canned	Dried	Used fresh
	Total	Unharvested	Harvested			
	Short tons	Short tons	Short tons	Short tons	Short tons	Short tons
1941	186,000	0	186,000	35,000	100,000	51,000
1940	198,000	0	198,000	27,700	102,000	68,300
Average						
1935-39	179,000	0	179,000	15,000	100,000	64,000

STRAWBERRIES

BACKGROUND.- Production of strawberries increased from 9.4 million crates in 1936 to 14.3 million in 1940. The crop in 1940 was the largest on record. The greatest production increases occurred in the late and intermediate States. There was a slight upward trend in production in the second early States, and production in the early States remained about constant. Prices have shown a downward trend since 1936. Returns to growers, however, have increased.

Production of early strawberries in 1941 is indicated to total 2.5 million crates compared with 2 million last year. The major portion of this crop has been marketed, although some Louisiana berries will be available until late May. Prices of Louisiana berries this year at Chicago probably will average below those of a year earlier.

Production of second early strawberries is indicated to total 4.3 million crates compared with 3.1 million in 1940, an increase of 39 percent. These strawberries are usually marketed during May. Prices of North Carolina strawberries at New York averaged 14 cents per quart in the week ended May 10 compared with 23 cents in the comparable week last year. The increase in consumer purchasing power this year over last has not been great enough to offset the depressing effect on prices of increased strawberry marketings.

Strawberry production in the intermediate States is indicated to total 4.0 million crates this season compared with 3.5 million in 1940. The Agricultural Marketing Service reports that growing conditions for the most part have been excellent, and shipments should start late this month. Market supplies during the remainder of May and in June will be larger than a year earlier. The intermediate crop will compete to some extent with the late crops. The acreage in the late States is indicated to be 300 acres larger this year than last. Yields last year, however, were very good.

APPLES

BACKGROUND.-- There were approximately 115.5 million bushels of apples produced commercially in 1940. In 1939 the commercial crop totaled 143.1 million bushels, of which 127.9 million bushels were marketed, in one form or another, through regular domestic trade channels. Even though the 1940 crop was smaller than 128 million bushels, the virtual loss of export outlets made it difficult to market varieties formerly exported. To alleviate this situation, the Department of Agriculture has made large purchases of export varieties from the 1940 crop.

Auction and wholesale prices of apples from September through November averaged considerably above those of a year earlier as the result of smaller domestic marketings and increased consumer incomes this year.

Cold storage holdings of apples on December 1 were the largest since 1937, and except for 1931 and 1937 were the largest in the last 12 years. The factors contributing to these large storage holdings have been discussed in detail in previous issues of this report.

Domestic marketings of fresh apples from December through March were greater than in the same period a year earlier. As a result of this, the rise in wholesale and auction apple prices from December through March was less than the rise during the same period last season. However, because of increased consumer purchasing power, prices in this period were higher this year.

Domestic sales in April smaller than those a year earlier

Approximately 4.6 million bushels of apples were withdrawn from cold storage in April compared with 5.0 million withdrawn in April 1940. The

movement into regular domestic trade channels was about 543,000 bushels less. Prices in April averaged above those of a year earlier.

Domestic supply will be exceptionally large during May and June.

There will be roughly 2.3 million bushels more apples to be marketed domestically during the remainder of the season than there were in the same period last year. On a percentage basis there will be 65 percent more apples to be marketed domestically during the remaining months of the season.

Auction and wholesale prices in the week ended May 10 averaged below comparable prices last year.

CITRUS

BACKGROUND.- During the decade prior to 1930, when variations in consumer purchasing power were relatively minor, a marked inverse relationship existed between total production of citrus fruits and citrus prices. The extremely low prices received for citrus fruits from 1930-32 were largely a result of increasing production and decreasing consumer purchasing power. Since 1932 consumer demand has been increasing, but production has increased so sharply that prices have continued to decline.

The trend in orange production in the United States has been steadily upward during the past 20 years. This upward trend has been particularly marked in the production of Valencias in California, and of all oranges in Florida. Although prices of oranges reflect changes in consumer income as well as changes in production, the upward trend in production during the past 20 years has been accompanied by a downward trend in prices received by growers.

During the decade, 1919 to 1929, grapefruit production in the United States followed a gradual upward trend. Since that period, the increase has been more pronounced, with production in Texas increasing at a more rapid rate than in other areas. Prices have not recovered from the low level of the depression years following 1929, chiefly because of the rapid increase in production since that time.

Both production and farm prices of lemons followed a gradual upward trend from 1921-22 to 1929-30. Since that time production has continued to increase, and the trend in prices has been generally downward. Imports of lemons have been negligible since 1929-30.

Production

Oranges: The latest estimate places 1940-41 orange production at 78.4 million boxes, a reduction of 2.2 million boxes from the estimate made as of April 1. In 1939-40, 75.6 million boxes of oranges were produced.

The Valencia crop in California is now placed at 25.1 million boxes, 1.7 million boxes smaller than that of a year ago. The Agricultural Marketing Service reports that the harvest of the California navel and miscellaneous crop is drawing to a close and harvest of Valencias has begun.

Grapefruit: The May 1 estimate of grapefruit production in 1940-41 was 7 percent greater than the estimate made a month earlier. Grapefruit production from the bloom of 1940 is now estimated to total 43.0 million boxes compared with 35.2 million in 1939-40. As a result of changes made in quarantine regulations, Texas producers will be permitted to pick grapefruit through May.

Shipments

Oranges: Shipments of California navel and miscellaneous oranges have been decreasing during the past month, and indications are that only a small quantity remains to be shipped. Shipments of these oranges from the beginning of the season to date have been 5 percent greater than in the same period in the 1939-40 season. The production of California and Arizona navels and miscellaneous in 1940-41 is estimated to be 10 percent greater than a year earlier. Shipments of Florida oranges between October 20 and May 10 totaled 48,000 cars compared with 44,000 in the same period a year ago. Shipments of Florida Valencias have been nearly double those of last year. The Florida shipment data do not include oranges trucked to canners. A larger portion of the Florida early and midseason crop was utilized by processing plants this year than in any previous year.

Grapefruit: Shipments of Florida and Texas grapefruit so far this season have been 13 percent greater than in the comparable period a year ago. Florida shipments do not include grapefruit trucked to canners and to boats. Total production of grapefruit is estimated to be 22 percent greater than in 1939-40. Indications are that the canned pack of grapefruit in the 1940-41 season is of record proportions. The segment pack is probably smaller this year than last, but the juice pack is greater. Approximately 16.4 million boxes of the 1939-40 crop were canned.

Prices

Oranges: April auction prices of California navel oranges averaged slightly above those of a year earlier, and April prices of Florida oranges averaged below April 1940 prices.

Grapefruit: Prices of Florida grapefruit at New York have been considerably below those of last year from the beginning of the season to date. Auction prices of Texas grapefruit at Chicago, except for the month of January, have been slightly below prices a year earlier.

Large purchases of grapefruit made by Department of Agriculture this season

Up to May 10 the Department of Agriculture had purchased approximately 1.2 million boxes of fresh grapefruit. Up to the same date the Department had purchased approximately 602,100 boxes of grapefruit to be processed, 401,000 cases of grapefruit segments from canners' stocks, and 717,600 cases of grapefruit juice from canners' stocks. Only a negligible quantity of grapefruit was purchased by the Department from the 1939-40 crop.

Compiled from reports of the Agricultural Marketing Service and Surplus Marketing Administration.

^{1/} Rail, boat, and truck. No truck shipments reported for Louisiana, Alabama, and Mississippi; total truck shipments from Texas; interstate truck shipments from California-Arizona; interstate and intrastate truck shipments (excluding trucked to canners and to boats) from Florida. All data subject to revision.

^{2/} Excluding relief shipments.

^{3/} Includes shipments from all producing areas, and also tangerines.

^{4/} Purchases made by Surplus Marketing Administration.

Compiled from reports of the Agricultural Marketing Service.

1/ Relates to crop from bloom of year shown. In California the picking season adopted extends from November 1 to December 31 of the following year. In other States the season begins about September 1. For some States in certain years, production includes some quantities donated to charity and/or eliminated on account of market conditions.

2/ Short-time average.

3/ Failure reported.

4/ Net contents of boxes varies. In California and Arizona the approximate average for oranges is 70 pounds net and grapefruit 60 pounds; in Florida and other States oranges 90 pounds and grapefruit 80 pounds; California lemons, about 76 pounds net.

5/ December 1 indicated production.

	<u>Page</u>	<u>Issue</u>
Supply and estimated disposition of dried fruits, 1940-41	4- 7	April 1941
Estimated fresh domestic sales of apples through regular trade channels, July-December, and January-June, 1928-40	6- 7	March 1941
Canned fruit supplies on January 1, 1941	9	February 1941
Comments on the use of a weighted price of all grades of a given variety of apples to measure the relative price movements of that variety	8-10	December 1940
Fruit Outlook for 1941	3-10	October 1940
Probable effects of the spread of the war on the fruit situation	7- 8	May 1940

Charts

Strawberries: Production in leading States, average 1933-37, distributed by weeks on basis of 1937 marketings		April 1941
Oranges and grapefruit: Weighted auction price at New York, normal seasonal trend, and 1939-41		March 1941
Pears, western: Weighted average auction prices of all grades, New York, normal seasonal trend, and 1939-40		January 1941
Apples, Washington Delicious: Weighted average auction prices, by grades, Chicago, normal seasonal trend .		December 1940
Apples, Washington Extra Fancy: Weighted average auction prices, normal seasonal trend, and 1940 ...		December 1940
All fruits: Production and price, United States		October 1940
Cash farm income from fruits, and income of industrial workers, United States, 1924-40		August 1940
Dried prunes: Production by States and average farm price, 1919-40		June 1940

Strawberries: Production and Price Received by Growers, by Regions, 1918-41

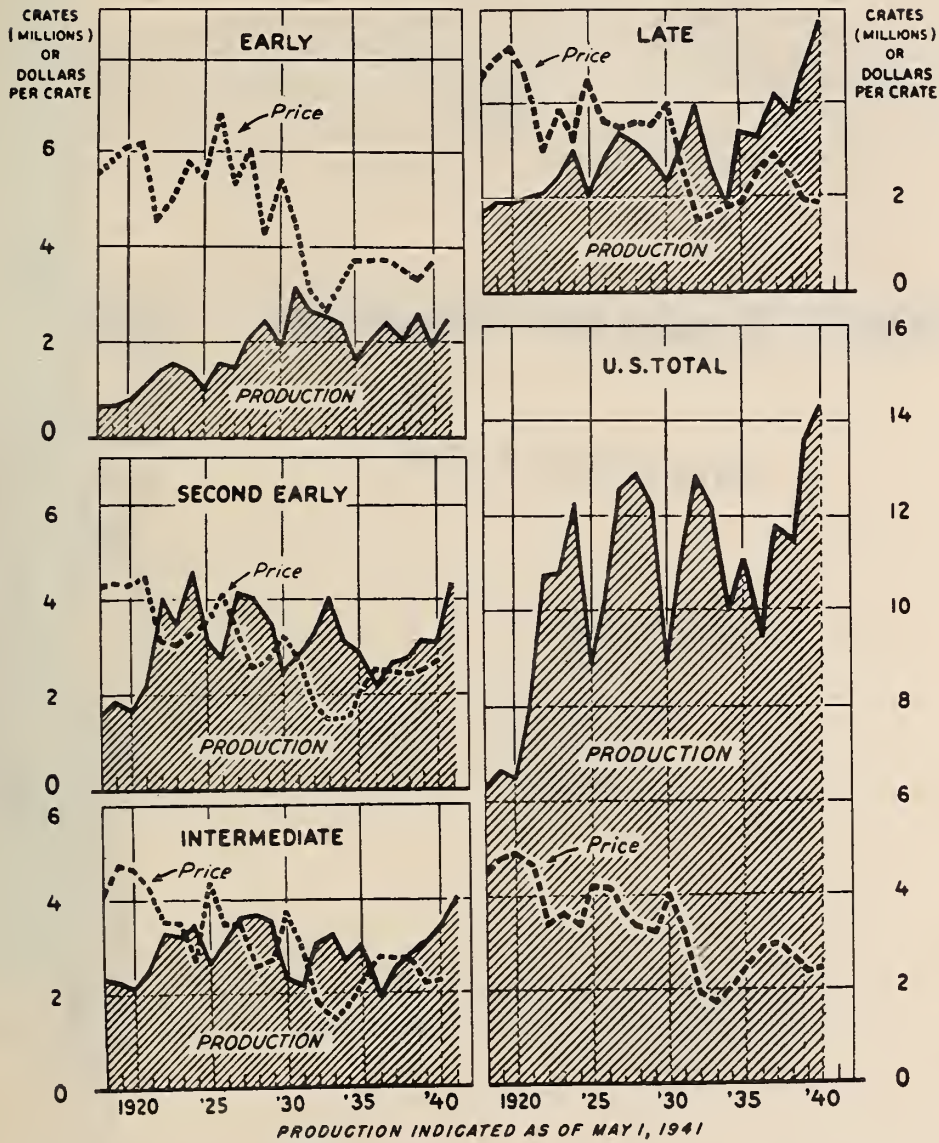

FIGURE 2.- PRODUCTION OF STRAWBERRIES IN THE LATE STATES HAS INCREASED SHARPLY DURING THE LAST DECADE, LARGELY AS A RESULT OF INCREASED PRODUCTION IN THE FAR WESTERN STATES. PRODUCTION IN THE EARLY STATES INCREASED GREATLY FROM 1918 TO 1931, BUT IN RECENT YEARS HAS REMAINED BELOW THE 1931 PEAK PRODUCTION. SINCE 1924 PRODUCTION HAS DECLINED SLIGHTLY IN THE SECOND EARLY STATES BUT HAS REMAINED ABOUT STABLE IN THE INTERMEDIATE GROUP. TOTAL UNITED STATES PRODUCTION HAS TENDED TO INCREASE. ALTHOUGH STRAWBERRY PRICES HAVE DECLINED SINCE 1920, IN RECENT YEARS THEY HAVE SHOWN SOME RECOVERY FROM THE LOW 1932 AND 1933 PRICES.
