

Drought Situation

- By mid-July 2017, several regions of Europe are affected by drought conditions.
 - Extended regions of the Iberian Peninsula and central Italy have suffered from a rainfall deficit over the last months. Combined with very high temperatures in June and July, this has resulted in very dry conditions.
 - North-western Europe has suffered from a longer-term rainfall deficit over the last 12 months, resulting in soil moisture deficits.
 - Dry conditions over large parts of the Mediterranean region are having severe impacts on agricultural production, but also on fire danger and public water supply.
