After 4th full paragraph, insert "The sagebrush biome is a winter concentration area for golden and bald eagles."

4-26.4.6.2: The Environment and Man

1st paragraph, Danger Cave is in Tooele County, Utah (not Wyoming). It is also outside the Green River, Hams Fork Coal region.

4-28, 1st Column, 2nd full paragraph:

"Seedshadee" should be "Seedskadee".

Commenter 266

Response. The FES contains these suggested modifications.

8. **Comment.** "No reference is made in this management program to the Great Divide Basin in the description of the Green River-Hams Fork Coal Region. This formation is a unique geological phenomenon containing several land forms, plant types, animal species and bird species peculiar to that area. The Basin also contains several potential National Natural Landmarks which have been identified by studies done for the National Park Service. However, no mention is made of any of those potential landmarks. This area is richly endowed with paleontological and archeological remains. Surely an area with so many varied cultural resources deserves some type of mention in this study. The Great Divide Basin, per se, is given a cursory mention in conjunction with a casual composite reference to endangered animal and bird species."

Commenter 122

Response. The environmental description contained in Section 4.6.1 applies to the entire Green River-Hams Fork Coal Region, of which the Great Divide Basin is a part. The FES contains a discussion of representative paleontological and archeological resources of the entire region.

9. **Comment.** "Specific corrections to Chapter 4 concern statements on Page 4-21 in the last paragraph in section 4.5.1, the species list for fish should read 'shovelnose sturgeon, sturgeon chub'; in section 4.6.1 on Page 4-26 the last paragraph in the left-hand column should not include rainbow trout and brown trout as native game fish (cutthroat trout should be substituted for these two species), walleye pike should be deleted from the list of fish that have been introduced, (the species

does not occur in the Hams Fork-Green River Drainage) under non-game species the word 'rednose' should be changed to 'redsided shiner,' and the word 'shiner' should be deleted; in the first paragraph on the upper right-hand side of this page, 'Farrow's goldeneye' should read 'Barrow's goldeneye'; in the next paragraph, the species is Kendall Warm Spring dace, not daren; the greenback cutthroat is also noted as an endangered species. This subspecies does not exist in the Green River-Hams Fork Region (it occupies the headwaters of the South Platte River); the native subspecies of the cutthroat in this drainage is the Colorado River cutthroat (*Salmo clarkii pleuriticus*); also on Page 4-26, under section 4.6.2 in the first paragraph in this section, Danger Cave in Tooele County, Wyoming, is an error as there is no Tooele County in Wyoming."

Commenter 006

Response. Agreed. The appropriate changes have been made.

10. **Comment** "(Page 4-30) There is disagreement with the statement in the DES that "... none of the regions are particularly fragile. With proper soil and vegetative management, all can be reclaimed to a near-original state, following surface mining." What basis exists for this conclusion (e.g., cited evidence of reclamation success on surface mined lands in terms of species diversity, productivity, and ground cover density)? We recommend that this phrase be stricken and that a more qualified statement be included in the FES to reflect the fragility of Western lands (e.g., reclamation difficulties in areas with low precipitation and limited soils, alluvial valley floors, and prime farmlands.)"

Commenter 091

Response: This phrase has been amended in Section 4.71 of the FES contains the suggested alteration.

11. **Comment.** "Additionally, the Utah prairie dog does not occur in the Green River-Hams Fork Region. This should be included in the discussion of the Uinta-Southwestern Utah Region."

Commenter 093 and 266

Response. The FES has deleted this species from Green River-Hams Fork Coal Region.

12. **Comment.** "It should initially be observed, however, that as regards the unsuitability criterion

of reclaimability, several comments are made for the separate regions which indicate that enough knowledge has already been generated to prove that such reclaimability is usually not a serious problem. See, for example, the comment in the third full paragraph on page 4-30 to the effect that none of the regions are particularly fragile and that with proper soil and vegetative management all can be reclaimed to a near original state following mining. Presumably, the Department will not lose sight of this admitted fact in requiring proof of reclaimability in any region."

Commenters 066, 182, and 187

Response. This statement in the DES has been qualified in the FES, to state that a high degree of reclamation attention would be required in sensitive areas, the Department will continue its awareness of reclaimability potential throughout the decision making process of the Federal coal management program.

13. **Comment.** "The statement is made here that 'potential evaporation exceeds normal precipitation by a factor of 6 or more' in the San Juan River Region. Certainly this factor has a direct relationship upon the recharge to aquifers used for coal development. Yet no discussion of the total effects of massive dewatering and minimal recharge is contained anywhere in the Draft Environmental Statement."

Commenter 057

Response. Chapter 5 of the FES addresses intraregional water requirements due to coal development. These requirements are considered in light of the water (surface and groundwater) resources of a given region as described in the Water Impacts section text and Appendix E water data.

14. **Comment.** "(Page 4-34) What is the basis for the statement that 'All areas within the region can probably be reclaimed after disturbance, provided that topsoil is replaced as a plant medium and adequate moisture is available for germination and emergence'?"

Commenter 091

Response. This statement is based on the ecological principle of secondary ecological succession which is basically defined as the return of an ecosystem to its natural state under appropriate conditions following a catastrophic change.

15. Comment. "Para 4.8.2. This paragraph discusses water as a limit on development in the Region. But it fails to mention that by the mid-1980's over 40,000 acre feet of water may be available from the de-watering of deep uranium mines."

Commenters 019 and 135

Response. The purpose of Section 4.8.2. is to describe the existing socio-economic environment of the San Juan River Coal Region in light of the historical role of mankind. For a future analysis of water availability, refer to the water impacts section of Chapter 5.

16. Comment. "Page 4-33: The statement is made here that water from the aquifers likely to be drawn upon in coal development are of "poor to fair quality". This is a mistatement, as the Westwater Canyon member of the Morrison Formation which is the aquifer most likely to be used in coal development and contains excellent drinking water used by the Crownpoint area, impacts to this aquifer will affect the only good drinking water available in the San Juan Basin. Substantial impacts such as this should be treated more fully in the final statement."

Commenter 057

Response. Chapter 4 of the FES contains the suggested modification. Ground water effects are addressed in Chapter 5. It should be noted that SMCRA provisions prohibit adverse impacts on ground water quality.

17. Comment. "Page 4-33: Although the Surface Mining Control and Reclamation Act mandates reclamation of lands which have been mined, and although the statement here describes the soils of the San Juan River Region as 'shallow, saline and erodable', no substantial discussion of the actual methods for reclaiming this type of soil is made."

Commenter 057

Response. The purpose of Chapter 4 is to describe the environment. Chapter 5 contains a discussion of reclaimability. The method of reclamation would be conducted within the confines of SMCRA. SMCRA enforcement would be conducted by the Office of Surface Mining Reclamation and Enforcement.

18. Comment. "Page 4-34: The statement 'all areas may be reclaimed if topsoil can be replaced

and adequate moisture is available.' This type of meaningless assertion makes a mockery of the whole process of mitigating environmental impacts. Of course all areas can be reclaimed if those conditions are present. According to statements in this Draft Environmental Statement, the San Juan River Coal Region has fragile topsoil and virtually no precipitation. The possibility that reclamation may not be possible should be discussed as well as the resulting possibility that with no, or minimal, reclamation coal development may well force the migration of all those people living in the area to be developed."

Commenter 057

Response. This statement has been clarified to indicate the area's fragility,

19. Comment. "Page 4-34: The San Juan River Coal Region is one of exceedingly complex land status. The discussion here should include a description of these various categories of land which include: Tribal trust land, Tribal fee land, Individual Indian allotments, Executive Order Land (set aside for exclusive Indian use and occupancy), Public Domain Land, Private Land and State Land. Each of these types of land is administered differently and by different individuals and agencies of the Tribal, State and Federal governments. To merely state that most of this land is 'Federal' land is to minimize the difficulties inherent in land use planning in this area. The difficulties are so great that a tri-partite agreement had to be reached between the Navajo Tribe, the Bureau of Land Management and the Bureau of Indian Affairs for the management of the area of proposed coal activity. This agreement and the problems which caused it to be adopted should be included in the final statement."

Commenter 057

Response. Discussions of coal reserves within the above indicated types of lands are contained in Chapter 4 does not contain detailed intraregional discussions of land ownership patterns, because this is site-specific information beyond the scope of the FES. Such information, however, would be germane to any future regional environmental analyses concerning designated tracts, and land for leasing purposes.

20. Comment. "Para 4.8.2. The paragraph also fails to mention the work force potentially avail-

able from a 5-county unemployment rate of 12.7% in 1977, as the Star Lake-Bisti Regional ES states."

Commenters 019 and 135

Response. Although this statement is true, Table 4-10 contains pertinent demographic and employment data for the San Juan River Coal Region.

21. **Comment.** "Para 4.8.2. The Draft Programmatic states that regional population is 'relatively' low; recreation is showing 'significant' growth; land ownership is 'primarily' federal; only 'a small percentage' of land is private; in 'many' communities lack of housing is 'extreme.' These are unquantified words, and should be quantified. Similar examples of this lack of quantification can be found throughout this Draft ES."

Commenters 019 and 135

Response. Chapter 4 contains general descriptive data which serve as a foundation for the Chapter 5 impact analyses. For further socio-economic data refer to Appendix E

22. **Comment.** "Para 4.8.2. It is true that the economy of the San Juan River Region is closely tied to energy. But, according to the Star Lake-Bisti Regional EIS, government accounts for the most employment, with 21.2% of regional employment and 24.3% of total income in 1977. This is completely at variance with the data given in Table 4-10."

Commenters 019 and 135

Response. The boundaries and consequently the regional socio-economic data bases differ for the Star Lake-Bisti Regional ES and this FES.

23. **Comment** Chapter 4 - Description of Regional Environments Section 4.9. - Uinta-Southwestern Utah Coal Region. A description of the coal resource (types, quantity) should be included. Fishing and hunting, plus other recreation oriented activities, should be included as significant economic characteristics of this region.

Commenter 266

Response. The FES contains these suggested additions.

24. **Comment.** "Page 4-36: The statement at issue here is that water will be a stringent limit on development." How stringent a limit water will be must be more fully discussed and here we run into the problem of cumulative impacts. Given the massive uranium development planned for the San

River Region and the equally massive coal development there is no doubt that water will be an absolute limit on development. Discussion of this limitation is imperative."

Commenter 057

Response. A discussion on regional water requirements is more appropriate to Chapter 5, which contains information and a discussion of water availability.

25. **Comment.** "The twelve coal regions are not sufficiently delineated. A map of each region should be included in the description of regional environments in Chapter 4. For example, the Black Mesa area in Arizona is shown on Figure 1-1 to be a part of the San Juan River Coal Region. However, the textual description of that region does not include any part of Arizona. The Navajo Indian Reservation comprises most of the San Juan Basin, however, the Navajos are mentioned only in a historical sense."

Commenter 088

Response. Rather than 12 separate regional maps, Appendix H (see Table H-6) has been expanded for purposes of detail to include a list of all counties involved in each region. No Arizona counties are included in the official San Juan River Coal Management Region and the text has been modified to so indicate. For information on Indian coal in the San Juan Coal Region, refer to Section 2.7.3.

26 **Comment.** "Hear the end of Section 4.9.1 on page 4-48, the discussion is directed to the reclaimability of lands in general and particularly in the Uinta-Southwestern Utah Coal Region. In stating that the reseeding process may take several years during the drought cycle, the Department is apparently making the unrealistic assumption that mines cannot be expected to have a water supply available for irrigation during the reseeding process. On the contrary, a coal mine simply cannot function without an adequate water supply for many purposes including hydromulching and other reclamation processes."

Commenter 066

Response. Section 4.9.1 has been modified to reflect the mitigatory effects of irrigation on reclamation during drought years.

27. **Comment** "The second paragraph on page 4-38 refers to the deterioration of some watersheds

in this region as a result of overgrazing by domestic livestock and big game animals. Presumably, therefore, the Department will not be so sensitive to relatively small scattered impacts on wildlife habitat as a result of the predominantly underground coal mining which is expected to occur in the Uinta-Southwestern Utah Region. Furthermore, it is hoped that this paragraph does not suggest that coal mining companies will have to bear significantly higher reclamation costs in order to compensate for such overgrazing, much of which occurred not only with the consent but the encouragement of federal land use agencies over the past several decades."

Commenter 066

Response. The intent of this paragraph is to demonstrate that certain ecosystems of the Uinta-Southwestern Utah Coal Region are presently in a state of deterioration. The paragraph does not suggest that coal mining companies will have to bear significantly higher reclamations costs in order to compensate for such overgrazing.

28. **Comment.** "Several corrections need to be made in the description of the Uinta-Southwestern Utah coal region. On page 4-36 it states that 'six billion tons of coal reserves are estimated to be located in this region'. Utah Geological and Mineral Survey reports that within Utah, there are 22.5 billion tons of coal reserves in place. Also, the Bureau of Mines Information Circular 8497, dated 1970, and titled 'Coal Production from the Uinta Region, Colorado and Utah' states (p. 3) that 41 billion tons of reserve are present in this region."

Commenter 093

Response. The six billion tons figure was obtained from 1977 Bureau of Mines data (see references 2 and 3 Section 2.10 of the DES). It should be noted that Utah's coal reserve base is not restricted to the Uinta-Southwestern Utah Coal Region as portions of Utah are included in the Green River-Hams Fork and the San Juan River Coal Region. As such, the six billion ton figure does not reflect the entire reserve estimate of Utah.

29. **Comment.** "Section 4.9 Uinta-Southwestern Utah Coal Region. A description of the coal resource (types, quantity) should be included and should reflect variability of the resource. Fishing and hunting, plus other recreation-oriented activi-

ties, should be included as significant economic characteristics of this region."

Commenter 093

Response. The FES contains the suggested modifications, except for descriptive information on coal resources. Regional coal resource information is contained in Chapter 2.

30. **Comment.** "The tables showing population and economic characteristics for the respective regions (Tables 4-1 through 4-12) list employment in the various sectors in terms of thousands of employees. This appears to be a typographical error which should be corrected.

"It would be helpful if the drafters provided references for the demographic data in this chapter. Perhaps the most useful data in this chapter are the socioeconomic characteristics, especially employment. Yet, without references, reviewers cannot tell how timely or accurate the data is. It is apparent that some of the data, especially coal mining employment, is not current, at least for the Powder River Coal Region."

Commenter 069

Response. Tables 4-1 through 4-12 have been edited to remove the term "in thousands" from the employment columns. The information for these tables was compiled from the Bureau of Land Management, Denver Service Center's Socioeconomic Data Systems.

31. **Comment.** "Chapter 4. A more complete description of the coal resources by region should be provided and detailed maps of the extent of each region should be included. Figure 1-1 could be repeated here. Coal is the reason for the document, proposed action, and controversy.

"Page 4-1, section 4.1.1. There is a great unbalance in discussion on the "environment" versus "history." The authors should compare their treatment of sections 4.1.1. and 4.1.2. with section 4.3.1.

"Page 4-19, paragraph 3. How was the figure 130,000 tons per acre derived? 120 feet x 1,770 tons/acre foot = 212,400 tons/acre.

"Page 4-29, column 1, paragraph 4. Clinker is also used to describe burned coal in local mining terminology.

"Page 4-36, section 4.9.1. A description of the region's coal and its quality is needed here."

Commenter 041

Response. Where considered appropriate, the FES contains modifications which reflect these concerns.

IMPACT ASSESSMENT METHODOLOGY

1. **Comment.** "Estimates of coal production from the Powder River Basin Region are considerably too high. The high probability placed on the 'medium' level scenario for the preferred program (Table 5-2, page 5-10 of the DES) is overly optimistic. In planning for projected increases in volume of coal transportation, Burlington Northern conducts a comprehensive research effort to predict future coal traffic from the Powder River Basin. The basis for this planning effort is primarily utility demand as expressed by present and future customers beginning with rate quotation requests by utilities exploring the use of Powder River Basin coal. We also look closely at the plans of the mines we serve and the contracts in effect between mines and their customers. Such analysis convincingly leads to projections more in the range of the 'low' scenarios mentioned in the DES rather than the 'medium' level which is favored in the DES.

"For example, our internal analysis predicts that total Powder River Basin coal production in 1985 will not exceed 175 million tons. This production may be as low as 133 million tons if full-control scrubbing requirements are promulgated by the Environmental Protection Agency. By contrast, the subject DES assumes a total of 205 million tons for the same territory in 1986 (Table 2-5, page 5-10).

"Our projections are further substantiated by the most recent demand forecast (August 1978) issued by the National Electric Reliability Council (attached as Table BN-1). This forecast indicates a total demand from all Western Regions of 290 million tons in 1985. In view of these forecasts, the "medium" projections used in this subject DES are highly illogical.

"A further illustration of wide discrepancies and over-estimations occur in the supply-demand flows shown in Figures 5-4 and 5-5 (pages 5-107 and 5-108, respectively). These charts depict expected coal flows in 1985 and 1990. Figure 5-4 shows a total of 131 million tons in 1985 from the Powder River Basin. Figure 5-5 indicates production of 329 million tons in 1990. No evidence supports this tremendous 250% spurt in demand in

a five year period. The coal volume predictions used in this DES do not appear to give sufficient weight to a number of factors which affect the competitiveness of this region's coal vis-a-vis other fuels as well as coal from other regions in the U.S. There are a number of developments currently in the offing which are now significantly tipping the competitive balance away from Powder River coal as may well reduce drastically even the 'low' scenario."

Commenter 067

Response. Comment a: The levels of production selected are based upon those projected by DOE. The rationale for the levels is to bracket anticipated coal production so that planning decisions can be made. Before selecting regional leasing targets, the Department would consider all evidence brought forward on future levels of production needs, including material such as that offered in this comment.

Comment b: The production estimates incorporated in the Environmental Statement are based upon DOE projections, but are somewhat modified. These modifications reflect the many uncertainties concerning future levels of coal production and energy substitutes, such as imported oil. The estimates of high, medium and low coal production will bracket the realistic range of production possibilities and accordingly, of environmental impacts accompanying such production. While it is possible that the high production level for the Powder River Coal Region is unattainable, inclusion of such a production scenario as the upper end of a range of production levels insures that the Environmental Statement considers *all* potential production levels. Additional National Coal Models incorporating major technical corrections re-confirm the levels of demand used for the EIS.

2. **Comment.** "Tables 5-2 and 5-3 present yet another startling insight into the ES's analysis. Chapter 2 gives the impression that if federal leasing is not undertaken soon production will fall substantially short of the 1990 "needs" - "Achievement of medium and high 1990 production levels would require extensive development of new courses of western coal production ... New federal leasing would make a major contribution in achieving such development." (p. 2-47). This statement is flatly contradicted by the information in Chapter 5, which shows that even with no new

leasing, national production will be sufficient to meet the goals of the preferred alternative medium scenario for 1990! The primary difference between the no new leasing alternative and the preferred alternative for 1990 is that coal production would be more evenly distributed around the nation. 100 million fewer tons would come out of the Powder River region which would be hit incredibly hard under the 'no new leasing' alternative anyway, its production rising from 37 million tons in '76 to 305 million tons in '90. But this would result in no national shortfall even if the 1990 'need' was 1.5 billion tons, which seems impossibly high.

"Having thus failed to demonstrate an actual need for coal leasing, the Department next tries to justify the institution of a leasing program by using other extreme arguments which have no relationship whatsoever to the amount of coal already under lease. These arguments are that leasing will

- 1) promote more desirable patterns of coal development;
- 2) increase competition in the coal industry; and

- 3) be necessary anyway to process PRLAs.

"These all attempt to establish reasons for leasing, rather than speaking to the need for leasing. There is a big difference between the two, and absent convincing proof of need, these arguments amount to little more than rationalizations and excuses for what Interior really wants to do - lease. Rationalizations, even if they are somewhat persuasive (which these are not), are an inadequate and inappropriate basis on which to make major public policy decisions. The West must not and will not be subjected to the impacts of a federal leasing program on the basis of DOI rationalizations."

Commenter 060

Response: The Secretary will determine the form of the program and the need for leasing based on the analysis presented in this document. The Department believes there are reasons for putting a coal management program in place other than for new leasing purely to meet near-term leasing needs in any particular region. Also, the Secretary does not consider forcing consumers to pay greatly increased energy bills, as would be the case under the no-new-leasing option in 1990, is in the national interest. That is the need for coal should

be met under relatively the same level of economic impact on the economy. In addition, while the Department is examining "need" for leasing in response to then Secretary Morton's 1973 order. The Mineral Leasing Act does not require any absolute quantitative showing before a lease can be issued. The program is structured to be sensitive to possible adverse effects from coal development while still meeting energy need.

3. Comment. "For example, the Draft ES takes as a given - as an unchallenged assumption of the entire study - that there are no physical, economic, legal, or environmental constraints on the production of coal. Amazingly, the ES assumes that there are no significant multiple use conflicts between coal development and other resources:

"Development of other resources in the Federal coal regions will not significantly interfere with coal development under the Federal coal management program.

"This assumption is obviously fallacious. There are very serious environmental and other constraints on coal development."

Commenter 158

Response. The commenter is incorrect in making the assertion that the Draft ES assumes no physical, economic, legal or environmental constraints on coal production. Production potential from existing leases and from preference right lease applications has been assessed in terms of economic and environmental constraints. They are also the bases for the analyses in Chapter 5.

Concerning the statement that no significant conflicts will occur between multiple resource use, it is implicit that, since this is a programmatic statement, the reference is made on a region-wide basis. Identification of site-specific resource use conflicts must be deferred to individual mine plans and specific lease environmental studies. However, the entire preferred program structure is aimed at identifying and resolving multiple use resource conflicts.

4. Comment. "The assumptions used in the analysis (5.1.2) are not realistic. The Department has assumed there will be no delays specifically related to compliance and implementation of current best practicable pollution control technology related to air and water pollutants. The assumption is invalid since the terms used, BPT

and BACT, as used in the statement, have not been adequately defined."

Commenter 069

Response. 1) The assumptions in Section 5.1.2.2 did not address delays related to compliance. Whether or not these delays will be significant cannot yet be assessed.

2) Current best practicable control technology is assumed to be the technology which currently can be applied to minimize air pollution and at the same time meet existing air pollution regulations.

3) Current best available control technology is assumed to be the technology which can be applied by 1985 to minimize water pollution and at the same time meet existing water pollution regulations.

4) The terms such as BATEA (best achievable technology economically available) and BCT (best control technology) are defined in the 1977 Federal Water Pollution Control Act Amendments.

5. **Comment.** "Section 5.1.2 discusses the assumptions made by the Department for analyzing future regional impact of the proposed federal coal leasing program.

"One of these assumptions expects that the production goals established by the Department of Energy will be met. However, in several instances early in the Statement the Department of the Interior indicated that it would not expect to meet these goals by its preferred alternative. Therefore, it would appear that the assumptions determining the environmental impact of the coal leasing program are deliberately based upon the 'worst case' situation. Although typical of environmental analyses, such a situation is not at all appropriate here since the Department has made it clear that the worst case is not preferred and that the preferred alternative will probably be selected with rather insignificant changes if any program is initiated by the Secretary.

"Another one of these assumptions is that no significant delays will be experienced by operating companies in obtaining any and all of the myriad authorizations from federal, state and local agencies. The industry would like nothing more than to be able to believe this, but based upon past experience and the incredibly complex procedures of the proposed federal coal leasing program, it ought to be apparent that such an assumption is

unrealistic. Furthermore, it is dangerous because it permits the Department to avoid focusing attention on the many instances in which delays could be decreased by assuming that such delays will not occur or will not create a problem.

"The Department is in general to be commended for the wide range of alternatives discussed in this Chapter based upon innumerable assumptions and recognition of the limitations of quantifying all impacts. This is a basically realistic approach which should tend to support the legal defensibility of the Statement. It must again be noted, however, that far too much attention is paid to developing what are admittedly unrealistic 'worst case' projections for environmental impacts. Although such projections may now have become common to environmental analyses, it is important in any environmental statement and in particular in one of such far-reaching implications as this statement, that the Department repeat emphatically with each presentation of 'worst case' data or environmental impacts that these extremes are very unlikely to occur and are presented only for the sake of bracketing and putting some kind of limit on what would otherwise be a hopelessly vague and unquantifiable analysis of environmental impacts. The Department has done this in several cases in Chapter 5. It can only be emphasized that in the final impact statement the Department should avoid any opportunity to give those who would be opposed to renewed federal leasing the ability to quote statements which would appear to insure that the impacts will be incredibly extreme. Such quotes are commonly used in public hearings and discussions with news media in an attempt to scare local officials and local citizens into believing that any coal development in their area will have devastating consequences."

Commenter 066 and 281

Response. The lease to meet DOE production goals was one of the seven major alternatives analyzed in this EIS. Other alternatives assumed higher and lower values for leasing levels. The Department has analyzed a range of cases, not just "worst case". The residuals analyses was based on typical levels of impact. The assumptions commented upon were made in order that the impacts of the Federal coal management program, required to be addressed in this environmental statement, could be analyzed. It would be impossible to perform the required analysis if these assumptions

were not made. If delays occur, they would tend to restrain production below anticipated levels. Thus, the impacts forecasted here would not occur for months or years later than the dates specified in the EIS.

6. Comment "(Page-22) Table 5-9 should be revised to show which are from Packer and which are from Leathers. Any references to cropland on the table attributed to Packer should be excluded (unless they are footnoted "North Dakota only")."

Commenter 091

Response Packer considers rehabilitation response units in Wyoming, and Montana as well as North Dakota. The data presented in Table 5-9 represent the relative nature of reclamation potential and better estimates of either time to achieve or potential to achieve will be available only when specific sites are considered.

7. Comment "(Page 5-10) Series of tables beginning with Table 5-2. Projections labeled low, medium, and high show "high" for Texas to be less than "medium". An explanation of this is not readily apparent."

Commenter 091

Response The high production level presented in Table 5-2 refers principally to production levels in the six western coal producing regions. The explanation for the Texas "high production" being lower than the "medium production" level is quite simple. Under the high production scenario, the level of Powder River Coal Region coal production flowing to Texas is substantially higher than at the medium production level. Accordingly, it is projected that the demand for Texas lignite will be reduced by 15.4 million tons in 1985 under the "no new leasing" alternative.

8. Comment "Given the prognosis of some 1 to 1.1 billion tons per year of coal to be consumed in this country by 1985 and higher amounts in 1990, some estimate of the fly-ash residual should be made. Assuming an ash content between 10-30% of the mined coal, we are talking about disposing of some 100-300 million tons per year. Disposal problems will differ regionally, but on a national level, such a magnitude of often toxic solid waste could pose severe localized groundwater problems. In the Eastern coal regions, greater leaching rates and acidic conditions could result in significant groundwater problems. We

have already alluded to the problem this could pose in the Colorado River system. Some discussion of potential mitigation measures to lessen this impact needs to be considered."

Commenter 281

Response. The loading factors associated with solid waste generation from all the phases of the coal fuel cycle are discussed on pages H-45, H-46, H-47, H-48 and H-49. Also the Tables H-37 through H-89 summarize these loading factors on a regional basis.

As for the ash content of coals, Table H-31 presents coal ash content on a regional basis. One of the impacts of solid waste disposal is land requirements. This aspect is discussed in the document (see pages H-45, H-56 through H-108).

As for the toxicity of fly ash and the mitigation measures associated with its disposal, it is our judgement that the Regional Environmental Statements are better suited to address this issue, and the disposal of solid waste will meet applicable local, state, regional, and Federal regulations.

9. Comment "Little or no analysis of noise impacts has been made. EPA could agree that at this level of national analysis, noise impacts cannot be meaningfully evaluated since they are very site-specific. We do expect that the Regional EI's will evaluate noise problems on specific communities and in certain sensitive areas. The Colorado State BLM, for example, has been working with the Region VIII EPA office to define background levels in "quiet" rural areas as well as assessing how various coal developments will affect these levels and more typical urban noise level criteria. This information will be used in the West-Central Colorado Regional Final EIS."

Commenter 281

Response. The commenter is correct in identifying the relatively low value of noise analyses at the national programmatic level. The Department does anticipate that noise impact analysis will be incorporated in the various Regional EI's and treated at length in the site-specific studies preceding any actual coal production.

In the site-specific studies, in-depth consideration of transportation noise impacts, especially rail and truck, will be expected. Also, potential increases in background noise levels in the "quiet" rural areas noted in the comment will be evaluated

vis-a-vis increased levels of activities throughout the coal development cycle.

10. Comment. "C. A further assumption of the ES is that 'Labor, equipment, and capital shortages will not significantly distort the projected levels or timing of the Federal coal management program.' (p. 5-3). In other words, none of these factors will inhibit the doubling of coal production by 1985, which is President Carter's stated goal and one of the goals of the preferred alternative.

"Common sense, the industry, and the General Accounting Office all disagree with this blithe assumption. For example, on June 9, 1977, the *Wall Street Journal* ran a front-page story entitled 'Increasing Use of Coal as President Proposes Faces Myriad Problems; Among Them: Mine Capital, Pollution, Transportation, and Industry's Resistance.' The article began: 'At first, President Carter's plan to increase coal use significantly by 1985 seemed difficult. On closer scrutiny, it looks almost impossible.' Once again, it is typical that everyone recognizes real-world constraints on the demand and supply of coal except the Department."

Commenters 060 and 200

Response. The assumption is made so that the analysis of impacts due solely to the Federal coal management program can be made. The environmental statement is required to analyze these impacts; speculation on the effects of shortages of labor, equipment and capital would delay implementation of the program, but not its impacts. The assumption that these shortages will not arise is at least as reasonable as assumption that they will.

11. Comment. "Since coal transportation costs are one of the variables included in the DOE model, it is instructive to see how the model's assumptions correspond to the real situation in the industry. First of all, we see that the mid-range figures are based on 1977 ICC rates escalated at an inflation of 5.5%. One does not need to be an economist to know that our present inflation rates are significantly higher, and that by 1990 the difference between the two could have an appreciable effect on coal movement which, of course, is not reflected in the DOE model as presently iterated. Furthermore, those 1977 rates are, according to the railroad industry, grossly inadequate to finance the capital expansion which they

need. In early 1978, for example, Burlington Northern and Southern Pacific applied to the ICC for permission to raise their coal haulage rates 52% on the Wyoming to San Antonio run. They argued that they needed the rate increase to be able to raise capital, but opponents said that such a boost would have a serious effect on efforts to increase coal production because it would wipe out the competitive advantage of coal relative to other fuels. *Wall Street Journal*, May 16, 1978, p. 17. The ES nowhere analyzes this argument, probably because it uses even older rates. The DOE model should be recalibrated accordingly. Of course, even this will not solve the more basic problem that the model and the ES's analysis of need in general have not dealt with the issue of equipment shortages and timing problems of building enough cars, locomotives, and additional lines to increase coal haulage by some 800% by 1990."

Commenter 060

Response. In the example cited above, the Interstate Commerce Commission authorized coal haulage rates to San Antonio approximately 50 percent higher than the rates informally discussed (but not requested) among the railroads and the utility. It is agreed that the DOE model should be modified to more accurately reflect future rail rates. If not, the Department of the Interior would take them into account during regional target setting in the future. However, such an adjustment at this time would be most difficult since there is no established rate structure for the movement of western coal. The establishment of such a rate structure is the subject of an on-going Interstate Commerce Commission investigation entitled Ex Parte No. 274. As part of its analysis, the Commission will address the relationship of rail freight rates on the demand, location, and timing of western coal, development. Changes in factors such as these will, under the preferred program, be taken into consideration in 2-year intervals.

12. Comment. "Para. 5.1.2.1. This paragraph should acknowledge that other resource developments (e.g., uranium in northwest New Mexico) will make an increased base load energy demand by 1985 of more than 300 megawatts."

Commenters 019 and 135

Response. Although this fact may be valid, it may or may not have been an assumption used in the impact analysis. The level of demand used in

the DOE energy model does take some account of specific coal users, but relies mostly on statistical forecasting techniques and modeling. The FES also assumes that the development of other resources in the Federal coal regions will not significantly interfere with coal development under the Federal coal management program. The FES did not investigate future individual, specific power plant sites. The FES did not investigate

13. Comment. "The Statement's assessment of the water impacts of the preferred program is inadequate due to the use of incorrect assumptions in some cases and to the failure to explain assumptions in others. Because the presentation of the Department's analysis of the program is overly general in a number of respects, it is difficult to determine whether the assessment of impacts is complete."

"(1) For example, the estimates of future water consumption are not broken down into uses, making it impossible to compare water usage associated with coal development to water usage for other activities. There is also no description of the assumptions that were used in estimating future water requirements (for example, the annual amount of water used by a standard-size coal gasification plant).

"Some of the data indicate extraordinary assumptions: for example consumptive water use decreases in the Denver-Raton Coal Region between 1976 and 1985, and in the Powder River Coal Region between 1985 and 1990. (Tables E-6 and E-11) Present trends in both of these regions indicate growing water demand. (2) Another inadequacy of the analysis is that estimates of available water in each region are taken from streamflow data of major rivers at the downstream end of each region. (p. 5-57) Using these data as estimates of water availability ignores the problem of water distribution within the region. Examination of this problem in the statement is totally inadequate."

Commenter 089

Response. 1. The estimates presented in Tables E-6 and E-11 were derived from Water Resource Council data. The decreases in consumptions cited for the two regions (2.2 percent and 6.6 percent) are gross projections which must be refined in the regional case sale environmental statements.

2. It is agreed that estimates of available water in each region could be more accurate. However in this programmatic environmental impact statement will be followed by regional lease sale environmental impact statements wherein more accurate water availability estimates will be presented. The data presented was deemed adequate enough to satisfy the needs of this statement.

14. Comment. "Page 5-7: "In the Coal Impact Estimation Program no mechanism for determining or mitigating impacts to water quantity is included. Since the reduction of water quantity in the aquifers of the San Juan River Region is a certainty given the development planned for the area, this issue should be addressed in any estimation of coal impacts."

Commenter 057

Response. The CIEP is a methodological approach used to quantify and estimate environmental impacts associated with specific program alternatives. Mitigation of such impacts is not a part of the CIEP. Impact mitigation is addressed in Chapter 6 of the draft programmatic environmental statement. In that chapter, mitigation measures are considered on a generic basis. Specific mitigation measures for impacts within a region should properly be addressed in the appropriate *regional* environmental statement.

15. Comment. "The principal component of chapter five's environmental assessment is the determination of environmental residuals which result from various coal production levels and patterns identified by the Department in Table 5-2 and Appendix H. These production projections are somehow derived from Department of Energy projections. The process for converting from DOE to DOI projections is entirely conjectural. Appendix H could not explain the basis of the conversion, and Departmental personnel were hard pressed to explain it in public meetings. One of the reasons for the adjustments is well justified—the inaccuracy of the DOE projections as described in these comments, *supra*. However, the adjustments do not reflect what we believe are rational attempts to correct DOE's errors. For example, Powder River production projections are untouched by DOI's adjustments, except for the 1985 High Powder River estimate, which is actually 70 million tons *higher* than DOE's estimate!"

"Further comparing Tables 5-2 (DOE projections) and 2-29 (DOE estimates), we find that Interior's estimates for 1985 production exceed DOE's forecasts in five regions and throughout the West by 145 million tons, (high level). In 1990, the DOI medium and high estimates each exceed DOE's in three regions and throughout the West by 94 million tons for the high level. When asked about these inconsistencies at the Denver, Colorado DES hearing, Departmental personnel indicated that the Coal Management Office had arbitrarily adjusted some of the projections in order to observe what would happen to the environmental impacts. Based on this explanation, we believe that the projections do *not* actually indicate the regional productions which could be expected under the preferred alternative, or for that matter, any other program. Hence, the environmental loadings which result from application of the Coal Impact Estimation Program (CIEP) to these production projections do not represent the environmental impacts of the preferred program. Prior to analysis of the preferred alternative, the Department must more clearly explain the process for disaggregation and conversion beyond the description provided in H.2.2 to allow a more accurate picture of the actual regional production targets and thus the impacts resulting therefrom."

Commenter 097

Response. The production estimates incorporated in the Environmental Statement are based upon DOE projections, but are somewhat modified. These modifications reflect the many uncertainties concerning future levels of coal production and energy substitutes, such as imported oil. The estimates of high, medium and low coal production will bracket the realistic range of production possibilities and accordingly, of environmental impacts accompanying such production. While it is possible that the high production level for the Powder River Coal Region is unattainable, inclusion of such a production scenario as the upper end of a range of production levels insures that the Environmental Statement considers *all* potential production levels.

16. **Comment.** "Socioeconomic impacts are relegated to insignificance by the environmental residual methodology of the DES. By their very nature, these impacts are local but extreme. The DES prefers to ignore the isolation of extreme

impacts to very local populations, preferring to sum population and employment impacts over vast tracts of land which have no relevance to the evaluation of social impacts. For example, the Powder River region includes thirteen countries, but residents indicate that most development has concentrated and can be expected to concentrate in the future on Campbell county. The Denver-Raton Mesa region includes the Denver metropolitan area, yet most of the industry interest is in the Raton Mesa area in relatively underpopulated southern Colorado, certainly outside of the major portion of the 1.9 million population attributed to the coal producing region. In each case, comparing coal related population increases to a 1975 baseline which includes the entire region makes absolutely no analytic sense. Any population impacts should be compared to baseline population in the locally affected communities, individually. A programmatic statement may not be able to evaluate each and every community, but could certainly indicate likely impacts in the more important communities in the affected regions."

Commenter 097

Response. The nature of a programmatic statement necessitates comparisons on a very broad basis particularly when such vast regions are under analysis. It has been stated in the document that such a general approach should serve only as a first step toward identifying potential areas of adverse impact that vary from region to region. While this has been accomplished by the analysis, it is agreed that individual communities within any one of the regions may be more severely affected. However, analysis of such local impacts are beyond the scope of the programmatic statement and can only be identified in the more site specific analyses that must be initiated as development occurs. The regional lease sale EIS under the preferred program would be mainly aimed at analyzing such problems.

17. **Comment.** "The heavy environmental considerations; primarily sociologic, included in the proposed federal leasing program promote and urge the development of underground coal mining versus surface mining because of less apparent environmental impacts."

Commenter 073

Response. We disagree. The sociologic changes associated with underground mining may

be greater than those associated with surface mining because of the greater number of people needed to produce a given amount of coal from an underground mine vs. a surface mine.

18. **Comment.** "Another equally erroneous assumption is stated openly on page 5-3, 'Development of other resources in the Federal coal regions will not significantly interfere with coal development under the Federal coal management program.'

"The Minerals Division of the Department of Economic Planning and Development (DEPAD) of Wyoming recently published a report on industrial activity which indicated Uranium employment will outstrip coal employment by 1983. (7394 to 6733 workers). In 1977, 2969 people worked in the Uranium industry in Wyoming, and produced 9 million pounds of yellowcake. In 1983, 7394 workers are expected to bring 25 million pounds to market. Interior must understand that Wyoming, (and to a large extent Campbell County), holds approximately 35% of the nation's Uranium reserves.

"The pressures to develop this resource are intense, and in many senses, unrestricted. There is no leasing program for Uranium. Since a good deal of Uranium activity will take place in Campbell and Converse Counties, Interior has an obligation to detail the impacts of that development, and how, in fact, it will interfere with Federal coal leasing.

"NOTE: In 1978, 11 Uranium mines and one mill were in operation in Converse County. In the period 1979-1985, 25 new mines and a new mill are expected in Converse County. In addition, 6 new Uranium mines and 2 mills are expected in Campbell County, and 4 mines are anticipated in Johnson County. (Mineral Development Monitoring System, DEPAD)."

Commenter 118

Response. The assumptions listed in Section 5.1.2.1 were made in order for the analysis to proceed. With regard to the assumption cited, the impacts of uranium development may be important but the quantification of those impacts is beyond the scope of this environmental statement. The summary of impacts for the Powder River Coal Region in Section 5.2.5 emphasizes the concern expressed in the comment. Conflicts between uranium and coal production would be addressed in Federal land use planning EISs.

Generally, they are not expected to cause significant dislocations.

19. **Comment.** "Table 5-12. 1990 figures are the same for the San Juan River Region and for the Uinta-Southwest Utah Region. One or the other is wrong."

Commenters 019 and 135

Response. The data in Table 5-12 of the DES are being checked to eliminate typographical errors and incorporate new data on water consumption in western coal regions.

20. **Comment.** "5-8.2: You should note that in the Uinta-Southwestern Utah Coal Region nesting areas for golden eagles and winter roosting concentration areas for bald eagles would be potentially affected."

Commenter 266

Response. The suggested language has been added to the FES.

21. **Comment.** "5-8.1: Green River-Hams Fork Coal Region: The endangered fishes mentioned are not supported by "the cold, clear waters of the Green River system." These endemic Colorado Basin fishes require the turbid, relatively warm waters of the lower elevations. The conversion of warm turbid waters to clear, cold waters by construction of reservoirs that trap sediment and lower summer temperatures is one of the main reasons for the decline of these species."

Commenters 266 and 093

Response. Concur; humpback chub and Colorado squawfish removed from section. Sentence changed to read "The waters of the Green River ...". Kendall Warm Spring Dace remains based on the inclusion of Kendall Warm Spring in our region as mapped.

22. **Comment.** In Section 5.2.3.3, pages 5-81, the "...cold clear waters of the Green River..." in the Green River-Hams Fork Region are described as supporting the endangered humpback chub, Colorado squawfish and Kendall warmsprings dace. This is totally untrue. The humpback chub and squawfish are restricted to lower quality, turbid waters of the Colorado River System and the dace to Kendall Warm Springs in Wyoming.

Commenter 266

Response. "Cold clear" has been removed from the sentence since Green River includes both

higher altitude "cold" water feeder streams and rivers typical of lower altitude. "Colorado squawfish" and "humpback chub" references have been removed from Green River-Hams Fork Region discussion. However, based on our region as mapped Kendall Warm Springs does fall into the Green River-Hams Fork, Coal Region.

23. Comment. "Water quantity and water quality relationships in the different coal regions should be better identified. In particular, activities in the Colorado River Basin need to focus closely on salinity problems, using data from recognized sources such as the Colorado River Basin Salinity Forum to predict cumulative water quality impacts. The Department will need to closely assess the potentially serious problem of trace metal contamination developing from mining operations in a number of coal producing regions."

Commenter 281

Response. The comment requests that mining activity and salinity problems in the Colorado River Basin be addressed in the draft EIS.

1) Recognizing the seriousness of the problem in the Colorado River Basin a paragraph was incorporated on page 5-44 to point out the issue at this stage. The paragraph reads as follows:

"To minimize the deleterious impacts on the Colorado River of saline drainage waters resulting from operation of mines and coal-using facilities, these facilities should operate in accordance with the policy, adopted by the seven-state Colorado River Basin Salinity Control Forum and the states of the Colorado River Basin, of no-salt returns in industrial discharges, wherever practicable. This policy has been followed by the states and the Environmental Protection Agency in the issuance of National Pollution Discharge Elimination System permits in the Colorado River Basin. Adherence to this policy will minimize the salinity deterioration below Hoover Dam."

2) It is true that trace metal contamination resulting from mining operations poses a serious problem to the environment, however it is not the intent of this programmatic Environmental Statement to go into such details. Regional Environmental Statements may be better suited to address this issue. This issue is discussed qualitatively in the final EIS.

24. Comment. "The potential impact of subsidence on water availability in springs and

seeps, water and mesic micro-habitat sources extremely important to wildlife, is not adequately addressed in Section 5.2.2.6, pages 5-26.

Commenter 266

Response. Any area adjoining an excavation is normally subjected to increased stress as a consequence of the redistribution of load. This may be at the front of, or at the sides or rear of, a working face. Changes, diversions, or pollution of surface or underground water may occur, and pits and cracks may result due to these stresses, resulting in increase of soil moisture in same areas. A change in soil moisture may lead to a change in plant cover which would result in a change in wildlife habitats. These changes are highly site specific and could be beneficial or detrimental to wildlife."

25. Comment. "Under the discussion of geologic impacts from coal extraction, the EIS categorizes impacts on archaeological resources as site-specific. While this is ultimately the case, we wonder whether the proposed BLM-USGS assessment mechanism could not at least identify regional locations where there is a high probability of certain strata containing archaeological fossil remains. Those strata likely to be affected by coal mining enterprises need to be identified early in the process. Eventually limited areas of such strata might be included under unsuitability criteria, if the potential resource is valuable enough."

Commenter 281

Response. While it is true that certain regions are presently known to have a higher probability for containing archaeological remains, this knowledge is more often the result of the intensity of investigations in the particular region rather than a definitive knowledge that the region has more sites (or a greater probability of sites) than another region. Unfortunately, the present level of archaeological knowledge of the various regions does not allow any particular region to be singled out as having a low probability for sites and thus would be a better location for mining than a region with a high probability. The leasehold specific or county specific survey is still a definite requirement.

26. Comment. "Page 5-24, Section 5.2.2.3. Surface mining is not the only phase with geological impacts. Subsidence and reclamation resulting from underground operations should also be discussed here."

Commenter 041

Response. Geological impacts (subsidence) due to underground mining are discussed in Section 5.3.2.3. Reclamation is discussed in Sec. 5.3.2.6.

27. **Comment.** "page 5-25, Section 5.2.2.4. No discussion of depletion should omit the quantity of coal in the United States and the fact that this coal could last on the order of 250 or 500 years."

Commenter 041

Response. Section 5.3.2.4 and Section 7.2 discuss the amounts of coal that would be depleted in the years 1985 and 1990, and Table 2-1 presents demonstrated reserves in the U.S. How long these reserves will last depends on many variables such as technology, future energy sources, health effects, policy, etc.

28. **Comment.** "Page 5-102, table 5-60. What is the royalty rate used in calculation? Were the current Federal royalty rates of 8 percent and 12 1/2 percent used? Was the royalty rate applied to the present price of coal or the expected price in 1985 and 1990?"

Commenter 041

Response. Yes, the Federal Royalty rates of 8 and 12 1/2 percent were used to compute projected royalties shown in Table 5-60 for the years 1985 and 1990. Also these rates were applied to an assumed coal price of \$20 per ton in 1978 dollars.

29. **Comment.** "Page 5-128, Table 5-70. Why is the standard of 1,750 tons/acre foot, which is used only for calculating lignite reserves, applied to surface disturbance of coal lands with higher rank coals? Mining of higher rank coals will disturb fewer acres."

Commenter 091

Response. 1750 tons of coal per acre foot is the widely accepted number for calculating tonnage from seam thickness. On a weighted average basis, this number is representative of most coals. This same number was also used in U.S. Energy, Research and Development Administration, 1977. Draft Environmental Impact Statement — Coal Research, Development and Demonstration Program, Washington, D.C.

30. **Comment.** "Page 5-154, note (a) at bottom. A matter that affects "almost all of Utah land" and favors leasing there should warrant appropriate treatment elsewhere in the EIS.

Commenter 091

Response. The unsuitability criteria as tested represented a draft version of the criteria. Results of the unsuitability criteria field test should be considered as representative of the effect of applying the draft criteria to potential lease areas. Subsequent versions of the criteria will, in all probability, result in substantial revisions to estimate of the land areas affected. Accordingly, the data presented in Table 5-73 should be viewed as preliminary, although representative, data. Additional data will be available by May, 1979, for on-going applications of the revised criteria in selected planning areas.

31. **Comment.** "(Page 5-94) With regard to the DES's discussion of impacts on agriculture, the DES should include a discussion of the alluvial valley floor protection provisions of SMCRA in addition to the prime farmland provisions."

Commenter 091

Response. Section 5.3.4.3 is being revised to reflect the provisions of SMCRA vis-a-vis alluvial valley floor protection.

32. **Comment.** "Archaeological Analysis. Under the discussion of geologic impacts from coal extraction, the EIS categorized impacts on archaeological resources as site-specific. While this is ultimately the case, we wonder whether the proposed BLM-USGS assessment mechanism could not at least identify regional locations where there is a high probability of certain strata containing archaeological fossil remains. Those strata likely to be affected by coal mining enterprises need to be identified early in the process. Eventually limited areas of such strata might even be included under unsuitability criteria, if the potential resource is valuable enough."

Commenter 281

Response. While it is true that certain regions are presently known to have a higher probability for containing archaeological remains, this knowledge is more often the result of the intensity of investigations in the particular region. Unfortunately, the present level of archaeological knowledge of the various regions does not allow any particular region to be singled out as having a low probability for sites and thus would be a better location for mining than a region with a high probability. The leasehold-specific or county-specific survey is still a definite requirement.

RECLAMATION

1. Comment. "Section 5.3.1. discusses land disturbance and reclamation in general terms. Although this section is helpful in finally putting into proper perspective the relatively small amount of disturbance which will be experienced in western coal regions relative to the rest of the country, it does contain some distortions and inconsistencies which should be corrected in the final impact statement."

Commenters 057, 058, 061, 089, 097, 105, 107, 111, 118, 123, 130, 148, 154, 160, 172, 173, 174, 176, 187, 188, and 281

Response. Land disturbance and reclamation are discussed in Section 5.3.2.1. This section is being expanded in the final ES and inconsistencies in the DES will be rectified.

2. Comment. "On page 5-22, a table entitled "Time Required to Reclaim Mined Land" in the West, states, by area, that very precise amounts of time are needed to reclaim to rangeland. For example, it says it takes 9.6 years in the Powder River area and 14.1 years in the San Juan area. Where has this been demonstrated? No areas are given as proof because there aren't any. At best, reclaimability in the West is an open question. This is half heartedly acknowledged on p. 5-23 by the statement that, 'The question of whether or not initially irrigated plant communities on reclaimed areas could maintain native area densities for an indefinite period of time has not been answered.' Yet all the tables of impact comparisons assume reclamation can and will occur."

Commenters 057, 066, 091, 093, 154, 163, 167, 171, and 266

Response. Table 5-24 has been changed to read *estimated* time required to reclaim mined-land. Estimate of years required to reclaim have been rounded up to remove the implied precision while retaining the relative importance. The emphasis should be on the fact that as a whole, reclamation in the San Juan River Coal Region is believed to take longer than in the Powder River Coal Region. The actual time required for reclamation is highly dependent upon site specific information which cannot be determined until actual sites are chosen.

No doubt each of the regions have areas which will take longer or shorter periods of time to reclaim (depending on the goal of reclamation)

and some areas that if disturbed cannot be reclaimed at all. The unsuitability process would screen out these latter areas.

3. Comment. "On page 5-17, at the bottom of the first column, reference is made to estimates of land which would normally not be reclaimed. Curiously, this estimate considers land occupied by buildings and coal conversion and processing plants as lands most likely not to be reclaimed. It should be noted that these lands are fully bonded for reclamation and, in the sense that the salvage of the buildings might pay for the reclamation itself, have as good or better chance of being reclaimed by the appropriate state authority or contractors working with that authority, if necessary, than any other areas. Furthermore, concentrating on such areas as unreclaimable indicated that the Department would expect a larger proportion of surface directly disturbed by underground coal mining to be unreclaimed relative to that expected to be unreclaimed as a result of surface mining. There is no basis for such an assumption particularly since on the same page under 'Reclamation Potential,' the flat statement is made that all mined land will be reclaimed. It would seem that this statement is directly contrary to the assumptions which are basis for the estimates in Table 5-8."

Commenter 066

Response. Estimates of land disturbed and reclaimed have been revised. However the revision numbers still reflect the probability that land committed to hard surfaces, (buildings, etc.) would remain unreclaimed longer than land used for mining coal. Some of the confusion might be caused by the fact that the FES includes building caused by the presence of mining in the area, but not located directly at the mine site.

4. Comment. "Also, this statement does not fairly assess the impacts new Federal coal leasing would create. Socio-economic and air quality impacts are too narrowly defined, but perhaps most disturbing is the section on reclamation. The assumption that prime farmland in the Northern Great Plains can be easily reclaimed after mining to equal or better production is not well documented, and contradicts substantial data to the contrary. In NRPC's seven years of work on the effects of coal development, we have rarely seen such a rosy prediction of reclaimability. The State

of Montana, which has the most stringent reclamation law in the nation, has yet to give its stamp of approval to a single acre of reclaimed land able to support agricultural production."

Commenters 172 and 185

Response. No assumption was made that prime farmland in the Northern Great Plains could be easily reclaimed after mining to equal or better production. To reclaim any area to a given use will take a lot of effort and will require detailed consideration of site-specific characteristics, and careful step by step planning. Prime farmland will not be leased unless it has been demonstrated that it can be reclaimed.

5. Comment. "The statement assumes that prime farmland will be reclaimed in five to fifteen years without providing a documentation of this assumption. The statement fails in some areas to distinguish between acreage mined and acreage disturbed, which is very inconsistent and leads to false conclusions. The statement also fails to assess the impacts of burning all that coal."

Commenters 185 and 172

Response. The reclamation potential of five to 15 years for prime farmland is based on personal communication with S.D. Zellmer (Agronomist, Argonne National Laboratory) and L. Ross (Department of Soil Conservation, Iowa). In addition, Packer, (1974) suggested that in higher response units (areas with best combination of factors influencing successful reclamation) reclamation to agricultural cropland may occur in one to five years.

Acre disturbed have been recalculated based on land allocated to mining and land allocated to other uses (coal banning and conversion). These will give a better basis for comparisons of the effects of coal extraction and those of coal conversion.

6. Comment. "The statement does not consider the long-term effects of unsuccessful or partially successful reclamation efforts. By limiting its scope to the period before 1990, the statement ignores the cumulative effects of long-term mining on Federal coal land. Dependence upon coal during the 1980's will create pressure to continue mining that resource in the future. A comprehensive environmental statement must consider the cumulative effects of unsuccessful reclamation efforts, or at least consider the possible effects of

continual coal mining activities over a time period that is sufficiently long to ensure steady-state conditions (*i.e.*, the amount of land being successfully reclaimed equals the amount of land being disrupted). Because the statement assumes *a priori* that all reclamation will be successful, neither of these alternatives is considered.

Commenter 089

Response. Section 5.3.2 has been upgraded to respond to these concerns. Under the preferred program, the Department would not lease unreclaimable lands.

7. Comment. "Para. 5.2.3.2. This paragraph discusses post-mining habitat losses, but does not address habitat gains which are likely with successful reclamation. Again, a subtle hint that impacts will be greater than they actually will be."

Commenters 019 and 135

Response. The impact assessment of habitat losses is based on a 1985 and 1990 time frame. Reclamation during this time period would be in its initial phases. In the long run, reclamation would most certainly be contributing to wildlife habitat gains.

8. Comment. "The League believes that the use of land should be related to its inherent characteristics and carrying capacities; therefore, we recommend that *reclaimability* of mined land be assigned a high priority in *land-use planning* and that lands that cannot be returned to their previous productivity be immediately screened out of consideration for leasing."

Commenter 171

Response. The Surface Mining Control and Reclamation Act of 1977 establishes strict standards of reclaimability for any coal lands to be mined. Consistent with this Congressional mandate, the Department includes *reclaimability* in its unsuitability criteria. As indicated in the draft statement, each criterion is applied in the initial phases of the land use planning process to eliminate lands from further consideration for leasing. It should be noted that SMCRA requires lands to be returned to their former use, not former level of productivity.

A final test for reclaimability will be applied before approval of the mining and reclamation plan.

9. Comment. "5-23, 1st Column, 5th paragraph: The Uinta-Southwestern Utah Region has areas equally as adverse to Reclamation efforts as those mentioned."

Commenter 266

Response. Concur. The referenced section has been expanded in the FES to better reflect reclamation potential.

10. Comment. "(Page 5-17) With regard to the discussion of reclamation potential, we offer the following comments.

a. Packer (1974) estimated reclamation potential on a scale of +9 to -9 (not +8 to -8). In addition, he addressed only the Northern Great Plains States of Montana, Wyoming, North Dakota, and South Dakota (not Colorado, Utah, Arizona and New Mexico). Therefore, the DES should not imply that his findings hold for the entire West.

b. Packer (1974) believes that the higher rated response units, which occur predominantly in North Dakota, can be rehabilitated successfully in one year to agricultural cropland and in five years to mixed grass range. In medium-rated response units found in moisture areas of southeast Montana and northeast Wyoming successful rehabilitation should be achieved in five to ten years, depending on whether land is to be returned to short-grass, grassshrub steppe, or a mixture of these and ponderosa pine. On the lower-rated response units in the drier portions of northeastern Wyoming and northeastern Montana, from five to fifteen years may be required to successfully return the land to short-grass and/or shrub steppe which was present prior to mining. It should be noted that restoration to cropland is mentioned only for North Dakota, not for the other two States (much less for the entire West). The time required for reclamation increases as areas become drier. One can therefore project that time to achieve reclamation in Arizona and New Mexico will be much in excess of those quoted for the Northern Great Plains.

c. Cook, et al. (*Revegetation Guidelines for Surface Mined Areas*, No. 16, December 1974) states that arid areas underlain by strippable coal have precipitation rates of six to nine inches, together with excessively high evaporation rates. For these reasons, Cook, et al., report that natural revegetation is unpredictable and may occur only

every five to seven years in most desert areas, when favorable conditions provide for germination, emergence, and establishment.

d. Although North Dakota mines are identified as having the highest reclamation potential, Packer (1974) does point out that there are serious problems associated with highly saline (sodic) overburden. Although this problem might presumably be dealt with by covering highly sodic spoils with topsoil, Power, Ries, and Sandoval (*Reclamation of Coal-Mined Land in the Northern Great Plains*, *Journal of Soil and Water Conservation*, March-April 1978, (pp. 69-74) pointed out that sodium in North Dakota mine spoils tends to migrate upward into soil material spread on the surface. The seriousness of this sodium migration problem has only been researched in recent years, and final answers as to how it can best be handled are not yet available.

e. Power, et al. (1978) conclude that the technology does not exist to economically restore the mixed native prairie of the Northern Great Plains in less than 30 to 40 years; however, Power, et al., indicate that introduced vegetative species can be established. Reclamation procedures required by Western States seem adequate for initial restoration of plant growth potentials, but long-term stability of the landscape and perennial vegetation is unknown.

f. Barth (*Reclamation Practices in the Northern Great Plains Coal Province*, *Mining Congress Journal*, 1977, Vol. 63, No. 5, pp. 60-64) studies revegetation success on seven mines in the Powder River and Fort Union Regions. He found that although a wide variety of species were planted, few of these species were found in revegetated areas. Species that failed to establish themselves were generally native grasses.

"In summary, with respect to the potential for revegetation in the West, there are reclamation management problems relating to salinity and aridity which are still unresolved by those charged with reclamation of Western coal mined lands. In addition, the long-term prospects of existing revegetated areas (only a few years old in most cases) are still in doubt. The DES should be revised to reflect this conclusion."

Commenter 091
Response.

The text has been changed to reflect Packer's scale of +9 to -9.

There are many remaining problems with successful reclamation as indicated by this thoughtful comment and the volume of current research. Each site potentially mined would require detailed information on existing conditions prior to any mining to give a data base for reclamation planning. Conditions would be expected to vary between sites and in different sections of a site. Each potential problem area could require a unique approach if reclamation is to be successful. Realistic land use goals are a must throughout the premining, mining, and reclamation planning process.

11. Comment. "(Page 5-82) Chapter 5 should somewhere address the availability of the mining equipment necessary to achieve the production estimates."

Commenter 091

Response.

The commenter is correct in identifying the need for additional mining equipment and the necessary lead times required as a potential obstacle to the attainment of production goals. It is true that a leasing program (whatever its form) will influence the demand for mining and related coal extraction equipment. The programmatic shows that the effect of differing levels of Federal leasing would largely be to shift the capital available for coal operations to different regions of the country. However, the programmatic nature of this environmental statement precludes estimation of specific equipment requirements. The appropriate forum to address this issue is in the regional environmental statements, where precise information about anticipated production facilities can be utilized by industry to generate precise estimates of equipment needs.

ENVIRONMENTAL ANALYSIS

1. Comment. "As is the case with the strip-mining or deep-mining of coal, the environmental impacts—the degradation of air quality, disruption of hydrologic systems, and the disturbance of agricultural land and wildlife habitat—are likely to be site-specific, rather than generalized. The Draft Environmental Statement should reflect this fact, rather than aggregating impacts and giving the appearance that they will occur generally over a broad geographic region."

Commenters 123 and 160

Response. The FES, as well as the DES, is restricted to generalized impact analyses due to its programmatic nature. Site-specific impacts cannot be analyzed at this time because the specific tracts involved have not been delineated. Tract delineation and site-specific environmental analyses would be the subject of future regional and site-specific environmental assessments if a program is adopted which necessitates leasing.

2. Comment. "The cumulative impacts of letting new leases and of their subsequent development must be evaluated. Likewise, the cumulative impacts of mining old leases should also be evaluated. Previous plans have understated or ignored this problem."

Commenter 176

Response. The precise cumulative impacts of all lease management actions will be the subject of future intraregional environmental statements subsequent to any tract delineation identification. This statement estimates what they might be based on generalized relationships between mining activities and impacts.

3. Comment. "The primary, and I think most serious problem with the Draft Environmental Statement, is that it totally ignores the issue of cumulative impacts which I know face the San Juan River Coal Region and which I presume may be present in other coal areas as well. As you should be well aware, no development takes place in a vacuum. When an area faces extensive coal development on the one hand and extensive uranium development on the other, as the San Juan River does, any discussion of the impacts of one type of development is virtually useless without a thorough consideration of the other type. Treatment of topics such as water impacts, socio-economic impacts or air quality impacts are fatally flawed without analysis of the cumulative impacts of all development planned for one area. I will discuss further the need for investigating and addressing cumulative impacts in the specific comments I will make later."

Commenter 057

Response. Non-coal related developments are not addressed in the FES because their impacts would occur regardless of any decision on a Federal coal management program. While a regional study of all future development scenarios might be useful, the coal program review and

analysis is not the proper instrument for such a study.

4. Comment. "There are other potential problems resulting from the adoption of either the preferred program or some of the other alternatives discussed in the DES, which also should be analyzed. The management of Federal coal resources is important to the overall national energy picture. Therefore, the results of any program adopted should be considered with respect to their effect on the domestic economy, the national defense, U.S. foreign policy, and the value of the dollar as well as on various economies around the world. If the effect of the coal program adopted by the government is inflationary or appears to place more importance on values such as esthetics, recreation or wildlife protection than on energy production, consideration should be given to the perception of other nations with respect to the resolve of the United States to carry out the objectives of the President's energy program."

Commenter 087

Response. The preferred program is primarily a domestic concern to the United States since it is essentially a means of reducing reliance on foreign energy. The macroeconomic effects of any programmatic option which increases the domestic coal production would have a positive effect on the domestic economy, national defense, U.S. foreign policy, and the value of the dollar. The precise effect, however, is speculative and subject to change. Though the affects of coal on the future of the world's economy and environment might prove significant, it is necessary to put some outer bounds on the scope of key analysis. The Secretary has decided that a regulatory analysis is not needed for the entire preferred program, but has requested enhanced economic analysis of unsuitability criteria and of the maximum economic recovery definition after notices.

5. Comment. "We also feel that the DES fails to provide an analysis of the effect of the semi-nationalization of the coal industry which would effectively be the result of the preferred program and its system of leasing in response to government determinations of supply and demand."

Commenter 087

Response. The DES, as well as the FES, does analyze the effects of the preferred program and its alternatives. The Department, however, does not

consider the Federal Coal Management Program to be equivalent to the "semi-nationalization of the coal industry." Rather, the program is intended to regulate coal development, which ultimately must be conducted by coal industries, in an environmentally sound manner consistent with national needs and the public interests.

6. Comment. "If the estimates of 0.2 to 2 percent coal dust loss from unit trains on p. 5-53 are based on the Weigert and Jensen report they should be researched again as these estimates are not based on research. More than one source of information should be used. These emissions do not accurately reflect emissions from dry western coals. The relationship between power plant emissions and coal leasing policy, if there is one, is unclear. Additionally, the impacts of gaseous emissions are not defined anywhere, nor are gaseous emissions from mines or power plants related to air quality standards. Probability of violation of standards should be addressed as well. Finally, there is no discussion of impacts from nitrogen oxide fumigations due to overburden and coal blasting."

Commenter 071

Response. Weigart and Jansen was not used as a source. In *Railway Age*, "Crusting Agent Minimized Loss of Coal in Transit," September 9, 1974, it was reported that a 70-ton coal car may lose up to 1.5 tons of coal in a trip from West Virginia to northern Indiana.

7. Comment. "Trace elements have impacts other than those associated with health (e.g. to livestock, crops, wildlife and vegetation) which should be discussed. How do trace element impacts, on coal dust, power plant emissions, and overburden vary from region to region and thus, how do they relate to the leasing policy?"

Commenter 071

Response. Trace elements that are harmful to man and his environment are found in coal. Concentrations of these elements may increase during production and consumption in various waste streams; for example, in the coal feed ash, water effluent, coal refuse, and stack gas. It is beyond the scope of this statement to estimate trace element impacts on a programmatic basis. This analysis is more appropriately performed in the regional coal lease sale environmental statement.

8. Comment. "Why are emission control standards for power plants addressed, and emission control for coal mines and coal transport not addressed? Certainly the latter would be of greater importance in defining a leasing policy. If not, why not? "The analysis of nonattainment areas is irrelevant. Where are the nonattainment areas, and how do they relate to coal mining and to coal leasing policies? Will emissions controls at coal mines be sufficient within the various regions to prevent allowable PSD increments from being violated?"

Commenter 071

Response. Relating gaseous emissions to air quality standards requires the application of diffusion models to translate emissions in the form of quantities of pollutants per unit of time (e.g., tons per year, pounds per day) into concentrations of pollutants expressed as micrograms per cubic meter. Such models require site-specific data such as local climatological characteristics, terrain features, and the size and operational conditions of the pollutant source. Because of this site-specific data requirement, a programmatic statement can only discuss such factors as air quality (i.e., pollutant emissions) and nonattainment areas generically. Air quality impacts and the relationship between a particular action and any nonattainment areas are detailed for specific actions in such documents as the environmental statements issued for each mining and reclamation plan. Emission control standards were presented for power plants because such performance standards exist; however, standards have not been promulgated for coal mining or coal transport except that a particular type of equipment may be included in a particular source performance category.

9. Comment. "There is no analysis of the variable geographic impacts which would occur as a result of the leasing program summarized in the EIS."

Commenter 197

Response. Chapter 5 (Section 5.2) has been revised so that the FES contains a region-by-region impact analysis summary.

10. Comment. "In Chapter 5 of the DEIS, there is not sufficient discussion of the impacts of a Federal coal leasing program, such as the no leasing alternative, which would result in the increase of the development of non-Federal coal

sources. The impacts from increased non-Federal coal development should be discussed in the FEIS."

Commenter 090

Response. Impacts due to non-Federal coal development are incorporated in the no new leasing alternative.

11. Comment. "There is little discussion of the broad impacts of a decision to delay leasing. What could be accomplished if the time were available to assess the impact of the Coal Leasing Act Amendments, the National Energy Plan, the New Source Performance Standards, the newest oil price increases, conservation which is taking place simply as a result of energy price increases, and so forth? What are the national human consequences of an oversupply of Western coal? As Mr. Laue pointed out, what are the national human environmental consequences of an undersupply of Western coal? The fact that it would be an undersupply answers no questions."

Commenter 195

Response. Impacts due to non-Federal coal development are incorporated in the no new leasing alternative. Analyses must be conducted on the basis of the situation as it exists at that time; the preferred program, which would include the possibility of no new leasing and would provide for periodic reassessments of the impact of coal leasing on the nation in light of changing situations.

12. Comment. "The environmental analysis sections suffer from fatal flaws:

1. It is written in gibberish. It is dominated by incomprehensible phrases such as "environmental residuals," and sentences such as "Due to the dynamic nature of coal transportation, incorporation of the transportation sector in the analysis required a methodological approach which recognizes the inherent differences between static processes and dynamic flows (p. 5-5)." These examples were selected at random. It is disorganized and pieces of analysis appear in several places. This style of writing occurs when authors do not understand their subjects. As a result, the EIS does not inform; it serves only to confuse the reader. On this count alone, it should be redrafted."

Commenters 154, 069, and 281

Response. The environmental analysis sections in Chapter 5 have been substantially revised for purposes of clarity.

13. **Comment.** "Define the jargon 'environmental residuals' (p. 5-1)."

Commenter 071

Response. The term "residuals" proved to be confusing and so the term has been deleted from this statement.

14. **Comment.** "How is your coal cycle cyclic (p. 5-1)? b. Will money be generated from this "cycle" to support alternative, especially solar, energy developments?"

Commenter 071

Response. a. The coal development cycle is cyclic in the sense that the statement considers impacts associated with all activities from coal extraction through utilization. b. Money generated from coal development cycle operations that accrues to the Federal government under the Federal coal management program becomes part of the general funds that are used to support Federal programs.

15. **Comment.** "The Department of Energy's coal demand projections should be revised to take into account 1) the current slump in the coal market; 2) the glut of Alaskan oil which may be crossing Montana via the Northern Tier Pipeline; and 3) the potential influx of Mexican natural gas."

Commenter 071

Response. As noted in Section 5.3.1.2 of the draft programmatic Environmental Impact Statement, many believe that the national coal model projection under the 1985 medium level demand of 1.1 billion tons (a 64% increase over 1976 production) is overly optimistic, particularly in view of the myriad of uncertainties involved in estimating coal demand, including, such as the factors mentioned in the comment. Nevertheless, it is felt that use of high, medium, and low production projections derived from the NCM output effectively bracket the range of regional coal demand in 1985 and in 1990.

16. **Comment.** "What other goals for reclamation are implied by the statement that "the major thrust would be to return disturbed land to the contour and use specified...?"

Commenter 071

Response. No goals were implied since these may be highly variable depending on individual mining and reclamation plans. The assumption used was that reclamation technology will not change significantly by 1990 and the major thrust would be to return disturbed land to the contour and use specified in the approved reclamation plan.

17. **Comment.** "How would shortages in the transportation network affect your assumption that development of other resources would not interfere with coal development. How have transportation costs been built into your assumptions on where to develop."

Commenter 071

Response. As explained in Section 5.1 and H.2 of the environmental impact statement, coal production and consumption levels were derived in part from the Department of Energy's National Coal Model (NCM). The NCM uses a least economic cost methodology first to estimate the level of regional coal production and second to allocate this production using the most economic transport route. The medium and high production estimates reflect 1977 Interstate Commerce Commission rates, escalated at an assumed inflation rate of 5.5 percent. The low estimates assume a one percent escalation.

18. **Comment.** "What is the meaning of the last sentence in the last assumption concerning compensating regional production adjustments?"

Commenter 071

Response. "Compensating regional adjustments" means that production shortfalls will be made up in other coal regions.

19. **Comment.** "Have reclamation costs been used to determine leasing policy?"

Commenter 071

Response. Reclamation costs are an element of the proposed alternative leasing policies to the extent they influence the ability of mine land to be reclaimed. Relatively low reclamation costs (in terms of both monetary and ecological values) would indicate a greater production success in reclaiming mine land. The converse would also be true.

20. **Comment.** "Basing reclamation potential on Packer's work is very risky, particularly in view of the time required for soil and plant community

development in a semiarid region such as the Powder River Basin (p. 5-17)."

Commenter 071

Response. Section 5.3.2.1 has been expanded to better explain the intent of Packer's work, and to include other research as well. Actual reclamation potential in any of the regions can only be determined after detailed site-specific information has been obtained. The intent at this programmatic level of alternative analysis is to show general trends that could be expected on a regional level. Individual leases, and areas within a leased tract, may vary considerably from the regional characteristics.

21. **Comment.** "Page 5-23 (6th paragraph) How is it possible to determine whether initially irrigated plant communities on reclaimed areas could maintain native area densities for *indefinite* period of time? Sounds like research Hodder might be interested in."

Commenter 071

Response. The sentence has been changed to read, "The question of whether or not initially irrigated plant communities can achieve and maintain densities similar to undisturbed native areas has not been answered."

22. **Comment.** "What are the potential air quality impacts?"

Commenter 071

Response. Air quality is measured in terms of concentrations of a given air pollutant per unit volume, such as grams per cubic centimeter. Since this environmental impact statement is not site-specific, it is impossible to estimate impacts, or air quality, other than in terms of emission rates. Thus, the use of the words "potential air quality impacts" is meant to imply that the measures are not only projections of what could occur, but the more precise method of measuring air quality cannot be used.

23. **Comment.** "Impacts of particulates are inadequately defined and addressed. The only impact defined is the reduction in visibility, but no context is given. How large is the surrounding area (p. 5-51)?"

Commenter 071

Response. Table 5-42 presents estimates of impacts on visibility as a function of particulate concentrations. It is impossible to calculate con-

centrations without site-specific data such as climate, winds, terrain features, emitter characteristics, etc.

24. **Comment.** "In conclusion, it would seem that information has been presented here in a random fashion without definition of impacts, or their magnitude and significance. Are we to conclude mining, particularly strip mining, has no impact on air quality? The data are obviously available; consequently, this section must be rewritten and the original authors sent back to their respective divisions, and replaced by qualified, competent professionals."

Commenter 071

Response. The kinds of detailed studies referred to will be presented in the regional coal lease sale environmental impact statements.

25. **Comment.** "Is the loss of potential productivity here based on acreage disturbed, on reclamation potential, or on postreclamation productivity projections? The impacts vary significantly depending on the definition (p. 5-73). Productivity losses are based on misleading data. It should be pointed out that belowground and aboveground productivity is listed in the tables."

Commenter 071

Response. Potential productivity loss is based on total commitment of land (assuming no reclamation) times an unweighted productivity average (excluding agriculture). As indicated in the text it is useful for comparisons between alternative leasing policies and should not be interpreted as actual losses. These can only be derived when actual sites are known and data specific to those sites is available. In Appendix D, potential productivity values were derived from allotment of acreages to various land use categories times estimates of potential productivity. Again these are expected to vary considerably once actual sites are known.

26. **Comment.** "What, in either the Powder River or Fort Union coal regions, could be defined as a nonsensitive ecosystem? In light of the climatic conditions, and the disastrous results of dryland farming in the 1930's (and the subsequent dustbowl conditions), it is insane to call any of this area 'nonsensitive' (p. 5-75)."

Commenter 071

Response. Concur. The sentence has been deleted. What was implied was that coal development was assumed to occur in common types of vacant land areas and not in known sensitive (e.g., nest areas of raptors) or limited ecosystems.

27. Comment. "In your discussion of impacts to endangered species of the Powder River coal region: where do grizzlies and wolves occur? Neither animal is mentioned in chapter 4. Is all the information presented herein as accurate as this (p. 5-81)?"

Commenter 071

Response. Neither the grizzly nor wolf are known residents of the Powder River Coal Region at present. They were residents in recent past and were included more on historical range than actual presence.

28. Comment. "Through the admission of the DES, 82% of the coal to be produced in the Powder River Basin will come from Wyoming. The figures below emphasize the point further, in that 88% of Wyoming's Powder River Basin Coal lies in one County; Campbell."

"This gross oversimplification renders meaningless the discussion of actual impacts in the Wyoming Powder River Basin. The DES discussed air quality impacts over an area of 31,300 square miles, when, as we have shown, an overwhelming percentage of activity and pollution will result in Campbell County, Wyoming, with an area of 4,800 square miles. The same holds true for population impacts, when the base used is 228,000 people while Campbell County, in the same year, had only 17,000 people. The treatment of impacts to wildlife agriculture, water and many other components of the environment is equally as useless, due to such a large base used for comparison."

Commenter 118

Response. While it is true that Campbell County does contain the vast majority of the Powder River Coal Region reserves, the programmatic nature of this environmental statement precludes the analysis of potential impacts at less than regional levels. It is the role of the regional and site-specific environmental studies to assess the cumulative effects of coal resource development at the county and community level.

29. Comment. "In the third full paragraph on page 5-53, the implication is left that Western coal

uniformly has more radioactive material in it than Eastern coal. We know of no authorities to support this implication, and would suggest that the Department clarify this to indicate that since both Eastern and Western coals vary widely in quality and trace element content, such a statement concerning radioactivity cannot be applied across the board to all Western coal."

Commenter 066

Response. This paragraph has been revised to dispel this implication.

30. Comment. "Although the draft ES for the preferred program mentions their existence four times and supplies a table of air pollution emission factors for 22 of them, trace elements are basically ignored. Their effect on the environment, however, may be as large as any other effect, and may well be more devastating in the long run."

Commenter 097 and 281

Response. It is true that the effect of trace elements on the environment may be serious; however, it is not the intent of this programmatic environmental statement to go into details which require characterization of local coals. Regional Environmental Statements would be better suited to address this issue. The discussion of trace elements in the FES has been reviewed and amplified as appropriate.

31. Comment. "Page 5-50. Any discussion of air quality impacts in the San Juan River Region must include the effect of the cumulative impacts of uranium mining and milling."

Commenter 057

Response. Emissions of air pollutants in the San Juan River Coal Region for the 1976 base case include those due to uranium mining and milling. Emissions of air pollutants for 1985 and 1990 are projected only for the Federal coal management program alternatives. To project emissions for other potential industrial activities in 1985 and 1990 is beyond the scope of this statement.

32. Comment. "The total suspended particulate has been underestimated, when we use the Pedco (sic) figures at two pounds per ton produced. That's an average figure, but it's been taken from most of the Western mines. I get around an average of twenty percent of the total impact was assessed in this statement."

Commenters 146 and 118

Response. The greatest variability in estimating total suspended particulates from mining would come from the fugitive dust portion of the TSP loading. The amounts of fugitive dust vary with the type of mining, the coal regions, and even within coal regions. Because of this, the loading used in the DES may be low for one region (or part of a region) and high for another region. It should be noted that the fugitive dust loadings and the resultant TSP loadings may vary as much as 25-fold per unit of coal produced depending on site-specific characteristics.

33. Comment. "The Statement's discussion of air quality impacts of the preferred program is insufficient. Because the Department assesses air quality impacts within the coal production regions only, the full end use impacts of the program on national air quality are not considered. Since much of the coal will be burned outside the coal production regions, the Department's region by region comparison of total emissions does not provide, as alleged,

A comparison of the emissions associated with the Federal coal management program alternatives against the no new leasing base case. (p. 5-50) We also question the Statement's proposal that a comparison of the total emissions for each alternative is the most meaningful measure of relative air quality impact available. (5-50)"

Commenters 089 and 281

Response Coal production (mine construction, extraction, cleaning, plant construction, and equipment operation) and coal consumption (facilities construction and use in coal - fired power plants, and coal conversion facilities) are the major sources of air pollutants attributable to the Federal coal management program. Tables 5-18 and 5-19 present coal production and coal consumption estimates for 1985 and 1990. These tables show that over 98 percent of the coal produced in the United States is forecast to be produced in the 12 coal regions examined in this statement, and over 75 percent of the coal is forecast to be consumed in the 12 coal regions. It is agreed, therefore, that impacts on national air quality are not considered. However, the method employed of comparing emissions associated with the Federal coal management program alternatives with the no new leasing base case is considered to yield an accurate relative estimate of how national air quality would

be impacted due to the Federal coal management program.

34. Comment. "Since the impact of a specified level of emissions in some regions would exceed the impact of the same level of emissions in others, the proposal is not necessarily correct. For example, the impact of a strip mine or a coal-fired electric generating plant is more likely to have a noticeable impact on air quality within an air basin in the Northern Great Plains or Four Corners Region than would a mine or plant of the same capacity if it were located in the Eastern Interior or Western Interior Region, because of the differences in ambient air quality of these regions."

Commenters 089 and 281

Response. The comment is well-taken. This is the reason why it is impossible to determine the impacts on air quality due to activities performed under the Federal coal management program without being site-specific. The rationale for this limitation is discussed in Section 5.3.2.7.

35. Comment. "The estimates of total land disturbance are subject to challenge. In addition, this method of calculating plant and wildlife loss neglects the fact that certain habitat zones support wildlife from a much larger area. For example, bottomlands cover only four percent of the land surface in the Northern Great Plains, but they provide water and winter forage for wildlife that range over a much larger area. Habitat characteristics vary within each coal region and in some cases the wildlife within different habitats are interdependent, so the loss of one type of habitat could upset the balance in another."

Commenters 089 and 281

Response.

Estimates of land disturbance have been recalculated to include land requirements for coal-related population increases. In addition, estimates of the various land-requiring activities have been separated into those which require land on a yearly basis (e.g., mining) and those which represent total land required by a specific point in time (e.g., land for fixed facilities).

The points on habitat and wildlife interdependence are quite true. However, to give a meaningful analysis of specific effects on a given population or habitat would require site-specific information. At this programmatic level of analysis it had to be assumed that each alternative had an equal

potential for effecting any habitat or population within a region. To analyze each habitat and each population within each region would provide interesting data, but would not give a means of comparing alternatives unless it can be shown that an alternative favors a specific habitat over another.

Loss of habitat in one area and its effects on adjacent area population are covered in the general discussion on Ecological impacts (Section 5.3.3).

36. Comment. "The statement also fails to deal adequately with the ecological impact of increased human population and easier access to previously undisturbed areas in the coal regions. The increased population resulting from coal development would exacerbate impacts due to hunting, fishing, off-road vehicles use, and other human outdoor activities. New roads and rights-of-way for pipelines, transmission lines, and aqueducts could open remote areas by providing a pathway for penetration into the areas, possibly disrupting fragile environments and faunal migration patterns. The most significant effect of increased human activity may be that it could drive certain species out of large areas, reducing their habitat by a much larger area than is represented by the estimates given in the statement."

Commenters 089 and 281

Response.

In the revised estimate of land disturbance, a component has been added to include land requirements for coal related population increases.

Impacts from human activity are included in the general discussion of Ecological impacts (see Section 5.2.3 DES)

37. Comment. "It is stated that degradation of local air quality would occur even though best available emission control technologies are employed (p. 7-2). Why is this chapter assuming best available technology for impact evaluation when in chapter 5 best practicable technology is assumed?"

Commenter 021

Response. Section 5.3.2.7 assumes best available emission control technologies.

38. Comment. "In the second paragraph of page 5-24, the incredible statement is made that the primary surface disturbance associated with un-

derground mining is a lowering of the surface in the area mined (subsidence) to depths which vary from a few feet to 'hundreds of feet.' We believe it would come as a great surprise to anyone in the industry to be made aware of areas in which underground mining has resulted in subsidence of hundreds of feet. Even considering the very thick, shallow deposits in the Powder River Basin which often exceed 100 feet and assuming that somehow that coal might be mined by underground mining techniques not yet developed, it still defies the imagination to determine how such mining would lower the original elevation by hundreds of feet. Such seemingly innocuous statements made in such an offhand manner are just the kind of statements which will be taken out of context by groups opposed to any new coal operations in the West to try to scare those who might otherwise support new leasing into believing that the consequences of that leasing could be devastating. Furthermore, the very next paragraph of the Statement recognizes swell factors and discusses typical lowerings which indicate that the Department, although using swell factors which are lower than those usually experienced, recognizes that the effects of subsidence in changing surface elevations are really not that serious."

Commenter 066

Response. It should be noted that the paragraph referred to is a description of the potential impacts to topography of *surface* mining, not underground mining. Underground mining is only mentioned in the first sentence and then only to indicate the considerable variation between the effects of surface and underground mining. For a discussion of the topographic effects of underground mining the commenter is directed to the section 5.3.2.2.

39. Comment. "*b. The statement's evaluation of the extent to which the preferred program will result in land disturbance is inaccurate.* In estimating land disturbance, the statement claims to use a figure that includes land committed to mining and conversion, although an adequate description of the derivation of this figure is not given. (pp. 5-17 and H-26) Estimation of other quantities of land was considered beyond the scope of the document due to site-specific factors. (p. 5-17) Since '(p)rospective environmental impacts of economic development and population growth stimulated by

the conversion of energy from stripable coal in the West are likely to far exceed the impact of surface mining alone,²⁸ some estimate of the amounts of land which would be disturbed by roads, pipelines, and residential and commercial structures should be made. It is possible to identify a range of estimates within which the probable amount of land needed for these developments would occur, given a specific level of coal-related development. One could then bracket a subset of the range of estimates for each region based on factors such as estimated population increase, average amount of land required for a residence, and a ratio of commercial to residential acreage."

Commenter 089

Response. Land disturbed due to secondary impacts such as roads, pipelines, and powerline construction was included in the analysis. (See Appendix H.)

40. Comment. "The next one is topographical features would be altered by construction and mining activity. Go out here anyplace where they are subdividing and people are moving in to this state, in small amounts, really, there is always some ground changes. Those changes are not bad."

Commenter 139

Response. The FES presents the topographical changes in view of physical changes to the environment. Judgemental assessments such as whether these changes are good or bad are beyond the scope of the FES.

41 Comment. "The subsidence of land could result from underground mining activities. Well, since when hasn't land subsided? Every time it rains out here we get something dropping in somewhere. If you want to talk about subsidence, you had better take a look at the environment itself, nature itself is producing subsidence. There are thousands, if not tens of thousands, of holes in the east part of the State of New Mexico, many of them right on the highway, many of them underneath railroad tracks, have dropped out underneath highways and are really a severe danger just from solution and natural collapse on the part of nature. The amount of subsidence that would take place, if you ever did get to underground mining,

would be very negligible. I think this thing could just be left out of this."

Commenter 139

Response. It is true that subsidence triggered by rainfall and other natural occurrences causes regional topography to be in a constant state of dynamic change. In most cases, subsidence due to underground mining would be comparatively negligible, but in certain cases it is major. The FES addresses underground mining subsidence because it is a relevant environmental impact.

42. Comment. "Para. 5.2.2.3. This paragraph states that 'surface mining operations would produce significantly greater geologic impacts than underground mining.' However, USGS Open File Report 78-473 states that in the Western Powder River Basin, underground mining is more geologically damaging if proper surface mining reclamation procedures are followed. This Draft Programmatic should be consistent with other Department of Interior documents."

Commenters 019 and 135

Response. The above-cited USGS statement is not considered applicable since it is referring to very long-term post-reclamation geological features. During the time frame of this FES, active mining will be on-going and on this basis the statement of the FES is considered valid.

43. Comment. "c. The Statement provides misleading assessment of the preferred program's impact upon topology and soils."

Commenter 089

Response. A description of the exact level of impacts to topography and soils that could occur due to mining activity requires detailed data from each site being mined. As stated in the DES, the amount of such changes would be highly dependent on the characteristics of a particular site. In a programmatic impact statement, the specific sites of coal extraction operations are not known and impacts can only be described on a general basis. Such detailed, site-specific impacts would be included in the impact statements issued in connection with each mining and reclamation plan.

44. Comment. "On page 5-25 at the top of the second column the statement is made that in-

²⁸ National Academy of Sciences, *op. cit.*, p. 107."

creased mining might result in uncontrolled fossil collection. This statement, although really of minor environmental impact, is rather farfetched in that surface mine properties, for a variety of reasons, including the liability of the mine operator for the safety of the surrounding populace, are simply not left open for anyone to run across the property gathering fossils or otherwise having free access to pit areas and other disturbed lands."

Commenter 066

Response. This statement was aimed at the possible impacts associated with conjunctive development and not actual surface mining. It is recognized that such mining activities would limit access to the areas by stringent controls. However, other surface-disturbance activities outside of the lease tract could expose fossiliferous rocks (e.g., cuts for access roads or rail lines). The statement has been revised to indicate its application to conjunctive development activities.

45. Comment. "The first two full paragraphs on page 5-26 discuss briefly potential conflicts between oil and gas development and coal mining. Unfortunately, it would seem to be the attitude of the Department that such potential conflicts will often be resolved by requiring that one resource be developed to the exclusion of the other. Such a decision will rarely prove necessary. In the northern Appalachian Coal Region, there have been hundreds of thousands of wells drilled over the past 100 years, yet that region has been and remains one of the prime coal producing areas in the country. Of course, it cannot be said that such dual development has never resulted in actual conflicts concerning recovery of one mineral or the other. However, the Department of Energy and the Bureau of Mines have developed techniques for mining through abandoned wells even in underground coal mines and there are many alternatives which can accommodate both methods of resource extraction without excluding one or the other in the same tract. This conflict is particularly important in the West, where many of the prime oil and gas producing areas in existence and that can be expected to be discovered will be in areas with important Federal coal reserves. Any program which sets up an 'all-or-nothing' battle between oil and gas interests can only result ultimately in losses of these critical resources to both industries and the Nation as a whole."

Commenter 066

Response. One purpose of the environmental impact statement preparation process is to present all the issues. Resource conflicts may not have been as serious in the past as they may be in the future as we strive to become more energy dependent. As set out in Chapter 3, the Department emphasizes planning to eliminate potential resource conflicts under the preferred coal managing program.

46. Comment. "Specifically, we request the following be added somewhere in Section 5.2.2.6, 'Water Impacts', beginning on page 5-26 of the report: 'To minimize the deleterious impacts on the Colorado River of saline drainage waters resulting from operation of mines and coal-using facilities, these facilities should operate in accordance with the policy, adopted by the seven-state Colorado River Basin Salinity Control Forum and the states of the Colorado River Basin, of no-salt returns in industrial discharges, wherever practicable. This policy has been followed by the states and the Environmental Protection Agency in the issuance of National Pollution Discharge Elimination System permits in the Colorado River Basin. Adherence to this policy will minimize the salinity deterioration below Hoover Dam.'"

Commenter 113

Response. The above paragraph was incorporated in section 5.3.2.6.

47. Comment. "Also, a serious study should be made into the effects of mining coal as an aquifer. Many ranchers in the Powder River Basin of Wyoming rely on the coal seam for stock water, and the mining of this resource will destroy a reliable water supply, in terms of both quantity and quality.

"According to our calculations, between 182-217 acre-feet of water are removed with every million tons of coal (25-30% of Powder River coal being water). By 1990, at 400 million tons per year mined from the Basin, a possible 86,800 acre-feet of water will be literally shipped out of the region. What are the long term effects of this practice?"

Commenter 118

Response. Groundwater is available in Powder River coal mines both from shallow and deep aquifers. For some cases, coal seams are associated with or located above groundwater aquifer systems. In order to mine this coal, it may

be necessary to dewater it (locally). This water can be used as process water and for other uses at the mine site.

Generally, mining of coal may cause change, diversion, or pollution of surface and underground water. However, appropriate mitigation based on Federal, state and local requirements should minimize these problems. These effects would be analyzed in the regional lease sale EISs under the preferred program.

48. Comment. "We are very concerned about the off-hand treatment of water consumption impacts due to renewed Federal coal leasing. The DES indicated that water deficiencies at the 95% low-flow levels should be expected in the Basin. It went on to say that increased coal production would not cause additional deficits in months not presently experiencing shortages, but would exacerbate the existing problems.

"As Interior should know, the water is most required in the West when there is none to be had.

"The worst months, in late summer, are very critical to agriculture in this state. While numbers may not reveal an apparent increased impact, it is obvious to any farmer that coal production will worsen a drought year, and possibly make that consumptive difference which spells disaster."

Commenters 118 and 146

Response. The textual statements in the DES regarding water shortages appear to be accurate and to reflect the projections shown in the Tables. Numbers do indeed reveal an apparent increased impact by showing for specific alternatives that the demands will be higher than under the base case. It is difficult to see how the DES could have been more explicit in pointing out that with or without the coal program, there may be water shortages in the West and that such shortages will be worsened under alternatives that increase consumptive use. It is also true that in the summary of regional impacts in Section 5.3 considerable emphasis is placed on the issue of water availability in the West.

49. Comment. "Tables 5-10, 5-11 and 5-12 show higher water requirements in the Fort Union Region for the low leasing level than for the medium level. This should be reviewed and explained if the figures are correct."

Commenter 204

Response. The apparent discrepancy is attributable to the overall level of development of coal production end use facilities presently envisioned in the medium and low production scenario for 1985. Slightly higher development rates of coal-using facilities are anticipated under the low production scenario, while under the medium production scenario a greater proportion of Ft. Union coal would be transported out of the region.

50. Comment. "The programmatic EIS should recognize that the focus of air-quality impact issues for Federal coal production will lie with the potential conflict between coal mining/processing operations and environmentally sensitive air quality areas. Specifically, EPA is concerned about the leasing of coal in proximity to Class I air quality areas defined under Prevention of Significant Deterioration Regulations. Under these regulations, most of the emissions from coal producing/processing facilities can be adequately controlled with the notable exception of fugitive dust, a major problem in many Western coal producing areas. Visibility reductions over Class I areas are a genuine concern with new leasing. Problems of this kind have already surfaced at the Alton, Utah coal field. In our discussions on Unsuitability Criteria we suggest a possible way of identifying these kinds of air quality impacts prior to leasing."

"Other specific comments are enumerated below and are keyed to page numbers.

"Page 5-53. The section which discusses emission control standards quotes EPA-proposed standards for power plants. It is difficult to understand the connection between power plant regulations and standards which would pertain to 'production facilities using fossil-fuel steam generators.'

"Page 5-56. The reason for the inclusion of Table 5-29 is unclear. The text (page 5-53) mentions only SO_x and TSP, yet Table 5-29 also lists NO_x. Furthermore, comparison of state emission regulations is a very complex subject. We believe that the table is factually incorrect, e.g., New Mexico's TSP regulation, Arizona's and Ohio's SO_x regulations are not more stringent than the proposed power plant NSPS; and the Pennsylvania SO_x regulation does not apply to all areas of the state. References 78 through 83 appear to have been omitted or are misplaced.

"Page 5-57. The purpose of Table 5-30 is obscure. While this material is factually correct, it is not used to develop any point.

"Pages 5-62 through 5-71. We believe that material of this type would be best if summarized (perhaps national totals) in the document with the detailed results placed in an appendix. It would be helpful to have totals on Tables 5-39 through 5-43.

"We are not sure how the Tables 5-34 through 5-43 were generated for nationwide emissions from all coal-related sources for the different alternative coal leasing programs. In particular, we find it difficult to see how there could be variations in SO₂emissions (powerplant-related) as shown in Table 5-35, given the assumption that the nationwide new source performance standards for SO₂emissions would be met as stated under Section 3.1.2. Yet on page 6-1 the statement says that the impact analysis in the previous chapter does not include those mitigating measures required by law of regulations. The EIS should make clear the extent to which controls have or have not been placed on impact parameter estimates.

"Since projections of end-use (basically power-plant combustion from the NCM model) define the level of expected impacts for various time frames and scenarios, the EIS should also make clear the number of actual new powerplants projected. The estimate of megawatt size should also be identified, particularly where industry projections are available."

Commenter 281

Response.

a. The emission control standards discussed address fossil fuel steam generators regulations. These generators have heat input of 250 million BTUs/hour or more. Whether these generators are for steam only or associated with electric power production, the emission standards are the same.

b. The reason for the inclusion of Table 5-45 is discussed in Section 5.3.2.7. The Table does not compare state regulations with proposed NSPS but it compares state regulations with existing NSPS. The references have been included. Also some changes are made to the Table to reflect some of your comments.

c. The Clean Air Act and the National Air Quality Standards were discussed in Section 5.3.2.7. Thus it was judged appropriate to show these standards in a separate table.

d. The referenced tables compare regions and alternatives, considered to be important and necessary presentations in this analysis.

e. A correction was made to read "The impact analysis in the previous chapter *does* include those mitigating measures required by law or regulation".

f. An estimation of the number of electric power plant facilities can be derived from the tables in Appendix F using an average of 1,000 MWe plant size consuming an average of 2.6 million tons of coal a year. Applying these assumptions to the Appendix F data (specifically, steam generation consumptive use), approximately 196 power plants were in existance. The number of plants would increase under the preferred program medium-level projections to 345 and 486 in 1985 and 1990, respectively.

51. Comment. "On page 5-41 is a discussion of the projected consumptive water requirements in the Upper Colorado River Basin. This discussion concludes with an observation which is made for other regions to the effect that the Water Resources Council figures relied upon in the Statement, are probably exaggerated by a "double count" which includes general use, plus coal development. The Statement should present more reasonable water consumption statistics based on efforts to eliminate this double count. Failure to do so, even with the express recognition that the double count may exist, again gives critics of the coal leasing program and of western coal development in general the opportunity to capitalize on a very sensitive subject in the West by using exaggerated figures for water consumption to imply that municipalities and agricultural activity will be severely deprived of water if additional coal leasing occurs. Even though the Department tries to put the exaggerated water consumption into perspective by describing it also as a percentage of low-flow total water availability, it is felt that additional efforts are necessary to prevent this very sensitive subject from being misunderstood."

Commenter 066, 089 and 097

Response. There is no feasible way now to relate specifically the assumptions which underlie the WRC data to the conditions postulated for any of the programmatic alternatives analyzed. The problem of double counting has been addressed and its effects largely removed in the tables of

water flow and in the revised text in Section 5.3.2.6. In the revisions, it is assumed that where the WRC requirements for a given watershed (or combination of river basins) in 1985 exceed estimates forecast by the analysts preparing this environmental impact statement for the no new leasing alternative, then the coal-related water usage is assumed to be reflected in the WRC figures. This approach can be supported by the fact that both the WRC projections and those of the above analysts (under the no new leasing alternative at the medium level of coal production) assume that 1.1 billion tons of coal will be mined in 1985. This point is established in a memorandum from the Bureau of Mines. There are four watersheds for which energy-related water requirements exceed those for all purposes as estimated by WRC. For these, the requirements are considered as *additional* to those of WRC and the residual flows shown in the tables are accordingly reduced (as in the draft EIS). Here the problem of double counting cannot be eliminated and the point is emphasized. The fact that the projections for these watersheds represent a "worst case" or upper bound on water consumption which is expected to exceed conditions that will actually exist. It happens that even with the double counting only one of these watersheds is projected to show a deficit; that is the Missouri-Kansas watershed where the deficit is for a single month and exists even without the double counting.

While the above approach mitigates the problem of double counting (by eliminating it in 60 percent of the watersheds), no totally satisfactory method is known at this time to relate the impacts of coal-related requirements to total water consumption. The point is made in the text that none of the alternatives differ significantly and that none will change a seasonal shortage into a surplus or conversely create a deficit.

52. **Comment.** "EPA considered this impact to be one of genuine national/regional concern. Water limitations could definitely put constraints on the proposed coal program. Unfortunately, the water resources/water quality portions of the Draft EIS on the Federal Coal Management Program are weak, poorly organized, and it is difficult to make any meaningful sense out of the information. It is not at all clear what specific water uses are included in the various alternatives. Therefore, it

seems to be impossible to directly compare figures in the draft with estimated water uses from other sources. As a specific example, we have attached water use estimates prepared by the Salinity Forum as Appendix A. These projections are about as good as any available; however, it does not seem possible to make a direct comparison between the Forum's projections and the figures in the draft EIS.

Commenter 281

Response. The water quality and water supply sections of this environmental statement have been reorganized in response to this and other commentors. This restructuring should allow comparability of the EPA and DOI water use estimates.

53. **Comment.** "Table 5-5 and following four tables imply a shifting of coal production to western coalfields under all but the 'no new leasing' alternative. Lacking here is an analysis and discussion of the competitive position of Western coal versus Eastern coal, particularly in view of new requirements for emission control devices on all powerplants, rising transportation costs, and increasing demands on limited water supplies in the West. Potential impacts of a western shift in coal production on employment and regional economic stability in Eastern coal producing districts should be briefly discussed."

Commenter 079

Response. Section 5.3 of the FES addresses the points raised.

54. **Comment.** "5.2.2 Physical Impacts and 5.2.2.6 Water Impacts "As a result of the lack of specificity in the draft statement, it is difficult — if not impossible — to evaluate this section. The terms are very general in nature, and it is difficult to assess whether the tables are adequate or meaningful."

"— Table 5-44, page 5-74, 'Comparison of Potential Primary Productivity Loss.' This table needs clarification and references. In addition, Tables 5-42, 'Nitrogen Oxide Emissions,' and 5-43, 'Hydrocarbon Emission,' are difficult to interpret. A statement should outline the criteria on which the emission factors were generated and what kind of emissions would impact what areas.

"— Table 5-46, 'Potential Threats to Endangered Species of Coal Regions,' is extremely misleading. The column labeled 'Most Serious

'Threat' to the endangered species is purely conjectural unless better referenced. It appears the most serious threat specifically related to strip mining is unfounded. For example, it states that mining is the most serious threat to the gray bat. This is unfounded, especially when the animal's normal habitat is limestone caves. Another endangered species, the black-footed ferret, is said to be threatened by strip mining. In fact, farming and farming practices are considered to be the principal cause for the degradation of the habitat. This also applies to the Utah prairie dog. Thus, Table 5-46 describes severe negative impacts as if they are solely resulting from strip mining.

Commenter 069

Response. Appendix H addresses the methodology used to calculate the various environmental factors, including air pollutants. The Regional Impact Summary Comparison (DES, Section 5.3, FES Section 5.2) now precedes the specific program impacts section and presents key impacts in a series of tables which lists the impacts of the various alternatives as a 'percent increase or decrease over the No New Leasing base case.

Reference for estimates of individual productivity are included in Appendix Table D-1. Table 5-44 DES (5-62 in FES) is the result of unweighted productivity averages times surface area required (see section 5.3.3.1) and is for comparison purpose only.

Any activity that removes changes or disturbs habitat is a threat to wildlife regardless of whether the species has protected status or not. Table 5-46 DES (5-64 in FES) has been modified to reflect this.

55. Comment. "TDWR invites attention to the following specific items in the DEIS relative to water resources which impact significantly on the State of Texas:

- a. The analysis of water availability is based on preliminary data pertaining to water flow and consumptive water use compiled by the U.S. Water Resources Council (WRC) (i.e., U.S. Water Resources Council, 1978 (Preliminary Review Copy) — 'The Nation's Water Resource — The Second National Water Assessment', Washington, D.C.). See DEIS at page 5-26, section 5.2.2.6, fourth paragraph under the caption 'Water Impacts'.
- b. The DEIS presents water resources data, including total streamflow, and estimated present

and future water requirements corresponding to the WRC's Texas-Gulf aggregated subregions (ASR) 1107 (Lower Red River Basin), 1201 (Sabine-Neches Basin), 1202 (Trinity-San Jacinto Basin), 1203 (Brazos River Basin), 1204 (Colorado River Basin), and 1205 (Nueces - Guadalupe - Mission - Nueces Basin) (See Appendix E of the DEIS at pages E-2 and E-6).

"Even though the said water availability data and the related projection methodology are presented with numerous conditions and cautions regarding the validity, applicability, and practicality of the data and methodology, TDWR has more fundamental objections to the use of the said WRC preliminary data. TDWR's review comments, suggested revisions, and point-by-point assessment relative to WRC's draft review report on the 'Second National Water Assessment', were presented in letter dated August 25, 1978, to the Secretary of the Interior. A copy of the said August 25, 1978 letter is attached for ready reference, and special attention is invited to comment 12, thereof. TDWR has been advised that WRC and the Department of the Interior are taking appropriate action to resolve the important problems and questions raised in the review of the Second National Water Assessment.

"Because the Texas Coal Region is not one of the eight coal regions for which the Department of the Interior is preparing separate, detailed environmental impact statements, (see DEIS at page 3-6, section 3.1.1.7, fourth paragraph under caption 'Meeting the Requirements of the National Environmental Policy Act.'), TDWR suggests that final version of the subject programmatic environmental impact statement include assurances that revised, coordinated WRC data relative to the Texas-Gulf Region water availability and demand will be used. TDWR emphasizes the Second National Assessment without substantial revision of the data will not be useful in determining the present and future adequacy of Texas water resources, and that the use of these unrevised data in major energy-related programs may unavoidably and seriously hamper the solution of energy-related problems. Unfortunately, the use of WRC's ASR aggregated water resources data appears to generalize water data beyond the point of being useful. The aggregate, generalized data tend to portray conditions as covering a much broader area than they actually do."

Commenter 056

Response. As requested, the new WRC data will be evaluated when available and incorporated in the programmatic where appropriate if they are significantly different than the data used in preparation of the draft. The ASR data was used because no other options were available to the Department in the time frame available for preparation of the draft environmental statement.

56. Comment. "Page 5-28: The discussion of water rights here should include the problem of Indian title to groundwater. The complexity of the issue, the problems of competing interests between the state and Indian water rights and the fact that no final determination of the ownership of the water underlying much of the coal in the San Juan River Coal Region should be addressed in any discussion of the feasibility of coal development in that region."

Commenter 057

Response. Indian water rights are a very complicated topic to address without being site-specific. The DES, page 5-28, footnote 1, addresses the rights of Indian tribes with Northern Great Plains. The footnote and supporting text have been revised to highlight potential Indian rights to water and the effect to coal development such rights might involve.

57. Comment. "Page 5-26: Under the section dealing with water impacts the problem of cumulative impacts is very serious. According to the figures in Table 5-10, water demands in the San Juan River Region from coal development could range from 30,000 to 52,000 acre feet per year depending upon the alternative chosen. It is a fact that in the San Juan Basin, where most of the coal development in the Region will take place, the only water available for coal development will come from the Westwater Canyon aquifer. Claims that water can be obtained from the San Juan River are unrealistic and misleading. Information from the New Mexico State Engineer's Office and the United States Geological Survey reveal the following facts.

"Page 5-41: As I have pointed out above no discussion of the availability of water for coal development in the San Juan River Region is sufficient without addressing the realities of the situation which are:

1) Virtually every drop of San Juan River water is already allocated and it is probable that none will be available for coal development.

2) Coal development in the San Juan Basin will have to depend entirely on water from the Westwater Canyon aquifer.

3) Cumulative demands on this aquifer will raise a very real possibility that no water will be available for coal development.

The problems raised here with respect to the water impacts of coal development go to the initial question of whether the entire San Juan River Coal Region should be considered at all for any development. These impacts should be discussed at the national level and should be included in the final Environmental Statement for the Program.

"These problems should also be discussed at the regional level. Again, the Star Lake-Bisti Coal Environmental Statement does not address any of these problems. If the regional statement is approved and implemented the area will be committed to development without the knowledge that there will be sufficient water to support that development."

Commenter 057

Response. It is recognized that water deficits are probably the most significant problem in development of western coal resources. More specifically, it is clear that additional development of coal resources in the San Juan River Coal Region will require a reallocation of existing fully-allocated surface water rights. It is the role of the programmatic environmental statement to identify such adverse impacts. It is up to regional planners and resource use decision-makers to prioritize and allocate scarce resources among competing uses.

It is also noted that the use of deep aquifers may offer some mitigation to the problem of inadequate surface water resources. Use of deep aquifer resources may, however, generate an entirely new set of environmental impacts.

58. Comment. "One of the issues overlooked by the DES is the lack of understanding of the effects of the use of fertilizers and irrigation."

Commenter 097

Response. A statement has been added as follows: The use of fertilizer consisting of nitrogen, phosphorous, or potassium have given variable results. In some cases, fertilizer addition has produced favorable results, but this response has

not been consistent. Intensive soil testing of specific sites would be required before fertilizer application.

59. Comment. "Later in the same Section (page 5-23, the sixth full paragraph), the statement is made that irrigation cannot be considered a solution for all mines in semi-arid regions simply because water rights are 'usually not available.' This statement is contrary to the experience of virtually every mine operator. Water rights are relatively expensive to develop or obtain anywhere in the West, yet we know of no mine operator who has been unable to acquire such rights either directly by purchase or by appropriation. Presumably this statement is based on a miscomprehension of western water law and the realization that most states consider all or almost all of their watersheds to be fully appropriated already, which may be the case on paper but not in reality."

Commenter 066

Response. The FES text has been changed to read "may not be available."

60. Comment. "Table 5-12. This Table also predicts water requirements for coal mining in the San Juan River Region as 62,500 acre feet at the middle range in 1990. However, the Star Lake-Bisti Regional EIS states that this demand will be only 14,488 acre feet in its high-level scenario. This discrepancy must be addressed, for, again, it implies impacts which other Department documents dispute as being too high."

Commenters 019 and 135

Response. As can be seen in the attached table extracted from the Star Lake-Bisti Regional ES, the projected 1990 high level water requirement is not 14,488 acre feet, but rather, 58,936 acre feet. Since the estimate of 62,500 acre feet is for coal extraction and use, the variation between the two reports of 3,564 acre feet (5.7%) represents a reasonable variation attributable to variation in the assumptions made vis-a-vis coal production and use.

TABLE I-11

PROJECTED ANNUAL WATER REQUIREMENTS
FOR COAL-RELATED DEVELOPMENT

(acre feet)

	1977	1980	1985	1990
Coal Mines	1,851	3,146	8,006	8,763
Generating Stations	11,715	14,822	30,962	47,997
Star Lake Railroad	0	760	70	70
Fruitland Coal Load	0	5	5	5
Transmission Line				
Community Water Use	429	1,451	1,510	2,101
Total	13,995	20,184	40,553	58,936

61. Comment. "The EIS failed to consider the limitation on coal development due to shortages of water within the western states. Utah in particular has far more development schemes than can be supported by the water available. As is being seen near Delta, agricultural water is being used to furnish water for the IPP plant. Large coal development within this region will take water which could be used for agriculture. One impact of this program would be a reduction in the food production within the region. Clearly the EIS is assuming that national policy is to favor energy production beyond need at the expense of agricultural development."

Commenter 104

Response. The water requirements due to coal development are contained in Chapter 5's water impact section and Appendix E. Where water consumption is excessive, it would be in definite competition with other intraregional water requirements. This site-specific competition is germane to future site-specific analyses. Further, the FES definitely does not assume that the national policy is to favor energy production at the expense of agricultural or other development.

62. Comment. "The discussion of groundwater reserves on page 5-41 is quite good. This should provide a rational foundation for extremely limited mining of the deep aquifers of Wyoming."

Commenter 118

Response. This environmental analysis will provide the foundation for future site-specific environmental analyses of any specific tract leasing. Cumulatively, these analyses will be used as a tool to weigh resource trade-off decisions.

63. **Comment.** "Table 5-12: This table might be better explained because in several instances the 'Medium' figure is not medium as related to adjacent 'High' and 'Low' figures. The same is true for tables 5-13 and 5-24."

Commenter 079

Response. The column headings in Table 5-12, 5-13, and 5-24 (Low, Medium, and High) in the DES refer to coal production scenarios as detailed by DOI. The high, medium, and low water measures presented in Tables 5-12, 5-13, and 5-24 are those associated with the three coal production scenarios.

64. **Comment.** "Also, in dealing with water, the Impact Statement does state that most of the coal used in the region is an aquifer itself. I have done a little bit more work on that and have computed that between 182 and 217 acre feet per million tons of coal is actually in that water."

"Now, we can argue about how much can be used and how much can't, but by the year 1990 we would be hauling out eighty-six thousand acre feet of water out of this state just by way of hauling the coal, and I think the Impact Statement—you had better look at that and see what we are doing to this country and whether this is a proper concern."

Commenter 146

Response. The comment has been noted. The assumptions cannot be verified and the conclusions are exaggerated and argumentative.

65. **Comment.** "In Chapter 5 we take exception to the statement the 'Yellowstone River Moratorium' would deplete the flow of the Yellowstone River to the extent it would preclude further processing of coal in the area. We testified in opposition to the Montana Department of Fish and Game's request for 8.2 million acre feet, as well as the request of the Department of Health and Environmental Science's request for 6.7 million acre feet instream flow. Section 5.2.2.6 should be rewritten to include the recent decision by the Board of Natural Resources and Conservation."

Commenter 179

Response. Approval of large instream water rights would *maintain* the flow of the Yellowstone and its tributaries at a minimum specified level, thereby possibly inhibiting the development of new (junior) water rights in those basins.

The Montana State Board of Natural Resources and Conservation handed down their decision ending the Yellowstone Moratorium on December 15, 1978. Based on conversations with personnel of the Montana DWR, it appears that the decision favored the in-stream flow interests and may result in the imposition of an additional constraint on the development of new water rights in the basin.

66. **Comment.** "The impacts attributable to the Federal coal management program would be only a small fraction of those resulting from meeting national coal requirements. (5-9)

"For example, the Department's assertion that the preferred program will not result in significantly greater environmental impacts than a no new leasing alternative is contradicted by its own projections of the relative regional water impacts of the two main alternatives. The Statement's comparison of the water consumption (evaporation) impacts of the various program alternatives shows that, while the total water consumption for the preferred program will be almost identical to that of the no new leasing alternative in 1985, the preferred alternative will result in more water losses from western rivers. (p. 4-59) Because of lower average streamflows, greater streamflow variation, and over-commitments to other uses, the ecosystems of western rivers will be less tolerant of water loss than would be those in the East. Thus, in the case of water, the preferred program is likely to have significantly greater impacts than the no new leasing alternative."

Commenter 089

Response. Nationally the impacts from different levels of leasing are similar. Regionally, which leasing level is chosen results in significantly different levels of impacts. Analyzing these patterns is the goal of the FES (see Section 5.2).

67. **Comment.** "Furthermore, the statement makes no attempt to assess the impacts of major surface water diversions, groundwater withdrawals, and new reservoirs which would be required under the preferred program."

"The statement also fails to assess the consequences of the impact of coal mining-related pollutants discharged into streams whose flows have been reduced as a result of coal development. The water flows predicted in some regions during periods of low flow are small, indicating that the

impact of chemical and sediment loading on streams is likely to be significant. The statement does discuss surface water shortages during periods of low flow in the Texas, Powder River, Denver-Raton, Green River-Hams Fork, Uinta-Southwestern Utah, and San Juan Coal Regions (pp. 5-33 to 5-47), but again it neglects to discuss the consequences of these shortages or of the impacts of measures taken to avoid them (*i.e.*, the construction of new reservoirs).

"Finally, the Department's approach does not provide an adequate comparison of the water impacts of the preferred program with those of the no-project alternative. First, the statement glosses over the difference in regional water impacts resulting from each of these options."

Commenter 089

Response. Section 5.3.2.6 Water Impacts has been substantially rewritten to address previous deficiencies with regard to the treatment given to water availability and quantity.

68. **Comment.** "It appears that the development of the Western Interior Region may bring about some reduction of flow in the Mississippi River along the state's eastern border and that development of the Fort Union Region may bring about more drastic reduction of flows in the Missouri River along the state's western border. Especially distressing is the following: Table 5-20 indicates that up to 14 percent of the annual average flow for this (Missouri) river basin could be required. Up to 38 percent of the 20-year low annual supply would be required in 1985." Page 5-41, DES, FCMP"

Commenter 011

Response. Table 5-20 of the DES refers to the upper Missouri River basin of the Powder River and Fort Union Coal Regions. These regions are located approximately 500 miles upstream from the segment of the Missouri River which form Iowa's western border. Due to the fact that numerous other tributaries feed the Missouri over this 500 mile river segment, Iowa would not be affected by the indicated magnitude of water reduction. The actual impact in Iowa would be minor.

69. **Comment.** "The Department mistakenly concludes that the impacts of the preferred program will be little greater than those of the no-project alternative.

"As we have discussed above, a major flaw in the Draft Environmental Statement is its failure to examine realistic alternatives to the preferred program. The alternatives examined in the DES, not leasing, emergency leasing or leasing to meet industry, state or DOE requirements, are not independent coal management programs. There are ways of answering one of the questions which a coal management program must answer: how much to lease. The most significant alternatives which the Department failed to consider is a program whereby new leasing is deferred until such time as it is clearly needed to meet future energy requirements, and whereby existing leases are managed in such a way as to balance environmental and economic concerns. It is likely that the environmental impacts of such a program would be quite different from those of continuation of the status quo, termed by the Statement as the no-project alternative.

"Because there are a variety of no-project alternatives which would have lesser environmental impacts than the 'no new leasing' alternative discussed in the statement, the Department's comparison of the environmental impacts of the preferred program with those of the no new leasing alternative gives the misleading impression that the impacts of the preferred program will be only marginally greater than those of a program which is explicitly designed to ensure full protection of environmental values in the development of Federal coal."

Commenter 089

Response. The major management alternatives used for this ES blanket the range of possible decisions by the Secretary. As is pointed out, the permutations in coal management decisions are endless; we do not believe the impacts of these different alternatives will, from a national viewpoint, change impact levels significantly. The preferred program described here would result in a balanced approach to coal leasing decisions. While this ES has reported a level of leasing to the preferred program for the purposes of analysis; this alternative does not in fact carry with it any pre-determined level of leasing.

70. **Comment.** "In a related factor, only land disturbance caused by the presence of mining operations, beneficiation, conversion, use and transportation of coal has been considered. This is

unacceptable. Surface mining of coal necessarily requires human involvement, as reflected in projected population increases. However, areas which will be temporarily or permanently disturbed for residential, commercial, industrial and governmental structures, ancillary support structures, recreation, and corridors for the service and utilities of such populations have been ignored. Stating that the 'multiplicity of site-specific factors which would dictate acreages committed to such developments' renders quantification 'beyond the scope of this document' is not a statement of environmental impact. It may be noted that residential development has traditionally taken place on the best agricultural lands, because that is where towns have been historically located. Expansion of existing urban areas to serve energy booms will only expand the agricultural losses."

Commenter 097

Response. Secondary land disturbance is quantified in the ES where it is felt that reasonable estimates could be made. Secondary impacts related to coal development including induced growth and community change are covered generally in Section 5.3.4. An estimate for the amounts of land required to support coal-related population increases has been added to the discussion of land disturbance. The factors which contribute to make land "prime farmland" are also often the best characteristics for other land uses.

71. **Comment.** "Some characteristics of the data presented concerning land disturbance are not clearly explained. Table 5-5 indicates that, for the low and high coal development scenarios, the preferred program would lead to more acres being disturbed than the 'no new leasing' alternative, but would lead to less for the medium level of coal development. (p. 5-18) It is not clear what factors are responsible for such conclusions."

Commenter 089

Response. Acres disturbed are based on coal production estimates. Where medium coal production level estimates are higher than high-level production, a shift of coal production to other regions is indicated. Land disturbance reflects this shift.

72. **Comment.** "On page 5-73 and Table 5-44 the term is meaningless. Productivity, being a rate measurement, is a function of time; however, no explanation of the time interval involved is given

for the data. Because productivity rates are inherently different among the coal regions, the procedure in this section of comparing productivity levels used throughout the document are suspect."

Commenter 088

Response. This section is being rewritten to clarify the time aspects of productivity.

73. **Comment.** "Furthermore, the statement completely ignores long-term and cumulative ecological effects: no consideration is given to impacts after 1990. (p. 5-3) Although it is difficult to assess long-term ecological effects of specific stresses, some comments can be made regarding potential consequences of coal development. For example, strip mining thick beds with shallow overburden can significantly alter drainage and erosional patterns. Mining can alter the quality and quantity of both surface and ground water, alter soil characteristics, and change the topography and geology of the land. Soils in arid and semi-arid climates recover very slowly, so loss of productivity could be a significant factor. While the statement assumes a return to original productivity, alteration of the environment may prevent it.

"Thus, the numerous environmental changes associated with coal development could diminish the ability of an ecological system to reestablish itself. If reestablishment is not attained after some period of time, then the fragile, low-density food webs of most western coal regions become very susceptible to disruption. As can be seen from the statement's list of endangered species in the western coal regions, (pp. 5-77 to 5-80) flora and fauna in these areas are already stressed; additional burdens caused by coal development may make extinction a real possibility.

"In short, the statement's discussion of the environmental impacts of the proposed program does not fully assess the consequences of Federal coal leasing to the natural ecosystems of each region. In order to provide an adequate analysis of the total environmental impact of the proposed program, the statement must relate its estimates of the 'loading' upon the environment to the long-run ecological consequences of such disturbance."

Commenter 089

Response. Section 5.3.3 discusses impacts on ecosystems in terms of productivity loss, habitat

losses, and endangered species. Appropriate material will be included in 5.3.3 to address more clearly the issues raised in the comment.

74. Comment. "The second one is existing vegetation would be destroyed on sites cleared for development and surface mining, wildlife habitat would be lost or temporarily displaced. Well, on the east side of the state the ranchers are always setting fire to the grass and burning it off for one reason or another. It is a little bit hard to be sure of. Sometimes for good, maybe for bad, I don't know. It depends on whether you get caught in the fire at the time it gets burned off. As far as the wildlife goes, I am sure that we don't get too concerned about the hunters going out and hunting the quail. It is my understanding the quail are going to die whether the hunters shoot them anyway. This is kind of getting at little things about how the wildlife is going to be affected. That is greatly overdone. I think the wildlife is more likely to come in because they will find more food around where there are people. If you want to take it from that point of view you might have more wildlife than you would have if there wasn't anybody out there."

Commenter 139

Response. Wildlife impacts due to the implementation of a Federal coal management program are most certainly within the scope of the FES and merit analysis while the wildlife effects due to the actions of ranchers, hunters or other non-Departmental actions do not.

75. Comment. "The statement does not assess the long-term impacts of the environmental stresses which will be caused by the preferred program. The statement acknowledges that the preferred program and other alternatives involving significant amounts of coal development will create serious environmental stresses in the regions where coal is mined. However, it does not attempt to estimate the impacts that these stresses will have on those regions. We believe that an evaluation of the long-run consequences on particular species and ecosystems within each region is also essential to any decision concerning Federal coal leasing policy.

"To its credit, the statement does attempt to address the issue of ecological impacts. Unfortunately, the assessment is too superficial to be meaningful; moreover, it relies once again on some

questionable assumptions. For example, the statement estimates plant and wildlife losses by multiplying plant and wildlife densities by the estimated number of acres directly disturbed by coal development. (p. H-26)"

Commenter 089

Response. Estimates of land disturbance over the long-term and short-term have been revised in Chapter 7 to indicate the amounts of land that would be committed in regions for each of these broad categories. The long-term consequences on specific species and ecosystems can only be generalized at this alternatives level of analysis (see section 5.3.3). Once specific sites are identified, impacts specific to the type of activity and the area being affected can be assessed in detail.

76. Comment. "The potential impacts of subsidence on water availability in springs and seeps water and mesic micro-habitat sources extremely important to wildlife, should be addressed more fully in Section 5.2.2.6, page 5-26."

Commenter 093

Response. Any area adjoining an excavation is normally subjected to increased stress as a consequence of the redistribution of load. This may be at the front of, or at the sides or rear of, a working face. Changes, diversions, or pollution of surface or underground water may occur, and pits and cracks may result due to these stresses, resulting in increase of soil moisture in some areas. A change in soil moisture may lead to a change in plant cover which would result in a change in wildlife habitats. These changes are highly site specific and could be beneficial or detrimental to wildlife.

77. Comment. "The discussion of wildlife disturbance and destruction is not adequate in the DES. The document indicates that larger, more mobile wildlife will rarely be killed (5-72). But the Eastern Powder River Coal DES finds 1,947 game mammals will be destroyed, along with 200,651 nongame. This is in addition to the loss of 280,359 birds. Further, the above statistics say nothing about car, 'domestic pet,' and wanton killings. These forgotten factors arguably kill more wildlife than the loss of habitat."

Commenter 118

Response. The document reads "while direct mortality of larger, more mobile wildlife species would be rare...." in the generic discussion of

ecological impacts. In Section 5.3.3.2 (habitat loss) and in Appendix D tables D-4 through D-25 estimates of potential wildlife losses due to habitat loss are presented. Increased traffic, pets, and illegal hunting will surely result in additional losses which cannot be reasonably estimated at this level. It's possible for a habitat to exist without wildlife, but unlikely that wildlife can exist without a habitat.

78. Comment. "The Section on Ecological Impacts beginning on page 5-72 appears to contain some conflicts. On page 5-75, the following statement appears: 'Since the specific tracts which may be leased are presently unknown, it is not possible to indicate the exact habitat which would be lost.' Several paragraphs later, reference is made to table 5-45 which represents estimates of potential big game population reductions which would occur due to habitat loss. Since it is not possible (as previously stated) to indicate the exact habitat that would be lost, then how can potential big game population reductions which would occur due to habitat loss be calculated?"

Commenter 121

Response. Potential big game population reductions were derived by using estimates of population densities of occupied habitat multiplied by estimates of acres required for coal development (See Appendix H.4.4 for more details).

Since specific tracts are unknown, a land use forecast was developed for each region which allotted percentages of the estimated land required for coal development to forest, range, cropland, pasture and wetlands. Potential big game population reductions (and other wildlife as well) were then determined by multiplying estimates of population densities of occupied habitat by acres of habitat (as determined by the land-use forecast). Details of the steps used to estimate the various components of this methodology are given in Appendix H.4.4. It is important to recognize that these are estimates based on a set of assumptions and that actual reductions may vary considerably once specific areas are defined.

79. Comment. "In addition, the DEIS could be improved with a benefit/cost analysis and economic comparison of the various proposed actions and alternative mitigation measures, since it is important to strike a balance between economics and environmental impacts."

Commenter 117

Response. While it is entirely appropriate to strike a reasonable balance between the extremes of environmental preservation versus economic development, it is beyond the scope of this programmatic environmental statement to develop the data necessary to adequately address the issues of cost/benefit analysis. Further, since the regions evaluated encompass such broad areas, the number of qualifying assumptions would, of necessity, be so extensive as to render useless any serious attempt to quantify program-wide costs and benefits. A far more appropriate setting for such analyses would be the regional impact statements, where the regional impacts, costs and benefits could most adequately be described. Economic factors are incorporated in the Secretary's decisions on the Federal coal management program.

80. Comment. "The DES indicates coal related population growth would reach 'hyperurbanization' levels in the Powder River *without any new leasing* (5-85). Under the preferred program medium level, the annual growth rate would be approximately 14.2%, creating an even worse situation. Might this be turbohyperurbanization?"

Commenter 118

Response. The text of the FES has been modified to more fully discuss the social and economic impacts of boom town developments.

81. Comment. "Unfortunately this draft fails to recognize, as some Federal legislation fails to recognize, that those jurisdictions which experience the most severe adverse impacts may not be the same as those which accrue the chief tax benefit. The statement implies that an increase in population is accompanied by an eventual increase in taxable valuation which eventually catches up with the cost of the additional demand for public services and facilities. In cities, towns and school districts this is not necessarily so: the catch-up may never occur. In that circumstance, loans can be part of the burden they are intended to alleviate and grants are much preferable. We are all familiar with interstate jurisdictional inequities, but they also occur within the state and it does not appear they can be completely nor equitably addressed by the state's adoption of any single jurisdictional mechanism, such as tax base sharing. By the same token, the statement suggests prepayment of taxes as a mechanism to help off-set tax lead time

problems. Although Montana has legal provisions which would allow prepayment of taxes, every time prepayment has been proposed industry has threatened to challenge its constitutionality."

Commenter 121

Response. The commenter is correct in noting the interjurisdictional nature of fiscal impacts potentially arising from coal development. Section 5.3.4.5 is being revised to incorporate this impact in the discussion of tax lead time impacts.

82. Comment. "The draft implies a minimal responsibility on the part of the Federal government for providing what we consider to be highly appropriate financial assistance to help mitigate adverse impacts. The statement is made: 'The task of providing mitigation rests primarily with states.' Montana has taken a lead in the nation in assuming its responsibilities toward the coal area through the establishment and use of our coal severance tax and our innovative approach to assisting impact communities through the Montana Coal Board. Recognizing that energy impact extends beyond the coal area, we are continuing to evaluate our role and to explore new possibilities. Montana has the highest coal severance tax in the nation—and it is currently subject to challenge by the energy industry. We, therefore, find it ironic that in discussing the inadequacy and unresponsiveness of existing Federal aid, the Department of Interior should recommend that 'the more severely impacted states such as Wyoming and Montana could seek to raise revenue by other means, for example, through the imposition of an increased coal severance tax'."

Commenter 121

Response. Reference to the State of Montana has been deleted from the quoted material.

83. Comment. "In addition to the environmental impacts, the National Wildlife Federation is concerned about the socio-economic ramifications of coal production of the magnitude expressed by Department of Energy projections for 1985 and 1990. The problems associated with the transformation of most of these geographic locations from an agricultural lifestyle to urban, industrial lifestyles include not only the physical implications discussed in the impact statement—a shortage of housing, health, recreational, and educational facilities; and inadequate police, fire, and water and sewer provisions—but metaphysical conse-

quences such as juvenile delinquency, alcoholism, drug abuse, serious emotional problems and increased crime rates. These are more than 'socio-economic' impacts—they are reflections of the dramatic transformation of a lifestyle chosen and enjoyed by the inhabitants of the Western States."

Commenters 160, 071, 123, 146, and 057

Response. The text of the FES reflects the existence of the mentioned metaphysical consequences, particularly as they relate to areas expected to experience rapid population increases (i.e., creation of hyper-urbanization or boom towns). However, the coal management program is not expected to generate lifestyle transformations as geographically broad as implied in the comment. Rather, population increases would be most rapid in areas expected to experience a concentration of energy-related development activities, while the broader coal region would experience more moderate increases.

84. Comment. "The preferred program does not adequately provide for consideration of cumulative social and economic impacts of leasing federal coal. The question of how, where and when the coal will be consumed (its end-use) is critical to this consideration."

Commenter 061

Response. The cumulative social and economic impacts of coal development will be assessed by production region and, indeed, is the main thrust of this analysis. The impact of regional coal consumption will be part of the regional lease sales EIS.

85. Comment. "What is considered 'high to moderate' development potential? Why not encourage low development potential which might be more suitable and sensitive to local demand?"

Commenter 118

Response. The terms refer to the potential economic feasibility of mining the coal deposit. Coal of low-development potential is, by definition, very costly to produce and would not be in demand, even locally. If anyone believes that he has information on a coal deposit that would change the USGS's determination of its development potential, he can present it to the Department, which will, if the presentation is reasonable, include the suggested coal deposit with the coal classified as having high or medium development potential.

86. Comment. "It is on Page 5-83. 'The goal of maintaining a physical and social environment consistent with tradition is not realistic. Residents who cherish this way of life will be forced to tolerate changes.' As I said, I find this really disturbing. You are making judgments about our lifestyles, how we should live. You have demonstrated a fairly keen prejudice against the rural lifestyle."

Commenter 161

Response. The FES does not make any judgment about how one should live, rather, it assesses the sociological changes which are anticipated to occur due to the adoption of a Federal coal management program.

87. Comment. "As a general note on Chapter Five, the impact section does not describe beneficial impacts from mine development; and does not discuss the economic benefits received from coal severance tax money. In addition, the statement should also describe the positive economic benefits of developing coal tracts within a particular region."

Commenter 089

Response. The commenter is referred to Section 5.3.4.2 which addresses the new jobs created and Tables 5-77 and 5-78, Projected Coal Royalties and Severance Taxes. Statements relating to the positive economic impacts accruing to a community due to coal production are included in Chapter 5 to amplify these points.

88. Comment. "The ES ignores non-coal related growth in the regions (p. 5-9) and analyzes only the direct impacts of development on socio-economics and the land. Both are contrary to established ES procedures and prevent the statement from presenting the total impacts development would have. Furthermore, all the impact analyses in the document are based on the assumption that underground mining produces no air pollution and no short- or long-term land disturbance (pp. H-34, 45, 56-108). This is another in the series of absurd assumptions on which the ES is based."

Commenter 158

Response. The objective of this programmatic environmental statement is to address coal-related development impacts. It is beyond the scope of this statement to address non-coal related growth.

Emissions from underground mining are assumed to be negligible compared to surface operations because of the widespread use of electrical equipment. Underground mining air emissions are addressed in Section 5.3.2.

Estimates of land disturbed have been revised for the FES. Incorporated in the revision to Section 5.3 is consideration of land committed on a short-term basis to roads, buildings, tailing piles, etc.

89. Comment. "In Section 5.2.4.1, a lengthy discussion is made of the assumptions used in projecting the population increases due to the new federal coal leasing and the resulting socio-economic impacts. On page 5-83 (second column) and near the beginning of page 5-85, are comments which indicate that those impacts assumed are based on increases in population which combine short-term increases due to major construction as well as long-term employment in coal mines and supporting services.

"Similarly, these impacts are based on figures which do not reflect any assumptions concerning the number of new people which would come into an area and the number of jobs related to new federal coal leasing which would be filled by present residents of an area. These two factors greatly exaggerate the socio-economic impacts of new federal coal leasing. This is particularly true in areas such as central Utah, where certain counties which would be directly impacted by new federal coal leasing are experiencing relatively high levels of unemployment or underemployment which would be alleviated by coal development without many of the related environmental impacts that occur when new residents move into a rather sparsely-populated area. Therefore, it is urged that the Department make a concerted effort in the final impact statement to relate current unemployment figures to influxes of population resulting from new federal coal leasing to develop not just the "worst case" picture again, but also to show to what degree the employment of existing residents in coal development projects and/or supportive services would reduce the projected environmental impacts. Many residents of the West are particularly opposed to any developments which would bring in large numbers of "outsiders." It is important to public support of the new federal coal leasing program and to the blunting of any

opposition based on population increases that the Department put such population increases in proper perspective by indicating to what extent existing residents might reduce immigration problems."

Commenter 066

Response. The objective of this programmatic environmental statement is to attempt to estimate overall levels of impacts associated with a Federal coal management program. As such, it is inappropriate to attempt to specify alternatives designed to provide solutions to county-level problems. Further, the "worst case" impact represents an extreme impact level. In all probability, this level of adverse impact would not occur.

90. Comment. "In Section 5.2.4.4 (the second full paragraph on page 5-96), the basis for projecting fiscal impacts on state and local government agencies is described as being based on admittedly overstated population shifts which assume, incredibly, that all population shifts would be interstate. It continues to be confusing and frustrating for the Department to be making assumptions on one page and then contradicting the same assumptions with completely unjustified assumptions on the next page. Although it might be helpful to present the 'worst case' scenario for physical impacts in order to avoid any criticism that the Statement is inadequate for failing to at least mention all possible impacts, it is basic to an objective analysis that the Statement also demonstrate what the Department considers to be the most likely situation so that published reports of the Statement or comments taken out of context by groups opposed to new federal coal leasing programs will not unduly alarm state and local governments to enact new taxes or increase existing taxes in preparation for problems based on wholly unrealistic assumptions."

Commenter 066

Response. It has been assumed that all population shifts will occur on an interstate basis to insure that the "worst case" impacts are presented. Some population shifts will occur on an intra-state basis; this does not imply that fiscal demands accompanying such intrastate shifts will "net out" to zero. Rather, those shifts into areas with inadequately developed infrastructures will result in additional fiscal demands.

The Department cannot control the ultimate use of specific sections of the environmental statement. It must, however, comply with all applicable law. In doing so, the worst case impact is presented.

91. Comment. "The population increase figures assumed by the Department are apparently in direct conflict with statements made on page 5-87, at the beginning of Section 5.2.4.2 to the effect that the principal source of labor for western coal development can be expected to be western workers in agriculture and to a lesser degree, in the construction industry. Here the Department is acknowledging that many existing residents of the West will be available to fill coal development-related jobs, thus making the exaggerated assumptions of the amount of in-migration even more unrealistic."

Commenter 066

Response. The existing supply of excess labor, on a regional basis, will be inadequate to meet total additional local labor demands. To present estimates of "worst case" impacts, it was necessary to assume all migration would be on an interstate basis.

92. Comment. "Page 5-82: The discussion of impacted communities is inadequate in the following respects:

- 1) Although it is stated that a growth rate of more than 10% on small communities would require special planning, no discussion is made of what effects any population increase would have on areas where there are essentially no services, as would be the case throughout the San Juan River Region.
- 2) No discussion is made of impacts on communities where there are no services, no housing and no private land on which to build these things.
- 3) No discussion is included about the boom-bust phenomenon experiences in areas which have sudden development but which have no structure to hold the influx of people after the development."

Commenter 057

Response. The material suggested by this comment is included in the final statement; see, for example, Section 5.3.4.2.

93. Comment. "No discussion is included about the effects of increased population on Indian communities, where English is not spoken and traditional lifestyles are dominant.

"These issues must be addressed in the final statement."

Commenter 057

Response. Additional text addressing the effect on Indian communities has been inserted in Section 5.

94. Comment. "Similarly, impacts on state and local expenditures have been diluted by considering only the impact in comparison with total budgets of all state and local governmental units. A 1990 impact on government expenditures in Colorado seems minuscule, but in real terms the \$16 to \$33 million will be mostly spent by local communities with budgets which are presently almost invisible."

Commenter 097

Response. While the commenter is correct in stating that the annual fiscal impacts on local budgets will be substantial, it is beyond the scope of this programmatic environmental statement to attempt to quantify impacts at the local level. Rather, the appropriate regional and site-specific impact statements would be the vehicle to identify, quantify, analyze and, where necessary, mitigate such impacts.

95. Comment. "It appears that Chapter 5 of the statement should include a discussion of the impact on utility bills from the preferred program and alternatives."

Commenters 013 and 197

Response. The Department has prepared an analysis of the impact on utility bills of no-new-leasing alternative vis-a-vis the preferred program as part of its study of the sensitivity of the DOE model. This analysis was not available in time for incorporation in the draft ES. It has been incorporated into Chapter 2 of the final ES.

96. Comment. "Page 5-96. Fiscal Impacts - Alternate funding for front end developments are loans or direct assistance.

"Loan programs would not assist the highway developments as future increases in highway development due to coal development would be minimal and not sufficient to repay loans. The EIS

should recognize that specially funded programs such as highways should receive direct assistance."

Commenter 014

Response. The FES does not specifically refer to highway funding programs. It is recognized that highway funding is normally conducted via direct governmental assistance. The basis, however, for governmental funding is taxes; coal development is one means of increasing an area's tax base.

97. Comment. "Other concerns involve the Department of Agriculture programs under SCS such as the P.L. 566 Program. A number of watershed developments are underway or planned. It is felt mining might cause surface problems on watersheds and also in the '208' non-point pollution program."

Commenter 001

Response. The statement recognizes that mining activity may cause surface problems on watersheds. However, this issue will be assessed on a site-specific and regional basis as subsequent plans are developed. Federal and State laws pertaining to water quality provide criteria and standards which must be met by any development. Leases issued will require conformity with established State and Federal water quality standards.

Chapter 5 in the final statement provides a discussion on water impacts in the 12 Coal Regions.

98. Comment. "Again on page 5-94 (bottom of first column), reference is made to Table 5-54 as containing projected increases in population due to construction of coal development-related facilities. These comments recognize that part of the increase is due to a national surge in construction of new combustion facilities but it also notes that the data is based on the assumption of the possible development of significant numbers of synthetic fuel plants. Earlier in the Statement, the Department clearly stated that, in general, its environmental impact policies contained in Chapter 5 will be based on the assumption that the end uses of coal would, during the unforeseeable future, not vary significantly from the present uses which are primarily for the generation of electricity and secondarily for conventional industrial boiler use with negligible or no synthetic fuel development. There would appear to be no justification for making an exception to this general observation in analyzing population increases. To assume signifi-

cant population increases from synthetic fuel plants can be unnecessarily alarming to existing residents in regions to be impacted by any new federal coal leasing program."

Commenter 066

Response. The assumptions incorporated in the impact analysis methodology (see Appendix H) clearly indicate that synthetic fuels development will occur by 1985, albeit on a limited scale. The purpose of including such development as a basis of impact projection is not to cause alarm, but rather, to provide an objective estimate of future population-related impacts.

99. **Comment.** "In the San Juan River Region, most of the coal lies in New Mexico, yet only the severance tax is used in computing economic benefit to the State.

"Actually, the severance tax is only a small part of *direct taxes* which New Mexico receives from coal production."

Commenter 136

Response. This comment is correct in stating that many different sources of tax revenue to the states will become available with increased coal production. However, the programmatic statement addresses severance taxes and royalties on an individual state basis because of their direct relationship to the amount of coal mined. The level of revenue from other taxes, such as sales, property and income taxes, will be more a function of land area used, employment levels, and income distribution patterns rather than coal production.

100. **Comment.** "Page 5-94: A discussion of who will bear the financial impacts of coal development in Indian communities should be included here. Much coal activity is planned for Indian areas which are not on a reservation and the issues of who will bear the costs is pertinent here.

"Here again there is a problem of what will be done in Indian areas with no tax base."

Commenter 057

Response. Developmental pressures will be most severely felt in those areas with no or little infrastructure. Indian communities will be severely affected by such pressures attributable to increased levels of coal resource utilization. Section 5.3.4 is being revised to include consideration of this comment.

101. **Comment.** "The impacts on prime farmland and other agricultural land by coal mining activities are discussed but no specific consideration is given to revegetating farmland that has lost its water supply. These lands may become subject to wind and water erosion because of inadequate vegetative cover, even though not disturbed by mining operations. Measures should be taken to reestablish native vegetation that can survive in an arid climate without irrigation before the water supply is removed."

Commenter 116

Response. Measures to prevent erosion (wind and water) either through revegetation or other means are an important part of any premining - mining - or post-mining planning process. These measures would be part of an adequate reclamation plan required for a mining permit.

102. **Comment.** "It seems questionable whether the section addressing loss of agricultural lands and productivity represents the situation fully - for example, the chart illustrating the costs to agriculture cannot fully reflect the adverse impact on agriculture because it does not take into account the potentially extensive and extremely detrimental disruption of the region's aquifers or possible increases in animal mortality because of air or water pollutants. These must be matters of concern to us as an agricultural state and as a nation which benefits from our agricultural productivity."

Commenter 121

Response. Adverse impacts to agriculture due to aquifer disruption would be dependent upon factors including: how development actually occurs and to what extent the aquifer was disrupted. Aquifers are protected under the Surface Mining Control and Reclamation Act of 1977. Similarly, effects of air and water pollutants are dependent upon increases over ambient levels considered harmful. Both areas would require more detailed site-specific information before impacts could be quantified.

103. **Comment.** "Page 5-94: The evaluation of where the work force for coal development will come from is based on the assertion that agricultural workers will be available for the work. In the San Juan River Region there are virtually no agricultural workers to draw upon. Virtually all employees in the coal development will have to come from outside the area. This influx of

outsiders constitutes a considerable impact and should be discussed.

Commenter 057

Response. This impact is considered in Section 5.3.4 of the FES, and is further reflected in Tables 5-65 and 5-66 of the FES.

104. Comment. "The third one is that present agriculture use in some areas would be converted to residential, commercial or industrial uses. Well, what is so bad about that? You read about the chamber of commerce all around the state, how they are growing and how the business is good and how this is going to be great for New Mexico, you read how New Mexico is increasing in population and it is always below Arizona, it is always below Colorado, it is always below Utah and it is way below Texas, yet we are afraid of a little increase in population or the building of a few houses. I can't see that that is bad. I am glad I built my house when I did. Maybe now I would have to file an impact statement to build it."

"The fourth one is industrial-municipal demand for water would increase. Generally water would be available for these uses when in some western states new demands compete with present water uses and the competition will cause price increases that may cause economic problems to agricultural water users. Well, the farmers are using the water and there is increased use on the part of the farmers, so why do you have to single out the miners for using some water?"

Commenter 139

Response. The purpose of the FES is, among other things, to assess the effects of a Federal coal management program on agriculture and water consumption. It does not make a judgement as to whether these effects are good or bad.

105. Comment. "In summation, agriculture is necessary, and the deprivations which it is suffering currently will be exacerbated by the proposed coal scheme. Losses will be permanent in some areas, and temporary in some areas. Long-term losses will also be created in less noticeable ways, such as yield decreases in response to air quality degradation in areas which are now relatively clean. The draft EIS fails to address these impacts on uranium."

Commenter 017

Response. Areas with relatively clean air quality will experience some air quality degrada-

tion if development occurs in these areas. Whether emissions will be sufficient to lower crop yields cannot be determined on the broad scale required for a programmatic ES (see 5.3.2.7).

106. Comment. "Page 5-94: The evaluation of impacts to agriculture based on the dollar value of the productivity of an area does not allow consideration of the very real impacts to areas where people grow or raise only enough to support themselves. These situations must be addressed."

Commenter 057

Response. Because this is a programmatic based on broad regions, impacts are necessarily general in nature. As sites become better defined more specific impacts and areas of impact can be better defined. Generally, the impacts on farm profits can be interpreted as an indication of impacts on any agricultural activity.

107. Comment. "There are also secondary impacts such as the loss of older buildings when a town grows due to coal mining. This is mentioned, but probably should be enlarged upon. The Colorado State Historic Preservation Officer considers it the responsibility of the Federal government to mitigate secondary damages on private and other lands caused by coal leasing. While this position is questionable, we need to be aware of such policies."

Commenter 025

Response. The nature of a programmatic environmental impact statement precludes the inclusion of site-specific details. Thus, mitigating measures to be undertaken to preserve for example, the older buildings of a town that might be affected by coal-related development activities cannot be addressed except in a generic way. When environmental impact statements are prepared for a coal leasing activity under the Federal coal management program, potential impacts on a site-specific basis would be discussed. At that time, coordination would be required between the land management agency involved and the appropriate State Historic Preservation Office to mitigate the kinds of impacts like the example cited. The determination of whether the Federal, state, or local government has the primary responsibility to mitigate undesirable secondary impacts would be decided during the coordination process.

108. Comment. "Page 5-104 — Paragraph 5.2.4.8. Recreation Impacts. Should be clarified that coal mining *may* cause significant changes in population distribution and concentration in certain areas, thus impacting certain recreation facilities. Coal mining does not increase the population as implied."

Commenter 119

Response. Population "loading factors" were incorporated in the CIEP to estimate population change. These loading factors are supported by numerous field studies which indicate a direct relationship between coal production, associated population levels and the level of services generally demanded by an average population. This programmatic statement addresses the population impacts associated with coal development and identifies the secondary impacts, such as recreation impacts, stemming from coal resource development. Consideration of impacts on specific recreation facilities is most properly addressed in the regional and site specific mining studies required prior to coal production.

109. Comment. "Moreover, each environmental statement should address not only how the project will affect the recreational use of the land itself, but also give some thought to how the impact of people could hinder or enhance the quality of the environment. The impact of needed recreational areas and/or facilities to cater to an increased population, should be considered in this Federal Coal Management Program."

Commenter 122

Response. Section 5.3.4 of the FES discusses generically the impact of additional people on an area's recreational facilities. As stated in this paragraph, a detailed determination of recreation-related impacts is highly dependent upon a variety of locally specific factors that are beyond the scope of a programmatic ES. Regional or site specific ES's would be able to detail such impacts.

110. Comment. "One specific error was noted in this section. A 100 car unit coal train with 5 locomotives and a caboose is 1.1 miles in length rather than 1.6 miles."

Commenter 114

Response. The text of the DES has been modified accordingly.

111. Comment. "Union Pacific is concerned particularly that the non-quantifiable impacts of increased coal transportation by rail not be exaggerated. As stated in the two preceding sections, it must be recognized that all rail traffic is increasing not just coal. Furthermore, it has been Union Pacific Railroad's experience that problems caused by operations of a railroad through a community seldom stem from either the length or frequency of trains. What problems do exist are often compounded because community leaders do not know how to contact those representatives of the railroad who may be in a position to provide a solution. In keeping with its generally perceived role as a good corporate citizen, this Company is continually involved in working to improve such communications and community relations in general.

"Apparently as a means of mitigating environmental impacts, transportation access is mentioned as being a factor which might limit the areas in which new Federal leases would be issued. Union Pacific concurs in the conclusion on page 5-115 that any such restriction would only delay, and not prohibit, new leasing in limited access areas. Union Pacific does not view transportation access as a stumbling block for the Federal coal management program simply because, as recognized in Section 5.4.4, major coal related rail extensions will only be built if the total mining project, including transportation facilities, is economically sound. In fact, Union Pacific's existing system provides ready access to several of the coal supply regions identified in the Draft Environmental Statement as containing significant reserves of Federal coal. Transportation access will only present a problem if necessary rights-of-way to serve coal mines can not be obtained across state or Federal land. It is assumed that rights-of-way across public lands will be available if leasing of Federal coal is permitted in a given area."

Commenter 114

Response. While impacts may not in all instances stem from train length and frequency, these factors do exacerbate problems created at many unseparated grade crossings. It is agreed that more open communication can mitigate problems. For example, railroads are receptive to citizen calls to assure that stopped trains are "cut" to prevent unnecessary blockage of grade crossings.

112. Comment. "As pointed out in the preceeding section, system capacity will have to be increased to handle all freight, not just coal. Consequently, the railroads' ability to make the financial investment required to provide adequate transportation services for all commodities must be considered. The Draft Environmental Statement properly takes such an approach and does consider financial capability in terms of the total investment required by the railroad industry to provide transportation services for both coal and other freight. In this context, it should also be recognized that revenues from coal traffic will certainly improve the railroad industry's financial ability to improve the country's rail transportation system with obvious benefits to all rail shippers."

Commenter 114

Response. No response required.

113. Comment. "The impact of coal traffic on system capacity must be viewed from the perspective that coal is only one of many commodities carried by railroads. System capacity must be increased to handle growing volumes of all freight, not just coal. This point is recognized in the introduction to Section 5.3.5.1, but it should be specifically emphasized in the discussion of system capacity.

"It is correct that capacity for a given segment of track is a function of line mileage, the number of tracks per line, the length and spacing of sidings ..., the type of signaling system and train control, traffic imbalance and peaking patterns, and track conditions.' Union Pacific is committed to insuring that its track system has sufficient capacity to handle projected increases in all rail traffic. In addition, Union Pacific recognizes that some segments of branch line trackage may require upgrading primarily in order to accommodate increased coal traffic in a safe and efficient manner. For example, the Company is currently replacing ties, relaying rail, lining and surfacing a 114 mile section of its North Platte branch in order to handle Powder River Basin coal traffic interchanged from the Burlington Northern at Northport, Nebraska."

Commenter 114

Response. While it is recognized that system capacity must be increased to handle growing volumes of all freight, the projected annual growth rate for noncoal traffic is significantly less than

that for coal. Accordingly, increased coal traffic would be a dominant factor in decisions to upgrade capacity, particularly for the major main lines in the western coal states.

114. Comment. "With respect to projected shortages of coal hopper cars and locomotives, it appears that the increased efficiency resulting from effective equipment management programs has been overlooked. Union Pacific is working with coal shippers, including electric utilities, to develop such efficiencies. While it is probably true that some increase in locomotive and hopper car production will be required to meet future demands, efficient equipment management can, in part, mitigate the projected car shortages."

Commenter 114

Response. The degree to which efficient equipment management would mitigate projected car shortages cannot be quantified. For example, improvements in turnaround time for unit trains through greater train speeds and more mechanized loading and unloading facilities would reduce equipment shortages. On the other hand, train speeds have been reduced in certain instances in response to the growing concern in the rail industry that unit trains are causing accelerated wear and tear of tracks and roadbeds, particularly along curved trackage.

115. Comment. "A calculation from page 5-51 indicates that coal trains lose from 20-200 tons of coal per trains load. In the worst case, this says that one out of every 50 unit trains blows away. What are the effects of this emission?"

Commenter 118

Response. Estimates of wind blown coal dust (fugitive dust) range from 0.2 to 2.0 percent. A unit train carrying 10,000 tons may lose 20 to 200 tons of coal. This is a worst case estimate, because it assumes that coal is transported dry. An effective mitigation major would be to transport the coal wet and covered. This would reduce fugitive dust emissions to negligible amounts.

Fugitive coal dust would be dispersed along the train route and over a wide area. The impact of the coal particles include possible reduction in visibility, damage to surfaces of structures, injury to vegetation, and damage to human health. The severity of this damage and the toxicological and epidemiological effects of coal dust are a function of particle size, concentration, and composition.

116. Comment. "On page 5-87, it is stated that 'Because coal transportation systems are not labor intensive, employment growth to transport coal would not be as dramatic as for mining or use of coal.' This is opposite the findings of the Colstrip III and IV EIS. Which is correct?"

Commenter 121

Response. Relative to other phases of the coal cycle, coal transportation facilities require lower per-ton labor inputs and higher per-ton capital inputs. Accordingly, it is reasonable to characterize coal transport systems as capital intensive rather than labor intensive.

117. Comment. "Although the draft addresses the problems associated with hauling coal by truck or by train, it does not recognize the severe adverse effects on both state and county roads not just from an unaccustomed volume of commuter traffic but also from the hauling of heavy equipment to and from mine or facility sites. This stress and the construction of new or relocated roads can cause overwhelming highway and roadway expenses."

Commenter 121

Response. The text of the FES reflects this comment.

118. Comment. "The bulk of the discussion on transportation impacts dwells at length on the impacts on the railroad industry. However, discussion of impacts on people due to railroad transport of coal is so brief that the statement virtually ignores this major impact. The impacts of railroad/highway crossing blockage, community disruption, and financing mitigation measures warrant discussion in character with the rest of the text."

Commenter 122, 121

Response. The text of the FES has been modified to reflect the concerns indicated in the comment.

119. Comment. "In Chapter 5, Regional Impacts, Page 5-113, the environmental impacts resulting from the transportation of coal by rail, there should be some mention of rail-side ecosystems. An appropriate comment here could be taken from a report published by the Office of Technology Assessment, dated March 1978, entitled, 'Coal Slurry Pipelines.' On Page 117, 118 and 120 of this report there is a rather complete review of the disruption of biological communities from two

modes of coal transportation systems. Copies of these pages have been attached."

Commenter 006

Response. The FES addresses the ecological impacts of rail transportation of coal in Section 5.3.5.

120. Comment. "On Page 5-116, the third paragraph under section 5.2.5.4, Coal Slurry Pipelines, the sentence which begins, 'While this quantity of water would be a small portion of available surface water, ... underlying the Madison Formation, the exporting of such a valuable resource has met with the opposition from Westerners,' we would suggest that the last part of this sentence read as follows, '... the exporting of such a valuable resource has met with opposition from some Westerners and is receiving growing support from others.' To support this suggested change, we have attached a copy of a letter to Sen. Dale Bumpers from Mr. Frank B. Odasz which includes a list of coal slurry pipeline proponents. This information is documented on Page 271 of hearings that were conducted on the Coal Pipeline Act on May 17, May 25, and June 19, 1978, before the Subcommittee on Public Lands and Resources (Publication No. 95-136.) To further support this addition, we have enclosed a copy of a list of Wyoming proponents of the coal slurry pipeline."

Commenter 006

Response. The FES text has been altered to indicate that the coal slurry pipeline issue receives mixed support and opposition from Westerners.

121. Comment. "On page 5-113, it is stated that funds are available from the 1978 Surface Transportation Act for rail-highway grade crossing improvements. It should be more specifically pointed out that this is a limited amount which is intended for use throughout the state. The needs at other locations throughout the state must also be recognized."

Response. It is understood that funds for rail-highway grade crossing improvements are not solely intended for rail lines hauling coal.

122. Comment. "Figure 5-3 shows no coal being moved by rail from the McKinley Mine to Texas or Arizona."

Commenters 019, 135

Response. Although these movements may have been occurring, they were not considered to be

of major volume. Figures 5.4 and 5.5 (1985 and 1990 interregional flows) should be consulted to obtain a graphical concept of how the total future coal productions will move.

123. Comment. "The major projected sources for unconventional natural gas are in the geopressurized zones of the Gulf Coast and the Rocky Mountain overthrust belt. Thus, such sources are perfectly situated to service the same region which will be receiving the bulk of Western coal (Figures 5-4, 5-5, show Texas, Western Interior and Other East (the Midwest) receiving the bulk of Western coal). There is also a good transportation network already in place. No mention is made of any of these facts."

Commenter 097

Response. Section 2.5 addresses trends in other sources of energy such as unconventional natural gas in the Gulf Coast and the Rocky Mountain states. It further states that this resource is considerable but the recovery technology has yet to be developed. Therefore, future development of unconventional natural gas may, at some future date, become a significant source of energy affecting the interregional demands of Western coal but not in the immediate future.

124. Comment. "The DES makes only passing reference to slurry pipelines because certain constraints on slurry transportation are unresolved. This avoidance of slurry pipeline issues is hardly justifiable in a presentation which undertakes to forecast such nebulous topics as coal demand and effects of coal demand in 1990. Slurry line proponents themselves represent that slurry line construction is a certainty in the early 1980's.

"In light of the serious environmental risks posed by slurry pipelines - especially the diversion of Wyoming's scarce water resource - careful treatment of these environmental impacts seems required."

Commenter 067

Response. Speculation as to the resolution of the major unresolved issues affecting future development of coal slurry pipelines is beyond the scope of this programmatic ES. The potential quantity of coal to be transported by slurry pipelines has been incorporated in estimation of potential environmental impacts. Environmental impact statements will be prepared prior to pipeline construction and operation. These impacts will be addressed quanti-

tatively on a site-specific basis when the specific pipeline routes have been identified.

125. Comment. "The DES indicates that certain rail links may have shortfalls in capacity to haul future coal traffic. Table 5-62, Potentially Constrained Rail Links, page 5-110, specifically identifies two Burlington Northern routes which allegedly will be unable to handle expected traffic volumes. Because reference No. 77 was omitted from the resource list at the end of Chapter 5, we are unable to analyze the assumptions which lead to the 'capacity shortfall' conclusion. The DES does recognize on page 5-109 that the railroad industry has expressed willingness to expand line capacity to accommodate projected increases in coal traffic. Capacity on the Burlington Northern route east from Gillette to South Dakota border (through Clifton) is adequate for current traffic levels and additional track is planned for this segment in the near future. The second Burlington Northern route mentioned (from Frannie Junction to Cheyenne) is not on an existing or planned route for unit coal trains and, therefore, the expectation of a severe capacity shortfall is puzzling. A portion of this route from Orin Junction to Wheatland, Wyoming is a coal route for which improvements to increase capacity are also planned in the near future. In light of the railroad industry's expressed willingness and plans to expand capacity of rail lines to meet projected coal traffic, Table 5-62 has only marginal significance. It would be more accurate and informative to include in this table information indicating track capacity after projected improvements have been made."

Commenter 067

Response. Reference No. 77 was inadvertently shown as the source of the data presented in Table 5-62 (Table 5-82 of the FES); this reference is not germane to the table. The information shown is based on original analysis which is intended to identify potential railroad capacity constraints on anticipated coal flows rather than projected track capacities. Coal flow data, developed as described in Section H.2.3, were the primary input to the analysis. Centroids (cities) were selected for the already indentified coal producing and consuming areas and formed into origin-destination pairs appropriate to the coal flow data. The route between each O-D pair was

then selected on the bases of lease circuitry and roadbed quality. The routes selected do not necessarily reflect existing routes as they were predicted on the coal flow information. The capacity of each route was expressed in terms of trains per day (assumed to be 25 for single-track lines and 70 for double-track lines). The number of trains per day required for estimated non-coal traffic was deducted from capacity and the balance compared (on a gross ton-mile basis) to coal traffic requirements. The capacity shortfall on the five routes shown in FES Table 5-82 rests, therefore, on the assumed track capacity of 25 trains per day in each case and on the estimated coal flow over these routes. To the extent that track capacity is above or will be increased beyond this level by 1985 or that the coal flow is overstated, the indicated capacity shortfall would be mitigated.

126. Comment. "The DES purports to compare energy consumed by various modes of transportation in moving coal from production facilities to other locations on the coal cycle. See pages 5-116 and H-54. The estimations of operating energy expended by railroads and slurry pipelines are not only inaccurate but are completely out of proportion. The recent task report on coal slurry pipelines prepared by the Office of Technology Assessment predicts slurry pipeline operation would consume about 920 BTUs per net ton-mile versus only 400 BTUs for rail transportation of the same quantity. Office of Technology Assessment, 1978. A Technology Assessment of Coal Slurry Pipelines. Washington, D.C., Volume II, Part 2, page 205. Burlington Northern's own experience with unit coal train service indicates a figure slightly lower than 400 BTUs per ton-mile. The DES energy consumption rates of 670 BTU for rail carriers and 450 BTU for slurry pipelines are unsupportable."

Commenter 067

Response. The comment noted that Burlington Northern's own experience of energy consumption is 400 BTUs per ton-mile versus reported 670 BTUs for rail carriers.

The 670 BTUs per ton-mile (Section 5.3.6 of the DES) were divided by 1.78 to give 376 BTUs per gross ton-mile. This closely agrees with Burlington Northern's statement. Also, on a gross ton-mile basis, pipelines consume more energy than railroads. How much more is argumentative.

It should be noted here that these numbers are subject to a number of varied interrelated influences, and they should be viewed as representative on a national basis rather than definitive.

Further information can be found in: "Committee on Interior and Insular Affairs, U.S. Senate, Conservation of Energy, A National Fuels and Energy policy study, serial #92-18, Washington, D.C., 1972 page 50.

127. Comment. "Again, in Section 5.2.5.1, the analysis of transportation impacts deliberately sets forth only the worst case situation in which the vast majority of coal is moved by railroads with a variety of resulting impacts. The Department should try to develop again a 'most likely' impact scenario because even where discussions are relatively brief and it is clearly stated that they are on the worst cases basis, a reader is likely to lose sight of that in attempting a detailed review of the bewildering amount of data contained in the Statement.

"The last paragraph on page 5-113 makes the incredible statement that it is possible to construct major new rail lines without prior authorization from the Federal government. In support of this statement is a footnote reference to a publication based solely on one section of the Interstate Commerce Act. We are aware of no major rail lines that have been constructed or that are proposed for construction which could avoid getting any authorization from the Federal government. Even in instances where rail lines have been built as spur lines by coal companies, the construction was the subject of at least an environmental analysis or an environmental impact statement because it was associated with one or more coal mine developments which in themselves required some Federal authorization. Therefore, the fears expressed in this part of the Statement would seem to be wholly unfounded and unnecessarily raise problems for new coal development in the West.

"As is noted in the closing sentence of this Section, such considerations have far-reaching social and political implications which can only be considered by Congress and not in an environmental impact statement on only one of a number of activities which will affect the population growth and result in environmental impacts in the West. This Section vividly portrays just a few of the many serious problems which would be created by

any end-use control system so that it is difficult to understand why the Department is expending any effort in further consideration of this option."

Commenter 066

Response. The mentioned article cites these instances where major rail extensions were or may be constructed without any prior approval of the Federal government. For example, a 19.2 mile line was constructed in 1972 by the Decker Coal Company to link its mine (with projected 1980 production of approximately 20 million tons) with The Burlington Northern mainline at Sheridan, Wyoming. No detailed environmental analysis was conducted for this line. In addition, the article notes on page 185 that "... the Burlington Northern recently prepared a preliminary engineering report for the 43.7 mile line from The Big Sky Spur near Colstrip to Ashland, Wyoming. The railroad's preferred route does not enter The Crow or Cheyenne Reservations and avoids Bureau of Land Management properties. "Accordingly, no right-of-work permit ... would be required." If built by a coal company or if classified as a spur line, commission authorization would similarly not be required.

128. Comment. "The ES's assumption that coal transportation will not be a problem stands in stark contrast to statements of industry spokesmen. Burlington Northern Chairman Louis Menk has stated that his company, a leading transporter of coal, is 'critically short of cars and locomotives', and Randall Meyer, President of EXXON Co. USA, has stated that 'The limitation (on producing Western coal) is getting coal trains in and out of there'. Wall Street Journal, February 15, 1978, p. 31.

"Exacerbating this problem, of course, is the huge quantities of capital which will be required to build up the railroads' coal hauling capabilities to handle and move a six-fold increase in Western coal production over the time period 1976-1990. According to the ES, during that time period, coal movement by railroad will increase at an even faster rate: from 110 billion ton-miles in 1976 to 872 billion ton-miles in 1990 (p. 5-109). Will this staggering increase cause any financing or equipment problems? 'No', says the ES analysis of supply and demand levels; 'Yes', say other portions of the ES and the railroad industry itself (p. 5-109 to 113). The most conservative estimate

in the ES is that the industry will require \$17 billion just to make capital improvements for Western coal traffic alone (p. 5-113). This will not be an easy chore for an industry whose financial strength is called 'anemic' and which has a rate of return on equity investment of 2%."

Commenter 060

Response. The DES does not imply that there would be no financing, equipment, or other problems related to achieving coal production levels projected for 1985 and 1990. Rather, Section 5.1.2.1 assumes that the mentioned factors would not present insurmountable constraints to meeting the Nation's future coal demands. While the rail industry as a whole has a low rate of return, most of the major coal-haul railroads (particularly those serving the Western coal fields) experienced rates of return considerably above the national average. For example, the five year average rates of return for the Union Pacific, Norfolk and Western, Chessie, and Burlington Northern Railroads were 6.0, 5.9, 4.8, and 4.3 percent, respectively (see Interstate Commerce Commission, 1977, Initial Paper of the Rail Services Planning Office in The Study of Rail Mergers and Consolidations. Washington, D.C.).

129. Comment. "The ES's estimates of the capital needs of the railroad industry to expand Western capacity, however, pale beside those of the coal industry itself. A US Bureau of Mines study, for example, is quoted in the Wall Street Journal as estimating that even to reach 988 million tons per year by 1985 (approximately equal to the 'low scenario') would require a capital investment of \$45.5 billion. It would also demand the training of 531,000 new miners. Wall Street Journal, September 26, 1977, p. 28. This is an incredibly difficult bill to fill in the next six years. No wonder, then, that the General Accounting Office concluded that doubling coal production to 1.2 billion tons by 1985 is impossible, and that reaching even one billion tons would be very difficult.

"Yet, the Draft ES assumes that achieving the higher of the two levels will entail no significant labor, capital, or equipment problems. It merely assumes these 'myriad problems' out of existence."

Commenter 060

Response. See response to comment 114, above.

130. Comment. "Page 5-115: There must be a discussion of the impacts of coal development in areas where there are no existing paved roads. The following statement points out the inadequacies of the Draft Environmental Statement in this regard:

"Perhaps the most important impact would be the perceived, rather than actual, impact of truck traffic on a local community-in terms of traffic volume, noise and vibrations, coal spillage and visual impacts".

"This irresponsible statement points out that whoever wrote this Draft Environmental Impact Statement has no perception of problems outside the scope of suburban life where this statement might have some validity.

"In the entire San Juan Basin, that area of the San Juan River Coal Region where most coal development will take place, there are two paved roads, neither of which comes near the areas to be developed. The impacts of traffic related to coal development in this area are tremendous and must be addressed."

Commenter 057

Response. The term "community" as used in the environmental statement is broadly construed to include rural as well as suburban areas. The need for paved roads in sparsely populated areas is but one component of local infrastructures which would be adversely impacted by accelerated coal development. Related fiscal impacts and tax lead time shortfalls are discussed in sections 5.2.4.4 and 5.2.4.5 of the DES.

131. Comment. "Inflated estimations of coal production from the Powder River Basin will cause a significant overstatement of impacts from coal transportation by rail carriers. Impacts attributed to rail operations in the Powder River Basin region are exaggerated throughout the DES and presumably are high for other regions as well. Track capacity, gaseous emissions from combustion of locomotive fuel and other impacts are dependent on coal volume transported and the system for transportation. All of the above factors appear to have been calculated based on a unit train consisting of 100 cars. In actuality, most Burlington Northern unit trains are and will be comprised of 110 cars, giving a train capacity of 11,000 tons. Ignoring for now differences in coal volume projections, the faulty assumption of a 100-car train leads to numerous erroneous conclusions,

Track capacity, for example, is stated as the number of trains per day over a track segment before congestion occurs. Generally tonnage hauled is not considered. Thus, the amount of coal which could be transported over a given line segment per day would be greater in 110-car trains than in 100-car trains."

Commenter 067

Response. The use of 100-car, 10,000 ton capacity unit trains reflects a generally accepted national average for unit train movements. It is recognized that actual train configurations vary widely depending upon track grade and curvature, operating practices of individual railroads, the availability of in-service hopper cars and engines, and the volume of coal movements to utilities and other consumptive points.

While most Burlington Northern unit trains will consist of 110 cars, the average system-wide capacity would be somewhat less.

132. Comment. "P. 5-115, 5.2.5.3 - Highway Transportation. The following information was not given and should be if there are potential impacts:

- a. Bridge weight restrictions.
- b. Highway design capacities - volume at service level C.
- c. Road bed construction.
- d. Additional traffic generated by employees and families.
- e. Noise generation.
- f. Impacts on small towns where the main street is often a major Federal or State Highway."

Commenter 031

Response. The need for highway improvements and additions mentioned in Section 5.3.5.3 would depend in part on the impacts mentioned, particularly bridge weight restrictions, highway design capacities, and secondary traffic generation. Truck transport of coal greatly accelerates the deterioration of road surfaces, particularly on secondary and local coal haul routes. The actual extent of resulting environmental impacts cannot be determined at the programmatic level as they are dependent on localized road conditions and coal haulage volumes.

133. Comment. "Pages 5-59 thru 5-72 show tables of estimates of emissions of SO₂, particulates, and other pollutants for 1985 and 1990 under the several alternative plans as well as the

preferred program. These show increases for the western areas, in particular those in the Southwest. The Bureau of Land Management should ensure that the requirements of the Clean Air Act Amendments of 1977 are fulfilled and that the program is implemented in a manner that will not impair the air quality related values that are a highly significant component of the environment of units of the National Park System in this region."

Commenter 233

Response. The impact of coal leasing on regional air quality will be assessed as part of the regional lease sales environmental impact statements under the Secretary's preferred program. Lease sale schedules would be conducted to avoid violations of the Clean Air Act Amendments as a direct result of mining or due to mine-related developments. In conducting the regional lease sales analyses, the BLM will be especially cautious about mine-related impacts on the air quality of National Parks and other Federal land management systems. Where such impacts are forecast, the participation of the affected land management agency would be sought.

134. **Comment.** "(Page 5-59) The discussion with respect PSD in the DES is related totally to power plants. The FES should address EPA's policy with respect to PSD and mining (i.e., EPA's treatment of fugitive dust). OSM's treatment of the fugitive dust issue should also be discussed."

Commenter 091

Response. The PSD discussion on page 5-59 in the DES gave one example that related to a power plant and was *not* related totally to power plants. The PSD class designations (Class I, II, and III) presently establish maximum allowable air quality degradation in terms of allowable incremental increases in sulfur dioxide and particulates. (PSD regulations for other criteria pollutants are expected later this year). The PSD system is not directed toward a specific activity or activity category but rather toward the air quality of the area, regardless of the source of potential pollutants in the area.

The document has been revised to include a discussion of the contribution of OSM's fugitive-dust control regulations to air quality.

SUBALTERNATIVES

1. **Comment.** "Section 5.4.7 discusses the apparent preferred alternative definition for 'maximum economic recovery' which requires that recovery be based on the mining of all collectively mineable seams in a property. While it is advantageous that a coal company have the option to mine all seams within one property rather than leasing separate seams to different companies, such an election should be based, as reflected in the third alternative discussed in this Section, on sound engineering practices which can be readily adapted to changing mining technology and economics. Any profit-making company such as a coal company which invests huge amounts of capital in its projects cannot realistically be expected to act to reduce the return on that investment by failing to mine the maximum amount of coal from each seam which can be safely and efficiently mined."

Commenter 066

Response. The Department recognizes that carrying out the Congress' directive to ensure that all mining plans for Federal leases achieve "maximum economic recovery" of the coal in the lease is one of the more difficult problems it faces. The goal of the standard is laudable: to make sure that coal is not unnecessarily left in the ground. Unfortunately, the solution is not as simple as the commenter suggests. First, companies do not have the incentive to mine all reasonably available coal—they have only the incentive to mine the coal that will yield the highest profit. Second, not all companies are capable of consistently maximizing their own return. Resistance to innovation is one factor, for example, that may limit a company from maximizing its return. The underground mining portion of the coal industry in the United States has been slow to adopt longwall mining techniques even though they are widely accepted in other countries. The failure to adopt this technique may be due to a variety of factors, but whatever the reason, the principle effect is that a lot of coal that might otherwise be recovered is permanently left in the ground. If the standard could be limited to situations where there will be major differences in total recovery it might be of universal benefit. The problem with this solution is that it appears that Congress was concerned with more subtle situations as well and intended the Department to oversee narrow gradations of recovery as well as large ones. As the text notes,

the major drawbacks of this approach are that it begins to involve the Department heavily in reviewing day-to-day economic decisions of a given company.

2. Comment. "5.4.2: In this section on requiring underground mining, references to the economic aspects of mining should be worked into the discussion."

Commenter 079

Response. The section does refer to economic aspects, particularly with a reference to the \$8-15 per ton cost difference between surface and underground mining. Additional language has been inserted to explain that the expected decline of production in some regions as a result of this policy stems almost entirely from economic considerations.

3. Comment. "5.4.2 Require Underground Mining"

"The summary of this alternative is at best, superficial and really lacks thoroughness. Such an alternative makes so little sense that it would be best to discard it in the final analysis. Fearing this will not be the case, we submit some additional thoughts.

"1. Some of the best reserves (quality) may be too shallow to mine by underground methods.

"2. It is assumed in the conclusion that safety can be assured by Federal regulations in underground mines to insure that their fatality/injury rate is similar to that of a surface mine. It is also assumed in the conclusion that Federal regulations concerning surface mine regulations will not have a similar positive effect on reclamation.

"3. By requiring only underground mining, the presently developed surface mining operations may wither away as fee reserves are depleted or surface mining becomes uneconomical because logical surface mining units are no longer available without the combination of fee and federal leases. This could cause serious social costs to surface mine employees whose services are no longer needed. It cannot be assumed that they will become underground miners. It cannot be assumed that a significant number will be absorbed into other jobs within the community.

"4. It is recognized that underground mining requires significantly more manpower than surface mining. One fact that is not discussed, is the

environmental damage that would be caused by the additional urbanization required to house and serve this larger number of miners. This environmental disturbance would be of a permanent nature. Environmental damage from surface mines is recognized and emphasized to the extent that it would be assumed that no reclamation was, or will be occurring. This is not the case as a number of mines have conducted good reclamation in recent years. The Federal surface mine law of 1977 requires thorough reclamation, controls the introduction of sediment into streams and insures that the area is replaced to its approximately original contour. Environmental damage caused by a surface mining operation is transitory; environmental damage caused by urbanization is permanent.

"5. Wishing away the cost differentials like those found between underground mining and surface mining, can only happen in the Federal government and sewing circles."

Commenter 152

Response. The text has been revised in response to the comment.

4. Comment. "Section 5.4.5 discusses diligence and continuous operation requirements. This section opens with a brief statement as to the advantages for strictly applying such requirements. It should be noted that the imposition of end-use controls would significantly decrease if not eliminate most of these advantages.

"Also in this Section, the Department continues to stress the fact that many existing leases are not producing. Although it is not disputed that some of these leases have been and continue to be held for speculation, it should also be noted that it was only within the last five or six years that there was any real market incentive for the development of western coal in general. Furthermore, as has already been noted in the Statement many of these leases exist in units too small for economic development or in areas where development would be prohibited or unduly costly because of environmental considerations. To this list of constraints beyond the control of the lessees of non-producing leases must be added the fact that in the past five or six years 'the rules of the game' for federal coal leasing and the stipulations under which mining could be conducted, if at all, have been changing constantly and significantly. In view of these facts

and the statements made at the top of the second column on page 5-133 concerning the long lead time to the opening of mines even under the best of conditions, it can be seen that many of the leases which were not developed are and perhaps will remain so because of circumstances beyond the control of either the lessee and/or the Department.

"Also on page 5-133, is a discussion of alternatives to the present diligent development and continuous operation requirements. It is puzzling why the Department of the Interior is concerning itself with such alternatives since it acknowledges at the beginning of this discussion that the authority to adopt any such alternatives is totally the responsibility of the Department of Energy."

Commenter 066

Response. The discussion of diligence is included in the programmatic statement first because factors affecting whether existing leases will be developed will, over the next five to 10 years, affect whether and to what extent the Department should lease additional coal reserves. Evaluation of existing lease production potential is part of the process required by the memorandum of understanding between DOE and Interior and is part of the regional production target process in the preferred program. The discussion will also be of some use to the DOE should it decide to modify the existing regulatory requirements for new leases.

As to the point that leases are not being developed because of "circumstances beyond the control of either the lessee or the Department", the Mineral Leasing Act does not contemplate that coal leases can be held indefinitely without production. Under the Act, a lessee is required to make prompt, active efforts to achieve production. Failing that, the lease should be returned to the government. Finally, the Department does not agree that government delays or changes in rules have substantially impeded western coal leases.

5. Comment. "It is necessary that both biological and social impacts be minimized in the process of siting new mining activities in Montana. The current experimental nature of mitigation of mining impacts in the undisturbed rural areas of the West indicates that concentration of mining activities and their effects is the only feasible strategy for reducing uncontrollable, areawide disruption. The draft Federal Coal Management

E.S. (DES) briefly discusses this option in Section 5.4.4. This strategy for Western coal mine siting is also covered in more detail in a paper presented to the Conference on Energy and the Public Lands, III, at the University of Utah, August 18, 1978, which should be studied by the Dept. of Interior.

"In Section 5.4.4, 'Concentrating Federal Leases,' several problems are pointed out regarding this strategy, in particular, the concentration of air and water pollution. It would be beneficial to concentrate these impacts so that a more economical and effective program of monitoring and abatement could be utilized. The construction of one or only a few high quality water treatment facilities, for use by several companies, would be less expensive and more effective in protecting water quality. Similarly, the joint use of dust abatement equipment and materials would be more cost effective and give better results. The current situation in Montana involves serious violations of TSP regulations at every mining site where monitoring networks are sufficient to adequately measure air quality. The Montana air quality regulatory process is currently inadequate (with financial support from the federal government) and will be spread more thinly and be even less effective with further dispersal of mining activities. Concentration of air pollution sources is the only way the regulatory agencies will catch up with the problems of monitoring and equitable enforcement, given the existing monetary constraints.

"Federal Coal Leasing Policy Guidelines: 'Where', 'When', and 'How' Curry, Robert R. and Charles van Hook. Conference on Energy and the Public Lands, III. Univ. of Utah, Park City, Utah. Aug. 18, 1978."

Commenter 071

Response. The text has been modified to show the advantages of concentration to regulatory agencies and overall compliance with environmental laws. The preferred program seeks to handle problems like this as part of the regional tract ranking process which will help determine tracts or patterns of development can best meet the nation's energy needs with minimum disruption in each region.

6. Comment. "Section 5.4.8 discusses unsuitability criteria development. Although it is not expressly stated in this Section, it is assumed that

the task force field studies and reports applying the draft criteria would be available to the public. These field tests as described in the third full paragraph on page 5-141 were applied in sections of Montana and Wyoming to indicate an exclusion of one-third to one-half of the available federal coal resources. This result is all the more incredible and unrealistic when viewed with the fact that such exclusion did not apply all twenty-four unsuitability criteria even though some of the criteria have since been modified to permit more leasing. As discussed above, it would appear that the criteria, particularly that related to endangered species and wildlife habitat, is being applied most rigidly and without exceptions or compromises which have been so often experienced in past development impacts on such aspects of the environment. It is hoped that the Department will consider a wholesale review and revision of the unsuitability criteria to minimize the amount of coal which would be excluded while meeting the clear mandates of relevant legislation. In the final statement, the Department should include an analysis of the same areas to which the draft unsuitability criteria were applied so that the industry and public in general can have a clear concept of just how and to what extent criteria in this final proposed form would exclude federal coal resources from development."

Commenter 066

Response. The Department shares the concern of this comment that land not be excluded from leasing unless mining would have a harmful effect on the resource that a criteria is intended to protect. This is particularly true with respect to wildlife concerns where field experience shows that some wildlife species can co-exist with coal mining operations if the operations are conducted with a reasonable degree of sensitivity to the wildlife. The Department's proposed standards are supposed to be sensitive to the distinction. The results of the new field tests of these standards were not available in time to be included in this final statement. We expect to publish a notice of availability of the results of the field tests on or about May 15, 1979.

7. Comment. "1. On page 5-131 under the heading of End Use Considerations, the text reads, 'To encourage development of new technology a lease stipulation could require the coal in the lease to be developed by a particular mining

method (such as in-situ gasification) to protect lands that offer high potential for a new technology.' I believe there is a need for encouraging development of new coal technologies and that lease terms can be an effective mechanism for advancing these new technologies. Other than stipulating the end use to which a coal lease can be put as exemplified in the above quotation, I suggest that certain lease terms as mandated by the Federal Coal Leasing Amendments Act of 1976 be modified for lessees and preference right lease applicants whose mining method is a new technology. Modifications recommended to encourage new technologies are:

"—Extension to 15 years the period for achieving diligent development. Retention of the provision allowing the Secretary to grant one five year extension to the period for achieving diligent development because of time needed to complete development of advanced technology.

"—Provision for advance royalties to be paid for 15 years.

"—Extension of the total 40 year production time to 50 years where reserves are large enough to warrant such an extension.

"Since the Department of Energy now has the authority to revise diligent development and continuous operation regulations and has established production goal levels for synthetic fuels produced by coal gasification, it seems appropriate that the Leasing Liaison Committee establish lease terms tailored to provide incentives for new coal technologies."

Commenter 112

Response. All three of these points would require new legislation to carry them out since the Mineral Leasing Act as amended by the Federal Coal Leasing Amendments Act mandates 10-year diligence requirements, allows advance royalties for only 10 years, and requires production of all reserves from mining plans in 40 years. As part of the decision making process, the Department may recommend legislative changes. The particular proposal raised by the comment is evaluated in section 5.4.5.

8. Comment. "Section 5.4.8 and Tables 5-72 and 5-73 discuss the unsuitability criteria utilized by the coal task force in the summary of 1978. The proposed unsuitability criteria which were published in the December 8, 1978 Federal Register

(43 Fed. Reg. 57668-57670) differ substantially from the unsuitability criteria discussed in the DEIS. The body of the FEIS should reflect the new proposed criteria and should contain sufficient information to permit a reader of the FEIS to know what areas of federal coal lands will be deemed unsuitable under each criterion and what amounts of coal will be excluded from consideration for development by utilization of each criterion."

Commenter 090

Response. Section 5.4.8 and Tables 5-72 and 5-73 differ from the actual proposed unsuitability criteria as of December 8, 1978, because the field tested criteria were scrutinized and modified in certain seemingly appropriate instances prior to December 8, 1978. The FES text of Chapter 3 and Appendix A (Proposed Regulations) contain detailed information on unsuitability criteria.

9. Comment. "Para. 5.4.9 implies EMARS II was boycotted by all environmental groups. This was not the case and should be so stated. For the BLM's Chaco Planning Unit alone, two environmental groups made nominations."

Commenters 019 and 135

Response. Section 5.4.9 states that the nominations process was boycotted by a "large number" of environmental groups rather than "all" environmental groups.

MITIGATION

1. Comment. "The DES fails to substantively address the problems of socio-economic impacts of leasing federal coal, and the preferred program avoids establishing any guidelines or specific requirements to include these effects in decision-making.

"The DES shows a complete misconception of the nature of the disruption in statements like: 'While the change offers long-term opportunities for the communities in question, short-term distress has too often been the more visible result.' (p. 6-4) The long-term benefits of extraction of a nonrenewable resource, particularly by strip mining in an area where reclamation is dubious, will very likely be the 'bust' of unemployment and poverty.

"The DES goes so far as to cheerfully suggest a public relations effort (top of p. 6-5), in coordina-

tion with the few who enjoy an economic boom with industrialization, as a mitigation measure.

"Since much of the federal coal lies in rural, agricultural areas, the introduction of coal mining will radically alter the character and economy of the communities. State and local governments, and the public, should be involved in determining levels of leasing. Guidelines or standards on levels of social and economic impacts that can be borne in an area should be developed."

Commenter 061

Response. The purpose of the FES is to analyze the environmental impacts of the preferred program and its alternatives. Among these impacts are the socio-economic impacts. The socio-economic findings in Chapter 5 demonstrate the above-described alteration of the character and economy of the communities (short-term and long-term), as well as benefits and detriments. The state and local governmental inputs to program decisions which drive these impacts are addressed in Chapter 3 of the FES.

2. Comment. "While we appreciate the symbolic attempt to mitigate the adverse impacts of the proposed action, it is obvious that this section is sorely lacking. The impacts itemized in Chapter Five are on quite a different and removed level of specificity compared to the mitigating measures. If the impact statement is to be consistent, it must speak in the same terms and planes in all chapters. Chapter Six attempts to conceptually mitigate the impacts, but does nothing to practically deal with the problems."

Commenter 118

Response. Chapter 6 addresses the mitigatory measures of a program which already incorporates environmental mitigatory measures, such as the unsuitability criteria. Chapter 5 addresses the environmental impacts of the total program, including these mitigatory measures. It is therefore not practical to address mitigation in the same terms as does Chapter 5.

3. Comment. "6.3.2 - Socioeconomic Impact Mitigation" "The statement fails to adequately point out the full range of assistance available to impacted communities. Of particular consequence are the changes in the formula for distributing federal royalty payments; increases in state severance taxes, impact aid under the Federal Land Policy and Management Act (FLPMA), and

payments in-lieu-of-taxes. Several, but not all, of the above programs are mentioned (6.3.2.8), but there is no quantification of the assistance available, or potentially available, to communities impacted by federal coal development. We believe the data will show a significant amount of financial aid is readily available which could reduce the socioeconomic impacts involved. In any case, further information should be provided."

Commenter 069

Response. An estimation of the quantity of financial assistance available, or potentially available, to communities impacted by Federal coal development is an economic issue as opposed to an environmental impact and as such is beyond the scope of the FES.

4. **Comment.** "The first introductory paragraph on page 6-1 contains the statement that 'The impact analysis in the previous chapter (Chapter Five) does not include those mitigating measures required by law or regulation' (emphasis added). As written, this is inconsistent with statements in Chapter Five, and we assume that a typographical error has been made. We believe the word 'not' in the above sentence should be deleted."

Commenter 069

Response. Agreed. The FES contains the suggested modification.

5. **Comment.** "On page 6-5 in the first column nine principal factors are listed which are to be considered in evaluating any impact of the proposed decisions discussed in this Statement. One of those factors is labeled 'cost internalization' and refers to the extent to which costs of all adverse impacts can be borne by the producing company or passed through to energy consumers.

"This statement perpetuates the popular myth that large corporations should be made to bear the brunt of costs which would be completely absorbed by them. In fact these costs simply add to the price of the coal or the product produced by the coal such as electricity and so all of these costs can be expected to ultimately be passed through to the energy-consuming public. This should be made clear in the final statement so that members of the public are not eager to adopt or support provisions which would unrealistically increase the price of the coal on the mistaken belief that in so doing their individual cost of energy consumption or of coping with the environmental impacts of coal

development are reduced. It is true that costs may be shifted into the operator's internal cost structure, so that such costs might be hidden from the public but to suggest that doing so 'relieves' the consumer from these costs is simply not true."

Commenter 066

Response. Cost internalization (the extent to which the costs of addressing adverse impacts resulting from energy development are borne by the producing company or passed through in energy product processes to energy consumers) is presented as one of nine factors which merit consideration during the evaluating of impacts of proposed decisions. It is in no way intended to imply that industry, or for that matter consumers, should be made to bear any cost whatsoever.

6. **Comment.** "Page 6-3: "The statement is made here that the changes brought about by coal development will bring about long-term opportunities for impacted communities. In many areas the changes will actually spawn ghost towns and the eradication of traditional lifestyles. These end results should be discussed in detail in the final Environmental Statement."

Commenter 057

Response. The socio-economic analysis in Chapter 5 (Section 5.3.4.1) contains an impact analysis of population changes.

7. **Comment.** "Our principal concern in development of the coal resources of the Colorado River Basin is in regard to the possible production and disposal of saline drainage waters resulting from the operation of the mines and coal-using facilities. To minimize deleterious impacts, the mines and coal-using facilities should operate in accordance with the policy, adopted by the Colorado River Basin Salinity Control Forum and the states of the Colorado River Basin, of no-salt n-returns in industrial discharges, wherever practicable."

Commenter 113

Response. All coal development operations are required to be conducted within the confines of all local, state, and Federal legislation. We assume these funds will be applied in the areas of greatest need.

8. **Comment.** "Although the statement carefully explains the Department's limited role in mitigation of socio-economic impacts, we fail to

find a thoughtful statement of what the Department can do. Let me be more specific. The statement might offer comment on what kind of a mitigation program could work, even if new legislation or modified budget requests are required. The statement could describe what assistance could be forthcoming to the states and local communities under the loan provisions of the Federal Policy Land Management Act. The statement could review the current involvement and coordination, or lack thereof, of other federal agencies with the Department of Interior, and what might be done to improve joint mitigation efforts. The issues of phasing of coal development and stipulations in leases to mitigate impacts—two critical tools—are not adequately addressed. Four pages devoted to mitigation of socio-economic impacts in the statement gives the appearance of an afterthought to an otherwise comprehensive statement. For the western states, socio-economic considerations are at the forefront of our concerns. The mitigation of these impacts must be realistically and thoughtfully addressed in the final EIS."

Commenter 155

Response. The Department can best mitigate socio-economic impacts on local communities by coordinating their actions with local communities and states. This kind of cooperation would prevent most of the "surprises" that have occurred in some rapidly growing areas. The Department believes it is the responsibility of state and local governments to plan for and provide the public services and facilities needed to meet the demands of a growing population. The state and local governments have the taxing authorities and land-use planning and control authorities that makes them the best qualified to meet these public needs. Front-end costs are a problem but they can be met by state governments; federal government assistance is available through a number of programs.

9. **Comment.** "Page 3-20: "Section 522 of the Surface Mining Control and Reclamation Act sets out certain standards for the protection of the environment. One of the standards set out is that the protection of all aquifers be provided for."

"In the San Juan River Coal Region, especially in the San Juan Basin where most of the coal activity of the Region will take place, coal development will probably depend exclusively on water from the existing aquifer. However, no

discussion of how the aquifer will be protected is included in this section. Since aquifers provide the only water supply for much of this region, discussion of mitigation measures is imperative."

Commenter 057

Response. Site-specific issues such as this must be addressed at the Land Use Planning step, the EIS on any lease sales, and the mining and reclamation plan. This issue, as important as it is, is beyond the scope of the Programmatic EIS.

10. Comment.

"On page 6-3, it is stated that 'The Secretary has also indicated that the Department should be responsible for determining, with reasonable certainty, that a specific tract can be developed without severe or permanent harm to the environment . . .'

"This obviously precludes development of coal leases in the Northern Powder River and Fort Union Coal Basins, as well as coal formations in other semiarid and arid areas, until the success of existing reclamation attempts has been thoroughly evaluated.

"It is also stated that EMRIA 'would provide site-specific reclamation data for use at the several decision points in the preferred program. . . From whom would this data be obtained and which points in the decision-making process are being referred to?'

Commenter 071

Response. The success so far of reclamation in the Powder River Basin and Fort Union Basin indicates surface mining can be carried out in those areas; however, some areas cannot be mined under present standards. All proposed mining will be reviewed on a site-by-site basis either by the state or OSM for an adequate reclamation plan.

The scope of the EMRIA program is presently under review, however, basic data generated by EMRIA would be used as input to tract site-specific analyses for ranking and selection purposes. EMRIA would also input to the inventory generated at the beginning of land use planning and possibly to the review of the mining and reclamation plan submitted by the coal developer.

11. Comment. *"Chapter 6-Mitigation of Major Adverse Impacts of a Federal Coal Management Program"*

"Opportunities for mitigation should be provided on a site-specific basis. We question that the

regional EIS approach will accomplish this objective. The preferred program should clearly describe its links to the process called for in SMCRA.

"A mitigative or compensatory measure not mentioned in this comment would be to provide habitat improvement concurrent with or preceding development of a coal mine in adjacent areas. This could provide habitat sufficient to sustain displaced animals in some instances and minimize the losses to wildlife for the thirty-to-thirty-plus year project life and until reclamation can be accomplished. This would be far preferable to an approach of using the unsuitability criteria as a means to exclude areas from any development, before the lands have been examined in detail for these kinds of possibilities."

Commenter 093

Response The unsuitability criteria do allow the local land manager to consider mitigation on a site-specific basis where appropriate; for example, the state resident wildlife criteria (o) do say that a lease may be issued where complete mitigation is possible or where the species being protected will not be adversely affected by all or certain methods of mining activity. The mitigation technique mentioned of providing enhanced habitat near a mine site to handle displaced populations for the life of the mine would be appropriate, especially if coupled with reclamation of some of the lands to wildlife habitat. The state resident wildlife criterion is not focused on general wildlife conservation, but rather preservation of high-interest populations from extinction or reduction to a critical level within an area. Wildlife conservation is expected to be sought most often through the use of threshold procedures by the local land manager.

12. **Comment.** "There are operations now in the state that are at an elevation of approximately nine thousand feet, and that's quite near the surface in the area of these operations.

"Considerable volumes of water are being interfered with in this operation, and the water is very vital to the forest production, which takes place in practically all of our state in these elevations.

"Not only is this *high elevation water important from the standpoint of community and irrigation uses downstream* where sufficient volume is available, but it's almost a must in the utilization of the forage resources in our high forest ranges, so I

would like to see something done more than has been done to give some consideration to the surface owner."

Commenter 128

Response. Qualifying surface owners are given an absolute veto under the law over surface mining, but other surface owners whose lands overlie Federal coal deposits that will be mined using underground methods still are protected under the law against damages from mining activity. Further safeguards, in the form of withholding certain lands from consideration for leasing or of lease stipulations, will result from the land use planning and activity planning processes under the preferred program. The objective of the multiple use planning process is to preserve the long-term use of renewable resources on Federal lands. An owner of water rights is protected by state allocation laws and Federal/state water quality laws. Special provisions to protect ground water against the adverse effects of mining are included in the Surface Mining Control and Reclamation Act.

13. **Comment.** "Moreover, by incorporating into the preferred program at the pre-lease stage *extensive provisions relating to environmental protection*, the Department appears to be ignoring the effect of the Surface Mining Control and Reclamation Act of 1977 (which is not even included in Table 1-5 listing statutes affecting coal leasing). As a result, it would require many critical environmental judgments at the pre-lease stage, whereas such determinations cannot realistically be made until mine plans have been formulated.

"The effect is to exclude other sources of information and expertise and to rely instead primarily on government with respect to such critical issues as the determination of which lands may be appropriate for mining and with respect to the value of coal production as contrasted to other land uses in the multiple-use resource management tradeoff decision process. We believe this goes so far beyond the objective of environmental protection as to jeopardize the achievement of the production goals."

Commenter 087

Response. The Secretary has decided that the Department should only offer for lease lands for which it is reasonably certain mining plans can be approved. By selecting this policy, the Secretary is

offering coal companies a fairly high degree of assurance that they will not be put in the position of leasing lands only to find that they cannot mine them because of environmental considerations. Early concern for the provisions of SMCRA also ensures the Nation of a more certain flow of coal from the Federal leases and increases management flexibility. The preferred program envisions a large role for industry. In fact, the preferred program will not work without the participation of industry.

14. Comment: "(Page 5-26): With regard to discussions of impacts resulting from the various alternatives, the DES should clearly delineate impacts resulting from more coal mining and impacts from coal mining and coal conservation.

Commenter 091

Response:

As indicated in the comment, it is desirable to quantify impacts where possible. It is not possible in a programmatic impact statement to quantify impacts on soils, minerals, geology, and topography without being site-specific. When the tracts to be leased have been identified, then these impacts can be addressed quantitatively. This will occur in the regional lease sale environmental impact statements."

15. Comment. "On page 6-3, the statements in the second paragraph of the second column suggest all environmental stipulations to be attached to a particular lease and mining plan would be determined prior to the lease sale. Earlier descriptions of the lease sale and mining plan approval process indicated that at both levels the *Department would anticipate attaching special stipulations although most of the stipulations would occur prior to lease sale as is only fair to the lease bidders.* This inconsistency should be clarified in the final impact statement."

Commenter 066

Response. Not all stipulations can be developed prior to lease sale; however, the Department expects the bidder to be able to determine the costs of meeting stipulations if he is familiar with SMCRA regulations, typical mining reclamation plans for the area, and pre-lease sale stipulations.

16. Comment. "The focus of our review involved Chapter 6, Mitigation of Major Adverse Impacts of a Federal Coal Management Program.

"Our primary concern has been the need to obtain direct federal financial assistance for planning as the State of Wyoming has deemed this activity ineligible for tapping Wyoming's share of mineral leasing royalties under Section 35 of the Mineral Leasing Act of 1920, as amended by Section 317(a) of the Federal Land Policy and Management Act of 1976.

"The Sweetwater County Planning and Zoning Commission, therefore, recommends re-consideration of the Department of Interior's 'inability' to provide direct financial assistance to the planning and management functions of local and areawide agencies. We are one agency of local government who has experienced energy and mineral impact. We contend that federal coal leasing policies cannot totally abdicate responsibilities on the distribution of these funds by State government."

Commenter 018

Response. As pointed out in Chapter 6, reduction of financial burdens on interest affected by leasing are anticipated as a result of the emphasis on early application of protective and mitigative measures. The preferred program and several alternatives are constructed to assure state, local, and Federal participation beginning in these early phases and continuing throughout the leasing process. As indicated in Chapter 6, financial assistance is beyond the Department's direct jurisdiction; however, some Federal assistance for planning and management possibly is available under section 601 of the Powerplant and Industrial Fuels Use Act of 1978 to be implemented by the Secretary of Agriculture.

17. Comment. "We assume that the wide effects of air and water degradation that might accompany coal development are being addressed, yet the draft ES says little about how impacts to these resources will be avoided or minimized. Degradation of air and water resources is equally as important as impacts resulting in direct losses of fish and wildlife habitat."

Commenter 287

Response. The program itself is geared toward managing Federal coal in an environmentally sound manner. Thus, because many of the program's elements are environmental mitigating measures (i.e. the unsuitability criteria and land use planning), the chapter on mitigation is limited and appears to be relatively small. It should be

noted that in addition to be mitigatory aspects of the program, air and water resources are protected by Federal, state, and local environmental statutes. For further information on relevant state statutes, refer to Appendix I.

18. Comment. "To our knowledge, there are no guidelines by which conflicts between oil and gas and coal production can be controlled or mitigated. Conversations with industry and governmental agencies have indicated that the two activities can occur on the same ground, but that protection of the oil and gas well(s) and pipelines would be required. It is the general opinion that leaving coal barriers or pillars to protect the wells and pipelines is perhaps the proper solution. If our information is correct, it would require leaving a coal pillar 2,000 feet in diameter to protect an oil or gas well where the coal is 1,000 feet below ground surface. This is assuming an angle of draw for subsidence of 45 degrees. Using an average coal thickness of 10 feet, this would result in the leaving of about 1,000,000 tons of coal for each well. A like amount would also be left for protection of each 2,000 feet of pipeline. This generates the following questions:

1. Are supporting coal pillars a proven method for the protection of oil and gas wells and pipelines?
2. Is this an acceptable method?
3. Who would be responsible should damage to an oil or gas well occur from the effects of coal mining?
4. Who would be responsible for the coal resources loss? For the coal value lost?
5. Would the coal company be given other coal to compensate for that lost?"

Commenter 282

Response. In the Mining Regulations, these issues are addressed under parts 211.11 and 211.21 which refer to mine plan and oil and gas/ coal management by the USFS Area Mining Supervisor and the Area O&G Supervisors

Coal pillars are an approved method, and are an acceptable method.

No damage should occur but if it did and the company should be found to have been negligent, then the coal company would be responsible. The USFS and MSHA would probably also be called on to account for such a problem.

There would be no loss if the well was already in place and a known effect on the mining plant, ie., the coal was known not to be recoverable.

19. Comment. "A mitigative or compensatory measure not mentioned in this document would be to provide habitat improvement concurrent with or preceding development of a coal mine in adjacent areas. This could provide habitat sufficient to sustain displaced animals in some instances and minimize the losses to wildlife for the thirty- to forty-plus-year project life and until reclamation can be accomplished."

Commenter 266

Response. Where it is feasible, providing enhanced habitat for displaced animals is a sound mitigative strategy. Such a strategy is not always possible, however, since many species require a definite amount of territory, and this spatial requirement varies only slightly with the quality of the habitat available. This form of mitigation could be recommended as a result of general land use planning, site profile analyses, or mine plan development by the lessee,

LONG-TERM IMPACTS

1. Comment. "Table 7-1. Production figures given again conflict with those in the Star Lake-Bisti Regional EIS."

Commenters 019, 135

Response. The geographic boundaries and consequently the data bases differ for the Star Lake-Bisti Regional ES and this FES.

2. Comment. "The second flaw is the substance of the impact analysis. It is misleading, contradictory, erroneous and based on false assumptions. One such assumption is that all "mitigating measures required by law or regulation" are 'in operation.' (p. 7-1) Using reclamation as an example, this assumes that all coal mines can and will reclaim to the standards of the federal act. The long history of poor reclamation enforcement in this country and the short record of the Office of Surface Mining's efforts do not support the rosy optimism implied in that assumption."

Commenter 154

Response. While the Department of the Interior intends to fully implement statutory responsibilities in mitigating mining impacts, the point of Chapter 7 is to realistically recognize those impacts which may be unavoidable. The program

described in the Environmental Statement is designed to assure, in conjunction with OSM's efforts, that only coal lands that are reclaimable will be mined and that all lands mined will be reclaimed.

3. Comment. "TDWR believes that the programmatic water resources impact analysis on pages 7-1 and 7-2 should include the following points:

- a. The consumptive use of water resources impact analysis induced energy - related or industrial activities (e.g., "mine-mouth" steam electric generating plants) may further degrade water quality in certain streams and rivers by increasing dissolved solids concentrations and by reducing the assimilative capacity for other pollutants as a consequence of reduced streamflows.
- b. Recent Federal regulations mandating the use of sulfur removal techniques on all new coal-fired power plants will substantially increase both water consumption and the amount of sulfur-bearing sludge that must be disposed.
- c. The cumulative effect of Federal regulations which involve increased water demands and consumptive water use in energy-related activities, is cause for concern in water-short areas such as certain portions of the Texas Coal Region, as the national coal production and conversion programs are escalated. TDWR believes that the feasibility of mitigative actions should be considered with respect to federal regulations which do not provide the necessary engineering flexibility to adapt energy-related activities to local, geologic, climatic, and hydrologic conditions. For example, the revised national standards for thermal discharges from electric power plants do not appear to provide the maximum; reasonable latitude for engineering flexibility in the design of cooling systems. This flexibility would permit the optimum selection and use of cooling systems (i.e., wet cooling towers, single-purpose cooling reservoirs, once-through cooling or multiple-purpose reservoirs, streams, or estuaries, and dry cooling systems, etc.) which would provide the

most desirable balance between water conservation (including minimum water consumption) and environmental protection."

Commenter 056

Response. The FES (Section 7.1.1.5) contains the modification suggested in point a. Points b and c however, are not addressed because the effects of recent Federal legislation are not the subject of this statement.

4. Comment. "Section 7.1.1.1 states that topographic features would be adversely altered by construction and mining. There exists considerable potential for upgrading the land surface to higher beneficial configuration after mining is completed. The draft should include discussion of such possibilities."

Commenter 106

Response. The purpose of the FES is to assess the environmental impacts of the preferred program and the alternatives. Regardless of the ultimate programmatic decision of the Department, coal companies would be required to comply with SMCRA, as well as any other regional reclamation laws. The environmental impact analysis is thus confined to these requirements, and any further analysis is beyond the scope of this FES.

5. Comment. "Portions of chapter 7 discuss the fact that reclamation is by no means an assured thing in many areas of the arid west. Given this uncertainty, it is difficult to put much faith in table 7-5 where estimates of wildlife populations that could be supported on reclaimed lands are made."

Commenter 121

Response. Section 7.3.4 has been revised to indicate that the wildlife populations which could be supported by reclaimed lands are a direct function of land in reclamation at any given time. Table 7-5 has been eliminated since it is no longer considered necessary.

6. Comment. "Tables 7.3 and 7.4 are also very misleading. They seem to indicate that reclamation will reestablish "forest" in the Powder River and Fort Union regions. It should be pointed out that to date very little success has been noted in attempts to reestablish ponderosa pine in these regions."

Commenter 121

Response. Tables 7.3 and 7.4 have been deleted, and replaced by a new table 7.2 which displays estimates of long term and short term land disturbances.

7. **Comment.** "The statement is made that 'Loss of habitat and reductions in population would occur as unavoidable consequences during the mining and use of coal.' Wildlife studies conducted the past five years at Peabody's Big Sky Mine have not shown a reduction in population due to the mining activity. The size of population appears to be more dependent on climatic changes and its effect on vegetation. In addition, additional acreage of certain habitat types beneficial to wildlife (i.e., reclamation areas and water impoundments) may be established. The statement also says that 'blasting, construction, and other noises associated with the mining activity would be unavoidable and would frighten away some wildlife species.' Wildlife species are adaptable to noise, as is man. Although animals may initially scatter at the time of a blast, studies have shown that a creature will generally remain within its territorial range. Elimination of surface water bodies would adversely affect waterfowl, but changes made by the mining activity can also be beneficial to waterfowl. Big Sky Mine has increased the waterfowl population in the area with the creation of shallow reclamation ponds. In essence, temporary disruption may occur, but long-term benefits could ensue. The statement should reflect this possibility. The statement remarks that 'In most cases, however, the diversity, density, and composition of the new populations would be altered from previous conditions.' Diversity, density, and composition are dynamic aspects of wildlife populations, and therefore constantly changing. Just because one of these aspects, or all three, may be altered to some degree does not necessarily mean that the impact is adverse."

Commenter 069

Response. Section 7.1.2 has not been altered to reflect these criticisms because (1) the elimination of vegetation during surface mining activity does eliminate habitat for species using the involved acreage and the carrying capacity for these species is therefore reduced (2) "some" sensitive species would not become habituated to intrusive noises and would therefore be frightened away, (3) the elimination of surface waters tradi-

tionally used for food, cover, and nesting sites generally is not replaced by the ecological features of a reclamation pond, and (4) in most cases human-induced changes in diversity, density, and composition of wildlife populations generally are more adverse than beneficial to the total ecosystem. It warrants mention, however, that environmentally sound mining and reclamation practices in many cases can minimize these adverse impacts and ultimately lead to the restoration of the ecosystem to its near natural state.

8. **Comment.** "Basic coal mining operations do not require large quantities of water, as it implied on page 7-2 (second column, first paragraph). Some water is used in coal processing facilities, but the only water used at some mines is for dust suppression and sanitary needs. Frequently, pit water provides most of the water requirements for a mining operation."

Commenter 069

Response. The large quantities of water referred to in Section 7.1.1.5 reflect the water requirements quantifications of Chapter 5's water impacts section. Although the individual water requirements of certain mines may be relatively small, the potential total regional water requirements are considered large.

9. **Comments.** "In that same Section (on page 7-8), statements are again repeated to the effect that reclamation will require from five to fifteen years in most areas. These statements are based on studies which were either conducted when there was little if any information available to accurately assess reclamation efforts on western coal mines or before the implementation of the strict reclamation requirements of applicable state statutes and SMCRA. These statements should be modified in view of these developments if for no other reason than that such assumptions left uncontested can result in enormous burdens to operators by extending and increasing bonding requirements unnecessarily. Such costs are, of course, passed on to the ultimate consumer of energy and products produced from coal."

Commenter 066

Response. Due to the SMCRA requirements concerning mining and reclamation upon prime farmland, the above-referenced statement has been deleted.

10. Comment. "In Section 7.1.3 (second full paragraph of the second column on page 7-3) a statement is made to the effect that prospects for higher wages in coal development areas would attract new people which would necessarily exceed the demand for labor and cause increases in unemployment. This statement would appear to be contrary to all experience to date with coal development in the West. The final impact statement should explain on what basis the Department asserts this statement since it is assumed in other parts of the Statement that coal development would severely decrease current unemployment rather than result ultimately in an increase of unemployment."

Commenter 066

Response. This statement is not included in the FES as it may not be the general case.

11. Comment. "In Section 7.1.1.2 the long term effects of mining on soils is discussed with the conclusion that some areas of the West would require hundreds of years for natural processes to reestablish fertile soils. This must assume that the disturbance of those soils will result from activity which will be clearly in violation of SMCRA which emphatically requires the segregation of all soils and the return and stabilization of all soils on mined areas. Perhaps this statement is referring to soil disturbances resulting from general population growth which are not controllable by operating companies. Under such circumstances, it should be made clear that this is not the responsibility of operating companies. Again, such extreme statements unnecessarily alarm all those who are already very concerned about increased coal development in the West and particularly agricultural interests. If space does not allow objective explanation of such statements then they should not be made in the first place. Such statements are even more incredible in view of other comments made in portions of the Statement. For example, in Section 7.1.2 (at the beginning of p. 7-3), it is flatly stated that mining simply would not be allowed in the first place on lands which could not be reclaimed and that bonding to insure reclamation would certainly continue after mining in areas where reclamation was particularly difficult."

Commenter 066

Response. In view of SMCRA, this statement has been deleted from Section 7.1.1.2 of the FES. It

should be noted, however, that violations of SMCRA could result in such lengthy reclamation time periods and that mining activities do create the potential for these effects.

12. Comment. "It appears that the description of the long-term effects of the preferred program and its alternatives tends to disregard the mitigative effects of recent environmental protection statutes. For example, the possible disruptions to the hydrologic balance mentioned in the statement (page 7-2, first column, third paragraph) would not appear to be reasonable in view of the provisions of SMCRA which prohibit disruption of the hydrologic balance. Adverse water quality impacts (page 7-2, second column, second paragraph) will be greatly mitigated by waste treatment and erosion control requirements under the Clean Water Act and SMCRA. The statement seems to belie the effects of these statutes."

Commenter 069

Response. Section 7.1.1.5 acknowledges the mitigatory effects of SMCRA, but goes on to state how certain coal mining activities would increase the potential for some unavoidable degradation of local and regional water quality.

13. Comment. "Section 7.3.3 discusses productivity of lands as affected by reclaimability. Again, as in Chapter 5, statements are made which indicate that even though existing laws require adequate bonds to insure the ultimate removal of all structures will be left and the land so disturbed will never be reclaimed. It is not clear how or why the Department makes this assumption and it is certainly contrary to the express provisions of SMCRA."

Commenter 066

Response. Although SMCRA requires comprehensive reclamation efforts for lands disturbed by coal mining, certain buildings may not be subject to reclamation. This is particularly true where coal development induces community development or transportation facility development and associated buildings become a permanent feature of the environment. Most structures constructed in association with coal mining operations, however, will be subject to demolition during reclamation, as required by SMCRA.

14. Comment. "Although it is difficult to assess long-term ecological effects of specific stresses,

some comments can be made regarding potential consequences of coal development. For example, strip mining thick beds with shallow overburden can significantly alter drainage and erosional patterns. Mining can alter the quality and quantity of both surface and ground water, alter soil characteristics, and change the topography and geology of the land. Soils in arid and semi-arid climates recover very slowly, so loss of productivity could be a significant factor."

Commenter 089

Response. The issues raised in this comment regarding potential ecological consequences of coal development are addressed in Section 7.1.1.

15. **Comment.** "Table 7-3 should include references. For example, we cannot determine whether the table represents potential productivity on an annual basis or in total. Some of the estimates for reclaimed land in Table 7-3 are as much as ten times greater than current empirical data would show for unmined land.

Commenter 069

Response. Tables 7-3 and 7-4 have been deleted.

16. **Comment.** "The statement does not assess the long-run impacts of the environmental stresses which will be caused by the preferred program. The statement acknowledges that the preferred program and any other alternative involving significant amounts of coal development will create serious environmental stresses in regions where coal is mined. However, it does not attempt to estimate the impacts that these stresses will have on those regions. We believe that an evaluation of the long-run consequences on particular species and ecosystems within each region is also essential to any decision concerning Federal coal leasing policy. To its credit, the statement does attempt to address the issue of ecological impacts. Unfortunately, the assessment is too superficial to be meaningful; moreover, it relies once again on some questionable assumptions. For example, the statement estimates plant and wildlife losses by multiplying plant and wildlife densities by the estimated number of acres directly disturbed by coal development. (p. H-26.)"

Commenter 089

Response. Without knowing specific sites or their location each alternative has an equal potential for impacting all or some of the charac-

teristic environments in a region. Land disturbance, as a function of coal production, is a variable. By applying average or typical densities for vegetation and wildlife to these variations estimates of the relative magnitude of an alternative can be derived. Only when sites are better defined and boundary areas narrowed can impacts for a particular species be projected meaningfully. We believe the level of detail in the programmatic is appropriate to decisionmaking at this level.

17. **Comment.** "In a Nuclear Regulatory Commission Report of June, 1973 it was stated that, 'Disposal of the coal ash ... deserves radioactive waste management consideration.' What are the cumulative affects of long term radioactive releases from coal fired plants? This statement does not do justice to the subject whatsoever."

Commenter 118

Response Traces of materials that are harmful to man or his environment are present in raw coal. These materials include potentially hazardous trace elements, toxic compounds, and radioactive substances. The concentrations of these materials in the ash from coal-fired plants may increase. Not enough information is currently available on the concentrations involved nor what concentration levels pose a health hazard.

18. **Comment.** "A discussion of long-term consequences resulting from the use of coal should allude to the belief among some climatologists that fossil fuel burning will lead to unacceptably high levels of carbon dioxide in the atmosphere. The resultant 'greenhouse effect' would increase the mean atmosphere temperature by several degrees, resulting in the onset of significant climatological changes. However, not all climatologists agree that increased atmospheric CO₂ will significantly affect the climate, and whether the net impact of any such climate change would be favorable or unfavorable is not known. Energy policy-makers should, nevertheless, be aware that possibly negative climatic impacts could result from increased development of coal resources."

Commenter 256

Response. The potential for coal development to cause increased atmospheric discharge which in turn could create its "greenhouse effect" is addressed in the Chapter 5 section on "Potential Air Quality Impacts".

INTRA-AGENCY COOPERATION

1. Comment. "A centralized decision making process, whereby the federal government attempts to control the rate and the location at which new mines will open, will have an anticompetitive effect on the marketplace by artificially limiting supply. In addition, such limitation on supply would have an inflationary impact through limiting the availability of coal to meet demands in a timely manner as they increase. (It does not appear, from the DES, page 8-17, Table 8-3, Federal Agencies Requested to Comment on the Draft Environmental Statement, that the Justice Department has been consulted in the formulation of the preferred program, as is required by the provisions of Section 15 of the Federal Coal Leasing Amendments Act of 1976, which provided for Justice Department participation in formulating the regulations and all aspects of the program in order to promote a competitive atmosphere.)"

Commenter 087

Response. Government control over the rate and location of coal development on Federal lands is a necessary corollary of government ownership over the mineral resource. The debate whether the government should control larger amounts of land began in earnest in the late 1800's and has continued until the present. At every important juncture, the latest being the enactment of FLPMA, the Congress has decided in favor of government retention of lands. The question, then, is not whether the government will exercise control over the lands it owns, but whether it will do so in a wise way. In the specific area of encouraging competition, it is obvious that the government can play a very beneficial role. It can adopt bidding procedures that lower the entry requirements, it can set aside sales for small businesses, it can set low acreage limitations and stiff diligence requirements to prevent large companies from dominating important reserves, and it can lease to assure that potential market entrants will be able to obtain needed coal reserves. It can also refuse to lease where the issuance would tend to cause violations of the anti-trust laws. The preferred program contains all of these elements.

The Justice Department does have an important role in this process (see new text in 1.3.2.4), as does the Energy Department, which can issue rates on bidding systems and competition. Although Chapter 8 did not adequately outline consultation

in the draft, the final statement sets out fully the consultation that took place.

2. Comment. "Section 8.1 describes in part several memoranda of understanding which are or will be executed by the various federal agencies with often overlapping authority for various portions of the federal coal leasing program. Although no deadline is suggested for the completion and publication of these memoranda, it would surely be highly desirable that such memoranda be available to the public for comment before or at the time of publication of the final impact statement."

Commenter 066

Response. Chapter 8.1 of the FES contains information on the availability of the MOU's.

GENERAL COMMENTS

1. Comment. "In this regard, I would like to interject another point. I might consider that there is also serious questions about their use of the interdisciplinary approach as required under NEPA. It requires a systematic and integrated approach, and I don't see that in the draft and, in fact, technically it could be illegal , if we really wanted to press it to maybe the fine lines."

Commenter 178

Response. The interdisciplinary approach was used during the preparation of the FES. For example, personnel trained in the following disciplines were employed: mineral and resource economics, community planning, computer programming, ecology, transportation technology, mining engineering, geology, forestry, biology, recreation planning, natural resource sciences, law, and personnel management.

2. Comment. "From beginning to end of the statement, economic benefits are downplayed and other values are overstated."

Commenter 136

Response. The purpose of this FES is to assess the range of environmental impacts due to any decision to adopt a Federal coal management program. Although strict monetary benefits and detriments are beyond the scope of this assessment, the socio-economic analysis does assess pertinent economic impacts. Also, the discussion in Chapter 5 on economic impacts of program alternatives has been expanded.

3. Comment. "The ES states that anticipated coal development in the Uinta-Southwest Utah region, which includes Delta County, exceeds the 1990 Department of Energy high production projection. Because coal production is expected to increase at a rapid rate without new federal leasing, we believe that the capacity of the area to sustain more growth should be carefully considered before any new leasing occurs."

Commenter 167

Response. This and other socio-economic effects are the subject of this FES and will be the subject of any future site-specific intraregional environmental analysis which will be prepared subsequent to tract delineation.

4. Comment. "The League of Women Voters believes that prime agricultural land and the water to make it productive should be preserved. A careful assessment should be made of the impacts of removing water from agriculture. There is a need for cumulative assessment of regional impacts to assure that the agricultural base of an area like Delta County is not destroyed."

Commenter 167

Response. The cumulative assessment of resource tradeoff decisions will be the subject of site-specific regional lease sales analyses, which would be prepared subsequent to tract delineation.

5. Comment. "There is another area of interest and that concerns resource conflict. The San Juan Basin coal region is underlain by the richest uranium belt in the country. The Power River Coal Basin is underlain by the second richest uranium basin in the country. Thus we find two major energy fuels competing for surface access. These concerns are not addressed in the federal coal management program. When you do exploration work for uranium, you need surface access to the sites even if they are very deep. You need to drill holes, you need a surface location to drill the holes. Even though there may be very deep coal, very deep uranium underlying very shallow coal, there are still resource conflict issues, in terms of just resource development that need to be developed in the final impact statement."

Commenters 137 and 146

Response. The cumulative assessment of resource tradeoff decisions would be the subject of the land-use plan/EIS process and site-specific

intraregional environmental analyses, which will be prepared subsequent to tract delineation.

6. Comment. "Two counties in the SENCOG area with known coal deposits are Nemaha and Pawnee. Since the deposits are known to be along the western side of the Missouri River in Nemaha County in the Brownville area, there is concern for the bluffs and for historic preservation in the Brownville area. It is felt that efforts should be developed for administering the program with other federal agencies that own lands which have mineral deposits. In this case the Corps of Engineers."

Commenter 001

Response. As stated in Chapter 1 of the FES, this is a programmatic statement addressing the existing environment and impacts resulting from a Federal coal management program in a general way. The extent and amount of historical-cultural values encountered on Federal land varies considerably from area to area. It is essential that these values be discussed on a site-specific basis prior to adopting any specific plans or proposals. Chapters 5, 7, and 8 in the final statement provide a general discussion on the cultural, historical and archaeological resources as well as the consultation and coordination efforts that were initiated between Federal, state and local governments in preparing this programmatic ES. The Department coordinates its coal leasing responsibilities with other Federal surface management agencies.

7. Comment. "How can regional environmental statements be prepared before there is a national leasing policy? How can the impacts of a non-existent coal program be assessed? As we find later on in the Programmatic, these areas are slated to be leased first because of these premature regional environmental statements."

Commenter 165

Response. Regional lease sales environmental impact statements will not be prepared until the Secretary makes a decision to conduct sales. Regional environmental statements, as well as this FES, are prepared based on a number of Departmental options prior to any decision on a major Federal action significantly affecting the quality of the human environment. After the environmental impacts of these options are weighed a decision on a Federal coal management program can be made. It should be noted that the Federal actions

pending decision during the preparation of previous regional coal environmental statements were basically mining and reclamation plans or rail right-of-way application approves or denials. Since the Department will have augmented data bases for these regions, but mostly since these regions represent those areas with the highest coal development potential, it does seem most likely that leasing over the next several years would be mainly located in these regions.

8. Comment. "The greatest weakness, however, it seems to me in the Programmatic is in the lack of protection for communities against adverse social and economic impacts that will follow from coal development. Of course, I'm particularly concerned with the treatment of our region, the Uinta-Southwest Utah Coal Region, and particularly with the Uncompahgre Area. In the first place, the Department does not justify the need for further federal coal leasing in our area. Yet, because we have an adequate MFP and West Central Regional EIS, which have been rushed through, we suddenly find ourselves as one of the prime targets for coal developments in the nation. The Programmatic clearly reveals that in order to meet Department goals by 1990, the Uinta Region should actually take 3.2 million tons of coal out of production."

Commenter 164

Response. The purpose of the FES is to assess impacts including adverse community impacts and the mitigating measures thereof so that prudent programmatic decisions can be made. Furthermore, the FES does not indicate any regional coal production requirements for any time period, but rather uses a high, moderate, and low level of production estimates to assess the potential range of environmental impacts. The need for leasing targets will not be decided until the Department has had time to weigh the results of this first EIS.

9. Comment. "We feel that greater consideration should be given alternative uses of the federal lands—for example, agricultural and recreational values should be given a higher status vis-a-vis the value accorded the coal resource."

Commenter 160

Response. Resource tradeoff decisions would receive due consideration during the land use planning phase of the program. Except for those values protected by unsuitability criteria, which do include some protection of agricultural and recrea-

tional sites, decisions are made on their case-by-case merits.

10. Comment. "Contacts or involvements of the Soil Conservation Districts are not mentioned. The impact of mining and related activities should be made known to local Soil and Water Conservation Districts."

Commenter 116

Response. It is the policy of the Department to provide all copies of coal-related environmental statements to the Department of Agriculture for review. Accordingly, the Soil Conservation Service is provided a means to the requested information. SCDS could obtain information in this way or through local notices of actions and meetings put out by the BLM and FS.

11. Comment. "The ES fails to describe the relationship between coal management in general and other major Bureau programs such as grazing plans and the wilderness inventory. There is no discussion of areas of critical environmental concern and how differing interpretations of that concept could affect existing leases."

Commenter 060

Response. During the land use planning phase of the program, resources tradeoffs, including those resources managed under other major Bureau programs would be weighed prior to any ultimate resource development decisions. Also during the land use planning phase, critical environmental concerns would be considered. ACECs are not a direct feature of the coal programs. For further detail refer to the land use planning text of Chapter 3, and to the proposed BLM planning regulations (Federal Register, December 15, 1978).

12. Comment. "Also, from an environmental impact point of view, do we really want to increase production in certain geographic areas at the expense of other geographic areas? By increasing production in the Powder River Basin, we would be concentrating impacts in this area and along the already overcrowded Burlington Northern rail corridor, which connects this area with its logical markets in the Midwest."

Commenter 197

Response. It is true that by increasing coal production in the Powder River Coal Region, adverse transportation impacts would be intensi-

fied along existing rail corridors, as identified in Chapter 5. Western railways, however, are aware of this potential and have begun efforts to improve their transportation facilities. The question of concentrated regional development is a valid issue of which the Department will weigh the pros and cons prior to any decision on the Federal Coal Management Program. Generally, the level of leasing of coal in any region is determined by the competitiveness of the coal in the market place.

13. Comment. "There is no word in the Environmental Impact Statement concerning how existing mines will be treated. We would submit to you that this is a flaw, in this Environmental Impact Statement, because if it is the Department's objective to lease and produce the maximum amount of coal with minimum environmental impacts, then certainly existing mining operations deserve special consideration, because these mining operations can double and even triple with very few, if any, environmental or socioeconomic impacts."

Commenter 197

Response. It is true that existing mining operations can, in certain instances, increase production without creating a proportionate increase in environmental impacts. However, whether these high levels are sustainable or cost efficient is questionable. The jurisdiction of this Federal Coal Management Program, however, concerns the future management of coal resources on Federal lands. This program provides for an orderly rate of mine development and protection. To this end Chapter 2 addresses the production potential of Federal coal.

14. Comment. "Criteria and guidelines for the protection and recovery of paleontological resources have not been released; therefore, the public is unable to evaluate those resources and potential impacts."

Commenters 069 and 109

Response. Paleontological resources are a new responsibility for the BLM and the criteria and guidelines for their protection, recovery and inventory are in an embryonic stage.

Interim guidelines were issued in a BLM instruction memorandum (79-111, Nov. 29, 1978). These interim guidelines will be developed further in the near future so that paleontological resources can be fully integrated into the BLM inventory

planning system and achieve a position equal to that of other resources on the public lands.

15. Comment. "It can be stated categorically that no one, today, can know whether they will be able to mine coal from a federal lease until they have gone down the long, long road above described and have in hand all the local, state and federal permits required to be able to legally mine coal. There can not possibly be a significant impact on the human environment from a coal mine until there is, in fact, coal that is legally available to mine and legally mineable. That can not be known by the federal government, or by a lessee of federal coal, until the lessee has in hand all of the required permits. In the process of obtaining all the required permits, a legally adequate 'site-specific' environmental impact statement must be prepared before the proposed mine plan will be approved. Therefore, it is the approval by the federal government of the mine plan, not the issuance of a lease, that is today the 'major federal action significantly affecting the human environment'."

Commenter 053

Response. The application of NEPA to the process of issuing Federal coal leases and granting mining permits is far from settled; several court cases which will help resolve this question have not been finally decided. These include *Sierra Club v Andrus* (Does the Department have to prepare an environmental statement before it issues a geothermal lease) and *EDF v Andrus* (Does the Department have to do an environmental statement on a detailed development plan for an oil shale lease where it has done an environmental statement prior to lease issuance). At what point in the process does the Department irrevocably commit resources and allow actions which significantly affect the human environment? When does a statement done on a general topic satisfy the need for a statement on a more specific application? The potential solutions to the problem are complex and worthy of extended discussion.

The process leading to mining of coal from a federal lease is a series of steps each of which narrows the options available to the government and industry and increases the resources that have been committed to a particular project, and limits the usefulness of each additional commitment except for how it promotes mining.

Completion of a Land Use Plan

Preparation or revision of a land use plan involves a moderate commitment of Interior's resources, to prepare the plan, but the information obtained has broad applicability. Information gathered to see if coal development is potentially a wise use of land can also be used to evaluate grazing or wildlife needs, or to make decisions on wilderness design characteristics. No other uses are precluded by adoption of a plan, no rights are granted to a private party, since only those areas totally unsuited to coal development are eliminated in the plan. The Department neither commits itself to issuance of a particular lease, or to a particular level of development in the planning unit. Identification of potential, not commitment is the goal of a land-use plan, while it does take effort to do a land-use plan, the effort is a general one and gives only minimal drive to mining.

Industry's commitment is similarly limited. It may expend money to gather information to submit to the resource managers, but it gains no expectation of rights nor can it rely on the eventual outcome. To both industry and the Department excluded not included activities is the focus of the land-use plans.

Lease Issuance: Delineation, selection, ranking of tracts and preparation of sale schedules and issuance of a lease entail a Department commitment of resources on an entirely different scale than that done to complete a land-use plan. The work done at this stage is important or needed only if coal leasing will be done. It is a more intensive focusing on the resources involved and the commitment rises extensively. Lease issuance is also the time when the Department makes the basic commitment to allow coal to be mined by a particular company at a particular site. Under the preferred program, the procedures leading up to lease issuance will give the answers to a broad variety of questions. Is there good coal at the lease site that can be mined under today's economic conditions? Are the social impacts of development acceptable? How will mine development affect state and local financing? Is it expected that the eventual lessee can meet all environmental laws? Lease issuance is also the threshold point for industry; the fundamental relationship between a company changes when a lease is issued. The company is no longer a mere applicant for a right, someone with a hope of mining; it is a holder of a

prescribed set of rights and has to undertake a specified set of duties. It must pay "fair market value" for its rights, pay rent and begin to prepare a mining plan for submission within three years. Pre-lease expenditure might be limited to several hundred thousand dollars at the most; post-lease expenditures will rise into the millions of dollars. Both for the Department and industry lease issuance is a crucial expensive step needed to mine coal. Even though the company's rights are conditioned the performance of certain actions and compliance with all laws, the relative position of the parties has greatly changed. There can be little doubt that it will be enormously more difficult to refuse to approve a mining plan than it would have been to refuse to issue a lease. As the commenter notes, however, issuance of a lease does not mean that mining will necessarily occur. It does mean that mining will occur if it can do so consistent with the lease and all applicable laws and regulations. To date, there has been no case where mining has been totally disallowed on a Federal lease despite the fact that virtually all leases were issued before Congress enacted NEPA. Despite the possibility that mining may not take place, because of the high likelihood that it will occur, and because of the fundamental change in degree of commitment by both industry and government, the Department feels it must do an environmental statement before it issues a lease.

The need to do an environmental statement before lease issuance is consistent with the Departments view that it is overwhelmingly in the public interest to resolve basic questions about the desirability of coal development as early in the process as possible. In other words, to save everyone time and money, everyone should take their best shot at whether to favor or oppose coal leasing at a particular location before a lease is issued, technical consideration on how to mine the coal should be everyone's concern; a leaseholder should not have to suffer delay while people endlessly argue whether leasing should take place.

16. Comment. "Table 5-6. No units of measurement."

Commenters 019 and 135

Response. The unit of measure for DES Table 5-6 is thousands of acres. This error is corrected in the FES.

17. Comment. "Moreover, consideration should be given to the effect of the passage of the Surface Mining Control and Reclamation Act (SMCRA) on the injunction issued in *NRDC vs. Hughes* and whether since the passage of the SMCRA, any federal leasing can be considered a major federal action with significant effect on the environment in view of the fact that the lessee must still comply with the severe environmental constraints of SMCRA. Should the department still consider itself bound by the mandates of that injunction, which caused the preparation of this document?"

Commenter 087

Response. The Department does not feel that the enactment of SMCRA eliminates the need to prepare an environmental statement on the coal program, although it does confirm that this statement should focus more on ways to analyze need for leasing and broad impacts of coal development rather than standards for mining at specific sites. While at times the obligations to prepare a NEPA statement seem more procedural than substantive, the Department considers this statement to have been most helpful in preparing to make decisions on a crucial range of issues that have developed over the years. Because the papers which formed the basis for the proposed program were used heavily in this statement, consideration of environmental impacts was truly a part of the decision-making process. The Department has for the first time gotten a good feel for the potential relationship between total production and Federal leases, for the potential of production from existing leases, the role of split-estate lands, and a host of other important factors, as well as the effects of different development levels in different regions. Even with the excellent standards set by SMCRA, these are important questions requiring independent evaluation.

18. Comment. "Further, under the Federal Land Policy and Management Act of 1976, which I refer to as the Organic Act, new rules and regulations are being formulated with public hearings to begin about May, and so forth, on April 1st, I believe. Again, somebody else has referred to it.

"My big point here is, going back to this cornerstone, again, how can this particular very important Draft Statement be made without, you know, regular Congressional formulated, authorized type procedures? And, in this event, this act

calls for broad management authority under the principles of multiple and sustained yield—and mining is not a multiple use—inventory and identification and mapping of public lands—and, as I understand, there is a big data lack, you know, several years in some of the areas they have studied—and also comprehensive land-use planning.

"To go ahead with an environmental statement which does not have the rules, regulations, and provisions of this Congressional act firmly set out with public inputs so people can really say what's going to happen with these regulations and use those as the cornerstone would be questionable unless we have them firmed up.

"The wise course of action would be to develop the various provisions, rules and regulations with ample public hearings of the Federal Land Policy and Management Act under comprehensive land-use planning into final form rather than proceeding with an unsound draft environmental statement for the benefit of energy corporations who are pushing to get the coal leased for their private interests."

Commenter 178

Response. A new subsection has been added to section 5.4 of the FES to respond to this and similar views.

19. Comment. "Figure 2-1. This map is illegible. I suggest it be made into smaller maps."

Commenter 019

Response. The quality of this map has been improved for the FES.

20. Comment. "This draft environment statement determines that by the year 1990 solar energy will not contribute more than one or two percent of the total water and space heating requirements of the U.S. In a crisis determined to be the moral equivalent of war this nation would be wise to devote its available resources to the rapid development of this relatively benign energy resource rather than pursuing programs where the environmental tradeoffs for the net energy gain are unacceptable."

Commenter 047

Response. The development of solar energy is being actively pursued by the Department of Energy. Despite these efforts it appears unlikely that solar energy technology will be perfected by 1990. The President's National Energy Plan calls

for a major role for coal for supplying the Nation's energy needs over the coming decades. The Department of the Interior is studying the alternative means of Federal coal management in an environmentally acceptable manner. The decisions on the energy mix strategy for the Nation to take do not belong to this Department.

21. Comment. "Also, the expression "pounds of trout/acre foot of stream" is a very unusual one and is in desperate need of clarification and/or definition. Under the wetlands criterion, it should be specified whether the 5cfs is an average flow, a minimum flow, or which specific flow is intended. The Falcon Cliff Nesting Site Criterion (page 3-12) is not printed properly in the table - a portion of it is printed on page 3-10. Apparently page 3-12 should come between pages 3-9 and 3-10."

Commenter 121

Response. The FES contains the suggested juxtaposition of pages. Pounds of trout per acre foot of stream refers to the average unit weight measure of the trout population in a given unit surface area of a stream. For example 100 pounds of trout per acre foot of stream would mean that there could be 100-one pound trout or 10 - ten pound trout in an average acre of a stream. For clarity this unit measure has been changed to pounds per surface area. Unsuitability criteria will be re-evaluated and changed as needed in light of all the comments received and in light of the ongoing field tests.

22. Comment. "We would like to have seen considered as serious national policy options, such alternatives as seeking repeal or at least clarification of much of the environmental legislation of the past ten years and also consideration of a policy that eventually would convey ownership of all federal coal into private hands. There has been much made over the 'fact', the accuracy and meaning of which is still in dispute, that a disproportionate amount of federal coal is under lease relative to the amount produced from federal lands. Further, that speculation is rampant and that industry is withholding federal coal from market for self-serving reasons. This line of reasoning usually arrives at the conclusion that consequently there is no need for any additional federal leasing in the foreseeable future.

"We believe this to be a gross misinterpretation of the situation and that the conclusion is in error.

To us, the fact that 93.5% of national coal production in 1977 came from non-federal lands does not suggest we discontinue federal leasing. Instead, it strongly suggests that in order to increase production from Federal lands, the lands should be under non-federal control. Leasing is at least a step in that direction and the fact that only 791,000 acres are under lease of the 11.5 million federal acres within Known Recoverable Coal Resource Areas, which in turn is only a small part of the approximately 100 million acres of coal rights owned by the federal government, borders on the criminal for a nation hungry for domestic energy supplies. Just imagine the furor if a private corporation held such dominant control of a resource and similarly refused to allow it to be developed! And regarding speculation, we can think of no better way to encourage speculation than to withhold the major portion of a resource from the market—that is certain to drive up the price of remaining available lands."

Commenter 066

Response. The Department believes that the suggestions to repeal all the environmental legislation of the past ten years and to convey ownership of all Federal coal into private lands are unworthy of response.

23. Comment. "All related regulations which may affect the coal leasing program must be published in the FES. All other pertinent documents such as solicitors opinions, internal memorandum and the like should be gathered under one office and made available to the public without requiring an FOIA request."

Commenter 118

Response. The Department has considered printing the final surface mining regulations and the proposed BLM planning regulations under FLPMA in the final EIS. At this time we do not believe the benefit from making this ancillary information available outweighs the cost of printing, especially the cost of paper. We are also concerned that we might discourage some readers with the sheer bulk of the EIS. Final copies of those memoranda anticipated to be of interest to the public have been gathered in one place and are available upon request until supplies are exhausted. These documents are available from the BLM, Office of Coal Management (142), Washington, D.C. 20240. If supplies of these memoranda have

been exhausted or if the request is of a memorandum for which the Department did not anticipate a request, there may be a slight charge to defer duplicating costs. The Department certainly prefers to avoid the formality of an FOIA request whenever possible.

24. Comment. "The process has a built in 'chicken-egg' enigma relative to tract leasing (especially so for underground mining). Namely, the resolution of the issues raised in land planning unsuitability criteria, resource evaluation, tract selection and ranking, Regional production quotas, State government, public and industry views, site-specific impacts, and cumulative effects. Unless the data is available from all sources simultaneously, it would seem impossible to reach a decision."

Commenter 282

Response. Options for achieving data efficiencies, including the pooling of data used in making decisions on other resource programs are being examined by several task forces that include participation from the Departments Bureaus and Offices and from other Federal agencies. Programs for sharing data should improve the decision making by all parties involved with the management of Federal coal.

25. Comment. "The responsibilities of the Geological Survey are either poorly addressed or ignored. The EIS implies that the Office of Surface Mining (OSM) has the sole management role. The role of the Geological Survey in conservation and recovery of the resource should be adequately and precisely defined."

Commenter 041

Response. The USGS has been represented fully in all the deliberations bearing on the development of the coal management program.

26. Comment. "Section 2.4 of the DEIS discusses the Clean Air Act Amendments of 1970 and 1977 on power generation. This section is conclusory in style and should be expanded."

Commenter 090

Response. A brief summary of EPA estimates of alternative sulfur standard impacts on western coal production has been added to Section 2.4. Discussion of the litigation and other details concerning these standards would go beyond the scope for this EIS.

27. Comment. "We hope that the Department will continue to follow this splendid example in how to write a program EIS in its subsequent EIS efforts. Past DOI efforts have been overly formalistic, highly structured and very short on culling out issues of significance. We think this present EIS does a commendable job in initiating the spirit of the Council of Environmental Quality's new regulations stressing conciseness and attention to decisionmaking issues in EISs. We do think that larger print would be advisable in the final EIS in view of the extensive information contained throughout the document. The EIS could also use a comprehensive Table of Contents."

Commenter 281

Response The FES contains enlarged print size and a comprehensive table of contents

APPENDICES

1. Comment. A large number of commenters expressed concerns with the various components of the Example Regulations in Appendix A of the DES.

Commenters 048, 052, 055, 061, 077, 082, 087, 089, 090, 097, 098, 099, 102, 104, 120, 122, 130, 133, 281, and 282

Response. All comments on the Example Regulations were considered during the preparation of the Proposed Regulations. In many cases Departmental changes from the Example Regulations were instigated by these comments and incorporated in the preliminary rulemaking published March 1979, in the Federal Register. These comments are fully discussed in the preamble to that rulemaking.

2. Comment. "Moreover, due to the provisions of the Department of Energy Organization Act, we feel that there is a legal issue as to whether the Memorandum of Understanding between the DOI and DOE attached as Appendix B to the DES, may be in violation of the said Act and also whether the production target process described in the preferred program is in conformity with either the Department of Energy Organization Act or the said Memorandum of Understanding."

Commenter 087

Response. The Department believes that both the Memorandum of Understanding and the preferred program meet the mandates of the Department of Energy Act. We have made some

corrections to the description of the proposed program in Chapter 3 and to the example regulations to clarify that the starting point for the regional prediction process is the DOE production goals when they are available. In other words, while the statement presents a range of figures for analyses and evaluation purposes, the program will start with a set of figures suggested by the Department of Energy. The commenter does not suggest any specific problem or shortcoming; our response is necessarily equally general. The Department encourages more specific comments as part of the rulemaking process.

3. Comment. "Table C-1. The figure of 1,750 tons per acre-foot conflicts with the figure of 1,770 tons per acre-foot which must be used according to USGS General Coal Mining Order No. 1, dated July 3, 1978."

Commenter 019, 135

Response. This difference is not considered significant enough to warrant change.

4. Comment "Appendix C, figure C-3. This figure is incorrect and misleading. It shows a continuous miner and conventional equipment in the same mining section. Separate figures should show the utilization of each type of equipment. Pillar recovery should also be shown for each system, preferably on a separate figure."

Commenter: 041

Response This figure is a generalized presentation of an entire mining process. Although separate figures may be appropriate, they are not considered to be warranted for this general degree of detail.

5. Comment. "The discussion of endangered species in the Uinta-Southwestern Utah Region indicates that "... at least 10 endangered species occur in this region. Presumably this includes the Yuma clapper rail listed in Appendix Table D-2, page, D-7. This species has never been observed in Utah and should be excluded from that table."

Commenter 093

Response. The regions as originally mapped appeared to include Arizona, Colorado and Utah. The actual production region (see Figure 1-1 and Appendix J) shows only Colorado and Utah, thus Yuma Clapper rail has been deleted from list since distribution appears limited to California and Arizona.

6. Comment. "I will cite an example. I believe there is a statement in here to the extent that one animal requires 11 acres of land in order to graze adequately. The figure is probably something more like one animal for every 22 acres. The argument has been made that this land is generally unproductive and for that reason it would be worthwhile to develop the coal reserves in that area. Well, I submit to you that you should probably be considering alternatives having to do with scaled-down development for the San Juan Region for the very simple reason that the people who are there have no place to go and they do depend greatly on grazing for their livelihood. Any mining of the coal, taking into account the ratio that you propose for animal grazing in this area, will essentially short-change and put a lot of people below the poverty level than are already below it at this point."

Commenter 138

Response. The referenced statement has been changed to reflect a grazing requirement of one animal per 22 acres in accordance with this comment. The preferred program would provide for analysis of regional socio-economic impacts, including proposal of appropriate mitigation techniques. Persons from different cultural backgrounds have different capabilities to adapt to change; such facts would be considered in the regional lease sale EISs.

7. Comment. "Appendix D - Ecological Data. The Uinta-Southwestern Utah portion of Appendix Table D-1 should be modified to include one antelope per 150 acres and one mule deer per 50 acres. Division of Wildlife Resources' estimates of carrying capacity for 15 deer herd units in Utah averages one deer per 47 acres.

"Also we wonder if the pounds fish per acre-foot values included for streams and reservoirs should be pounds per acre. The values reported seem high where expressed on an acre-foot basis."

Commenter 093, 121, 266

Response. Table D-1 has been modified as indicated. Pounds per acre-foot has been corrected to read pounds per surface area.

8. Comment. "Table D-1: Estimated Regional Carrying Capacities and Primary Productivities. The acres per animal figures for some big animals are low. For example, one mule deer/100 acres in Uinta-Southwestern Utah region. The average

capacity for 15 herd units in Utah is one mule deer/47 acres based on Utah Division of Wildlife Resources data."

Commenter 266

Response. Carrying capacity for mule deer has been changed in the FES as noted.

9. Comment. "In earlier correspondence we recommended that potential losses of wildlife incorporation in Table D-5, pages D-13 through 34, be identified in terms of habitat units, not animal numbers. We reiterate that recommendation here. It is the Division's position that the numbers shown do not provide an adequate base for impact assessment or ultimate establishment of thresholds."

Commenter 266

Response. Habitat units would have more meaning at a regional or site specific level. In comparing alternatives, without knowing where actual mining activities would occur, all potential habitat within a region would need to be identified—thus no apparent difference would be detected. Once sites are determined, and if aerial photos are available or can be easily obtained, habitat units can be determined, and differences between sites can be determined. The level of detail then required (e.g. species or category such as game animal) can be applied more meaningfully.

10. Comment. "The references cited for the sources of information in Table D-1 are too general in nature for the uses to which the data is put. More site-specific studies should be cited. Much of the data were obtained as values for an entire state and used as regional values. For the San Juan River Region, 11.04 acres/animal unit is extremely low; a more believable value would be 11.04 acres/animal unit month, which would translate to 132.48 acres/animal unit, a more believable figure (USDA, Soil Conservation Service, 1977. Technical Guide, New Mexico: Technical range site description.) The value for productivity of 4.5 tons/acre/year (Table D-1) or 3.2 tons/acre/year (Table H-15) is far too high. The Soil Conservation Service estimates productivity for several range sites in the San Juan Basin to be approximately 500 pounds per acre per year (USDA, Soil Conservation Service, 1977. Technical Guide, New Mexico; Technical range site descriptions). Corn productivity is alleged to be 96.6 bushels/acre/year for the San Juan Basin;

however, the official New Mexico Agricultural Statistics, 1974, produced by New Mexico State University list average irrigated corn production in San Juan County in 1973 as 50 bushels/acre and in 1974 as 60 bushels/acre. The productivities of all crops for which values were found in the literature were below the values used in this document. All regions contain suspect productivity values. Similar productivity values also appear in Tables H-15 and H-17. The calculation of potential loss of animal units does not take into account the data in Table H-14 on allocation of land to various land-use categories; the values are calculated on the basis of each land-use category comprising 100% of the land area. Tables D-5 through D-26 are therefore suspect due to the questionable values used in the calculations of potential losses of plant and animal productivity. The use of computer modeling to derive potential biomass losses does not negate the importance of using a proper data base."

Commenter 088

Response. The references cited in Table D-1 are necessarily general because of the areas involved. As areas become better defined, data specific to given sites, if available, should be used. The intent at this level of analysis was to provide comparison among alternative leasing options.

Data used in most cases were the typical average values for each state contributing to the region. For example, average corn for grain yields for New Mexico, Colorado, Utah was 98.3 bushels, 103.3 bushels and 88.3 bushels, respectively, between 1975 and 1977. This gave an average of 96.6 bushels which was multiplied by an estimate of the amount of land assumed to be in corn. Whether the acreage allotted to corn is actually in corn, or potentially available to grow corn, and exact yields are simply beyond the scope of this document. This is not to suggest that any number could be used without some data base. It is fully expected that more representative data will be used when areas are narrowed and better defined.

Several comments have been received on the value used for animal units in the San Juan Region, ranging from the value is 10 times too high to the value is two times too low. The value of 11.04 acres/animal unit is the average derived from U.S. Department of Agriculture, Agricultural Statistics, 1975. Because of comments received it has been changed to 22 acres/animal unit/month.

With the exception of big game animals, as indicated in Table D-1, all other wildlife population estimates and animal units were derived from total acres times estimated population densities. While the percentages allotted to the various land use categories may suggest that a category occurs as a discrete unit, the regions were assumed to have a mosaic pattern of vegetation. Where grassland or range occurred continuously over broad areas, it is probable that grazing animals may remain only on range. Where range is broken by other types, it is probable that grazing animals may pass through or use these other areas for some periods of time.

11. Comment. "In this section, revegetation of range in Texas is stated as taking three years, where in Section 7.3.3 the same vegetation in Texas is stated as taking one year."

Powder River	1 game mammal/13 acres (7-5), 1 game mammal/33 to 200 acres (D-1)
Green River	1 game mammal/13 acres (7-5), 1 game mammal/66-250 acres (D-1)
Fort Union	1 predator/500 acres (7-5), 1 predator/3,200 acres (D-1)
Denver-Raton Mesa	1 game bird/5 acres (7-5), 1 game bird/1 acre (D-1)
Denver-Raton Mesa	13.7 acres.animal unit (7-5), 1.6 acres/animal unit (D-1)

In reviewing the two sets of data, Table 7-5 and Appendix D-1 seem to imply that reclaimed land in the Powder River, Green River, and Fort Union Regions will support three (3) to nineteen (19) times the relative wildlife population said to exist naturally, while the Denver-Raton Mesa will support a wildlife population five (5) to nine (9) times less than exist naturally. Explanation of this extreme variance is needed."

Commenter 069

Response. Data in Appendix Table D-1 has been checked and corrected. Table 7-5 has been eliminated.

The discrepancy between Table D-1 and Table 7-5 lies in the estimates of carrying capacity (D-1) which are based on density estimates of occupied habitat. Data in 7-5 presents estimates if all area is occupied habitat. This discrepancy should be eliminated once areas become better defined and site specific data can be applied.

12. Comment. "DOE quotes the carrying capacity of the land which will be mined here (Table D-1) at 11.04 acres per animal unit, a figure exaggerated more than 10 times." It projects a grassland productivity of 4.5 tons/acre/year in this same region when usable forage actually ranges from 0 to 250 lbs./acre/year. When fish production in reservoirs in the San Juan River Region are given as 250 pounds of fish/acre foot, it becomes apparent that prejudices against Western Coal development are a part of the leasing plan. I have been involved in fisheries research 25 years, and this is my first experience with fish productivity given in acre feet and not surface acres except when deception or a hard sell were intended. The very fact that highly productive Texas reservoirs are shown to have approximately one-half this carrying capacity when they should show nearly twice as much does not appear to be error, but attempted deception."

Commenter 136

Response. The carrying capacity has been changed to 22 acres per animal unit based on comment 4. U.S. Department of Agriculture 1975 statistics indicate that about 25 acres per animal unit are required in Arizona and New Mexico, 9 acres per animal unit in Utah and 7.7 acres per animal unit in Colorado for an average of about 16 acres per animal unit for these four states which contribute to the San Juan Region. The figure of 4.5 tons per acre per year (grassland productivity) is from L.E. Rodin et al, 1975 and reflects an average for semiarid regions (subboreal belt). No doubt actual site productivity will vary from this figure. If 250 pounds per acre per year is an acceptable figure that be referenced, there is no problem in changing the multiplier to reflect this.

There is no intended prejudice or attempt to deceive by using a higher figure for fish productivity in San Juan. Carlander, 1955, figures for standing crops of fish were used for this estimate. A figure of 25-150 pounds per surface acres was used for Texas since it seemed to fall into the category of warm-water lakes, while 250 pounds surface acres was used for San Juan since there was no category specific to that region. Carlander lists a standing crop of between 200-300 pounds per surface for "other reservoirs and ponds." Standing crop should have appeared as pounds per surface acre and not pounds per acre foot as listed.

13. Comment. "The thing that really caught my attention was the 455,000 acres to be disturbed in the Texas Region of this plan, which the plan says includes mining and coal handling and preparation facilities, 455,000 acres to be disturbed between now and 1980 would produce 370,000 tons of coal a year, figuring 10,000 tons per acre, a figure which is 20 times what is being produced there now, a figure which to anyone has to be nonsensible."

Commenter 136

Response. Acres committed are being revised to better reflect actual land requirements to support a given coal production. In the original draft, a yearly total of land required for mining and a consuming industry was multiplied by the time period to give total land requirements. The error in this is that it assumes that land required for a consuming industry would increase at a much faster rate than was actually needed.

14. Comment. "The following data were acknowledged as erroneous by Mr. Uram, Mr. Van der Walker, and Mr. Moore on January 3, 1979 at the informal meeting in Albuquerque. These, too, must be corrected, since they imply a productivity from San Juan Basin that simply is far from accurate.

- Table D-1, page D-3. The Figure of 11.04 acres/animal unit/year is acknowledged by the BLM's Albuquerque District as inaccurate. The figure given by the BLM for the Star Lake-Bisti Region is 12.52 acres/animal unit/ month . The figure given in the Programmatic should be revised.
- For sagebrush steppe the Programmatic gives a figure of 1.8 tons of productivity per acre. The BLM's Albuquerque District was unable to provide an accurate figure, but estimated that 1,000 pounds per acre would be excessive.
- For Grasslands the Programmatic gives a productivity of 4.5 tons per acre in the San Juan Basin. A 1974 figure for intensive hay production in Illinois (*FES Related to the Proposed Braidwood Station*, done by Commonwealth Edison and accepted by AEC) predicts only 2.92 tons of productivity per acre. To suggest that the San Juan Basin is 2X as productive as the heartland of mid-America is ludicrous.

d. Table D-1 also gives productivity figures for corn, hay, wheat, cotton, and sugarbeets. None of these crops are presently grown on any potential coal lands in the San Juan Basin. The current use and likely end use of these lands is grazing. Moreover, cotton is grown in new Mexico no farther north than Socorro, 60 miles south of Albuquerque."

Commenter 019, 135

Response. Appendix D has been revised to reflect more accurate information.

15. Comment. "The statement undervalues the productive ability of western lands. This in conjunction with the inadequate assessment of reclamation in the West, results in a vast underestimation of the long-term loss of productivity and renewable resources."

Commenter 061

Response. Estimates of the productive ability of western lands are from Rodin et al (1975). Productivity of the world's main ecosystems are average productivity value for type of vegetation. They do not reflect specific productivity for a given area. This can only be determined by productivity measurements of the specified tract.

16. Comment. "Coal development projects, in particular coal slurry transport and coal gasification (as described in Appendices C and H) use large quantities of water. Thus, water availability may become a very serious problem to some areas with marginal or insufficient quantities of water required for the operations of the existing hydro and/or other developments, for example, in water deficient parts of the Central Plains and southwestern states. Water impacts (Chapter 5) would be more effectively demonstrated if water deficit, the difference between the minimum available and maximum demand in water for each particular region during critical periods, was included as one of the impact evaluation criteria."

Commenter 117

Response. Appendix E addresses total stream flows and consumptive water requirements. The tables in Appendix E indicate on a per month basis the amounts of water available and needed for the Federal coal management program.

17. Comment. "The WRC report 'The Nation's Water Resources' was referenced as the source for

the Consumptive Water Requirements shown in Appendix E. It appears that these consumptive use figures may be high for the Missouri River Basin. Therefore, the streamflow impacts in the Missouri River (Tables E-4 and E-7) may be somewhat exaggerated."

Commenter 204, 028

Response. Table E-12 explains the rationale for the data, as well as their source. The data are not considered to be exaggerated.

18. **Comment.** "Appendix F presents coal production projections by state and includes projected in-state coal consumption as well. However, the process used to derive these numbers is not indicated. The manner in which Appendix F supports or is incorporated into the main body of the EIS is also not explained in the Appendix, although references may exist in the body of the text. The Montana and Wyoming shares and total Powder River production are summarized as follows (from Tables F-2 and F-3) in million tons per year (mtpy): Production Consumption data.

"There are several obvious problems with this data. In 1976 Wyoming power plants consumed approximately 7.5 million tons of coal (mt) in electric generating plants and Montana plants consumed approximately 2.3 mt. It is not clear why Wyoming consumption is projected to be lower in 1985 than in 1976 and why Wyoming consumption is lower in both 1985 and 1990 than Montana since more coal-fired generating projects are already in operation or scheduled for construction in Wyoming. The Montana coal consumption projects are not unreasonable in light of future planned facilities which the state is aware of. However, if low BTU coal gasification by 1990 is among facility construction plans for Montana, the state of Montana would like to be informed.

"On p. 2-24, three actions are specified which will be undertaken at the national level to address the problem of growing energy demands; these include expanded domestic use of coal, increased foreign supplies of oil and gas, and greater energy conservation. We in Montana would like to see a fourth action added, namely, to allocate the necessary support and research efforts required to increase reliance on renewable forms of energy."

Commenter 121

Response. Low-Btu projections were not based on any specific new construction plans, but

on general energy demand considerations. National energy planning includes greater reliance on solar energy and other possible renewable resources. However, for the short run, these sources do not appear likely to provide a major contribution to national energy. The difference in Montana and Wyoming projections appears attributable to different power plant sizes.

19. **Comment.** "Table F-1 says 27,400 people, or 16% of the population of northwest New Mexico is coal-related population. The BLM's Star Lake-Bisti Regional EIS states that only 3,475 people were coal-related in 1977, and this includes basic and non-basic and indirect employment plus families. This discrepancy must be addressed, since carried further in later tables it suggests that coal-related socio-economic impacts will be far greater than they actually will. Tables F-2 and F-3 show the same great discrepancy discussed in Item No. 41 above."

Commenter 019, 135

Response. The boundaries and consequently the data bases for the Star Lake-Bisti ES and the San Juan River Coal Regions differ.

20. **Comment.** "What is the source of the Appendix F data?"

Commenter 121

Response. Appendix F data is based on the detailed DOE production projections adjusted for the estimated impacts of alternative Federal coal management programs.

21. **Comment.** "Table G-2 differs enormously from approximately similar tables in the Star Lake-Bisti Regional EIS. For example, (Page H-7) DOE's National Coal Model (NCM) was run with the assumption that the Federal Government would lease enough coal reserves such that the reserves cheapest to be mined would be mined first. How would the results of the NCM change if this assumption was not made?"

Commenter 091

Response A DOE and DOI report, Effects of No Further Federal Leasing on the Nation's Coal Markets (draft January 1979) can be obtained which analyzes this question."

22. **Comment.** "In Table H-15 (page H-29), it is questionable that in the Powder River Region, productivity in an upland forest (8.0 tons/acre) is greater than that in a wetland/bottomland forest

(5.4). Also, it is difficult to believe that rangeland produces 6.7 tons per acre and pastureland only 1.7.

"Some of the productivity data in Table D-1 appear to be questionable. If, as indicated, productivities per acre/year in the Powder River Region (page D-2) are 5.4 tons for floodplains and higher than this for prairie (6.7), hardwood forest (5.8), and evergreen forest (8.0), then it seems as though unsuitability criteria should include more than just the floodplain type."

Commenter 121

Response. Tables H-15 and D-1 have been revised to reflect more accurate information.

23. Comment. "One transparently incorrect conclusion regarding environmental loadings from coal transportation is the assumption that coal slurry pipeline operations would not contribute to air emissions. See, for example, Tables H-65 on page H-84 and H-89 on page H-108. Although a pipeline is powered by electricity and may not visibly produce emissions along its line, generation of that electricity does cause air emissions. Moreover, these emissions are localized around power generation facilities. Failure to include emissions from electricity generation necessitated by slurry pipeline operation, distorts environmental impacts of the various modes of transportation.

"Based on those factors identified above, all estimates in this DES of air emissions from transportation as they relate to the Powder River Basin are suspect and should be given little weight. Regarding rail carriers, emissions factors from locomotive combustion are inaccurate, fuel consumption estimates are contradictory, unit train length was shortened and total coal to be transported is excessive. The bottom line is not a 'worst case' estimate of impact, but a totally improbable result."

Commenter 067

Response. The comment is that emissions from electric power generation needed to power pipelines should be considered in calculating air emissions resulting from coal slurry pipeline operations. This approach is not consistent with the analysis of residuals generated from fuel coal cycle. Air emissions from electric power plants are addressed separately and to recount them by end use categories will be double counting. The amount of total cost to be transported was based

upon production numbers, and emission factors were derived from references 7 and 45 pages H-114 and H-115.

24. Comment.

The comment also quotes regional factors that are less than those reported in the environmental statement. It should be noted here that the factors are based on 10,000 capacity trains and are subject to a number of varied interrelated influences and they should be viewed as representative on a material basis rather than definitive.

Commenter 067

Response. The typical train air emissions listed on page H-34 are per train mile of travel. However, as shown in Table H-22 these emissions are for long-haul rail. Page H-34 will be corrected to reflect this. Also it should be indicated that those emissions were calculated from U.S. EPA 1976, Compilation of Air Pollutant Emissions Factors, Second Edition, AP-42, Research Triangle Park, N.C.

25. Comment. "Table H-22 is also subject to criticism because without very careful review it is highly misleading. It purports to compare air emissions from various modes of transportation but does not compare equal volumes of coal transported by each. Fuel consumption used for calculation of emissions is also inconsistent with relative energy consumption for the various modes stated on page 5-116. It stretches credibility that one mode of transportation which allegedly consumes the same Btus to transport a ton of coal as another mode (670 Btus for rail and 680 Btus for barge) suddenly consumes 2500 times the fuel volume per unit of coal transported (50 gallons of fuel to transport 10,000 tons one mile by rail versus 0.02 gallons of fuel to transport 10,000 tons one mile by tug.)"

Commenter 067

Response. Table H-22 addresses air emissions from various modes of transportation in pounds/mile. These numbers were then converted to tons of pollutants per billion ton miles based on the weight of equipment and average distance transported. Then these factors were inputted to the model based on equal volumes of coal that agrees with your suggestion.

The calculations indicated for computing pollutants gives pounds of pollutants in the fuel,

and does not account for the oxygen in CO, NO_x, and SO_x or the uncombustible hydrocarbons.

26. Comment. "Paragraph H.5.1.3 Transportation, page H-34, states that typical train emissions have been estimated at 18.5 pounds of nitrogen oxides, 6.5 pounds of carbon monoxides, and 4.7 pounds of hydrocarbons per train mile of travel. Such casual use of national estimates does not provide a valid measure of locomotive emissions for a specific region. Fuel consumption and gaseous emissions are related to train speed, track grade, train load and many other operating conditions. This is particularly misleading when juxtaposed with the statement that transportation facilities are responsible for a large share of air pollutant emissions in many areas of the United States. This glib declaration begs the conclusion that rail carriers alone are responsible without help from automobiles, trucks, and other "transportation facilities."

"A more reasonable and logical measure relates gaseous emissions to fuel consumption. The following factors were provided by the manufacturer of the locomotive most likely to be used in unit train service in the Powder River Basin Region.

At a fuel consumption rate of 400 Btus per ton-mile, gaseous emissions from "long haul rail" would be as follows: 3.3 pounds of nitrogen oxides, 0.45 pounds of carbon monoxides, and 0.13 pounds of hydrocarbons per train mile of travel."

Commenter 067

Response. The values used in the analysis for train emissions are conservative. It is true that in certain cases lower emission values may be more suitable than those used.

27. Comment. "Four, regarding Tables H-90 and H-91 on the value of all agricultural products sold per acre of all land and the maximum agricultural opportunity costs of mining the figures and corresponding narrative are questionable. They reflect the typical BLM disregard for and undervaluing of the agricultural industry, which, in the long run, makes for a more easily justifiable resource trade-off. No mention is made anywhere in the statement of impacts to the livestock industry."

Commenter 174

Response. The values used to estimate opportunity costs of coal production, i.e., agricul-

tural revenues foregone, represent the average of all agricultural revenues divided by all agricultural land acreage. Accordingly, the values utilized reflect the incorporation of high and low value crops and production. Included in these per-acre opportunity costs are the revenues generated by livestock production. Such an approach is used because it would be inherently biased to utilize only high value per acre crops in calculating such opportunity costs.

28. Comment. "The principal component of Chapter five's environmental assessment is the determination of environmental residuals which result from various coal production levels and patterns identified by the Department in Table 5-2 and Appendix H. These production projections are somehow derived from Department of Energy projections. The process for converting from DOE to DOI projections is entirely conjectural. Appendix H could not explain the basis of the conversion, and Departmental personnel were hard pressed to explain it in public meetings. One of the reasons for the adjustments is well justified—the inaccuracy of the DOE projections as described in these comments, *supra*. However, the adjustments do not reflect what we believe are rational attempts to correct DOE's errors. For example, Powder River production projections are untouched by DOI's adjustments, except for the 1985 High Powder River estimate, which is actually 70 million tons *higher* than DOE's estimate!"

"Further comparing Tables 5-2 (DOE projections) and 2-29 (DOE estimates), we find that Interior's estimates for 1985 production exceed DOE's forecasts in five regions and throughout the West by 145 million tons (high level). In 1990, the DOI medium and high estimates each exceed DOE's in three regions and throughout the West by 94 million tons for the high level. When asked about these inconsistencies at the Denver, Colorado DES hearing, Departmental personnel indicated that the Coal Management Office had arbitrarily adjusted some of the projections in order to observe what would happen to the environmental impacts. Based on this explanation, we believe that the projections do *not* actually indicate the regional productions which could be expected under the preferred alternative, or for that matter, any other program. Hence, the environmental loadings which result from application of the Coal Impact

CONSULTATION AND COORDINATION

Estimates Program (CIEP) to these production projections do not represent the environmental impacts of the preferred program. Prior to analysis of the preferred alternative, the Department must more clearly explain the process of disaggregation and conversion beyond the description provided in H.2.2 to allow a more accurate picture of the actual regional production targets and thus the impacts resulting therefrom."

Commenter 097

Response. Section H.2.2 has been revised to present additional descriptive material concerning the disaggregation and derivation of coal production and consumption levels.

29. **Comment.** "Table I-1 shows reclamation costs to be \$2,900/acre. Our experience at our San Juan Mine shows such costs to average approximately \$5,200/acre. I suggest this table be revised through contacting the surface mine operators in the San Juan Basin.

"Table I-1. The heading on the right-hand column is wrong. It should not be "Total \$/acre."

"Table I-3 gives an average dollar cost/ton of coal mined as 9¢ for reclamation. Our experience suggests this figure is 26¢ to 30¢ per ton. This table can also be easily revised through contacting the surface mine operators in the San Juan Basin."

Commenter 019, 041, 091

Response. The reclamation cost appendix has been eliminated from the FES due to data inaccuracies, prediction uncertainties, and the fact that this information is strictly economic and therefore not essential to an environmental impact statement.

8.3.8 LIST OF ALL WRITTEN COMMENTERS

All of the written comments that were received during the extended review period were given an index number and reviewed by the Department for substantive comment on the draft programmatic environmental statement.

Written comments received after the 60 day review period were assigned to the environmental staff analysts for evaluation and for resultant changes or insertion in the text of the DES. However, no response was generated for these late comments. All of the comments have been recorded and are on file and available for public review at the Office of Coal Management, Bureau of Land

Management, Room 3610, Washington, D.C. 20240. Below is a list of all respondents to the environmental statement, including the witnesses who appeared at the public hearings.

1. Southeast Nebraska Council of Governments
2. Natural Resources Council (Iowa)
3. BLM (730)
4. BLM (Oregon State Directors)
5. BLM (ESO)
6. Energy Transportation Systems, Inc.
7. BLM (Idaho State Director)
8. State of Utah, - Department of Development Services
9. David Ronick, Jr.
10. Intermountain Exploration Company
11. Natural Resources Council (Iowa)
12. Mr. Snyder
13. Ray Brady
14. North Dakota State Planning Division
15. BLM (ESO)
16. Department of the Interior - (HCRS)
17. Wallace McMartin
18. Sweetwater County Planning Department
19. Western Coal Company
20. BLM (DSC)
21. BLM (Montana State Director)
22. Eleanor C. Robbins
23. BLM (Nevada State Director)
24. BLM (Colorado State Director)
25. Friends of the Earth, Inc.
26. The Colorado Mountain Club
27. Friends of the Earth, Inc.
28. North Dakota State Planning Division
29. Bruce Seegert
30. Doris Ellis
31. T.W. Thursby
32. Edwina Eastman
33. BLM (TF-13)
34. Wesco Resources, Inc.
35. BLM (Utah State Director)
36. Intermountain Power Project
37. Mrs. Arthur Beier
38. Greg Flakers
39. Board of County Commissioners - Sheridan, Wyoming
40. Western Coal Company
41. USGS
42. High Country Citizens Alliance
43. M. Christopher
44. Bruce Seegert
45. Friends of the Earth, Inc.

APPENDIX A

EXAMPLE REGULATIONS

PROPOSED RULES

[4310-84-M]

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[43 CFR Group 3400]

COAL MANAGEMENT

AGENCY: Bureau of Land Management, Interior.

ACTION: Proposed rulemaking.

SUMMARY: The proposed rulemaking sets out the procedures the Secretary of the Interior proposes to use in carrying out the authority granted him to manage Federally-owned coal through leasing or exchange under the provisions of the Mineral Leasing Act of 1920, as amended; the Mineral Leasing Act for Acquired Lands, as amended; the Federal Coal Policy and Management Act of 1978; the Surface Mining Control and Reclamation Act of 1977; the Multiple Mineral Development Act and other related Acts. These procedures are to be carried out in a manner that will afford protection for the environment.

DATE: Comments by May 18, 1979. Only those comments received by the above date will be considered.

ADDRESS: Comments are to be sent to Director, (210), Bureau of Land Management, 1800 G Street, N.W., Washington, D.C. 20240. Comments will be available for public review in Room 5555 of the above address during regular working hours (7:45 a.m.-4:15 p.m.) Monday through Friday.

CONTACT:

Don Mitchell, 202-343-4537, or Robert C. Bruce, 202-343-8735.

SUPPLEMENTARY INFORMATION: This proposed rulemaking is designed to establish the procedures that the Secretary of the Interior will use to carry out his authority to manage Federal coal, through leasing or exchanging of coal interests and other actions. This authority is granted under the provisions of the Mineral Leasing Act of 1920, as amended (30 U.S.C. 181 et seq.); the Mineral Leasing Act for Acquired Lands, as amended (30 U.S.C. 351 et seq.); the Federal Land Policy and Management Act of 1978 (30 U.S.C. 1701 et seq.); the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1201 et seq.); the Multiple Mineral Development Act (30 U.S.C. 521 et seq.); and the Department of Energy Organization Act (42 U.S.C. 7191 et seq.). These procedures are to be carried out in a manner that will afford protection for the environment.

This proposed rulemaking consolidates all regulations concerning the management of coal in a new Group 3400 in Title 43. At the present time, coal is handled in the same manner as other leasable minerals (except oil and gas) and is covered by the provisions of Part 3500 of Title 43 of the Code of Federal Regulations. Because of the special considerations required in the disposal of coal in recently enacted legislation, it was decided that the coal program of the Department of the Interior needed special handling and all references to coal should be removed from Part 3500 and placed in a new group that addresses coal exclusively. In addition, Part 3500 will be rewritten to eliminate all references to coal and to make Part 3500 easier to read and understand.

This proposed rulemaking is a further step by the Department of the Interior in carrying forward a new Federal coal management program. This new program was initiated in response to the President's May 23, 1977, Environmental Message; the President's May 24, 1977, direction to the Secretary of the Interior to establish and implement an entirely new, safe and comprehensive Federal coal management program; and the President's Energy Plan of April 29, 1977, which stressed the need to increase national coal production to meet the Nation's growing energy needs while diminishing its dependence on imported oil and gas. The statutory base for coal management has been altered substantially over the last three years by the passage of the Federal Coal Leasing Amendments Act of 1978, the Federal Land Policy and Management Act of 1978, the Surface Mining Control and Reclamation Act of 1977, the Department of Energy Organization Act of 1977, and the Federal Coal Leasing Amendments of 1978. This new statutory and program direction is reflected in the proposed rulemaking.

On September 27, 1977 in *NRDC v. Hughes*, 437 F. Supp. 981 (DCC 1977), modified 454 F. Supp. 148 (IDC 1978) it was held that the 1975 final environmental statement on a proposed Federal coal management program (termed Energy Minerals Activity Recommendation System (EMARS)) was inadequate. The accompanying opinion required the Director of the Interior to prepare a supplement to that environmental statement which would address certain coal management issues. The Secretary chose not to simply publish a supplement but instead to develop a new program responsive to the many statutory changes and new program directions which had been made since the filing of the 1975 statement. As a result, an entirely new draft environmental

statement was issued on December 15, 1978, which addresses a new preferred alternative coal management program.

In that environmental statement, as appendix A, was a set of example regulations for the preferred alternative. As a first step in the rulemaking process, the Department of the Interior published a notice of intent to propose rulemaking in the *FEDERAL REGISTER* of December 15, 1978 (43 FR 58776), which requested comments on the example rulemaking in the draft environmental statement. The notice of intent requested comments by February 13, 1979, but a later notice made it clear that any comments received prior to publication of the proposed rulemaking would be considered.

As a result of the notice of intent to propose rulemaking, the Department of the Interior received 22 written comments. Six of the comments were from mining companies, four were from Federal agencies, seven were from interest groups, with three representing industry interest groups and four representing environmental interest groups. One comment was from a State governmental agency and four from private individuals. Oral comments were received at hearings and meetings held on the environmental statement. In addition, written comments submitted on the draft environmental statement after close of the comment period, to the extent they were relevant, were treated as comments on the notice of intent to propose rulemaking. Each of the written comments and all of the oral comments received were carefully considered during the preparation of the proposed rulemaking and are discussed as part of this preamble.

Subpart 3400 contains material that applies generally to all the subparts of the proposed Group 3400. It contains citations to the statutory provisions establishing this proposed division of responsibilities among the agencies in the Department of the Interior that have a role in managing Federal coal; definitions of the terms used throughout Group 3400; a statement of the Federal lands that are subject to the provisions of the group, especially the leasing provisions of Group 3400; and a description of the leadership and functions of the regional teams that have a central role in administering the provisions of Group 3400.

The authorities section lists all statutes that are significant sources of authority for the proposed rulemaking. Each subsequent subpart of the proposed rulemaking contains a reference to this general list and notes a specific statute or section of a statute upon which that subpart chiefly implements or is chiefly derived from that authority. The example regulations carried the

authorities cited in the existing Group 3500 regulations into each of its subparts, with the addition of authorities that did not exist when the coal regulations were last revised in 1976. The proposed rulemaking alters only the format of the example rulemaking, as indicated above. No comments were received on the authorities section of the example rulemaking. The responsibilities section was not in the existing Group 3500 regulations. The surface management regulations for mining operations (43 CFR Subpart 304, May 17, 1977) contain some of the material in this section, but not as broad and the passage of the Surface Mining Control and Reclamation Act changed much of those regulations.

The responsibilities section appeared for the first time in the example rulemaking and is carried forward into the proposed rulemaking with several changes. One noteworthy change in section 3400.04 is the qualification in section 0-4(c)(1) that makes it clear than only the Office of Surface Mining Reclamation and Enforcement will formally designate lands unsuitable for mining operations. In section 522(c) of the Surface Mining Control and Reclamation Act, in addition, section 0-4(c)(6) was added to ensure the inclusion of the Office of Surface Mining Reclamation and Enforcement's role as the negotiator of cooperative agreements with the States on State enforcement of reclamation laws on federal lease operations under section 523(c) of the Surface Mining Control and Reclamation Act.

The comments were offered on the responsibilities section of the example rulemaking. The first comment suggested that the Fish and Wildlife Service could not carry out its responsibilities under the rulemaking unless it had the authority to designate lands unsuitable for coal development rather than simply recommending lands as unsuitable. The Secretary of the Interior by authorization of the Surface Mining Control and Reclamation Act has delegated the authority to designate lands as unsuitable to the Office of Surface Mining Reclamation and Enforcement.

The agency making the unsuitability determination will give careful consideration to the recommendations of the Fish and Wildlife Service prior to making its final decision.

A second comment on the responsibilities section recommended that the Bureau of Land Management be required to obtain the concurrence of the landowner, if it is someone other than the Federal Government, before determining an appropriate postmining land use of surface-mined lands. Postmining land use is determined through the Bureau of Land Management's land use planning process, reaffirmed at time of lease offering, and again during review of the mining and reclamation permit application. Where private surface owners own the surface land use is given the highest priority, subject to provisions of the Surface Mining Control and Reclamation Act (See 30 CFR 780.23, 816.131) and mitigating measures during the environmental assessment process under the National Environmental Policy Act of 1969. No changes were made in proposed rulemaking as a result of the comments offered. In fact, the proposed rulemaking requires surface owner approval of any land use substantially different from the pre-existing usage (§ 3463.4).

The terms in the definitions section were drawn from all subparts of the present Group 3500 regulations. These were substantially supplemented by definitions in the example rulemaking to incorporate terms introduced by new legislation as well as to clarify existing usage. The proposed rulemaking is even more inclusive in an attempt to make the use of terms in each subpart of the example rulemaking consistent and to reduce ambiguity and conflict. To make the usage consistent throughout the new Group 3400, new definitions were added to those in the example regulations for the following terms: Bypass coal; compliance bond; Federal lands; lease; licensee; and license to mine. The definition of commercial quantities in § 3400.0-5(i) was corrected from the example regulations—subsection (ix)(2) was changed from "lease issued after August 4, 1976," to "lease issued before August 4, 1976."

Definitions relating to functions of the Office of Surface Mining Reclamation and Enforcement or terms that apply to mining operations on private lands and the Federal lands review are intended to be the same as those contained in the permanent program regulations of the Office of Surface Mining Reclamation and Enforcement. The timing of the publication of that agency's final rulemaking and the proposed rulemaking has made it difficult to assure that all definitions are identical in substance, if not in wording. Any discrepancies between the definitions and other aspects of the two rulemakings will be resolved in the preparation of the final rulemaking for this program.

Several comments were directed to the definitions section of the example rulemaking. One comment suggested that the definition of the term "fair market value" include not only the bonus payment, but also rentals and royalties. The comment pointed out that the higher royalty bonus have the effect of lowering the bonus in a fair market value estimate. After careful

consideration, a minor change was made in the definition of the term "fair market value".

In the definition of the term "logical mining area" two comments asked for a change in the 25,000 acre limitation and the 40 year limitation incorporated in the definition. These limitations are statutorily imposed and cannot be changed.

A comment suggested changes in the definition of the term "maximum economic recovery". Even though the comment was considered and no change was made in the definition, the Department of the Interior solicits comments on whether the term should be changed to reflect the marginal cost and the marginal revenue of all seams, to use strictly the average cost and average revenue of all seams, or to use some other definition. Under the present definition, a lessee will mine those seams which can be collectively extracted at a normal level of profit with consideration given to social and economic costs.

An interagency task force is presently considering the methods employed by the Department in determining fair market value and the proposal for defining maximum economic recovery. The task force report will be submitted in April, will be made public, and will be considered by the Secretary when he renders his decision on these proposed regulations.

Finally, a comment on the definition of the term "written consent" suggested that the term "negative consent" should also be defined. This comment has not been adopted because the refusal to give consent process is fully described in §§ 3420.2-3 and 3420.8 of the proposed rulemaking.

Sections 3400.1 through 3400.3 are derived from the related provisions of the existing Subparts 3500 and 3501. These sections are the focus of two comments. The first comment indicated that § 3400.3-1 was in conflict with § 3420.2-5. An analysis of the two sections did not disclose any such conflict and no changes have been made in either of the two sections of the proposed rulemaking.

A second comment from the same source requested changes in § 3400.3-3 of the example rulemaking. The first change would require the Secretary of Agriculture to make a formal finding for decisions under § 3400.3-3(b)(2). The second change was to provide some method of appeal or protest within the Department of the Interior, when it is alleged that the finding cannot be sustained. The comment also suggested that a possible alternative way of achieving the same result—providing for a review of the facts in question when the decision is made by another agency—might be to allow the Department of the Interior to

PROPOSED RULES

lease under these conditions only when such leasing is in accord with a land use plan developed under the National Forest Management Act, thereby allowing the issue to be contested under the Department of Agriculture's planning rules. The change proposed in the comment has not been adopted because the Secretary of Agriculture essentially makes a formal finding under § 3400.3-3(b)(2) when potential coal leasing is found compatible with other uses during the Forest Service land use planning process under the provisions of the National Forest Management Act. Also, the Department of the Interior affords the right of appeal if any party adversely affected by a decision of an officer of the Bureau of Land Management or an Administrative Law Judge. The Department of Agriculture has a similar appeals procedure. In addition, (1) a person adversely affected by a decision to lease for surface mining can submit a petition to have lands classified as unsuitable for surface mining, and (2) any decision to lease coal, whether for surface mining on National Forest lands or otherwise, will be generally subject to environmental assessment, not only through the land use planning process, but also through the requirements of the National Environmental Policy Act of 1969 and Council on Environmental Quality regulations in 40 CFR Part 1500.

Section 3400.4 of the proposed rulemaking was not in either the existing Group 3500 regulations or in the example rulemaking. This set of sections proposes to establish regulations that will be consistent with administration of the new coal program. This proposal formalizes the Department's commitment of close Department-State relations in administering program functions and the Department's commitment to conduct its coal management decisionmaking in a manner which ensures that it considers all cumulative region-wide impacts of its decisions. The regional coal teams' functions are found in the substantive provisions of the proposed rulemaking. Since these provisions are particularly specific, comments were received on it and the public is asked to be particularly alert to these provisions when making comments on the proposed rulemaking. The proposed regions will be set out in the final environmental impact statement and in an appendix to this notice. Comments are specifically requested on these proposed regions.

Subpart 3410 governs all pre-lease exploration activity for coal for commercial purposes on Federal lands. The provisions of the proposed rulemaking are primarily taken from Subpart 3507 of the existing regulations. These were established in January 1977 to implement the Federal Coal

Leasing Amendments Act of 1976 which repealed the former prospecting permit system of coal exploration on public lands. The proposed rulemaking is carried over from the example rulemaking with some changes: The sections have been reordered so that the rulemaking follows the chronology of the licensing process; and provisions have been made for publishing the notice soliciting participants in the exploration upon the filing of an application for a license. Participants should expect license issuance, participation will be solicited while the exploration plan is being reviewed and approved, not afterwards.

In addition, § 3410.3-4(c) was added concerning exploration for Federal coal on split estate lands where the surface is under private ownership (whether or not the owner is qualified for the purpose of consent for leasing).

Three different comments were received on this subpart of the example rulemaking. One comment of a general nature on exploration licenses suggested that an exploration license granted by the Bureau of Land Management would be duplicative of exploration permits authorized by the Surface Mining Control and Reclamation Act. The only licenses to explore for coal on unleased public lands will be those authorized under this subpart.

A comment on § 3410.2-1 of the example rulemaking, which has been renumbered § 3410.2-4 in the proposed rulemaking, suggested that wording be included that would require consultation with the U.S. Geological Survey in the assessment of the potential effect of a coal exploration program on an area and its environment. This comment was adopted.

Another comment recommended that § 3410.2-1 of the example rulemaking, which has been renumbered § 3410.2-2 in the proposed rulemaking, be deleted since it appears to be unnecessary. The comment suggested that an environmental statement should not be considered for an exploration license because exploration is only an information gathering activity and information gathering activity is permitted only if there is no substantial disturbance. Presently, an environmental statement will be done only when it is required under section 102(2)(C) of the National Environmental Policy Act of 1969 (42 U.S.C. 4332(2)(C)). The section has been retained, but the Department does not recommend categorical exclusion for the issuance of exploration licenses from the environmental statement requirements of the National Environmental Policy Act under the regulations of the Council on Environmental Quality (40 CFR 1508.4, 43 FR 56003). This exclusion is being requested be-

cause exploration under a license is not supposed to cause substantial disturbance to the natural land surface.

A second comment from the same source recommended that the Bureau of Land Management, rather than the applicant, publish the Notice of Information which the proposed rulemaking requires. This suggestion was based on the fact that the applicant received no preference right in return for the exploration data received at little or no cost to the Federal Government. Since the exploration licenses yield no revenue to the Federal Government, the costs involved in an exploration permit should be borne by the applicant.

A final comment on Subpart 3410 of the example rulemaking suggested that exploration results obtained under a license may need to be held confidential even though they have been leased where other private holder issues at issue or surface owner consent negotiations with the Government may be taking place. The suggested change was not adopted because it would be inconsistent with the Federal Coal Leasing Amendments Act.

The Department of the Interior has been informed that some coal exploration is done in the guise of uranium exploration, since the two minerals may both be identified by identical methods and both may reasonably be thought to underlie the same lands.

Coal exploration for commercial purposes without an exploration license constitutes trespass against the United States. To assist in administering the law, the Department solicits comments on how widespread such a practice might be and how the Department might best act to prevent this trespass, and to acquire the data respecting Federal coal deposits Congress intended it should have to administer a coal management program.

Subpart 3420 contains the general competitive coal leasing provisions that are proposed to replace the Energy Mineral Activity Recommendation System (EMARS) now in Subpart 3355 of existing regulations. The enforcement of EMARS as enjoined by the U.S. District Court for the District of Columbia in *NRDC v. Hughes*, 437 F. Supp. 981 (D.D.C. 1977), modified, 454 F. Supp. 148 (D.D.C. 1978). This new leasing process is to be used as an integral part of the preferred alternative in the Draft Environmental Statement on the Federal Coal Management Program, and is discussed at greater length there. The example rulemaking sets out the chronology of the land use planning and activity planning process that would be completed before a competitive lease sale. The provisions of §§ 3420.1 through 3420.5 prescribe the screening steps that must be completed in the proce-

dure before lands can be considered acceptable for further consideration for leasing. Section 3120.1-5 requires that a land use plan or under certain circumstances, a land use analysis, be conducted for Federal lands before an area can be considered for lease sale.

The land use plan requirement in §3420.1-5 has been clarified to establish more clearly what organizational unit is chiefly responsible for the completion of land use plans on what lands, and to clarify the Secretary's authority, in the absence of Federal agency plans, in the absence of a relevant state plan, to conduct a land use analysis. The revision is designed both to clarify the importance of a completed land use plan (or land use analysis) as a statutory prerequisite to leasing, and to conform this proposal to the proposed Bureau of Land Management planning regulations for Group 1600 of Title 43 (43 FR 53764-58774).

The provisions of §§3420.2 through 3420.2-7 describe the land use planning process necessary on lands administered by the Bureau of Land Management before those lands will be considered acceptable for further consideration for leasing; this process is conducted as an integral part of Bureau-wide land use planning, but specific steps must be taken during planning to screen lands that should be considered during coal activity planning. Section 3420.2-3 sets out the screening that is to be applied to all coal-bearing lands during the land use planning. The high and medium coal development potential surface owners' consultation screening process has been modified from those contained in the example rulemaking. Just as §3420.1-5 was revised to make it consistent with the proposed group 1600 rulemaking, §3420.2, governing coal-related land use planning required before an area will be identified as acceptable for further consideration for leasing, was also revised in some respects. The requirements in this section would not supersede or modify any requirements of the proposed group 1600 rulemaking, and are intended to be fully consistent with them. The texts of §3420.1-5 and the sections under §3420.2 dealing with land use planning are not verbatim copies of the group 1600 rulemaking. Additional text has been added in order to specify the details that will be required in land use plans to be prepared under the procedures of the Group 1600 rulemaking for lands containing coal deposits subject to leasing.

The Bureau of Land Management has chosen to repeat certain provisions, such as requirement for consultation with qualified surface owners in section 714(d) of the Surface Mining Reclamation and Enforcement Act, in both the proposed land use planning

rulmakings and this proposed rulemaking (43 CFR 1801.3(f), and 3420.2-2(d)) rather than raise a question as to the propriety of referring to the same language in either the land use planning process or the coal management program. The consultation process is unchanged by the dual reference. The Bureau of Land Management will closely coordinate its review of the related comments on the two proposed rulmakings and will closely coordinate the drafting of final rules to avoid any inconsistency between the two sets of final rulemakings.

A new subsection has been added to the initial land use planning screening procedure where all but high and medium coal potential lands are screened out from further consideration for leasing. The subsection would assure that companies and the public have the opportunity to submit information on the coal resource, and that this screen is applied with the broadest possible data available to the land use planners. This valuable resource information gathering step is not, however, a call for expressions of leasing interest; the opportunity to submit coal resource data is.

The public is asked to give careful consideration to the provisions for consultation in the land use planning for coal and the impact that the nonmining preference can have on land use planning. The use of the firm intent not to provide consent disclosure and its impact on the management program is an area on which comment is specifically requested (see comment on firm intent disclosure in preamble discussion of Subpart 271).

The provisions of §3420.3 through §3420.3-4 contain an element absent from EMARS: The establishment of regional leasing targets to guide the post-land use planning coal management decisionmaking. This group of sections has been revised in the proposed rulemaking in these major respects: (1) It now shows more explicitly and directly how the leasing target setting process is tied to the Department of Energy's national coal production goals and the Memorandum of Understanding between the Department of the Interior and the Department of Energy on setting and using those national goals; (2) it establishes the distinction between regional coal production goals generally and the Department of the Interior's regional leasing targets—the amount of coal, both Federal and non-Federal able to be developed only in conjunction with Federal coal, that the Department of the Interior will consider reasonable for production in its current four-year competitive leasing cycle; and (3) it describes the role of the regional coal team in the process of setting regional leasing targets.

The provisions of §§3420.4 through 3420.4-6 set out the activity planning (as opposed to land use planning) steps. These are the steps for determining areas for leasing and exchange of coal interests from lands that have been identified in the land use plans, after the land use planning screening has been fully applied, as areas acceptable for further consideration for leasing. Each discrete step is set out in §§3420.4 through 3420.4-6: calls for expression of leasing interest; tract delineation, the physical description of the lands and coal seams that could become a mine; tract ranking, comparing all delineated tracts in a region; tract selection, determining how many and which highly ranked tracts should be sold to meet the regional leasing target; and sale scheduling, timing the sale of the selected tracts over the four-year sale cycle. The proposed rulemaking is different from the example rulemaking chiefly in the establishment of the role of the regional coal team as the central actor in this process.

The proposed rulemaking also requires the preparation of a "tract profile" in the tract delineation process (§3420.4-3(f)), to assist the team in tract ranking, selection and scheduling. Section 3420.4-4, which sets out the regional tract ranking, selection and scheduling procedures, has been expanded to discuss the formulation of alternative sales schedules as an integral part of this process. The process includes the preparation of a regional sale environmental statement that will formally discuss the results of the process and alternatives.

The example and proposed rulemaking differ significantly from the EMARS regulations in that the Department's call for expressions of leasing interest from coal companies, utilities and others is issued as the first step in the tract delineation process after land use planning is completed. In the EMARS process, this step preceded land use planning and was the driving force in determining what lands would be leased; in the preferred alternative, expressions of interest can be filed early for land already identified in the land use planning process as acceptable for further consideration for leasing.

In sections of §3420.2 through 3420.2-7, 3420.3 through 3420.3-4 and 3420.4 through 3420.4-6 described above, the successive steps in the land use planning, leasing target setting and activity planning processes are designed to complement each other once the program, if adopted, is fully implemented. The latter two processes will continue on a regular cycle, using areas found to be acceptable for further consideration for leasing in the on-going Bureau-wide land use planning effort.

PROPOSED RULES

If the program is adopted and if leasing is needed before the first four year regional lease sale schedules could be set using the same step-by-step process, the Department proposes these start-up provisions.

First, the land use planning section, expressly provides that an already completed land use plan (or management framework plan, under current Bureau usage), is an adequate basis for determining the acceptability of lands for further consideration for leasing, as long as it is formally supplemented by the application of the lands unsuitable and surface owner consultation screens set out in proposed § 3420.3. Thus the absence of final land use planning regulations under the proposed rulemaking for group 1600, or land use plans formally revised in conformity with those rules after they are final is not a bar to coal activity planning and the issuance of a coal lease, just as it has not been for coal or other resources—foreage, timber, wilderness—since the enactment of the Federal Land Policy and Management Act in October 1976. Both the Federal Land Policy and Management Act, as well as the proposed land use planning regulations for each, specifically provide for continued use of existing land use plans for resource management decisionmaking until new plans under the proposed rulemaking are prepared.

Second, the initial regional leasing targets may be formulated on the basis of the analysis contained in the final environmental statement on the Federal coal management program. If adopted, the proposed Subpart 3420 would provide that the regional leasing target provisions of §§ 3420.3 through 3420.3-4 would not be used in activity planning until after the Department of Energy issues the national coal production goals that are essential to activating the procedures for setting regional leasing targets and such procedures have been fully followed.

The formal State and Federal agency consultation provisions in section 3420.4 will be retained, even though another surface management agency will have indicated the acceptability of leasing in its land use planning process for the potential tract, and even though the States will have been involved in the process through the deliberations of the regional teams.

The provisions of §§ 3420.6 through 3420.6-3 are new since surface owner consent to lease has been required only since the enactment of the Surface Mine Control and Reclamation Act on August 3, 1977. The proposed rulemaking has been changed from the example rulemaking in order to incorporate the Under Secretary's ex-

pression of preference in an issue option memorandum of February 27, 1979, for the policy option of not scheduling for sale any tract on which written consent or evidence of such consent is not yet on record with the Bureau of Land Management. At the same time, § 3420.2-3(d)(2) has been added to allow the land use planner to consider changes in surface ownership or in the attitudes of qualified surface owners toward leasing.

Approximately 50 percent of the comments received on the example rulemaking were directed at the sections in Subpart 3420. Those comments ran from recommendations of support for actions taken in the example rulemaking to recommended changes to a large portion of the sections in Subpart 3420. Each of the comments was given careful consideration during the reexamination of the sections contained in Subpart 3420 and, where possible, were incorporated in the almost simultaneous and more orderly rulemaking of Subpart 3420. The public is asked to review the new provisions of Subpart 3420 and to comment on the part.

Much of Subpart 3422 is derived from §§ 3525.2(e) and 3525.8 of existing regulations. The example rulemaking contained supplemental provisions dealing with the notice of sale and the bid evaluation after the sale. The example rulemaking also contains a listing of the information currently required by the Office of the Director of the Department of Justice for its statutory review of lease issuance and readjustment. This listing had been used on the basis of an informal agreement with the Department of Justice. The Department of Justice has informally advised the Department of the Interior that it will change its reporting requirements. When the Department of the Interior receives any new or modified requirements, they will be substituted in § 3422.3-1.

The proposed rulemaking (§ 3422.1-1) changes the chronology of the sale process to provide that the public's views on fair market value and maximum economic recovery will be solicited as economic evaluation of the scheduled tracts begins, as well as after the Geological Survey makes its recommendation on these determinations to the Bureau of Land Management.

Three comments were received on the sections under Subpart 3422. Two comments question the bonus bid system, while one comment focussing on the minimum bonus of \$25 contained in § 3422.1-2. The comment pointed out that a bonus of \$25 was not normally considered high, but in those cases where a 12½ percent royalty is mandated and where the Department, for the purposes of conserva-

tion, wishes to encourage maximum recovery of marginal value coal during ongoing mining, it might be too high. Even though this section has not been changed in the proposed rulemaking, a task force is currently considering the bonus bid to the establishment of a minimum bonus for future proposals.

One comment focused on § 3422.4 suggesting that the section be altered to provide that the collection of receipts be accelerated to a maximum level so that cash management practices are observed. The section has not been changed to incorporate the comments offered. However, every effort will be made by the Bureau of Land Management to see that cash management practices are maximized.

Subpart 3425 contains the emergency leasing procedures. The Department of the Interior has had "short-term" or "emergency" leasing criteria ever since the imposition of the leasing "moratorium" with the first short-term standards in February 1973. The existing regulations contain a short-term need exception (43 CFR 3525.1(b)(2)) but do not specify criteria. Presently, the Department is conducting short-term lease sales at a rate of approximately two a month under criteria set forth in the modified court order in *NRDC v. Hughes*. The example rulemaking specified the conditions under which the Department would sell a lease outside of the normal competitive leasing process. The proposed rulemaking carries forward the example rulemaking criteria (which are similar to those in the modified court order in *NRDC v. Hughes*) with these following changes: (1) The proposed rulemaking sets a limitation on the number of years of reserves that can be leased to an existing operation. This is designed to avoid a domino effect of competitive leasing under the coal management program by meeting leasing targets only through issuance of leases to existing operators. The limit is designed so that future needs of the same existing operation should be able to be met through future cycles of the general competitive leasing process. (2) The proposed rulemaking establishes a "hardship" category much like the listed lease application in the *NRDC v. Hughes* order, which will allow leasing that would lead to the opening of a new mine or expansion of an existing mine, with safeguards for the integrity of the general competitive leasing process. The Department recognized that there are urgent needs for Federal coal in cases where an existing operation is not about to shut down, as well as where one is about to close.

Apart from preference right leases, emergency leases are the only leases that will be issued in response to applications. The Department solicits com-

ments on these emergency leasing criteria to assist in the determination of whether legitimate needs for Federal coal may go unanswered under these criteria. It could easily be that these criteria threaten the intent of the general competitive leasing process.

The one comment received on Subpart 3425 of the example rulemaking was concerned that the "short-term", limited reserve, piecemeal leasing concept provided for in the example rulemaking would produce extremely small reserve blocks and thus create unnecessary difficulties for underground mines. The subpart has been rewritten and is new in its conception. The comment was given full consideration during the rewrite.

Subpart 3427 implements section 714 of the Surface Mining Control and Reclamation Act, and sets out when and how the Department of the Interior will determine whether split estate lands are acceptable for further consideration for leasing, are acceptable for tract ranking, but not scheduling, or are acceptable for lease sale. The provisions of Subpart 3427 were new in the example rulemaking and are carried forward to the proposed rulemaking. In these changes, (1) the rulemaking now provides for a qualified surface owner to submit a "refusal to consent" that will result in the Department dropping coal underlying the covered surface from consideration for leasing for surface mining in activity planning whenever it is filed; and (2) the rulemaking deletes the exception formerly in § 3427.2 that allowed the Department to offer a tract for sale in certain circumstances even though written consent had not yet been given by the qualified surface owner. These changes are derived from the Under Secretary's explanations of preference for policy options in an issue option memorandum dated February 27, 1978.

With respect to the first of these issues, the rulemaking now proposes in § 3427.4 that a refusal of consent may be filed with the Bureau of Land Management at any time during activity planning and that the tract involved will be promptly eliminated from further activity planning for the life of the land use plan. In the February 27, 1978, memorandum, a second issue option was put forward to permit a qualified surface owner to disclose during the surface owner consultation screening process in land use planning that the owner has the firm intent not to provide consent to mine by other than underground methods during the life of the plan. Upon such a disclosure, that surface owner's land would be identified in the land use plan as land unsuitable for coal development by other than underground mining methods. The Under Secretary chose

to defer a decision on this issue option, but to include it in the proposed rulemaking with a specific request for public comment. The Department solicits comments particularly on this issue. Intent disclosure procedure but also more generally on the procedures and policies set forth in this rulemaking for both surface owner consultation and surface owner consent acquisition.

In the preferred alternative that this proposed rulemaking implements, the Secretary chose to allow consents to be acquired only by private parties, not by the Bureau of Land Management. The Department also solicits comments on whether the Bureau of Land Management should negotiate consents from those qualified surface owners who seek to mine under specific terms and have the coal deposit's underlying their surface considered for leasing, but who do not wish to negotiate the terms of consent with any specific company.

Six comments were received on Subpart 3427. These comments were directed at the example rulemaking which has been substantially rewritten in the proposed rulemaking. A couple of comments suggested that the proposed rulemaking should contain provisions that would automatically exclude lands from leasing when consent to lease has not been obtained from the surface owner. This suggestion was not adopted. The proposed rulemaking goes even further and now provides for refusals of consent on lands. A refusal to consent eliminates the lands from all consideration in the leasing process during the life of a land use plan. The proposed rulemaking has dropped the provision of the example rulemaking that allows a State Director of the Bureau of Land Management to publish a notice of lease sale for split-estate land where the surface is owned by a qualified surface owner and conduct that sale even though no consent has been provided by the owner. This change was suggested in three comments received on the example rulemaking.

Subpart 3430 reflects wording found in Subpart 3521 of existing regulations, especially the procedures and standards for filing preference right applications that were issued prior to May 7, 1976 (41 FR 18843). The existing regulations were carried forward into the example rulemaking with only two significant changes: (1) specific provisions on the relationship of lease right adjudication and possible exchanges were added; and (2) a land use plan must be completed on the lands in the lease application. This will assure the application of the availability criteria to preference right lease applications in manner consistent with land use plan-

ning on other lands. This latter requirement for land-use planning was an element in prior practice, but it was not made explicit in the prior regulations.

The example rulemaking provisions are carried into the proposed rulemaking with the addition of a provision (§ 3430.2-1(d)) incorporating the requirements that a complete application include a certified abstract of title for the purpose of determining whether the lands were "unclaimed and undeveloped" at the time a prospecting permit was issued prior to its amendment in 1976. This is necessary for consistency with the provisions of section 2(b) of the Mineral Leasing Act. See Solicitor's Opinion M-36893, 84 I.D. 442 (1977).

With respect to the comment of the Interior soliciting comments from states and the public on whether preference right lease application reserve data should be maintained as confidential after lease issuance, since: (a) The reserve calculations are essential to determining commercial quantities, a process that will include public participation in land use planning and the environmental assessment processes under the National Environmental Policy Act of 1969; (b) the lease reserves must be calculated for the purpose of establishing the lessor's diligence requirements under the existing diligence regulations; and (c) Congress has provided that reserve data or exploration licenses be made public upon lease issuance.

Section 3430.2-2 of the example rulemaking was amended by the deletion of subsections (a) and (c). The time provided for filing an initial showing in response to the May 1976 regulations has passed, and any subsequent initial showing, showing how the applicant will comply with the reclamation requirements of the Office of Surface Mining Reclamation and Enforcement regulations can be submitted with the final showing, if necessary. The same is true of the abstracts of title needed to show that the permit lands were "unclaimed or undeveloped"—all abstracts are already filed except for those of applicants to whom specific extensions of time were granted. The extension periods with respect to the initial showing thus did not need to be carried forward from the existing regulations in Subpart 3521.

A total of ten comments were received on the various sections of subpart 3430 of the example rulemaking. All of the comments were considered during the decision process that led to the rewrite of the subpart in the proposed rulemaking. Some of the suggestions made in the comments were adopted as part of the rewrite. A number of the comments which were

PROPOSED RULES

not adopted were directed at what was claimed to be a change in the rights granted by a prospecting permit and the requirements that had been set. The proposed leasing and its requirements relating to preference right lease applications is consistent with the various Acts of the Congress on the subject. A review of the Mineral Leasing Act of 1920 showed that it was the intent of Congress that the commercial quantities test applicable to preference right lease applications incorporate the standards of the president man test applicable under the Mining Law of 1872. It was found that mining prospecting permits were issued too readily, resulting in vast areas being leased under preference right lease applications, but little or no mining being done. The proposed rulemaking is designed to create a coal management program that will cause diligent development of mining on leased lands.

Subpart 3431, which provides for the sale of coal to be taken in the exercise of a right-of-way granted across, through or under Federal lands, was now in the example rulemaking because the authority to dispose of coal in such a manner was not part of the law until enacted in October 1978. The provisions have not been significantly changed for their inclusion in the proposed rulemaking. No comments were received on this subpart of the example rulemaking.

A comment of the Interior solicits comments from those persons whose plans for the development of other Federal or non-Federal coal have been previously frustrated by the absence of this authority on whether the provisions of the proposed rulemaking will successfully implement the new authority.

The modification provisions of subpart 3432 were taken from existing regulations (43 CFR 3524.2-1) and expanded in drafting the example rulemaking to reflect the amendments in the Act of October 30, 1978 (Pub. L. 95-554) to the authority to make modification less burdensome on existing leases.

A modified lease under the new authority is not subject to the increased minimum royalty and the new diligence requirements mandated by the Federal Coal Leasing Amendments Act. The example rulemaking also spelled out more precisely when non-competitive "leasing by modification" could occur and when a tract would only be leased under the provisions of Part 3420.

The modification sections were moved from the part of the example rulemaking covering "management of existing leases" to the part of the proposed rulemaking covering "noncompetitive leasing" to reflect their func-

tion and potential significance as a system for leasing small tracts of Federal coal. No comments were received on these provisions of the example rulemaking.

The provisions of Subpart 3435 carry forward the existing regulations issued in December 1977 for the exchange of lease interests as they relate to the relinquishment of coal leases of preference right lease applications in an exchange. Comparable non-coal mineral lease exchange regulations will remain in the group 3500 section when they are rewritten. The proposed rulemaking is not significantly different from the example rulemaking. The proposed rulemaking thus carries forward the requirement that a preference right lease applicant must demonstrate the discovery of commercial quantities of coal on the applied for lands before an exchange involving those lands can be consummated (43 CFR 3425.2(a)). The proposed rulemaking carries forward the powers enunciated by the Department of the Interior in Circular S. 3189, the general coal leasing exchange authority promulgated in the 85th Congress that the Department would not seek authority to consummate an exchange in any case where the constraints of the Surface Mining Control and Reclamation Act could lawfully be applied to prevent environmentally unsatisfactory mining from occurring.

The proposed rulemaking was changed in one important respect from the example rulemaking in order to conform to the intent of Congress in the exchange of mineral leases and coal lands. Coal lease exchanges in alluvial valley floors, fee land exchanges in alluvial valley floors, and the special lease exchange authorized by the Act of October 30, 1978 (Pub. L. 95-554), all are required to be equal value exchanges. Subpart 3435 in the example rulemaking, however, contained the provision of the December 1977 rewrite, from which it was derived, only required that the value of the exchange tracts be "comparable". Section 3435.3-3 of the proposed rulemaking requires that equal values be exchanged in any action under the subpart.

Comments were received from two different sources on this subpart of the example rulemaking. One of the comments raised a number of questions about the exchange procedure as it was presented in the example rulemaking and an effort was made in the rewrite of the subpart for the proposed rulemaking to address each of those questions. The other comment was directed at what perceived as unnecessary burdens placed on a lessee that is party to an exchange. These points were considered in the rewrite

but little or no change was made in the proposed regulations.

Subpart 3436 of the proposed rulemaking implements the alluvial valley floor lease exchange authority contained in the Surface Mining Control and Reclamation Act. This provision appeared for the first time in the example rulemaking. The subpart incorporates the principles and procedures outlined in Subpart 3435 of the proposed rulemaking to the extent applicable. No significant changes were made between the language of the example rulemaking and that of the proposed rulemaking.

One comment was received on this subpart of the example rulemaking. The comment raised a number of concerns about the procedures that will be followed in making exchanges under the provisions of the subpart. Detailed procedures will be developed when the manual sections for the subpart are prepared following the issuance of final rulemaking on a coal management program. All of the concerns are in areas that will be closely examined in developing the program procedures.

Subpart 3437, which is designed to implement partially the alluvial valley floor land exchange authority (private lands for Federal lands, with no lease interest involved) contained in the Surface Mining Control and Reclamation Act, was new language in the example rulemaking. The example rulemaking only made cross-reference to Group 220 of the regulations in Title 43 that would be used to implement section 206, the general exchange authority of the Federal Land Policy and Management Act. The proposed rulemaking establishes criteria under which the Department of the Interior will determine which exchanges of potential alluvial valley floor private fee for federal fee lands the Department will, as general manager, consider consummating under the authority of section 206. These criteria are felt to be necessary since alluvial valley floor exchanges are by law to be carried out under section 206 of the Federal Land Policy and Management Act. Section 206 has no inherent limitations on when the Secretary may exchange lands in alluvial valley floors or elsewhere except for the requirements that the exchange be in the public interest, be for lands of equal value (with some cash equalization authorized), and be for lands in the same State. The same party that commented on Subpart 3435 commented on this subpart and again raised questions about the procedure to be followed in carrying out the subpart. As stated above, the procedure will be worked out in the Bureau of Land Management manual sections after the issuance of a final rulemaking.

Subpart 3440, which governs licenses to mine coal granted to persons or municipalities who supply coal only for domestic use, is derived from existing regulations (43 CFR Part 3530). The language of the example rulemaking has not been significantly changed in the proposed rulemaking. The Department of the Interior solicits comments about whether this little-used authority remains worthwhile and useful, or whether it is no longer relevant to the economic and environmental protection considerations controlling coal mining today. No comments were received on this subpart of the example rulemaking.

Subpart 3450 provides the language that will govern readjustment of the terms and conditions of Federal coal leases. Over half of the existing Federal coal leases will be subject to adjustment by 1986, and this is the time when the economic and other terms of each lease can be changed.

The example rulemaking expanded on the provisions of § 3522.2-1(b) of existing regulations, the existing readjustment provisions, to express more precisely both the process and the substance of lease readjustment, including consultation with the Attorney General with respect to the anti-trust impacts of lease continuation under the proposed readjustment terms. The proposed rulemaking does not differ significantly from the example rulemaking.

Two comments were received on this subpart of the example rulemaking. One comment stated that the proposed provisions had the effect of changing agreed-on lease terms and impacted existing property rights and should be changed. The agreed-on terms of each lease provide for such readjustments, and Congress has required that each lease contain such a term. The second comment felt that a time limitation should be imposed on lease readjustments. This comment was partially adopted in changes to the proposed rulemaking by section 3451 which provides that a lease will become subject to readjustment after 1980, the Bureau of Land Management's failure to notify the lessee that readjustment will occur will signify a waiver of the Bureau's right to readjust.

Subpart 3452 governs how Federal coal leases are closed out, whether at the initiative of the lessee or the United States. The language of the proposed rulemaking is carried forward from Subpart 3523 of the existing regulations without significant change. No comments were received on this portion of the example rulemaking.

Subpart 3452 is derived from the coal-related provisions of the existing regulations in Subpart 3506, "Assign-

ments or Transfers and Subleases." The example rulemaking made no substantive changes in the language of the existing regulations. The proposed rulemaking, however, did make changes: (1) Revising the use of the word "transfers" to embrace all changes in ownership interests in Federal leases, whether designated assignments, subleases or whatever by the parties, thus simplifying the provisions; and (2) setting out clearly in checklist form the requirements for approval and causes for disapproval of any transfer of an interest in a Federal lease.

The Department of the Interior is presently examining its authority to condition approval of transfers of interests in coal leases on the submission of or agreement to specific development plans by the transferee, or to changes in the diligence provisions of the lease designed to assure that lease transfers are not serving solely speculative ends. If greater authority than that which is currently exercised exists, the Department will consider adding to this proposed rulemaking provisions relating to conditioning approval of transfers on specific development plans, much as the acquisition of oil and gas leases are being conditioned under current Departmental policy. No public comments were received on this subpart of the example rulemaking.

Subpart 3461 of the proposed rulemaking sets out the content and procedures for the elements of the Federal lands review the Congress directed the Secretary to conduct in section 522(a) of the Surface Mining Control and Reclamation Act. Under which the Bureau of Land Management, either by itself or through cooperative agreement with other surface management agencies, has been entrusted to carry out. As the Surface Mining Control and Reclamation Act was passed after the last regulatory revisions of the coal program, these provisions were developed for the example rulemaking. Several important changes have been made from the example regulations in the language of the proposed rulemaking.

First, the unsuitability criteria have been structured more precisely to spell out the exemptions to each criterion. Second, the provisions governing the application of the criteria to operations on existing leases (43 CFR 3461.1-2) have been expanded and clarified.

Most important, the proposed rulemaking clarifies the division of responsibility for the administration of the Surface Mining Control and Reclamation Act within the Department of the Interior by clearly distinguishing between the unsuitability assessments carried out by the Bureau of Land

Management through its land use planning process and unsuitability designations carried out by the Office of Surface Mining Reclamation and Enforcement in response to petitions to formally designate, or to terminate designation of, Federal lands as unsuitable for all or certain types of surface coal mining operations (43 CFR 3461.1-3 and 3461-4). After making its assessment as part of the lands review, the Bureau of Land Management might: (a) Condition any leasing to require that operations be conducted in a manner consistent with the land use plan; (b) withdraw the Federal lands assessed as unsuitable; or (c) itself petition the Office of Surface Mining Reclamation and Enforcement to formally designate the lands as unsuitable.

The proposed rulemaking does not change the Department of the Interior's intention to make unsuitability assessments in the land use planning process (43 CFR 3420.2), a screening provision to be applied in determining what Federal lands are acceptable for further consideration for leasing.

An individual offered comments on this subpart of the example rulemaking during one of the field hearings. The comment was directed at what was perceived as a lack of guidance to Bureau of Land Management managers in preparing land use plans. This instruction will be provided by the proposed Group 1800 rulemaking that is now under review and by other policy guidance, rather than in this rulemaking. The same individual also raised questions about the designation of areas of critical environmental concern. These designations will be handled under guidelines now under development in the Bureau of Land Management and no comments were received.

Six written comments were received on this subpart of the example rulemaking. One comment stated that industry nominations should be called for immediately after an area is determined unsuitable for mining. This suggestion was not adopted because industry is expected to participate fully in the land use planning process at each stage when an opportunity for public participation is provided. A second comment wanted a clarification of the exemption from unsuitability criteria for lands on which surface mining operations were being conducted on August 3, 1977, or where substantial financial and legal commitments to the operations had been made prior to January 4, 1977. The exemption is required under section 522(a)(6) of the Surface Mining Control and Reclamation Act and is adequately covered in the proposed rulemaking. In addition, the definition section of the rulemaking defines "substantial financial or legal commit-

PROPOSED RULES

ment". Another comment raised questions about the applicability of the unsuitability criteria to existing leases. The criteria will be applied to existing leases during the land use planning process or when the mining plan is submitted, whichever comes first. The provisions of the Surface Mining Control and Reclamation Act authorize the application of the unsuitability criteria to existing leases.

One comment from unnamed Indian tribes to be included in the unsuitability criteria application process. The unsuitability criteria are applicable to Federal lands, which specifically exclude Indian lands. Indian tribes can submit their views on the application of unsuitability criteria to the Federal lands during the land use planning process. One comment raised two points. First, that the placing of the unsuitability criteria in the regulations rather than in the statute or policy guidance documents might deny flexibility needed in certain cases, and second, that there seems to be little purpose to including lands determined to be unsuitable for mining within applications for exploration licenses. No changes have been adopted in response to the issues raised by this comment because, first, the criteria have been determined to be needed part of rulemaking, and second, expansion could be useful for determining underground mining data. The final comment received indicated that the procedures for documenting exceptions in the example rulemaking do not appear to mesh with the Bureau of Land Management's present efforts to field test and incorporate the proposed unsuitability criteria into the land use planning system. The suggestions outlined in the comment are only interim guidance for approved, ongoing land use plans. Future land use plans will be covered by later guidance in separate instructions.

The only changes to the wording of the specific criteria in this proposed rulemaking over the wording of those published in the example rulemaking were made to correct minor conflicts with existing statutes and to improve clarity. As noted above, the criteria as they appeared in the draft programmatic environmental statement are now being field tested. Changes suggested in comments received on the draft environmental statement and the example rulemaking will not be considered until results of the field testing have been assessed. This is expected to occur sometime during April, 1978. All comments will be considered prior to the issuance of the final rulemaking. If a proposed program is adopted and leasing resumes, the land use plans in the field

test areas will be conformed to all revised criteria before leasing begins.

The provisions of Subpart 3465 of the proposed rulemaking generally govern environmental protection during operations on leases and leases to mine. The example rulemaking was derived from Subpart 3041 of existing regulations, but was substantially reduced by the transfer of many of the surface management functions to the Office of Surface Mining Reclamation and Enforcement as a result of the passage of the Surface Mining Control and Reclamation Act. The example and proposed rulemaking reflect this transfer of functions.

Five comments were received from the public on this subpart of the example rulemaking. The first comment wanted to include language that would require compliance with the regulations of another Federal agency. This recommendation was incorporated into the proposed rulemaking. The other comments were aimed at changes that would expand the rulemaking more under the control of the environmental assessment process. The proposed rulemaking complies with the requirements of the National Environmental Policy Act and the environmental requirements of the Surface Mining Control and Reclamation Act. No changes were adopted as a result of the review of these four comments.

Part 3470 contains the technical requirements of the coal management program, with Subpart 3471 setting out the requirements for land description in leases, what happens if the surface of the leased land is conveyed by the United States while the coal is under lease, and what protection is afforded bond fide purchasers of leases that are subject to cancellation or forfeiture. The language of this subpart is derived from §§ 3501.1-2, 3501.1-3, 3501.2-4, 3501.3-2(b)(2), 3501.3-2, 3502.1-2 of existing regulations or title 43. Several insignificant changes in the language of the existing regulations were made in the proposed rulemaking. No comments were received on this subpart of the example rulemaking.

Subpart 3472 governs the qualifications to take or hold a coal lease. The language of the subpart is derived directly from Subpart 3502 of existing regulations with only slight modification. Two comments were received on this example subpart. One comment suggested that the acreage limitations imposed in the rulemaking were not needed. The limitations were established by the provisions of the Federal Coal Leasing Amendments Act of 1976 and have been retained in the proposed rulemaking. The other comment wanted to know if the restriction in the subpart pertaining to railroad holding companies holding leases ap-

plied to subsidiaries of a railroad. The limitation does not apply to a subsidiary of a railroad that is a legitimate holding company; such a company is authorized to hold a lease under the provisions of the Mineral Leasing Act.

The provisions of Subpart 3473 contain the financial terms of leases and the methods for getting them waived or reduced. The rulemaking language has been taken from Subpart 305 of existing regulations. The example rulemaking reflects the Department of the Interior raised the annual per acre lease rental. That increase, \$3 per acre per year, has been carried forward to the proposed rulemaking. The proposed rulemaking also prohibits the reduction of the production royalty on surface-mined coal below 12% percent and on underground-mined coal below 5 percent. The example rulemaking states that the Secretary of the Interior's authority without limiting the scope of the Secretary's discretion to reduce royalties. These reduction limitations are not required by law; they are proposed as an exercise of discretion.

Subpart 3474 contains the bonding requirements for Federal leases and was derived from Subpart 3504 of existing regulations. The example rulemaking contained several notable changes from the existing provisions. The bond required by the Bureau of Land Management no longer covers reclamation; the Office of Surface Mining Reclamation and Enforcement has assumed that bonding function in connection with the issuance and supervision of permits to mine. In addition, there is no longer an authorization to issue nationwide or statewide bonds; each lease of a Federal portion of a logical mining unit must be separately bonded. Upon issuance of this rulemaking in final form, each lessee holding such a blanket coverage bond would be notified of this requirement.

The proposed rulemaking changes the example rulemaking to standardize the terms used with respect to bonding. The term "performance bond" is limited to reclamation obligations. The term "lease bond", which has had many different uses, has been dropped, and the Department uses the term "compliance bond" in the proposed rulemaking to mean the bond covering compliance with the financial and other non-reclamation lease obligations of the mine. The Department solicits comments on this difference. It may be that Federal lessees have had or may have in securing adequate bonds for these purposes.

Subpart 3475 contains the general lease term provisions on diligent development and continued operation obligations (diligence requirement) issued by the Department of the Interior in May 1976 to cover the existing leases, and those issued in December 1976 to

PROPOSED RULES

cover leases issued after the passage of the Federal Coal Leasing Amendments Act of 1976. The rulemaking is carried forward from §§ 3500.0-5 and 3520.2-5 of existing regulations without substantive change, since the authority to propose new regulations respecting diligence on Federal coal leases was transferred to the Department of Energy by the Act creating that Department. If and when the Department of Energy promulgates new or additional diligence requirements for Federal coal leases, these provisions will be amended to state or simply cross-reference the Department of Energy regulations. Provisions dealing with the administration of the diligence requirements, such as in § 3452.3-2(b) of existing regulations, will remain.

The only comment received on the provision of Part 3470 was one questioning the lease terms requirements of Subpart 3475. The comment was considered and not adopted.

The principal authors of this proposed rulemaking are Steven Quarles and Charles Rech of the Office of Coal Leasing, Planning and Coordination; Lawrence McBride, Office of the Solicitor; and Don Mitchell, Office of Coal Management, Bureau of Land Management, assisted by the staff of the Division of Legislation and Regulatory Management of the Bureau of Land Management.

It has been determined that the publication of this document is a major Federal action significantly affecting the quality of the human environment. A draft environmental statement was published on December 15, 1978, and a final environmental statement is now being prepared pursuant to section 102(2)(C) of the National Environmental Policy Act of 1969 (42 U.S.C. 4332(2)(C)).

Note.—The Department of the Interior has determined that this document is not a significant regulatory action requiring the preparation of a regulatory analysis under Executive Order 12044 and 43 CFR Part 14.

Under the authority of the Mineral Lands Management Act, the Mineral Leasing Act for Acquired Lands, the Federal Land and Policy and Management Act of 1976, the Surface Mining Control and Reclamation Act and the Multiple Mineral Development Act, it is proposed to amend Subchapter C, Chapter II, Title 43 of the Code of Federal Regulations by adding a new Group 3400 as set forth below:

GROUP 3400—COAL MANAGEMENT
PART 3400—COAL MANAGEMENT—GENERAL
Subpart 3400—Introduction—General

PART 3410—EXPLORATION LICENSES
Subpart 3410—Exploration Licenses

PART 3420—COMPETITIVE LEASING

Subpart 3420—Competitive Leasing
Subpart 3422—Lease Sales
Subpart 3425—Emergency Leasing
Subpart 3427—Split Estate Leasing

PART 3430—NONCOMPETITIVE LEASING

Subpart 3430—Preference Right Leases
Subpart 3431—Negotiated Sales—Rights-of-Way
Subpart 3432—Lease Modifications

Subpart 3400—Introduction—General**§ 3400.0-3 Authority.**

(a) These regulations are issued under the authority of:

(1) The Mineral Leasing Act of February 25, 1920, as amended (30 U.S.C. 181 et seq.).
 (2) The Mineral Leasing Act for Acquired Lands of August 7, 1947, as amended (30 U.S.C. 351-359).
 (3) The Federal Land Policy and Management Act of 1976, October 21, 1976 (43 U.S.C. 1701 et seq.).

(4) The Surface Mining Control and Reclamation Act of 1977, August 3, 1977 (30 U.S.C. 1201 et seq.).
 (5) The Multiple Mineral Development Act of August 13, 1954 (30 U.S.C. 521-531).

(6) The Department of Energy Organization Act of August 4, 1977 (42 U.S.C. 7101 et seq.).
 (7) The National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.).

(b) Specific citations of authority in subsequent subparts of this Group 3400 are to authorities from which the subpart is chiefly derived or which the subpart chiefly implements.

§ 3400.0-4 Responsibilities.

(a) The Bureau of Land Management has the responsibility on Federal lands to:

(1) Determine the acceptability of lands for leasing and development, except as provided in subsection (c)(7) of this section;

(2) Issue, modify and readjust leases and serve as the Office of Record for transfers, relinquishments and similar transactions on leases;

(3) Ensure that fair market value is received for rights to extract Federal coal before issuing a lease;

(4) Issue and administer all use authorizations for facilities related to coal development on BLM administered lands outside the area of mining operations;

(5) Determine, in consultation with the Office of Surface Mining Reclamation and Enforcement, the appropriate post-mining land use of BLM administered lands on which surface coal mining operations will be conducted;

(6) Include terms in each lease to protect nonmineral resources and to ensure reclamation of mined lands to the applicable standards;

(7) Recommend judicial action to cease leases for noncompliance with lease terms;

(8) Consult with other surface management agencies and surface owners when they are involved in or affected by coal management actions that are the primary responsibility of the Bureau of Land Management; and

(9) Adjudicate applications for, issue, and administer exploration licenses.

PROPOSED RULES

(b) The Geological Survey has the responsibility on Federal lands to:

(1) Supervise production and resource recovery in the area of mining operations;

(2) Make geologic, engineering, coal resource economic value, and maximum economic recovery determinations for the Department's leasing program;

(3) Review and concur with mining and reclamation plans and amendments to plans to establish production and resource recovery requirements;

(4) Approve exploration plans and supervise exploration under an exploration license, and on a lease outside a permit area; and

(5) Deal with operators on the matters listed in paragraphs (a)(1) through (4) of this section.

(c) The Office of Surface Mining Reclamation and Enforcement has the responsibility on Federal lands to:

(1) Approve mining and reclamation permit applications;

(2) Ensure that mining operations are consistent with environmental criteria and reclamation plans;

(3) Monitor reclamation operations for compliance with plans;

(4) Deal with operators during mining operations on the matters listed in paragraph (c)(1) through (3) of this section;

(5) Ensure that the rights of holders of noncoal Federal leases and permits are protected in the permit approval process;

(6) Negotiate, in consultation with the Bureau of Land Management and Geological Survey, and recommend for Secretarial approval, cooperative agreements with the states to establish the authority of state regulatory agencies over Federal operations on a lease; and

(7) Designate lands, in response to petitions, as unsuitable for all or certain kinds of surface mining operations, lease stipulations, and terminate designations of lands.

(d) The Fish and Wildlife Service has the responsibility on Federal lands to:

(1) Protect and conserve endangered and threatened species, migratory birds, eagles, and other fish and wildlife;

(2) Recommend lands unsuitable for leasing due to fish, wildlife, and related ecological values;

(3) Recommend tract ranking factors and weights, for fish and wildlife;

(4) Recommend lease stipulations related to fish and wildlife values;

(5) Review and recommend post mining land uses of surface mined lands as they relate to the creation or maintenance of fish and wildlife values;

(6) Review exploration, mining, and reclamation plans to make recommen-

dations about their potential impacts on fish and wildlife values; and

(7) Review water resource development projects and all other projects that will result in the impoundment, diversion, or control of streams or other bodies of water, for the purposes of mitigating or avoiding adverse impacts on fish and wildlife values.

§ 3100.9-5 Definitions.

As used in this part:

(a) "Alluvial valley floor" means unconsolidated, stream-laid deposits holding streams where water availability is sufficient for subirrigation or flood irrigation agricultural activities. This definition does not encompass upland areas generally covered by a thin veneer of colluvial deposits composed chiefly of debris from sheet erosion; deposits laid down by unconcentrated runoff or slope wash, including talus; other mass movement accumulations; and windblown deposits.

(b) "Area of Mining Operation" means that area of non-Federal land and Federal and Indian lands or leases to which (within a logical mining unit) (1) contains surface or underground excavations from which coal is extracted as part of a commercial venture, that is, one which has a historic production record or existing contractual production commitments or both; (2) contains support facilities that contribute directly to coal mining, preparation and handling; (3) contains coal reserves intended for extraction in the course of the mining operation.

(c) "Authorized officer" means any employee of the Bureau of Land Management delegated the authority to perform the duty described in the section in which the term is used.

(d) "Bonus" means that the value in excess of the fair market value that accrues to the United States because of coal resource ownership.

(e) "Bypass coal" means an isolated coal deposit that cannot, for the foreseeable future, be practically mined either separately as part of any logical mining unit other than that of the applicant for an emergency lease under the provisions of Subpart 3425 of this chapter.

(f) "Certificate of bidding rights" means a right granted by the Secretary to apply the fair market value of a relinquished coal or other mineral lease or right to a preference right lease as a credit against the bonus bid or bids on a competitive lease or leases acquired at a lease sale or sales.

(g) "Coal deposits" mean all Federally-owned coal deposits, except those held in trust for Indians.

(h) "Coal resource economic value (CREV)" means the value of the coal resource in a lease in its best operational and market application.

(i) "Commercial quantities" as used in paragraph (n) mean:

(1) For any lease issued after August 4, 1976, an amount of production equal to one percent of the LMU reserves per year; or

(2) For any lease issued before August 4, 1976, an amount of production equal to one-forth of the LMU reserves per year.

(j) "Compliance bond" means the bond or equivalent security given the Department to assure payment of all obligations under a lease, exploration license, or license to mine, or to assure that all aspects of the mining operation other than reclamation operations on a lease are conducted in conformity with the approved mining or exploration plan. This is the same as the "lease bond" referred to in 30 CFR 742.11(a).

(k) "Continued operation" means the production of coal equal to one percent of the LMU reserves for each of the first two years following the achievement of diligent development, and an annual average amount of one percent of the LMU reserves thereafter. The average annual amount shall be computed on a three year basis, and the three-year period for which the average shall be computed shall consist of the year in question and the two preceding years.

(l) "Contiguous" means having at least one point in common, including cornering tracts.

(m) "Department" means the United States Department of the Interior.

(n) "Diligent development" means (1) for any lease issued after August 4, 1976, the timely preparation for and initiation of coal production from the LMU of which the lease is issued so that coal is actually produced in commercial quantities by the end of the tenth year from the effective date of the lease; or

(2) For any lease issued before August 4, 1976, the timely preparation for and initiation of coal production from the LMU so that coal is actually produced in commercial quantities before June 1, 1986, except for the period of time during which production of coal in commercial quantities must be achieved may be extended as provided in 43 CFR 3475.4.

(o) "Exploration" means drilling, excavating, and geological, geophysical or geochemical surveying operations designed to obtain detailed data on the physical and chemical characteristics of coal deposits and their environment, including data obtained below the deposits, the hydrologic conditions associated with the deposit, and any other information that may be used to prepare a coal resource evaluation of the land.

(p) "Exploration license" means a license issued by the authorized officer

to permit the licensee to explore for coal on Federal lands under terms and conditions that will protect the surface and subsurface resources and the environment, and provide for the reclamation of areas disturbed by such exploration.

(q) "Exploration plan" means a plan prepared in sufficient detail to show the location and type of exploration to be conducted, environmental protection procedures, present and proposed roads, and reclamation and abandonment procedures to be followed upon completion of operations under an exploration license.

(r) "Fair market value" means that amount in cash, or on terms reasonably equivalent to cash, for which in all probability the coal deposit would be sold or leased by a knowledgeable owner willing but not obligated to sell to a knowledgeable purchaser who desires but is not obligated to buy or lease.

(s) "Federal lands" mean lands owned by the United States, without reference to how the lands were acquired or what Federal agency administers the lands, including mineral estates or coal estates underlying private surface, excluding lands held by the United States in trust for Indians, Aleuts or Eskimos.

(t) "Governmental entity" means a Federal or State agency or municipality or their subdivisions, including any corporation acting primarily as an agency or instrumentality of a State, which produces electrical energy for sale to the public.

(u) "Grant of modifications" means the Secretary's approval to expand an existing lease to include additional coal areas or deposits contiguous to the existing lease.

(v) "Filing application" or "bid" means any record or instrument overriding royalty interest, working interest, operating rights or option, or any agreement covering such an interest; any claim or any prospective or future claim to an advantage or benefit from a lease; and any participation or any defined or undefined share in any increments, issues, or profits that may be derived from or that may accrue in any manner from the lease based on or pursuant to any agreement or understanding existing when the application was filed or entered into while the lease application or bid is pending.

(w) "Intertract bidding competition" means a lease sale method where tracts containing more reserves in total than the Department intends to lease in that sale are offered for sale, and each bidder competes against other bidders on the same tract for which he bids and against bidders on the other tracts offered in the same sale.

(x) "Know Recoverable Coal Resource Area (KRCRA)" means an area determined by the Geological Survey, where data are believed to be sufficient to evaluate the extent, depth, quality, and potential for development of coal deposits that are technically recoverable based on past and current mining practices in the area. Boundaries for such an area show only the extent of recoverable coal deposits based on data available at the time of determination.

(y) "Lessee" means a Federal lease, issued under the coal leasing provisions of the mineral leasing laws, which authorizes the exploration for and extraction of coal. In provisions of this Group that refer to Federal leases for minerals other than coal, the term "Federal coal lease" may be used.

(z) "Licensee" means the holder of an exploration license.

(aa) "License to mine" means a license issued under the provisions of Part 3440 of this Chapter to a municipality or charitable organization to mine coal for domestic use.

(bb) "Logical Mining Unit (LMU)" means an area of coal land that can be developed and mined in an efficient, economical, and orderly manner with due regard for the conservation of coal reserves and other resources. An LMU may consist of one or more leases and may include intervening or adjacent non-Federal lands, but all lands in an LMU must be contiguous, under the effective control of a single operator, and capable of being developed and operated as a unified operation with complete extraction of the LMU reserves within 40 years from the date of first approval of a mining plan for that LMU. No LMU approved after August 1, 1978, shall exceed 25,000 acres, including both Federal and non-Federal coal deposits.

(cc) "Logical Mining Unit Reserves" mean the sum of (1) estimated recoverable reserves under Federal lease in the LMU, and (2) estimated non-Federal recoverable reserves in the LMU. The LMU reserves associated with a Federal lease are the LMU reserves estimated as of the effective date of the LMU, of which that lease is a part, except that the LMU reserves of this section may be adjusted by the Mining Enforcement Service when it approves a modification of the LMU boundaries or whenever significant new information becomes available concerning the amount of such reserves.

(dd) "Maximum economic recovery (MER)" means the amount of coal that can be recovered by prudent mining practices from all seams that are collectively profitable to be mined on any tract evaluated for a lease sale at the time of the MER determination. Social and environmental costs

shall be considered in determining profitability.

(ee) "Mining method evaluation" means a written comparison of mining method alternatives used to determine maximum economic recovery.

(ff) "Mineral leasing laws" mean the Mineral Leasing Act of 1920, as amended (30 U.S.C. 181 et seq.), and the Mineral Leasing Act for Acquired Lands of 1947, as amended (30 U.S.C. 351-359).

(gg) "Mining plan" means a mining and reclamation operations plan that fully complies with the requirements of the Mineral Leasing Act of 1920 as amended, the Surface Mining Control and Reclamation Act of 1977, and all other applicable laws.

(hh) "Mining Supervisor" means the Area Mining Supervisor, Conservation Division, U.S. Geological Survey, or the District Mining Supervisor, or a subordinate acting under the Supervisor's direction.

(ii) "Mining unit" means an area containing technically recoverable coal that will feasible support a commercial mining operation. The coal may either be Federal coal or be both Federal and non-Federal coal.

(jj) "Operator" means a lessee, lessee, or one conducting operations under a lease or exploration license under the authority of the lessee or licensee.

(kk) "Participate" means to have or take part or share with others in an exploration license.

(ll) "Permit" means the document issued, to authorized surface coal mining and reclamation operations on Federal lands either by the Director of the Office of Surface Mining Reclamation and Enforcement, or, where a cooperative agreement pursuant to section 523 of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1273) has been executed by the state regulatory authority (30 CFR Part 741), for the approval of a mining plan by the Assistant Secretary, Energy and Minerals.

(mm) "Permit area" means the area, including all natural and human resources, included within the boundaries specified in a permit, whether or not the areas will be affected by surface coal mining and reclamation operations, which is designated on the approved maps submitted by the applicant with this permit application and which is covered by the performance bond required Part by CFR Part 300-808.

(nn) "Public bodies" means Federal and state agencies, municipalities, electric cooperatives and similar organizations, and nonprofit corporations controlled by any such entities.

(oo) "Qualified surface owner" means the natural person or persons (or corporation, the majority stock of

PROPOSED RULES

which is held by a person or persons) who (1) Hold legal or equitable title to the land surface;

(2) Have their principal place of residence on the land, or personally conduct farming or ranching operations upon a farm or ranch unit to be affected by surface mining operations; or receive directly a significant portion of their income, if any, from such farming and ranching operations; and

(3) Have met the conditions of (paragraphs (00) (1) and (2) of this section for a period at least 3 years prior to the granting of the permit to mine) or its predecessors. In computing the three year period the authorized officer may include periods during which title was owned by a relative of such person by blood or marriage if, during such periods, the relative would have met the requirements of this subsection.

(pp) "Reserves" means coal deposits which are economically feasible to extract.

(qq) "Secretary" means the Secretary of the Interior or his authorized representative.

(rr) "Sole party in interest" means a person or entity and will be vested with all legal and equitable rights under a lease, bid, or an application for a lease. No one is, or shall be considered, a sole party in interest with respect to a lease or bid in which any other party has any interest.

(ss) "Split estate" means land in which the ownership of the surface is held by persons including governmental bodies other than the Federal government, and the ownership of underlying coal is, in whole or in part, reserved to the Federal government.

(tt) "Substantial legal and financial commitments" mean major investments of money in power plants, railroads, coal handling and storage facilities and other capital intensive improvements, and fixed equipment made on the basis of long-term, legally enforceable coal sales contracts. Investments are "major" if they are substantial in relationship to the aggregate investment expenditures which reasonable can be anticipated to be made for capital improvements and fixed equipment at the mine site up to and including completion of all reclamation operations. Costs of the acquisition of the coal in place or of the right to mine it do not alone constitute "substantial legal and financial commitments".

(uu) "Surface management agency" means the Federal agency with jurisdiction over the surface of Federally-owned lands containing coal deposits.

(vv) "Surface Mining Office" means the field representative authorized to act for Director of the Office of Surface Mining, Reclamation and Enforcement.

(ww) "Surface mining operation" means activities conducted on the surface of the lands in connection with a surface coal mine or surface operations and surface impacts incident to an underground mine, as defined in section 701(28) of the Surface Mining Reclamation and Environmental Act of 1977, 30 U.S.C. 1291(28).

(xx) "Written consent" means the document or documents that the surface owner has signed that: (1) permit a coal operator to extract and commence surface mining of coal; (2) describe any financial considerations given or proposed in return for the permission, including in-kind considerations; (3) describe any considerations given in terms of type or method of operation or reclamation for the area; (4) contain any supplemental or related contracts between the surface owner and any other person party to the permission; and (5) contain a full and accurate description of the area covered by the permission.

§ 3400.1 Multiple Development.

The granting of the exploration license, a license to mine, or a lease for the prospecting, development, or production of coal deposits will neither preclude the issuance of prospecting permits or mineral leases for prospecting, development or production of deposits of other minerals in the same land with suitable stipulations for simultaneous operation, nor will it preclude the allowance of applicable entries, locations, or selections of leased lands with a reservation of the mineral deposits to the United States.

§ 3400.2 Lands subject to leasing.

The Secretary may issue coal leases on all Federal lands except:

- (a) Lands in:
- (1) The National Park System;
- (2) The National Wildlife Refuge System;
- (3) The National Wilderness Preservation System;
- (4) The National System of Trails;
- (5) The National Wild and Scenic Rivers System, including study rivers designated under section 5(a) of the Wild and Scenic River Act;

- (6) Incorporated cities, towns, and villages;
- (7) The Naval Petroleum Reserves, the National Petroleum Reserve in Alaska, and oil shale reserves; and
- (8) National Recreation Areas.

- (b) Tide lands, submerged coastal lands within the Continental Shelf adjacent or littoral to any part of land within the jurisdiction of the United States;
- (c) Land acquired by the United States for the development of mineral deposits, by foreclosure or otherwise for resale, or reported as surplus prop-

erty pursuant to the provisions of the Surplus Property Act of 1944; and

(d) Lands acquired with money derived from the Land and Water Conservation Fund.

§ 3400.3 Limitations on authority to lease.

§ 3400.3-1 Consent or conditions of administering agency.

(a) Leases for land, the surface of which is under the jurisdiction of any Federal agency other than the Department of the Interior, may be issued only with the consent of the head or other appropriate official of the other agency having jurisdiction over the lands comprising the coal deposits or holding a mortgage or deed of trust secured by such lands.

(b) Exploration licenses and leases to mine for lands described in paragraph (a) of this section shall be subject to such conditions as that official may prescribe with respect to the use and protection of the nonmineral interests in the lands, but may be issued without the consent of that official.

§ 3400.3-2 Department of Defense lands.

The Secretary may issue leases with the consent of the Secretary of Defense on required lands set apart for military or naval purposes only if the leases are issued to a governmental entity which:

- (a) Produces electrical energy for sale to the public;
- (b) Is located in the state in which the leased lands are located; and
- (c) Has production facilities in that state, and will use the coal produced from the lease within that state.

§ 3400.3-3 Department of Agriculture lands.

(a) Subject to the provisions of § 3400.3-1, the Secretary may issue leases that authorize surface coal mining operations on Federal lands within a National Forest or a National Grassland, where:

- (1) There are no significant recreational, timber, economic or other values which may be incompatible with the surface mining operations; and

- (2) Either (i) the surface mining operations are incident to an underground coal mine; or (ii) the Secretary of Agriculture determines (on lands west of the 100th Meridian that do not have significant forest cover) that surface mining complies with the Multiple-Use Sustained-Yield Act of 1960, the Federal Coal Leasing Amendments Act of 1976, the National Forest Management Act of 1976, and the Surface Mining Control and Reclamation Act of 1977.

- (b) The Secretary may not issue leases that would authorize surface mining operations on Federal lands

within the boundaries of the Custer National Forest, § 3400.3-4 Trust protection lands. The regulations in this group do not apply to the leasing and development of coal deposits held in trust by the United States for Indians. See 43 CFR 3500.0-5(g). Regulations governing those deposits are found in 25 CFR Chapter I.

§ 3400.4 Federal/State government cooperation.

(a) In order to implement the requirements of law for Federal-State cooperation in the management of Federal lands, a Department/State regional coal team shall be established for each coal region. The team shall consist of a Bureau of Land Management field representative for each State in the region, who will be the State Director or, in his absence, his designated representative; the Governor of each State or, in his absence, his designated representatives; and a representative appointed by and responsible to the Director of the Bureau of Land Management. The Director's representative shall be chairman of the team. If the region is a multi-State region under the jurisdiction of one Bureau of Land Management State Office, the State Director shall designate a second representative.

(b) Each regional coal team shall consider and suggest policy for regional target setting, tract delineation and site specific analysis in the coal production region, guide and review tract ranking, and conduct the selection and sale scheduling process in order to suggest regional lease sale alternatives to be analyzed in the regional lease sale environmental statement and to be recommended to the Secretary. Each team member may submit a lease sale schedule alternative which shall be treated equally in the draft and final regional lease sale environmental statement.

(c) Upon completion of the final regional lease sale environmental statement, the chairman shall submit the recommendations of the regional coal team to the Director. Any disagreement as to the recommendations among the team shall be documented and submitted by the chairman along with the team recommendation. The Director shall submit the final regional environmental statement to the Secretary for his decision, together with the recommendations of the team and any recommendations the Director may wish to make after review of the final statement.

(d) The regional coal team shall also serve as the general Department/State forum for all other major Department coal management program decisions in the region, concerning preference right lease applications,

public body and small business set-aside leasing, emergency lease exchanges, and readjustment of lease terms and exploration licenses.

(e) Participation in the proceedings of a regional coal team need not be limited to the designated representatives of the Bureau of Land Management State Directors or the Governors. Additional representatives of State and Federal agencies may participate directly in the proceedings or indirectly—in the preparation of oral to assist the team at different points in the process at the request of the team chairman. At a minimum, participation shall be solicited from State and Federal agencies with special expertise in topics considered by the team or with direct responsibilities in areas potentially affected by coal management decisions. However, at every point in the deliberations the official team spokesperson for the Bureau of Land Management and for the Governors shall be those designated under paragraph (a) of this section.

PART 3410—EXPLORATION LICENSES

Subpart 3410—Exploration Licenses

Sec.

- 3410.0-1 Purpose.
 - 3410.0-2 Objective.
 - 3410.0-3 Authority.
 - 3410.0-4 Responsibilities.
 - 3410.1 Exploration licenses—Generally.
 - 3410.1-1 Lands subject to exploration license.
 - 3410.1-2 When an exploration license is required.
 - 3410.2 Prelicensing procedures.
 - 3410.2-1 Application for an exploration license.
 - 3410.2-2 Environmental review.
 - 3410.2-3 Cultural resources.
 - 3410.2-4 Threatened or endangered species.
 - 3410.2-5 Surface management agency.
 - 3410.2-6 Substantial disturbance to the natural land surface.
 - 3410.3 Exploration licenses.
 - 3410.3-1 Issuance and termination of an exploration license.
 - 3410.3-2 "Limitations on exploration license."
 - 3410.3-3 Operating regulations.
 - 3410.3-4 Surface protection and reclamation.
 - 3410.3-5 Ground and surface water data.
 - 3410.3-6 Bonds.
 - 3410.4 Use of data.
 - 3410.5 Use of surface.
- Authority: 30 U.S.C. 181 et seq.

Subpart 3410—Exploration Licenses.

§ 3410.0-1 Purpose.

This subpart provides for the issuance of licenses to explore for coal deposits subject to disposal under Group 3400.

§ 3410.0-2 Objective.

The objective of this subpart is to allow private parties singularly or

jointly to explore coal deposits to obtain geological, environmental, and other pertinent data concerning the coal deposits.

§ 3410.0-3 Authority.

(a) These regulations are issued under the authority of the statutes listed in § 3400.0-3 of this Group, principally section 30 of the Mineral Leasing Act of 1920 (30 U.S.C. 180).

(b) These regulations primarily implement section 2(b) of the Mineral Leasing Act of 1920, as amended by section 4 of the Federal Coal Leasing Amendments Act of 1976 (30 U.S.C. 201(b)).

§ 3410.0-4 Responsibilities.

(a) The Bureau of Land Management exercises the Secretary's discretionary authority to determine whether exploration licenses are to be issued. The Bureau is also responsible for issuing and cancelling exploration licenses and terminating the period of liability of the licensee under any conditions that may arise as a condition of license issuance. The regulations in this Subpart shall be administered by the Director of the Bureau of Land Management through the State Director and the authorized officer, subject to the supervisory authority of the Secretary. The Bureau of Land Management State Office having jurisdiction over the lands involved (43 CFR Subpart 1821) is also the Office of Record.

(b) The Geological Survey exercises the Secretary's authority regarding operations conducted within the area covered by the license, including responsibility for all geological, economic, and engineering determinations.

(c) The authorized officer, in consultation with the Geological Survey, and where appropriate, the surface management agency, the Fish and Wildlife Service, and the surface owner, if other than the United States, formulates the requirements to be incorporated in exploration licenses for the protection of the surface resources and for reclamation.

(d) The Geological Survey, after consultation with the authorized officer, and where appropriate, the surface management agency, and the surface owner, if other than the United States, shall provide technical review and approval of the exploration plan. The Geological Survey shall recommend bonding requirements to the Bureau of Land Management. Upon the completion of exploration operations, the Geological Survey shall recommend termination of the period of the licensee's liability under any bond posted.

PROPOSED RULES

§ 3410.1 Exploration licenses—Generally.**§ 3410.1-1 Lands subject to exploration licenses.**

(a) Exploration licenses may be issued for:

(1) Lands administered by the Secretary that are subject to leasing, § 3400.2;

(2) Lands administered by the Secretary of Agriculture through the Forest Service or other agency that are subject to leasing, § 3400.2;

(3) Coal deposits in lands which have been leased by the United States subject to a reservation to the United States of the mineral or coal deposits, to the extent that those deposits are subject to leasing under § 3400.2; and

(4) Coal or lignite deposits in acquired lands set apart for military or naval purposes.

(b) No exploration license shall be issued for land on which a lease has already been issued.

§ 3410.1-2 When an exploration license is required.

(a) An exploration license shall not be required for "casual use" as defined in 30 CFR 211.10(a).

(b) No person may conduct exploration activities for commercial purposes on lands subject to this subpart without an exploration license.

(c) Exploration activities conducted without an exploration license in violation of paragraph (b) of this section shall constitute a trespass, and shall be subject to the provisions of 43 CFR 9239.5-3(f).

§ 3410.2 Prelicensing procedures.**§ 3410.2-1 Application for an exploration license.**

(a) Exploration license applications shall be submitted at the Bureau of Land Management State Office having jurisdiction over the lands covered in the application. (43 CFR, Subpart 1821.) The applications shall be subject to the following requirements:

(1) No specified form of application is required.

(2) The area to be explored shall be described by legal description or, if on unsurveyed lands, by metes and bounds.

(3) Each application shall contain three copies of an exploration plan which complies with the requirements of 30 CFR 211.10(a).

(4) Each application and its supporting documents shall be filed with a nonrefundable filing fee (43 CFR 3473.2).

(5) Coal exploration license applications shall normally cover no more than 25,000 acres in a reasonably compact area and entirely within one State. Applications for more than 25,000 acres must include a justifica-

tion for an exception to the normal acreage limitation.

(b) Any person qualified to hold a lease under the provisions in Subpart 3472 of this chapter may apply for an exploration license.

(c) Nothing in this Subpart shall preclude the authorized officer from issuing a call for expressions of leasing interest in exploration licenses for a given area.

(d) Applicants for exploration licenses shall be required to provide an opportunity for other parties to participate in exploration under the license on a pro rata cost sharing basis.

(1) Immediately upon the filing of an application for an exploration license the applicant shall furnish a "Notice of Invitation," approved by the authorized officer, once every week for four consecutive weeks in at least one newspaper of general circulation in the area where the lands covered by the license application are situated. This notice shall contain an invitation to the public to participate in the exploration under the license.

Copies of the Notice of Invitation shall be filed with the authorized officer two weeks prior to publication by the applicant for distribution to the proper Bureau of Land Management Office and for Bureau of Land Management's publication of the Notice of Invitation in the FEDERAL REGISTER.

(2) Any person who elects to participate in the exploration program contained in the application shall notify the authorized officer and the applicant in writing within 30 days after the final publication. Any person who seeks to participate in the exploration program, but who wants to be accommodated in any respect shall submit, with his notification to the authorized officer, three copies of an exploration plan that complies with the requirements of 30 CFR 211.10(a), showing the modifications that would be required in the exploration plan in which he seeks to participate. The authorized officer may require modification of the original exploration plan to accommodate the needs of additional participants.

(e) An application to conduct exploration which could have been conducted as a part of exploration under an existing or recent coal exploration license may be rejected.

§ 3410.2-2 Environmental review.

(a) Before an exploration license may be issued, the authorized officer, using the exploration plan submitted by the applicant, as approved by the Geological Survey, shall make an assessment of the potential effect of such exploration on the area and its environment. Aspects of the environment to be examined include surface water and groundwater, fish and other

aquatic resources; wildlife habitats and populations; visual resources; recreational resources; cultural resources; and social factors in the affected area.

(b) If, before issuance of the license, the authorized officer determines that an environmental statement is required by Section 102(2)(C) of the National Environmental Policy Act of 1969 (42 U.S.C. 4332(2)(C)), a statement shall be prepared.

§ 3410.2-3 Cultural resources.

If lands in or nominated for inclusion in the National Register of Historic Places contain cultural resources which might be affected by an action taken under an exploration license, no exploration license for such land shall be authorized until after compliance with section 106 of the Historic Preservation Act (16 U.S.C. 470f). Other cultural resource values shall also be protected pursuant to Section 106 of the Historic Preservation Act.

§ 3410.2-4 Threatened or endangered species.

If threatened or endangered species of fauna or flora or their critical habitat would be destroyed or adversely modified as a result of the issuance of an exploration license, no exploration license for such lands shall be authorized. In making this determination the authorized officer shall consult any other surface management agency, and if the presence of threatened or endangered species or their habitat is suspected or known, with the Fish and Wildlife Service in accordance with 50 CFR Part 402.

§ 3410.2-5 Surface management agency.

The authorized officer may issue an exploration license covering lands the surface of which is under the jurisdiction of any Federal agency other than the Bureau of Land Management only in accordance with those conditions prescribed by the surface management agency concerning the use and protection of the nonmineral interests in those lands.

§ 3410.2-6 Substantial disturbance to the natural land surface.

No exploration license shall be issued if exploration under it would result in substantial disturbance to the natural land surface. Substantial disturbance to the natural land surface means any disturbance other than that necessary to determine the nature of the overlying strata and the depth, thickness, shape, grade, quality and hydrologic conditions of the coal deposit, or which causes unnecessary and undue degradation of the lands.

§ 3410.3 Exploration licenses.**§ 3410.3-1 Issuance and termination of an exploration license.**

(a) The authorized officer has the discretion of issuing an exploration license or rejecting the application therefore under this subpart.

(b) An exploration license shall become effective on the date specified by the authorized officer as the date when exploration activities may begin. An exploration license shall not be valid for more than two years from its effective date. Cleanup and reclamation must be completed during this period.

(c) An exploration plan approved by Geological Survey shall be attached and made a part of each exploration license.

(d) Subject to the continued obligation of the licensee and the surety company to comply with the terms and conditions and special stipulations of the exploration license, the exploration plan, and the regulations, a licensee may relinquish an exploration license for all or any portion of the lands in it. A relinquishment shall be filed in the Bureau of Land Management State Office in which the original application was filed. See 43 CFR Subpart 1221.

(e) An exploration license may be revoked by the authorized officer for noncompliance with its terms, the exploration plan, or the regulations, after the authorized officer has notified the licensee of the violation(s) in writing and the licensee has failed to correct the violation(s) within the period prescribed in the notice.

(f) Should a licensee request a modification to the exploration plan, the Mining Supervisor, with the concurrence of the authorized officer, and where appropriate the surface management agency, may approve the modification if geologic or other conditions warrant. If modification of the exploration plan could result in significant disturbance or damage, the authorized officer, after consultation with the Mining Supervisor, and where appropriate the surface management agency, may adjust the terms and conditions of the license to mitigate such disturbance or damage. Unless the licensee concurs in the adjusted terms and conditions of the license, the modification of the exploration plan will not be approved.

(g) When unforeseen conditions that could result in significant disturbances or damage to the environment are encountered, or when geologic or other physical conditions warrant a modification in the approved exploration plan, the authorized officer, after consultation with the Mining Supervisor, and where appropriate, the surface management agency, may adjust

the terms and conditions of the exploration license, or (2) the Mining Supervisor, after consultation with the authorized officer and where appropriate, the surface management agency, may direct adjustment in the exploration plan. If the licensee does not concur in the adjustment of the terms of the exploration license and exploration plan, he may relinquish the exploration license.

(h) Exploration licenses shall not be extended. Exploration operations may not be conducted after the exploration license has expired. The licensee may apply for a new exploration license as described in § 3410.3-1. A new exploration license may be issued simultaneously with the termination of the existing exploration license.

§ 3410.3-2 Limitations on exploration licenses.

(a) The issuance of exploration licenses for an area shall not preclude the issuance of leases under applicable regulations for that area. If a lease is issued for lands included in an exploration license, the authorized officer shall cancel the exploration license on the effective date of the lease for those lands which are common to

§ 3410.3-3 Operating regulations.

The licensee shall comply with the provisions of the operating regulations of the Geological Survey (30 CFR Part 211). Copies of the operating regulations may be obtained from the Mining Supervisor. Authorized representatives of the Secretary and, where appropriate, the surface management agency shall be permitted to inspect the premises and operations. The licensee shall provide for the free ingress and egress of Government officers and other persons using the lands under authority of the United States.

§ 3410.3-4 Surface protection and reclamation.

(a) The authorized officer shall include in each exploration license requirements and stipulations to protect the environment and associated natural resources and to ensure reclamation of the land disturbed by exploration.

(b) The exploration plan shall be designed to prevent substantial disturbance of the natural land surface.

(c) The authorized officer may issue an exploration license for Federal lands underlying private surface. The establishment of the bond amount, when the exploration license will embed such lands, shall reflect any agreement or lack of agreement between the licensee, applicant and the surface owner with respect to consent to or compensation for operations on

the surface of the lands in the exploration license.

§ 3410.3-5 Ground and surface water data.

The applicant may be required to collect and report ground and surface water data to the authorized officer.

§ 3410.3-6 Bonds.

(a) Bonding provisions in Subpart 2474 of this chapter apply to these regulations.

(b) Prior to issuing an exploration license, the authorized officer, after consultation with the Mining Supervisor and, where appropriate, the surface management agency and the surface owner, shall insure that the amount of the bond or bonds to be furnished is sufficient to assure compliance with the terms and conditions of the exploration license, exploration plan and regulations. In no event shall the amount of such bond be less than \$5,000.

(c) Upon completion of exploration and reclamation activities that are in compliance with the terms and conditions of the exploration license, the exploration plan, and the regulations, or upon discontinuance of exploration operations and completion of such reclamation as may be needed to the satisfaction of the authorized officer and, where appropriate, the surface management agency, the authorized officer shall terminate the period of liability under the compliance bond. Where the surface of the land being explored is privately owned, the authorized officer shall not terminate the period of liability under the compliance bond until each surface owner has notified the authorized officer, in writing, that the surface has been reclaimed in a satisfactory manner. Should the licensee and any surface owner be unable to agree on the adequacy of the reclamation, the authorized officer shall make the final determination. The period of liability under the compliance bond shall be terminated after it is determined that the terms and conditions and special stipulations of the exploration license, the exploration plan, and the regulations have been met.

§ 3410.4 Use of data.

The licensee shall furnish to the Mining Supervisor copies of all data (including, but not limited to, geological, geophysical, and core drilling analysis) obtained during exploration. The licensee shall submit the data and, where appropriate, the methods by which the data were gathered, at such time and in such form as required by the Mining Supervisor, the authorized officer, or surface management agency, or as specified in this subpart, the license, or the plan. All proprietary data shall be considered confi-

PROPOSED RULES

dential and not made public until the areas involved have been leased or until the Mining Supervisor determines that public access to the data would not damage the competitive position of the licensee, whichever comes first. (30 CFR 211.6; 43 CFR 2.20).

§ 3410.5 Use of surface.

(a) A licensee shall be entitled to use for exploration purposes only that surface area of the lands in the exploration license that is authorized in the exploration plan.

(b) Operations under these regulations shall not unreasonably interfere with or endanger operations authorized, under any other Act or regulation.

(c) The licensee shall comply with all applicable Federal, State and local laws and regulations, including the regulations in Group 3000 and Part 3400 of this chapter, and 30 CFR Parts 211 and 741.

PART 3420—COMPETITIVE LEASING**Subpart 3420—Competitive Leasing****Sec.**

- 3420.0-1 Purpose.
- 3420.0-2 Objectives.
- 3420.0-3 Authority.
- 3420.1 Policy.
- 3420.1-1 Procedures.
- 3420.1-2 General.
- 3420.1-3 Lands subject to evaluation for leasing.
- 3420.1-4 Known Recoverable Coal Resource Areas.
- 3420.1-5 Special leasing opportunities.
- 3420.1-6 Requirement for land use planning.
- 3420.2 Land use plans prepared by the Bureau of Land Management.
- 3420.2-1 Preparation of a land use plan.
- 3420.2-2 Cost resource information.
- 3420.2-3 Areas acceptable for further consideration.
- 3420.2-4 Hearing requirements.
- 3420.2-5 Consultation with Federal surface management agencies.
- 3420.2-6 Consultation with states.
- 3420.2-7 Identification of lands as acceptable for further consideration.
- 3420.3 Regional production goals and targets.
- 3420.3-1 General.
- 3420.3-2 Evaluation of coal needs.

Subpart 3427—Split Estate Leasing

- 3427.0-1 Purpose.
- 3427.0-3 Authority.
- 3427.1 Coal deposits subject to consent.
- 3427.2 Application for consent.
- 3427.3 Validation of information.
- 3427.4 Refusal of consent.
- 3427.5 Pre-existing consents.

ATTORNEY: 30 U.S.C. 181 et seq.; 30 U.S.C. 351-359; 30 U.S.C. 521-531; 30 U.S.C. 1201 et seq.; 42 U.S.C. 7101 et seq.; 43 U.S.C. 1701 et seq.; and 15 U.S.C. 631-644

Subpart 3420—Competitive Leasing

- § 3420.0-1 Purpose.
- This subpart sets forth the procedures for the competitive leasing of rights to extract Federal coal.

§ 3420.0-2 Objectives.

The objectives of these regulations are to establish standards and procedures for considering and, where appropriate, causing development of coal deposits through a leasing system involving land use planning and environmental assessment processes to ensure that an adequate supply of Federal coal is developed efficiently in compliance with the planning processes, and other safeguards designed to protect society and the environment; to ensure that coal deposits are leased at

their fair market value; and to ensure that coal deposits are developed in consultation, cooperation, and coordination with the public, State and local governments, and involved Federal agencies.

§ 3420.0-3 Authority.

(a) The regulations in this part are issued under the authority of the statutes cited in § 3400.0-3 of this Group.

(b) The regulations in this part implement: (1) Primarily Section 2(a) of the Mineral Leasing Act of 1920, as amended by Sections 2 and 3 of the Federal Coal Leasing Amendments Act of 1976 (30 U.S.C. 201(a)); and (2) The Small Business Act of 1953, as amended (15 U.S.C. 631 et seq.).

§ 3420.0-4 Policy.

All leases except those issued under the provisions of Part 3430 of this chapter shall be issued competitively. There shall be special opportunity lease sales for qualified public bodies and for small businesses. The fair market value determinations for special opportunity lease sales shall be derived in the same manner as for other lease sales. Before each sale, the Department shall evaluate and compare the method or methods of mining that will achieve the maximum economic recovery of the resource. The Department shall receive fair market value for all coal leased.

§ 3420.1 Procedures.**§ 3420.1-1 General.**

The competitive leasing program is part of the Federal coal management program and consists of four principal elements: Comprehensive, multiple resource land use planning; establishment of resource areas; systematic specification of resource areas; and lease selection, and scheduling; and lease sale. The application of criteria for unsuitability for mining is an integral part of land use planning. All competitive lease sales under this subpart shall be initiated by the Secretary; applications for a competitive lease will be accepted only when filed under the provisions of Subpart 3425 of this chapter.

§ 3420.1-2 Lands subject to evaluation for leasing.

(a) All lands subject to coal leasing under the mineral leasing laws are subject to evaluation under this subpart (43 CFR 3400.2).

§ 3420.1-3 Known recoverable coal resource areas.

No area outside a designated Known Recoverable Coal Resource Area (KRCRA) shall be leased. Each KRCRA shall be formally designated

by publication in the **FEDERAL REGISTER**.

§ 3420.1-4 Special leasing opportunities.

(a) The Secretary shall, under the procedures established in this subpart, including § 3402.4, reserve and offer a reasonable number of lease tracts through completed lease sales open only to restricted classes of potential bidders. Except for the limitation on bidding contained in paragraph (b) of this section, all requirements in this Subpart apply equally to special leasing opportunities, including the requirement that coal be leased at its fair market value.

(b) Special leasing opportunities shall be provided for two classes of potential lessees:

(1) Public bodies.

(i) Only public bodies with a definite plan for producing energy for their own use or for their members or customers shall bid for leases designated as special leasing opportunities for public bodies. To qualify as a definite plan, a plan must clearly state the intended use of the coal and have been approved by the governing board of the public body submitting the plan.

(ii) Each public body shall submit evidence of qualification as part of its expression of leasing interest or upon submission of a bid if no expression of interest is made.

(iii) The Secretary may designate certain coal lease tracts as special leasing opportunities for public bodies only if a public body has submitted an expression of leasing interest under § 3420.1-2, requesting that the procedures of this section apply.

(iv) Leases issued under this section to public bodies may be assigned only to other public bodies.

(2) Small businesses.

(i) When necessary to comply with the requirements of the Small Business Act, the Secretary shall designate a reasonable number of tracts for special leasing opportunities for businesses qualifying under 13 CFR Part 121.

(ii) Leases issued under this section may be assigned only to other small businesses qualifying under 13 CFR Part 121.

§ 3420.1-5 Requirement for land use planning.

(a) The Secretary may not issue a lease for coal development unless the lands containing the coal deposits have been included in a land use plan or land use analysis and unless the sale is compatible with, and subject to, any relevant stipulations, guidelines and standards set out in that plan.

(b) Plans for lands administered by the Bureau of Land Management shall be prepared in accordance with the provisions of § 3420.2 of this title.

(c) Plans for lands under the jurisdiction of the Department of Agriculture or any other Federal agency with surface management authority over lands subject to leasing shall be prepared by the surface managing agency, except as provided in the following subsection.

(d) In an area where the Secretary finds either that there is no Federal interest in the surface or that the coal deposits in the area are insufficient to justify the costs of a Federal land use plan, lands may be leased if:

(1) The lands have been included in a comprehensive land use plan prepared, authorized or recognized by the state in which the lands are located, which shall govern Federal coal leasing recommendations affecting surface management except for those decisions for which the Secretary is responsible under the Surface Mining Control and Reclamation Act of 1977, and those recommendations that are in conflict with Federal law; or

(2) The lands have been included in a land use analysis completed under the regulations comprising Group 1600 of this chapter, or prior to adoption of the regulations comprising Group 1600, a comparable land use analysis under existing procedures.

(e) In the absence of a completed land use plan, a member of the public may petition for a land use analysis for coal related uses of the land as provided for in this group.

§ 3420.2 Land use plans prepared by the Bureau of Land Management.

§ 3420.2-1 Preparation of a land use plan.

The Bureau of Land Management shall prepare resource management plans and land use analyses as provided in Group 1600 of this chapter, or, prior to adoption of the regulations comprising Group 1600, a comparable management plan or land use analysis under existing procedures.

§ 3420.2-2 Coal resource information.

A land use plan shall contain an assessment of the amount of coal recoverable by either surface or underground mining operations or both.

§ 3420.2-3 Areas acceptable for further consideration for leasing.

The major land use planning decision concerning the coal resource shall be the identification of areas acceptable for further consideration for leasing. The areas acceptable for further consideration for leasing shall be identified by the following screening procedures in each subsection below. Each screening procedure shall be applied only to those lands still identified as acceptable for further consideration for leasing after application of

the screening procedure in each preceding subsection.

(a) Only those areas subject to evaluation for leasing (§ 3420.1-2) that have high or moderate development potential coal deposits shall be considered acceptable for further consideration for leasing.

(1) This determination shall be based generally on the Geological Survey's Coal Resource Occurrence-Coal Development Potential (CRO/CDP) maps. If CRO/CDP maps are not available, the Geological Survey shall use other available data sources to estimate coal development potential for the land management agency. If other data sources are used, the same criteria for designating coal reserves as high or moderate development potential shall be used.

(2) Coal companies, the State governments, and members of the public may submit non-confidential coal geologic and economic data during the earlier inventory process of land planning. Where such information is determined to indicate significant development potential for an area not shown to be of medium or high potential in the CRO/CDP maps, the area shall be considered medium development potential and shall not be excluded from further consideration and application of the remaining screens in the land use planning process.

(b) The authorized officer shall, using applicable criteria and procedures set out in § 3420.1-3(d), review Federal lands to assess whether there are areas unsuitable for all or certain types of surface mining operations. Areas considered unsuitable for all types of surface mining operations shall not be acceptable for further consideration for leasing.

(1) On Federal lands administered by the Bureau of Land Management, an unsuitability assessment will be made as part of the land use planning process, using both the environmental and resource management criteria of the bureau, including those set out in Subpart 3461, and the reclamation and environmental criteria developed by the Office of Surface Mining Reclamation and Enforcement. This assessment shall be consistent with any decision of the Office of Surface Mining Reclamation and Enforcement to designate lands unsuitable or to terminate a designation in response to a petition.

(2) In cases where land use plans to be used for coal activities prior to having been prepared by other Federal agencies or State governments that do not contain an unsuitability assessment, the Secretary shall conduct an assessment. This assessment shall provide opportunity for public comment.

(c) Multiple land use decisions shall be made which may eliminate addi-

PROPOSED RULES

tional coal deposits from further consideration for leasing to protect other resources values of a locally important or unique nature not included in the unsuitability criteria discussed in paragraph (b) of this subsection.

(d) While preparing a land use plan, the Bureau of Land Management shall consult with all qualified surface owners, as defined in § 3400.0-5 of this chapter, whose lands overlie coal deposits to determine preference for or against mining by other than underground mining techniques.

(e) Where a significant number of qualified surface owners in an area who have not previously granted any option, preference, or right of first refusal to any other party to mine their land by other than underground mining methods have expressed a preference against mining by other than underground mining techniques, and that area would be considered acceptable for further consideration for leasing only if development by underground mining techniques. In addition, the area may be offered for lease for development by other than underground mining techniques if there are no acceptable alternative areas available to meet the regional leasing target.

(2) An area subject to paragraph (d)(1) of this subsection may be considered acceptable for further consideration for leasing for mining by surface underground or surface methods if the number of qualified surface owners who have expressed their preference against mining by other than underground methods is reduced below a significant number because qualified surface owners who expressed their preference against such mining subsequently have given written consent for such mining; (ii) the ownership of the surface estate of qualified surface owners who expressed such a preference is transferred to surface owners who are not qualified surface owners or to qualified surface owners who subsequently provide consent to such mining; or (iii) both (i) and (ii); and the land use plan is amended accordingly.

(3) If any qualified surface owner indicates a firm intent not to give written consent during the expected life of the land use plan to the mining of the coal deposit underlying his surface estate, and signs a written statement that he has not granted any option, preference, or right of first refusal to acquire consent to any other party, that portion of a coal deposit underlying the land is otherwise considered acceptable for further consideration for leasing as a result of the application of the screen in the preceding subsection, shall be considered acceptable for leasing for development by underground mining methods.

(4) A portion of a coal deposit considered acceptable for leasing for mining by underground methods pursuant to clause (3) may be considered for leasing also by other than underground mining techniques if the ownership of the surface estate is subsequently transferred to a surface owner other than a qualified surface owner or to a surface owner who does not express a firm intent not to provide consent for such mining and if the land use plan is amended.

(e) The land use plan may provide for impact thresholds to manage coal development. Thresholds are pre-specified levels or rates of coal development, measured by impacts on natural, social, or economic resources for the areas assessed as acceptable for further consideration for leasing. Where a threshold is exceeded, the Bureau of Land Management may halt, suspend, or condition further consideration of the areas acceptable for leasing.

(f) Where the areas acceptable for further consideration for leasing within a planning unit, in the judgment of the local land manager contain more reserves than are likely to be needed for leasing over the life of the plan, the plan may specify broad areas greater than 60,000 acres for earliest consideration for leasing, if any is to be done.

3420.2-4 Hearing requirements.

The Bureau of Land Management shall conduct a public hearing before it is adopted if such a hearing is requested by any person may be adversely affected by the adoption of the plan. A hearing conducted under Group 1600 of this chapter may fulfill this requirement.

The authorized officer conducting the hearing shall: (a) publish a notice of the hearing in a newspaper of general circulation at least once in each of two consecutive weeks in the affected geographical area;

(b) provide an opportunity for testimony by anyone who so desires; and

(c) record the proceedings of the hearing so that a complete transcript of the hearing can be compiled if requested.

3420.2-5 Consultation with Federal surface management agencies.

In situations where another Federal surface management agency administers limited areas overlying Federal coal within the boundaries of a land use plan being prepared by the Bureau of Land Management, the Bureau of Land Management shall consult with the other agency to obtain its recommendations as to the acceptability for further consideration for leasing of the land the other agency administers.

3420.2-6 Consultation with States.

Before adopting a land use plan that makes any formal assessment of lands acceptable for further consideration for leasing, the Bureau of Land Management shall consult with the state Governor and the state agency charged with the responsibility for maintaining the state's unsuitability program (43 CFR 3401.4-1).

3420.2-7 Identification of lands as acceptable for further consideration.

Formal determination that lands are acceptable for further consideration for leasing will be made under Subpart 1600 of this chapter. Any lands determined to be acceptable may be further determined for leasing under § 3420.4 of this Subpart.

3420.3 Regional production goals and leasing targets.

3420.3-1 General.

(a) The coal production regions to which this section applies shall be designated by publication in the *Federal Register*. They may be changed or their boundaries altered by publication in the *Federal Register*.

(b) The Secretary, in consultation with the Secretary of the Department of Energy, affected State Governors, and other concerned parties shall biennially adopt regional coal production goals provided by the Department of Energy adjusted as necessary. The Secretary shall also establish regional leasing targets for the purposes of setting Departmental priorities, aiding the States in planning for potential future impacts of coal development, and supplying the guidance for establishing the amount of coal to be offered through proposed lease sale schedules.

3420.3-2 Evaluation of coal needs.

This section sets out the process the Department shall follow in establishing regional coal needs and appropriate coal management actions.

(a) Proposed regional production goals stating the desired levels of production of coal from various types of coal shall be established by the Department of Energy consistent with the procedures as agreed to by the Secretary of Energy and of the Interior on production goals for energy resources on Federal lands.

(b) The Secretary shall, within 60 days of receipt of the proposed production goals, review and comment thereon to the Secretary of Energy. The Secretary shall inform the Secretary of Energy of potential policy conflicts or problems concerning, but not limited to: (1) the Department's responsibility for the management, regulation, and conservation of natural resources; (2) the capabilities of Federal

lands and Federal coal resources to meet these goals; and (3) the national need for coal resources balanced against the environmental consequences of developing the resources.

(c) The Secretary of Energy shall issue final production goals not more than 30 days after receipt of the Secretary's comments. In establishing or revising regional lease sale schedules, the Secretary shall be guided by these final production goals of the Department of Energy.

(d) The Department of Energy's final production goals and related production statistics of the Department of the Interior shall be provided to the regional coal teams. Each team shall consider the regional situation and recommend adjustments to the relevant regional production goals based on such factors as (1) public comment received as a result of the publication of the Department of Energy's final regional production goals in the *FEDERAL REGISTER*, (2) testimony received in hearing(s) held by the team in the region, (3) state government, BLM State Office, regional development policies, (4) administrative capacity to satisfy the indicated level of leasing based on the Department of Energy's final regional goals, and (5) other information available to the states and BLM State offices which they believe should receive consideration by the Secretary in his review of the Department of Energy's final regional production goals. Regional teams may also recommend preliminary regional leasing target to the Secretary.

(e) The Secretary shall consider the findings and recommendations of the regional coal teams and other relevant information and review the Department of Energy's final regional production goals to determine whether any adjustments are necessary. The Secretary shall either adopt such goals or make the necessary adjustments thereto and then adopt the goals, as adjusted. Upon adoption of the Department of Energy's final regional production goals, with or without adjustments, such goals, together with the reasons for adjustments, if any, shall be transmitted to the Secretary of Energy and published in the *Federal Register*.

(f) The Secretary shall also establish preliminary regional leasing targets, based on the Department of Energy's final regional production targets, as adopted; recommendations of the regional coal teams; and other relevant information. In establishing the preliminary regional leasing targets, at a minimum, the expected and potential production for existing coal leases, noncompetitive coal leases, non-Federal coal holdings, expected non-Federal leasing, the level of competition within the coal region, and the envi-

ronmental benefits of leasing in the management of the Federal coal resource shall be evaluated. Preliminary regional leasing targets shall reflect the difference between desired levels of production in the region and projected supplies, shall be set out on the basis of reserve coal tonnages, shall be for 4 years, and shall be based on the coal that would come into production as a result of Federal leasing. Consideration shall also be given to the relative economic, social, and environmental differences among the coal regions, the comparative benefits of developing Federal rather than non-Federal coal, and other factors as the Secretary deems appropriate. The preliminary leasing targets shall be published in the *FEDERAL REGISTER*.

(g) In the process of adopting the Department of Energy's final regional production goals and establishing preliminary regional leasing targets, the Secretary may call a national conference of the regional coal teams to review their recommendations.

(h) In addition to participating in the Secretary's regional hearings on the Department of Energy's final regional production goals, the coal and utility industries, agricultural and community organizations, environmental groups, and other concerned parties shall be afforded the opportunity to submit their views on these goals, as adopted by the Secretary, and the preliminary regional leasing targets by notice in the *FEDERAL REGISTER* and, if sufficient requests are received, from the public through additional hearings.

(i) The Secretary shall consult with the State Governors seeking their views concerning the Department of Energy's final regional production goals, those goals as adopted by him, and the preliminary leasing targets. The Secretary shall particularly seek the Governors' views regarding the relationship between the preliminary regional leasing targets and potential social and economic effects on the State and region.

(j) Based on the consultation with the State Governors, consideration of the Department of Energy's final regional production goals, as adopted, and the comments received on these goals and the preliminary regional leasing targets, the Secretary shall adopt final regional leasing targets for the guidance of regional coal teams as set forth in § 3420.3-3 of this title.

(k) Two years after the adoption of each new regional lease sale schedule, the Secretary shall review the final regional leasing target which applies to that schedule through the process set out in paragraphs (b) through (j) of this section and, if necessary, revise the final regional leasing target for the final 2 years of the sale schedule.

(l) The initial regional leasing targets established for the first regional lease sales may be established by the Secretary based on the analysis presented in the final Environmental Statement, Federal Coal Management Program, and related analyses without regard to the provisions of paragraphs (a) through (j) of this section.

§ 3120.3-3 Use of final regional leasing targets.

(a) The final regional leasing targets shall guide the regional coal team in the preliminary delineation, ranking, selection, and scheduling of tracts for lease sale in the coal production regions.

(b) The final regional leasing targets do not represent final leasing decisions and may, with the approval of the Secretary, be revised by the regional coal teams as a result of consideration of national needs and social, economic, and environmental factors that are taken into account during the tract ranking, selection, and scheduling process. Circumstances justifying a revision of a final regional leasing target may include, but not be limited to, the following:

(1) Expressed industry interests in coal development in the region not reflected in the final regional leasing target;

(2) Expressed interests and rationale thereof from a community or group of communities for coal development in the adjacent and surrounding areas;

(3) Expressed interests for special opportunity sales;

(4) Actual results indicated by the success or failure of the scheduled lease sales in meeting the final regional leasing target;

(5) An expressed desire on the part of the state or local government to shift or disperse development patterns in the region or sub-region by additional leasing, reductions in leasing, or shifts in locations of lease sales; and

(6) Results from the analyses contained in the regional lease sale environmental statement.

(c) In any case, one alternative shall be analyzed in the regional lease sale environmental statement that represents the applicable final leasing target established pursuant to § 3420.3-3(j).

(d) Where a regional coal team elects to propose a revision of the relevant final regional target during the selection of tracts proposed for lease sale and the design of the recommended regional sale schedule, the team shall clearly set out the proposed revision and the reasons therefor in the regional sale environmental statement and request public comment on the proposed revision in the public participation process for the regional lease sale environmental statement. Such a

PROPOSED RULES

proposed revision shall not become effective unless and until the Secretary approves the recommended alternative leasing target and schedule.

§ 3420.3-4 Environmental assessment.

An environmental assessment in the form of an updating of the coal programmatic environmental statement shall be conducted by the Secretary if:

(a) determines that the regional production goals and regional leasing targets established under § 3420.3-1 of this title and § 3420.3-2(e) vary significantly from those analyzed in the most current version of the coal programmatic statement; or

(b) has reason to believe that the tracts available for selection in the next round of the tract ranking, selection, and scheduling process (Section 3420.4-4) in any given region(s) may generate significantly different levels or types of environmental impacts than were anticipated in the most current coal programmatic environmental statement.

§ 3420.4 Activity planning—The leasing process.**§ 3420.4-1 Area identification process.**

This section describes the process for identifying, ranking, selecting, and scheduling lease tracts after land use planning has been completed. This process considers the activity planning aspect of the coal management program. Activity planning may occur (a) where areas acceptable for further consideration for leasing have been identified in the Bureau of Land Management's land use planning process or (b) where the surface management agency or State has completed acceptable planning under § 3420.1-5 of this title. Activity planning may also occur where coal leasing and development is consistent with resource plans completed prior to the adoption of this group 3400 of this title that have been supplemented by the application of the unsuitability criteria in accordance with subpart 3461 of this title and consultation with the surface owners in accordance with § 3420.2 of this title.

§ 3420.4-2 Expressions of leasing interest.

(a) A call for expressions of leasing interest may be made after areas acceptable for further consideration for leasing have been identified through the Bureau of Land Management's land use planning process. A call for expressions of leasing interest may also be made in other areas having acceptable planning completed by other surface management agencies or state governments under the provisions of § 3420.1-5 of this title. The call may be made in any one, several, or all of the above mentioned areas when the Sec-

retary determines, using the regional production goals and regional leasing targets established under § 3420.4-1 of this title, that additional federal coal leasing may be needed to meet local, state, or national needs in the foreseeable future.

(b) The expressions of leasing interest provided for in this Sub-part is not exclusive. Any individual, business entity, governmental entity, or public body may participate in the general public participation opportunities and procedures that are part of the land use planning process which precedes the call for expressions of leasing interest.

(c) Entities qualifying for special leasing opportunities as defined in § 3420.1-4 of this title shall make their intentions known through submission of expressions of leasing interest when called for by the Secretary.

(d) Any expressions of leasing interest may include supportive nonproprietary data. Such data may include, but are not limited to, location and quantities of coal desired, time frames, proposed uses of coal, technical coal data, commitment with private surface and coal owners and affected land owner or lessee, and basic development proposals. Expressions which identify quantity and quality of coal and timing of need without specifying a location shall be given as serious consideration in activity planning as those that specify a location. Data which are considered proprietary shall not be submitted as part of an expression of leasing interest.

(e) Public inspection and copying of information submitted under this subpart shall be governed by the procedures in part 2 of this title.

(f) Each call for expressions of leasing interest will be published as a notice in the *Federal Register* and in at least one newspaper of general circulation in each affected state. This notice of request shall specify the area or areas involved, information required, the time period within which expressions may be submitted, where to write for further information, and where to submit the expressions.

§ 3420.4-3 Preliminary tract delineation.

(a) Preliminary tracts shall be delineated for analysis during ranking, selection, and scheduling. The preliminary tracts may include non-Federal as well as Federal coal reserves and may include existing mining operations.

(b) In addition to expressions of leasing interest, factors to be considered in delineating preliminary tracts may include but are not limited to:

(1) Technical coal data, including reserve tonnage, rank, sulfur content, seam thickness, and ratio of overburden to recoverable coal;

(2) Conservation considerations, including preliminary calculation of maximum economic recovery, land ownership patterns, and the potential formation of logical mining units; and

(3) Surface ownership, including qualified surface owners' preferences expressed in consultation during land use planning, and the existence of written surface owner consents and their terms.

(c) The potential tracts shall be delineated in accordance with § 3471.1-2 of this title and by seam(s) or coal bed(s). More than one potential tract may be delineated for a specific coal bed or potential mining unit.

(d) When potential public bodies have submitted expressions of leasing interest, tracts to meet those needs shall be delineated when and where technically feasible for public body special leasing opportunities in accordance with § 3420.1-4 of this title.

(e) In cooperation with the Small Business Administration, tracts may be delineated when and where technically feasible for small business special leasing opportunities in accordance with § 3420.1-4 of this title.

(f) Other tracts to be used in a lease or fee exchange (43 CFR Subparts 3435, 3436, and 3437) may be delineated.

(g) A tract profile shall be formulated for each preliminary tract. The profile shall include:

(1) A summary of the information used in the delineation of the tract, and

(2) A site-specific environmental inventory and preliminary analysis.

(h) The regional coal team shall determine the location, priority, and timing of both preliminary tract delineation and site-specific environmental inventory and analysis, subject to limitations of data availability, budget, and manpower.

§ 3420.4-4 Regional tract ranking, selection, and scheduling.

(a) If the final regional leasing target established for any given region suggests a need for additional Federal coal leasing, tracts shall be ranked and a proposed lease sale schedule shall be prepared pursuant to this section. Tracts may also be ranked for other coal management purposes.

(b)(1) The ranking classes shall be those of high, medium, and low desirability. In ranking the tracts three major data categories shall be considered: coal economics, mineral environment, and socioeconomic. The list of surfaces to be considered under each category shall be those determined by the regional coal team as appropriate for that region. The regional coal team may defer the ranking of any given preliminary tract for which they

PROPOSED RULES

16821

determine there is generally insufficient data.

(2) The regional coal team shall solicit the recommendations of Federal and State agencies having appropriate expertise. These Federal agencies shall include but are not limited to the Department of Energy, the Fish and Wildlife Service, the Geological Survey, and the Office of Surface Mining, and any Federal agency that administers the title or use of any lands in a preliminary tract.

(c) Upon completion of tract ranking, the regional coal team shall select tracts for inclusion in alternative proposed lease sale schedules or for other management purposes to be forwarded to the Secretary for final selection.

(1) The total of the coal reserves included in the selected tracts in the proposed lease sale schedules shall be based on the applicable final regional leasing target. This will include the provisions of § 3420.3 of this title.

(2) The regional coal team shall select tracts for scheduling based on tract ranking as adjusted using the following considerations: (i) the compatibility of coal quality and market needs; (ii) cumulative environmental and socioeconomic impacts; (iii) the compatibility of reserve size and demand distribution for tracts; (iv) public opinion; (v) avoidance of future by-pass situations; and (vi) special leasing opportunity requirements.

(3) The regional coal team shall identify all those combinations of tracts which they feel may be equally desirable to meet the applicable final regional target. In addition to tract combinations designed to meet the leasing target, the team may recommend tract combinations representing alternative leasing targets based on impact assessment or revised regional coal demand assessments, but the reasons for any such recommendations must be properly documented.

(d) A notice of intent to rank tracts shall be published in the Federal Register and selected newspapers of general distribution within the region no less than 30 days before the ranking process begins. The notice shall contain a description of the tracts to be ranked and procedures under which any interested parties may become involved in the process.

(e) The results of the process, including the tract rankings, the tracts selected, the proposed schedule, and the information referred to shall be published in the regional lease sale environmental statement prepared on the tract ranking, selection, and scheduling process (Section 3420.4-5). Detailed information on each of the tracts ranked will be available for inspection in the Bureau of Land Management State offices that have jurisdiction within the region (43 CFR

Subpart 1821). Those parties interested in commenting on the results of the tract ranking, selection and scheduling process shall have the opportunity to do so in the environmental statement process, prior to any final decision by the Secretary to adopt a regional lease sale schedule including any of the selected tracts.

(f) Upon the close of the comment period on the draft environmental statement the regional coal team shall analyze the comments and make any revisions in the ranking, selection and scheduling analysis they feel are necessary. The team shall then forward their final recommendations of alternatives for a regional leasing schedule to the Secretary.

(g) The tract ranking, selection, and scheduling process shall normally be repeated every four years with an additional performance review two years in accordance with any need identified by the regional production goal and regional leasing target. The Secretary, in consultation with the Governor(s) of the affected States and surface management agencies, initiate or postpone the process to respond to considerations such as major planning updates, new preliminary tract delineations, and increases or decreases in regional leasing targets.

§ 3420.4-5 Environmental assessment. (a) In conjunction with the tract ranking, selection, and scheduling process, a regional environmental statement of the proposed alternative lease sale schedules shall be prepared in accordance with the provisions of the National Environmental Policy Act of 1969. The statement shall consider both:

(1) The site-specific potential environmental impacts of each tract being considered for lease sale; and

(2) The intraregional cumulative environmental impacts of the proposed leasing action and alternatives, and other coal development activities.

(b) The regional lease sale environmental statement prepared for the original regional lease sale schedule shall be updated if the Department makes any significant alterations to that schedule not considered in the original environmental statement.

§ 3420.4-6 Public meetings on proposed tracts.

After the draft regional lease sale environmental statement has been completed on alternative lease sale schedules, a public meeting shall be held in the region affected to announce the results of the ranking, selection, and scheduling process; the alternative lease sale schedules; and the potential impacts, including proposed mitigation measures.

§ 3420.5 Final consultations.

§ 3420.5-1 Timing of consultation.

Following the release of the final regional lease sale environmental statement, and prior to adopting a regional lease sale schedule, the Secretary shall formally consult with the Governors of those States within which lease sales are under consideration, and with any surface management agency other than the Interior Department which administers lands overlying any lease tract under consideration.

§ 3420.5-2 Consultation with surface management agencies.

(a) The Secretary, for any proposed lease tract containing lands the surface of which is under the jurisdiction of any agency other than the Department of the Interior, shall request that the agency: (1) consent, if it has not already done so, to the issuance of the lease (43 CFR 3400.3-1), and (2) if it consents, prescribe the terms and conditions the Secretary will impose in any lease which the head of the agency requires for the use and protection of the nonmineral interests in those lands.

(b) The Secretary may prescribe additional terms and conditions that are consistent with the terms proposed by the surface management agency to protect the interest of the United States and to safeguard the public welfare.

§ 3420.5-3 Consultation with Governors.

(a) The Secretary shall consult the Governor of the State in which any proposed lease tract is located. The Secretary shall give the Governor a specified period of time to comment, not less than 30 days nor more than 60 days, before issuing a final decision regarding any potential lease sale within the state.

(b) When a lease proposal would permit surface mining within the boundaries of a National Forest, the Governor of the State in which the tract to be leased is located shall be so notified by the Secretary. If the Governor fails to object to the lease proposal in 60 days, the Secretary may adopt a sale schedule including that tract. If, within the 60 day period, the Governor, in writing, objects to the lease proposal, the Secretary may not hold the sale for that lease tract. Issuance of the lease will be held in abeyance for six months from the date that the Governor objects to the lease. The Governor may, during this six-month period, submit a written statement of reasons why the lease sale should not be held or the lease issued, and the Secretary shall, on the basis of this statement, reconsider the lease proposal.

PROPOSED RULES

§ 3420.6 Qualified surface owner consent considerations.

§ 3420.6-1 Receipt of written consent.

Prior to making a final decision on a regional lease sale schedule, the Secretary shall give consideration to what acceptable written consents have been received for those potential lease sale tracts under consideration for inclusion in the regional lease sale schedule. The Secretary's considerations shall be given in accordance with the split estate leasing provision of section 3427 of this title.

§ 3420.6-2 Announcement of tracts under consideration.

Following the release of the final regional lease sale environmental statement, the Secretary shall publish an announcement in the FEDERAL REGISTER containing:

(a) A legal description of all tracts under consideration for inclusion in the regional lease sale schedule; and
 (b) The deadline for anyone to submit a written consent for any tract under consideration by the Secretary for selection for inclusion in the regional lease sale schedule.

§ 3420.6-3 Consideration of consents.

The Secretary shall, pursuant to § 3427.2, take the existence of written consents into consideration in making his decision on the final regional lease sale schedule. All other factors, including the environmental statement, and scheduling factors being considered, those tracts for which acceptable written consents have been received shall be chosen for inclusion in the regional coal lease sale schedule over those for which no acceptable written consents have yet been received.

§ 3420.7 Adoption of final regional lease sale schedule.

§ 3420.7-1 Announcement.

Following completion of the requirements of §§ 3420.5 and 3420.6 of this title the Secretary shall announce a final regional lease sale schedule. The announcement shall be published in the FEDERAL REGISTER and contain a legal description of each tract included in the lease sale schedule and the date when each tract has been tentatively scheduled for sale.

§ 3420.7-2 Revision.

(a) The Secretary may revise either the list of tracts included in the schedule or the timing of the lease sales in accordance with any alternatives considered in the regional lease sale environmental statement and during consultation with the Governors and other surface management agencies if such revision would be in the public interest. Notice of any such revision

shall be published in the FEDERAL REGISTER.

(b) Any regional lease sale schedule may be updated or replaced as a result of a new regional tract ranking, selection, and scheduling effort conducted in accordance with the provisions of § 3420.4-4 of this title.

Subpart 3422—Lease Sales

§ 3422.1 Economic evaluation.

§ 3422.1-1 Mineral evaluation and initial comments on fair market value and maximum economic recovery.

After announcement of the regional lease sale schedule, the authorized officer shall:

(a) Solicit public comment on the fair market value of the tract or tracts to be offered. Such solicitation shall present the standards and procedures that guide the Government's appraisals and ask for comments on these items which affect the appraisal. At the same time, the conditions of similar market transactions, the quality and extent of the coal resource, the price that the mined coal would bring in the market place, the cost of producing the coal, the interest rate at which anticipated income streams should be discounted, the value of the surface estate (or private surface), the mining method or methods which would achieve maximum economic recovery, and any other items which might affect the value of the tract or tracts. Such comments will be solicited for a period of 30 days. The authorized officer shall forward copy of all comments to the USGS.

(b) Request from the Geological Survey an evaluation including a coal resource economic value (CREV) and a maximum economic recovery (MER) determination. The CREV determines the conservative value, coal quality, quantity, and marketability, probable mining methods, costs, prices, preliminary logical mining units, and other appropriate elements. Prior to issuance of the notice, the Geological Survey shall forward this evaluation to the authorized officer. This evaluation shall include the coal resource economic value, mining method evaluation, estimated recoverable reserves by seam, MER determination, coal assessment, royalty and compliance bond recommendations; an estimate of reclamation fees that would be generated by mining the proposed lease; and public comments on fair market value and maximum economic recovery.

§ 3422.1-2 Estimated fair market value determination.

When the authorized officer receives the mineral evaluation and accompanying information, he shall estimate the fair market value of the coal de-

posits and the proposed lease. Minimum bonus bids shall be not less than \$25 per acre. The estimated fair market value, minimum acceptable bid, deferred bonus and other financial terms and requirements shall be the same for special opportunity, emergency, and regular competitive leasing. When the estimated fair market value has been determined, the authorized officer shall inform the Geological Survey of the determination.

§ 3422.2 Notice of sale.

(a) Prior to the lease sale, the authorized officer shall publish a notice of the proposed sale in the FEDERAL REGISTER and in a newspaper(s) of general circulation in the county or equivalent political subdivision in which the tracts to be sold are situated. The newspaper notice shall be published once a week for four consecutive weeks. Such notice shall also be posted in the Bureau of Land Management State Office and mailed to any affected surface owner. The lease sale shall not be held until at least 30 days after such posting.

(b) The notice shall:

- (1) List the time and place of sale, the type of sale, bidding method, and the description of the tract(s) being offered and minimum acceptable bid to be considered;
- (2) Contain a request for final comments on the fair market value of the tract(s) and maximum economic recovery and state the address for submitting the comments and;

(3) Contain information on where a detailed statement of the terms and conditions of the lease(s) which may result from the lease sale may be obtained.

(c) The detailed statement of the terms and conditions of the lease(s) sale offered for sale shall:

(1) Contain an explanation of the manner in which the bids may be submitted;

(2) Contain a statement that, if sealed bids are submitted, they may not be modified or withdrawn unless the modification or withdrawal are received prior to the time fixed for opening the bids;

(3) Contain a statement that, if the sale is by oral bid, sealed bids may also be submitted;

(4) Contain a warning to all bidders concerning 18 U.S.C. 1860, which prohibits unlawful combination or intimidation of bidders;

(5) Specify that the Secretary reserves the right to reject any and all bids and the right to offer the lease to the next highest qualified bidder if the successful bidder fails to obtain the lease for any reason;

(6) Specify that if any bid is rejected, any deposit shall be returned;

(7) Contain a notice that each bid shall be accompanied by the bidder's qualifications (43 CFR 3472.2-2);

(8) Contain a notice to bidders that the winning bidders shall have to submit to the information required by the Attorney General for post-sale review (43 CFR 3422.3-4);

(9) Require the bidder to pay one fifth of the bonus bid;

(10) If appropriate, contain a copy of any written consent given by a qualified surface owner and its terms, including payments which the high bidder, if not the holder of the consent, will have to make; and

(11) If appropriate, contain a notice that bidders shall file a statement that all information they hold relevant to written consents affecting any area offered in the sale by which the bid is submitted, has been filed with the proper Bureau of Land Management State Office (43 CFR Subpart 1821) in accordance with the provisions of subpart 3427 of this title.

(d) The successful bidder, if any, shall reimburse the Government for the cost of publishing the notice of sale as a condition of lease issuance.

(e) After the lease sale notice is published and the final public comments on fair market value and maximum economic recovery are received, these comments shall be forwarded to the Geological Survey for consideration in the final mineral evaluation, which will be presented to the authorized officer at the convening of the sale panel.

§ 3422.3 Sale procedures

§ 3422.3-1 Conduct of sale.

(a) Sealed bids shall be received only until the hour on the date specified in the notice of competitive bidding. All bids submitted after that hour shall be returned. The authorized officer shall read all sealed bids. If the announced procedure is to receive sealed bids followed by oral bids, the authorized officer conducting the sale shall open and read the sealed bids after which the oral bidding shall begin at the level of the highest sealed bid. Only those submissions shall be allowed to offer oral bids. After the oral bidding has ceased, the highest bid shall be announced. No decision to accept or reject the high bid will be made at this time.

(b) A sale panel shall convene to determine: (1) if the high bid was properly submitted; (2) if it reflects the fair market value of the tract; and (3) whether the bidder is qualified to hold the lease. The recommendations of the panel shall be sent to the authorized officer who shall make the final decision to accept, bid off, or reject all bids. The successful bidder shall be notified in writing. The Department serves the right to reject any and all

bids regardless of the amount offered, and shall not accept any bid that is less than fair market value. The authorized officer shall notify any bidder whose bid has been rejected and include in such notice a statement of the reason for the rejection. The Department reserves the right to offer the lease to the second high bidder if the unsuccessful bidder fails to execute the lease, or is for any reason disqualified from receiving the lease.

(c) Each sealed bid shall be accompanied by a certified check, cashier's check, bank draft, money order, personal check or cash for the sum of the amount of the bonus, and a qualifications statement over the bidder's own signature with respect to citizenship and interests held, as prescribed in § 3472.2-2 of this title. A high oral bidder shall tender by certified check, cashier's check, bank draft, money order, personal check or cash at the close of bidding any additional amount necessary to bring the amount tendered with his sealed bid up to one fifth of his oral bid.

§ 3422.3-2 Other bidding systems.

(a) The use of intertract bidding competition is authorized when, and if, the Bureau of Land Management and the Geological Survey in consultation with the Department of Energy determine it is needed in the public interest. The authorization to use intertract bidding competition does not preclude the use of any other form of competitive bidding procedures. Tracts including nontransferrable, written consent from a qualified surface owner given prior to August 3, 1977, shall be offered only in a sale using intertract bidding competition.

(b) In intertract bidding competition, the winning bidders, if any, are selected by determining first the tract with the single highest bid per ton of reserves among all tracts, then the tract with the second highest bid and so forth. The bids may be weighted to compensate for differences in the hydrocarbon quality of the coal in such tracts. If leases are awarded, they shall be awarded for tract proceeding in this sequence until the total reserve tonnage sought to be leased in that sale has been reached. Tracts receiving lower bids per ton shall not be leased as a result of a bid submitted in that sale.

§ 3422.3-3 Unsurveyed lands.

If the land is unsurveyed, the successful bidder shall not be given 30 days notice to comply with the requirements of § 3422.4 of this title for lease issuance until the land has been surveyed under § 3471.1-2 of this title (See 43 CFR 3471.1-2).

§ 3422.3-4 Consultation with Attorney General.

(a) Subsequent to a lease sale, but prior to issuing a lease, the authorized officer shall require the successful bidder to submit the information set out in this subsection relating to the bidder's coal holdings to the authorized office for transmittal to the Attorney General. Upon receipt of the information, the authorized officer shall notify the Attorney General of the proposed lease issuance, the name of the successful bidder, and the terms of the proposed lease. The statement of coal holdings that the authorized officer will transmit shall include the following best available information required by the Attorney General for each coal tract or deposit controlled by the bidder.

(1) Location of the tract or deposit by county and state (and by public land survey subdivisions if applicable);

(2) Whether the deposit is Federally or non-Federally owned;

(3) Interest held by bidder (if Federal), lease or lease application number, if non-Federal, statement of the nature of the interest-owner, lessee, operator, joint venture);

(4) Surface ownership of the tract;

(5) If the surface is owned by other than bidder, nature of agreement with the surface owner if any;

(7) Reserves broken down: (i) by tonnage and acreage; and (ii) into recoverable by surface and underground mining methods;

(8) BTU content or rank of the coal; and

(b) Any successful bidder who has previously submitted a statement of coal holdings may file a statement incorporating the prior statement by reference to the date and proposed lease or lease application serial number, and containing any and all changes in holdings since the date of the prior submission.

(c) The authorized officer may not issue a lease until 30 days after the Attorney General receives the notice and statement of the successful bidder's coal holdings. If the Attorney General notifies the authorized officer that the statement of coal holdings is incomplete or inadequate, the 30-day period shall stop running on the date of such notification and not resume running until the Attorney General receives the supplemental information.

(d) The authorized officer shall not issue the lease to the successful bidder during the 30-day period. If, during the 30-day period, the Attorney General notifies the authorized officer that lease issuance would create or maintain a situation inconsistent with the antitrust laws,

(e) If the Attorney General notifies the authorized officer that a lease should not be issued, the authorized officer may:

PROPOSED RULES

(1) Reject all bids or may notify the Attorney General in accordance with paragraph (a) of this section that issuance of the proposed lease to the next qualified high bidder is under consideration; or

(2) Issue the lease if, after a public hearing is conducted on the record in accordance with the Administrative Procedure Act, the authorized officer determines that: (i) issuance of the lease is necessary to carry out the purposes of the Federal Coal Leasing Amendments Act of 1978; (ii) issuance of the lease is consistent with the public interest; and (iii) there are no reasonable alternatives to the issuance of the lease consistent with the Federal Coal Leasing Amendments Act of 1978, the antitrust laws, and the public interest.

(f) If the Attorney General does not reply in writing to the notification in paragraph (a) of this section within 30 days, the authorized officer may issue a lease without waiting for the advice of the Attorney General.

§ 3422.4 Award of lease.

(a) After the authorized officer has accepted a high qualified bid and notified the successful bidder, and the Attorney General has not objected to lease issuance or the procedures in § 3422.3-4(e) have been completed, the authorized officer shall file four copies of the lease form to the success bidder. The form shall be completed, signed, and returned within 30 days of receipt. In addition, the bidder shall, within the 30-day period, pay the balance of the bonus bid. If required, pay the first year's rental, and file a compliance bond as required by Subpart 3474 of this chapter. Upon receipt of the above, the authorized officer shall execute the lease.

(b) If the successful bidder dies before the lease is issued, the provisions found in § 3472.2-4 of this title shall apply.

(c) At least half of all competitive coal lease sales shall be held on a deferred bonus payment basis. In a deferred bonus payment, the lessee shall pay the bonus payment in 8 equal installments; the first installment shall be submitted with the bid. The balance shall be paid in equal annual installments due and payable on the next four anniversaries of the date of the lease. If a lease is relinquished or otherwise canceled or terminated, the unpaid remainder of the bid shall be immediately payable to the United States.

Subpart 3425—Emergency Leasing**§ 3425.0-1 Purpose.**

This subpart sets forth the regulation for the emergency leasing of Federal coal.

§ 3425.0-2 Objective.

The objective of this subpart is to provide an application process through which the Department may consider holding lease sales apart from the normal competitive leasing process (Sections 3429.4 through 3423.7) where an emergency need for unleased coal deposits is demonstrated.

§ 3425.0-3

Leasing proposals developed by this application process differ from those that originate through the normal leasing process only with respect to (a) the method of tract delineation and (b) the manner in which the planning and environmental assessment process will be completed. Only as much of a coal deposit as is necessary to meet the need of the emergency lease applicant without compromising the normal leasing process shall be offered.

§ 3425.1 Application for emergency lease.**§ 3425.1-1 Where filed.**

Application for an emergency lease covering lands subject to leasing (43 CFR 3400.2) shall be filed in the Bureau of Land Management State Office having jurisdiction over the lands or minerals involved (43 CFR Subpart 1821).

§ 3425.1-2 Form.

An application for an emergency lease shall be filed on a form approved by the Director, Bureau of Land Management. Three copies of the application and preliminary and other data required by this subpart shall be filed. The application must be accompanied by the filing fee (43 CFR 3473.2).

§ 3425.1-3 Qualifications of the applicant.

Any applicant for an emergency lease shall meet the qualifications required of a lessee as specified in subpart 3472 of this title.

§ 3425.1-4 Emergency leasing criteria—existing operations.

(a) An emergency lease sale may be held in response to an application under this Subpart if the applicant can show:

(1) That the application involves an existing mining operation that has been producing coal for at least two years before the date of application, and either: (i) The Federal coal is needed within three years to maintain an existing mining operation at the average annual level of production, as substantiated by the proposed production levels stated in the application or preliminary level of production on the date of application, as substantiated by a complete copy of the supply or delivery contract, or both; or (ii) the coal deposits are not leased they shall

be bypassed in the reasonably foreseeable future, and if leased, some portion of the tract applied for shall be used within three years, as substantiated by the proposed production levels stated in a mining sequence plan; and

(2) That the need for the coal deposits shall have resulted from circumstances that were beyond the control of the applicant or that he could not have reasonably foreseen and planned for.

(b) The extent of any lease issued under this section shall not exceed 8 years of coal reserves at the average annual production level or new contracted level of production on the date of the application.

§ 3425.1-5 Emergency leasing criteria—Hardship cases.

An emergency lease sale may be held in response to an application under this Subpart if the applicant can show that the application involves coal deposits that are needed to avoid significant hardship to the lease applicant or users of the coal.

(a) The application shall show that the coal deposits are unlikely to be delineated or scheduled for sale in the normal competitive system because:

(1) They are outside a coal production region established pursuant to § 3420.3-1(a);

(2) They are inside a coal production region in which activities pursuant to § 3420.4 have yet to be commenced; or

(3) They are of a size, quality or end use that is not significantly related to meeting the regional leasing target.

(b) The application shall show hardship of the following type:

(1) A locality has lost or will lose its alternative sources of domestic coal supply;

(2) A mine which has been closed will be reopened, and local unemployment will be alleviated;

(3) The mine will test new technology; or development is supported by a Federal agency;

(4) Mining and reclamation of the tract will promote a program or policy of another surface management agency, such as rehabilitation of lands scarred by past uses; or

(5) Similar reasons that the Secretary determines substantially in the public interest after allowing opportunity for public hearing and considering the comments therein.

(c) The Secretary may issue a lease under this subpart to any applicant listed in the modified court order in *NRDC v. Hughes*, 454 F. Supp. 148 (D.C. 1978).

§ 3425.1-6 Preliminary data.

(a) Any application for an emergency lease shall contain preliminary data to assist the authorized officer in

making an environmental assessment as described in § 3430.3-1 of this title.

(b) Such preliminary data shall include:

(1) A map, or maps, (which may be available from state or Federal sources) showing the topography, physical features and natural drainage patterns, existing roads, vehicular trails, and utility systems; the location of any proposed exploration operations, including seismic lines and drill holes; to the extent known, the location of any proposed mining operations and facilities, trenches, access roads or trails, and supporting facilities including the approximate location and extent of the areas to be used for pits, overburden, and tailings; and the location of water sources or other resources that may be affected by the proposed operations and facilities.

(2) A narrative statement, including:

(i) The anticipated scope, method, and schedule of exploration operations, including the types of exploration equipment to be used;

(ii) The method of mining anticipated, including the best estimate of the mining sequence and production rate to be followed;

(iii) The relationship between the mining operations anticipated on the lands applied for and existing or planned mining operations, or support facilities on adjacent Federal or non-Federal lands;

(iv) A brief description, including maps or aerial photographs, as appropriate, of the existing land use within and adjacent to the lands applied for; known geologic, visual, cultural, or archaeological features; and known habitat of fish and wildlife—particularly threatened and endangered species—any of which may be affected by the proposed or anticipated exploration or mining operations and related facilities;

(v) A brief description of the proposed measures to be taken to control or prevent fire and to mitigate or prevent soil erosion, pollution of surface and ground water, damage to fish and wildlife or other natural resources, air and noise pollution, adverse impacts to the social and infrastructure systems of local communities, and hazards to public health and safety; to reclaim the surface; and meet other applicable laws and regulations. The applicant may submit other pertinent information that the applicant wishes to have considered by the authorized officer;

(vi) A statement which describes the intended use of the coal covered by the emergency application; and

(vii) Any other information which will show that the application meets the requirements of this subpart.

(c) The applicant shall not undertake any mining operations on the land except for casual use, without

prior authorization by exploration license. Casual use excludes activities that cause significant surface disturbance or damage to lands, resources, and improvements such as the use of heavy equipment, explosives, or any off-road vehicle that could disturb the land. Determination of significant surface disturbance or damage shall be made by the authorized officer.

(d) The authorized officer, after reviewing the preliminary data contained in an application, and at any time during an environmental assessment may request additional information from the applicant. Where the surface of the land is held by a qualified surface owner (Section 3400.0-5) and the mining method to be used is other than underground mining techniques, the authorized officer shall obtain documents necessary to show ownership of surface. The applicant shall submit evidence of written consent from any qualified surface owner(s). (See 43 CFR Subpart 3427).

§ 3423.1-7 Rejection of applications.

(a) An application for an emergency lease shall be rejected in total or in part when the authorized officer determines that: (1) The application is not consistent with conditions for emergency lease sales specified in § 3426.1-3 of this title; (2) the lands listed in the application are not available for coal leasing under § 3400.2 of this title; (3) the lands applied for are assessed to be unsuitable for leasing under the provisions of subpart 3461 of this title, or lie within an identified area of critical environmental concern; (4) the applicant cannot qualify as defined in § 3425.1-2 of this title to hold a lease under this subpart; (5) preliminary data required under § 3425.1-5 of this title, including additional information specifically requested in the application by the authorized officer, are found to be insufficient to determine whether the application meets the conditions for emergency leasing, and to complete the environmental assessment satisfactorily; (6) the lease would violate the integrity of the normal leasing process; or (7) after thorough investigation of the issues involved, leasing of the lands covered by the application for environmental or other sufficient reasons would be contrary to the public interest.

(b) Any application subject to rejection under paragraph (a)(5) of this section shall not be rejected until the applicant is given written notice of the opportunity to provide requested missing information and fails to do so within the time specified in the decision issued for that purpose.

§ 3425.2 Land use plans.

No emergency lease shall be issued under this subpart unless the lands

have been included in a comprehensive land use plan or a land use analysis, as required in § 3420.1-5 of this title. The decision to issue an emergency lease shall be consistent with the appropriate land use plan or analysis.

§ 3425.3 Environmental assessment.

(a) Before an emergency lease sale may be held the authorized officer shall conduct an environmental assessment of the proposed lease area and prepare an environmental assessment record.

(1) The environmental assessment shall include:

(i) An evaluation of direct and indirect potential impacts including cumulative impacts of coal leasing and development upon the physical and socio-economic environment of the proposed lease area and adjacent areas that may be affected;

(ii) An evaluation of the technical and natural potential for successful reclamation on the proposed lease area; and

(iii) An evaluation of all reasonable alternatives to leasing the area or to any known plans of operation for the proposed area.

(2) The environmental assessment record shall be prepared containing recommendations and special stipulations regarding:

(i) Lands that should be excluded from the proposed areas to avoid unacceptable environmental or special impacts, including those lands to be excluded as identified through the application of the unsuitability criteria in subpart 3461 of this title.

(ii) Any specific measures required to avoid or mitigate adverse impacts to, or to reclaim areas that are unacceptable for leasing and development, including measures to assure appropriate post-mining land use and measures to prevent irreparable damage or destruction of unique environmental values that are identified through the application of the unsuitability criteria in subpart 3461 of this title.

(3) If, based upon the environmental assessment record prepared under (2), the authorized officer determines that an environmental statement is required under the National Environmental Policy Act of 1969, either a statement shall be prepared under 40 CFR 1500, or the authorized officer may determine that because of critical environmental considerations under § 3425.1-6(a)(7) of this title.

(4) If, based upon the environmental assessment record prepared under (2), the authorized officer determines that an environmental statement is not required under the National Environmental Policy Act of 1969, a finding of no significant impact shall be pre-

PROPOSED RULES

pared and issued in accordance with 40 CFR 1501.4 and 1505.6.

(b) For lease applications involving lands under the National Forest System, the authorized officer shall submit the lease application to the Secretary of Agriculture for consent, for compilation of an environmental assessment and for the attachment of appropriate lease stipulations, and for the making of any other findings prerequisite to lease issuance. (43 CFR 3400.3-3).

§ 3425.4 Consultation and sale procedures.

(a) The following sections of subpart 3420 of this title shall apply to all leases offered for sale under the provisions of section 3420.3-3:

- (1) Section 3420.4-6;
- (2) Section 3420.5-1; and
- (3) Section 3420.5-2.

(b)(1) Subpart 3422 of this title applies in full to any sale to be held in response to an application filed under subpart 3425 of this title.

(2) In addition to the requirements set forth in § 3422.2 of this title, the successful bidder must meet the emergency leasing criteria (See § 3425.3-3).

§ 3425.5 Diligence and other lease terms.

Diligent development and continued operation shall be required on all emergency leases consistent with the provisions governing other competitive leases (See 43 CFR 3400.5-5).

Subpart 3427—Split Estate Leasing.

§ 3427.0-1 Purpose.

The purpose of this subpart is to set out the protection that shall be afforded qualified surface owners of split estate lands (43 CFR 3400.5-5).

§ 3427.0-3 Authority.

(a) These regulations are issued under the authority of the statutes cited in § 3400.3 of this title.

(b) These regulations primarily implement section 714 of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1304).

§ 3427.1 Deposits subject to consent.

On split estate lands (43 CFR 3400.5-5) where the surface is owned by a qualified surface owner, coal deposits that will be mined by methods other than underground mining techniques shall not be included in a lease sale notice without written consent from the qualified surface owner (43 CFR 3400.5-5) allowing the lessee/operator to enter and commence surface mining operations.

§ 3427.2 Procedures.

(a) Each written consent, evidence of written consent, or statement of refusal to consent shall be filed with the appropriate Bureau of Land Management State Office (43 CFR Subpart

1821) at least 30 working days prior to the publication of the lease sale notice of the lands to which it applies. It shall be the responsibility of parties intending to file consents to be aware of pending coal lease sale notice dates. Generally, these dates shall be as published in the final regional sale schedule (43 CFR 3420.7).

(b) Written consent or evidence of written consent may be filed by any private person or persons with an interest in the lease sale of split estate lands. A statement of refusal to consent shall be filed by the qualified surface owner.

(c) The filing shall, at a minimum contain the present legal address of the qualified owner, and, if it is a written consent or evidence thereof, a copy of the written consent or evidence thereof, and the name, ownership, interest, if any, and legal address of the party who acquired the consent.

(d) At each stage in the tract delineation, ranking and scheduling in that area, areas covered by a written consent shall be filed with the appropriate State Office before the final delineation on the pending regional lease sale schedule shall be given priority over other split estate areas where there is a qualified surface owner.

(e) Within fifteen working days after the filing of a written consent, evidence thereof, or a statement of refusal to consent, the State Office shall verify that the written consent or evidence of such consent meets all of the following requirements, and that the statement of refusal to consent meets the requirements of paragraphs (2) and (3):

(1) The right to enter and commence mining is transferable to whomever makes the successful bid in a lease sale for a tract which includes the lands to which the consent applies. A written consent shall be considered transferable only if, at a minimum, it provides that after the lease sale for the tract to which the consent applies (i) the payment for the consent is to be made by the successful bidder or (ii) the successful bidder is permitted to reimburse the company which first obtained the consent for the purchase price of the consent.

(2) The named surface owner is a qualified surface owner as defined in § 3400.5-5 of this title and resides at the address specified in the filing.

(3) The title for all lands described in the filing is held by the named qualified surface owner.

(f) Upon receipt of a filing from anyone other than the named qualified surface owner, the authorized officer shall contact the named qualified surface owner and request his confirmation in writing that the filed, transferable, written consent to enter and commence mining has been granted

and that the filing fully discloses all of the terms of the written consent.

(g) The conditions of (e) and (f) shall be met prior to publication of the sale notice.

(h) The State Director shall in all cases notify the person or persons filing the written consent, evidence of written consent, or statement of refusal to consent of the results of the review of the filing, including any request for additional information needed to satisfy the requirements of this subpart. In cases where insufficient information was supplied with the original filing.

(i) The terms and purchase price of any applicable written surface owner consent shall be included with the description of the tract(s) in the notice of lease sale.

(j) Any statement of refusal to consent shall be treated as controlling until the land use plan that includes the area covered by the refusal to consent is revised, or the surface estate is sold. When revision of the land use plan is initiated, the qualified surface owner shall be notified that his prior statement of refusal has expired, and given the opportunity to submit another statement.

§ 3427.3 Validation of information.

Any person submitting a written consent shall include with his filing a statement that the evidence submitted, to the best of his knowledge, represents a true, accurate, and complete statement of information regarding the consent for the area described.

§ 3427.4 Refusal of consent.

Any person having knowledge of qualified surface owners who have refused outright grant written consent is advised to contact the appropriate Bureau of Land Management State Office. (43 CFR Subpart 1821). Should the authorized officer decide on the basis of this information, any statement of refusal, or qualified surface owner preferences expressed during land use planning, that written consent cannot be obtained for the foreseeable future, coal deposits that underlie land owned by such qualified surface owners shall be eliminated from the regional sale scheduling process.

§ 3427.5 Pre-existing consents.

An otherwise valid written consent given by a qualified surface owner prior to August 4, 1977, shall be considered valid for the purposes of this subpart. Where the authorized officer determines that any such written consent is not transferable to any potential bidder on the tract in which the area covered by the consent is included, that tract shall be offered for sale only in a sale using intertract bidding

PROPOSED RULES

competition as defined in §3400.0-5 of this title.

PART 3430—NONCOMPETITIVE LEASES

Subpart 3430—Preference Right Leases

See:

- 3430.0-1 Purpose.
- 3430.0-3 Authority.
- 3430.0-7 Scope.
- 3430.1 Preference right leases.
- 3430.1-1 Showing required for entitlement to a lease.
- 3430.1-2 Commercial quantities defined.
- 3430.2 Application for lease.
- 3430.2-1 Initial showing.
- 3430.2-2 Additional information.
- 3430.3 Planning and environment.
- 3430.3-1 Land use planning.
- 3430.3-2 Environmental assessment.
- 3430.4 Final showing.
- 3430.4-1 Request for final showing.
- 3430.5 Additional.
- 3430.5 Determination of entitlement to lease.
- 3430.5-1 Rejection of application.
- 3430.5-2 Appeals, lack of showing.
- 3430.5-3 Determination to lease or seek an extension.
- 3430.5-4 Lease exchange.
- 3430.6 Lease issuance.
- 3430.6-1 Lease terms.
- 3430.6-2 Bonding.
- 3430.6-3 Lease area.
- 3430.6-4 Duration of leases.
- 3430.7 Trespass.

Subpart 3431—Negotiated Sales—Rights-of-Way

- 3431.0-1 Purpose.
- 3431.0-3 Authority.
- 3431.1 Qualified purchaser.
- 3431.2 Terms and conditions of sale.

Subpart 3432—Lease Modifications

- 3432.1 Application.
- 3432.2 Availability.
- 3432.3 Terms and conditions.

Subpart 3435—Lease Exchange

- 3435.0-1 Purpose.
- 3435.0-3 Authority.
- 3435.1 Coal lease exchanges.
- 3435.2 Qualified exchange proponents—Limitations.
- 3435.3 Exchange procedures.
- 3435.3-1 Exchange notice.
- 3435.3-2 Initial response by lessee or leasee.
- 3435.3-3 Agreement to terms.
- 3435.3-4 Determination of value.
- 3435.3-5 Notice and public hearing.
- 3435.3-6 Consultation with Governor.
- 3435.4 Issuance of lease, lease modification, or bidding rights.

Subpart 3436—Lease Exchange—Alluvial Valley Floors

- 3436.0-1 Purpose.
- 3436.0-3 Authority.
- 3436.1 Qualified exchange proponents.
- 3436.2 Exchange procedures.
- 3436.3 Recovery costs.
- 3436.4 Lease issuance.

Subpart 3437—Coal Exchange—Alluvial Valley Floors

- 3437.0-1 Purpose.

- 3437.0-3 Authority.
- 3437.1 Qualification criteria.
- 3437.1-1 Qualified exchange proponents.
- 3437.1-2 Qualified proponents.
- 3437.2 Exchange procedures.

Authority: 30 U.S.C. 181 et seq.; 30 U.S.C. 521-531; 30 U.S.C. 351-358; 30 U.S.C. 1201 et seq.; 42 U.S.C. 7101 et seq. and 43 U.S.C. 1701 et seq.

Subpart 3430—Preference Right Leases

§ 3430.0-1 Purpose

These regulations set forth procedures for processing noncompetitive (preference right) coal lease applications on Federal lands.

§ 3430.0-3 Authority.

(a) These regulations are issued under the authority of the statutes cited in §3400.0-3 of this title.

(b) These regulations primarily implement section 2(b) of the Mineral Leasing Act of 1920 (30 U.S.C. 201(b)).

§ 3430.0-7 Scope

Because section 4 of the Federal Coal Leasing Amendments Act of 1976, amending 30 U.S.C. 201(b), repealed the Secretary's authority to issue or extend a coal prospecting permit on Federal lands, the regulations in this subpart apply only to lease applications which have already been filed. No additional prospecting permits that confer a preference right to a lease shall be issued. Therefore, these regulations address only the procedures for processing pending preference right lease applications. The surface owner consent provisions of the Surface Mining Control and Reclamation Act of 1977 do not apply to preference right lease applications.

§ 3430.1 Preference right leases.

§ 3430.1-1 Showing required for entitlement to a lease.

An applicant for a preference right lease shall be entitled to a noncompetitive coal lease if the applicant can demonstrate that he discovered commercial quantities of coal on the permit lands within the term of the permit, all other requirements having been met.

§ 3430.1-2 Commercial quantities defined.

For the purpose of § 3430.1-1 of this title, commercial quantities is defined as follows:

(a) The coal deposit discovered under the permit shall be of such character and quantity that a prudent person would be justified in further expenditure of his labor and means within a reasonable prospect of success in developing a marketable mine.

(b) The applicant shall present sufficient evidence to show that there is a reasonable expectation that revenues from the sale of the coal shall exceed

the cost of developing the mine and extracting, removing, transporting, and marketing the coal. The costs of development shall include the estimated cost of exercising environmental protection measures and suitably reclaiming the lands and complying with all applicable Federal and state laws and regulations.

§ 3430.2 Application for lease.

§ 3430.2-1 Initial showing.

All preference right coal lease applications shall have contained or shall have been supplemented by the timely submission of the following information:

(a) The measured and indicated quantity and quality of the reserves discovered within the boundaries of the permit.

(1) Coal quantity shall be indicated by structural maps of the tops of all beds to be mined, isopachous maps of beds to be mined and interburden; and, for beds to be mined by surface mining methods, isopachous maps of the overburden. These maps shall show the location of test holes and outcrops. An estimate of the measured and indicated reserves for each bed to be mined shall be included.

(2) Coal quality data shall include, at a minimum, an average proximate analysis, sulfur content, and BTU content of the coal in each seam to be mined. Also, all supporting geological and geophysical data used to develop the required information shall be submitted.

(b) Topographic maps as available from State or Federal sources showing physical features, drainage patterns, roads and vehicle trails, utility systems, and water sources. The location of proposed development and mining operations facilities shall be identified on the maps. These maps shall include the approximate locations and extent of tallings and overburden storage areas; location and size of pit areas; and the location of water sources or other resources that may be used in the proposed operation and facilities incidental to that use.

(c) A narrative statement that includes:

(1) The anticipated scope of operations, the schedule of operations, and the types of equipment to be used;

(2) The mining method to be used and an estimate of the expected mining sequence and production rate;

(3) The relationship, if any, between operations planned on the land applied for and existing or planned operations and facilities on adjacent lands;

(4) A brief description, including maps, of surface and subsurface appropriate to (i) existing land uses on and adjacent to the applied for land; (ii) known geologic, visual, cultural, or ar-

PROPOSED RULES

chaeological features on the applied-for land; and (iii) known wildlife habitat, and that of threatened or endangered plant and animal species, that may be affected by the planned exploration and mining operations.

(5) A brief description of measures planned to prevent or control fire and to mitigate or prevent soil erosion, ground and surface water pollution, damage to wildlife or its habitat, air and noise pollution, hazards to public health and safety, and impacts to the social and infrastructure systems of local communities; and

(6) A brief description of any plans that the applicant wishes to have considered by the authorized officer which show how the applicant expects to reclaim disturbed sites and otherwise meet applicable laws and regulations.

§ 3430.2 Additional information.

In addition to the information required by § 3430.1 of this title, the applicant shall have submitted certified abstracts indicating the presence of any mining claims lying within or partly within the preference right lease application area that were located prior to the issuance of the prospecting permit.

§ 3430.3 Planning and environment.**§ 3430.1 Land use planning.**

A preference right lease may not be issued until the lands involved have been included in an acceptable land use plan that complies with the current applicable planning regulations in effect for the land management agency, or a land use analysis, under § 3430.1-5 of this title.

§ 3430.2 Environmental assessment.

(a) After the applicant has completed the initial study required under § 3430.1 of this title, the authorized officer shall conduct an environmental assessment of the proposed preference right lease area and prepare an environmental assessment record.

(b) The environmental assessment shall include:

(1) An evaluation of direct and indirect potential impacts including cumulative impacts of leasing and development upon the physical and socioeconomic environment of the proposed lease area and adjacent areas that may be affected;

(2) An evaluation of the technical and natural potential for successful reclamation on the proposed lease area; and

(3) An evaluation of all reasonable alternatives to leasing the area or to any known plans of operation for the proposed area as set forth in any preliminary data and information.

(c) The environmental assessment record shall be prepared containing recommendations on lease terms and special stipulations regarding:

(1) Lands that should be excluded from the proposed lease area to avoid unacceptable environmental or social impacts, including those lands to be excluded as identified through the application of the unsuitability criteria of subpart 3461 of this title;

(2) Any specific measures required to avoid or mitigate adverse impacts, or to reduce areas that may be acceptable for leasing and development, including measures to assure appropriate post-mining land use and measures to prevent irreparable damage to or destruction of unique environmental values that are identified through the application of the unsuitability criteria of subpart 3461 of this title.

(d) If, based upon the environmental assessment record prepared under (c), the authorized officer determines that an environmental statement is required under the National Environmental Policy Act of 1969, such a statement shall be prepared according to 40 CFR 1500.

(e) If, based upon the environmental assessment record prepared under (c), the authorized officer determines that an environmental statement is not required, a finding of no significant impact shall be prepared and issued in accordance with 40 CFR 1501.4 and 1506.6.

§ 3430.4 Final showing.**§ 3430.4-1 Request for final showing.**

(a) Upon completion of the environmental assessment, the authorized officer shall promptly request a final showing by the applicant.

(b) The authorized officer shall transmit to the applicant, with the request for final showing, the following:

(1) The proposed lease form, including any proposed stipulations; and

(2) A copy of the environmental assessment, including a map or maps showing all areas subject to specific stipulations because they have been assessed or designated to be unsuitable for coal mining operations or otherwise.

(c) Within 90 days of receiving the proposed lease form, the applicant shall submit the following information:

(1) Estimated revenues;

(2) The estimated costs that a prudent person would consider before deciding to operate the proposed mine, including but not limited to, the cost of developing the mine, removing the coal, processing the coal to make it salable, transporting the coal, paying applicable royalties and taxes, and complying with applicable laws and regu-

lations, the proposed lease terms, and special stipulations; and

(3) A comparison of the estimated costs and revenues and of mining venture constituting the logical mining unit of which the lease would become a part.

(d) The information submitted by the applicant shall be sufficiently detailed to determine whether the applicant's showing (1) has a reasonable factual basis, (2) supports the applicant's assertion that the proposed lease contains commercial quantities of coal, and (3) reflects a consideration of all factors required by this section.

(e) The applicant may delete any area subject to special stipulations, because it has been assessed to be unsuitable or otherwise, and the costs of mining subject to the stipulations, from the final showing required by paragraph (c) of this section.

§ 3430.4-2 Additional information.

(a) If the applicant for a preference right lease has not submitted all information required in § 3430.4-1 of this title, the authorized officer shall request additional information and shall specify the information required.

(b) The applicant shall submit any requested additional information within 60 days of the receipt of the request. The authorized officer may grant one 60-day extension if the applicant files a written request within the first 60-day period.

§ 3430.5 Determination of entitlement to lease.**§ 3430.5-1 Rejection of application.**

The authorized officer shall reject the application if:

(a) The final showing of the applicant fails to show that coal exists in commercial quantities on the applied for lands; or

(b) The applicant does not respond to a request for additional information within the time period specified in § 3430.4-2 of this title.

§ 3430.5-2 Appeals, lack of showing.

(a) If the application is rejected because the existence of commercial quantities of coal has not been shown, the applicant may, in accordance with the procedures in Part 4 of this title, file a notice of appeal and a statement of the reasons for the appeal.

(b) The applicant shall have the right at a hearing before an Administrative Law Judge if the applicant alleges that the facts in the application are sufficient to show entitlement to a lease.

(c) In such a hearing, the applicant shall bear both the burden of going forward and the burden of proof to show, by a preponderance of evidence,

PROPOSED RULES

that commercial quantities of coal exist in the proposed lease area.

§ 3430.5-3 Determination to lease or seek an exchange.

(a) A preference right lease shall be issued if, upon review of the application, the land use plan or analysis, and environmental assessment record, the authorized officer determines:

(1) The coal has been discovered in commercial quantities on the lands applied for; and

(2) That the applicant has used reasonable methods of location and data to support the showing that coal has been found on the proposed lease in commercial quantities; and

(3) That the protective lease stipulations assure that environmental damage can be avoided or acceptably mitigated and that the mined land can be reclaimed in accordance with applicable laws and regulations.

(b) If the authorized officer determines that:

(1) The land under application has been shown to contain commercial quantities of coal;

(2) All or a portion of the proposed lease has been assessed as land that should be unavailable for coal development because of land use or resource conflicts or as land that is unsuitable for coal mining operations under the provisions of subpart 3461 of this title; and

(3) The land is exempted from the application of any relevant unsuitability criteria or, for similar reasons, the Secretary lacks the authority to prevent damage to the lease or the land use of resource values threatened by lease operations—he may recommend that the Secretary initiate exchange proceedings under § 3530.5-4 of this title.

§ 3430.5-4 Lease exchange.

The Secretary may initiate, upon his own initiative, the recommendation of the authorized officer, or the request of the applicant, lease exchange procedures under 43 CFR Subpart 3435 for the issuance of coal lease bidding rights, modifications to existing coal leases, and the issuance of subpart 3526 of this title, or in the case of an application including lands in an alluvial valley floor, the issuance of a coal lease under provisions of subpart 3436 of this title, if he finds that the three conditions in § 3430.5-3(b) of this title are met.

§ 3430.6 Lease issuance.

§ 3430.6-1 Lease terms.

Each preference right lease shall be subject to requirements for Federal coal leases established in subpart 3475 of this title including: diligent development and continued operation, royalty and rental rates, and logical mining

unit requirements as provided in § 3475.4 of this title.

§ 3430.6-2 Bonding.

The compliance bond for a preference right lease shall be set in accordance with subpart 3474 of this title.

§ 3430.6-3 Lease area.

A preference right lease shall include all lands in the application used in determining the entitlement to a lease.

§ 3430.6-4 Duration of leases.

Preference right leases shall be issued for a term of 20 years and for so long thereafter as coal is produced in commercial quantities as defined in subpart 3400.0-5 of this title. Each lease shall be subject to readjustment at the end of the first 20-year period and at the end of each period of 10 years thereafter.

§ 3430.7 Trespass.

Mining operations conducted prior to the effective date of a lease shall constitute an act of trespass and be subject to penalties specified by § 9239.5 of this title.

Subpart 3431—Negotiated Sales—Rights-of-Way.

§ 3431.0-1 Purpose.

The purpose of this subpart is to provide procedures for the sale of coal that is necessarily removed in the exercise of a right-of-way issued under Title V of the Federal Land Policy and Management Act of 1976 (43 U.S.C. 1761 et seq.).

§ 3431.0-2 Authority.

(a) The regulations of this subpart are issued under the authority of the statutes cited in § 3400.0-3 of this title.

(b) These regulations primarily implement section 2(a)(1) of the Mineral Leasing Act of 1920, as amended by section 2 of the Act of October 30, 1978 (30 U.S.C. 201 (a)(1)).

§ 3431.1 Qualified purchaser.

An person who has acquired a right-of-way under Title V of the Federal Land Policy and Management Act of 1976 and is required to remove Federal coal in order to develop, construct or use the right-of-way is qualified to purchase the coal to be removed.

§ 3431.2 Terms and conditions of sale.

(a) Coal to be removed in connection with a right-of-way shall be sold to the qualified purchaser only at the estimated fair market value, as determined by the Secretary.

(b) Where the right-of-way is being used in connection with the development of a lease, the removal of coal from the right-of-way shall be subject

to the same requirements for health and safety protection, surface protection and rehabilitation, and maximum economic recovery that apply to the lease involved.

(c) Where the right-of-way is not being used in connection with the development of a Federal coal lease, the removal of the coal shall be made subject to the Surface Mining Control and Reclamation Act of 1977, and subject to such terms and conditions as the authorized officer determines are necessary: (1) to protect public health, safety, and the environment; and (2) to ensure the same recovery of the resource in the right-of-way that is required under a lease under the provisions of group 3400 of this title.

(d) All terms and conditions of the right-of-way and shall be administered under the provisions of group 2800 of this title.

Subpart 3432—Lease Modifications

§ 3432.1 Application.

(a) A lessee may apply for a modification of a lease to include coal lands or coal deposits contiguous to the lease embraced in the lease. In no event shall the acreage in the lease, when combined with the total area added by all modifications made after August 4, 1976, exceed 160 acres on the number of acres in the original lease, whichever is less.

(b) The lessee shall file the application for modification in the Bureau of Land Management State Office having jurisdiction over the lands involved (43 CFR Subpart 1821), describing the additional lands desired. The lessee's needs or reasons for such modification, and the reasons why the modification would be to the advantage to the United States.

§ 3432.2 Availability.

(a) The authorized officer may modify the lease to include the lands applied for if he determines that: (1) the modification serves the interests of the United States; (2) there is no competitive interest in the lands or deposits; and (3) the additional lands or deposits cannot be developed as part of another potential or existing independent operation.

(b) Coal deposits underlying land the surface of which is held by a qualified surface owner, and which would be mined by other than underground mining techniques, may not be added to a lease by modification.

(c) The lands applied for shall be added to the existing lease without competitive bidding, but the United States will receive the fair market value of the lands and the added lands, either by cash payment or adjustment of the royalty applicable to the lands.

PROPOSED RULES

§ 3432.3 Terms and conditions.

(a) The terms and conditions of the original lease shall be consistent with the laws, regulations, and lease terms applicable at the time of modification except that if the original lease was issued prior to August 4, 1976, the minimum royalty provisions of the Federal Coal Leasing Amendments Act of 1976 (96 Stat. 1083) shall not apply to any lands covered by the lease prior to its modification until the lease is re-adjusted.

(b) Before a lease is modified, the lessee shall file a written acceptance of the conditions imposed in the modified lease and a written consent of the surety under the bond covering the original lease to the modification of the lease and to extension of the bond to cover the additional land. Such modifications must meet the same environmental safeguards as set out for emergency leases in § 3426.5 of this title.

Subpart 3433—Lease Exchange**§ 3433.0-1 Purpose.**

The objective of these regulations is to provide methods for exchange of coal resources when it would be in the public interest to shift the impact of mineral operations from leased lands to currently unleased lands to preserve public resources or social values, and to carry out Congressional directives authorizing coal lease exchanges.

§ 3433.0-3 Authority.

(a) These regulations are issued under the authority of the statutes cited in § 3400.0-3 of this title.

(b) These regulations primarily implement:

(1) Section 3 of the Mineral Leasing Act of 1920, as amended (30 U.S.C. 203);

(2) Section 522 of the Surface Mining Control and Reclamation Act (30 U.S.C. 1272); and

(3) Section 1 of the Act of October 30, 1978 (92 Stat. 2073).

§ 3433.1 Coal lease exchanges.

Where the Secretary determines that coal exploration, development and mining operations would not be in the public interest on an existing lease or preference right lease application, or where the Congress has authorized lease exchange for a class or list of leases, an existing lease or preference right lease application may be relinquished in exchange for:

(a) Cases where the Congress has specifically authorized, the issuance of a new coal lease.

(b) The issuance of coal lease bidding rights of equal value;

(c) A mineral lease other than coal, by mutual agreement between the ap-

plicant and the Secretary under sub-part 3526 of this title; or

(d) Federal coal lease modifications;

or

(e) Any combination of the above.

These interests may be granted to the extent of the Secretary's authority in exchange for the relinquishment of all or part of the existing lease or preference right lease application and any part of which has been or may be assessed as unacceptable for development because of non-coal public values identified or discovered after the lease or permit was issued.

§ 3433.2 Qualified exchange proponents—Limitations.

(a) Any person who holds a Federal coal lease, or a preference right lease application that has been found to meet the commercial quantities requirements for §§ 3430.1 and 3430.5 of this title on lands described in § 3435.1 of this title is qualified to ask the Secretary to initiate an exchange.

(b) Except for leases qualified under subpart 3536 of this title, the Secretary may issue a new coal lease in exchange for the relinquishment of outstanding leases or lease applications or in those cases listed in section 1 of the Act of October 30, 1978.

(c) The Secretary shall evaluate each qualified exchange request and determine whether an exchange is appropriate.

§ 3433.3 Exchange procedures.**§ 3433.3-1 Exchange notice.**

(a) The Secretary shall initiate exchange procedures by notifying in writing a Federal coal lessee or preference right lease applicant that consideration of an exchange of mineral leases or other coal lease interests is appropriate. The notification may be on the Secretary's initiative or in response to a request under § 3435.2 of this title.

(b) The exchange notice shall include a statement of why the Secretary believes an exchange may be in the public interest.

(c) The notice may contain a description of the lands on which the Secretary would grant lease interest in exchange. If the exchange is for coal development rights, the lease shall be selected from those found acceptable for further consideration for leasing under § 3420.2 of this title. The description of the interests under consideration for relinquishment may include all or part of an existing lease or preference right lease application.

(d) The notice shall contain a request that the lessee or preference right lease applicant indicate whether he is willing to negotiate an exchange.

§ 3433.3-2 Initial response by lessee or lease applicant.

(a) The lessee or preference right lease applicant wishing to negotiate an exchange shall so reply in writing within 60 days of the receipt of the exchange notice. The reply may include a description of the lands on which the lessee or lease applicant would accept an exchange lease or grant of coal lease modifications and, if appropriate, a showing of written consent from a qualified surface owner.

(b) A reply to the exchange notice by a lessee or preference right lease applicant indicating willingness to enter into an exchange shall also indicate willingness to provide the geologic and economic data needed by the Secretary to determine the fair market value of the lease or lease application to be relinquished. The lessee or preference right lease applicant shall also indicate willingness to provide any geologic and economic data in his possession that will help the Secretary to determine the fair market value of the potential Federal lease exchange tract or tracts.

§ 3433.3-3 Agreement to terms.

(a) If both parties wish to proceed with the exchange, the authorized officer and the lessee or preference right lease applicant shall:

(1) Negotiate the selection of appropriate exchange lands containing a logical mining unit of coal in those cases where the Secretary is authorized to issue a coal exchange lease, or a mineable unit of leaseable minerals other than coal;

(2) Negotiate appropriate coal lease modifications;

(3) Negotiate to establish the value of coal lease bidding rights; or

(4) Negotiate any combination of the above.

(b) Any land leased in exchange shall, to the satisfaction of the lessee or lease applicant and the Secretary, be a lease tract containing coal or deposits of other leaseable minerals equal to the fair market value of the relinquished deposits.

(c) Land proposed for lease in exchange for, or for inclusion in, an existing lease or preference right lease application shall be subject to leasing under subpart 3420 or group 3400 or 3500 of this title as appropriate.

§ 3433.3-4 Determination of value.

The value of the land to be leased, or added by lease modification, or of the bidding rights to be issued in exchange shall, to the satisfaction of the applicant and the Secretary, be equal to the estimated fair market value of the lease or lease application to be relinquished.

§ 3435.3-5 Notice and public hearing.

After the lessee or lease applicant and the Secretary agree on the land to be traded, the lessee or lease applicant to be granted or the bidding rights to be issued, notice of the proposed exchange shall be published in the *Federal Register* and in at least one newspaper of general circulation in each county or equivalent political subdivision where both the offered and selected lands are located. The notice shall announce that, upon request, at least one public hearing will be held in a city or cities located near each land involved. The notice shall also contain the Secretary's preliminary findings why the proposed exchange is in the public interest. The hearing(s), if any, shall be held to obtain public comments on the merits of the proposed exchange.

§ 3435.3-6 Consultation with Governor.

(a) The Secretary will notify the Governor of each State in which lands in the proposed exchange are located of the terms of the exchange and the Secretary's preliminary findings why the proposed exchange is in the public interest. The Secretary shall give each Governor at least 45 days after this notification to comment on the proposal prior to consummating the exchange.

(b) If, within the 45 day period, the Governor(s), in writing, objects to an exchange that involves leases or lease rights in more than one State, the Secretary will not consummate the exchange for 6 months from the date of objection by the Governor(s). If, during this 6-month period, however, a written statement why the exchange should not be consummated, and the Secretary shall, on the basis of this statement, reconsider the lease proposal.

§ 3435.4 Issuance of lease, lease modification, or bidding rights.

(a) If, after any public hearing(s), the Secretary by written decision concludes that the issuance of a coal or other mineral lease or coal lease modification or coal lease bidding rights in exchange for the relinquishment of the existing lease, preference right lease application or portion thereof is in the public interest, lease stipulations for operations on the exchange lease or modified lease shall be established.

(b) The exchange lease shall contain:

(1) A statement that the lessee thereby relinquishes any right or interest in the lease or preference right lease application exchanged; and

(2) A statement of the Secretary's findings that lease issuance is in the public interest.

(c) The exchange lease or lease modification shall be issued upon re-

linquishment of the lease, preference right lease application, or portion thereof.

(d) The exchange lease or lease modification shall be subject to all relevant provisions of group 3400 or 3500 of this chapter, 30 CFR Chapter VII, Subchapter D, and 30 CFR Part 211, as appropriate.

Subpart 3436—Lease Exchange—Alluvial Valley Floors**§ 3436.0-1 Purpose.**

The purpose of this subpart is to establish procedures for coal lease exchanges where coal development operations would interrupt, discontinue or preclude farming on alluvial valley floors west of the 100th Meridian, west longitude.

§ 3436.0-3 Authority.

(a) These regulations are issued under the authority of the statutes cited in § 3400.0-3 of this title.

(b) These regulations primarily implement section 510(b)(5) of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1280(b)(5)).

§ 3436.1 Qualified exchange proponents.

(a) The coal lease exchange program for alluvial valley designations shall be limited to any person who holds a Federal coal lease or preference right lease application on lands west of the 100th Meridian, west longitude, and who have made substantial financial and legal commitments, as defined in § 3400.0-5 of this title prior to January 4, 1977, in connection with the lease or preference right lease application, and who otherwise meets the criteria in the provision in section 510(b)(5) of the Surface Mining Control and Reclamation Act of 1977. Any such person may propose an exchange under this subpart.

(b) The lease offered in exchange by the Secretary shall be for lands determined to be acceptable for farming under criteria of the Bureau of Land Management and Geological Survey, including the unsuitability criteria in subpart 3461 of this title.

§ 3436.2 Exchange procedures.

(a) Any qualified lessee may propose the exchange to the Secretary through the Bureau of Land Management State Office having jurisdiction over the leased land (43 CFR Subpart 1821). No special form of application is required.

(b) The exchange shall proceed in accordance with the procedures in subpart 3435 of this title for other lease and lease interest exchanges.

§ 3436.3 Recovery of costs.

The exchange proponent shall bear all administrative costs of the ex-

change, including the cost of establishing the value of each lease involved in the exchange.

§ 3436.4 Lease issuance.

Any coal lease issued as a result of an exchange under this support shall be subject to all relevant provisions of group 3400 of this title, 30 CFR Chapter VII, Subchapter D, and 30 CFR Part 211.

Subpart 3437—Coal Exchange—Alluvial Valley Floors**§ 3437.0-1 Purpose.**

The purpose of this subpart is to establish criteria for the exchange of privately owned (fee) coal for unleased federally-owned coal where coal mining operations would interrupt, discontinue or preclude farming on alluvial valley floors west of the 100th Meridian, west longitude.

§ 3437.0-3 Authority.

(a) These regulations are issued under the authority of the statutes cited in § 3400.0-3 of this title.

(b) These regulations primarily implement:

(1) Section 510(b)(5) of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1280(b)(5)); and

(2) Section 206 of the Federal Land Policy and Management Act of 1976 (43 U.S.C. 1716).

§ 3437.1 Qualification criteria.**§ 3437.1-1 Qualified exchange proponents.**

The fee coal exchange program for alluvial valley designations shall initially be limited to all qualified persons who own coal west of the 100th Meridian, west longitude, and:

(a) Who have made substantial financial and legal commitments, as defined in § 3400.0-5 of this title prior to January 4, 1977, in connection with the coal holding; or

(b) Who have had a surface mining permit issued by the state regulatory authority because the holding is in an alluvial valley floor, and who otherwise meet the criteria of the provision in section 510(b)(5). Any such person may propose and exchange under this subpart.

§ 3437.1-2 Unqualified proponents.

The Secretary shall not consider an exchange proposed by the owner of coal west of the 100th Meridian, west longitude, where:

(a) The premining land use is undeveloped cropland which is not significant to farming;

(b) The area of affected alluvial valley floor is small and provides or may provide only negligible support for production from one or more farms; or

PROPOSED RULES

(c) The prohibition against mining the coal in the alluvial valley floor does not substantially decrease the value of, or prevent the successful mining of, other coal that would have been developed in conjunction with the coal in the alluvial valley floor.

§ 3437.2 Exchange procedures.

(a) The Secretary shall evaluate each qualified exchanged request and determine whether the exchange proponent is qualified and whether a request is appropriate and is in the public interest.

(b) Qualified requests shall be processed in accordance with the regulations of subpart 3430 of this title subject to the provisions of this subpart.

(c) The coal deposits offered in exchange by the Secretary shall be assessed as acceptable for mining operations under the criteria of the Bureau of Land Management, and the Geological Survey, including the unsuitability criteria in subpart 3481 of this title.

(d) Exchange under this subpart, whether proposed by the Secretary or by a qualified exchange proponent, may include the coal estate, the entire mineral estate, or the entire mineral and surface estates in the lands conveyed to the United States or in the lands conveyed by the United States.

PART 3440—LICENSES TO MINE

Subpart 3440—Licenses to Mine

Sec.

3440.0-1 Purpose.
3440.0-3 Authority.

3440.1 Terms.

3440.1-1 Forms.

3440.1-2 Limitations on coal use.

3440.1-3 Area and duration of license.

3440.1-4 Production reports.

AUTORITY: 30 U.S.C. 181 et seq.

Subpart 3440—Licenses to Mine

§ 3440.0-1 Purpose.

A license to mine may be issued without the payment of any rent or royalty for a period of 2 years to an individual or association of individuals to mine and take coal for local domestic need for fuel.

§ 3440.0-3 Authority.

(a) These regulations are issued under the authority of the statutes cited in § 3400.0-3 of this title.

(b) These regulations primarily implement section 8 of the Act of February 25, 1920, as amended (30 U.S.C. 208).

§ 3440.1 Terms.

§ 3440.1-1 Forms.

(a) Four copies of the application for a license to mine coal for domestic needs or for a renewal of such a li-

cense shall be filed on a form approved by the Director, or a substantial equivalent of the form, in the Bureau of Land Management, State Office having jurisdiction over the lands involved (43 CFR Subpart 1821). The original application or any renewal application shall be accompanied by the fee prescribed in section 3473 of this title, except when the application is filed by a relief agency.

(b) A municipality shall file the information required under § 3472.2-5(b) of this title.

§ 3440.1-2 Limitations on coal use.

License may be issued to municipalities for the nonprofit mining and disposal of coal to their residents for household use only. Under such a license, a municipality may not mine coal either for its own use or for non-household use such as for factories, stores, other business establishments and heating and lighting plants.

§ 3440.1-3 Area and duration of license.

(a) A license to mine for an individual or association in the absence of unusual circumstances of necessity, shall be limited to a legal subdivision of 40 acres or less and may be revoked at any time. Each license to mine shall terminate at the end of 2 years from the date of issuance, unless an application for a 2 year renewal is filed and approved before its termination date.

(b)(1) The authorized officer may authorize recognized and established relief agency of any State, upon the agency's request, to take state-owned coal deposits within the State and provide the coal to localities where it is needed to supply families on the rolls of such agency who require coal for household use but are unable to pay for that coal.

(2) Tracts shall be selected in areas assessed as acceptable for mining operations and at points convenient to supply the families in a locality. Each family shall be restricted to the amount of coal actually needed for its use, not to exceed 20 tons annually.

(3) Coal shall be taken from such tracts by the lessee with written authority from the relief agency. All mining shall be done pursuant to such authorization. All Federal and State laws and regulations for the safety of miners, prevention of fires and of waste, etc., shall be observed. The relief agency shall see that the premises are left in a safe condition for future mining operations.

(c) A license to mine in a municipality may not cover more than 320 acres for a municipality of less than 100,000 population, 1,280 acres for a municipality between 100,000 and 150,000 population, and 2,560 acres for a municipality of 150,000 population or more. A license to mine to a municipality shall termi-

nate at the end of 4 years from date of issuance, unless an application for a 4 year renewal is filed and approved before its termination date.

§ 3440.1-4 Production reports.

Each holder of a license to mine shall provide an annual report to the appropriate Bureau of Land Management State Office describing all operation conducted under such license.

PART 3450—MANAGEMENT OF EXISTING LEASES

Subpart 3451—Continuation of Leases—Readjustment of Terms

Sec.

3451.1 Readjustment of lease terms.
3451.2 Notification of readjusted lease terms.

Subpart 3452—Relinquishment, Cancellation, and Termination

3452.1 Relinquishment.
3452.1-1 General.
3452.1-2 When filed.
3452.1-3 Acceptance.
3452.2 Cancellation.
3452.2-1 Cause for cancellation.
3452.2-2 Cancellation procedure.
3452.3 Termination.

Subpart 3453—Transfers by Assignment, Sublease or Otherwise

3453.1 Qualifications.
3453.1-1 Who may transfer or receive a transfer.
3453.1-2 Number of copies required.
3453.1-3 Sole party in interest.
3453.1-4 Attorney-in-fact.
3453.1-5 Helm and devices.
3453.2 Requirements.
3453.2-1 Application.
3453.2-2 Description and statements.
3453.2-3 Filing location and fee.
3453.2-4 Bonds.
3453.2-5 Description of lands.
3453.3 Approval.
3453.3-1 Conditions for approval.
3453.3-2 Disapproval of transfers.
3453.3-3 Effective date.
3453.3-4 Extensions.

AUTORITY: 30 U.S.C. 181 et seq; 30 U.S.C. 351-359; 30 U.S.C. 521-531; 30 U.S.C. 1201 et seq; 42 U.S.C. 7101 et seq; and 43 U.S.C. 1701 et seq.

Subpart 3451—Continuation of Leases—Readjustment of Terms

§ 3451.1 Readjustment of lease terms.

(a) All leases issued prior to August 4, 1976, shall be subject to readjustment at the end of the current 20-year period and at the end of each 10-year period thereafter. All leases issued after August 4, 1976, shall be subject to readjustment at the end of the first 20-year period and each 10-year period thereafter, if the lease is extended.

(b) The authorized officer shall notify the lessee whether or not any readjustment of terms and conditions is to be made. If feasible, the authorized officer shall so notify the lessee of any lease which becomes subject to re-

adjustment prior to January 1, 1980, before the expiration of the initial 20-year period, or any succeeding 10-year period.

(c) If the lease became subject to readjustment of terms and conditions before August 4, 1976, but the authorized officer prior to that date neither readjusted the terms and conditions nor informed the lessee whether or not a readjustment would be made, the terms and conditions of that lease shall be readjusted to conform to the requirements of the Federal Coal Leasing Amendments Act of 1976.

(d) The authorized officer shall notify the lessee of any lease which becomes subject to readjustment after January 1, 1980, whether any readjustment of terms and conditions will be made prior to the expiration of the initial 20-year period, or any succeeding 10-year period thereafter. On such a lease the failure to so notify the lessee shall mean that the United States is waiving its right to readjust the lease for the readjustment period in question.

(e) In the notification that the lease will be readjusted, the authorized officer shall require the lessee to furnish information specified in § 3422.3-4 of this title for review by the Attorney General as required by section 27(1) of the Mineral Leasing Act of 1920, as amended. The lease shall be subject to cancellation if the lessee fails to furnish the required information within the time allowed. No lease readjustment shall be effective until 30 days after the authorized officer has transmitted the required information to the Attorney General.

§ 3451.2 Notification of readjusted lease terms.

(a) If the notification that the lease will be readjusted did not contain the proposed readjusted lease terms, the authorized officer shall, as soon as feasible, notify the lessee of the proposed readjusted lease terms.

(b) The notification of readjusted lease terms shall also notify the lessee that if he does not file either an objection to the proposed readjustment or a relinquishment of the lease within 60 days after receipt of notice of the proposed readjusted terms from the authorized officer, the terms of such readjustment shall be considered agreed upon.

(c) The notification of readjusted lease terms shall specify the procedures to be followed if the lessee objects to the proposed readjusted lease terms.

(d) The readjusted lease terms shall become effective either 60 days after the lessee is notified what they are, or 30 days after the authorized officer transmits the required information to

the Attorney General, whichever is later.

Subpart 3452—Relinquishment, Cancellation and Termination

§ 3452.1 Relinquishment.

§ 3452.1-1 General.

Upon a satisfactory showing that the public interest shall not be impaired, the lessee may surrender the entire leasehold legal estate therein, or an aliquot part thereof (not less than 10 acres), or any seam or bed of the coal deposits therein. A partial relinquishment shall describe clearly the surrendered parcel or coal deposits and give the exact acreage relinquished.

§ 3452.1-2 Where filed.

A relinquishment shall be filed in triplicate by the lessee in the Bureau of Land Management State Office having jurisdiction over the lands involved (43 CFR Subpart 1821).

§ 3452.1-3 Acceptance.

The relinquishment shall be effective on the date that the authorized officer determines that all accrued rentals and royalties have been paid and that all the obligations of the lessee under the regulations and terms of the lease have been met.

§ 3452.2 Cancellation.

§ 3452.2-1 Cause for cancellation.

(a) The authorized officer, after compliance with § 3452.2-2 of this title, may take the appropriate steps to institute proceedings in a court of competent jurisdiction for the cancellation of the lease if the lessee: (1) fails to comply with the provisions of the Mineral Leasing Act of 1920, as amended; (2) fails to comply with the general regulations in force at the date of the lease or in force at the effective date of any readjustment of the terms and conditions of the lease, or with regulations issued after lease issuance and readjustment but made applicable under the terms of the lease; or (3) defaults in the performance of any of the terms, covenants, and stipulations of the lease.

(b) A waiver of any particular breach or cause of forfeiture shall not prevent the cancellation and forfeiture of the lease for any other breach or cause of forfeiture, or for the same cause occurring at any other time.

(c) Any lease issued or readjusted before August 4, 1976, on which the lessee does not meet either the dilferent development requirements or the continuing obligation requirements shall be subject to cancellation in whole or in part. In deciding whether to initiate lease cancellation proceedings under this subsection, the Secre-

tary shall not consider adverse circumstances which arise out of (1) normally foreseeable costs of compliance with requirements for environmental protection; (2) commonly experienced delays in delivery of supplies or equipment; or (3) inability to obtain sufficient sales.

§ 3452.2-2 Cancellation procedure.

The lessee shall be given notice of any proposed cancellation and be afforded 30 days to correct the default, to request an extension of time in which to correct the default, or to submit evidence showing why the lease should not be cancelled.

§ 3452.3 Termination.

(a) Any lease issued or readjusted on or after August 4, 1976, shall be terminated if the lessee does not meet the developmental requirements.

(b) Existing leases that are not included within an approved mine plan shall be subject to assessment of all or part of the lands contained in the lease as unsuitable for coal mining operations as set out in § 3461.1(c) of this title. This assessment shall be made either after an operator submits a mining plan, at the initiation by the lessee of a request for exchange, or during land use planning. If a lease area or portion of a lease area is assessed to be unsuitable for coal mining operations or the lease is found to be unsuitable for the land use plan, the Secretary may enter into negotiations with the lessee for exchange of coal lease bidding rights or other mineral leases or coal lease modifications as described in subpart 3435 of this title. If a lease area or portion of a lease area is assessed to be unsuitable because of impacts to alluvial valley floors, the Secretary may enter into negotiations with the lessee to exchange the lease for another Federal coal lease in an area acceptable for mining operations pursuant to subpart 3439 of this title.

(c) Should a lease be cancelled or terminated for any reason, all deferred bonus payments shall be immediately payable and all rentals and royalties, including advance royalties, already paid or due, shall be forfeited to the United States.

Subpart 3453—Transfers by Assignment, Sublease or Otherwise

§ 3453.1 Qualifications.

(a) Leases may be transferred in whole or in part to any person, association, corporation qualified to hold such leases except as provided by §§ 3420.1-4(b)(X)(ii) and 3420.1-4(b)(X)(iii) of this title.

PROPOSED RULES

(b) A minor is not qualified to hold a lease and transfers to a minor shall not be approved. However, a transfer in behalf of a minor heir or devisee of a lease to a legal guardian or trustee may be approved.

§ 3453.1-2 Number of copies required.

A single signed copy of the qualifications required under subpart 3472 of this title is sufficient.

§ 3453.1-3 Sole party in interest.

The transferee or transferees shall comply with § 3472.1-1 of this title.

§ 3453.1-4 Attorney-in-fact.

The attorney-in-fact shall comply with § 3472.2-3 of this title.

§ 3453.1-5 Heirs and devisees.

An appropriate showing as required under § 3472.2-4 of this title shall be furnished before the heirs or devisees of a deceased holder of a lease, operating agreement, or royalty interest in a lease can be recognized by the Secretary as the new holders of a lease, agreement, or interest.

§ 3453.2 Requirements.

§ 3453.1-1 Application.

Applications for transfers of leases, whether by direct assignments, working agreements, transfer of royalty interests, subleases or otherwise, shall be filed for approval within 90 days from final execution.

§ 3453.2-2 Forms and statements.

(a) Transfers of any interest shall be filed in triplicate.

(b) No specific form need be used for requests for approval of transfers. The application shall contain evidence of the transferee's qualifications, including statements on other coal leases held by the transferee. This evidence shall consist of the same showings of qualifications required of a lease applicant by subpart 3472 of this title.

(c) A separate instrument of transfer shall be filed for each lease when transfers involve record titles. When transfers to the same person, association, or corporation involving more than one lease are filed at the same time, one record title for approval and one showing as to the qualifications of the transferee shall be sufficient.

(d) A single signed copy of all other instruments of transfer is sufficient, except that collateral assignments and other mortgage documents shall not be accepted for filing.

§ 3453.2-3 Filing location and fee.

An application for approval of a transfer shall be filed in the Bureau of Land Management State Office having jurisdiction over the leased lands proposed for transfer (43 CFR Subpart

1821). Each application shall be accompanied by a nonrefundable filing fee (43 CFR 3473.2).

§ 3453.2-4 Bonds.

(a) If a bond is required, it shall be furnished before a lease transfer may be approved. The consent of the surety to the substitution of the transferee as principal or a new bond with the transferee as principal shall be submitted if the original lease required the maintenance of a bond. If the transfer is for part of the leased land only, it shall be for the legal subdivision and (b) the consent of the surety to the transfer and its agreement to remain bound as to the interest retained by the lessee shall be submitted, as well as (2) a new bond with the transferee as principal covering the portion of the leased lands transferred.

(b) The person transferring a lease, including a sublessee, and the surety for the lease shall continue to be responsible for the performance of any obligation under the lease until the effective date of the approval of the transfer. In the case of a transfer providing their obligation to the United States shall continue as though no such transfer had been filed for approval. After the effective date of approval, the transferee, including any sublessee, and the transferee's surety shall be responsible for all lease obligations notwithstanding any terms in the transfer to the contrary.

§ 3453.2-5 Description of lands.

The description of the lands involved in the instrument of transfer shall include the description of lands in the lease. The approval of transfer of only a part of the lands described in a lease shall create a new lease. The transfer of only a part of the lands shall be permitted only where it is demonstrated that each remaining lease area is a logical mining unit or part of a logical mining unit.

§ 3453.3 Approval.

§ 3453.3-1 Conditions for approval.

No transfer shall be approved if:

- (a) the transferee is not qualified to hold a lease under subpart 3472 of this title;

(b) the lease bond is insufficient;

(d) the transferee would hold the lease in violation of the acreage requirements set out in subpart 3472 of this title;

(e) the transfer would create an overriding royalty interest in violation of § 3473.3 of this title; or

(f) the lease account is not in good standing.

§ 3453.3-2 Disapproval of transfers.

The authorized officer shall deny an application for approval of a transfer if any reason why the transfer cannot be approved (listed in § 3453.3-1 of this title) is not cured within the time established by the authorized officer in a decision notifying the applicant for approval why the transfer cannot be approved.

§ 3453.3-3 Effective date.

A transfer shall take effect the first day of the month following its final approval by the Bureau of Land Management, or if the transferee requests, the first day of the month of the approval.

§ 3453.3-4 Extensions.

The filing of or approval of any transfer shall not alter any terms or extend any time periods under the lease, including those dealing with readjustment of the lease and the diligent development and continued operation on the lease.

PART 3460—ENVIRONMENT

Subpart 3461—Federal Lands Review—Unsuitability

Sec.

3461.0-3 Authority.

3461.0-6 Policy.

3461.1 Relationship of leasing to unsuitability.

3461.1-1 Application of criteria on unleased lands.

3461.1-2 Application of criteria on leased lands.

3461.1-3 Relationship of assessment to designation.

3461.2 Criteria for assessing and designating lands unsuitable for all or certain types of mining operations.

3461.4 Unsuitability assessment procedures

3461.4-1 Assessment and land use planning.

3461.4-2 Consultation with state and local governments.

3461.4-3 Findings.

3461.4-4 Petitions to designate lands.

3461.4-5 Underground mining exception.

3461.4-6 Land exclusion.

Subpart 3465—Surface Management and Protection

3465.0-1 Purpose.

3465.0-2 Objective.

3465.0-3 Authority.

3465.0-4 Suitability.

3465.1 Use of surface.

3465.2 Obligations and standards of performance.

3465.3 Inspections and noncompliance.

3465.3-1 Inspections.

3465.3-2 Discovery of noncompliance.

3465.3-3 Failure of lessee or holder of license to mine to act.

3465.4 Alternative postmining land use.

3465.5 Conduct, completion, and abandonment of operations.

3465.7 Environmental assessment—Post-mining land use.

PROPOSED RULES

AUTHORITY: 30 U.S.C. 181 et seq.; 30 U.S.C. 351-359; 30 U.S.C. 521-521; 30 U.S.C. 1201 et seq.; and 43 U.S.C. 1701 et seq.

**Subpart 3461—Federal Lands Review—
Unsuitability for Mining**

§ 3461.0-3 Authority.

(a) These regulations are issued under the authority of the statutes listed in § 3400.0-3 of this title.

(b) These regulations primarily implement:

(1) The general unsuitability criteria in section 522(a) of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1272(a));

(2) The Federal lands review in section 522(b) of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1272(b)); and

(3) The prohibitions against mining certain lands in section 522(e) of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1272(e)).

§ 3461.0-6 Policy.

(a) The Department shall carry out the review of Federal lands under section 522 of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1272) through land use planning assessments by the surface management agency regarding the unsuitability of Federal lands for coal mining.

(b) The Department shall develop sufficient information prior to leasing any tract to be reasonably certain that subsequent operations on any tract can be conducted in compliance with the Surface Mining Control and Reclamation Act of 1977.

(c) All criteria regarding the designation of lands as unsuitable for surface coal mining operations established by the Office of Surface Mining Reclamation and Enforcement under 30 CFR Part 760 shall be used in assessing unsuitability, in addition to the criteria in this subpart.

§ 3461.1 Relationship of leasing to unsuitability assessment.

§ 3461.1 Application of criteria on unleased lands.

(a) The unsuitability criteria shall be applied, prior to lease issuance, to all lands leased after the issuance of these regulations, including emergency leases and noncompetitive (preferential right) leases.

(b) The unsuitability criteria shall be initially applied either:

(1) During land use planning or the environmental assessment conducted for a specific emergency lease application or noncompetitive or preference right lease application under either § 3425.2 or § 3430.3 of this title; or

(2) During land use planning under the provisions of § 3420.1-3 of this title.

§ 3461.1-2 Application of criteria on leased lands.

(a) For any lease issued prior to the promulgation of these regulations the unsuitability criteria shall be applied to all non-producing leases. The Department may await the lessee's submission of mine plan before applying the unsuitability criteria. This shall not preclude evaluation of an existing lease as part of the normal land use planning process.

(b) The leased lands shall be reviewed in light of the unsuitability criteria to determine which, if any, apply. If any criterion applies, the specific criterion and any exception to it which applies shall be identified. If a criterion does apply and the conditions do not permit an exception, a further review shall be made on whether the leased lands are exempt from the criterion because of the source of the authority for the criterion. Mining shall be permitted on land to which no criterion applies; on land where a criterion applies but where the conditions permit an exception; and on land to which a criterion applies, no exception applies, but which is exempt from that criterion.

§ 3461.2 Criteria for assessing and designating lands unsuitable for all or certain types of mining operations.

(a)(1) Criterion. All Federal lands included in the following land systems or categories and an appropriate buffer zone, if necessary, as determined by the land management agency, shall be considered unsuitable for coal mining: National Park System, National Wildlife Refuge System, National Systems of Trails, National Wilderness Preservation System, National Wild and Scenic Rivers System, National Recreation Areas, lands acquired with money derived from the Land and Water Conservation Fund, Custer National Forest, and Federal lands in incorporated cities, towns, and villages. All Federal lands which are recommended for inclusion in any of the above systems or categories by the Administration in legislative proposals submitted to the Congress or which are required by statute to be studied for inclusion in such systems or categories shall be considered unsuitable.

(2) Exception. A lease may be issued and mining operations may be approved within the Custer National Forest with the consent of the Department of Agriculture as long as no surface coal mining operations are permitted.

(3) Exemptions. The application of this criterion to lands within the listed land systems and categories is subject to voluntary restrictions. The application of the buffer zone portion of this criterion does not apply to lands to which substantial financial and legal

commitments were made prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(b)(1) Criterion. Federal lands that are within rights-of-way or easements or within areas used for residential, commercial, industrial, or other public purposes, or for agricultural crop production on Federally owned surface shall be considered unsuitable.

(2) Exceptions. A lease may be issued, and mining operations approved, in such areas if the surface management agency determines that:

(i) All or certain types of coal development (e.g., underground mining) will not interfere with the purpose of the right-of-way or easement; or

(ii) The right-of-way or easement was granted for mining purposes; or

(iii) The right-of-way or easement was issued for a purpose for which it is not being used; or

(iv) The parties involved in the right-of-way or easement agree to leasing; or

(v) It is impractical to exclude such areas due to the location of coal and method of mining and such areas or uses can be protected through appropriate stipulations.

(3) Exemption. This criterion does not apply to lands on which mining would result in substantial loss or reduction of long-range productivity of food or fiber products, and it does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(c)(1) Criterion. Federal lands affected by section 522(e) and (5) of the Surface Mining Control and Reclamation Act of 1977 shall be considered unsuitable. This includes lands within 100 feet of the outside line of the right-of-way of a public highway or within 100 feet of a cemetery, or within 300 feet of an occupied public building, school, church, community or institutional building or public park or within 300 feet of an occupied dwelling.

(2) Exemption. A lease may be issued and mining operations approved for lands:

(i) Used as mine access roads or haulage roads that join the right-of-way for a public road;

(ii) For which the Office of Surface Mining Reclamation and Enforcement has issued a permit to have public roads relocated;

(iii) For which owners of occupied buildings have given permission to mine within 300 feet of their buildings,

PROPOSED RULES

(3) **Exemption.** The application of this criterion is subject to valid existing rights.

(d)(1) **Criterion.** Federal lands designated as wilderness study areas shall be considered suitable while under the care of the Administration and the Congress for possible wilderness designation. For any Federal land which is to be leased or mined prior to completion of the wilderness inventory by the surface management agency, the environmental assessment or impact statement on the lease sale or mine plan must consider whether the land possesses the characteristics of a wilderness study area. If the finding is affirmative, the land shall be considered unsuitable.

(3) **Exception.** A lease may be issued and mining operations approved if authorized by the Federal Land Policy and Management Act of 1976.

(3) **Exemption.** The application of this criterion to lands for which the Bureau of Land Management is the surface management agency is subject to valid existing rights.

(e)(1) **Criterion.** Scenic Federal lands designated by visual resource management analysis as Class I or II (an area of outstanding scenic quality or high visual sensitivity) but not currently on the National Register of Natural Landmarks shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operations approved if the surface management agency determines that mining operations will not significantly diminish or adversely affect the scenic quality of the designated area.

(3) **Exemption.** This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977, on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(f)(1) **Criterion.** Federal lands under permit by the land management agency for scientific studies involving food or fiber production, natural resources, or technology demonstrations and experiments shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operations approved:

(i) With the concurrence of the principal scientific user or agency; or

(ii) Where it would be stipulated that the mining would be done in such a way as not to jeopardize the purpose of the study as determined by the surface management agency.

(3) **Exemption.** This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which

include operations on which a permit has been issued.

(g)(1) **Criterion.** All districts, sites, buildings, structures, and objects of historic, architectural, archeological, or cultural significance which are included in or eligible for inclusion in the National Register of Historic Sites, and an appropriate buffer zone around the outside boundary of the designated property (to protect the inherent values of the property that make it eligible for listing) shall be considered unsuitable by the land management agency, in consultation with the Advisory Council on Historic Preservation or by procedures approved by the Advisory Council, shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operations approved if the surface management agency determines:

(i) With the concurrence of the state, that the site, structure, or object is of regional or local significance only;

(ii) In consultation with the Advisory Council on Historic Preservation, that the direct and indirect effects of all or certain stipulated methods of coal mining on a property in or eligible for the National Register of Historic Sites will not result in significant adverse impacts to the site, structure, or object.

(3) **Exemption.** The application of this criterion is subject to valid existing rights.

(h)(1) **Criterion.** Federal lands designated as natural areas or as National Natural Landmarks shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operation approved in an area or site if the surface management agency determines that:

(i) With the concurrence of the state, the area or site is of regional or local significance only;

(ii) The use of appropriate stipulated mining technology will result in no significant adverse impact to the area or site; or

(iii) The mining of the coal resource under appropriate stipulations will enhance information recovery (e.g., paleontological sites).

(3) **Exemption.** This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(i)(1) **Criterion.** Federally designated critical habitat for threatened or endangered plant and animal species, and habitat for Federal threatened or endangered species which is determined by the Fish and Wildlife Service and the surface management

agency to be of essential value and where the presence of threatened or endangered species has been scientifically documented, shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operations approved if, after consultation with the Fish and Wildlife Service, the surface management agency determines the species and habitat will not be adversely affected by all or certain stipulated methods of coal mining operations.

(j)(1) **Criterion.** Lands containing habitat deemed critical or essential for plant or animal species listed by a state pursuant to state law as endangered or threatened shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operations approved if, after consultation with the state, the surface management agency determines that the species will not be adversely affected by all or certain stipulated methods of coal mining.

(3) **Exemption.** This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(k)(1) **Criterion.** A bald or golden eagle nest that is determined to be active and a buffer zone of land in a ¼ mile radius from a nest are areas which shall be considered unsuitable. Consideration of avoidance techniques for prey species shall be included in the determination of buffer zones.

(2) **Exceptions.** (i) A lease may be issued and mining operations approved if:

(A) They can be conditioned in such a way, either in manner or period of operation, that eagles will not be disturbed during breeding season; or

(B) Golden eagle nest sites will be moved to the concurrence of the Fish and Wildlife Service.

(ii) Buffer zones may be decreased if the surface management agency determines that the active eagle nests will not be adversely affected.

(l)(1) **Criterion.** Bald and golden eagle roosts and concentration areas used during migration and wintering shall be considered unsuitable.

(2) **Exception.** A lease may be issued and mining operations approved if the surface management agency determines that all or certain stipulated methods of coal mining can be conducted in such a way, and during such periods of time, to ensure that eagles shall not be adversely disturbed.

(m)(1) **Criterion.** Federal lands containing falcon cliff nesting sites with active nests and a buffer zone of Federal land in a ¼ mile radius from the nest to provide needed prey habitat

PROPOSED RULES

shall be considered unsuitable. Consideration of availability of habitat for prey species shall be included in the determination of buffer zones.

(2) *Exception.* A lease may be issued and mining operations approved where the land management agency, after consultation with the Fish and Wildlife Service, determines that the certain stipulated methods of coal mining will not adversely affect the migratory bird habitat during the periods when such habitat is used by the species.

(nX1) *Criterion.* Federal lands which are high priority habitat for migratory bird species of high Federal interest on a regional or national basis, as determined jointly by the surface management agency and the Fish and Wildlife Service, shall be considered unsuitable.

(2) *Exception.* A lease may be issued and mining operations approved where the surface management agency, after consultation with the Fish and Wildlife Service, determines that the certain methods of coal mining will not adversely affect the migratory bird habitat during the periods when such habitat is used by the species.

(oX1) *Criterion.* Federal lands which the land management agency and the state jointly agree are fish and wildlife habitat for resident species of high interest to the state and which are essential for maintaining these priority wildlife species shall be considered unsuitable. Such lands may include appropriate buffer zones as determined jointly by the surface management agency and the state. Such lands shall include:

(i) Active dancing and strutting grounds for sage grouse, sharp-tailed grouse, and prairie chicken;

(ii) The most critical winter ranges for deer, antelope, and elk; and

(iii) Migration corridors for elk.

(2) *Exception.* A lease may be issued and mining operations approved if the surface management agency, in consultation with the state wildlife agency, determines that:

(i) Complete mitigation is possible; or

(ii) The species being protected will not be adversely affected by all or certain stipulated methods of coal mining.

(3) *Exemption.* This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977, on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(pX1) *Criterion.* Federal lands containing inland lakes, impoundments, and associated wetlands:

(i) Inland shallow, predominantly vegetated wetlands; or

(iii) Riverine wetland systems, lower and upper perennial systems with flow greater than 5 cubic feet per second, and riparian zones in a "relatively undisturbed" state that are larger than one linear mile along a riverine system shall be considered unsuitable.

(2) *Exception.* A lease may be issued and mining operations approved where the surface management agency determines that:

(i) The use of appropriate stipulated mining or reclamation technology will not significantly affect the wetlands or will provide for complete restoration; or

(ii) The wetlands contain no significant values for groundwater recharge, fish and wildlife habitat, recreation, or scientific study.

(3) *Exemption.* This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(qX1) *Criterion.* Riverine, coastal, and special floodplains (100-year recurrence interval) shall be considered unsuitable.

(2) *Exception.* A lease may be issued and mining operations approved where the surface management agency determines that:

(i) Leasing a particular tract and appropriate mining operations is the only practicable method of access to coal lands outside the floodplain which are not unsuitable under any other criterion; and

(ii) Potential for harm to people or property and natural and beneficial values of floodplains can be minimized through stipulated use of demonstration mining and mitigation measures.

(3) *Exemption.* This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(rX1) *Criterion.* Federal lands which have been committed by the land management agency to use as municipal watersheds shall be considered unsuitable.

(2) *Exception.* A lease may be issued and mining operations approved where:

(i) The surface management agency determines that all or certain stipulated methods of coal mining will not adversely affect the watershed to any significant degree; and

(ii) The municipality or water users occur in the issuance of the lease.

(3) *Exemption.* This criterion does not apply to lands to which the opera-

tor made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(sX1) *Criterion.* Federal lands with National Resource Waters, as identified by states in their water quality management plans, and a buffer zone of Federal lands $\frac{1}{4}$ mile from the outer edges of the banks of the water, shall be considered unsuitable.

(2) *Exception.* The buffer zone may be eliminated or reduced in size where the surface management agency determines that it is not necessary to protect the National Resource Waters.

(tX1) *Criterion.* Where the surface management agency, with the concurrence of the Secretary of Agriculture (Soil Conservation Service), identifies Federal lands having prime farmland soils, such lands shall be considered unsuitable.

(2) *Exceptions.* A lease may be issued when:

(i) Conditions such as soil rockiness, aspect, or slope or historic or other conditions leading to a negative determination under the permanent regulations of the Office of Surface Mining Reclamation and Enforcement are present; or

(ii) Scientific studies show that crop yields equivalent to pre-mining crop yields on non-mined prime farmlands in the surrounding area under equivalent levels of management could be obtained and that an operator or potential operator could meet the soil reconstruction standards in section 515(b)(7) of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1265b(X7)), and the permanent regulations of the Office of Surface Mining Reclamation and Enforcement.

(uX1) *Criterion.* Federal lands identified by the surface management agency, with the concurrence of the State in which they are located, as alluvial valley floors according to the definition and standards in the permanent regulations under the Surface Mining Control and Reclamation Act of 1977, and the final alluvial valley floor guidelines of the Office of Surface Mining Reclamation and Enforcement, and approved state programs under the Surface Mining Control and Reclamation Act of 1977, where mining would interrupt, disconnect, or preclude farming, shall be considered unsuitable. Additionally, when mining Federal land outside an alluvial valley floor would materially damage the quantity or quality of water in surface or underground water systems that would supply alluvial valley floors, the land shall be considered unsuitable.

PROPOSED RULES

(2) **Exception.** A lease may be issued where all or certain methods of coal mining would not interrupt, discontinue, or preclude farming on land to which the first sentence of the criterion applies.

(w)(1) **Criterion.** As information regarding reclaimability on a local or regional basis becomes available, the surface management agency shall use such information to determine if areas of Federal land are reclaimable to the standards of the Surface Mining Control and Reclamation Act of 1977, the regulations, and approved state programs. Examples of information on reclaimability would be soil studies, hydrologic studies, and studies concerning revegetation. If any area is determined not to be so reclaimable, such area shall be considered unsuitable.

(2) **Exception.** A lease may be issued upon presentation of information which contains results of studies showing that reclamation is possible to the standards in the permanent regulations of the Office of Surface Mining Reclamation and Enforcement, and an approved state program, including state regulations.

(w)(1) **Criterion.** Federal lands in a state to which is applicable a criterion (I) proposed by the state, and (II) adopted by rulemaking by the Secretary of the Interior, shall be considered unsuitable for coal mining.

(2) **Exception.** A lease may be issued when:

(i) Such criterion is adopted by the Secretary less than 6 months prior to the publication of the draft land use plan, or supplement to a land use plan, for the area in which such land is included; or

(ii) The surface management agency, in consultation with the state, determines that, although the criterion applies, mining will not adversely affect the value which the criterion would protect.

(3) **Exemption.** This criterion does not apply to lands to which the operator made substantial financial and legal commitments prior to January 4, 1977, on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

(x)(1) **Criterion.** A buffer zone of Federal lands necessary to provide protection for any adjacent area designated as land unsuitable for mining by the state shall be considered unsuitable.

(2) **Exception.** The buffer zone may be modified or eliminated where the surface management agency, in consultation with the state, determines that all or parts of the zone are not necessary to protect the designated area.

(3) **Exemption.** This criterion does not apply to lands to which the opera-

tor made substantial financial and legal commitments prior to January 4, 1977; on which operations were being conducted on August 3, 1977; or which include operations on which a permit has been issued.

§ 3461.3 Exploration.

(a) Assessment of any area as unsuitable for coal mining pursuant to sections 522 and 523 of the Surface Mining Control and Reclamation Act of 1977 (30 U.S.C. 1272, 1273) and the regulations of this subpart does not prohibit exploration of such area for coal under subpart 3410 of this title.

(b) An application for an exploration license on any lands assessed as suitable for coal mining shall be reviewed by the Bureau of Land Management to ensure that exploration does not harm any value for which the area has been assessed as unsuitable.

§ 3461.4 Unsuitability assessment procedures.

§ 3461.4-1 Assessment and land use planning.

(a) The authorized officer of the surface management agency shall describe to the land user the plans the result of the application of each of the unsuitability criteria to the planning area. The authorized officer shall state each instance in which a criterion if found to be applicable and show the area which is excluded from leasing, or should the authorized officer determine that the conditions for an exception exist, describe the area to which the exception applies and discuss in detail the manner in which the exception is made and what type of conditions or stipulations will be required in any lease or mining permit to assure compliance with the exception.

(b) The authorized officer shall make his assessment on the best available data that can be obtained given the time and resources available to prepare the plan. The plan shall also disclose when during activity planning or lease sale activities, or prior to approval of a permit to conduct surface mining operations, the data used to make an assessment with reasonable certainty would be generated. When that data is obtained, the authorized officer shall make public his assessment on the application of each criterion and the reasons therefor in the land use plan, whether or not additional data are needed. The documentation in the plan should explain whether additional data would be likely to affect significantly the conclusions reached about unsuitability.

(c) All lands not assessed as unsuitable for all methods of coal mining may be considered further in the land use planning and activity planning processes. All lands assessed as unsuit-

able for certain methods of coal mining may be considered in these processes with the condition that those methods of coal mining would not be authorized.

§ 3461.4-2 Consultation with State and local governments.

Prior to assessing Federal lands as unsuitable for coal mining, the Secretary shall consult with the appropriate state and local agencies (43 CFR 3420.2-6).

§ 3461.4-3 Findings.

Prior to assessing Federal lands as unsuitable, the Secretary shall prepare a detailed statement for such lands on (a) the potential coal resources, (b) the demand for coal resources, and (c) the impact of such designation on the environment, the economy, and the supply of coal.

§ 3461.4-4 Petitions to designate lands.

Petitions for designation or termination of a designation of Federal lands as unsuitable for coal mining shall be processed by the Office of Surface Mining Reclamation and Enforcement under 30 CFR Part 769.

§ 3461.4-5 Underground mining exception.

Federal lands with coal deposits that would be mined by underground mining methods shall not be considered unsuitable for coal mining where there will be no surface coal mining operations, as defined in § 3400.5-5 of this title. Where underground mining will include surface operations and surface impacts on Federal lands to which a criterion applies, it shall be considered unsuitable unless the surface managing agency finds that a relevant exception or exemption applies. Surface impacts include surface occupancy, subsidence, fire, and other environmental impacts of underground mining which are manifested on the surface.

§ 3461.4-6 Land exclusion.

After a land use plan is completed, the Department may exclude additional lands from consideration for leasing, or reassess lands as acceptable for further consideration for leasing, as warranted by new information, including action by the Office of Surface Mining Reclamation and Enforcement on a petition to designate lands unsuitable or to terminate a designation of unsuitability, without formally revising the plan. A description of any lands so excluded shall be added to the documentation developed during the tract analysis phase of activity planning (43 CFR 3420.4).

Subpart 3465—Surface Management and Protection**§ 3465.0-1 Purpose.**

This subpart establishes rules for the management and protection of the surface of the Federal lands when coal deposits are developed.

§ 3465.0-2 Objective.

This subpart is designed to ensure the use of effective and reasonable coal mining operations, and the reclamation of mined lands in a manner that will minimize any adverse social, economic, and environmental effects of coal mining.

§ 3465.0-3 Authority.

These regulations are issued under the authority of the statutes listed in § 3400.0-3 of this title.

§ 3465.0-7 Applicability.

This subpart applies to leases and licenses to mine, issued by the Bureau of Land Management for the development of Federal coal.

§ 3465.1 Use of surface.

(a) The operator shall use only that part of the surface area included in his lease or license that has been included in an approved permit (30 CFR Part 741).

(b) Separate leases, permits, or rights-of-way under the appropriate provisions of Title 43 of the United States Code of Federal Regulations are required for the installation of power generation plants or commercial or industrial facilities on the lands in the lease or license to mine or for the use of mineral materials or timber from the land in the lease or license to mine.

(c) Other land uses under other authorities may be allowed on an area in a lease or license to mine provided there is no unreasonable conflict and that neither the mining operation nor the other use is endangered by the presence of the other.

§ 3465.2 Obligations and standards of performance.

(a) A lessee or a holder of a license to mine shall comply with the regulations in this subpart and with the terms and conditions of the lease or license.

(b) A lessee or a holder of a license to mine shall comply with the applicable performance standards in 30 CFR Chapter VII, Subchapter D, and 30 CFR Part 211.

(c) When changed conditions or newly discovered information indicate that an approved permit (30 CFR Part 741) needs to be reviewed or supplemented, the authorized officer may propose the appropriate revision or supplement to the Office of Surface

Mining Reclamation and Enforcement.

(d) The authorized officer may develop and include additional specific stipulations in any lease or license to mine involving special management consideration.

§ 3465.3 Inspections and noncompliance.

The authorized officer, Mining Supervisor, or inspectors from the Office of Surface Mining Reclamation and Enforcement shall have the right to enter lands under a lease or license at any reasonable time.

§ 3465.3-2 Discovery of noncompliance.

(a) Upon discovery of activities that are not in compliance with the terms of a lease or license to mine, or with an approved permit (30 CFR 741), but that do not pose a serious and immediate threat to public health and safety or to natural resources and environmental quality, the authorized officer shall refer the matter to the Office of Surface Mining Reclamation and Enforcement for remedial action, or to the Mining Supervisor on matters of exploration.

(b) Upon discovery of activities that are not in compliance with the terms of a lease, license to mine, or an approved permit and that do pose a serious and immediate threat to public health and safety or to resources and environmental quality, the authorized officer may order the immediate cessation of the threatening activities provided that the Office of Surface Mining Reclamation and Enforcement is immediately informed of the issuance of any such emergency cessation order.

§ 3465.3-3 Failure of lessee or holder of license to mine to act.

Failure of a lessee or the holder of a license to mine to comply with an emergency cessation order issued under § 3465.3-1(b) or with a written notice of noncompliance issued by the Office of Surface Mining Reclamation and Enforcement under this subpart or with 30 CFR Part 211 or 30 CFR Chapter VII, Subchapter D, shall be grounds for suspension of the permit and may be grounds for cancellation of the lease or license to mine, in accordance with subpart 3452 of this title.

§ 3465.4 Alternative postmining land use.

When a lessee, holder of a license to mine, or permit applicant proposes any postmining land use that is substantially different from the land use prior to exploration, mining, and the Office of Surface Mining Reclamation and Enforcement, with the approval of the authorized officer of the appropriate surface management agency,

may approve such alternative postmining land use. The authorized officer shall not approve the alternative postmining land use unless it:

(a) Does not conflict with land use plans for the area in the lease or license to mine and surrounding lands;

(b) Is considered an equal or better economic or public use of the land as compared to the premining use of the land;

(c) Does not, as determined by the authorized officer, cause a significant adverse impact upon the aesthetic character of the land or the lives of people who inhabit the area immediately surrounding the land in the lease or license to mine; and

(d) Is approved by the legal owner of the surface where the surface is privately owned.

§ 3465.5 Bonding.

(a) Bonding for compliance with the terms of a lease or license to mine shall be furnished in accordance with the applicable provisions of subpart 3474 of this title.

(b) A reclamation bond shall be secured in accordance with 30 CFR Part 742.

(c) A lease or license to mine may be denied any applicant or successful bidder who has previously forfeited a bond because of failure to comply with an approved plan (30 CFR Part 741) or permit unless the affected lands covered by that plan or permit have been reclaimed without cost to the Federal Government. Notwithstanding this section shall modify or limit the discretionary authority of the authorized officer to deny for other causes any successful bid or application for a lease or license to mine.

§ 3465.6 Conduct, completion, and abandonment of operations.

All terms of the permit shall be administered under 30 CFR Chapter VII, Subchapter D, and 30 CFR 211.

§ 3465.7 Environmental assessment—Post-mining land use.

If the Director of the Office of Surface Mining Reclamation and Enforcement determines that a decision to approve any alternative postmining land use or alternative rehabilitation practices would constitute a major Federal action requiring an environmental statement under section 102(2)(C) of the National Environmental Policy Act (42 U.S.C. 4332(2)(C)) and that the decision has not been discussed in any environmental statement that may have been prepared for the issuance of the lease or the approval of the permit, a statement shall be prepared by the Director of the Office of Surface Mining Reclamation and Enforcement.

PROPOSED RULES

PART 3470—COAL MANAGEMENT PROVISIONS AND LIMITATIONS

Subpart 3471—Coal Management Provisions and Limitations

- 3471.1 Land description requirements.
 3471.1-1 Land description in application.
 3471.1-2 Land description in lease.
 3471.2 Effect of land transactions.
 3471.2-1 Disposal of land with a reservation of minerals.
 3471.2-2 Effect of conveyance to state or agency.
 3471.3 Cancellation or forfeiture.
 3471.3-1 Cancellation or forfeiture for cause.
 3471.3-2 Protection of bona fide purchaser.
 3471.3-3 Sale of underlayment interests.
 3471.4 Future interest, acquired lands.

Subpart 3472—Qualification Requirements

- 3472.1 Qualified applicants and bidders.
 3472.1-1 Special qualification provisions.
 3472.1-2 Accredited organizations.
 3472.1-3 Contents of qualification statements.
 3472.2-1 Sole party in interest statement.
 3472.2-2 Contents of qualification statement.
 3472.2-3 Signature of applicant.
 3472.2-4 Special qualifications, heirs, and devisees (estates).
 3472.2-5 Special qualifications, public bodies.

Subpart 3473—Fees, Rentals, and Royalties

- 3473.1 Payments.
 3473.1-1 Form of payment.
 3473.1-2 Where paid.
 3473.1-3 When paid.
 3473.2 Fees.
 3473.2-1 General fee provisions.
 3473.2-2 Proportions from fee provisions.
 3473.2-3 Rentals and royalties.
 3473.2-4 Royalties.
 3473.4 Suspension of operation, production, and payment obligations.

Subpart 3474—Bonds

- 3474.1 Bonding requirements.
 3474.2 Type of bond required.
 3474.3 Qualifier sureties.
 3474.4 Default.

Subpart 3475—Lease Terms

- 3475.1 Duration of leases.
 3475.2 Dating of leases.
 3475.3 Land description.
 3475.4 Different development and continued location.
 3475.5 Logical mining unit.

AUTHORITY: 30 U.S.C. 181 et seq. and 30 U.S.C. 351-359.

Subpart 3471—Coal Management Provisions and Limitations

- § 3471.1 Land description requirements.
 § 3471.1-1 Land description and coal deposit in application.

Any application for a lease, lease modification, or license to mine shall include a complete and accurate description of the lands for which the lease, modification, or license to mine is desired.

(a) If the land has been surveyed under the public land rectangular

system, each application shall describe the land by legal subdivision (section, township, and range), or aliquot part thereof (but not less than 10 acres).

(b) Where protraction surveys have been approved and the effective date has been published in the *Federal Register*, the application for land shown on such protraction surveys and filed on or after the effective date shall contain a description of the land according to the section, township, and range shown on the approved protraction surveys.

(c)(1) If the land has not been surveyed on the ground and is not shown on the records as covered by protraction surveys, the application shall describe the land by metes and bounds, giving courses and distances between the successive angle points on the boundary of the tract, in cardinal directions except where the boundaries of the land are in irregular form and connected by courses and distances to an official corner of the public land surveys. In Alaska, the description of unsurveyed land shall be connected by courses and distances to either an official corner of the public land surveys or to a triangulation station established by an agency of the United States such as the Geological Survey, the Coast and Geodetic Survey, or the International Boundary Commission, if the record position is available to the general public.

(2) If the land is acquired land which has not been surveyed under the rectangular system of public land surveys, and the tract is not within the area of the public land surveys, the land shall be described as in the deed or other document by which the United States acquired title to the lands or minerals.

(i) If the land constitutes less than the entire tract acquired by the United States, it shall be described by courses and distances between successive angle points on its boundary tying by course and distance into the description in the deed or other document by which the United States acquired title to the land.

(ii) If the description in the deed or other document by which the United States acquired title to the land does not include the courses and distance between the successive angle points on the boundary of the desired tract, the description in the application shall be expanded to include such courses and distances.

(iii) The application shall be accompanied by a map on which the land is clearly marked showing its location with respect to the administrative unit or project of which it is a part, and is not necessary to submit a map if the land has been surveyed under the rectangular system of public land sur-

veys, and the land description can be conformed to that system.

(iv) If an acquisition tract number has been assigned by the acquiring agency to the tract, a description by tract number will be accepted.

(v) Any acreated land not described in the deed to the United States shall be described by metes and bounds, giving courses and distances between the successive angle points on the boundary of the tract, and connected by courses and distances to an angle point on the perimeter of the acquired tract to which the acrements belong.

§ 3471.1-2 Land description in lease.

All lands in a public land survey system State shall have a cadastral survey performed at Federal Government expense before a lease or license to mine may be issued, except for areas covered by a skeleton survey, i.e. Utah and Alaska, and the lease when issued shall be described by legal subdivision (section, township, and range), or aliquot part thereof (but no less than 10 acres).

§ 3471.2 Effect of land transactions.

§ 3471.2-1 Disposal of land with a reservation of minerals.

(a) Where the lands included in a lease or license to mine have been or may be disposed of with reservation of the coal deposits, a lessee or the holder of a license to mine must comply fully with the law under which the reservation was made. See, among other laws, the Act of March 3, 1909 (34 Stat. 844; 30 U.S.C. 61x; June 22, 1910) (35 Stat. 583; 30 U.S.C. 63-65); December 29, 1913, as amended (39 Stat. 867; 43 U.S.C. 291-301); June 17, 1949 (63 Stat. 200); June 21, 1949 (63 Stat. 214; 30 U.S.C. 54); March 8, 1922 (42 Stat. 415; 48 U.S.C. 376-377); and October 21, 1976 (90 Stat. 2759; 43 U.S.C. 1719).

(b) Any sale or conveyance of lands subject to the Mineral Leasing Act for Acquired Lands by the agency having jurisdiction shall be subject to any lease or license to mine previously issued under that act.

(c) Leases on acquired lands outstanding on August 7, 1947, and covering lands subject to the Mineral Leasing Act for Acquired Lands may be exchanged for new leases to be issued under that act subject in each case to such appropriate conditions as may be prescribed.

(d) When: (1) the coal is to be mined by other than underground mining techniques, (2) the surface of the land is owned by a qualified surface owner, and (3) the lease is issued after August 7, 1977, the lessee shall comply with the terms of the written consent of the qualified surface owner not inconsistent with Federal and state mining

PROPOSED RULES

land reclamation laws and regulations (43 CFR 3420.6).

§ 3471.2-2 Effect of conveyance to State or local entity.

(a) If the United States has conveyed the title to, or otherwise transferred control of the land surface containing the coal deposits to, (1) any state or political subdivision, agency, or its instrumentality; (2) a college, any other educational corporation, or association, or (3) to a charitable or religious corporation or association, the transferee shall be notified by certified mail of the application for the license to mine or lease, or the scheduling of a lease sale. The transferee shall be given a reasonable period of time within which to suggest any stipulations necessary for the protection of existing surface improvements or uses to be included in the license or lease and state the supporting facts, or to file any objections to its issuance and state the supporting facts.

(b) If the state or local entity proposes the issuance of the license to mine or lease, the facts submitted in support of the opposition must be carefully considered, and, in case separately decided on its merits. Opposition by the state or local entity is not a bar to issuance of the license to mine or lease for the reserved minerals in the lands. (See, however, § 3461.2(b).) In each case, the final determination on whether to issue the license to mine or lease is based on the best interests of the public.

§ 3471.3 Cancellation or forfeiture.

§ 3471.3-1 Cancellation or forfeiture for cause.

Any lease or license to mine may be cancelled or forfeited for violation of the act under which the lease or license to mine was issued, applicable Federal regulations, or the terms of the lease or license to mine (43 CFR 3452.2).

§ 3471.3-2 Protection of bona fide purchaser.

(a) The Secretary's right to cancel or forfeit a lease for any violation will not adversely affect the title or interest of a bona fide purchaser of any lease or any interest therein. A bona fide purchaser must be a person, association, or corporation qualified to hold such lease or interest, even though the holdings of the party or parties from which the lease or interest derived was acquired or their predecessor in title (including the original lessee of the United States), may have been canceled or forfeited for any such violation.

(b) Any party to any proceedings with respect to a violation of any provision of the mineral leasing laws has

the right to be dismissed promptly as a party by showing that he or she holds and acquired his or her interest as a bona fide purchaser without having violated any provisions of the mineral leasing laws. No hearing shall be necessary on such showing unless prima facie evidence is presented to indicate a possible violation on the part of the alleged bona fide purchaser.

(c) If, during any such proceeding, a party waives his or her rights under the lease, or if such rights are suspended by order of the Secretary pending a decision, rental payments and time counted against the term of the lease shall be suspended as of the first day of the month following the filing of the waiver or the Secretary's suspension until the first day of the month following the final decision in the proceeding or the revocation of the waiver or suspension.

§ 3471.3-3 Sale of underlying interests.

If, in any proceeding to cancel or forfeit a lease or any interest therein acquired in violation of any of the provisions of the mineral leasing laws, the lease or interest therein is cancelled or forfeited, and if there are valid options to acquire the lease or an interest therein that are not subject to cancellation, forfeiture, or compulsory disposition, this lease or interest therein shall be sold to the highest responsible qualified bidder by competitive bidding, in a manner similar to that provided for in the offering of leases by competitive bidding, subject to all outstanding valid interests and options. If less than the whole interest in the lease or interest therein is cancelled or forfeited, the partial interest shall be sold in the same way. If no satisfactory offer is obtained as a result of the competitive offering of a whole or partial interest, it may be sold by other methods that the authorized officer finds appropriate. However, the terms shall not be less favorable to the Government than those of the best competitive bid received.

§ 3471.4 Future interest, acquired lands.

An application to lease lands in which the United States has a future interest filed less than one year prior to the date of the vesting in the United States of the present interest in the coal shall be rejected. Upon the vesting in the United States of the present possessory interest in the coal, all applications for future interest leases outstanding at the time shall automatically lapse. Only applications for a present interest lease shall be considered after that time.

Subpart 3472—Qualification Requirements

§ 3472.1 Qualified applicants and bidders.

A lease may be issued only to (a) citizens of the United States; (b) associations of citizens organized under the laws of the United States or of any state thereof, which are authorized to hold such interests by the statute under which they are organized and by the instrument establishing their association; (c) corporations organized under the laws of the United States or of any state thereof, including a company or corporation operating a common carrier railroad; and (d) public bodies, including municipalities.

§ 3472.1-1 Special qualification provisions.

(a) Each applicant or bidder for a lease shall furnish a signed statement showing that, with the area applied or bid for, the applicant's bidder's interest in leases or lease applications, held directly or indirectly, do not exceed in the aggregate the acreage limitation in § 3472.1-2 of this title.

(b) A lease or license to mine shall not be issued to a minor but may be issued to a legal guardian or trustee on behalf of a minor.

(c) Every company or corporation operating a common carrier railroad shall make a statement that it needs the coal for which it seeks a lease solely for its own railroad use; that it operates main or branch lines in the state in which the lands involved are located; that the aggregate acreage in the leases and applications in which it holds an interest, directly or indirectly, does not exceed 10,240 acres; and that it does not hold more than one lease for each 200 miles of its railroad lines served or to be served from such coal deposits. This last requirement excludes spurs or switches, branch lines built to connect the leased coal with the railroad, and parts of the railroad operated mainly by power not produced by the railroad.

(d) Aliens may not acquire or hold any direct or indirect interest in licenses to mine or leases, except that they may own or control stock in corporations holding leases if the laws of their country do not deny similar or like privileges to citizens of the United States. If any appreciable percentage of stock of a corporation is held by aliens who are citizens of a country denying similar or like privileges to United States citizens, that corporation's application or bid for a lease shall be rejected.

(e) A license to mine may not be issued to a private corporation.

§ 3472.1-2 Acreage limitations.

(a)(1) No person, association, or corporation, or any subsidiary, affiliate, or person controlled by or under common control with such person, as

PROPOSED RULES

sociation, or corporation shall take, hold, own, or control at one time Federal coal leases, lease applications, or bids for more than 10 percent of any one state or for no case on more than 100,000 acres in the United States.

No person, association, or corporation holding, owning, or controlling lease, lease applications or bids (individually or through any subsidiary, affiliate, or person under common control) on more than 100,000 acres in the United States on August 4, 1976, shall be required to relinquish any lease or lease application held on such date. However, it shall not be permitted to hold any additional interests in any future leases or lease applications until such time as its holdings, ownership, or control of leases or applications has been reduced below 100,000 acres within the United States.

(b)(1) In computing acreage held, owned, or controlled, the accountable acreage of a party owning an undivided interest in a lease shall be the party's proportionate part of the total acreage acreage or accountable acreage of a party owning an interest in a corporation or association shall be the party's proportionate part of the corporation's or association's accountable acreage. However, no person shall be charged that person's pro rata share of any acreage holdings of any association or corporation unless that person is the beneficial owner of more than 10 percent of the stock or other interest in the partnership or control of such association or corporation.

(2) On acquired lands, if the United States owns only a fractional interest in the coal resources of the lands involved, only that part of the total acreage involved in the lease, proportionate to the extent of ownership by the United States of the coal resources, shall be charged as acreage holdings. The acreage embraced in a future interest lease is not to be charged as acreage holdings until the lease for the future interest takes effect.

§ 3472.2 Filing of qualification statements.

§ 3472.2-1 Sole party in interest statement.

Every applicant or bidder for a lease or license to mine shall submit to the Bureau of Land Management State Office having jurisdiction over the lands (43 CFR Subpart 1821) at the time of filing the application or bid a signed statement that the applicant is the sole party in interest in the application or bid, and the lease or license to mine, if issued, will be the sole party in interest. The applicant or bidder shall set forth the names of the other interested parties in the application or bid. A separate or joint statement shall be signed by them and by the ap-

plicant or bidder setting forth the name and extent of the interest of each in the application or bid, the nature of the agreement between them, if oral, and a copy of such agreement if written. Such separate or joint statement of interest and written agreement, if any, or a statement of the nature of such agreement, if oral, shall accompany the application or bid. All interested parties shall furnish evidence of their qualifications to hold the lease or license to mine including a statement regarding knowledge of written consent from any qualified surface owner for the area involved (43 CFR Part 3427).

§ 3472.2-2 Contents of qualification statement.

(a) If the applicant or bidder is an individual, he shall submit a signed statement setting forth his citizenship with each application or bid for a license to mine or lease.

(b) If the applicant or bidder is an association or partnership, the application or bid shall be accompanied by a certified copy of its articles of association or partnership, together with a statement showing: (1) that it is authorized to hold a lease or license to mine; (2) that the member or members executing the lease or license to mine is authorized to act on behalf of the association or partnership in such matters; (3) the names and addresses of all members owning or controlling more than 10 percent of the association or partnership and their citizenship and holdings.

(c) If the applicant or bidder for a lease or license to mine is a corporation, it must submit statements showing: (1) the state of incorporation; (2) that the corporation is authorized to hold leases or licenses to mine; (3) the names of the officers authorized to act on behalf of the corporation; (4) the percentage of the corporation voting stock and all of the stock owned by aliens or those having addresses outside of the United States; and (5) the name, address, relationship, and acreage holdings of any stockholder owning or controlling 10 percent or more of the corporate stock of any class. If more than 10 percent of the stock is owned or controlled by or on behalf of aliens or persons who have addresses outside of the United States, the corporation shall provide their names and addresses, the amount and class of stock owned by each such person, and to the extent known to the corporation or which can be reasonably ascertained by it, the facts as to the citizenship of each such person. Any applicant who has previously filed a qualification statement may submit either a serial number reference to the record and office where the statement is filed or a new qualifi-

cation statement. Applications on behalf of a corporation shall be accompanied by proof of the signatory's authority to execute the instrument except in a case where an officer of a corporation signs an application on behalf of the corporation.

(d) To qualify as a small business for the purpose of bidding on any tract to be offered as part of a special opportunity lease sale for small businesses, the bidder shall submit evidence demonstrating qualification under 12 CFR 121.

(e) Where there is a legal guardian or trustee, the following shall be provided: a certified copy of the court order authorizing the guardian or trustee to act as such and to fulfill in behalf of the minor or minors all obligations of the lease or obligations arising thereunder; a statement by the guardian or trustee as to the citizenship and holdings of each of the minors and as to the trustee's own citizenship and holdings, including holdings for the benefit of other minors.

§ 3472.2-3 Signature of applicant.

Every application or bid for a lease or license to mine shall be signed by the applicant or bidder or by its attorney-in-fact. If executed by an attorney-in-fact, the application or bid shall be accompanied by the power of attorney and the applicant's own statement as to citizenship and acreage holdings unless the power of attorney specifically authorizes and empowers the attorney-in-fact to make such statement or to execute all statements which may be required under these regulations.

§ 3472.2-4 Special qualifications, heirs, and devisees (estates).

If an applicant or bidder for a license to mine or a lease dies before the license to mine or lease is issued, the license or lease shall be issued if the estate has not been probated, to the executor or administrator of the estate; if probate has been completed, or is not required, to the heirs or devisees; and if there are minor heirs or devisees, to their legal guardian or trustee. The lease or license to mine shall not issue under the following circumstances: it has been filed.

(a) Where probate of the estate has not been completed: (1) evidence that the person who acts as executor or administrator has the authority to act in that capacity and to act on the application or bid; (2) evidence that the heirs or devisees are the heirs or devisees of the deceased applicant or bidder, and are the only heirs or devisees of the deceased; and (3) a statement over the signature of each heir or devisee concerning citizenship and holdings.

(b) Where the executor or administrator has been discharged or no probate proceedings are required: (1) a certified copy of the will or decree of distribution, if any, and if not, a statement signed by the heirs that they are the only heirs of the applicant or bidder, and citing the provisions of the law of the deceased's last domicile showing that no probate is required; and (2) a statement over the signature of each of the heirs or devisees with reference to citizenship and holdings, except that if the heir or devisee is a minor, the statement shall be over the signature of the guardian or trustee.

#3472.2-5 Special qualifications, public bodies.

(a) To qualify to bid for a lease on a tract offered for sale under §3420.1-4 of this title, a public body shall submit:

(1) Evidence of the manner in which it is organized;

(2) Evidence that it is authorized to hold a lease;

(3) Evidence that the action proposed has been duly authorized by its governing body; and

(4) A definite plan to produce energy within the next 10 years solely for its own use or for sale to its members or customers (except for short-term sales to others).

(b) To obtain a license to mine, a municipality shall submit with its application:

(1) Evidence of the manner in which it is organized;

(2) Evidence that it is authorized to hold a license; and

(3) Evidence that the action proposed has been duly authorized by its governing body.

(c) To qualify to bid for a lease on a tract of acquired land set apart for military or naval purposes, a governmental entity shall submit:

(1) Evidence of the manner in which it is organized, including the state in which it is located;

(2) Evidence that it is authorized to hold a lease;

(3) Evidence that the action proposed has been duly authorized by its own governing body; and

(4) Evidence that it is producing electricity for sale to the public in the state where the lands to be leased are located.

(d) If the material required in paragraphs (a), (b), or (c) of this section has previously been filed, a reference to the serial number of the record in which it has been filed, together with a statement as to any amendments, shall be accepted.

Subpart 3473—Fees, Rentals, and Royalties

#3473.1 Payments.

#3473.1-1 Form of payment.

Payments shall be made in cash, or by money order, check, certified check, bank draft, or bank cashier's check payable to the Bureau of Land Management or Geological Survey, as appropriate.

#3473.1-2 When paid.

(a) Payments for all licenses to mine shall be paid to the Bureau of Land Management State Office having jurisdiction over the land (43 CFR Subpart 211).

(b) Payments of all rentals for non-production leases shall be paid to the Bureau of Land Management State Office having jurisdiction over the land (43 CFR Subpart 1821).

(c) Rentals and royalties on producing leases shall be paid to the Geological Survey Mining Supervisor for the area in which the lands under lease are situated.

#3473.1-3 When paid.

First year's rental for preference right leases shall be remitted at the time of filing the applications. First year's rental for competitive leases shall be payable when required by decision. Thereafter, rental for all leases shall be paid in accordance with the lease provisions.

#3473.2 Fees.

#3473.2-1 General fee provisions.

A filing fee of \$250.00 must accompany each application for an emergency exploration license, and lease modification. A filing fee of \$50.00 must accompany each application for approval of any transfer of a lease or an interest therein. The fee shall be retained as a service charge even if the application is rejected or withdrawn in whole or in part. An application not accompanied by the filing fee will not be accepted for filing; it will be returned to the applicant without action.

#3473.2-2 Exemptions from fee provisions.

No filing fee is required for:

(a) Licenses to mine to relief agencies as described in subpart 3440 of this title; or

(b) Preference right lease applications.

#3473.3 Rentals and royalties.

#3473.3-1 Rentals.

(a) The annual rental per acre or fraction thereof on any lease issued or readjusted after the promulgation of this subpart shall not be less than \$3.

The amount of the rental will be specified in the lease.

(b) Until a lease issued before August 4, 1976, is readjusted, the rental paid for any year shall be credited against the production or advance royalties for that year.

(c) On leases issued or readjusted after August 4, 1976, rental payments may not be credited against royalties.

#3473.3-2 Royalties.

(a)(1) Royalty rates shall be determined on an individual case basis prior to lease issuance and upon lease readjustment. For competitive leases, initial royalty rates shall be set out in the notice of lease sale.

(2) A lease shall require payment of a royalty of not less than 12% percent of the value of the coal removed from a surface mine.

(3) A lease shall require payment of a royalty of not less than 8 percent of the value of the coal removed from an underground mine, except that the authorized officer may determine a lesser amount, but in no case less than 5 percent if conditions warrant.

(4) The value of coal removed from a mine is defined for royalty purposes in 30 CFR 211.63.

(b)(1) The Mining Supervisor shall have the discretion, upon the request of the lessee, to authorize the payment of an advance royalty in lieu of continued operation for any particular year.

(2) The advance royalty for each lease shall be based on a percentage of the value of a minimum number of tons of coal. The percentage shall not be less than the percentage prescribed in that lease for the production royalty. For any lease issued after August 4, 1976, the minimum number of tons shall be determined on a schedule sufficient to exhaust the leased reserves in 40 years from June 1, 1976.

(3) The use of advance royalties in lieu of continued operation shall not be permitted for more than a total of 10 years during the life of any lease, including the life of the lease after readjustment. No payment of an advance royalty during the first 20 years of a lease issued after August 4, 1976, may be used as credit against production royalty due after the 20th year of that lease.

(4) The Mining Supervisor may, upon notifying the lessee six months in advance, cease to accept advance royalties in lieu of the requirement of continued operation.

PROPOSED RULES

(c) An overriding royalty interest shall not be created by a lease transfer, surface owner consent, or otherwise (1) that exceeds 50 percent of the total of royalty first payable to the United States under the lease or (2) that, when added to any other overriding royalty interest, exceeds that percentage. Where an interest in the leasehold or operating agreement is transferred, the transferor may retain an overriding royalty in excess of the above limitation if he shows to the satisfaction of the Bureau of Land Management that he has made substantial investments for improvements on the land covered by the transfer that would justify a higher percentage.

(d)(1) In order to encourage the greatest ultimate recovery of coal, and in the interest of conservation, the Secretary, whenever he determines it necessary to promote development or finds that the lease cannot be successfully operated under its terms may waive, suspend, or reduce the rental or minimum royalty, or not advance royalty, or reduce the royalty on an entire leasehold, or on any deposit, tract, or portion thereof, except that in no case shall the royalty be reduced below 12% percent for surface mined coal, or 8 percent for underground coal.

(2) An application for any of the above benefits shall be filed in triplicate in the office of the Mining Supervisor. The application shall contain the serial number of the lease, the Bureau of Land Management State Office, the name of the record title holder, and any operator or sublessee, and the description of the lands in the manner provided by § 3471.1 of this title.

(i) Each application shall include the number and location of the mine, a map showing the extent of the mining operations, a tabulated statement of the coal mined and subject to royalty for each month covering a period of not less than 12 months immediately prior to the date of filing of the application, and the average production per day mined for each month, with complete information as to why the minimum production or continued operation requirement was not met.

(ii) Each application shall contain a detailed statement of expenses and costs of operating the entire lease, the income from the sale of coal, and all facts indicating whether the mines can be successfully operated upon the royalty or rental fixed by the Secretary in the application for a reduction in royalties. All information shall be furnished as to whether royalties or payments out of production are paid to parties other than the United States, the amounts so paid, and efforts made to reduce them, if any.

(iii) The applicant shall also file a copy of agreements between the lessee and the holders of any royalty interest, a permanent reduction of all other royalties from the leasehold so that the total royalties owed the holder of royalty interests will not be in excess of one-half of the Government royalties, should the royalty reduction be granted.

§ 3473.4 Suspension of operations, production, and payment obligations.

(a) Application by a lessee for relief from any operations and producing requirements of a lease shall be filed in triplicate in the office of the Mining Supervisor. By Department Order No. 2699 and Geological Survey Order No. 218 of August 11, 1952, the Mining Supervisor is authorized to act on applications for suspension of operations or production, or both, filed pursuant to this section and to terminate suspensions of this kind which have been or may be granted.

(b) The term of any lease shall be extended by adding thereto any period of suspension of all operations and production during which term in accordance with the direction and assent of the Mining Supervisor.

(c) A suspension shall take effect as of the time specified in the direction or assent of the Mining Supervisor. Rental and minimum royalty payments will be suspended during such period of suspension of all operations and production, beginning with the first day of the lease month on which the suspension of operations and production becomes effective. If the suspension of operations and production becomes effective on any day other than the first day of the lease month, rental and minimum royalty payments shall be suspended beginning with the first day of the lease month following such effective date. The suspension of rental and minimum royalty payments shall end on the first day of the lease month in which operations or production is resumed. Where rentals are creditable against royalties and have been paid in advance, proper credit shall be allowed on the next rental or royalty due under the lease.

(d) The minimum annual production requirements of a lease shall be proportionately reduced for that portion of the lease year for which suspension of operations and production is directed or granted by the Secretary in the interest of conservation.

(e) A suspension under this section shall not be granted on a lease issued after August 4, 1978, on which the lessee has not met its diligent development obligations unless administrative action caused the lessee's delay or failure to comply with those obligations.

Subpart 3474—Bonds

§ 3474.1 Bonding requirements.

(a) Before a lease or license to mine may be issued, one of the following forms of compliance bond shall be furnished:

(1) Corporate surety bonds;

(2) Cash; or

(3) Personal lease bonds secured by personal U.S. bonds of a par value equal to the amount of the required surety bond, together with a power of attorney executed on a form approved by the Director.

(b) The applicant or bidder shall file the compliance bond in the proper office within 30 days of receiving notice. An original bond shall be furnished on a form provided by the Director. The period of liability for the compliance bond shall not be terminated until the lease account is in good standing.

(d) The bonding obligation for a new lease may be met by an adjustment to an existing bond covering another lease within the same logical mining unit.

§ 3472.4 Type of bond required.

(a) A compliance bond lease or license to mine, conditioned upon compliance with all provisions of the lease or license to mine except reclamation, shall be furnished in the amount determined by the authorized officer. The amount of the bond may be changed if the authorized officer considers such a change to be proper and necessary.

(b) A reclamation bond may be required in accordance with 30 CFR Part 742.

(c) For exploration licenses, a compliance bond must be furnished in accordance with § 3410.3-7 of this title.

§ 3474.3 Qualified sureties.

The authorized officer will notify those leaseholders who have nationwide or statewide bonds at the time of issuance of this subpart of the requirement to secure a separate compliance bond for each lease in the amount determined by the authorized officer to be proper and necessary. A list of companies holding certificates of authority from the Secretary of the Treasury under the Act of July 30, 1947 (6 U.S.C. 6-14) as acceptable sureties on Federal bonds is published annually in the *FEDERAL REGISTER*.

§ 3474.4 Default.

When the surety makes payment to the Government of any indebtedness due under a lease, the face amount of the surety bond and the surety's liability thereunder shall be reduced by the amount of such payment.

Subpart 3475—Lease Terms**§ 3475.1 Duration of leases.**

Leases shall be issued for a period of 20 years and so long thereafter as the condition of continued operation is met. If the condition of continued operation is not met the lease will be cancelled as provided in § 3452.2 of this title.

§ 3475.2 Dating of leases.

(a) Leases will be dated and made effective the first day of the month following the date signed by the authorized officer. However, upon receipt of a prior written request, the authorized officer may date a lease to be effective on the first day of the month in which it is signed.

(b) Future interest leases shall become effective on the date of vesting of title to the minerals in the United States as stated in the lease.

§ 3475.3 Land description.

Compliance with § 3471.1 of this title is required.

§ 3475.4 Diligent development and continued operation.

(a) Each lease shall require (1) diligent development, and (2) either (i) continued operation except when operations under the lease are interrupted by strikes, the elements, or casualties not attributable to the lessee, or (ii) in lieu thereof, when the Secretary determines that the public interest will be served, payment of an advance royalty as described in § 3473.3-2(b) of this part.

(b) For coal leases issued before August 4, 1976, the 10-year period for achieving diligent development may be increased as follows:

(1) Upon application by the lessee, the 10-year period shall be extended by an amount of time equal to the period during which diligent development is, in the opinion of the Secretary, significantly impaired by (i) a strike, the elements, or casualties not attributable to the lessee, (ii) an administrative or executive department which is not caused by the lessee's action, (iii) extraordinary circumstances not attributable to the lessee and not foreseeable by a reasonably prudent operator. In determining whether any of the conditions listed in

subdivisions or (i), (ii), (iii) of this paragraph occurred and whether one or more of those conditions did, in fact, significantly impair diligent development, the Secretary's finding shall stand firm. The Secretary shall, however, not find to be an extraordinary circumstance under subdivision (iii) any condition arising out of normally foreseeable business risks such as: fluctuations in prices, sales, or costs, including foreseeable costs of compliance with requirements for environmental protection; commonly experienced delays in delivery of supplies or equipment; or inability to obtain sufficient sales.

(2) Upon application by the lessee, the 10-year period shall be granted one extension, not exceeding five years, of the 10-year period because of (i) time needed to complete development of advanced technology, e.g., in situ gasification or liquefaction processes; (ii) the magnitude of the project (ordinarily magnitude means a mine in which the production in the first year after the end of the extended period for diligent development is expected to be at least two million tons if an underground mining operation or five million tons if a surface mining operation); or (iii) a contract which is a firm commitment for the sale or use of the first one-fourtieth of the LMU reserves after the 10-year period. Regardless of the reason for granting an extension, the lessee shall produce the first one-fourtieth of the LMU reserves before the end of the extended term.

(c) At the time when the Secretary grants an extension under paragraphs (a) and (b) of this section, the lessee shall be notified of the revised date by which coal shall be produced in commercial quantities.

§ 3475.5 Logical mining unit.

(a) Criteria for approving or directing establishment of an LMU are found in 30 CFR 211.80. Each lease shall automatically be considered to constitute an LMU on the effective date of the lease or June 1, 1976, whichever is later. The lease LMU may, at a later date, by enlarged by the addition of other Federal leases or with leases in non-Federal coal deposits, or both. An LMU containing any interest other than a single Federal lease shall become effective only at the direction of the Mining Supervisor.

sor, or by designation during the normal tract delineation phase of the coal activity planning process, or upon its approval by the Mining Supervisor when requested by the lessee. The Mining Supervisor shall not direct or approve the establishment of such an LMU unless it is determined that the maximum economic recovery of all Federal coal deposits in the LMU will be achieved. The boundaries of an LMU may later be changed either upon application by the lessee and with the approval of the Mining Supervisor after consultation with the authorized officer, or by direction of the Mining Supervisor after consultation with the authorized officer.

(b) When a lease is included in an LMU with other Federal leases or with leases in non-Federal coal deposits, the terms and conditions of the lease shall be amended to be as consistent with the requirements imposed on the LMU of which it has become a part. In particular, diligent development, continued operation, and production in commercial quantities anywhere within the LMU, with respect to either Federal or non-Federal coal deposits, shall be considered to have occurred on each Federal lease in the LMU. The rental and royalty payments on all Federal leases in an LMU shall be combined, and advancement royalties paid on any Federal lease in that LMU may, at the request of the lessee, be credited against those combined royalties.

(c) The lessee may, upon approval of the authorized officer, surrender the rights to any coal deposits. If these rights are surrendered, the LMU reserves shall be adjusted. When the Mining Supervisor is determining the LMU reserves, the lessee shall be consulted about any coal deposit subject to the lease which the lessee does not intend to mine. The lessee shall also be consulted about the rights the lessee is prepared to surrender to decrease the LMU reserves upon which the requirements of diligent development, continued operation, and production in commercial quantities will be based.

GUY R. MARTIN,
Assistant Secretary of the Interior.
MARCH 13, 1979.

APPENDIX B

MEMORANDA OF UNDERSTANDING

APPENDIX B

MEMORANDUM OF UNDERSTANDING BETWEEN THE DEPARTMENT OF THE INTERIOR AND THE DEPARTMENT OF ENERGY CONCERNING THE ESTABLISHMENT AND USE OF PRODUCTION GOALS FOR ENERGY RESOURCES ON FEDERAL LANDS

1. Purpose

The purpose of this Memorandum of Understanding between the Department of the Interior (DOI) and the Department of Energy (DOE) is to set forth concepts, assumptions, and responsibilities for the establishment and use of production goals for Federal energy leasing and to set forth mechanisms for implementing those responsibilities.

2. Concepts and Assumptions

- a. The development of an integrated national energy policy by the Department of Energy requires the coordinated treatment of Federal resources as a constituent part of national energy planning consistent with overall national economic, environmental, and social goals and applicable law. These energy and resource development activities must be based on adequate data, rigorous analysis, and appropriate program decisions.
- b. Each Department has responsibilities, authorities, information, and data which, when properly combined and executed, can produce efficient energy resource development in an environmentally acceptable manner.
- c. The planning process must reflect the statutory responsibilities of each Department and the inherent uncertainty of forecasts as well as include public consultation, environmental considerations, and appropriate energy resource development.
- d. Program goals should be reviewed on a regular basis.
- e. Energy resources for purposes of this Memorandum include offshore oil, offshore natural gas, onshore oil, onshore natural gas, coal, oil shale, tar sands, geothermal resources, and uranium. Leases include leases of Federal lands (including Outer Continental Shelf (OCS) lands) or interests in such lands.

f. Projection periods for onshore and offshore oil and natural gas, coal, oil shale, and geothermal resources are 5, 10, and 15 years each; projection periods for tar sands and uranium will be specified in the individual information exchanges between the Departments on an *ad hoc* basis.

g. Production goals are the objectives for the national production of energy resources from Federal lands or interests in lands including the OCS which are necessary to carry out national energy policy and to enable each Department to fulfill its responsibilities under section 801 (b)(1) of the Department of Energy Organization Act.

3. Data Responsibilities of the Secretary of the Interior

a. The Secretary of the Interior will supply data and information (including supporting analyses and methodology) to the Secretary of Energy related to the extent of energy resources and current and anticipated production from the Federal lands, including OCS lands, or interests in such lands for the relevant projection period for each resource, consisting of:

- (1) Estimated energy resources and estimates of anticipated annual production for the 5th, 10th and 15th projection years expected from leases currently under production and from leases expected to be developed, taking account of changes due to exhaustion of resources and abandonment of leases, under existing and proven technology and under existing laws and regulations. Where necessary, explanations of uncertainties as to estimates and data will be included; and
- (2) Estimated energy resources underlying areas not currently under lease but which

are included in a leasing schedule or plan.

b. The Secretary of the Interior will also provide to the Secretary of Energy the following data and information, to the extent available:

- (1) An evaluation of the energy resource potential of Federal lands neither currently under lease nor included in an established lease or schedule;
- (2) Any other related data that may be requested by the Secretary of Energy in carrying out his pertinent statutory and regulatory duties.

4. Goal Setting Responsibilities of the Secretary of Energy

Subject to the process and timetable provided in Section 6:

- a. The Secretary of Energy will develop proposed national energy production goals for Federal lands and, following review of those goals by the Secretary of the Interior, will establish final production goals.
- b. The Secretary of Energy will propose and establish production goals for energy resources, on a resource by resource basis, on lands or interests in lands under Federal jurisdiction, for the relevant projection period, based upon the following.

- (1) The production estimates provided by the Secretary of the Interior;
- (2) Production estimates, developed by the Secretary of Energy, from Federal lands scheduled by the Secretary of the Interior to be leased;
- (3) Increases or decreases in these estimates resulting from modification to pertinent regulations or statutes, anticipated advances in technology, or use of enhanced recovery methods; and
- (4) Any additional increases or decreases in production which the Secretary of Energy may propose.

c. In setting these goals, the Secretary of Energy will take into account developmental lead times and will consider:

- (1) The overall energy strategy set forth in the current or most recent Annual Report and National Energy Policy Plan prepared in accordance with sections 657 and title VIII of the Department of Energy Organization Act;

(2) The estimates, evaluations and other information provided by the Secretary of the Interior pursuant to section 3;

(3) Estimates, information, data and evaluations furnished by the Administrator of the Department of Energy's Energy Information Administration concerning, but not limited to, reserves and undiscovered resources;

(4) Such other considerations as the Secretary of Energy may deem pertinent; and

- (5) With respect to coal, and as available and applicable for the other energy resources:

- (a) The availability of the energy resource from private, State, Indian, and other non-Federal reserves already leased but not yet committed to production;
- (b) The impact on potential production from non-Federal resources or on those Federal resources already leased but not yet committed to production, of leasing for production of additional Federal energy resources.

d. The Secretary of Energy will provide the Secretary of the Interior the assumptions and data used in developing the production goals.

e. The Secretary of Energy will include appropriate proposals on matters within his jurisdiction to adjust production, including, if applicable:

- (1) Changes in regulations identified by section 302(b) of the Department of Energy Organization Act.
- (2) Changes in procedures for setting production rates, or changes in the rates themselves; and
- (3) In the Annual Report and National Energy Policy Plan required by section 657 and title VIII of the Department of Energy Organization Act, proposals for changes in legislation or other actions affecting the broad aspects of energy policy for which the Department of Energy has responsibility.

5.

In reviewing and commenting on the Secretary of Energy's proposed production goals, the Secretary of the Interior will inform the Secretary of

Energy of potential policy conflicts or problems concerning, but not limited to:

- a. The Department of the Interior's responsibilities for the management, regulation, and conservation of natural resources;
- b. The capabilities of the Federal lands and Federal energy resources to meet these goals;
- c. The national need for these energy resources balanced against the environmental consequences of developing them.

6. Process and Timetable

- a. As soon as practicable after the effective date of this Memorandum the Secretary of the Interior will provide the Secretary of Energy the information, data, and assessments pursuant to section 3.
- b. Within 30 days after receipt of the Secretary of the Interior's information, data, and assessments regarding a particular energy resource, the Secretary of Energy shall advise the Secretary of the Interior of the time schedule for his preparation of proposed production goals. Such production goals shall be transmitted to the Secretary of the Interior as soon as practicable after receipt by the Secretary of Energy of the above mentioned information.
- c. The Secretary of the Interior will have 60 days to review and comment on the proposed production goals.

d. The Secretary of Energy will issue final production goals not more than 30 days after the Secretary of the Interior's comments have been received.

e. This process will be repeated biennially from the effective date of this Memorandum or at such other interval as the Secretaries may agree.

f. The final production goals will be published in the current or next Annual Report or National Energy Policy Plan of the Secretary of Energy under section 657 and title VIII of the Department of Energy Organization Act.

g. In establishing or revising leasing programs and lease planning schedules, the Secretary of the Interior shall be guided by the final production goals established pursuant to this Memorandum consistent with the Secretary's other statutory responsibilities.

7. Coordination

Coordination of these procedures *may be* accomplished through the Leasing Liaison Committee established in accordance with section 210 of the Department of Energy Organization Act.

8. Effective Date

This Memorandum shall be effective upon execution.

MEMORANDUM OF UNDERSTANDING BETWEEN THE BUREAU OF LAND MANAGEMENT AND THE FISH AND WILDLIFE SERVICE ON COAL

I. PURPOSE

The purpose of this agreement is for the Bureau of Land Management (BLM) and the Fish and Wildlife Service (FWS) to assure the effective consideration of fish and wildlife resources in coal related activities on public lands in a manner that recognizes existing cooperative relationships with the States. It is also to promote harmonious working relationships and program efficiency in the public interest.

A. Responsibilities

The key to achieving the purpose of this agreement is clear definition of BLM and FWS roles and responsibilities within respective statutory authorities. Broad responsibilities are defined below. Specific responsibilities and relationships are set forth in section II of this agreement.

1. The BLM has the statutory responsibility for inventory, planning, and multiple-use management of the public lands and public land resources, including coal and fish and wildlife. In connection with this responsibility, BLM must have the capability to efficiently inventory, manage and protect fish and wildlife habitat.
2. FWS has statutory responsibilities for protection of migratory birds, including eagles, and threatened or endangered species and their habitats. The Fish and Wildlife Coordination Act responsibilities of FWS extend to some water development projects on public lands.
3. FWS and BLM have general responsibilities to conduct research and to compile information on the status of the fish, wildlife and plant resources and those factors affecting them in their respective area of responsibility. These general assessments for wildlife and vegetative conditions and trends extend to concerns within major coal regions.

4. Both Agencies have wildlife advocacy roles within their statutory authorities or other assigned functions.

B. General Principles

1. The cooperative relationship between the two Agencies is built upon the concept that field level input into the BLM land use planning system will achieve the basic objectives of each Agency, and the Department of the Interior (DOI). The BLM has a statutory responsibility to see that fish and wildlife resources are effectively considered in all stages of its land management programs and activities. Procedures consistent with this MOU will be established by BLM State Directors and FWS Regional Directors to provide for regular exchange of information and advice as early as feasible in the BLM planning process. FWS input will reflect BLM's responsibility of the need to balance wildlife interests with other concerns in coal development and multiple-purpose land management. In those cases where there are disagreements, such disagreements should be expressed through the chain of command of the two Agencies beginning at the lowest appropriate field level.
2. BLM has responsibility for assuring the collection, inventory, and subsequent analysis of fish, wildlife and vegetative data on the public lands. FWS also has responsibilities for collection and analysis of data to meet its requirements. FWS concerns in this area relate to the adequacy of the data and analysis as these relate to responsibilities of FWS relative to endangered species, migratory birds, and other species. FWS is also concerned with the general adequacy of data and analysis for management and protection of wildlife, wildlife habitat, and threatened and

- endangered plant species on a national and regional basis. These responsibilities and concerns can best be met by FWS participation in appropriate components of the planning system as identified in subsequent sections of this MOU. Both Agencies will coordinate inventory system development and applicable data gathering activities to foster a common and compatible resource data base, to share information, and to minimize conflicts and disagreements concerning adequacy of wildlife data related to coal development decisions from the outset. BLM will seek FWS participation in the actual conduct of data collection activities to meet its requirements where such participation is mutually advantageous. In turn, FWS will seek BLM participation in data collection and analysis to meet its requirements where it is appropriate.
3. The BLM State Offices and the FWS Regional Offices or their delegated Offices will be the primary Offices through which field coordination will take place. Each is responsible for ensuring that appropriate Offices of their organization are involved whenever appropriate. On matters pertaining to coal related field studies or investigations, the FWS Regional Director or the BLM State Director will determine which items of mutual interest are administered by their respective Office and which items should be referred to other field organizational units (i.e., BLM Denver Service Center, FWS Research Centers and National Teams). Upon referral, the Directors or Leaders of the field unit will be the coordination focal point for that activity or activities within the respective Bureaus. Additionally, the Directors or Leaders of these field units will apprise FWS Regional Directors and BLM State Directors of planned or ongoing coal related studies, projects, and activities. Frequent informal consultation on matters of mutual concern is to be encouraged at all levels.
4. BLM State Directors and FWS Regional Directors will keep each other apprised of actions planned or taken with State

wildlife agencies on wildlife matters of concern in coal areas. Whenever coal-related research actions and nonoperational studies are proposed with State wildlife agencies by field units within BLM and FWS that are not administered by the FWS Regional Director or BLM State Director, it shall be the responsibility of the Director or Leader of that field unit to keep both the Regional and State Director informed. BLM will ensure State wildlife agency involvement in the coal programs. Officials of both Agencies will also keep each other informed of their respective activities relating to coal resources on public lands.

5. FWS will otherwise assist BLM in a manner consistent with this MOU, through cooperative procedures mutually agreed by BLM State Directors and FWS Regional Directors, or as appropriate, Directors or Leaders of other BLM or FWS field units. Some examples include participation in certain field projects, providing highly specialized expertise, developing methodologies for data collection and interpretation and assessing major impacts on wildlife for preventing or mitigating damage to important habitats, and conducting and sharing research findings to support BLM identified needs.

C. General Coordination

1. *Meetings.* There shall be annual coordination meetings between State and District BLM Offices and appropriate FWS Regional and Area Offices, and such other Offices as deemed appropriate, timed to coincide with the budget cycle, to discuss programs and plans relative to coal and other items of mutual concern to both Agencies. WO level meetings shall be held by the BLM/FWS Coordinating Committee.
2. *Written Communication.* When FWS advice/recommendations are solicited on subjects related to this agreement, the FWS will be afforded 30 days unless specified otherwise in which to make its views known to BLM to the extent time deadlines imposed on BLM permit. If no

response is received within the 30 days or other specified time period, BLM will assume that FWS either concurs or has no comments to offer.

3. *Supplemental Agreements.* BLM and FWS field organizations or other appropriate organizational units may enter into supplemental agreements where needed to specify interrelationships in detail or for specific project type activities. Such agreements must be within the policy parameters of this agreement. Both BLM State Directors and FWS Regional Directors will make every effort to ensure coordination is achieved at their lowest appropriate field units. Where mutually agreeable, BLM State Directors and FWS Regional Directors will delegate coordination functions to their field units.

II. FUNCTIONAL COORDINATION

This section outlines Agency responsibilities and working relationships by functional area.

A. Preleasing

1. Subject: Resource Inventories

- a. *Description:* Inventories must be conducted to determine the nature and extent of living and nonliving resources; to provide a basis for land use planning and decisionmaking; and to identify the nature, extent, and condition of all resources located in planning areas with potential for coal development.
- b. *Responsibilities:* The Federal Land Policy and Management Act (FLPMA) directs BLM to maintain resource inventories on a continuing basis. FWS has legislative responsibilities to conduct nationwide inventories related to migratory birds, wetlands, and threatened and endangered species. Both Agencies may also be assigned responsibilities for inventory via Presidential or Departmental direction. BLM has responsibility for inventory work relative to data necessary for public land management. This includes inventory and planning responsibilities for threatened and endangered species on public lands in coal areas pursuant to regulations regarding Section 7 of the Endangered

Species Act (ESA). FWS will provide support in terms of cooperative development of new methodology and inventory techniques and supply applicable data to BLM. FWS Regional Directors and BLM State Directors will take steps to ensure that appropriate organizational units, e.g., FWS Area Offices and BLM District Offices will periodically coordinate their activities and capabilities. Joint efforts in this regard will be guided by the Interagency Agreement Relative to Classification and Inventory of Natural Resources, effective June 6, 1978. In accordance with that agreement, both Agencies will work in partnership to ensure that needed data are obtained in a cost effective and expedient manner.

The BLM's planning system contains several inventory steps applicable to coal activities. These steps, including their overall purposes, are outlined together with the nature of specific FWS inputs at the field or BLM planning unit levels:

Step	BLM Responsibility	FWS Input(s)
1. Preplanning Analysis	Determine wildlife resource data needs; develop planning/inventory schedule for wildlife resources; estimate financial requirements.	Help identify general wildlife situations in coal areas, and recommend data elements needed to address wildlife issues.
2. Unit Resource Analyses (URA)	Identification of existing wildlife resource conditions and potentials on planning area basis.	Help identify known significant wildlife habitats (existing and potential) and provide other assistance, technical support, and advice.
2. Subject: Land Use Planning	a. <i>Description:</i> Land plans must be developed as a requisite for management and decisionmaking regarding allocation and use of resources located on public lands, in accordance with planning mandates in the FLPMA, the Federal Coal Leasing Amendment Act of 1975, and the Secretary's decision of October 22, 1977, which calls for plans prior to identification of lease tracts. In BLM, such plans are	

called management framework plans (MFP's).

- b. *Responsibility:* The FLPMA directs development, with public involvement, of BLM land use plans which provide, by tracts or areas, for the use of the public lands. Such plans must address: multiple-use and sustained-yield, areas of critical environmental concern (ACEC), interdisciplinary concerns, present and potential uses for wildlife and other resources, and certain other requirements. To the extent consistent with law, these plans must be coordinated with land use inventory and management programs of other Federal Agencies and State and local governments. Therefore, FWS will provide comment on URA's/MFP's in potential coal production areas by participating in a consultative manner to minimize conflicts and disagreements. Such comments will be considered and incorporated, as deemed appropriate, into decisionmaking by BLM District Managers, as well as comments from other Federal and state agencies and private organizations.

3. Subject: Identification of Areas to be Excluded From Leasing and Lands Unsuitable for Mining

- a. *Description:* Certain areas that may be excluded from leasing or identified as unsuitable for mining because of: (1) statutes or (2) policy determinations such as for high socioeconomic or ecological values associated with wildlife, archaeology, cultural and other resources, and (3) for reasons of public health and safety.
- b. *Responsibility:* The FLPMA directs that critical environmental areas be identified during BLM land use planning. The Federal Coal Leasing Amendments Act requires planning prior to coal leasing. Also, the interagency agreement between BLM, Geological Survey (U.S.G.S.), and the Office of Surface Mining Reclamation and Enforcement (OSM), approved July 1978, delineates Agency responsibilities for identification of "areas unsuitable for mining" as directed by the Surface Mining Control and Reclamation Act (SMCRA). In accordance with these

authorities and relationships, BLM must decide which areas of public lands are of environmental concern and, thus, may be unsuitable for mining or excluded from leasing.

The Department is providing BLM with criteria relative to land suitability for leasing. Such criteria will serve as a basis for unsuitability designations or excluding lands from leasing. Within the parameters of Departmental criteria, FWS may provide to BLM information which it feels should be considered in making these designations during the land use planning process.

4. Subject: Tract Selection

- a. *Description:* This involves identification and selection of specific tracts for short and long term leasing, preference right leasing, and land use decisions by BLM District Managers. Selection of such tracts will be after decisions are reached on areas unsuitable for mining, or excluded from leasing.
- b. *Responsibilities:* BLM is responsible for selection of tracts suitable for leasing after decisions are made as to "areas unsuitable for mining." Using information available through the land use planning process and from specific recommendations from FWS, States, and others, tracts will be selected, then ranked for priority of leasing. Thus, through participation in the planning and tract selection process, FWS will have opportunity to provide information and opinions in the tract decision process.

5. Subject: Lease Stipulations, Terms, and Conditions

- a. *Description:* This involves preparing special terms regarding environmental performance standards and other protective provisions in coal related leases.
- b. *Responsibility:* The FLPMA directs that all actions necessary be taken to prevent unnecessary or undue degradation of the public lands. BLM is the official representative of the Secretary in dealing with lease applicants and, as such, is responsible for placing protective provisions and stipulations on coal leases.

Such stipulations and provisions are developed and based upon decisions flowing from the MFP,

upon findings in environmental impact analysis, and the technical examination.

BLM is responsible for incorporating stipulations and conditions into leases after consideration of all recommendations, including those from FWS. FWS recommendations or suggested modifications will be solicited for appropriate analysis in coal lease stipulations.

6. Subject: Environmental Analysis

- a. *Description:* This involves preparation of regional or, when warranted, site specific prelease environmental analysis reports (EAR) or environmental statements (ES) concerning lease tract selections.
- b. *Responsibilities:* Sec. 102(2)(c) of the National Environmental Policy Act (NEPA) requires agencies taking major Federal actions significantly affecting the quality of the human environment to prepare ES's on those actions. Extraction or mining of coal and related activities, such as issuance of rights-of-way and water developments to support such industrial activities are also among the actions to be considered. Present "lead agency" responsibilities for preparation of such analyses rest with BLM except in special exceptions where another agency may be designated as lead agency. These responsibilities must be carried out in consultation with all appropriate agencies and organizations, including the FWS. The following procedures are hereby established to ensure close working relationships between the two Agencies in this regard:

(1) BLM will keep FWS apprised of current and projected ES schedules via the regularly scheduled meetings of the FWS-BLM Coordinating Committee and other means, as appropriate.

(2) BLM will request FWS data and other inputs into the applicable ES's at the earliest possible date. Where FWS has special expertise or unique talent needed for the ES, such will be made available to the BLM ES team under terms and conditions mutually agreeable to the concerned FWS Regional Director and BLM State Director. This may include detail of FWS personnel to assist in ES preparation.

(3) FWS and BLM budget requests for ES's and associated work will be coordinated to reflect

their respective responsibilities in the most cost-effective approach and to foster clear communications between the two Agencies. The FWS-BLM Coordinating Committee will be the principal vehicle for ensuring such coordination at the Washington Office (WO) level. Coordination at the field level will be in accordance with procedures agreed to by FWS Regional Directors and BLM State Directors.

(4) BLM will provide FWS review copies of draft ES's at the earliest possible time for official review and comment within specified time frames.

7. Subject: Endangered Species Consultation

- a. *Description:* BLM must consult with FWS on any action which may affect threatened or endangered species or their habitats.
- b. *Responsibilities:* Whenever it is found that threatened or endangered species or their habitat may be affected by coal leasing or mining activities, the concerned BLM State Director must initiate written formal consultation in accordance with Interagency Cooperation Regulations dated January 4, 1978. To the extent that the concerned BLM State Director and the FWS Regional Director can agree, and as provided for in the above regulations, an aggregate approach to consultation in coal areas will be followed. Whenever FWS rules that additional data are needed upon which to issue a biological opinion, such data must be provided by BLM before the consultation process can be concluded. It is jointly agreed that not all habitat modifications are prohibited, only those which diminish habitat for the species in question. The FWS will provide methodology, expertise and recommendations, upon request, to help resolve operational problems caused by endangered species in coal areas.

B. Post Leasing

1. Subject: Compliance With Lease Stipulations
 - a. *Description:* This involves monitoring exploration and associated activities to ensure compliance with lease stipulations and/or special terms and conditions.
 - b. *Responsibilities:* BLM is responsible for ensuring that lessees abide by lease terms

and conditions. Where in the course of other activities, FWS personnel find or become aware that a lessee is not in compliance with lease terms or conditions, such personnel should immediately advise the nearest BLM Office. The BLM will then take necessary action.

2. Subject: Emergency Environmental Situations
 - a. *Description:* Some situations may arise in leased areas that involve either imminent danger to public health or safety or where conditions, practices, or violations of regulations or lease terms are causing or may cause significant, imminent environmental harm to land, air or water, or other resources or significant waste of coal. In such cases, it may be necessary to order cessation of such activities or violations and to order immediate remedial action.
 - b. *Responsibility:* The BLM has such authority when authorized mine inspectors are unable to take action before significant harm or damage will occur. If in the course of other activities FWS personnel become aware that such conditions exist, the appropriate BLM State Director and/or District Manager is to be so informed immediately and will take appropriate action to resolve the situation.
3. Subject: Review of Reclamation Plans and Abandonment Procedures
 - a. *Description:* Lessees must prepare adequate plans for reclaiming mined areas which meet the reclamation requirements of the SMCRA and multiple-use management requirements of FLPMA.
 - b. *Responsibilities:* The OSM has primary Federal authority to inspect and approve abandonment procedures. BLM must concur in such abandonment procedures as related to protection and postmining use of the lands regarding fish, wildlife and other natural resources. BLM resource staffs will analyze the adequacy of such procedures. Where such procedures are found to be inadequate, BLM will suggest needed changes and improvements. FWS will be afforded an opportunity to provide comments to BLM as to the adequacy of proposed procedures

prior to BLM concurrence, in accordance with procedures agreed to by appropriate BLM and FWS field officials. BLM will notify/negotiate/ resolve with applicable agencies and groups, including FWS, any issues which would serve as grounds for BLM nonconcurrence.

III. RESEARCH AND DEVELOPMENT

Annual meetings shall be held at the field and WO levels to coordinate research surveys, investigations, and studies being conducted that are of mutual program interest to both Agencies. This includes such work being conducted by the FWS WELUT and the EELUT, cooperative research units, or other applicable entities of FWS and BLM's Denver Service Center. Such meetings shall be initiated, scheduled, and organized by mutual agreement of appropriate officials of both Agencies. Agenda items should provide for discussion/resolution of Agency needs and priorities relative to coal activities and associated wildlife considerations.

When it is of mutual interest, the FWS and the BLM may conduct cooperative research in coal areas.

Each Agency will be given an opportunity to identify and review research proposals relating directly to its lands or management responsibilities developed by the other for the purpose of avoiding duplication and to determine if similar research is being conducted by other agencies. Pertinent research results of either Agency will be made available to the other on a timely basis, including significant interim findings. The FWS will provide a periodic report summarizing wildlife research pertinent to coal.

IV. INFORMATION TRANSFER

It is recognized that a wide variety of biological, ecological, and scientific information, published and unpublished, exists within both Agencies. This includes information and data relating to resource conditions and trends, wildlife and habitat inventories and baseline studies, economic or other values, demand/supply, and use statistics. Free exchange of this information in compatible and standardized formats is essential.

It is, therefore, mutually agreed that procedures will be developed under the direction of the national BLM/FWS Coordinating Committee for

more formalized transfer of information between BLM and the FWS at all levels.

V. PERMITS REGARDING WORK IN NAVIGABLE WATERS

The Secretary of the Interior has delegated to the FWS Director and Regional Directors authority to act for the Department in the review of and reporting on permit applications administered by the USA-CE (503 DM I, August 3, 1973). Procedures and necessary evaluations of permit application for coal operations on public lands, as required under secs. 402 and 404 of the Federal Water Pollution Control Act and by the Rivers and Harbors Act of 1899, shall be coordinated at the FWS Area Office and BLM District Office or other appropriate level before a formal application is made to the U.S. Corps of Engineers.

VI. RELATIONSHIPS TO STATE, OTHER AGENCIES, AND INSTITUTIONS

Nothing in this MOU is intended to modify in any manner the present or future cooperative programs of either Agency with States, other public agencies, or educational institutions. Both Agencies share the concern that State fish and wildlife resource agencies be consulted on a routine basis to strengthen coordination and cooperative relationships. Every effort will be made to prevent duplicative requests or contracts to these State agencies for information and data assistance relative to coal.

VII. OBLIGATION OF FUNDS

Nothing in this agreement shall be construed as obligating either party to the expenditure of funds in excess of appropriations authorized by law or otherwise commit either Agency to actions for which it lacks statutory authority.

VIII. EFFECTIVE DATE, REVIEW, AMENDMENT, AND TERMINATION

This agreement shall become effective upon the date subscribed by the last signatory, and shall remain in force until terminated by either Agency upon 90 days written notice. It shall be reviewed by all parties no later than Calendar Year 1981 for adequacy and timeliness. Amendments to existing wording within this agreement may be proposed by either Agency at any time and shall become effective upon joint approval.

IX. BUDGET COORDINATION

To insure maximum compatibility of budgetary requests and the subsequent distribution and utilization of funds, the following coordinating functions shall apply:

A. Joint Review of Budget Materials

1. Prior to formulating coal related budget instructions, the BLM and FWS shall jointly review the coal program to determine program objectives and budget assumptions.
 2. Each Agency shall provide the other an opportunity to review budgetary material relating to all activities on behalf of coal leasing and coal development. Where coal related work is supported by a number of activities, these will be identified to facilitate review of budgetary plans.
 3. To the extent possible, review opportunity shall be given sufficiently in advance of budgetary due dates to permit meaningful input and discussion before such budget material must be finalized.
 4. Neither Agency shall advance a program which is directly linked or referenced to the activities, actions, or authorities of the other Agency without advance consultation and mutual understanding as to the nature of that program and actions to be undertaken within the scope of this agreement.
 5. Budget materials as used herein apply to Departmental Program Strategy Papers, Office of Management and Budget (OMB) Estimates, Budget Justifications for Congressional review, and any amendments or supplements thereto.
- ##### B. Budget Year Consultation
1. Where the budget (or appropriations act) for the upcoming fiscal year (FY) in one Agency contains funds or positions earmarked for direct transfer to other Agency, such funds and positions shall be identified in writing prior to the start of the FY for budget planning.
 2. Where funds and manpower are to be retained in the Agency, but are to be committed toward those efforts related to coal leasing and coal development, each Agency shall, to the extent known, inform the other as to the approximate level of

direct funding, its distribution, and expected accomplishments for the upcoming FY. Each Agency's plans shall be communicated to respective field offices to facilitate further coordination at the State-Regional level.

3. Funds earmarked for cooperative research shall be identified and transferred to the Agency designated as "lead Agency" for the research project.

C. Coordination Points

Coordination activities, as described in this section, shall be the primary responsibility of:

For BLM - Chief, Division of Budget and Program Development and For FWS - Assistant Director - Planning and Budget

X. CONFLICT RESOLUTION

Should interagency controversy arise at any working level, the facts regarding such controversy shall be forwarded to the next higher level of authority for resolution.

APPENDIX C

COAL TECHNOLOGY BACKGROUND INFORMATION

COAL TECHNOLOGY BACKGROUND INFORMATION

C.1 IMPORTANT COAL CHARACTERISTICS

Coal is a readily combustible mineral containing more than 50 percent by weight and more than 70 percent by volume carbonaceous materials, including inherent moisture formed from compaction and induration of variously altered plant remains similar to those in peat [1]. Character and quality (as defined by rank and grade) are the factors that determine the relative value and usefulness of coal. These factors are controlled principally by conditions during formation and the depth of burial of the coal.

Coal is classified according to a particular property such as degree of metamorphism or "coalification" (rank), constituent plant materials (type), or degree of impurity (grade). The rank of a particular coal is established according to the percentage of fixed carbon and the peat content, calculated on a mineral-matter-free basis. As shown in Figure C-1, the percentage of fixed carbon and the heat content (measured in British thermal units, Btus) increases from low rank lignite to higher rank bituminous coal as the percentages of volatile matter and moisture decrease. Coal is classified by grade largely according to the content of ash, sulfur, and other constituents.

C.2 MINING TECHNOLOGY

Exploration, development, production, and reclamation are the four operations executed during the life of a coal mine. These operations are described in the following sections.

C.2.1 Exploration

Generally, exploration aims at locating the presence of economic deposits and establishing their nature, shape and grade. There are three broad phases which comprise mineral exploration—initial appraisal, preliminary reconnaissance, and detailed physical sampling [3].

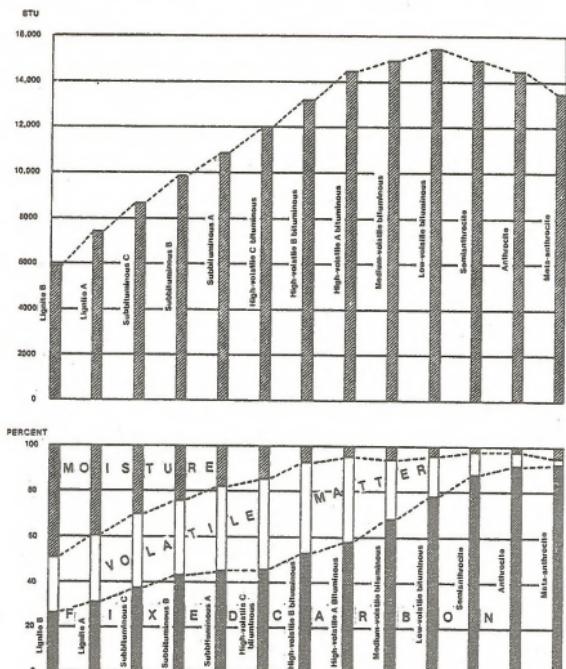

C.2.1.1 Initial Appraisal. This step involves literature search and the review of maps (geological,

geographical, hydrological, etc.) to ascertain factors relating to surface and mineral ownership, access routes, seam thickness, seam pitch, surface contours, overburden thickness and composition, the presence of other minerals, as well as surface and groundwater flows.

C.2.1.2 Preliminary Reconnaissance. If the initial appraisal looks promising, a preliminary field visit is made to check surface hydrology, the location of coal outcrops, and unusual obstacles such as areas of archeological or cultural interest. A series of spot or information drillings may be made for better determination of stratigraphy and coal seam thickness. Chemical and calorific checks of outcrops and/or drilling samples are also made.

C.2.1.3 Detailed Physical Sampling. As the expectation for profitably extracting coal increases, more drillings are made to verify physical and chemical characteristics and map the coal seam. A set of outline drillings are made to ascertain the dimensions of the deposit and amount of reserves. These may then be followed by sampling drillings to determine the necessary parameters with enough certainty that reliable economic appraisals are possible. In general, coal deposits require less drilling than other minerals because coal is fairly consistent in thickness and quality and wider spacing can be tolerated between exploratory holes. In some instances, drilling on 1/4 mile centers is satisfactory; this is unique in mineral extraction programs since 200-foot centers are usually required. Besides the mineralogical, chemical and physical testing of drill core samples and outcrop cuttings, there are several types of down-hole or bore hole tests which can be made with instruments lowered into the drill hole. These experiments involve devices making seismic, gravimetric, magnetic, and electrical resistance readings of the different underground strata.

Exploratory drilling is generally done with truck-mounted rotary rigs, and the samples taken with such rigs can be either cuttings or core, or

FIGURE C-1
COAL CLASSIFICATION BY RANK

C-2

both. Additional equipment used by an exploration crew may include water trucks, personnel carriers, a hole-logging equipment truck, and a dozer or grader to assist in obtaining access to the exploration area and to prepare the drill site.

C.2.2 Mine Development

Development, the operation preparatory to production, begins after a promising coal deposit has been found. Actual development cannot begin until all necessary arrangements have been made with Federal, state and local governments, as well as any private owners that may be involved. Such arrangements include obtaining a lease; providing access to the mine property for roadways, railroad, utilities; and obtaining the permits and licenses required by Federal, state, and local authorities. A usual requirement is that a mining and reclamation plan be approved before a permit is granted. Bond is posted to insure payment of rents, royalties, and land reclamation costs as mining progresses.

Planning, the first stage of development, involves specifying how the development work is to be accomplished, the method and equipment to be used for mining, the design of above-ground facilities, the plan for prevention of air and water pollution, and the provisions for reclaiming disturbed land.

After planning, the development of a mine includes construction of roads, utility line tie-ins, and the mine plant. Depending on the amount of coal produced and where it is to be used, construction of a railroad spur may be required. For coal that contains excessive impurities, a washing plant could be constructed as part of the mine plant. Otherwise, the mine plant consists of coal handling and storage facilities, offices, shops and laboratories, equipment storage buildings, and waste disposal areas. If the coal is to be mined by underground methods, the mine plant is constructed near the main portal or entrance. For coal mined by surface methods, the mine plant would be located off the outcrop, if possible.

Access to coal deposits at an underground operation is provided by drifts, slopes, or shafts (Figure C-2). The coalbed is developed for further operations by driving entries. Although terminology varies, the following system of entries is universal in the industry. Main entries are extensions of the access openings and often run several miles in one direction. Three or more parallel

entries, 12 to 22 ft. wide and 40 to 100 ft. between centers, are driven in a given direction and connected at intervals by crosscuts to provide proper air circulation. These are the major routes of underground transport and access, and serve for the life of the mine [1]. Panel entries are driven from the main entries, resulting in a subdivision of the coalbed into blocks or panels having dimensions that may be as much as 1 by 1/2 mile. Panel entries serve as routes from main entries to the working places, and for air circulation. Although coal is removed during the driving of both the main and panel entries, it is with completion of the panel entries that the production cycle begins.

Access to coal deposits at a surface operation involves the use of large equipment such as bucket-wheel excavators, draglines and shovels to remove overburden from the coal so extraction can begin. As mining progresses, development mainly consists of extending paved roads and power lines, and constructing new roads for access to the coal deposit.

C.2.3 Coal Production

This section addresses the primary operations of extracting the coal from a deposit and preparing (cleaning and purifying) it for shipment and use.

C.2.3.1 Extraction. There are two major methods of extracting coal: by underground mining methods or surface mining methods. Associated with each method are a number of alternatives.

Underground Mining. In underground mining, after the initial development has gained access to the coalbed, one of three methods, i.e., room-and-pillar, longwall, and shortwall, is commonly used to extract the coal.

Room-and-pillar mining has been used in the United States longer than any other underground method. Mining is accomplished by driving entries off the panel entries. As mining advances, rooms are excavated in the coal seam; the strata above the seam are supported by pillars of coal left in place. After a block panel or section has been mined, part of the coal in the pillars can be recovered as a retreat is made toward a main entry (Figure C-3). Until about 1950, most of the coal produced from underground mines was by this conventional technique. Since then, conventional mining gradually has been replaced by more mechanized, continuous mining. Conventional

C-4

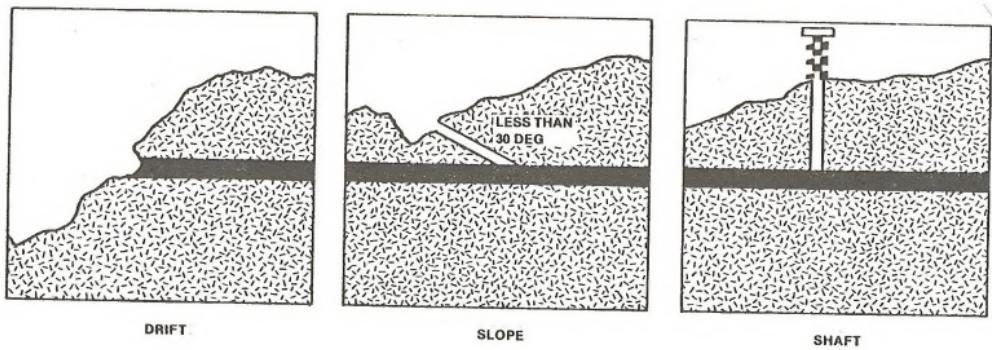

FIGURE C-2

THE THREE TYPES OF ACCESS USED
IN UNDERGROUND COAL MINES

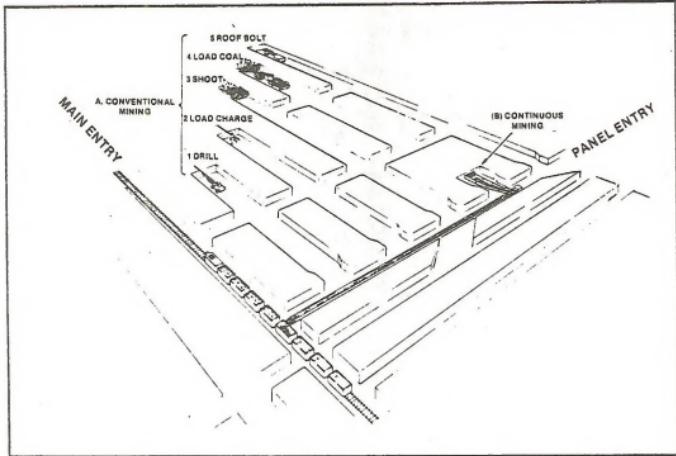

FIGURE C-3
ROOM-AND-PILLAR MINING TECHNIQUES

mining requires driving a number of entries so that each operational phase, i.e., undercutting, drilling, placing explosives, blasting, loading the shot coal, and roof bolting, can be done simultaneously. Continuous mining is performed by electric-powered machines that either bore, dig, or rip the coal from the working face. As shown in Figure C-3, many of the operations performed in separate panels with the conventional technique are performed simultaneously in the same panel with the continuous technique. Such machines are usually crawler-type vehicles operated by one man. They either load the coal directly into a shuttle car or pile it behind the machine where it is loaded separately onto the shuttle cars. True continuous operation of a mining machine cannot be achieved, however, because stops are required to support the roof, await haulage equipment, advance power and water supplies, change cutting bits, etc. Where the entire thickness of a coal seam is to be mined, recovery averages about 50 percent. However, it is not always possible to take all the coal in the seam because it may be necessary to leave part of it for roof support. This is common practice in seams greater than 10 feet in thickness. Roof bolts and timber are used for additional support.

Contemporary longwall mining, first introduced to the United States in the 1950s, has long been practiced in European mines. To support the roof at the face, longwall mining originally used manually operated props, then gradually evolved to the presently used powered, self-advancing supports (Figure C-4). Longwall mining is used most efficiently in uniform coal seams of medium height (42 to 60 in.). As in the room-and-pillar method, longwall mining starts with sets of entries cut into the panel areas. The difference in the technique lies in the distance between these sets of entries and the method used to extract intervening coal. Longwall blocks range from 300 to 600 ft. wide and are sometimes a mile long. The longwall machine laterally shears or plows coal from the entire face, transports the fallen coal by an advancing conveyor to a secondary haulage conveyor, reverses direction at the end of a cut, and supports the roof in the area of the face by a self-advancing system of hydraulic jacks. The roof is allowed to cave behind the advancing work areas; the roof is occasionally blasted to ensure a

controlled cave-in rate and to reduce overburden pressure on the coalbed being mined.

The shortwall method of mining coal, a relatively new innovation, is best described as a method similar to longwall mining with two exceptions. The blocks of panels are smaller, usually ranging from 100 to 150 ft. wide and 300 to 500 ft. long, and the coal is cut with a continuous miner and is loaded into shuttle cars.

Surface Mining. Strip and auger mining are the two most common surface methods of extracting coal in the United States. Two other methods, open-pit and quarry-type mining, are being tried in thick, shallow-lying western coal seams and may become generally accepted where conditions warrant their use.

Strip mining is accomplished by two techniques, area stripping and contour stripping (Figures C-5 and C-6). Where coalbeds are relatively flat and near the surface, as in much of the west, area stripping is the dominant technique [4]. In area strip mining, overlying material is removed from a seam of coal in long narrow parallel bands, or strips, followed by removal of the exposed coal. With the exception of the first cut (box cut), overburden from each cut is discarded in the previous cut from which the coal has been removed. These parallel cuts continue across the coal seam until the thickness of the overburden becomes too great to be removed economically or until the end of the coal seam or property is reached. Figure C-7 depicts a cross-section and plan view of a portion of a strip coal mine. Both single and multiple seams, near the surface, can be mined in this manner.

Overburden removal can be accomplished with almost any kind of earth-moving equipment, but bucket-wheel excavators, draglines, and shovels are the three kinds of equipment used at large area-stripping operations. Bucket-wheel excavators are used extensively in Europe, but in the United States the dominant machines are draglines and shovels. This is not strictly a matter of preference, but results from the nature of the overburden material. In the United States much of the overburden contains layers of shale, limestone, or sandstone that must be drilled and blasted before it can be removed. Draglines and shovels are more efficient in these materials than a bucket-wheel excavator. After the overburden is removed, coal is

OF A PORTION OF A STRIP COAL MINE

usually drilled and blasted. Then it is loaded into coal haulers with either a shovel or a front-end loader.

Contour stripping is practiced on steep terrain, mostly in the Appalachian Coal Region. The method consists of removing overburden from the coalbed with the first cut at or near the outcrop, and proceeding around the hillside. Overburden is stacked along the outer edge of the bench. After the uncovered bed is removed, successive cuts, usually only two or three, are made until the depth of the overburden becomes too great for economic recovery of the coal. Contour mining creates a shelf or bench on the side of the hill. On the inside it is bordered by the highwall, ranging in height from a few feet to more than 100 feet, and on the outer side by a high ridge of spoil. Equipment commonly used for contour stripping is smaller in size and load capacity than that used for area stripping. Dozer and front-end loaders are often used for overburden removal at these operations.

In the eastern United States, auger mining is used on hillside terrain. It requires a surface cut (removal of overburden and a portion of the coal bed) to allow the auger access to the bed. It is often used to recover part of the coal left from underground mining. In the western United States, auger mining is used in conjunction with strip mining. Coal mining by the auger method entails boring horizontal or near horizontal holes in an exposed face of coal and loading the coal removed by the auger. Three choices of auger heads—single, dual or triple—are available to remove up to 90 inches of coal for a distance of over 200 feet. Average depth is about 160 feet. Augering is generally used to supplement recovery at contour or strip mines when the overburden thickness becomes too great to be economically removed. It is also used where the terrain is too steep for overburden removal and where recovery by underground methods would be impractical or unsafe.

In open-pit mining, overburden is removed and placed outside the mining area. The pit increases in size and depth as mining progresses, and it is unusual that the overburden, once removed, is ever returned to the pit. Open-pit mining is used extensively for mining ores of copper and iron, and sand and gravel. Its use in coal mining is being tried where numerous pitching seams lie parallel to each other and outcrop on a relatively flat terrain. The overburden can be

removed with either scrapers or shovels loading into trucks.

For quarry-type mining the coalbed typically averages over 60 feet in thickness. It is benched to facilitate its removal. A variation of strip mining of thick coalbeds, it first requires dividing the mine area into 40-acre tracts, for example. Overburden is removed from two tracts, away from the outcrop, with shovel and trucks and spoiled (piled) on land toward the outcrop that will be mined later. Thus, 80 acres of spoil will have to be handled twice. When mining is completed, land that did not produce coal will not have been disturbed. When overburden is removed from a third tract, enough of the thick coal seams will have been mined from the first tract to allow spoiling in the first tract. When mining terminates, the mined area will have an appearance similar to that before mining started, but lower in elevation.

Table C-1 shows the number of acres that would be stripped of overburden each year from a coal deposit to expose the required tonnage to be mined. In actual practice, stripping is 6 months or more ahead of mining. The number of acres disturbed shown in Table C-1 does not include areas impacted by other mining activities such as overburden storage, access roads, utility corridors and the mine plant. These additional disturbed areas could equal that shown in the table.

C.2.3.2 Coal Beneficiation. Crushing and cleaning of mine-run coal is commonly referred to as beneficiation or preparation. Often crushing and sizing is all that is required, but many coal seams, especially those in eastern and midwestern states, contain enough impurities to necessitate further cleaning. Impurities in coal are innumerable, but those occurring in quantity, such as clay, rock, shale, and pyrite, require removal. Processes vary from simple to complex. The simplest are crushing and screening operations which remove large pieces of foreign material, normally through the use of a breaker. Beyond this, whether the process is wet or dry, it is commonly referred to as washing. The dry washing method has advanced from merely blowing the dust from coal to using pulsating air to separate the coal, and largely eliminate the need for close screen sizing. Presently, almost all air-cleaning machines depend on pulsating air. Wet washing of coal is accomplished by floating the coal and sinking the impurities in

TABLE C-1
RELATIONSHIP OF COAL THICKNESS TO PRODUCTION

SEAM THICKNESS IN FEET	TONS OF COAL (a) PER ACRE OF SEAM	ANNUAL PRODUCTION	NO. OF ACRES STRIPPED/YEAR @ 90% RECOVERY

		2,000,000	25.40
		5,000,000	63.49
75	131,250	500,000	4.23
		1,000,000	8.46
		2,000,000	16.93
		5,000,000	42.33

(a) Calculated on the basis of 1,750 tons per acre foot.

water. Wet washing starts with breaking and screening the coal to remove the large, hard pieces of impurities. Additional cleaning depends upon the amount, size, and type of impurity, how it is dispersed in the coal, and how the coal is to be used. Equipment can include any or all of the following: jigs, screens, landers, heavy-medium cyclones, tricone separators, concentrating tables, froth flotation, cells, filters, and driers.

Whether the coal to be supplied a given customer is to undergo preparation processing at the mine plant depends upon the customer's needs. Customers using best available control technology (BACT) for emissions can probably use run-of-mine coal directly. Other customers may already have preparation facilities to size the coal to their specific needs.

C.2.4 Land Reclamation

The term reclamation is used here to mean any process for rehabilitating land disturbed by coal mining. The term refers to returning the disturbed land to a condition and/or productivity equal to or higher than that prior to mining. Reclamation consists basically in making a mine site safe, acceptable in appearance, and available for other uses before mine abandonment.

The goals of reclamation related to coal development are different from those of restoration, which can entail, for example, the conversion of waste, desert, marshy or submerged land into farmland. Reclamation is intended to bring the land back to its former values, sometimes including a desert or arid situation.

The aesthetic qualities of coal-mined areas will be changed most drastically in areas with steep topography and 6 inches or less of annual precipitation. Before commitment of an area to coal mining, other developments proposed for adjoining or nearby areas must also be considered. Coal mining may disturb relatively small areas at any one time if rehabilitation is done as soon as possible. However, in combination with environmental impacts from other sources, the added impacts from coal mining could be more serious than if they were the only ones on the landscape. The precise nature of impacts can be determined only when a specific mining proposal is examined. That step is taken by interagency teams making environmental analyses in connection with applications for prospecting and mining plans, in

developing stipulations to be incorporated in coal leases, in administering coal leases, in directing rehabilitation measures, and in assessing any unmitigated impacts that remain after all requirements have been met and leases are terminated.

Reclamation consists of four phases: planning, topsoil/overburden segregation, backfilling, and revegetation. The planning phase begins prior to mining and continues throughout the mining cycle. This phase mainly involves: 1) site mapping, 2) identification of the probable effects of mining before mining begins, 3) development of the reclamation plan, including mitigating measures to be followed during all mining activities, 4) preparation of periodic environmental reports, 5) bond and permit fee related activities, 6) supervision of the reclamation work, 7) engineering and surveying for environmental protection, 8) water quality monitoring, 9) dust control, and 10) consultation with outside experts.

Topsoil/overburden segregation and backfilling usually include: 1) removal of vegetative cover when its removal is necessary for topsoil salvage, 2) removing and stockpiling topsoil and overburden separately, 3) backfilling and grading cuts with original overburden, and 4) replacing topsoil [5,6].

Techniques used in the topsoil/overburden segregation and backfilling phases differ according to the type of mining method used. In the Appalachian Coal Region where contour mining is dominant, two mining approaches, box-cut and truck haulback, have been implemented to integrate the topsoil/overburden segregation and backfilling reclamation phases into the mining cycle [7]. Such integration has increased the efficiency of the overall mining process by reducing backfill requirements after overburden removal and spoil placement.

Area strip mining is dominant in most non-Appalachian coal regions. Separation of topsoil from overburden is accomplished by draglines, bucket wheel excavators, and scrapers [8]. In areas with shallow coal seams, the overburden can be removed with a single effort and is referred to as the full-cut technique. In areas with thick overburden, the bench technique is used to rotate overburden from an active cut to a previous cut in its natural sequence. Topsoil is usually applied and graded by draglines and dozers [8,9,10]. Surface configuration methods include: 1) terracing, 2)

pitting, 3) ditching, 4) listing, 5) deep chiseling, and 6) discing.

The revegetation phase usually consists of the following in each coal region: 1) soil preparation (discing, mulching, fertilizing, etc.), 2) seeding and/or planting, 3) reseeding and/or replanting, and 4) irrigation [5,6]. The methods used in each of the four categories differ substantially in various coal regions, due mainly to different topsoil characteristics and environmental conditions.

Most of the Federal coal is in the Rocky Mountain and Northern Great Plains Coal Provinces. The dominant surface uses of Federal land in those two provinces are for livestock forage production, wildlife habitat, watersheds, wide-ranging recreational activities, and timber production. In those provinces, surface mining on Federal lands will occur mainly in nonforested areas. On the other hand, forested terrain is generally such that if coal is mined, it will be by underground methods. Consequently, except for areas disturbed at mine portals and plant sites, the principal effect on existing forests will be from subsidence.

In the Fort Union, Powder River, and Denver-Raton Mesa Coal Regions, revegetation limiting factors are: 1) the amount and distribution of precipitation, 2) soil nutrient concentrations, 3) soil alkalinity and salinity levels, and 4) the suitability and availability of different plant species [11,12]. Most soils are deficient in phosphorus and nitrogen but receive in excess of 12 inches of precipitation annually. Erosion is as serious a problem in some areas as excessive aggregation is in others.

Surface soil replacement is necessary for successful vegetation reestablishment [11]. Spoils are graded to short lengths of gentle-to-moderate slopes and the highest site-production overburden is placed near the surface. Tillage is accomplished by conventional agricultural techniques. Fertilizers are applied for best vegetation success. Gypsum is added to saline soils and irrigation is sometimes necessary during erratic climatic years. Most areas are seeded grass and legume mixtures using established farming practices [9]. Management measures are similar to those described for the San Juan Coal River Region below.

In the San Juan Coal River Region, the major limiting factor to revegetation is water [13]. Precipitation averages 6 inches annually and evapotranspiration is much higher [14]. Another factor is a thin topsoil layer overlying an imperme-

able overburden, which causes flash flooding and wind erosion. Alkalinity values of the topsoil approach a pH of 9.0, and large amounts of sodium are present.

Irrigation is essential during the first year of revegetation and may be necessary in subsequent years of extraordinarily low rainfall [15]. Currently, the most effective method is to simulate 12-14 inches of effective annual precipitation with sprinkler irrigation in the first growing season, followed with spring irrigation the next growing season [13]. In the Black Mesa Field, irrigation is not normally necessary. Species used for revegetation are selected on the basis of the future land use, which is usually grazing [13].

Revegetation limiting factors in the Uinta-Southwestern Utah and Green River-Hams Fork Coal Regions are similar to those in the San Juan River Coal Region. Revegetation is accomplished by: 1) spoils segregation; 2) addition of topsoil (4-6 inches) selected for nutrient status and moisture capacity; 3) surface manipulation to reduce the rate of surface flow; 4) broad mixture seeding of adapted species; 5) precipitation conservation using slow drainage design, moisture-retaining subsoil, and mulches; and 6) gradient reductions [16].

In the Eastern and Western Interior Coal Regions, the primary limiting factors to revegetation are topsoils with low organic matter, low pH, low nitrogen, and poor tilth [10,17]. These problems are mitigated by the use of fertilizers, lime and leguminous plant species. Conventional farming methods and aerial broadcasting are used in reseeding [10].

Topsoil is not salvaged in the Texas Coal Region because plant nutrients have been leached to subsurface material [5]. Therefore, the latter is used as the growth medium. Bulldozers and scrapers are used to grade soil into gently rolling flatland to be used for row crops, hay meadows, or pasture. Spoil is usually revegetated with Bermuda grass. Seeding, discing, and fertilizing occur in the spring. The second and consecutive years are used for hay, pasture, or both.

A number of reclamation techniques have been tested in recent years which will allow more efficient and economic reclamation. A lateral groove technique allows efficient terracing of steep slopes in areas of rugged terrain, such as the Appalachians [18]. This method allows rapid plant

establishment on easily erodible slopes by increasing soil moisture and producing a "banding" effect of seed and fertilizer.

Dryland planting innovations in Montana include: 1) condensation traps, 2) supplemental rooting, 3) tubelings, and 4) use of plants which are tolerant to drought, alkalinity, and salty soil [19]. Surface manipulation techniques such as deep chiseling, gouging, and dozer basins have increased soil moisture and plant establishment.

A precipitation management method has been successfully used [20] which will aid revegetation in arid and semi-arid regions. This technique involves concentration of precipitation runoff in parallel contours, which increases soil moisture amount and duration of availability to plant roots. In one test, most perennials survived a 1 inch rainfall year (one runoff event).

C.3 FUTURE USES OF COAL

Although coal comprises 90 percent of the country's fossil fuel reserve, only 18 percent of the national energy needs are met with coal. A cornerstone of the National Energy Plan is to correct this imbalance between reserves and consumption. In the near term, conversion of existing facilities in industry to coal from oil and natural gas is encouraged, and construction of new facilities that burn oil or gas prohibited. Expanding future use of coal will depend largely on the successful commercialization of new technologies that convert coal to clean fuels and that permit coal to be burned in an environmentally acceptable manner. Processes are being developed under Federal sponsorship to convert coal into substitutes for oil and natural gas (such as crude oil, fuel oil and distillates; chemical feedstocks; and high, low and intermediate Btu gas) as well as to permit increased use of coal by direct combustion (such as in industrial boilers and process heaters, and as primary fuel for electric power generation).

Coal gasification processes have been commercially available for many years. However, the processes are costly, and, in many cases, limited in the kinds and sizes of coal that can be processed [21].

C.3.1 Coal Gasification

Coal gasification is a process of chemical transformation of solid coal into gas which is essentially methane, carbon monoxide or free

hydrogen and virtually free of sulfur. Commercial coal gasification processes in use today outside the United States include the Lurgi, Koppers-Totzek, and Winkler processes. Presently, three types of coal gasification plants are being proposed: low Btu gasifiers for industrial and utility boiler fuels; intermediate-Btu gasifiers producing feed-stock for manufacture of liquid fuels; and high-Btu or synthetic natural gas (SNG) to support declining pipeline quality gas supplies.

Processes currently being developed under the High-Btu Gasification Subprogram of the Department of Energy include: Bi-Gas, Hygas, CO_2 Acceptor, Self-Agglomerating Ash, Synthane, and Hydrane. Figure C-8 is a flow chart for the CO_2 Acceptor Process.

Processes currently being investigated under the Low-Btu Gasification Subprogram of the Department of Energy include: Fixed Bed (Stirred and Slagging), Fluid Bed (Two Stage and Three Stage), Entrained Bed Atmospheric, Combined Cycle, and Molten Salt Pressurized. Figure C-9 is a flow chart of the Fluid Bed, Three Stage Process.

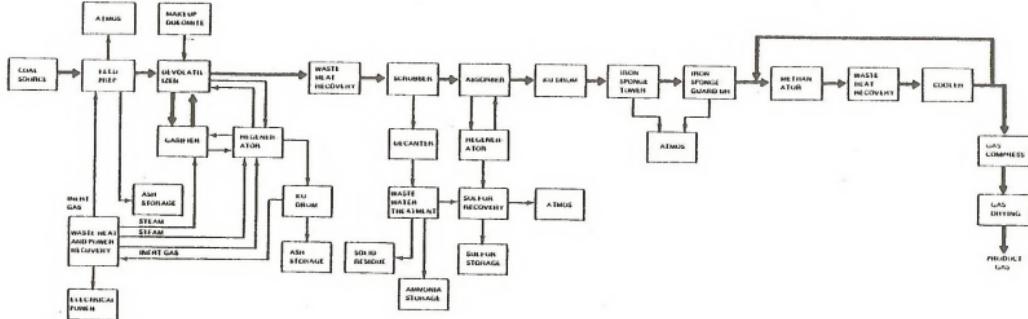

C.3.2 Coal Liquefaction

Coal liquefaction is the conversion of solid coal to a liquid; this involves hydrogenation to depolymerize the coal molecules into simpler molecules. The products derived from coal liquefaction could compete with petroleum-refined products in two markets: first, as a low-ash, low-sulfur boiler fuel suitable for clean electric power generation; and second, as a substitute for high-grade fuels such as gasoline, heating oil, and chemical feedstock. Processes currently being investigated under the Liquefaction Program of the Department of Energy include: H-coal, Synthoil, Solvent Refined Coal, Donar Solvent, Entrained Pyrolysis, and Flash Liquefaction. Figure C-10 is a flow chart of the H-Coal Process.

C.3.3 Direct Combustion

Direct combustion processes are intended to develop fluidized bed combustion systems capable of directly burning high-sulfur coals of all ranks and quality in an efficiently and environmentally acceptable manner. These processes will permit increased utilization of coal by direct combustion in utility, industrial/institutional boilers, for heat and electric power generation. Processes currently being investigated are Fluidized Bed Boilers and

APPENDIX E
WATER RESOURCES DATA

TABLE E-1
WATER RESOURCES COUNCIL AGGREGATED SUBREGIONS

Region	Aggregated Subregion (ASR)	Basin	Discharge Point(s)
Ohio	501	Allegheny-Monongahela	Allegheny River at Natrona, Pa., above Pittsburgh; and Monongahela River at Braddock, Pa.
	502	Pittsburgh-Cincinnati Little Miami	Ohio River immediately above Kentucky River Junction
	503	Muskingum-Scioto-Great Miami	The junction of each river with the Ohio River Junction.
	504	Kanawha	Kanawha River at Ohio River junction.
	505	Licking and Kentucky, Louisville-Sale, Evansville-Green	Ohio River at Mississippi River junction.
	506	Wabash	Wabash River at Ohio River junction.
	507	Cumberland	Cumberland River at Ohio River junction.
	601	Upper Tennessee	Tennessee River at South Pittsburg, TN
	602	Lower Tennessee	Tennessee River at Ohio River junction.
Mississippi	701	Minnesota-Mississippi-St. Croix	Mississippi River at Prescott, WI
	702	Chippewa-Mississippi-Wisconsin	Mississippi River at Wisconsin river junction.
	703	Mississippi to Quad Cities	Mississippi River at Keokuk, IA, and Des Moines River at Keosauqua, IA
	704	Mississippi-Illinois	Mississippi River immediately above Missouri River (Alton, ID)
	705	Mississippi-Kankaskia-St. Louis	Mississippi River immediately above Ohio River (Thebes, ID)
Souris-Red-Rainy	901	Souris-Red-Rainy	U.S.-Canadian Border (all discharge points).
Missouri	1001	Missouri-Poplar-Milk	Missouri River near Culbertson, MT
	1002	Missouri headwaters to Marias	Missouri River at Virgelle, MT
	1003	Missouri-Musselshell	Missouri River below Fort Peck Dam, MT
	1004	Yellowstone-Bighorn-Powder	Yellowstone River at Missouri River junction (Sidney, MT)
	1005	Little Missouri-Cheyenne-White to Oahe	Missouri River below Ft. Randall, SD

TABLE E-1
WATER RESOURCES COUNCIL AGGREGATED SUBREGIONS (CONCLUDED)

Region	Aggregated Subregion (ASR)	Basin	Discharge Point(s)
Missouri (concluded)	1006	James-Missouri-Big Sioux	Missouri River at Sioux City, IA
	1007	Upper Platte Basins	North Platte River at Lewellen, NE and South Platte River atJulienburg, CO
	1008	Niobrara-Loup-Platte-Elkhorn	Platte River at Louisville, NE, Niobrara River, Verdel, NE
	1009	Missouri-Sioux City to Kansas City	Missouri River at Kansas City, MO minus Kansas River at Bonner Springs, KS
	1010	Republican-Smokey Hill-Blue-Kansas	Kansas River immediately above Missouri River (Bonner Springs, KS)
	1011	Grand-Charitan-Osage-Gesconde-Missouri	Missouri River above Mississippi River Junction (Herman, MO)
	1101	White	White River at Black River junction (Newport, AR)
	1102	Upper Arkansas	Arkansas River near Coolidge, KS
	1103	Cimarron-Arkansas to Keystone	Arkansas River at Cimarron River junction (Tulsa, OK)
	1104	Verdigris-Neosho-Lower Arkansas	Arkansas River at Little Rock, AR
Arkansas-White-Red	1105	Canadian	Canadian River near Whitefield, OK
	1106	Red-Washita	Red River at Dennison Dam, TX
	1107	Lower Red	Red River at Alexandria, LA
	1201	Sabine-Neches	Gulf of Mexico
	1202	Trinity-San Jacinto	Gulf of Mexico
	1203	Brazos	Brazos River near Juliff, TX
	1204	Colorado	Gulf of Mexico
Texas-Gulf	1205	Navidad-Lavaca-Guadalupe-Mission-Nueces	Gulf of Mexico
	1401	Green-Yampa-White	Green River immediately above Colorado River junction (Green River, UT)
	1402	Gunnison-Colorado-Dolores	Colorado River immediately above Green River junction (near Cisco, UT)
	1403	San Juan-Colorado	Colorado River at Lee's Ferry, AZ
Upper Colorado

TABLE E-12

FOOTNOTES FOR WATER FLOW DATA IN TABLES E-2 THROUGH E-11

- (a) Total Stream Flow is an estimate of the stream flow that would be observed without any upstream consumption or groundwater mining, but with evaporation, imports, and exports continuing as at present. It is computed for the discharge point of the aggregated sub-region (ASR most closely corresponding to the coal region). The 95% flow represents a low flow that is likely to occur during 5 out of 100 years (or months).
- (b) Consumptive surface water requirements are the projected water requirements for all areas upstream of the discharge point(s) of the ASR(s), including estimated increased evaporation from new impoundments and any changes in inter-basin exports. The actual amount of water consumed during a particular year may be less than the indicated requirements due to such factors as insufficient supplies at specific points within the region, unavailability of water of sufficient quality, and operator error or mechanical failure during diversion. Additionally, during periods of below-normal rainfall, irrigation demands could be greater than those projected.
- (c) Calculated Flow is the difference between total stream flow and the consumptive requirements for both average and low flow conditions. The calculated flow for 1975 is the estimated current stream flow (as adjusted by the WBC) minus the estimated contribution of groundwater mining. Negative flows indicate water shortages that would have to be borne by water users. Positive flows do not necessarily imply that the water is available for use. The actual availability depends on such factors as minimum in-stream requirements, water quality, and water law as determined by each state and by compacts between the states (see text).
- (d) Annual totals may not equal the sum of the individual months due to accumulated round-off error.

APPENDIX H

IMPACT ESTIMATION METHODOLOGY

APPENDIX H

IMPACT ESTIMATION METHODOLOGY

H.1 INTRODUCTION

The Department of Energy's (DOE) National Coal Model (NCM) is designed to forecast coal production, consumption, and prices and to analyze coal-related public policy issues. It generates equilibrium solutions through a linear programming model which balances the supply and demand for coal at minimum cost. The model has a high degree of resolution with 30 supply regions, 35 demand regions, up to 40 possible coal types, and six consuming sectors. The model is capable of making both short-term and long-term annual projections under a variety of policy alternatives because it is demand driven. This means that users of the model have the capability of changing such factors as region specifications, assumed inflation rates, or assumed growth rates in electricity sales through modifications in the data base. Such factors are not a part of the model's structure. This built-in flexibility and high degree of resolution allows users to address public policy issues with a great deal of precision because the model can be tailored for the analysis to be done. In addition, the model offers analysts the capability of performing the sensitivity analyses needed to gauge the uncertainty surrounding a forecast [1].

The NCM has been used as the point of departure for determining the levels of activity in the various phases of the coal cycle.

An allocation algorithm has been employed to adjust the NCM outputs for use in the present analysis. This algorithm: (1) translates the 30 NCM coal production areas and 35 consumption areas to 41 production areas and 53 consumption areas; and (2) estimates interregional flows from the 41 production areas to the 53 consumption areas utilized in this environmental impact statement. This algorithm is further described in Section H.2.

The third analytical tool employed in the impact analysis of this chapter is a computerized program developed for this environmental impact statement, the Coal Impact Estimation Program

(CIEP). A detailed description of this program is presented in Section H.3.

H.2 COAL PRODUCTION AND DEMAND PROJECTIONS

H.2.1 DOE Projections (Demand Assumptions)

Three coal production levels were used to specify the DOE National Coal Model demand values—low, mid-range, and high. The level titles relate to expected coal consumption and the demand for western coal. Model runs for each level were made by DOE for 1985 and 1990, giving six possible level/year combinations. The levels relate to values assumed for each of the following parameters:

- Crude oil prices and availability.
- Gas prices and availability.
- Coal labor costs.
- Coal transportation costs.
- Electricity demand growth rates.
- Nuclear capacity.
- Air pollution control regulations and scrubber costs.
- Coal conversion regulations and industrial coal consumption.
- Synthetic fuel production.
- Local coal provisions.
- Federal leasing assumptions.

The level of each parameter is based upon assumptions described below. Tables H-1 and H-2 summarize the assumptions for each of the three levels for 1985 and 1990, respectively.

H.2.1.1 Crude Oil Prices and Availability. The oil prices for the 1985 low level were developed from the Project Independence Evaluation System (PIES) forecasting model. This forecast assumed crude oil at \$13 per barrel (1975 dollars). From this price, it was then forecast that prices for 0.9 percent sulfur residual oil in Texas would be \$2.30 per million Btu, while distillate would be \$2.70 per million Btu.

TABLE H-1

ASSUMPTIONS FOR
DOE'S 1985 REGIONAL COAL PRODUCTION LEVELS

	High	Mid- Range	Low
1. Crude Oil Prices in 1985 (\$1975)	\$20/bbl	\$15/bbl	\$13/bbl
2. Gas Prices in 1985 (\$1975)	Same as mid-range	Senate conferees proposal	Continuation of existing regulations
3. Coal Labor Costs	Same as mid-range except 2%/yr. real escalation after 1980	UMW settlement with 1%/yr. real escalation in the post-1980 period	Same as mid-range except zero real escalation after 1980
4. Transportation Costs	Same as mid-range	Current ICC rates escalated for inflation	1%/yr. real escalation over current rates
5. Electricity Growth Rate (1977-1985)	NERC forecast (5.8%/yr.)	4.6%/yr.	3.5%/yr.
6. Nuclear Capacity (1985)	101 GW	97 GW	84 GW
7. Environmental Regulations			
• Utilities	Same as mid-range	• 85% FGD in the East • 60% FGD on low sulfur coal	• 90% FGD on all new plants
• Industry	Same as mid-range	FGD on all new boilers greater than 25 MW	FGD on all new boilers greater than 5 MW

H.2.1.2 Gas Prices and Availability. Gas prices for the low levels (1985 and 1990) assumed a continuation of existing regulations. Prices and availabilities for 1985 were based on PIES forecast model output. Prices and availabilities for 1990 were based on the PIES mid-range trendlong level (Series C) with natural gas regulations and \$13 per barrel oil (1975 dollars).

H.2.1.3 Coal Labor Costs. The mid-range levels (1985 and 1990) incorporated the terms of a recent United Mine Workers Association (UMWA) settlement. In addition, they assumed a real escalation in labor costs of one percent per year in the post-1980 period. The low level (1985 and 1990) was the same as the mid-range, except there was no labor cost escalation after 1980. The high level alternatives (1985 and 1990) were the same as the mid-range, except that there was a two percent annual real escalation in labor costs after 1980.

H.2.1.4 Coal Transportation Costs. The mid-range and high levels (1985 and 1990) reflect 1977 current Interstate Commerce Commission (ICC) rates, escalated at the assumed general inflation rate of 5.5 percent. The low case reflects 1977 ICC rates with a one percent annual real escalation.

H.2.1.5 Electricity Demand Growth Rates. Electricity growth rates for each level were as follows (percent/year):

	Low	Mid-Range	High
1975-85	4.0	4.8	5.8
1985-90	3.5	4.0	4.5

For the 1985 mid-range levels, the regional distributions were developed from PIES Model Forecast 5, which had a 4.82 percent average national growth rate. The growth rate for each PIES region was assigned to each of the component U.S. Census regions. Where U.S. Census regions overlapped PIES regions, the growth rate for the U.S. Census region was developed as a weighted average.

The 1985 high level was based on the National Electric Reliability Council (NERC) forecast, which assumed an annual growth rate of 5.8 percent. This distribution was also based on NERC data, and in some cases was quite different from the PIES regional growth patterns.

The 1985 low alternative was developed from the mid-range level by scaling down the growth

rates. This was done in two steps. First, each region's growth rate was scaled down by dividing by the ratio of the national growth rates; e.g., 4.82 percent/4.0 percent = 1.205. These new regional growth rates were then applied to the 1975 regional sales to project 1985 sales by region. The national total and implied growth rates were then computed. Since this national growth rate was slightly different than the 4.0 percent target, a second iteration was required. The new national growth rate was divided by 4.0 percent, and the quotient was divided into the regional growth rates. This process can be iterated until the national growth rate is not significantly different from the target of 4.0 percent.

The 1990 electricity demands were developed in a manner similar to that used in the 1985 low level. For the mid-range alternative, the 1985 mid-range regional totals were extended to 1990 by extrapolating regional growth rate by a factor of 1.205. The national total was computed and implicit growth rate determined. This new national growth rate was used as a base for a second iteration on changing the regional growth rates, and the process was repeated until the national growth rate of 4.0 percent was reached.

For the 1990 low and high levels, the process was the same. For each, the 1985 low and high regional totals were used as a base, and the growth rates scaled by the ratio of the 1985 national rate to the 1990 target national rate. The process was repeated until the national growth rates of 3.5 and 4.5 percent were reached.

H.2.1.6 Nuclear Capacity. Nuclear generating capacity for these levels was as follows (in gigawatts):

	Low	Mid-Range	High
1985	84	97	101
1990	150	167	181

These capacity data were provided by Reference 2.

H.2.1.7 Air Pollution Control Regulations.

Best Available Control Technology (BACT) is defined as 90 percent SO₂ removal, except that partial scrubbing would be permitted if annual average SO₂ emissions were reduced to a specified floor:

Level	Floor	(lb. SO ₂ /MBtu)
Low-Range		0.2
Mid-Range		0.5
High-Range		0.5

The industrial BACT regulations vary by level as follows. All industrial facilities with greater than 25 MWe capacity are subject to the regulations in the high and mid-range alternatives. Industrial facilities with capacity of five MWe or greater are subject to BACT regulations in the low range level. These regulations were addressed in the industrial demand estimates [3].

H.2.1.8 Coal Conversion Regulations and Industrial Coal Consumption. For utilities, the low level assumed a continuation of existing regulations. Combined cycle systems were allowed anywhere. The mid-range and high levels assumed the regulatory program passed by the Conference Committee. Combined cycle systems were prohibited everywhere except in southern California.

Industrial coal demand estimates for 1985 reflected the sum of baseline demand and incremental coal demand stimulated by alternative regulatory and incentive programs. The sources and assumptions for the baseline and coal conversion estimates were summarized for each level below.

Level	Baseline Demand	Coal Conversion
High-Range	Same as mid-range.	Same as mid-range.
Mid-Range	PIES Mid-Range/Trendlong, Level (1/14/78).	Boiler only oil/gas user tax and Conference regulatory bill.
Low-Range	PIES Mid-Range/Trendlong, Level (1/14/78).	Existing regulations

1985 demand estimates by NCM region were provided for two sulfur classes and two ranks (bituminous and subbituminous)[3].

H.2.1.9 Synthetic Fuel Production. Coal demand for synthetics was based on DOE estimates. These estimates indicate demand (in 10¹² Btu) by end-product (liquefaction, high-Btu gas, medium-Btu gas), NCM demand region, coal-type (bituminous

– 11,000 Btu/lb, subbituminous – 9,000 Btu/lb, lignite – 7,000 Btu/lb), year (1985 and 1990), and level (low, medium, high). Two adjustments were made to the original estimates. First, demand was aggregated across end-products, resulting in a single "synthetics" demand category. Second, demand from regions AN, KN, and TX were attributed to the coal-type most prevalent, so that each region is demanding only one coal-type (see Table H-3).

H.2.1.10 Local Coal Provisions. The Clean Air Act Amendments of 1977 included a "local coal" provision (now Section 125 of the Act), which would permit, under certain conditions, an order that locally or regionally available coal be used to comply with SIP requirements. This provision was not considered.

H.2.1.11 Federal Leasing Assumptions. For all three levels in both 1985 and 1990, it was assumed that the Federal government would lease enough coal reserves such that the reserves cheapest to mine (regardless of ownership) would be mined first. This assumption has the effect of minimizing total national costs of coal production, transportation, and consumption.

H.2.2 Department of the Interior Production Projections

The establishment of production levels for this environmental statement was not based on any one computer run, forecasting model, or other single mechanical procedure. There was no one authoritative set of future projections or even method of projection readily available; hence, judgmental decisions were necessary. Accordingly, a number of sources of information were considered in forming these judgments. These sources include:

- Department of Energy projections.
- Preliminary Department of the Interior regional environmental impact statements.
- Coal industry and government forecasts.
- Approved and pending mine plans.
- Current production levels.
- Contractually obligated production.

Based on these factors, the production levels shown in Tables H-4 and H-5 were developed. The broadest basis for the state-by-state production estimates embodied in the preferred program is found in the DOE coal production forecasts. Those

forecasts were then modified to reflect the regional configuration adapted for this ES. Insofar as coal flows and production levels in the DOE-furnished data required modification, these modifications were held to a minimum to avoid distortion of the production and distribution pattern. Where necessary, coal flows were allocated to specific destination regions on the basis of population, generation capacity, and industrial demand. Precision at the level of tenths of a point (equivalent to 100,000 tons) does not have much absolute meaning. Such small changes in production levels are most significant in indicating expected relative changes in production levels among regions and, within a region, the expected direction of change in production from one alternative to another. Table H-6 contains a regional list of all counties considered during the impact analyses of Chapters 5 and 7. It should be noted that the counties listed in Table H-6 vary slightly from the counties delineated in the regions of Figure 1-1. For a county listing of Figure 1-1 counties, refer to Appendix J, Table J-1.

H.2.3 Allocation Algorithm and Constraints

The objective of the algorithm is to generate estimates of production and consumption on a regional basis when only limited information is provided about western coal production levels. The algorithm utilizes an origin/destination (O/D) coal flow matrix upon which are superimposed predetermined western coal production levels. The contents of the O/D matrices are reallocated so that regional energy demands are satisfied and the level of coal consumption for each region is identified. This is done for each Federal coal management program alternative being considered. The algorithm uses a translation of the 30 NCM coal production areas and 35 consumption areas (see Table H-7). The NCM regions are translated to 41 production areas and 53 consumption areas in this ES (see Table H-8).

The 35 NCM demand (consumption) areas consist primarily of multistate areas. For example, the States of Alabama and Mississippi are combined to form the NCM consumption area "AM". It was necessary to disaggregate this demand region to its component states in order to more accurately portray production, transportation, and consumption impacts.

Coal flows into multistate consuming areas were allocated among the individual states on the

basis of population, projected level of coal demand by energy conversion facilities, and existing patterns of coal consumption by industry and steam electric generation capacity. Specific data sources used for the disaggregation and allocation of coal flows included References 4, 5, and 6.

For example, in the specific case of Alabama and Mississippi, it was determined that, on the basis of the data sources and judgmental factors listed, the flows of coal into the NCM area would be distributed 95 percent to Alabama and five percent to Mississippi.

The major assumptions incorporated in the "Allocate" algorithm governing consumption levels include:

- Fixed Btu demand within consuming areas. The level selected reflects national production at a low, medium, or high level.
- Coal flows (in Btus) remain constant for intrastate shipments.
- Tonnage levels of coal flows from origin to destination vary based upon a representative heat value for coal in the producing state.

For each Federal coal management program alternative analyzed, consumption expressed as a demand for energy (heat value equivalent) was assumed to be fixed and represented a particular mix of energy using facilities within a consuming region (consistent with the NCM assumptions).

The assumption of coal flows remaining constant on an intrastate basis was made to incorporate the fact that local coal supplies represent a least cost source of coal. If, under a given program alternative, coal production levels for a particular state decrease by a given percentage, only the levels of coal leaving the state would be reduced.

Under the various production levels and alternate leasing programs analyzed, specific levels of coal flows vary. Reduced flows from one producing area would be offset by increased flow from other areas. The heat value in millions of Btu per ton (MBtu/ton) of coal varies from mine to mine and from state to state. The actual tonnage flows from substitute producing states would be weighted by their relative average heat value. Accordingly, if the heat value per ton of coal from a substitute state is higher than the original supplying state, the actual tonnage flow from the substitute state would be lower.

The allocation algorithm utilizes a multiplier concept to convert projected DOE production levels in western coal supply areas to the projected production level of each program alternative. By prespecifying coal production levels in each western region, and allowing production levels in non-western areas to "float" in response to the level of unsatisfied Btu demands in each consuming state, a new origin/destination matrix of coal tonnage flows was generated. When western coal production was constrained, demand was shifted to eastern producing areas. Since eastern coal has generally higher Btu content, the actual tonnage flows from the substitute supply states are directly proportional (on a MBtu/ton basis) with the preconstrained flows from the original supply state. The new O/D matrices were also used to estimate coal consumption in each coal demand area for each alternative. Domestic coal consumption was estimated by subtracting DOE projected coal exports from designated exporting states. In developing the "Allocate" algorithm, the following assumptions were used:

1.) The weighted MBtu/ton values were determined by using the heat value of each NCM coal category (see Table H-9).

2.) The following heat-value categories are defined in the NCM.

Coal Category	MBtu/Ton	Assumed MBtu/Ton
Z	26	26
H	23-25.99	24.5
M	20-22.99	21.5
S	15-19.99	17.5
L	15	15

3.) Total tonnage shipped (by category) for each producing state was determined and expressed as a percent of total coal produced in that state.

4.) The category percentages were then multiplied by the MBtu/ton value for each coal category. The multiplication products were then summed to obtain a weighted MBtu/ton value for all coal shipments from a given state, as in Table H-10

5.) Western coal region production levels were determined exogenous to "Allocate". These levels were fixed and the output of the remaining coal

producing areas allowed to "float" in response to fixed Btu demand levels in each consuming area.

H.2.4 Transportation Assumptions (Modal Split)

The assumption was made that the majority of interstate coal movements would be by rail while a smaller volume of intrastate shipments would be transported in this way. The remainder of the intrastate movements would move by barge, highway, or slurry pipeline, depending on existing and projected transportation facilities of these types. Specific modal split information is presented in Table H-11.

Due to the dynamic nature of coal transportation, incorporation of the transportation sector in the analysis requires a methodological approach recognizing the inherent differences between static processes and dynamic flows. In contrast to the other phases of the coal cycle (i.e., production and consumption), the characterization of coal flows in terms of tonnage does not result in a clear presentation of environmental impacts. The measure chosen to determine transportation environmental impact factors is gross ton-miles generated as a result of transporting coal. In this context, gross ton-miles consists of the following components:

- Net ton-miles - weight of coal times distance moved.
- Tare ton-miles - weight of transportation equipment utilized times round trip distance from mine to destination and return.

The inclusion of tare weight recognizes the fact that trains, trucks, and barges which haul coal also generate environmental impacts during the return trip to the coal mine or loading facility. Within this context, the following additional assumptions were used:

- 1.) Modal Split Assumptions - Gross Ton-Mile Estimation (see Figure H-1)
- 2.) Interstate Coal Flows - Total gross ton-miles were calculated on the basis of 100 percent movement by rail. This estimate was then adjusted for 1976 waterway coal transport as a percent of total coal moved. (Waterway transport was deducted from total gross ton-miles), and total slurry pipeline net ton mileage added to gross ton-mile estimates to obtain a revised estimate of gross ton-miles.
- 3.) Intrastate Coal Flows

(a) Gross ton-milage estimates presented here represent the sum of gross ton-mileage for rail, truck and waterway transport plus net ton-mileage of slurry pipeline transport.

Source: Reference Number 19.

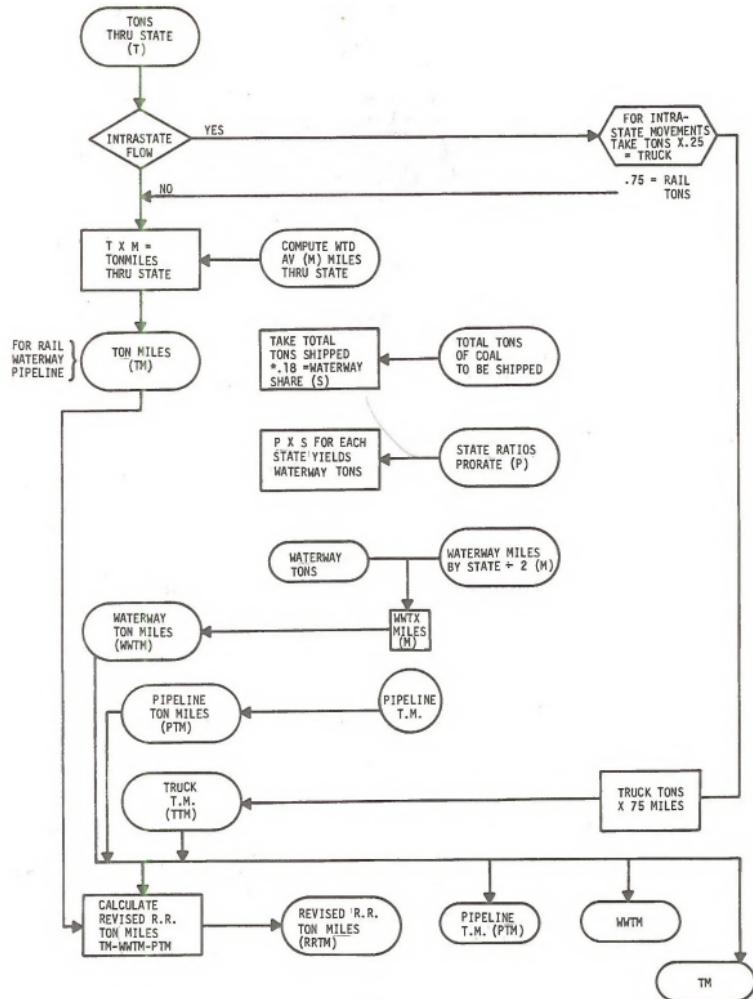

FIGURE H-1
TRANSPORTATION MATRIX-METHODOLOGY (MODAL SPLITS)

- 75 percent moved by rail
- 12 percent moved by truck - average truck haul assumed to be 20 tons moved over 75 mile distance.
- 13 percent minemouth utilization
- Barge transport estimate of gross ton-mileage based on same rationale as interstate flows.
- Slurry pipelines - constant quantity of coal transported for all alternatives analyzed.
- Rail haul distance between origin and destination (intrastate and interstate) assumed to be 1.15 times short line distance to account for rail line circuitry.

H.2.4.1 Ton Mile Analysis - 1985 DOE Mid-level Consumption Estimates. The methodology developed to estimate the base case level of gross ton-mile per state consists of:

- 1) Identification of a representative origin/destination matrix for the 1985 DOE mid-level coal flows.
- 2) Identifying all coal flows, probable routes, and length of route within each state between origin and destination.
- 3) Calculation of number of trips and coal tonnage flows within each state.
- 4) Combination of coal flow, distance, and transport mode information.
- 5) Estimation of gross ton-mileage generated per state for the consumption level represented in the origin/destination matrix used.

Estimates of gross ton-mileage per state are presented in Table H-12.

The distribution of gross ton-mileage per state for each program alternative was determined on the following basis:

- The 1985 DOE mid-level coal production consumption used was the base case.
- Production/consumption for each alternative was derived through use of the "Allocate" program. This production/consumption was then divided by the base case to produce a unique ratio for each alternative. Table H-13 presents the calculated ratios for each alternative.
- Base case gross ton-mileage (by mode of transport within each consuming region) was then multiplied by the ratio to obtain revised estimates of gross ton-mileage for each program alternative.

H.3 COAL IMPACT ESTIMATION PROGRAM.

In order to identify and evaluate nationwide coal cycle impacts on a quantitative basis for a range of alternative Federal coal management programs, a computerized analytical tool (the CIEP) has been developed. The CIEP consists of the following major modules:

- Main Impact Estimation Module.
- Socioeconomic Impact Estimation Module
- Ecological Impact Estimation Module

H.3.1 Main Impact Estimation Module.

The five major classes of input information required to operate the Main Impact Estimation Module are:

- Production levels
- Transportation levels
- Consumption levels
- Coal cycle flow distribution
- Environmental loading factors

Coal production, transportation, and consumption estimates for each region of the country are input to the routine to produce numerical estimates of the major environmental impact factors. This is done by expressing coal production, transportation, and consumption levels as flows through the coal cycle. Once quantities of coal flowing into each phase of the coal cycle are calculated (based on percent distribution) for each geographic area, the environmental loading factors are then applied.

H.3.1.1 Production Levels. Production input flows in 100,000 ton units of coal are first divided between surface and underground mining by the application of percent distribution levels. Then the resulting quantities are multiplied by a loading factor to generate impact factors from mining operations. Also, the production input flows are divided between crushing and screening and mechanical cleaning by the application of percent distribution levels. The resulting quantities are then multiplied by a loading factor to generate impact factors from coal cleaning operations. These factors are added to generate total impact factors resulting from production input flows or are stored to be added to factors generated from the other phases of the coal cycle (see Figure H-2).

H.3.1.2 Transportation Levels. Transportation input flows in billion gross ton-miles of coal transported

**SUMMARY OF TRANSPORTATION STATISTICS

Total	72,338	101,596	583,694	5,140	103,657	103,657	10,487	(e)	(e)	69	6,184	2,890	19,763	3,900

(a) Since most of Kentucky's coal moves via waterway, using railroad net ton-miles to estimate waterway ton-miles understated ton-miles since waterway traffic is 26 percent more circuitous than rail. Railroad ton-miles have been increased by 26 percent for Kentucky.

(b) Assume zero rail ton-miles.

(c) Assume all pipeline.

(d) Insignificant value equals 0.1.

(e) Since tons are unique to a shipment and not a state, tons for rail and barge cannot be added since this would involve double counting. The same ton moves through all states on its route.

Source: Reference Number 19.

TABLE H-13
RATIOS USED IN TRANSPORTATION^(a)

ALTERNATIVES	1976	1985			1990		
		LOW	MED.	HIGH	LOW	MED.	HIGH
Baseline Year	0.592

State Determination				1.005		1.362	
Preferred		0.871	0.996	1.093	0.897	1.397	1.745

(a) Ratios based on estimate done for 1985 DOE Mid-level transportation values by R.L. Banks and Associates, Inc. Ratios derived by adding total production and consumption tonnage per year for each alternative and dividing by the same total for 1985 DOE Mid-level Alternative.

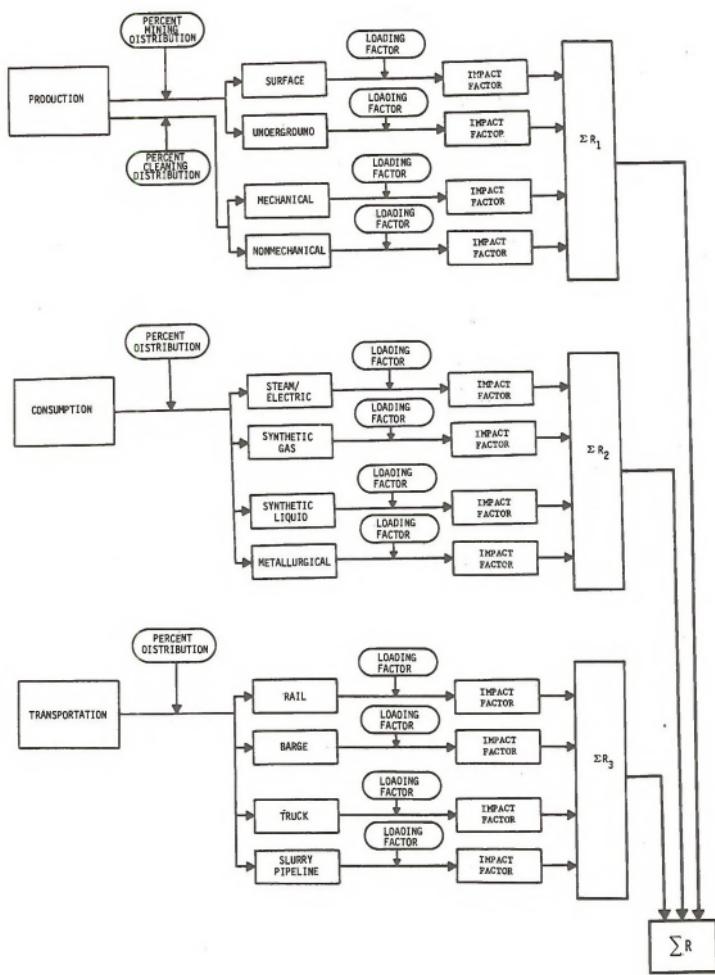

FIGURE H-2
PAIN IMPACT ESTIMATION MODULE (IMPACT FACTOR ESTIMATOR)

are first divided among rail, barge, truck, and slurry pipeline modes by the application of percent distribution levels. Then the resulting quantities are multiplied by a loading factor to generate impact factors from transportation activities. These factors are added to generate total impact factors resulting from transportation input flows or are stored to be added to factors generated from the other phases of the coal cycle.

H.3.1.3 Consumption Levels. Consumption input flows in 100,000 ton units of coal are first divided among steam/electric, synthetic gas, synthetic liquid, and metallurgical use by the application of percent distribution levels. Then the resulting quantities are multiplied by a loading factor to generate impact factors from conversion activities. These impact factors are added to generate total impact factors resulting from conversion input flows or are stored to be added to impact factors generated from the other phases of the coal cycle. Similar impact factors generated from production, transportation, and consumption activities are then added to generate total impact factors resulting from the coal development activity.

H.3.2 Socioeconomic Impact Estimation Module

The Socioeconomic Impact Estimation Module uses estimates of direct construction and direct operating workers generated by the Main Impact Estimation Module and applies employment multipliers to generate estimates of indirect workers. Then the indirect workers are split into married and single components by means of a percent multiplier. The married component is then multiplied by the family size multiplier to generate married workers and dependents. To that, the single component is added to arrive at workers and dependents associated with direct construction workers (see Figure H-3). Similarly the module processes direct operation workers to generate estimates of indirect workers and dependents.

The four separate worker and dependent components are then summed to arrive at a total worker and dependent population. Total population is then multiplied by rates of services and facilities required per 1,000 population to derive estimates of:

- Public school children.
- Physicians.
- Hospitals.

- Housing units.
- Water treatment (mgd).
- Sewerage treatment (mgd).
- Solid waste generated.
- Policemen.
- Firemen.

Teachers are calculated by applying pupil/teacher ratios to public school children. Then, the services and facilities are multiplied by fiscal multipliers to arrive at fiscal requirements on a regional basis.

H.3.3 Ecological Impact Estimation Module

The Ecological Impact Estimation Module uses acreage disturbed throughout the coal cycle, on both a long term and a short term basis, generated in the Main Impact Estimation Module, and applies percent multipliers to estimate acres disturbed by land use category. Acreages disturbed by category (other than cropland) are multiplied by productivity multipliers to generate estimates of natural vegetation (forest, range) lost. Croplands disturbed are multiplied by a percent multiplier to generate estimates of acreage, by crop, such as corn, soybeans, cotton, wheat, oats, and sugarbeets. Each of the agricultural product estimates is multiplied by productivity estimates to generate estimates of the losses in primary productivity such as bushels of corn forgone per acre disturbed (see Figure H-4).

Density multipliers are also used to generate potential decreases in wildlife populations. With the exception of big game (excluding white-tailed deer), other wildlife are assumed to be equally distributed over the entire area disturbed. As such, density multipliers are multiplied by total land disturbed to give potential decreases in small mammal, bird, predator, amphibian/reptile, and deer populations. Estimates of range and pasture disturbed are multiplied by density multipliers to give potential decreases in mule deer and antelope populations, while estimates of forest and wetlands are multiplied by density multipliers to give potential decreases in moose and elk populations.

H.4 ENVIRONMENTAL LOADING FACTORS

The methodology described in Section 5.1 uses "environmental loading factors" to identify and quantify environmental impact factors associated with coal extraction, preparation, transportation,

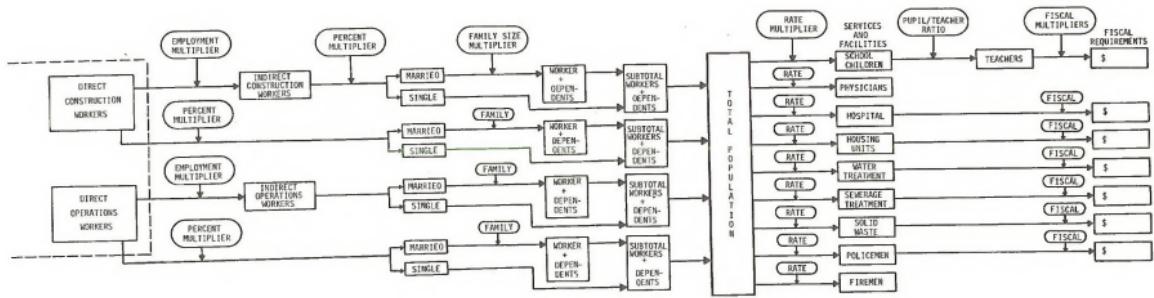

FIGURE H-3
SOCIOECONOMIC ESTIMATION PROFILE

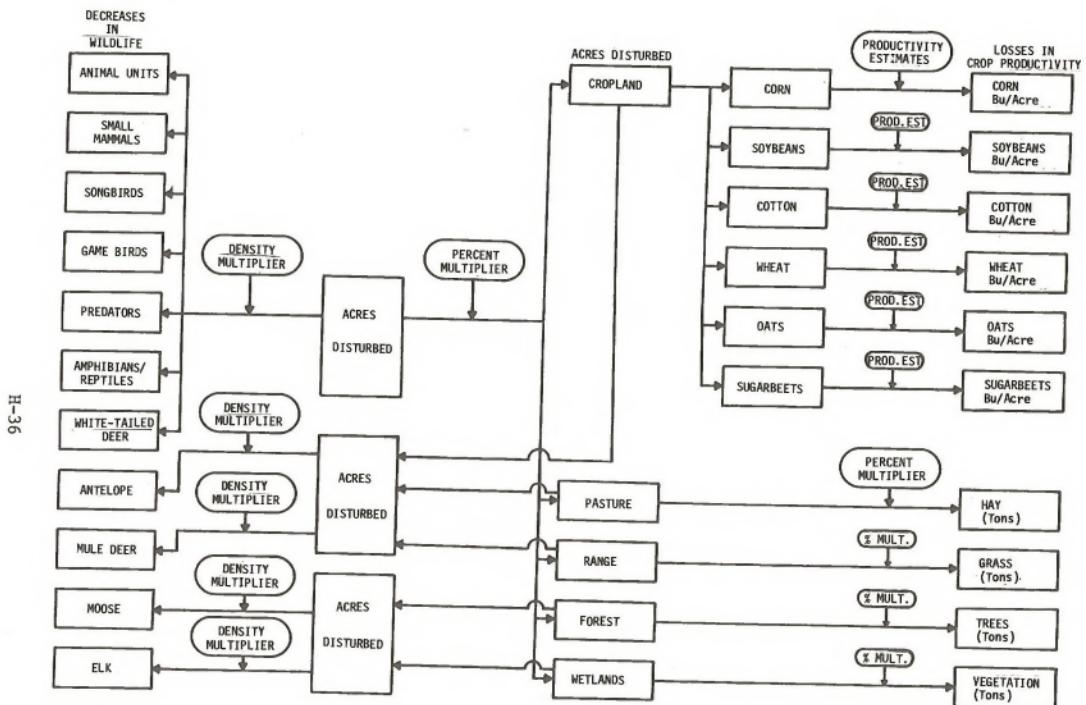

FIGURE H-4

ECOLOGICAL ESTIMATION SUBROUTINE

and conversion. These loading factors relate specific impacts to 100,000-ton units of coal. This approach was used in all coal cycle phases with the exception of transportation. In the transportation sector, impacts were estimated on the frequency of occurrence per billion gross ton-miles travelled. By expressing all impacts in terms of tons of coal, estimation of impact factors can be readily accomplished once a coal production level is determined.

Tables H-14 to H-66 present the environmental loading factors which were applied to flows of coal in the particular geographic units assessed in this ES. In states where no coal production occurred, (e.g., Florida) the production coal flows equaled zero. The transportation and conversion flows were positive, thus resulting in positive impact factors when the appropriate loading factor was applied. The following examples illustrate how the environmental, socioeconomic, and ecologic loading factors were derived.

Environmental loading factors used as input to the Main Impact Estimation Module were generated for 17 major categories for the 53 geographic regions defining the United States (41 producing regions, overlain with 53 consuming regions). Additional multipliers were also generated for a broad range of social, economic, and environmental parameters estimated in the socioeconomic and landloss modules. The environmental loading factors are derived from various literature sources and then multiplied by input data for production, transportation, and conversion to produce impact factors (e.g., impact factors = Flow x Percent x Loading Factor). The following are examples of impact factors developed by the Main Impact Estimation Module.

H.4.1 Total Suspended Particulates (TSP)

The loading factor for particulate (TSP) emissions from crushing and screening operations is 24 pounds of particulate per ton coal cleaned without control devices.¹ By assuming 99 percent control efficiency, the loading factor would be 12 tons/100,000 tons. For example in Colorado, Uinta-Southwestern Utah Coal Region:

¹Derived from U.S. Environmental Protection Agency, [7].

²DOE needs alternative, medium production level.

³DOE mid-level.

	1976 ²	1985 ²	1990 ²
Annual coal production in Colorado (in 100,000 tons)	21.7	43	77
Percent coal cleaned (crushing and screening)	71.9	71.9	71.9
Loading factors tons/100,000 tons	12	12	12
Annual TSP emitted from crushing and screening in tons	188	371	664

H.4.2 Direct Construction Workers

For surface mine construction workers in Colorado, Uinta-Southwestern Utah Coal Region, the impact factors are calculated:

	1976 ³	1985 ³	1990 ³
Annual coal production × 10 ⁶ tons	21.7	43	77
Percent coal mined by surface methods	0	42	19
Loading factors tons/10 ⁶ tons	3.21	3.21	3.21
Numbers of workers required for surface mining	0	58	47

The loading factor is based on peak employment during construction of a 5.6 million ton per year mine and is estimated to be 180 workers.⁴ Output of the mine divided into number of workers produces estimates of construction workers per 100,000-ton capacity. This would be 180 divided by ((5.6 times 10⁶) divided by 105) which equals 3.21⁴.

H.4.3 Direct Operation Workers

The annualized loading factor for underground mine operators in the Colorado portion of the Uinta-Southwestern Utah Coal Region is 19.7.⁵ Multiplying this factor by the coal production flow results in the following calculation:

	1985 ⁶
Annual coal production in Colorado in 100,000 tons	43
Percent mined underground	58
Loading factor in workers/10 ⁶ tons	19.7
Underground miners in Colorado	491

Applying this same methodology to the direct construction worker loading factor of 4.8 yields 120 underground direct construction workers for

⁴Toman et al., 1976.[25]

⁵Derived from U.S. ERDA [8]

⁶DOE mid-level.

IMPACT ESTIMATION METHODOLOGY

this region. These operation and construction worker numbers provide the basis for calculating total population by using the Socioeconomic Impact Estimation Subroutine. Specifically, assuming 1.4 indirect workers per direct worker, a 75 percent married workforce, and a 2.5 person average family size,⁷ the following estimates are made.

Underground Workers	Workers and Dependents
Direct operation	491
Direct construction	120
Indirect operation	687
Indirect construction	168
Total	3,116

This results in a population of 3,116 related to underground mining in Colorado, Uinta-Southwestern Utah Coal Region, for the 1985 DOE mid-level production. When these assumptions and methodologies are applied to all phases of the coal cycle, the total population in the region related to coal production amounts to 7,058.

Remaining socioeconomic characteristics are estimated per 1,000 population units. For example:

Total population	-	7,058
Policemen required per 1,000 population	-	2.1
Total policemen required	-	15

Similar calculations are shown in Table H-67 for other socioeconomic variables. It should be noted that numbers tabulated in other sections of this report may vary slightly from this example since they are related to production level changes between 1976-1985 and 1985-1990.

H.4.4 Acreage Disturbed

Since specific locations for the various activities required for coal development were unknown, a land-use forecast was developed for each region and used as a tool to display potential impacts to the natural environment.

Loading factors (multipliers) for land disturbed to produce 100,000 tons of coal were developed as a function of acreage, coal seam thickness and average yield per acre-foot.

In Colorado, Uinta Southwestern Utah Coal Region, average coal seam thickness is 11 feet, and average yield is 1,750 tons per acre-foot of seam. This yields a multiplier of 5.2 acres for each

100,000 tons of coal required. In 1985, 94 acres would be disturbed per 100,000 tons of coal. This is obtained as follows:

Annual coal production in Colorado	
in 100,000 tons	43
Percent surface mined	42
Loading factor	5.2
Land disturbed short-term (acres)	94

When these assumptions and methodologies are applied to all phases of the coal cycle the total land disturbed (short-term) would be 156 acres.

These acreage-disturbed impact factors provide the basis for calculating the potential losses of plant and animal productivity by using the Ecological Impact Estimation Module.

Once the total number of acres for each time period was determined, a percentage was allocated to various land uses as presented in Table H-68. The assumption was made that development would occur in currently undeveloped or open areas, and not in urban or built-up areas.

Acres by land-use category were multiplied by productivity estimates (Table H-69) to determine potential losses due to land disturbance. Potential losses to wildlife due to habitat loss were determined by multiplying total acres disturbed for each time period by estimated population densities. (See Tables H-70 and H-71.)

As an illustration, 8,446 acres were estimated to be required for coal development in the Powder River Coal Region under the medium production level of the preferred alternative in 1985. Of this total, 455 acres (five percent) were allocated to cropland, 91 acres (one percent) to pasture, 7,463 acres (88 percent) to range, 73 acres (one percent) to forest, and 364 acres (four percent) to wetland or bottomland forest (see Table H-68). These numbers were analyzed outside the subroutine to allow for the entire time period under consideration.

Following this initial allocation, cropland was further divided into acres by crop, based on major crops grown in the states occurring in the region (see Table H-72) as follows:

Wheat	287 acres (63 percent)
Hay	150 acres (33 percent)
Oats	9.1 acres (2 percent)
Sugarbeets	4.6 acres (1 percent)

including their dependents are $368 \times 2.5 + 920$. Thus, the total of all workers (married and single) including their dependents is $920 + 123 = 1,043$.

⁷Derived from U.S. ERDA [7]

⁸75 percent of 491 is 368 married and 123 single. The married force

Denver-Raton Mesa	13	-	1	53	-	2	31

By multiplying acres by average yields per acre for the respective crops, (Table H-69), an estimate of the potential agricultural production loss can be determined.

Crop	Acres	Average Yield	Potential Loss
Wheat	287	26.2 bu/acre	7,520 bushels
Hay	241 ¹⁰	1.7 tons/acre	255 tons
Oats	9.1	43.0 bu/acre	391 bushels
Sugarbeets	4.6	19.5 tons/acre	90 tons

Similarly, by multiplying acres allocated to range and forest (upland and bottomland) by rate of potential production (Table H-69), productivity losses for natural ecosystems can be determined. (See Table H-73)

Potential loss of wildlife due to habitat loss was estimated by the module by multiplying typical population densities (Tables H-70 and H-71) by the number of acres disturbed. (See Table H-74.)

The above potential losses in natural and agricultural productivities and wildlife reflect the short-term effects due to total land conversion during 1985. To determine potential losses from 1976-1985, land disturbed by mining was multiplied by ten to give an estimate of total mining land required, and added to estimates of land required for coal cleaning and conversion industry. Actual losses would be determined by site-specific characteristics, and the acres actually subjected to the direct and indirect effects associated by specific activities.

H.5 DERIVATION OF ENVIRONMENTAL LOADING FACTORS

H.5.1 AIR EMISSIONS

H.5.1.1 Recovery and Extraction. The air emissions from mining 100,000 tons of coal were calculated as follows.

Air emissions from surface mining operations are generated from the use of diesel equipment. Emissions from underground mining operations are assumed to be negligible because of the wide use of electrical equipment. Table H-75 shows the air loading factors for the coal regions that were derived from U.S. Energy, Research, and Development Administration. [8]

H.5.1.2 Coal Cleaning (Beneficiation).

¹⁰Acres of pasture were assumed to be equal to hay in productivity; 241 acres reflects total of 150 acres allocated to hay production plus 91 acres allocated to pasture.

Coal cleaning is the process by which undesirable materials are removed from bituminous and anthracite coal and lignite. The coal is screened, classified, washed, and dried at coal preparation plants. The major sources of air pollution from these plants are the thermal dryers. The average particulate emissions are: 24 lb/ton of coal cleaned without control, and by assuming 99 percent control efficiency, particulate emissions would be 12 tons/100,000 tons of coal crushed and screened. For mechanically cleaned coals, the emission factor would be 18 tons/100,000 tons of coal cleaned. [7]

H.5.1.3 Transportation. The loading factors for coal transportation systems are based on gross ton-miles transported (which incorporates the coal weight plus weight of equipment; as well as the weight of equipment that returns empty). The next step in the methodology is to calculate total gross ton-miles on a state-by-state basis. This is accomplished through calculation of route lengths for origin/destination flows of coal. Total ton-miles per state were expressed on the basis of 10⁹ gross ton-miles. Multipliers were then calculated in terms of impacts generated per billion (10⁹) ton-miles.

Because of their widespread use, transportation facilities are responsible for a large share of air pollutant emissions in many areas of the United States. Typical unit train emissions have been estimated at 18.5, 6.5, and 4.7 pounds of nitrogen oxides, carbon monoxide, and hydrocarbon respectively, per train mile of travel (for long-haul rail) [7].

Similarly, emissions from tugs, trucks, and locomotives (short haul) are based on emission factors derived from U.S. Environmental Protection Agency [8]. These factors are listed in Table H-76. These numbers are converted into pounds per gross tons-miles transported.

H.5.1.4 Steam-Electric Power Plants. Coal is burned in a wide variety of furnaces to produce heat and steam. Coal-fired furnaces range in size from small, hand-fired units with capacities of 10 to 20 pounds of coal per day to large, pulverized coal-fired units which may burn 300 to 400 tons of coal per hour. Based on emission factors listed in

TABLE H-73
PRODUCTIVITY LOSSES FOR NATURAL ECOSYSTEMS

Vegetation	Acres	Rate of Production	Potential Loss
Range	7,463	6.7 Tons/Acre	50,000 Tons
Upland Forest	73	8.0 Tons/Acre	600 Tons
Bottomland (Forest-Wetland)	364	5.4 Tons/Acre	1,970 Tons

TABLE H-74
POTENTIAL LOSS OF WILDLIFE DUE TO HABITAT LOSS

Population	Estimated Density	Acres	Total Individuals Lost
Small Mammals	9 Individuals/Acre	8,446 ^(a)	76,000
Song Birds	1 Individual/Acre	8,446	8,400
Game Birds	0.03 Individual/Acre	8,446	250
Predators	0.002 Individual/Acre	8,446	17
Amphibians/Reptiles	2.5 Individual/Acre	8,446	2,100

TABLE H-76

AIR EMISSIONS FROM MODES OF TRANSPORTATION
(miles/gallon)

EMISSION	LONG-HAUL RAIL (DIESEL)	FEEDER RAIL	TRUCK	TUG
SO ₂	2.85(a)	0.57	0.0062	0.29
NO _x	18.5	3.7	0.04	3.0
CO	6.5	1.3	0.063	1.1
HC	4.7	0.94	0.01	0.54
TSP	1.25(a)	0.25	0.0029	0.011

Long-haul Rail - unit trains of 100 cars - 10,000 ton capacity.

Feeder Rail - 20 cars of 100 tons coal capacity each - 2,000 ton capacity. 0.1 miles/gallon was assumed.

Truck - 20 tons capacity highway trucks. 150 tons capacity short haul.

Tug - Barges - As many as 36 barges of 1,500 tons capacity each - 54,000 tons per trip and 0.09 miles/gallon used.

(a) Was assumed five times the Feeder Rail amount (five locomotives vs. one).

SOURCES: Reference Numbers 7 and 45.

Table H-77, the loading factors are found in Table H-78.

Steam-electric power plants are assumed to emit pollutants at a rate equivalent to the New Source Performance Standards (NSPS). This assumption is conservative, since NSPS are subject to revision and would presumably be made stricter as control technologies improve. Furthermore, the assumption that facilities emit at NSPS discounts the possibility that many plants may emit at a rate lower than regulations require, especially because of better coal characteristics. Therefore, estimates of the cumulative air impacts should be on the high side.

The emission factors for sulfur oxides and particulate for different geographic units are estimated based on coal characteristics listed in Table H-79.

H.5.1.5 Gasification and Liquefaction Processes. The two important sources of air emissions from coal conversion and combustion plants include:

- Process operations, and
- Auxiliary operations (operations that result in burning fuel).

Process operations occur in enclosed and pressurized systems and emissions from pump seals, joints and flanges, among others. The amount of such emissions would depend upon maintenance operations carried out on the systems, safety controls installed to prevent leakage, collection systems installed, and treatment of vent gases. Since commercial-scale plants have not yet been built in the United States, the information regarding the composition and the amount of some emissions is not readily available in the published data. However, it is assumed that under normal operations some emissions from process operations would not be significant as compared to emissions from auxiliary operations. Therefore, for the purpose of this report, only the auxiliary operations are considered in estimating air emissions associated with coal conversion plants. Unit plants for each of the technologies considered in this report have been defined by the U.S. Energy Research and Development Administration [7].

To determine the emissions from auxiliary operations, it is assumed that all auxiliary power is generated by the burning of coal (or another fuel equivalent). The amount of coal that would be consumed for auxiliary operations by individual

unit plants depends upon the type of coal and its Btu content. The amount of coal to be used for auxiliary operations is a fixed portion of coal consumption by the unit plant. Coal consumption by the auxiliary operations is estimated to be:

- Gasification process: 18 percent of total coal consumption (average of Hygas and CO₂ acceptor processes),
- Liquefaction process: 11.2 percent of total coal consumption, based on H-coal (direct hydrogenation process).

For gasification, an average input feed rate of 16,846 tons of coal per day and 28,454 tons of coal per day for Hygas and CO₂ acceptor processes, respectively, yielded the following emission estimates:

Pollutants	Tons of Emissions per	
	22640 tons	100,000 tons
HC	15	66.3
CO	3	13.3
SO ₂	5.3	23.4
NO _x	17	75.0
TSP	1.2	5.3

Similarly the emissions for liquefaction were based on the H-Coal process (see Table H-80).

H.5.1.6 Metallurgical Coal. Two processes are used for the manufacture of metallurgical coke, the beehive process and the by-product process. The by-product process accounts for more than 98 percent of the coke produced [8]. Air emissions are based on Tables H-81 and H-82.

H.5.1.7 Delivery. Air emissions in this phase of the coal cycle result from heavy duty, gaseous fueled internal combustion engines which are used in the oil and gas industry for driving compressors in pipeline pressure boosting systems, and in gas distribution. Loading factors for gas lines were derived from publications of the U.S. Environmental Protection Agency [8] and the U.S. Energy Research and Development Administration [7]. The following factors per 100,000 tons of coal equivalent are obtained:

HC: 0.663 tons
 CO: Negligible
 SO_x: 0.3315 tons
 NO_x: 0.5525 tons
 TSP: Negligible

There are no air emissions from the distribution and transmission of electricity or from

TABLE H-77

EMISSION FACTORS FOR BITUMINOUS COAL COMBUSTION
WITHOUT CONTROL EQUIPMENT

Furnace Size, 10^6 BTU/hr. (a) Heat Input	Particulates ^(b)		Sulfur Oxides ^(c)		Carbon Monoxide		Hydrocarbons ^(d)		Nitrogen Oxides

Hand-Fired Units	20	10	38S	19S	90	45	20	10	3	1.5

(a) 1 Btu/hr = 0.252 kcal/hr.

(b) The letter A on all units other than hand-fired equipment indicates that the weight percentage of ash in the coal should be multiplied by the value given. Example: If the factor is 15 and the ash content is 10 percent, the particulate emissions before the control equipment would be 10 times 15, or 160 pounds of particulate per tons of coal (10 times 8, or 80 kg of particulates per MT of coal).
 (c) S equals the sulfur content (see footnote b above).

(d) Expressed as methane.

(e) Without fly-ash reinjection.

(f) For all other stokers use 5A for particulate emission factor.

(g) Without fly-ash reinjection. With fly-ash reinjection use 20A. This value is not an emission factor but represents loading reaching the control equipment.

electrically driven pumps that operate gas or liquid pipelines.

H.5.2 Water Use

Water is a major resource required in coal development. It is required in (1) mining operations and revegetation, (2) coal preparation, (3) transportation, and (4) conversion processes. The largest water consumption is the evaporation of water used in cooling and in pollution control. On a per-unit Btu basis, more water is evaporated for cooling electric power generation plants than in synfuel processes [9].

H.5.2.1 Recovery and Extraction. The principal categories that consume water in coal mining are dust control for roads, mines, and embankments and revegetation of reclaimed areas. However, the mine location and the type of mine, surface or underground, would strongly influence the quantity of water consumed.

Water sprayed for dust control in the mine and on the road are based on rainfall and evaporation rates and are calculated based on area disturbed, evaporation rate, rainfall rate, and wetted area rate.

Using the above relationship, and based upon the evaporation rates of:

- (1) 45 inches/year for Fort Union Coal Region;
- (2) 54 inches/year for Green River-Hams Fork and Denver-Raton Mesa (GR/Denver)
- (3) 61 inches/year for San Juan River and Uinta-Southwestern Utah (SJ/Uinta)
- (4) 49 inches/year for Powder River Coal Region,

The water requirements would be:

	lb of water/lb of coal mined (surface)	acre-ft/100,000 tons
Fort Union	0.055	4.047
GR/Denver	0.038	2.796
SJ/Uinta	0.052	3.827
Powder River	0.047	3.459
Eastern Areas	0.03	2.208

The loading factor for surface mining results from adding 0.0306 lb water per lb of coal for revegetation. It is also assumed that 75 percent of the water used for revegetation and 100 percent of the water used for dust control evaporates. Therefore, the effluent loading factor for surface mining is (0.25 multiplied by 2.252) or 0.56 acre-ft per

100,000 tons. This methodology results in the following loading factors for the extraction phase of the coal cycle (see Table H-83).

H.5.2.2 Coal Cleaning (Beneficiation). In coal preparation plants, dust is generated during loading and unloading, breaking, conveying, crushing and general screening, and storage. Water is used to control fugitive dust, and to wash the coal to lower the ash and sulfur content. Jigging is used in over one-half of all coal-washing facilities. The water loading factor for crushing and screening is one lb of water/50 lb. of coal or 1.5 acre-ft/100,000 tons of coal [10]. For mechanically cleaned coal most of the wet washing is done by the jigging process (63 percent in 1975). The amount of water needed is 270 gpm per 696 TPH cleaned, or 7.12 acre-ft/100,000 tons cleaned which is divided as follows: 3.12 acre-ft/100,000 tons evaporative, 4.0 acre-ft/100,000 tons effluent.

H.5.2.3 Transportation. The transportation of coal via slurry pipeline consists of pumping finely powdered coal mixed with water. By assuming 50 percent by weight water use, then 100,000 tons of coal would require 50,000 tons or 36.8 acre-ft, of water.

H.5.2.4 Steam Electric. The amount of coal consumed by 3,000 MWe power plant is 8,154,255 tons/year, and the annual water requirements for the plant are 28,000 acre-ft/year [9]. Thus, water required per 100,000 tons of coal is 343 acre-ft. Of the 343 acre-ft, 90 percent is evaporated (309 acre-ft) and the remaining 10 percent (34 acre-ft) is effluent.

H.5.2.5 Synthetic Gas and Liquid. Loading factors were derived from a publication of the U.S. Energy Research and Development Administration [7]. The water make-up per 100,000 tons coal gasified is 179 acre-ft, the effluent portion of which is 46 acre-ft. The water make-up per 100,000 tons of coal liquified is 147 acre-ft, the effluent portion of which is 43 acre-ft.

H.5.2.6 Coke Plant. The water use in the by-product process for the manufacturing of coke is mostly for quenching coke, and for cooling purposes. Cooling water use is 107 gal/ton coke and quench water use is 350 gal/ton coke of which 123 gallons are evaporative and 227 gallons are effluent. Therefore, total water make-up is: 107 +

TABLE H-83

WATER LOADING FACTORS FOR EXTRACTION PHASE OF COAL CYCLE

COAL REGION	SURFACE EFFLUENT	SURFACE (a)	U.G. (b)	U.G. EFFLUENT (c)
Fort Union	0.56	6.299	3.68	1.84
Green River-Hams Fork/ Denver-Raton Mesa	0.56	5.048	3.68	1.84
San Juan River/ Uinta-Southwestern Utah	0.56	6.079	3.68	1.84
Powder River	0.56	5.711	3.68	1.84
Other Regions	0.56	4.460	5.88 (d)	2.94

Water requirement for miners is included in the socioeconomic section.

-
- (a) Water required for dust control and revegetation.
 - (b) For underground mining 50 lb./1,000 lb. coal or 3.68 acre/ft./100,000 tons of coal.
 - (c) Assume 50 percent of water used is effluent.
 - (d) Source: Reference Number 50.

$350 = 457$ gal/ton coke of which 123 gal/ton evaporate and 334 gal/ton are effluent [11]. Converting the above to acre-ft/100,000 tons of coal and assuming 70 percent conversion from coal to coke [12] results in the following loading factors:

- Water make-up: 457 gal/ton coke or 200.3 acre-ft/100,000 tons of coal
- Effluent water: 123 gal/ton coke or 53.9 acre-ft/100,000 tons of coal used, and
- Evaporative water: 334 gal/ton coke or 146.4 acre-ft/100,000 tons of coal used.

H.5.2.7 Delivery. There are no water uses in this phase of the coal cycle.

H.5.3 Acreage Disturbed

H.5.3.1 Surface mining. The number of acres required to produce 100,000 tons of coal is based on average coal seam thickness and average yield per acre-foot of seam. The calculations for the Colorado-Uinta Coal Region are: 100,000 tons of coal divided by (11 feet (seam thickness) times 1,750 tons/acre-ft) which equals 5.2 acres.

Regional variations in average coal seam thickness produce different loading factors that are shown on individual loading factor sheets. Acres disturbed by underground mining operations are negligible.

H.5.3.2 Coal Cleaning (Beneficiation). A loading factor for land required for coal cleaning was derived from a 1,000 ton/hour (24,000 ton/day) plant sited on .75 acres of land [49]. This loading factor is 0.85 acres/100,000 tons coal cleaned.

H.5.3.3 Rail Transportation. A loading factor for rail transport of 32.4 acres/mile was derived from an average railroad right-of-way width of 268 feet [7].

H.5.3.4 Truck Transportation.

A loading factor for land required for truck traffic was derived from average right of way width in a typical roadway network [7]. An average right-of-way width of 75 feet would take 9.1 acres of land per mile of roadway.

H.5.3.5 Coal Slurry Pipeline. One pipeline (48 inch diameter) could require up to 13 acres of land per mile, while two pipelines sharing a common right of way could require up to 15 acres per mile [7]. Additional land would be required for support facilities such as pumping stations and coal slurry

dumping basins. For a coal slurry pipeline, each pump station, including dump basin and water reservoir would require about 40 acres per 100 miles of line [13].

H.5.3.6 Steam Electric. A loading factor for a steam-electric generating plant was derived based on the assumption that 500 acres of land is required by a plant which burns 10,000 tons a day [7]. This loading factor is 13.6 acres per 100,000 tons of coal mined.

H.5.3.7 Synthetic Gas. A loading factor for a synthetic gas plant was derived based on the assumption that 900 acres of land are required by a plant that consumes 22,640 tons of coal per day [7]. This loading factor is 10.9 acres per 100,000 tons of coal mined.

H.5.3.8 Synthetic Liquid. A loading factor for a synthetic liquid plant was derived based on the assumption that 475 acres of land would be required by a plant that consumed 20,773 tons of coal per day [7]. This loading factor is 6.3 acres per 100,000 tons of coal mined.

H.5.3.9 Coke Plants. A loading factor for a metallurgical (cooking) plant was derived based on the assumption that 60 acres of land would be required by a plant that consumed 10,000 tons of coal each day [14]. This loading factor is 1.89 acres per 100,000 tons of coal mined.

H.5.3.10 Transmission Lines. A loading factor of 18.2 acres per mile was derived for a transmission line based on an average right-of-way of 150 feet [7].

H.5.3.11 Liquid and Gas Pipelines. A loading factor for pipelines of 15 acres per mile was derived based on an average right-of-way width of 125 feet [7].

H.5.4 Solid Wastes

H.5.4.1 Recovery and Extraction. For underground mining, the amount of inactive wastes generated is approximately three percent of the coal extracted [15].

For surface mining, solid wastes generated are returned to mining pits. Active wastes are not removed until the coal cleaning phase.

H.5.4.2 Coal Cleaning (Beneficiation). Data used to estimate the amount of solid waste generated during crushing and screening and mechanical

cleaning were provided in [12] and [15]. The amount of solid waste generated by crushing and screening assumed to be equally proportional to the mechanical cleaning waste data.¹² Also, national mechanical cleaning data show that the ratio of solid waste to clean coal is 40 percent [12]. Therefore, where no data are available for mechanically cleaned coal, the 40 percent ratio was used.

Data tabulated in Table H-84 were taken from the two sources listed above or derived according to the previously mentioned assumption.

Waste values are multiplied by 1,000 to yield tons of solid waste per 100,000 tons of coal mined. For example, the loading factors for Alabama (Southern Appalachian Coal Region) are 15,972 and 19,775 ton per 100,000 tons of coal for crushing and screening, and mechanically cleaned coal, respectively.

H.5.4.3 Transportation. No solid waste is generated during coal transportation activities.

H.5.4.4 Conversion. The quantity of inert and active wastes generated during coal conversion is related to the ash and sulfur content of the coal. Ash sulfur ratios were determined in Table H-85 [7, 16]

H.5.4.5 Steam/Electric Plants. Inert (ash) and active (sludge) solid wastes are produced at a rate of 10,429 and 11,756 tons, respectively, per 100,000 tons of coal converted when using coal having 12 percent ash and three percent sulfur content coal [17]. Assuming a directly proportional relationship between ash, sulfur content and solid waste generation, Table H-86 presents quantities of inert and active wastes produced per 100,000 tons of coal mined.

For example, the loading factor for Alabama (Southern Appalachian Coal Region) is 7,822 tons of inert waste per 100,000 tons of coal burned.

H.5.4.6 High Btu Gasification. Coals with an ash : sulfur ratio of 10.8 percent to 3.9 percent are known to yield 2,155 tons of inert solid waste (ash) and negligible amounts of active waste per 16,846 tons of coal processed [7]. Assuming a directly proportional relationship between ash content and solid waste generation, Table H-87 presents esti-

mates of quantities of inert wastes produced per 100,000 tons of coal mined.

H.5.4.7 Low Btu Gasification. Coals with an ash to sulfur content ratio of 7.2 percent to 0.6 percent are known to yield inert (ash) and active (dolomite and sulfur compounds) solid wastes at a rate of 2,583 and 1,860 tons, respectively, per 28,434 tons of coal processed [7]. Assuming a directly proportional relationship between ash and sulfur content and solid waste generation, Table H-88 presents estimates of quantities of inert and active wastes produced per 100,000 tons of coal processed.

High and low Btu values were averaged to obtain gasification loading factors (See Table H-89). For example, the loading factor for Alabama (Southern Appalachian Coal Region) is 10,432 tons of inert waste for 100,000 tons of coal (10,064 plus 10,800 divided by 2).

H.5.4.8 Synthetic Liquid. Coals with an ash to sulfur ratio of 9.12 percent to 4.45 percent are known to yield 2,015 tons of inert solid waste (slag, soot) per 20,773 tons of coal processed [7].

Active wastes (dolomite, sulfur compounds) are generated at a rate of 1,860 tons per 20,773 tons of coal processed. Assuming a direct proportional relationship between ash and sulfur content and solid waste generation, Table H-90 presents estimates of quantities of inert and active wastes produced per 100,000 tons of coal mined.

For example, the loading factor for Alabama is 9,572 tons of inert waste per 100,000 tons of coal liquefied [2,015 times 100,000 times 9 divided by (20,773 times 9.12)].

H.5.4.9 Coke Plant. During coke making, 200 acre-feet of water are normally required per 100,000 tons of coal processed [11]. Of this, about 146.4 acre-feet become effluent. The average concentration of suspended sediments in effluent is approximately 50 ppm solids. Other solids generated are ash and slag from the coking process. Therefore, tons of solid are calculated to be 1,985 tons per 100,000 tons of coal processed.

H.5.4.10 Delivery. No solid wastes would be generated during delivery phase of the coal cycle.

¹²The amount of solid waste from mechanical cleaning divided by coal cleaned mechanically equals the solid waste from crushing and screening divided by coal crushed and screened.

H.5.5 Fatalities

H.5.5.1 Recovery and Extraction. The average surface mining fatality rate is 0.011 fatalities per 100,000 tons mined; the average deep mining fatality rate is 0.04 per 100,000 tons mined. These loading factors were derived from Table 39 in Injury Experience in Coal Mining 1975, Mining Enforcement and Safety Administration [17].

H.5.5.2 Coal Cleaning (Beneficiation). Loading factors were based on the following assumptions:

- 1975 total coal processed = 374.1×10^6 tons (raw coal).
- 1975 total man-hours worked = 29.130×10^6 hours.
- Averaged processed coal per man-hour = 12.84 tons/man-hour.
- Average man-hours necessary to process 100,000 tons (raw coal) = 100,000 divided by 12.84 = 7787 man-hours.
- Average fatality rate (coal cleaning plants) = 0.31 fatalities per 10^6 man-hours or 0.031 fatalities per 100,000 man-hours.
- National average fatalities per 100,000 tons of raw coal processed = (7786 divided by 10^6) $\times 0.031 = 0.0002$.
- For crushing and screening plants fatality rates are assumed to be 1/3 those for mechanical plants, or 0.00005.

H.5.5.3 Transportation. Loading factors were based on the following assumptions:

- 0.2135 fatalities per 10 billion gross ton-miles traveled by unit trains.
- 47.2 fatalities per 10 billion gross ton-miles traveled by trucks.

These factors were estimated on the methodology set out by Bliss [18] and data supplied by Banks [19].

H.5.5.4 Conversion. The steam electric power plant fatality rate was derived from fatality data presented by Bliss [18] and equals 0.00006 fatalities per 100,000 tons of coal consumed.

Fatality rates for gasification and liquefaction plants are 0.0017 fatalities per 100,000 tons used in gasification plants, and 0.0011 fatalities per 100,000 tons used in liquefaction plants [7].

H.5.5.5 Coke Plants. Coke oven fatalities are estimated to equal 0.0001 per 10^6 tons of coal loaded into coke ovens. This loading factor is derived

from standards promulgated by the U.S. Department of Labor [20, 21].

H.5.6 Disabling Accidents

H.5.6.1 Recovery and Extraction. Estimates of disabling accidents resulting in man-days lost were developed for each coal production state. In states where data was insufficient to make accurate estimates of disabling accident rates per 100,000 tons mined, national data was substituted. The data supporting the accident loading factors is contained in Reference 17.

H.5.6.2 Beneficiation. The estimates of total disabling accidents in the beneficiation sector were derived from the same data source as for mining and extraction.

H.5.6.3 Transportation. Estimates of coal-related disabling accidents in the rail and truck transport sectors of the coal cycle were derived from data in Reference 18. To simplify estimation processes, it was assumed that the level of disabling accidents in the slurry pipeline sector of the coal cycle was statistically equivalent to zero.

H.5.6.4 Conversion. Estimates of the level of disabling accidents occurring in the various conversion sectors of the coal cycle were derived from estimates and data in Reference 18.

H.5.7 Man-days Lost

Estimates of the man-days lost as a result of the disabling accidents projected in the various sectors of the coal cycle are based upon data in References 17 and 18.

It was assumed that:

- Each fatality was the equivalent of 6,000 man-days lost
- Disabling accidents in the mining and beneficiation sectors resulted in an average of 141 man-days lost per accident.
- Rail-sector disabling accidents resulted in an average of 59.5 man-days lost per accident.
- Truck-transport sector disabling accidents resulted in an average of 45.4 man-days lost per accident
- Based upon National Safety Council estimates [51], an average of 102 man-days are lost per accident occurring in other phases of the coal cycle.

H.5.8 Operating Energy

The operating energy consumed in the coal fuel cycle includes:

H.5.8.1 Recovery and Extraction. The overall operating energy required for coal extraction is four percent of the Btu content of marketable coal [23, 24].

Based on an average of 22 million Btus per ton of coal, the loading factor for coal extraction is 0.088 trillion Btus/100,000 tons of coal [$0.04(22 \times 10^6 \times 10^9)$].

H.5.8.2 Refining and Processing (Beneficiation). The operating energy required for crushing and screening coal is 0.7 percent, and for mechanically cleaned and dried coal is 4.6 percent of the Btu content of coal [23, 25]. Therefore, the loading factor for coal crushing and screening is 0.0154 trillion Btus/100,000 tons of coal [$0.007(22 \times 10^6 \times 10^9)$], and for mechanical cleaning is 0.1 trillion Btus/100,000 tons of coal [$0.046(22 \times 10^6 \times 10^9)$].

H.5.8.3 Coal Transport. The operating energy required in the transportation sector is measured in Btus consumed per ton-mile transported and is a function of the mode of transportation as follows [32]:

- 670 Btus/ton-mile for rail transport or or 0.670 trillion Btus/billion ton-mile;
- 680 Btus/ton-mile for barge transport or 0.680 trillion Btus/billion ton-mile;
- 2800 Btus/ton-mile for truck transport or 2.8 trillion Btus/billion ton-miles, and
- 450 Btus/ton-mile for slurry pipe line, or 0.450 trillion Btus/billion ton-miles.

To account for empty return trips of transportation equipment, it is necessary to adjust the above numbers to Btus consumed per gross ton-mile transported. Thus, the loading factors are [19]:

- 0.67 divided by 1.78 or 0.3764 trillion Btus/billion ton-miles for rail transport;
- 0.68 divided by 1.43 or 0.4755 trillion Btus/billion ton-miles for barge transport;
- 2.8 divided by 2.04 or 1.3725 trillion Btus/billion ton-miles for truck transport, and
- 0.45 divided by 1.0 or 0.45 trillion Btus/billion ton-miles for slurry pipelines.

H.5.8.4 Coal Conversion and Utilization. The operating energy measured in Btu input to coal

conversion facilities is: three percent for steam electric power plants [24], 2.1 percent for gasification plants, 0.9 percent for liquefaction plants [7], and 2.7 percent for coke plants [11]. Based on 22 million Btus per ton of coal, the loading factors are:

- [$0.03(22 \text{ times } 10^6 \text{ times } 10^9)$] or 0.066 trillion Btus/100,000 tons of coal for steam electric power plants;
- [$0.021(22 \text{ times } 10^6 \text{ times } 10^9)$] or 0.046 trillion Btus/100,000 tons of coal for gasification plants;
- [$0.009(22 \times 10^6 \times 10^9)$] or 0.019 trillion Btus/100,000 tons of coal for liquefaction plants, and
- [$0.027(22 \times 10^6 \times 10^9)$] or 0.06 trillion Btus/100,000 tons of coal for coke plants.

H.5.8.5 Delivery. Losses in transmission and distribution facilities occur between the electric generating plant busbar and the appliance or piece of equipment which operates on electricity. These losses are approximately nine percent of the total electricity transmitted. However, substation and transformers use only one percent of the electric load transmitted [6]. Therefore, the loading factor is 0.022 trillion Btus/100,000 tons of coal. To operate liquid pipelines to and from refineries, 2.3 percent of the equivalent heat content of oil is consumed; and to operate gas pipelines, 2.9 percent of the equivalent heat content of gas is consumed [23]. Therefore, the loading factors are: 0.0506 trillion Btus per 100,000 tons of coal equivalent for oil lines, and 0.0638 trillion Btus per 100,000 tons of coal equivalent for gaslines.

H.5.9 Operation and Construction Employment

H.5.9.1 Recovery and Extraction. The loading factor is based on peak employment during construction of a 5.6 million tons per year mine and is estimated to be 180 workers. Thus, 3.21 construction workers would be required per 100,000 tons annual output.

Approximately 50 percent more workers are required for underground mine construction, i.e., 4.8 construction workers per 100,000 ton annual output.

Loading factors for direct operation workers are:

- Underground Miners — Loading factors for underground miners are derived by utilizing

the number of miners required to mine 100,000 tons of coal per day [7] divided by 365 days per year. These numbers vary according to mine characteristics and, therefore, yield different loading factors for each of the coal regions. In Alabama, the loading factor is 37.8.

- Surface Miners — The same methodology was applied utilizing the number of surface miners required to mine 100,000 tons of coal per day divided by 365 varying by region [7]. In Alabama, the loading factor is 17.8.

H.5.9.2 Refining and Processing. During the construction of a coal preparation plant, the peak construction force is 150 men.

In 1975, there were 388 mechanical cleaning plants. They cleaned a total of 374.1×10^6 tons (raw) coal. Average yearly tonnage cleaned per plant equals $964,180 = 9.64$ in 100,000 ton coal units [23, 27]. 150 man-years peak construction effort divided by $9.64 = 15.6$ man-years of construction effort per 100,000 ton unit of coal. For crushing and screening plants, assume 1/2 the work force spread over two years. For example, a 75 man peak labor force divided by $9.64 = 7.8$ man-years construction effort per 100,000 ton unit of coal crushed and screened [28].

Total man-hours worked in 1975 was

29.13097×10^6 hours [29]. Total tonnage cleaned = 374.1×10^6 tons. Therefore, 7,812 man-hours are required per 100,000 tons of coal cleaned, or 12.84 tons/man-hours.

Assuming an eight-hour shift and a 365-day work year, one man-year = 2,920 man-hours. Therefore, 2.67 man-years of effort are required to clean a 100,000 ton unit of coal [29, 30].

For crushing and screening plants, operational workers are estimated to be one-third of those for mechanical cleaning plants or 0.9 man-years per 100,000 ton unit of coal.

H.5.9.3 Transportation. Loading factors for direct construction workers are:

- Rail — Construction workers were derived from a U.S. Energy Research and Development publication [8] and equal 300 construction workers per 1,000 miles of track.
- Truck — Highway construction workers were derived from the same publication [8]

and equal 170 workers per 1,000 mile system with three years to build.

• Slurry Pipeline — Pipeline construction workers were derived from [13] and equal 4,900 workers per 1,036 miles of pipeline. Loading factors for direct operation workers are:

- Rail — Rail operator loading factors assume a unit train of 10,000 ton capacity traveling 1,000 miles round trip. Also, a six day turn around time results in approximately 60 trips per year and 110 total operating employees per one million train-miles. These assumptions yield 22 employees per billion gross ton-miles.
- Truck — This factor assumes a 25 ton capacity truck unit traveling 150 miles round trip and three trips per day requiring 1.35 employees per unit or 1,346.4 employees per billion gross ton-miles [31].
- Barge — Barge loading factors assume 21,000 ton capacity (14 barges) per 500 mile round trip and 24 employees per 3.5 day round trip or 44 employees per billion gross ton-miles [31].
- Slurry Pipeline — This factor assumes a capacity of 25 billion ton-miles per year and 239 employees or 10 employees per billion net ton-miles [13].

H.5.9.4 Steam Electric (Construction). Loading factors for steam electric construction workers are based on the assumption of a 1,000 MWe coal fired power plant which consumes 10,000 tons of coal per day [32]. Also, the peak construction work force amounts to 1,400 workers [33]. Using a 100,000 ton unit of coal results in a loading factor of 38.4 workers per 100,000 tons of coal consumed.

H.5.9.5 Synthetic Gas (Construction). Synthetic gas loading factors are derived from data of two gasification plants, one consuming 16,846 tons of coal per day and the other consuming 28,434 tons per day. It also assumes a 1,500 man peak construction work force [8]. These assumptions yield 18.1 workers per 100,000 tons of coal consumed.

H.5.9.6 Synthetic Liquid (Construction). This factor assumes a liquification plant which consumes 20,773 tons of coal per day with a peak construction force of 1,500 workers [8]. This yields an

estimate of 19.73 workers per 100,000 tons of coal consumed.

H.5.9.7 Coke Plants (Construction). The peak labor force for coke oven construction is 180 men [28]. Loading factors are based on:

- Average number of plants under construction = nine million tons of coke capacity/year.
- 9 million tons of coke = 12,857,000 tons of coal.
- 1975 average number of plants = 62.
- 1975 coke production was 56,494,000 tons.
- Therefore, average coke production per plant equals 911,193 tons.
- Therefore, to produce nine million tons, an average of 10 plants is required.
- Total peak construction labor required for 10 plants equals 10 times 180.
- Total construction labor expended = 1,800 divided by 128.57 equals 14.0 man years per 100,000 ton-units. [23, 28, 34].

H.5.9.8 Steam Electric (Operation). Loading factors for steam electric operation workers are based a 1,000 MWe coal-fired power plant which consumes 10,000 tons of coal per day [32]. The operating work force of the plant is 160 employees [32]. These assumptions yield an estimate of 4.38 workers per 100,000 ton coal unit.

H.5.9.9 Synthetic Gas (Operation). Synthetic gas loading factors are derived from averaging data of two gasification plants. One consumes 16,846 tons of coal and the other consumes 28,434 tons per day [8]. Based upon an operating force of 1,000, calculations yield 12.1 workers per 100,000 of coal feed.

H.5.9.10 Synthetic Liquid (Operation). This factor assumes a liquification plant which consumes 20,773 tons of coal per day with an operating force of 1,000 employees [8]. This yields an estimate of 13.15 workers per 100,000 tons of coal feed.

H.5.9.11 Coke Plants (Operation). Assuming a coking efficiency of 70 percent, the average coal used per man-hour equals 2.1938 tons. For 100,000 tons of coal, an estimated 45 man-hours (100,000 divided by 2.1938 equals 45,581.8) would be needed to produce 70,000 tons of coke. This is equivalent to 15.6 full time employees.

Thus, the direct employment multiplier for metallurgical coal (coking) is 15.6 per 100,000 tons of coal used [22].

H.5.9.12 Delivery.

Direct Construction Workers:

- Transmission-line construction workers were estimated to be 300 workers per 100 miles of line [8].
- Pipeline (liquid) construction workers for liquid pipelines were estimated to be 1,150 workers per 1,000 miles of pipeline [8].
- Pipeline (gas) construction workers were estimated to be 1,150 workers per 1,000 miles of pipeline [8].

Direct Operation Workers:

- Transmission Operation workers were estimated to equal 20 workers per 100 miles of line [8].
- Pipeline (liquid) operation workers were estimated to equal 115 workers per 1,000 miles of pipeline [30].
- Pipeline (gas) operation workers were estimated to be 139 workers per 1,000 miles of pipeline [30].

H.6 AGRICULTURAL OPPORTUNITY COST DERIVATION METHODOLOGY

This analysis focuses on estimation of monetary costs of trade-offs made if coal development occurs. It is limited to areas where at least partial market information exists.

The opportunity cost of coal production is equal to foregone outputs that could be obtained from the alternative employment of resources used. These resources include land and other natural resources, labor, and capital. Capital is a highly mobile resource with a national market. With respect to capital, there is very little difference at the margin between returns "with" coal development at a particular location versus "without" coal development. Labor tends to be geographically committed to a far greater degree than capital. Most workers tend to stay in one city or town for long periods of their lives; most usually move only when a substantial change occurs in their lives. Thus, if coal resource development were to decrease employment opportunities significantly, it would be necessary to consider that fact as one of the costs of development. This cost would

then be added to other development costs to obtain the total costs of coal development.

When considering the opportunity cost of labor, we are assessing the value of labor resources in alternative productive uses. Labor resources would freely move within coal development areas and workers could freely choose their employment activity. It is likely that, given the high wages paid in the mining industry, opportunity costs for labor will be less than wages in coal mining and related activities. Under these conditions, opportunity costs will be generated by those who could be employed in the coal mining industry but elect not to do so.

Land resources are totally fixed, both in location and amount. The opportunity costs of land resource use are the value of outputs foregone due to coal development. The most substantial opportunity costs occur in agricultural production. Surface mining will result in substantial losses in agricultural output per acre mined (Table H-91). Values presented in Table H-91 represent the annual gross revenue return per acre to the agricultural sector, by state. Some double counting is inevitable because sales within the farm sector are not netted out.¹³ Double counting results in overestimation of the value of final agricultural products produced. The degree of over estimation is related to the interdependence of a region's agricultural sector with respect to both agriculture itself and also other sectors of the economy (e.g., trade, services, etc.).¹⁴

Although the opportunity cost estimates presented in Table H-91 overstate the time level of such costs, they represent the maximum annual agricultural opportunity cost per acre of land used for production of coal. It is assumed that, in the foreseeable future, rehabilitated land will not yield agricultural output commensurate with premining levels of production. It is anticipated that, for each acre of land required for coal development in each region, the annual opportunity cost approximates the values presented in Table H-91. The estimates presented can be refined in two specific ways.

First, by estimating a single value that can be compared to the total resource value of the coal;

and second, by estimating values appropriate to the state within the production region that specify, for the community at-large, the opportunity costs resulting from foregone agricultural outputs as land resources are withdrawn from agriculture and utilized in the production of coal. To make the comparison of the total resource value of coal, it is necessary that the annual agricultural output per acre be converted to a measure of present value. In the course of future analyses, the present value of land used in coal production can be compared to the present value of land in agricultural production. To estimate the present value of land in agriculture, we have estimated the capitalized¹⁵ value of land for each state within the production regions. The capitalized value assumes that the return to farmers as a result of agricultural productive activity is 100 percent of gross returns. This of course, is not true, but by making such an assumption we can estimate the upper bound for the opportunity costs of land in agriculture. Thus, this analytic framework also enables separate estimates of agricultural factor payments and expected values of agricultural opportunity costs. The upper limit of the present value of agricultural opportunity costs of land not including externalities are presented in Table H-92. The application of information on regional earnings in agriculture as a percent of the gross value of agricultural sales reduces the upward bias in the Table H-92 estimates. The resulting value is no longer an upper limit, but, rather, is an estimate of the average agricultural opportunity cost of land.

Regional agricultural earnings used in this analysis are estimated to equal 18 percent of the value of all agricultural products sold for all regions.¹⁶ This is an approximation of the national average and has not been varied among the coal production regions. The loss of these earnings is an additional estimate of agricultural opportunity costs. The generation of information about the level of value-added in agriculture for each coal production area will allow more specific estimates of agricultural earnings and accordingly, opportunity costs. Once calculated, these revised estimates

¹³ The use of the national input-output table or a regional input-output table might be used to estimate intra-agricultural transactions.

¹⁴ Input-output models could also be used in this case to estimate sales of other sectors to agriculture.

¹⁵ Capitalized value is computed by dividing the yield of an investment

which in this case is taken to be the average value of agricultural output per acre of all land by the interest rate.

¹⁶ Estimated as a simple average of data for Sector 3: meat, animals and miscellaneous livestock products and Sector 5: feed grains, and grass seeds Table C-1 in U.S. Water Resources, Guidelines 5 [35].

(a)Present sum of the capitalized value of all agricultural products sold per acre of all land from Table H-91 and the indirect component; regional earnings dependent upon agricultural output per acre of all land.

will reflect the wide differences in the agricultural sectors of the various coal producing areas.

To this point in the analysis, externalities (indirect effects) have not incorporated in the estimation of opportunity costs. The next step in the analysis is to examine the indirect consequences of reducing the agricultural land base within each coal region. Such reductions are external to the agricultural sector and are the result of interdependence in regional economies. It is assumed that surface mining will reduce output by the average capitalized value shown in Table H-92 and that "regional final demand" will be also reduced by this amount. While external decreases in output in the agricultural sector are generated by coal mining, e.g., fewer farms result in reduced demand for tractors, in many instances these decreases may be offset by increased coal industry demand for comparable goods and services. The estimates presented in Table H-93 represent the maximum total direct and indirect changes in regional earnings resulting from the use of one acre of land for mining activities. From the estimates presented in Table H-93, it is possible to estimate expected values of total capitalized agriculture opportunity costs including direct and indirect costs within a coal producing region. These estimates are presented in Table H-94.

It must be emphasized that the agricultural opportunity costs presented are estimated for an average acre of land in each coal region, regardless of current use and without knowing the precise location of potential mining activities.

APPENDIX I

EXISTING LEASES AND PRLAs DISCUSSION PAPER

United States Department of the Interior

OFFICE OF THE SECRETARY
WASHINGTON, D.C. 20240

MAR 20 1979

Memorandum

To: Under Secretary

Through: Assistant Secretary, Land and Water Resources

From: Director, Office of Coal Leasing, Planning and Coordination

Subject: Discussion paper on Departmental management of existing coal leases and preference right lease applications

I. INTRODUCTION

A major element of any new federal coal management program would be a competitive coal leasing process. Much of the analysis in the Department's draft environmental statement on the federal coal management program focused on this element. Another significant element of the program is how the Department proposes to treat existing leases and pending noncompetitive preference right lease applications. The role of these leases and applications is discussed throughout the draft environmental statement (DES). The purpose of this memorandum is to summarize the material in the statement and other relevant information about this second element of a coal management program to ensure that those who are interested in these matters will have thorough and convenient access to the necessary material. The Solicitor's Office has been asked to give expedited consideration to the legal questions identified in this memorandum, and this office will prepare any necessary issue option documents on the policy issues that are outlined in this memorandum, and that may arise out of the conclusions reached by the Solicitor's Office on the legal questions. The memorandum will first discuss why existing leases and pending lease applications are important to federal coal management and then go on to discuss the specific steps that have been and will be taken in managing them.

A. SIZE OF THE MATTER

As of October 1978, there were 533 federal coal leases containing an estimated 17 billion tons of coal. Sixty-seven percent of these reserves are surface mineable, while thirty-three percent are mineable by underground methods. All but 66 of the 533 leases are located in the six

principal coal regions in the western United States. Table I, taken from Chapter 2 of the DES, shows the region, number of leases, acreage, and amount of coal under lease broken down according to the principal coal areas. In 1977, annual production from these leases was slightly over 50 million tons.

As of March 1976, there were 172 applications for preference right leases pending before the Department, containing an estimated 9.9 billion tons of coal, 3.5 billion tons of which is estimated to be surface mineable, and 6.4 billion tons of which is mineable by underground methods. Table II, also taken from Chapter 2 of the DES, shows the number of applications, the acreage and amount of reserves, again broken down by region.

B. IMPORTANCE TO COAL MANAGEMENT PROGRAM

Forecasts of future coal use in the United States predict that both national coal use and western coal use will increase over the next 15 years. While demand growth rates in these forecasts vary and may change, the certainty of increased demand and the need for increased coal production cannot be denied. Federally-owned coal makes up 25 to 30 percent of all national coal reserves and 60 percent of western coal reserves. It thus has the potential to influence levels and distribution of national coal production.

Only a little more than one percent of federally-owned coal acreage has been leased. Even if no additional coal was competitively leased, however, the estimated 26.9 billion tons of leased coal and coal subject to noncompetitive lease application could significantly add to national coal production. Using the crudest and most optimistic estimate of annual coal production potential from these lands, that is, assuming that all coal can be economically and environmentally mined, the coal in existing leases and pending applications could supply 670 million tons annually for 40 years. A more realistic estimate of production from existing leases is that they are capable of producing in the neighborhood of 360 million tons annually by 1985. The Department calculates from approved and pending mining plans that lessees have planned production of around 310 million tons annually by 1985. Existing preference right lease applications, if granted, would likely produce not more than 100 million tons annually by 1990. By comparison, 1977 production from federal leases was only 50 million tons. The magnitude of this possible increase underscores the importance of focusing on what role these leases and lease applications may play, and what policies and procedures the Department will adopt to ensure that they are managed in an economically and environmentally sound manner.

II. EXISTING LEASES

There are several important issues concerning existing leases. How are they considered in setting regional leasing targets? How will

unsuitability criteria be applied? How do the diligent development and continued operation standards work? Are there any constraints on assigning lease rights? One other important issue, application of the interim and permanent programs adopted under the Surface Mining Control and Reclamation Act, is, of course, addressed very extensively in the environmental statement on that program and in regulations developed to carry out the mandates of that Act. Simply stated, however, operations on all federal leases will comply with that Act unless it authorizes an exception.

A. REGIONAL LEASING TARGETS

An integral part of the preferred alternative is a process to decide how much coal should be leased competitively. The process of setting regional production goals and leasing targets starts with comparisons of likely production from all possible sources, with projections of demand derived from computer models developed and operated by the Department of Energy. It then proceeds with consultations with state governments, the industry and the public to modify the computer-derived estimates with other projections and estimates, and specific reasons for leasing or not leasing certain types of coal or in certain locations. Finally, the environmental and socio-economic impacts of specific levels of leasing-influenced development will be studied for each of the Department's coal regions where leasing might occur. This process requires the Department to have informed estimates of likely production from all lands, including existing leases. The Department will use a variety of outside sources to gather this information, including the information published by the Department of Energy, the National Coal Association, and the Keystone Coal Manual. For existing leases, the Department has relied, and will continue to rely, heavily on estimates from pending and approved mining plan applications as well as inquiries of and conversations with lessees. To make certain that this information is both easily available and accurate, the Department has developed an automated coal data system which, for the first time, centralizes all information on coal leases. The information in the system should contain the best available estimates of planned and potential future production from coal leases.

Table III, taken from Chapter 2 of the DES, is derived from information in the automated coal data system. It is the source of the statistics recited above: that planned 1985 production from coal leases in approved or pending mine plans will be around 310 million tons per year; and, combined with Table 2-21 in the DES, that likely 1985 production from federal leases will be over 360 million tons per year. These figures are derived from a systematic canvass of all leases existing in early 1978 by the Geological Survey's mining supervisors. Information on potential production was broken down into five lease categories: (1) leases with approved mining plans; (2) leases with approved mining plans to which modifications are pending; (3) leases with mining plans

pending approval; (4) leases on which no mine plan has been submitted, but for which the lessees have discussed a plan with the Geological Survey; and (5) leases for which there are no development plans of any kind known to the Geological Survey.

Estimated production from the first three lease categories was included in the 310 million tons per year "planned production" figure, with the understanding that the actual figure could vary substantially. Production from leases in the first category is the least likely to change from the planned amounts; the leases are likely to be exempt from unsuitability prohibitions and variation in amount of production, though allowed under the approved plans, is constrained by the resource conservation and sound mining method principles that governed initial approval of the mining sequence. Planned production from leases in the second category is less certain, of course, but still quite reliable. Significant mine plan modifications might increase as well as decrease production, although environmental assessments of major modifications may delay the planned production. The third lease category embraces planned production that will occur, but its timing is less certain. As a rule of thumb, lessees' plans were not systematically revised in calculating these quantities of planned production, even though the Department knows, and other users of this information should realize, that conforming the pending plans to the interim performance standards of the Office of Surface Mining Reclamation and Enforcement caused, as conforming the plans to the permanent program regulations will cause, some delay in reaching planned production levels and some possible loss of production to meet those environmental standards.

Potential production from leases in the fourth category became the additional "likely production" set out in Table 2-21 of the DES—some 57.3 millions tons per year in 1985. Potential production from leases in the fifth category was not included in 1985 production estimates at all.

The likely production information on leases, as well as all other information, will be publicly available and will be used by the regional coal teams who participate in the work on setting regional production goals and leasing targets.

B. UNSUITABILITY OF LANDS

1. How the criteria are applied.

The preferred unsuitability criteria under consideration for adoption as part of the federal lands program under the Surface Mining Control and Reclamation Act (SMCRA), 30 U.S.C. § 1201 *et seq.*, and as part of the federal coal management program, were established by Secretarial decision on October 3 and November 2, 1978. (The 24 criteria are set out in section 3461.2 of the example regulations, Appendix A to the DES.) Those criteria finally adopted would be applied to all federal coal lands. SMCRA mandates the Secretary to review all federal lands for

unsuitability and it allows citizens to petition for and against designation of lands as unsuitable. Consequently, under SMCRA the Department must have procedures to apply unsuitability criteria both as part of a comprehensive federal lands review and as part of a petition process.

Section 522(b) of SMCRA requires the Secretary to review all federal lands, even though many coal areas are under the land managing jurisdiction of another agency, principally the Forest Service or the Corps of Engineers. By adopting the principle that the unsuitability criteria are best applied to federal lands in the land use planning conducted by each federal surface management agency, the Department has set a course for the federal lands review that would allow other surface management agencies to enter into cooperative agreements with the Department to carry out the federal lands review on lands they administer just as the Bureau of Land Management (BLM) will on land it administers. For any agency that does not have the resources to conduct such a review, the Secretary would remain obligated to complete this review.

Section 522(b) of SMCRA goes on to say that the Secretary will condition leasing on, or withdraw from leasing, lands that are found to be unsuitable for all or certain types of mining. For lands under the administration of other agencies, the conditions may be imposed by the Secretary or by the surface management agency when it consents to coal leasing on "its" lands. (Section 3 of the Federal Coal Leasing Amendments Act of 1976 (FCLAA), 30 U.S.C. § 201(a)(2)(B)(iii).) For lands already leased, the Secretary will of course consult with the surface management agency in approving a mine plan on the lease, so that step will be the focus for the application of conditions to implement the unsuitability criteria. While the discussion below focuses on the federal lands review process with respect to lands administered by BLM, it is applicable as well to lands administered by other federal agencies, whether the other agency is applying the Department's unsuitability criteria under a cooperative agreement or whether BLM is doing so for the other agency's lands.

2. The relationship between the federal lands review and the designation process.

With respect to lands administered by BLM, the Under Secretary on July 5, 1978, approved a delegation of authority that gives BLM the responsibility to administer the federal lands review through its land-use planning system and the Office of Surface Mining Reclamation and Enforcement (OSM) the responsibility to administer the statutory petition process. (Issues A3 and A2, Appendix B to the Federal Register Notice of December 8, 1978. 43 Fed. Reg. 57662, 57666.)

The federal lands review under section 522(b) of SMCRA, it must be emphasized, is not a program for the designation of lands as unsuitable for mining. Formal designation of federal lands as unsuitable, discussed in greater detail below, will occur only in response to a petition to designate under section 522(c) of SMCRA. The results of the federal lands review, rather than "designation" under 522(c) of SMCRA, will be: (a) land-use planning determinations, or trade-offs between competing resource values and land uses; and (b) unsuitability assessments or land-use planning recommendations to condition any leasing or mining, or to withdraw the lands from leasing. This conclusion is derived directly from the statutory definitions of the terms used to describe the petition and designation process under subsection 522(c), and the differences in the federal lands review under section 522(b).

A lessee's right to produce from a lease could be affected by both the federal lands review and the petition process. The SMCRA forbids the Department from approving a mining plan for lands that have been designated as unsuitable. In the absence of a petition, the Department's preferred alternative is not to approve a mining plan for an existing lease until after it has reviewed the leased lands for possible unsuitability. This is consistent with the President's direction in his Environmental Message to the Congress and an accompanying memorandum to the Secretary for the Department to take steps necessary to deal with environmentally unacceptable lease problems. (Vol. 13 Compilation of Presidential Documents 782, 787 (1977).) Thus,, review of the unsuitability of leased lands could take place either through the land-use planning process under section 202 of the Federal Land Policy and Management Act of 1976 (FLPMA), 43 U.S.C. § 1712, which is the primary vehicle for the federal lands review, or another surface management agency's planning process, through the petition process, or through the mine plan approval process.

In some instances, the Department lacks legal authority to designate as unsuitable, or prevent the mining of lands in existing leases. The Department's preferred unsuitability criteria have their origin in a variety of legal mandates and the authority to regulate existing leases varies under these different authorities. In designing the preferred alternative, the Department has drawn legal prohibitions, agency policies and executive order directives into a single framework for the purpose of simpler administration of the federal lands review. For example, criteria which stem from section 522(a) of SMCRA, the direct source of the concept of "unsuitability criteria," cannot be applied to lands on which an operator is in production on August 4, 1977, or to operations for which "substantial financial and legal commitments" had been made by January 4, 1977. Standards which derive from section 522(e) of SMCRA cannot divest "valid existing rights." Table IV, which should be thought of as an explanation and supplement to Table 3-1 in the DES, lists each proposed criterion and its statutory source. It also indicates whether

TABLE IV

PROPOSED UNSUITABILITY STANDARDS:
THEIR SOURCES AND LIMITATIONS

CRITERION (Proposed Rule Section)	STATUTORY SOURCE 1/	NATURE OF CRITERION	EXEMPTIONS	DERIVATION OF EXCEPTIONS
1-1. Lands in federal land preservation systems (National Parks, Wildlife Refuges and Trails)	a. 522(e)-SMCRA;	a. mandatory	a. valid existing rights; surface coal mining operations existing on 8-3-77	operations that involve no surface coal mining operations (522(e)(2)(B) proviso-SMCRA)
	b. 16-FCLAA	b. mandatory	b. none	
1-2. Buffer zones around such land	522(a)(3)-SMCRA Clean Air Act	discretionary	522(a)(6)-SMCRA 2/	
1-3. Lands in Custer National Forest [3461.2(a)]	522(e)-SMCRA	mandatory	valid existing rights; existing surface coal mining operations	

1-7

1/ Statutory sections are cited if clear. SMCRA means the Surface Mining Control and Reclamation Act of 1977, 30 U.S.C. § 1201 *et seq.*; FCLAA means the Federal Coal Leasing Amendments Act of 1976; FLPMA means the Federal Land Policy and Management Act of 1976, 43 U.S.C. § 1701, *et seq.*

Section 2 of the Mineral Leasing Act, as amended, 30 U.S.C. § 201, contains the Secretary's ultimate discretion to lease or not to lease in the public interest. It applies to all the criteria. Similarly, sections 201 and 202 of FLPMA, the Secretary's resource inventory and land use planning authorities, apply to all criteria on all lands administered by the Bureau of Land Management. These sections are cited only when they are relied on as authority for the criterion.

2/ In every case, section 522(a)(6) exempts: (a) operations approved under SMCRA; (b) surface coal mining operations existing on August 3, 1977; and (c) operations to which substantial legal and financial commitments were made prior to January 4, 1977.

3/ The general authority for the exception is found in the coverage or limitations on the coverage of the statutory policies and protections.

it is mandatory or discretionary, and what exemptions it carries, and thus what its probable effect on existing leases will be. These are the criteria adopted as the preferred alternative last fall after the Department field tested the initial draft criteria in the summer of 1978 and modified the test criteria in response to the results of the field testing.

It must also be emphasized that assessment of lands as subject to an unsuitability criterion does not mean (exemptions aside) that no mining may occur there. The federal lands review is to assess whether the lands are "unsuitable for all or certain types of surface coal mining operations." (Section 522(b) of SMCRA (emphasis added).) While the term "surface coal mining operations" does include "surface operations and surface impacts incident to an underground coal mine" (section 701(28) of SMCRA), it is clear that some unsuitability assessments will result in recommendations only against leasing for, or prohibitions against, mining of certain types. These considerations will be an integral part of the application of the unsuitability criteria (either in land-use planning or in the mine plan approval process), or in the designation of lands in response to a petition.

3. The federal lands review.

As stated above, the review of federal lands administered by BLM will occur either as a land-use planning function or in the process of mine plan approval.^{1/} The responsible official of the Federal land management agency would describe in the land use plan the results of the application of each of the unsuitability criteria to the medium and high potential coal lands in the planning area. He would state each instance in which a criterion is found to be applicable and show the area which is excluded from further coal development consideration, or, should he determine that the conditions for an exception exist, describe the area to which the exception applies and discuss in detail the reasons why the exception is made and what type of stipulations will be required in the lease or mining permit to assure compliance with the exception.

In applying the criteria and exceptions, the responsible official would first publish a composite map showing full application of all criteria prior to consideration of any of the exceptions. The map would be part of the formal documentation to be made available to the public. Only after the map has been prepared and made public would the exceptions be applied; however the responsible official would consider using an exception only when a small area (1) has applicable to it a criterion, (2) is in a larger area to which no criteria otherwise apply, and (3) would likely preclude the designating of any lease tracts within the larger area. This procedure deters aggressive application of the exceptions and places a distinct burden of proof on the responsible official to carefully and forcefully document any application of exceptions which he or she would make.

^{1/} It could also occur during other activities such as lease readjustment depending on the timing of those activities.

The responsible official would make his assessment on the best available data that can be obtained given the time and resources available to prepare the land-use plan. The description in the plan would explain whether additional data would be likely to affect significantly the conclusions reached about unsuitability. The plan would also disclose when in activity planning, lease sale, or post-lease activities the necessary data would be obtained. When the data are finally acquired, the responsible official would then be required to make public the resulting assessment concerning unsuitability and the reasons therefor and provide opportunity for public comment before that assessment is adopted. Any changes which either result from a petition process for designating land unsuitable or are warranted by additional data acquired in any activity planning or mine plan review process would be made without formally revising the plan.

Lands with coal that would be mined by underground mining methods would not be considered unsuitable for coal mining where the mining would result in no hydrologic or surface effects. Where underground mining would produce hydrologic or surface effects on Federal lands to which an unsuitability criterion applies, those lands would be considered unsuitable unless the conditions exist to permit an exception.

The unsuitability review process is set out in two instruction memoranda from the Director, BLM. Instruction Memorandum (I.M.) 79-76 (November 8, 1978), published at 43 Fed. Reg. 57664 (December 8, 1978), instructs the coal state BLM offices how to apply the criteria to lands in completed, approved management framework plans (MFPs). Because the criteria and exceptions selected by the Under Secretary for the preferred program are changed significantly from the criteria and exceptions originally field tested by the task force, the Department determined that they should be field tested anew as part of their application in selected BLM planning areas before any final decision on them is made by the Secretary. Furthermore, the procedures for these field tests were designed to ensure that the criteria and exceptions would receive attention not only from the land management agencies' planners, but also from interested user groups and the public. The field tests are being conducted in Alabama and in 20 coal areas in 10 planning units in Colorado, Montana, Utah, and Wyoming, and the results will be made available to the public in the form of supplements to existing land-use plans. The supplements will be published in May of this year and will be fully considered by the Secretary prior to making any final decision on a Federal coal management program. Any changes in the preferred criteria and exceptions adopted by the Secretary would be subsequently incorporated in the supplements which will have been published before the Secretary's decision.

Subsequently, I.M. 79-139 (December 15, 1978), published at 44 Fed. Reg. 2201 (January 10, 1979), instructed the coal state BLM offices how to incorporate application of unsuitability criteria into ongoing and future planning processes. While I.M. 79-76 dealt with formulating a

discrete MFP "supplement" on unsuitability, I.M. 79-139 describes which steps in unsuitability assessment are to be taken at which steps in the existing BLM planning process: during inventory, during mapping, at public participation points, and during multiple-use trade-off determinations.

Both completed "supplements" and ongoing planning products will be subject to revision and supplementation to accommodate any changes in the unsuitability criteria, both in the coal program decision and in the future. The ongoing tests have been carefully structured to simplify their revision or supplementation if standards change. The review may be done for leased as well as unleased lands.

To repeat, the assessment of unsuitable areas in the land-use plan is not the formal designation that may result from a petition under section 522(c) of SMCRA. In addition, the assessment of unsuitable lands in the land-use planning process will have different consequences for unleased and leased lands. For unleased lands, as described above, the planners will then determine whether or not to exercise any applicable exception to a criterion. The Department will not further consider for leasing those unleased lands with identified problems, and on which it chooses not to assert an identified exception.

The assessment that leased lands are unsuitable, however, means that the Department applies all exceptions to the criteria in question. Again, this may happen either in the course of land-use planning or in response to submission of a mine plan on the lease. If any exception applies, the Department will allow mining subject to any conditions or mitigating measures inherent in the exception. If no exception applies, however, the Department will proceed to the final "screen" and determine whether the lease is exempt from the application of the criterion in question because, for instance, the operator has made substantial financial and legal commitments to the lease. If the lease is exempt, the assessment that the lands are unsuitable will still not prevent mining. Only if the leased lands are not exempt, that is, not "grandfathered" from adverse application of the criteria as valid existing rights or as an operation to which "substantial financial and legal commitments were made," will the Department then continue to prohibit mining, and the Department may formally designate the lands as unsuitable in response to a petition under section 522(c) of SMCRA.

4. Mine plan approval.

If land-use planning has not been completed on a leased tract at the time a mine plan is submitted for approval, the unsuitability criteria will be applied to the lands as part of the approval process. The environmental analysis or impact statement on mine plan approval will document the application of the criteria and their exceptions to the leased lands, whether the criteria were applied during prior land-use planning or as part of the mine plan review.

If a criterion applies, the Department would evaluate whether, under an exception to the criterion, the plan could be changed to eliminate the harmful effects on the value which the criterion is designed to protect. If no change could be made and some or all of the proposed operation could not occur consistent with the criterion, the Department would decide whether the operator was exempt from application of the criterion. If he is not, the Department will condition or prohibit operations on some or all of the leased lands when it acts on the mine plan.

The mine plan approval process, whether under 30 CFR Part 211 with Geological Survey as the lead agency, or under the SMCRA permanent program regulations with OSM as the lead agency, will contain public participation procedures (especially if an environmental impact statement is completed on the plan) comparable to those applicable to land-use planning.

5. Petitions to designate federal lands.

Apart from application of the unsuitability criteria in land-use planning and in response to a proposed mine plan, the designation process may be initiated by a petition to designate lands as unsuitable under section 522(c) of SMCRA. Petitions will be filed with OSM under the division of responsibilities established on July 5 (Issue A2, Appendix B to the Federal Register notice of December 8, 1978). Section 522(c) requires the petitioner to be adversely affected by potential mining of the lands in question, and requires each petition to "contain allegations of facts with supporting evidence" to establish the truth of the allegations. Because of these threshold requirements, it is assumed that the public lands will not be blanketed by petitions. On those petitions that do pass the threshold requirements, designation as unsuitable, rejection of the petition, or termination of a prior designation must occur within one year. The year provides the time in which the BLM (or other surface management agency) will substantively review the petition, and if necessary and possible examine the tract, and in which a public hearing on the petition will be held and a written decision rendered.

The petition process is not limited in application, and appears to apply to leased as well as unleased federal coal lands, subject of course to the exemptions set out in SMCRA: that the application of criteria derived from section 522(e) is subject to valid existing rights; and that the application of criteria derived from section 522(a) does not apply to operations in existence on August 4, 1977, operations permitted under SMCRA, and operations to which substantial financial and legal commitments were made prior to January 4, 1977. Thus the unsuitability of leased lands may be assessed under this process without any mine plan pending, or without any land-use planning process occurring. Conversely, the lessee may petition to have any designation of the leased lands as unsuitable for coal mining terminated under the same petition process and time limits. The surface management agency's response to OSM's referral to

it of a petition will of course be easier and quicker for lands on which land-use planning has occurred, since the inventory of the lands and analysis of the criteria on those lands will already have occurred.

While the criteria applied in the federal lands review and the petition process are the same, it is important to note that OSM, not the surface management agency, controls the outcome of the petition process. It may be that certain lands which are not found to be unsuitable in land-use planning may be designated unsuitable upon petition, and conversely, lands deemed unsuitable by the surface management agency may not be designated unsuitable upon petition. This is possible because the unsuitability criteria themselves, and their exceptions, are, in origin and function, designed to ensure environmental protection and establish mitigation of adverse impacts, while the formal designation process requires consideration of coal demand and the socio-economic impacts in carrying out the environmental purposes served by the criteria. Section 522(d) of SMCRA requires OSM, prior to designating federal land unsuitable, to prepare a "detailed statement on (i) the potential coal resources of the area; (ii) the demand for coal resources, and (iii) the impact of such designation on the environment, the economy, and the supply of coal." 30 U.S.C. § 1272(d). In order to assure the greatest consistency between OSM's unsuitability designations and BLM's land-use planning unsuitability assessments, the BLM's draft coal management regulations require that the same "detailed statement" be made by BLM to document its unsuitability assessments when it adopts a land-use plan. (Draft 43 CFR 3461.4-3.)

6. Exchange of unsuitable lands.

The Department has some limited authority to issue new coal leases, coal lease modifications, leases for other minerals, or lease bidding rights in exchange for the relinquishment of outstanding coal leases or preference right lease applications. This authority can be exercised in some cases where the Department finds that it would be in the public interest to shift the impacts of mining operations from the lands under lease to other lands, or to relieve lessees of lease obligations on leases wholly or partially unmineable because of unsuitability assessments or designations. What follows is a description of the Secretary's existing exchange authority, a discussion of the substantial limitations on this authority,, and a discussion of the issues involved in the Department's present policy toward exchanges, which further limits the number and class of cases in which the Department is likely to consummate an exchange.

a. Existing authority. Congress has authorized the outright exchange of certain federal coal leases within alluvial valley floors for leases outside alluvial valley floors (section 510(b)(5) of SMCRA, 30 U.S.C. § 1260(b)(5)). Although this authority can be exercised whether or not the lessee has had a surface mining permit rejected for the leased lands

(Memorandum of November 2, 1978 from Associate Solicitor, Energy and Resources, to Director, Office of Coal Leasing, Planning and Coordination (OCLPC) "Legal Issues in the Draft Coal Regulations"), it has potentially narrow application. The only leases on which such lease-for-lease exchanges can be based are those on which the operator neither was producing coal in 1976-77, nor had a permit to do so from the state regulatory authority, but on which he had made substantial financial and legal commitments to an operation prior to January 1, 1977. The size of this class of operators is as yet undetermined.

Outside of alluvial valley floor lease exchanges, the Secretary has the authority, under regulations promulgated over a year ago, to accept the relinquishment of a federal coal lease and in exchange: (1) to issue a federal lease for sodium, potassium or phosphate; (2) to modify another existing coal lease to include additional acreage; (3) to issue bidding rights for the value of the relinquished lease, which could be redeemed in payment of all or any portion of a bonus bid on a competitive coal lease sale; or (4) any combination of the above. (43 CFR Subpart 3526, December 23, 1977, 42 Fed. Reg. 64346, example regulations 43 CFR Subpart 3435 (DES Appendix A-22-23).) It is also possible under the existing rules for a sodium or other non-coal lessee to exchange his lease or preference right lease application for coal lease modifications or bidding rights, as well as another non-coal lease.

Prior to the enactment of the Federal Coal Leasing Amendments Act of 1976 (FCLAA) on August 4, 1976, the Secretary had the authority to issue exchange coal leases in the same manner as he can continue to do with sodium, potassium and phosphate leases. The Congress provided in the FCLAA, however, that coal leases could only be issued by competitive bidding, and removed from the coal leasing provision the general authority to issue leases by "such other methods as [the Secretary] may by general regulations adopt" that remains in the sodium, potassium and phosphate provisions of the Mineral Leasing Act, and which was used to promulgate the exchange lease regulations for other minerals. The Department requested general coal exchange leasing authority in the 95th Congress, but failed to receive it. The Senate passed such provisions, including a provision that adopted the Department's policy toward coal exchanges discussed below, but the House enacted authority to consider only a few named coal lease exchanges. The House version prevailed. (S. 3189, the Act of October 30, 1978, 92 Stat. 2073. See 124 Congressional Record S 18754, S 18755 (October 13, 1978), remarks of Senator Jackson.)

b. Limitations on existing authority. There are difficulties with effecting lease exchanges under existing law that may eventually motivate the Department to return to the Congress with a request for general coal lease exchange authority. Since the alluvial valley floors of the West have not been mapped, it is not certain how many such exchange lease cases there may be. The Department has read the section 510(b)(5) proviso

to authorize lease exchanges even though the entire lease is not in an alluvial valley floor (Memorandum of November 2, 1978, cited above, "Legal Issues on the Draft Coal Regulations"), but the substantial financial and legal commitments threshold may still restrict the number of operators who will ever be eligible for an exchange lease under this authority.

Unless and until competitive coal leasing is resumed on a regular basis, there is little incentive for an operator to seek bidding rights. Even should coal leasing be needed, it might not occur in regions or locations, or in types of coal, that the holder of existing leases on unsuitable or potentially unsuitable lands would be interested in seeking through bidding rights. Exchange leases of other minerals are of interest, of course, only to companies which mine minerals other than coal.

Coal lease modifications are attractive only if operations on the original lease acreage are not likely to be limited or prohibited by application of the unsuitability criteria. Thus they are likely to be considered by lessees who have other federal leases that either are operating, and are thus grandfathered from the application of most of the unsuitability requirements, or are not operating but are on lands likely not to be found unsuitable. 2/ No modification or modifications to a coal lease can add more than 160 acres, or the original lease acreage, whichever is less, to the lease. (90 Stat. 1090-91, 30 U.S.C. § 203.) The acreage a lessee could acquire by modification is thus limited by the number of existing leases he holds that could be modified. The coal in a 160-acre modification might well not be equal to the value of an unsuitable lease that would be relinquished in such an exchange.

This discussion demonstrates that there is some authority to deal with some cases of existing coal leases on lands assessed or designated to be unsuitable for coal mining operations, or on which land-use planning decisions indicate that mining operations should not occur. At the same time, this discussion demonstrates that: each specific exchange will be a complicated, detailed matter that can only be proposed after case-by-case examination of a land-use plan, mine plan approval application, or

2/ The Congress did amend section 3 of the Mineral Leasing Act, 30 U.S.C. § 203, in the 95th Congress, to change the language of section 13(b) of the FCLAA, which required that the original coal lease that had acreage added by modification had to conform to all the provisions of the FCLAA, including the higher minimum royalties and the statutory diligence requirements. Section 3 of the Act of October 30, 1978, made the imposition of revised diligence terms on the original lease discretionary with the Secretary, and prohibited the increase of the royalty rate on the original lease until its normal twenty-year readjustment. Pub. L. No. 95-554, section 3, 92 Stat. 2074.

a petition to designate leased lands unsuitable; and 2) the Department may require additional general coal lease exchange authority before exchanges are seen as a viable management tool.

c. Policy issues in exchanges. Neither section 510(b)(5) of SMCRA, the alluvial valley floors provision, nor the Department's exchange leasing regulations require the Secretary to consummate or even to consider an exchange in any given case. Thus, initiation of an exchange remains within the informed discretion of the Secretary. The existing exchange regulations do not contain any specific standards for the exercise of this discretion; rather, they prescribe procedures designed to ensure a soundly-based conclusion that an exchange, in a given case, is in the public interest. (See 43 CFR 3526.1(b) and (c).) The following discussion is designed to illuminate classes of cases in which exchanges will and will not be likely to be considered.

Leases issued prior to August 4, 1976, on which the lessee does not diligently initiate production in compliance with the applicable regulations and lease terms will be subject to cancellation. (These requirements are discussed in part C below.) Cancellation of coal leases is accomplished by initiation of a suit to cancel the lease by the United States in the federal district court for the district in which the leased lands are located. (30 U.S.C. § 188(a).) Such action will be appropriate in any case of a lease maintained in violation of its terms or applicable regulations, whether or not the lands have been designated or assessed as unsuitable for all or any type of coal mining operations. For instance, some leases require the lessee to submit a mine plan within three years after readjustment. If a lease was re-adjusted in late 1976 and a mine plan is now due for the lease in late 1979, the Department probably would not consider an exchange for the tract unless a mine plan was filed in a timely fashion or the lessee otherwise made reasonable efforts to begin production. Even if the lands in such a lease are eminently likely to be designated or assessed to be unsuitable, the Department will not normally initiate an exchange. Rather, the Department will wait until late 1979, and if no mine plan is timely submitted, will seek cancellation of the lease for violation of its terms.

In contrast, there will be cases where a potential lease operation will be exempt (as discussed above) from the application of the Department's unsuitability criteria, even though the criteria would have applied to prevent the leasing and development of the tract if the lands were unleased. In these cases the Secretary is quite likely to initiate an exchange, since the unsuitability criterion applicable to the lands is an expression of the public interest in how public lands should and should not be managed and developed. If the lessee were willing to agree to an exchange, the Department would be able to shift the impacts of coal mining from a tract on which the Department's formal position

was that mining should not occur to acceptable lands elsewhere. If the lessee were unwilling to enter into an exchange, he could mine his existing lease.

Between these two extremes lie the more difficult cases. In the case of a lease on which both: (1) the lessee has diligently engaged in development activities, especially by the submission of a mine plan for approval, is in no other way in violation of the lease, and is not exempt from the unsuitability criteria; and (2) the Secretary designates or assesses all or significant portions of the tract as unsuitable for the contemplated type of coal mining operation, the Secretary could initiate exchange proceedings. Is it in the public interest to exchange a lease in a case where the Department could lawfully prevent mining of part of the lease without compensating the lessee? A lessee who (1) intends to develop his lease and (2) is not in violation of any lease diligence requirement will not be able to develop parts of his lease if he cannot meet the requirements of SMCRA. The Congress, in establishing the unsuitability concept, did not authorize the Department to "take" or condemn lease rights. Unsuitability standards, however, like Clean Air Act or Water Pollution Control Act standards or tax or health laws, can limit or control the manner in which the lease can be developed, or whether it can be developed at all. The lessee would eventually be faced with the fact that because a mine plan cannot be approved on the lease, he will violate the diligent development requirement of his lease. Just as in the case of operations that cannot be permitted under the Clean Air Act or other laws, the lessee would be unable to operate and eventually the lease would be subject to cancellation.

In letters to both of the Congressional Committees, the Department requested that the Congress make it clear that the generic exchange authority contained in the bill could be applied only to leases on which the unacceptable impacts of mining could not be prevented or adequately mitigated under the authority of SMCRA or other federal law. Letter of June 27, 1978, from Deputy Assistant Secretary Wicks to Senator Jackson; letter of July 24, 1978, from Assistant Secretary Martin to Congressman Udall. Under this policy an exchange could be consummated either because the operation was exempt from the application of unsuitability criteria or other SMCRA authority, or because the unacceptable adverse impacts would be socio-economic in nature or affect environmental values not incorporated into the unsuitability criteria, and would not be subject to direct regulation under SMCRA or other environmental laws. The Senate incorporated this amendment as subsection (i) of section 1 of S. 3189. S. Rep. No. 95-1169, at 6, 10 (August 1978). These letters stand as statements of Departmental policy in these cases.

The passage of S. 3189 in a form (P.L. 95-554, 92 Stat. 2073) that does not speak to generic exchange authority leaves the Department with its prior discretionary authority intact. If the Department altered the policy expressed in the June 27 and July 24 letters, it would then have

the difficult task of establishing policies, either by regulation or by case-by-case action on such leases, to govern the cases of lessees who cannot mine because they are not exempt or excepted from the unsuitability criteria applicable to their leases. Any policy must answer these questions about exchanges of this type. 3/ What is the value of the relinquished lease which cannot be mined? If the value of a lease that the Department can lawfully prevent from being mined is zero, is the Department giving away something in exchange for nothing? Is it appropriate to exercise discretion to avoid the risk of an eventual determination that an unsuitability criterion cannot constitutionally be applied to a lease pre-dating its establishment? While we may be able to establish objective criteria for determining which cases are proper for exchanges and which are not, we may also find that this set of problems may eventually motivate the Department to return to the Congress for generic, clarified exchange authority.

3/ The Congress clearly authorized the Department to consummate exchanges in cases where private coal could not be mined because of the alluvial valley floor mining prohibition in SMCRA. In fact, the Congress directed the Secretary to establish a program for the exchange of title to federal coal lands in exchange for the conveyance to the United States of private coal subject to the alluvial valley floors mining prohibition (section 510(b)(5) proviso of SMCRA, 30 U.S.C. § 1260(b)(5)). At the same time the Congress did not speak to the question whether the authority should be exercised only when necessary to avoid a taking, or whether it should be exercised to avoid ever having to establish the existence or nonexistence of a taking in an alluvial valley floor mining prohibition. Thus the Congress never spoke to questions related to the exchange value of a tract on which the Secretary could lawfully prohibit mining. While the Congress did not direct the Secretary to establish a program for the exchange of federal leases subject to the alluvial valley floor mining prohibition, its intention to give the Secretary as much authority with lease exchanges as it gave him with private land exchanges seems clear. The exchange leasing regulations for coal lease modifications and bidding rights discussed above, however, are derived from discretionary authority granted the Secretary by the Mineral Leasing Act, and there is thus no Congressional direction to follow in this regard. The generic exchange authority passed by the Senate but deleted from the enacted version of S. 3189, the Act of October 30, 1978, would have superseded the Department's lease bidding rights exchange regulations, but left the lease modification and inter-mineral exchange regulations intact. S. Rep. No. 95-1169, on S. 3189 (at 6).

7. Potential legislation for purchase or condemnation of leases.

The exchange authorities set out above do not, however, include the authority to compel an exchange. The procedure is mutually voluntary, and the exchange will be consummated only if both the United States and the lessee are satisfied by its terms. In cases where the lessee is unwilling to consider an exchange proffered by the Secretary, or the Secretary and the lessee are unable to agree on the location or value of exchange tracts or rights, an operation which is exempt from the applicable unsuitability criterion will go forward unless the Secretary suspends the lease in order to seek legislation authorizing him to prevent the operation.

The Secretary has no generic condemnation authority over private interests in public lands and resources. Congress in 1976 gave the Secretary the authority to condemn rights-of-way "only if necessary to secure access to public lands." (Section 205(a) of FLPMA, 43 U.S.C. § 1715(a).) In 1978, Congress gave the Secretary the authority to terminate (in effect cancel) Outer Continental Shelf oil and gas leases. (Section 204 of the Outer Continental Shelf Lands Act Amendments of September 18, 1978, 43 U.S.C. § 1334(a)(2).) There is no comparable authority, however, for "onshore" federal mineral leases. This authority for federal coal leases was part of the same provision dealing with the exchange of federal coal leases that the Congress failed to enact as part of S. 3189, the Act of October 30, 1978, Pub. L. No. 95-554. The processes of approving mine plans, and assessing and designating leased lands unsuitable for coal mining, or rejecting petitions for designation, will be followed closely in the Department to determine whether coal lease condemnation authority, or the authority to compel the exchange of lease rights, should eventually be sought from the Congress in order to implement successfully the purposes of the unsuitability concept as a land-use planning and environmental protection mechanism.

C. DILIGENCE REQUIREMENTS ON LEASES ISSUED PRIOR TO AUGUST 4, 1976.

The FCLAA established diligent development and continued operation requirements for all federal coal leases issued after the passage of the FCLAA on August 4, 1976. Many of these requirements were derived, if not adopted, from the diligent development and continued operation requirements established by the Department for all existing leases by regulations issued in May 1976. The FCLAA requirements are applicable, however, only to the some 9 leases issued since August 4, 1976. All of the 525 or so existing leases that were issued prior to August 4, 1976, are subject to the diligence requirements established on May 28, 1976. (41 Fed. Reg. 21780.) The regulations were revised on December 29, 1976, to reflect the co-existing requirements of the May regulations for pre-FCLAA leases and the new requirements governing post-FCLAA leases. (41 Fed.

Reg. 56644.) The May regulations establish two discrete sets of requirements, diligent development standards and continued operation standards, which we will refer to below collectively as "diligence requirements." Because the administration of the May regulations will govern the development of the 500 plus leases to which they apply, their provisions and the issues in their administration are of significance to the Department. Following a discussion of the issues in their administration, the provisions of the December 1976 regulations to implement the FCLAA are discussed.

1. May 1976 requirements.

First, the regulations state that, for the purposes of the regulations, each lease is automatically a "logical mining unit" (LMU). (43 CFR 3500.0-5(d)(1977).) Thus, diligent development and continued operation requirements apply, strictly speaking, to an LMU, rather than a lease. The second requirement of the May 1976 regulations is the "diligent development" requirement that production of coal in commercial quantities from each LMU must begin within 10 years of the effective date of the rules. (43 CFR 3500.0-5(f)(2) (1977).) The regulation defines "commercial quantities" for this purpose as one-fortieth or 2 1/2% of the LMU reserves. Third, the May 1976 regulations also imposed the "continued operation" requirement that after commercial production begins, one percent or more of the lease reserves be mined annually. The annual percentage is to be calculated on a three-year basis, to allow for fluctuations in production levels that may be expected to occur. (43 CFR 3500.0-5(g) (1977).)

Fourth, the May regulations authorize the Secretary, at the request of a lessee, to combine the lease with other federal leases or private lands to form a larger LMU. This combination of leases or lands allows production on other federal or nonfederal lands that are part of the lease LMU to count toward compliance with these regulatory requirements governing federal leases. The ability to credit production on some lands against production obligations of other lands promotes more sensible development from both economics and resource conservation perspectives. The example regulations in the DES carry these diligence regulations into the new 43 CFR Group 3400 verbatim. In the absence of rulemaking by the Department of Energy (DOE) these rules would be re promulgated as they stand in June. DOE has transmitted draft regulations that would establish new milestone requirements, like the three-year mine plan submission requirement of the FCLAA, on existing leases, but it has drafted no changes in the requirements set out above.

2. Extensions and modifications of requirements.

The Secretary can, in the course of administering existing leases, modify these requirements for any specific LMU as follows. First, the ten-year period for achieving diligent development may be extended (upon application

by the lessee) for the length of time development is significantly impaired by: strikes or acts of God; administrative delay not caused by the lessee (such as completion of an environmental impact statement); or extraordinary and unforeseeable circumstances (coal price or market condition fluctuations do not qualify). (43 CFR 3520.2-5(c) (1977).)

Second, the Secretary has the discretion under the existing regulations to extend the ten-year period up to five more years upon application by the lessee if the extension period is necessary: to complete work on an advanced technology process (such as gasification or liquefaction); to develop a very large mine (over 2 million tons per year underground or 5 million tons per year surface mining at the initiation of production); or the firm commitment of the LMU coal to a use or sale after the ten-year period.

Third, it appears that the Congress in enacting section 6 of the FCLAA (30 U.S.C. § 207, as amended), did not repeal the Secretary's authority to suspend federal coal leases and all operations and obligations totally under section 39 of the Mineral Leasing Act (30 U.S.C. § 209). ^{4/} This type of section 39 suspension, authorized only in the interest of conservation of the natural resources, suspends the lease in its entirety, not just the running of diligence obligations. (43 CFR 3503.3-2(e).) Thus, if the Secretary were to order or consent to a suspension of this type under section 39 during the fifth year of the ten-year period in which diligent development must be achieved, and the suspension lasted two full years, no rental or advance minimum royalty obligation would be owed on the lease, and the lease would, upon termination of the suspension, still be in the fifth year of the running of its diligence requirements.

The statute is silent on how the Secretary is to exercise the discretion granted by section 39 to suspend leases, and the Department has never delimited that discretion by regulation. E.g., 43 CFR 3503.3-2(e)(1977). It is clear, however, that it is a broad authority, and is applicable to the situations described in the preceding paragraphs on extending or modifying the diligence requirements, as well as situations not embraced by those other authorities, such as administrative or judicial delay in taking action on timely development plans.

At the same time the Congress left almost wholly intact the Secretary's other type of suspension authority under section 39 of the Mineral Leasing Act—the authority to "waive, suspend, or reduce the rental, or minimum

^{4/} Section 6 of the FCLAA, 30 U.S.C. § 207 (1976), and the provisions it amended, 30 U.S.C. § 207 (1970), are the sources of both the diligence requirements and of the extension and modification authorities discussed above. Section 39, however, is not limited in application to coal leases, and was only slightly amended by the FCLAA.

royalty, or reduce the royalty on an entire leasehold" 30 U.S.C. § 209. This authority may be exercised whenever it is necessary "to promote development, or whenever . . . the leases cannot be successfully operated under [their] terms." This authority is now limited solely by the further provision that the Secretary cannot "waive, suspend, or reduce advance royalties." Section 14 of the FCLAA, 30 U.S.C. § 209 (emphasis added). Advance royalties are royalties paid in lieu of continued operation under the lease.

Finally, the Secretary has the authority to "extend" or "modify" the diligence requirements by waiving violations of the lease terms and governing regulations. Such a waiver may occur formally, in writing, under the authority set out above to waive payment obligations, or under the Secretary's general discretionary authority to administer leases in the public interest. In addition, a prosecution of a violation of a lease term, including a diligence requirement, might be temporarily "waived" or deferred by the Secretary's decision not to recommend initiation of a suit to cancel the lease or by the Justice Department's prosecutorial discretion to decline to initiate a suit requested by the Secretary. It must be noted, however, that the lease terms themselves have provided that a violation of the lease is not waived by the Department except in writing to the lessee (e.g., sec. 6(a) of 1920 lease form, 47 L.D. 489, 498 (1920)), and that the waiver extends only to the breach actually waived (sec. 3(e) of 1956 and 1967 forms).

Because of these authorities to extend and suspend the operation of the diligent development and continued operation requirements, it is difficult to quantify in any reliable fashion how much federal coal will be produced from what existing federal coal leases and when the production might commence, except by reference to the intentions of existing lessees. In addition, because of the manner in which the lease terms on diligent development and continued operation were administered prior to the issuance of the May 1976 regulations, there is not a substantial body of precedent on how these authorities are to be exercised. In the years immediately preceding the June 1, 1986, deadline for the initiation of commercial production from every existing federal lease LMU, the Department may have to "write the book" on how the Secretarial discretion to extend or suspend these requirements will be exercised.

3. Issues in implementation of diligence requirements.

Three more elements complicate establishing the timing and quantity of federal coal production over the next few years from existing leases in a systematic, reliable fashion. Resolution of the issues in the following discussion, and administration of the requirements set out below, will require substantial effort and cooperation among BLM, other offices of the Department, and the Department of Energy.

a. Readjustment of lease terms. Each existing coal lease is subject to readjustment every twenty years after issuance. For leases which will be readjusted in the near future, a number of changes in lease terms will be made that may greatly affect the lessee's plans with respect to development of his existing leases. (i) The royalty rate on production will increase to at least 12 1/2 percent of the gross value of the coal produced for surface-mined coal and at least 8 percent for underground coal. The first figure is statutory; the second regulatory (30 U.S.C. § 207, as amended; 43 CFR 3503.3-3(b) (1977)). This compares to current royalty rates as low as five cents per ton, the former statutory minimum royalty, and more commonly ten or fifteen cents per ton on many leases that are now or will soon be subject to readjustment.^{5/} (ii) The lessee will be required to submit a mine plan on the lease not later than three years after its readjustment. 30 CFR 211.10(a)(1) (1977). This statutory diligence requirement was not an element of the Department's May 1976 regulations, but will be imposed so that each lease maintained after readjustment is consistent with the FCLAA. (30 U.S.C. § 207(c), as amended.) (iii) The lease will be expressly conditioned to be subject to the Department's unsuitability criteria.

Around 85 leases are currently subject to readjustment, and around 250 more existing leases will be subject to readjustment through 1986. Of the leases now subject to readjustment, about 51 leases had their twentieth anniversary date prior to the passage of the FCLAA. Some lessees in administrative proceedings now pending have challenged whether the BLM has the authority to readjust these leases at all, and if it can, whether the readjustment can include the imposition of FCLAA royalty and mining plan submission requirements, or only those royalty and diligence requirements applicable prior to passage of the FCLAA. The appeals have been briefed, and await decision by the Board of Land Appeals. If the Board affirms the BLM's position, the lessees may still seek judicial review of the issue.

b. Problems in enforcing the May 1976 regulations. Our analysis of the regulations has led us to ask the Solicitor's Office to answer a series of complicated questions dealing with the enforcement of the May 1976 diligence requirements. In brief, these questions relate to two central themes: (1) are the May 1976 regulations in any way inconsistent with the Mineral Leasing Act itself?; and (2) how do the individual lease diligence terms relate to the May 1976 regulations?

The first theme is derived from the limitations in the Mineral Leasing Act itself on the Secretary's authority to cancel a coal lease, found in section 31(a) of the Act, 30 U.S.C. § 188(a). The second theme is derived

^{5/} Lessees who are unable to operate successfully under this higher lease term may petition to have the royalty reduced. 30 U.S.C. § 209; 43 CFR 3503.3-2(d) (1977).

from potential inconsistencies between the diligence provisions of specific leases issued between 1920 and 1976 and the diligence requirements of the May 1976 regulations. The Department, in promulgating the May 1976 regulations, made a number of assumptions about the nature and viability of the lease terms related to diligence that require close examination before any definite strategy for the enforcement of diligence requirements can be settled upon.

Without exploring the specific questions that inhere in these themes, we can set out the three possible scenarios that will unfold on the issue of enforcement of diligence requirements. First, if the questions raised in our analysis thus far are resolved to show that the May 1976 regulations were well-founded and enforceable, we will have the situation described above: existing leases will either be in production on June 1, 1986 or be subject to cancellation. If the questions asked lead to the answer that the May 1976 diligence regulations are by and large unenforceable, the Department will then turn to enforcing the diligence terms in the existing leases. Depending on the answers to a series of questions about the meaning of the lease terms themselves, this scenario may result either in the Department having the authority to enforce diligence requirements more strict than those in the May 1976 regulations, or the Department having to await lease readjustment before it can impose any effective, enforceable diligence requirements at all.

To summarize, there are three possible conclusions to this examination of the enforcement of diligence requirements: 1) the May 1976 diligence regulations may be enforced intact; 2) the Department will have the discretion to enforce lease diligence requirements at least as strict as the May 1976 regulations; or 3) the lease diligence terms will be found to be ineffective and the Department will have to await lease readjustment before it can impose effective diligence requirements.

The three possibilities are not as clearly distinct from each other as this summary indicates, and the Department may be in each of the three situations with respect to different classes of leases. We foresee this result because of changes in the diligence and other terms in the lease form, including changes made in 1956 and 1965 during the Department's most significant period of leasing. For example, the May 1976 regulations may be enforceable with respect to the more recent (post-1965) leases even if they are unenforceable with respect to earlier leases. For another example, changes in the lease diligence terms in 1956 and the manner in which the changed terms were administered may have rendered some diligence obligations in later leases unenforceable while the terms of earlier leases may still be fully enforceable. Thus each of the three possible situations outlined above with respect to enforcement of diligence obligations may, in the end, turn out to apply to some leases issued during certain periods on certain forms, or previously readjusted in a certain manner. The three situations, however, are the simplest accurate

characterizations of the postures in which the Department could stand when the questions that have been asked of the Solicitor's Office have been answered. We have asked the Solicitor's Office to give the questions that must be resolved to determine our diligence enforcement policies its highest priority.

c. Role of Department of Energy. While the Secretary remains solely responsible for the administration of existing leases, including the administration of the existing diligence regulations, only the Secretary of Energy is now authorized to promulgate regulations under the Mineral Leasing Act "which relate to the . . . establishment of diligence requirements for operations conducted on Federal [coal] leases . . ." (42 U.S.C. § 7152(b), (b)(3).) Thus any regulatory changes enacted on DOE's initiative, and any regulatory changes the Secretary of the Interior might seek after full consideration of the issues set out above, are the responsibility of the Secretary of Energy after consultation with the Secretary of the Interior. (42 U.S.C. § 7153(b).) As noted above, DOE has transmitted for Departmental review regulations that would establish new milestones to be met by a lessee in order to be diligently developing his lease.

D. DILIGENT DEVELOPMENT AND CONTINUED OPERATION ON LEASES ISSUED AFTER AUGUST 4, 1976.

Congress' revision of section 7 of the Mineral Leasing Act, 30 U.S.C. § 207, in section 6 of the FCLAA (90 Stat. 1087), has meant that all leases issued since August 4, 1976, and earlier leases readjusted after August 4, 1976, are subject to somewhat different diligence and continued operation requirements than leases issued prior to August 4, 1976, which were discussed above.

1. FCLAA requirements.

The first requirement of the FCLAA is almost identical to the Department's May 1976 regulations: the lessee must be producing coal in commercial quantities in the tenth lease year. Any lease which is not producing at that time shall be terminated. "Commercial quantities," undefined by the statute, is defined by the December 1976 regulations implementing the FCLAA to mean one percent of the LMU reserves. (43 CFR 3500.0-5(f)(1) (1977).) In contrast, the Department's May 1976 regulations defined "commercial quantities" for the purpose of measuring diligent development as two and one half percent of the LMU reserves. In addition, the lessee must produce at a rate that will result in the exhaustion of the reserves in forty years from the date of approval of a mine plan.

Second, the December 1976 regulations require continued operation in an amount equal to the pre-FCLAA lease requirements: production of one

percent of the LMU reserves annually, with computation on a three-year basis. (43 CFR 3500.0-5(g) (1977).)

Third, a provision of section 5 of the FCLAA, 30 U.S.C. § 201(d)(6), authorized the Secretary to require each (post-FCLAA) lessee to form a logical mining unit (LMU). The Secretary so provided in the December 1976 regulations. (43 CFR 3520.2-6(a) (1977).) Thus the diligent development and continued operation requirements apply to an LMU, strictly speaking, rather than a lease. To restate what is also true of LMU's containing pre-FCLAA leases, this allows: (1) production on nonfederal lands that are part of the lease LMU to count toward compliance with these regulatory requirements; and (2) federal leases to be combined into a single LMU for purposes of more sensible development from the perspective of both economics and resource conservation. (43 CFR 3520.2-6(b).)

Fourth, the Congress added the milestone requirement that the lessee submit a mine plan within three years of lease issuance. (30 CFR 211.10(a)(1) (1977).)

Fifth, the FCLAA has a separate, independent "diligence" requirement that will apply no matter what is the eventual resolution of the questions on the relationship between the lease and regulatory diligence requirements. Section 3 of the FCLAA prohibits the Secretary from issuing a lease to anyone who holds (or is affiliated with one who holds) a lease that has been held for ten years and is not producing coal in commercial quantities. (30 U.S.C. § 201(a)(2)(A).) This provision applies to leases issued before and after the FCLAA, and becomes effective on August 4, 1986. The Secretary has no authority to accelerate or delay this date; only the Congress can change it.

2. Extensions and modifications of requirements.

Section 7(b) of the Mineral Leasing Act (30 U.S.C. § 207(b)), although amended by the FCLAA, continues to authorize the Secretary to accept advance minimum royalty payments in lieu of continued operation. The statute requires the payments to be set on a fixed reserve-to-production ratio. Unlike the earlier lease clauses, however, the statute limits the number of years in which advance royalties can be accepted to ten, and prohibits the lessee from offsetting the advance royalties paid in the first twenty lease years against actual production royalties owed after the twentieth lease year.

The diligent development and continued operation requirements may be extended for the length of time operations "are interrupted by strikes, the elements, or casualties not attributable to the lessee." (30 U.S.C. § 207(b).)

The Secretary retains the authority to suspend a lease in its entirety in the interests of conservation under section 39 of the MLA (30 U.S.C. § 209.) This authority is discussed in part C.2.(c). above with respect to earlier leases.

The Congress' revision of the diligence requirements did not, however, leave the Secretary with the discretionary authority to defer compliance with the diligence and continued operation requirements in cases of advanced technology demonstration, development of large-scale mines, or firm delivery commitments for the lease coal after the ten-year period, as set out in part C.2.(b). above. (43 CFR 3520.2-5(c)(2).)

Although there are currently only 9 newly-issued and 11 readjusted leases subject to these provisions, it is again evident that it is difficult to predict with certainty when, within the ten-year period after issuance, a given lease will become productive. There is only the assurance that each lessee will submit its mine plan not later than three years after lease issuance, and produce coal in commercial quantities in the tenth lease year, or the lease shall be terminated.

3. Issues in implementation of diligence requirements.

Leases issued after August 4, 1976, do not contain specific provisions for diligent development and continued operation like those in older leases discussed at length above. Rather, they simply incorporate as the diligence requirements the applicable regulatory requirements, that is, the regulations issued December 29, 1976, to implement section 6 of the FCLAA, 30 U.S.C. § 207 (1976). (41 F.R. 56644.) Thus they present no issues of potential conflict between lease terms and regulatory requirements.

In addition, leases issued after August 3, 1977, are clearly and now expressly subject to the Department's unsuitability criteria, so that issues related to the exemption of lands from those criteria will be less likely to arise.

Finally, new leases as well as old are subject to the transfer of rulemaking authority related to diligence to the Department of Energy. To the extent these diligent development and continued operation requirements are not required by law, they are subject to amendment by the Secretary of Energy on his own initiative or at the request of the Secretary of the Interior.

E. ASSIGNMENTS OF LEASES.

Many leases are not presently held by those who first received them. Because there have been assertions that an undesirable speculative resale market exists in federal coal leases, the Department has begun to consider whether it should take any action to control the assignment market. In

turn, this requires the Department to examine its authority to deny or condition approval of lease assignments, especially on non-producing leases where the transfer would not clearly promote prompt development of the lease.

Section 30 of the Mineral Leasing Act, 30 U.S.C. § 187, provides, "That no lease issued under the authority of this Act shall be assigned or sublet, except with the consent of the Secretary of the Interior." This authority appears on its face to be without limitation, in contrast to the limited authority to disapprove oil and gas lease assignments contained in section 30a of the Act, 30 U.S.C. § 187a, under which the Secretary can only disapprove assignments where the assignee is unqualified to hold the lease or is unbonded.

Up to now, the Department has examined assignments only to assure compliance with a specific group of public purposes. First, the Department requires the assignor's lease account to be in good standing. All accrued rental and royalty obligations must have been paid, and any known violations of lease terms must be resolved, including compliance with reclamation or other environmental stipulations. (43 CFR 3506.2-4.)

Second, the Department is expected to examine and approve the assignee's qualifications. This includes: (1) computing acreage holdings to assure compliance with 43 CFR 3501.1-4(b)(1); determining the qualifications of the holder under the corporation or association information and citizenship requirements of 43 CFR Subpart 3502 (43 CFR 3506.2-2); (3) receiving a sufficient bond from the assignee, or consent from the assignor's surety to the substitution of the assignee on the bond (43 CFR 3506.2-3);^{6/} and (4) evaluating whether the outstanding private royalty interests exceed fifty percent of the federal royalty interest (43 CFR 3503.3-2(c)(3)).

In addition to these considerations governing approval of assignments, the Assistant Secretary, Energy and Minerals, has asked the Solicitor's Office whether the statutory requirement that assignments be approved (30 U.S.C. § 187) allows the introduction of other considerations into the approval process. Specifically, could assignment approval be conditioned on acceptance of adjustment to the royalty, rental, or diligent development and continued operations provisions of the lease? As noted above, the general lease assignment provision, in contrast to the provision related to the assignment of oil and gas leases and Secretarial approval

^{6/} For partial assignments, both the remaining interest of the assignor and the assignee's interest must be properly bonded. Bonding for reclamation liability will soon become an OSM function, and will drop out of consideration by BLM in approving assignments. OSM will have separate regulatory provisions governing the assignment of OSM permits to mine, and the rights and obligations attached to them.

of such assignments, 30 U.S.C. § 187a, is on its face without limitation. The existence of additional authority to condition approval of assignments could be of significance. If the answers to the questions posed in the diligence discussion above indicate that the May 1976 requirements and other lease diligence provisions may not be imposed on pre-FCLAA leases until the twenty-year readjustment comes due, some of those diligence policies might be implemented through the process of approval of lease assignments.

If the authority to condition or disapprove assignments for reasons not currently in the Department's regulations exists it might be exercised to prevent speculative sale and resale of coal leases even if none of the questions raised in the diligence discussion above are resolved in a manner that would frustrate existing diligence and continued operation policies. In any event, formulation of the issues suitable for policy guidance in this area must await legal guidance on the existence of any relevant limitations on the Secretary's authority to condition or disapprove assignments.

One policy that might be established in the exercise of additional authority to condition approval of assignments is review of assignments by the Justice Department for any inconsistency with the antitrust laws. Section 15 of the FCLAA requires antitrust review of lease issuance and readjustment. (30 U.S.C. § 184(1).) It does not expressly prohibit antitrust review at other points in the life of a coal lease.

F. ENVIRONMENTAL IMPACT STUDY STRATEGY.

1. Background.

As the Department completed its first programmatic coal leasing environmental statement (ES), and began to implement the Energy Minerals Activity Recommendation System (EMARS) (43 CFR Subpart 3525), it divided the major federal coal areas into regions and initiated studies of impacts of proposed federal coal development in each of the designated regions. The focus of each study was a Departmental projection of the probable level of federal coal leasing under the EMARS, and the probable level of federal coal development (through coal mine plan approvals by Geological Survey). The regional ES's discuss the cumulative impacts of different levels of specific lease issuance or mine plan approval decisions the Department might make. The Department did not, however, propose "coal development plans" for the regions covered in the statements.

At the same time, each regional statement includes site-specific analyses of each discrete proposal within the region that constitutes a major federal action. Some of the site-specific analyses may require supplemental work, to the extent the mine plans have been prepared and analyzed without fully accounting for the performance standards now applicable under SMCRA. The cumulative impacts of the several site-specific

proposals and the relation of each to expected non-federal regional coal development is embraced in the regional analysis portion of the regional ES.

At the time of the issuance of the District Court injunction in NRDC v. Hughes, the eight regional ES's included site-specific analyses of some 32 mine plan approval applications. They also considered new competitive coal leasing proposals. Because the injunction prohibited taking any action, directly or indirectly, to implement the program for new leasing, the Department ceased processing coal lease applications (except those which met the court's short-term criteria), and ceased work on all analysis in the regional ES's directly and exclusively related to new competitive coal leasing at a specific site. Specifically, the enjoined EMARS nominations, proposed leasing activities and the identification and study of leasing tracts were deleted. In lieu of specifically studying the proposed new leasing tracts in each region, the Department is calculating regional, cumulative impacts based on alternative coal development scenarios that might result from development of existing leases and possible new federal leasing, although at least one development scenario in every statement is based on no new federal leasing.

When the regional ES's are completed this year, the Department will have to make decisions on the 32 mine plans within the eight regions. In addition, there are three applications for mine plan approvals outside the areas covered by the regional ES's. These plans are being covered by separate site-specific ES's.

2. Mine plan approval under the new program.

If no new leasing is found to be required by the new programmatic study, environmental study of the development of existing leases would proceed in the context of the existing completed regional or comprehensive environmental statements. In other words, a site-specific environmental statement would be prepared by Geological Survey (or by OSM when it assumes this aspect of its function) as a lead agency in the approval of mine plans, especially for surface mines. The regional or cumulative impacts of the proposed operation would in many instances already be analyzed as part of an alternative development scenario of regional development. The regional impact portion of the mine plan ES would normally be limited to an analysis whether the proposal's impacts significantly depart from a regional development scenario already fully studied. Only if it is not would a full exploration of non-site specific matters be required. This is consistent with the newly revised Council on Environmental Quality regulations governing compliance with the National Environmental Policy Act (NEPA). (40 CFR 1502.20, 1508.28(b), 43 F.R. 55978 (November 29, 1978).)

If new leasing is found to be required, the Secretary's preferred alternative would be implemented by region-by-region identification of need for leasing, and regional tract delineation, ranking, selection, and sale scheduling. An integral element in the tract ranking, selection, and sale scheduling process, of course, will be environmental study of the tracts delineated in the regions where leasing will occur.

While half of the environmental study in this process will examine the impacts of developing the delineated tracts, the other half will be an examination of the regional impacts of the regional leasing proposal. The regional impact portion of the environmental study may, to the extent that the regional leasing proposal is consistent with a level of development that has already been studied in an the existing comprehensive ES, be simplified by the use of the analysis in the existing ES. The more fully developed regional environmental analysis will include a discussion of development of existing leases and may incorporate any pending mine plans as site-specific impact studies in the regional new-leasing statement. The Department may not have to do another environmental statement on mine plan approval for new leases; the specific and regional impacts should already have been fully discussed for NEPA purposes. Fresh environmental study of mine plans on existing lease cannot be avoided. It may be simplified, however, either by treatment of the mine plan on a site specific basis in a regional leasing ES, or if the timing of the studies prevents that, by use of the regional impact analysis from the prior comprehensive or regional leasing ES in the separate ES on the mine plan.

In regions in which no new leasing is necessary, environmental analysis of mine plans on federal leases could continue just as it has occurred in the regional ES's now being completed with no leasing proposals in them. Finally, if a mine plan is submitted on a lease that is outside all areas in regional environmental studies, it will be studied discretely unless there are other coal development proposals before the Department that would justify or require joint study.

III. NONCOMPETITIVE (PREFERENCE RIGHT) LEASE APPLICATIONS

A. REGIONAL LEASING TARGETS

The process by which regional leasing targets will be established is set out in part II.A. above. Potential production from preference right leases will be one important component of the expected regional production predictions from which leasing needs will be derived. As was indicated in Part I above, preference right lease applications embrace lands that are estimated to contain 9.9 billion tons of coal. The amount of that coal that will finally be leased and developed is and will be uncertain for some few years, since the applicants' entitlements to leases have not yet been determined, and the process of lease adjudication under

the Department's May 1976 regulations defining "commercial quantities" of coal incorporates environmental analysis under NEPA. Table V, also taken from Chapter 2 of the DES, shows the Department's best estimate of potential production from lands now under preference right lease application. It, like the table of planned production from existing leases discussed above, is derived from a systematic examination of pending lease applications.

B. UNSUITABILITY OF LANDS

1. How the criteria are applied.

The preceding discussion on the applicability of the unsuitability criteria to existing leases is generally applicable to preference right lease applications, but there are some significant differences. Most of the differences are derived from the fact that the noncompetitive lease applicant's right to the lease had not yet been adjudicated at the time the SMCRA was passed, so that application of the criteria will occur during, and as an integral part of, adjudication of the right to a lease.

Lands in preference right lease applications will have the criteria applied in the development of a land-use plan, or supplementation of an existing land-use plan, for the area if either action occurs prior to adjudication of the lease right itself. Application of the criteria will first be completed, then the exceptions to any relevant criterion will be applied. (The exceptions to each proposed criterion are set out in section 3461.2 of the example regulations with each criterion.) If a criterion applies, and no exception applies, the Bureau of Land Management or other surface management agency will determine whether the lease application is exempt from the criterion because of the source of authority for the criterion. As indicated in Part II.B.1 above, some criteria are subject to no exemptions, the application of some criteria is subject to "valid existing rights," and some criteria do not apply to the mining of lands on which mining permits have issued or in which substantial financial and legal commitments have been made.

If land-use planning, or the supplemental application of the unsuitability criteria to lands in existing land-use plans, has not occurred on the applied for lands at the time of lease right adjudication, the criteria will be applied as part of the adjudication process. Under the regulations for determining whether the applicant has discovered commercial quantities of coal, and thus has a right to a lease, the applicant first makes a showing containing the geological information about the thickness and quality of the coal deposits discovered during prospecting. (43 CFR 3521.1-1(b) (1977).) The Department then does a technical and environmental assessment designed to evaluate the applicant's showing and develop any necessary environmental protection or reclamation stipulations that the Secretary intends to impose on the lease. This latter step will include

application of the unsuitability criteria and their exceptions, and the determination whether the lands are exempt from the criteria. (See 43 CFR 3521.1-4, 3521.1-5 (1977).)

In this process, the determination that a criterion applies, but that an exception would also apply if appropriate mitigating steps were taken, could lead to the recommendation of a specific lease stipulation. Consistent with both the unsuitability process and the lease adjudication process, the Department would submit the recommended lease terms and stipulations to the applicant to allow the applicant to formulate his final showing, which includes estimates of the costs and revenues from the potential lease operation subject to those terms and stipulations. The adjudicator would then determine whether the applicant has discovered commercial quantities of coal and is entitled to a lease. (43 CFR 3521.1-1(c) (1977).) This process was approved (although not in direct reference to unsuitability) as complying both with NEPA and the noncompetitive leasing provisions of the Mineral Leasing Act in Natural Resources Defense Council (NRDC) v. Berklund, 458 F. Supp. 925 (D.D.C. 1978), appeal pending.

For example, the land could be assessed as a wilderness study area by the BLM, but because an underground mine is involved, stipulations to control the location of the mine portal and surface facilities, and mining method stipulations to prevent or mitigate subsidence, would assure nonimpairment of wilderness suitability. The relevant exception to the criterion would be found to be applicable, and the applicant's entitlement to a lease would be determined on the basis of those stipulations.

2. Unsuitability designations.

As would be the case with existing leases, formal designation of lands would be a separate step from application of the criteria, and would occur only in response to a petition. With respect to lands in noncompetitive lease applications, the petition process could occur either prior to the adjudication of the lease right, by itself or during land-use planning, or in the adjudication process itself. The environmental assessment on the lease application might, for instance, recommend that certain areas of the tract be assessed or designated unsuitable for all or certain kinds of surface mining operations. One of three things would then occur.

First, if the lease applicant is exempt for whatever reason from assessment or designation of those applied for lands as unsuitable, the Department may seek to initiate an exchange of lease rights for that area or, if it appears to be in the public interest, the entire lease. Exchanges are discussed in greater detail below. If the lease applicant were uninterested in an exchange, then the lands could not be designated unsuitable

nor mining prohibited, and adjudication of the lease application would have to proceed. Even though mining on that area or in that manner could not be prohibited by formal designation, the Secretary could still include reasonable mitigating stipulations in the proposed lease on which the applicant would make its final showing.

Second, if the lease applicant is not exempt from designation, formal designation as unsuitable or prohibition would occur and the lease applicant could elect whether to delete the unsuitable lands from the application as adjudication proceeds. This is the Department's construction of the language of the former preference right leasing provision, 30 U.S.C. § 201(b) (1970), that

if . . . the permittee shows to the Secretary
that the land contains coal in commercial
quantities, the permittee shall be entitled to
a lease . . . for all or part of the land in
his permit. (Emphasis added.)

In our view, the U.S. District Court in NRDC v. Berklund did not reject this construction. (458 F. Supp. at 938, discussed in Memorandum of November 2, 1978, cited above, "Legal Issues in the Draft Coal Regulations.") The "costs" and "revenues" of mining the prohibited tract or of mining in the prohibited manner would simply drop out of the calculations leading to the determination of "commercial quantities," and the lands would not be leased.

Third, if the lands are designated as unsuitable or mining is prohibited, and the applicant chooses not to delete them from the application, the Department will have to formulate a method for determining the costs and revenues of mining a tract or deposit that would be included in the lease, but which the lessee would be prohibited from mining unless and until (i) improvements in mining or reclamation technology brought the land or deposit under an exception and the designation as unsuitable or mining prohibition was terminated; or (ii) the unsuitability criteria are amended to delete the criterion prohibiting mining on the tract or deposit in question.

The two immediately preceding options in this section 2 raise an issue that deserves discussion at this point. The noncompetitive lease applicant's application for a lease is a "valid existing right" saved from the repeal of the noncompetitive leasing provision of the Mineral Leasing Act by section 4 of the FCLAA, 90 Stat. 1085-1086. This "valid existing right," the fact that the noncompetitive lease applicant has the right to adjudication of his entitlement to the lease, and a right to the lease if he is found entitled, does not mean that the applied for lands are automatically exempt from the application of the unsuitability criteria. In other words, the right to have entitlement to a lease adjudicated is

substantially different from and substantially less than an unencumbered right to a lease that contains no restrictions on the lessee's authority to mine certain coal or to mine using certain methods. Thus, a company's holding a preference right lease application alone is not "substantial legal and financial commitments" that would exempt the applicant from unsuitability designations based on criteria derived from section 522(a) of SMCRA, where that phrase for exemptions is found. More importantly, the pendency of a preference right lease application is not per se the existence of a "valid existing right" to mine that would exempt the lease applicant from designation of the applied for lands as unsuitable because of criteria derived from section 522(e) of SMCRA, where that phrase for exemptions is found. The crucial distinction the Department has concluded the Congress intended in the application of these criteria is the difference between a valid right to mine that land or to mine it in a certain manner and a valid right to have one's entitlement to a lease determined.

For instance, the Congress could not have intended to give noncompetitive lease applicants greater protection from unsuitability designation than it gave to existing lessees. This is especially true in light of the fact that the Department has long held that a noncompetitive lease applicant may earn a right to a lease, but that he does not have the right to a lease containing any specific terms or on any specific form. (Montana Eastern Pipe Line Co., 55 I.D. 189, 191 (1935).) It is clear to the Department that the Congress may alter the terms under which leases will be issued after a certain date and that those terms will apply to non-competitive as well as competitive leases issued after that date. Thus the Department regards noncompetitive leases issued after August 4, 1976, as subject to the royalty and diligent development requirements of section 6 of the FCLAA (30 U.S.C. § 207, as amended), and leases issued after August 3, 1977, as subject to the unsuitability assessment and designation authorities of section 522 of SMCRA, except as the Congress itself limited the coverage of section 522. (See Memorandum of November 2, 1978, cited above, "Legal Issues in the Draft Coal Regulations.")

3. Petitions to designate lands.

The petition process established by section 522(c) of SMCRA applies to lands under preference right lease application as well as it does to any other lands. The process itself is amply set out in Part II.B.2. above, and need not be repeated. How actual designation applies to noncompetitive lease applicants and lands in those applications is set out in the section above (III.B.2.). The filing of a proper petition on lands in a preference right lease application will probably activate the technical and environmental assessment for adjudication of that lease application, since the examination of the lands in response to the petition, and the findings to be made after any hearing on the petition are, as discussed above, an integral part of the determination of appropriate lease stipulations, and thus of the commercial quantities determination.

4. Exchange of unsuitable lands.

The same authorities set out and discussed in Part II.B.3. above are applicable to exchanges arising out of noncompetitive lease applications: lease application for coal lease if the lease application is in an alluvial valley floor; lease application for other mineral lease, coal lease modifications or future lease sale bidding rights if it is not. In addition, on October 30, 1978, the Secretary was authorized to consummate a "lease" exchange for 8 preference right lease applications held by Utah Power and Light Company in the Kaiparowits Plateau area of Southern Utah. (Section 1(a) of P.L. 95-554, 92 Stat. 2073.)

The same difficulties that attend lease-for-lease exchanges also attend the exchange of a preference right lease application for a lease but some additional questions arise. The Department's December 1977 exchange regulations require that the Secretary determine that the lease applicant has a preference right to a lease before he can consummate an exchange. With the class of exchanges motivated by the fact that the lease applicant is exempt from designation of the lands as unsuitable though criteria clearly apply to the lands, this presents no problem. When the Secretary determines, upon the applicant's final showing, that the applicant discovered commercial quantities of coal on the lands, the lease would issue unless an exchange is proffered and consummated (or legislation to prevent the mining by condemnation or otherwise is sought).

In cases where the unsuitability criteria do apply, the requirement that the right to a lease must be determined may moot the exchange. When the lease applicant demonstrates that he is entitled to a lease even when the costs of complying with protective or mitigating stipulations are considered, and even if the applicant deletes portions of the lands from the application or some types of mining are prohibited by designation, the motivation for an exchange may be gone. The lease applicant will have designed an approximate plan of operation to complete its final showing, and will have committed itself to that extent to that operation. It will also have a clear concept of the economic desirability of the operation. From the Department's view, it does not on its face appear to be in the public interest to try to prevent (by exchange) operations for which the operator has demonstrated that he can make a profit even when all reasonable environmental protections and mitigating measures are taken in account in that determination.

The motivation for an exchange is strongest prior to assessment or designation of the lands as unsuitable and determination of the right to a lease. The applicant seeks to avoid the risk of being found to have no right to a lease, and to avoid the time and expense of formulating and establishing the economics of a plan of operations it is not interested in carrying out. The United States seeks to avoid the risk that the applicant will prove commercial quantities and proceed to mine the tract

in question, and to avoid the time and expense of an environmental assessment, or possibly an environmental statement, to formulate lease terms and protective stipulations for a lease on lands which no one wants to have mined.

As was stated above, the present exchange regulations require that the determination of entitlement be made before an exchange may be consummated. The formulation of policies whether to delete this requirement or not must await guidance on two questions: (a) is it lawful for the Secretary to determine the existence of commercial quantities of coal without having completed the procedures set out in the May 1976 commercial quantities regulations (43 CFR Part 3521); and (b) is it lawful to issue a lease or lease rights in exchange for the relinquishment of a preference right lease application on which a commercial quantities determination has not been made?

5. Unclaimed, undeveloped lands.

There is one additional complicating factor in the process of noncompetitive lease right adjudication, the impact of which is not yet quantified. While it is not strictly an "unsuitability" question, it will affect how many lease applicants will be entitled to leases and how much acreage is eventually leased in response to preference right lease applications.

The coal prospecting permit provision of the Mineral Leasing Act, prior to its amendment in 1976 by the FCIAA, authorized the issuance of permits only on "unclaimed, undeveloped" lands. The preference right lease applications now pending before the Department are derived from permits which were issued without any showing by the applicant or finding by the Department that the lands were "unclaimed" and "undeveloped."

In Solicitor's Opinion M-36893, 84 I.D. 442 (1977), the Solicitor concluded that permits (and preference right lease applications based on them) issued on "claimed" lands were potentially void for those lands. That opinion chiefly dealt with the threshold question whether that statutory phrase was still viable or had been repealed by implication. Since the Solicitor concluded that the statutory phrase was still viable, the BLM has asked a follow-up series of questions about: (1) the meaning of the term "undeveloped;" (2) what types of claims may void a lease application—currently valid claims, claims valid when the permit issued, or mere subsisting locations; and (3) what procedures should be used to resolve the potential conflicts. This last question asks whether the lease applicant must contest the mining claim, whether the BLM must challenge the validity of the permit or whether the mining claimant must challenge the permit.

All coal preference right lease applicants were directed in August and September 1977 to submit title abstracts for the permit lands to establish whether any mining claims exist on the lands. BLM needs to have the answers to its follow-up questions, however, before it can integrate this step into the process of adjudicating rights to leases on those applications found to contain lands subject to mining claims. BLM Coal Task Force 124 reported in May 1978 that abstracts submitted for 118 applications revealed 20 applications overlying 465 mining claims.

C. DILIGENT DEVELOPMENT AND CONTINUED OPERATION

1. What requirements apply?

As set out in the unsuitability discussion above, the Department has long maintained that a preference right lease applicant has no right to a lease containing specific terms or on a specific lease form. (Montana Eastern Pipe Line Co., 55 I.D. 189, 191 (1935).) Both competitive and noncompetitive leases issued prior to August 4, 1976, were issued on the same forms subject to the identical diligence and royalty requirements—those established by section 7 of the Mineral Leasing Act. (30 U.S.C. § 207 (1970).) Likewise, the Department regards both competitive and noncompetitive leases issued after August 4, 1976, to be subject to the same lease requirements—those established by section 6 of the FCLAA. (90 Stat. 1087, 30 U.S.C. § 207 (1976). Memorandum of November 2, 1978, cited above, "Legal Issues in the Draft Coal Regulations.")

The requirements of the FCLAA for diligent development and continued operation are set out in Part II.D.1 above. They are fully applicable.

In addition, the authorities to extend and defer compliance with these requirements are identical for preference right and competitive leases. These are set out in Part II.D.2. above.

2. Issues in implementation of diligence requirements.

The current lease form does not contain specific diligence provisions. Rather, it incorporates the applicable regulatory diligence requirements. These leases are, of course, subject to the authority of the Department of Energy to promulgate regulations related to diligent development and continued operation. They are also subject to the requirements of SMCRA with respect to the permitting of operations and, consistent with the exemptions discussed above, the application of unsuitability criteria, including the petition process. There are some points worth mentioning about operations under preference right leases.

First, in the course of establishing his right to the lease, the applicant will have devised something which approximates a draft plan of operations

for the lease. Because of that investment and the momentum the adjudication process will provide, the Department assumes that preference right leases issued during the program may be developed more promptly than existing leases on which there is not even the requirement to submit a mine plan in three years. This may not be true in every case, but it will be a consideration in the formulation of potential coal supply predictions in regions where preference right leases are being issued. In any event, as new leases, preference right leases will be subject to the requirement that a mine plan be submitted in three years.

Second is an issue that is not strictly a diligence matter, but it is certainly a matter to be considered when production from potential preference right leases is factored into regional coal supply and demand evaluations. The revised section 7 of the Mineral Leasing Act establishes minimum royalty requirements, but it establishes no maximums. (30 U.S.C. § 207 (1976).) The statute does not provide that preference right lease applications must be processed on the assumption that the statutory minimum royalty will be applied to the lease. Clearly the establishment of a policy to impose higher royalties could have major impact. For instance, all preference right lease applications could be adjudicated using the minimum royalty figures to determine the applicant's entitlement to a lease. As a matter of policy the Department would then calculate what higher royalty, if any, should be set in the lease to be issued in order to capture for the United States the fair market value of coal leased noncompetitively. On leases that meet the commercial quantities test without any more than the reasonable profit that earns the entitlement to a lease, the royalty would be set at or near the minimum rates. On leases where the minimum royalty rate would allow the lessee a substantial surplus or windfall profit, the royalty would be raised above the minimum accordingly.

Policy on this question is important for two other reasons. First, a similar issue is present in the readjustment of existing coal leases. It appears that readjustment of royalty may be the opportunity for the Department to establish its right to the fair market value of production from leases, especially nonproducing leases, that were issued noncompetitively or "competitively" for insignificant bonuses. Second, policy in this area must be mindful of the fact that some land owners, who hold coal that is most properly developed in conjunction with federal leases, provide in their private leases that the applicable royalty will be that established in the federal lease for the adjacent federal coal. Any policy to maximize royalty payments on such leases may directly result in increases in the cost to the lessee of private coal being developed in conjunction with the federal lease, which may be passed directly to the utility company or other purchaser of the federal and nonfederal coal.

D. ENVIRONMENTAL IMPACT STUDY STRATEGY

In NRDC v. Berklund, 458 F. Supp. 925 (D.D.C. 1978), which is now before the Court of Appeals, the U.S. District Court held that the National Environmental Policy Act fully applies to preference right lease issuance. It held that the Secretary's lack of residual discretion to reject an application once he determines that the applicant has shown commercial quantities of coal on the lands does not render NEPA inapplicable. It also held that the scope of the "proposed action" on which the Department must determine whether an environmental statement is required is the whole lease and potential operations thereon, not just the portion of the proposal with respect to which the Secretary has the discretion to formulate lease terms and mitigating measures. Unless and until the Court of Appeals for the District of Columbia Circuit reverses Berklund, the Department will follow its directives on how to implement NEPA in preference right leasing.

1. NEPA compliance and unsuitability determinations.

As set out above, the adjudication of a preference right lease application includes an environmental assessment of the potential operation. Whether this assessment will be a formal environmental statement will be determined, using normal NEPA standards and considering the full scope of the impacts of the potential lease operations, in response to the applicant's initial showing regarding the coal discovered in the tract. Again as indicated above, the unsuitability criteria will be applied, exceptions considered, and exemptions evaluated, as part of this environmental assessment. The imposition of protective stipulations on lease operations or the designation of some or all of the lands as unsuitable for some or all types of mining operations will be considered as mitigating measures and alternatives, respectively, in this analysis. Exchange of lease rights or legislation to authorize lease-for-lease exchange or purchase of the lease rights may be alternatives considered in the analysis.

Complete environmental analysis of potential lease operations will thus be completed as part of the adjudication of the applicant's entitlement to the lease.

2. Mine plan environmental analysis.

Because of the full environmental study that will have been completed in the process of lease adjudication, mine plan approval may be shortened and simplified. To the extent that the mine plan submitted for approval does not deviate from that studied in lease issuance, and to the extent that adjudication of the entitlement to a lease included the costs of compliance with lease stipulations and predicted performance conditions related to proper reclamation under SMCRA, no duplicative environmental

analysis or impact statement will be required. Only where the mine plan deviates from that studied in lease adjudication, and where the OSM's participation in predicting permit terms cannot be complete, or the reclamation standards change (or unsuitability designations are terminated), will new environmental review or a new environmental statement be required. Even though a different agency (Geological Survey or OSM) will be the lead agency on this analysis, the process of surface mining permit or mine plan approval should be vastly simplified by the environmental review completed during lease adjudication.

3. Relation to program environmental studies.

If adjudication of a preference right lease were occurring while a regional environmental statement were being completed for proposed competitive lease tracts in that region, the assessment for the preference right lease could become part of that regional study, most likely as a site-specific study as part of the regional lease sale statement. It would then be treated much like a site-specific study of a mine plan on an existing lease is treated in one of the current regional environmental statements. Under the third program alternative, in which preference right leasing would occur to the exclusion of competitive leasing (DES Ch. 3.1.3), the Department could do case-by-case environmental study, or in areas containing numerous preference right lease applications, "regional" preference right leasing environmental statements could be formulated. Whether the latter would be a sensible strategy would depend on how the priorities for the adjudication of the pending preference right lease applications would be established: according to degree of potential environmental damage; according to regional demand; or according to length of time pending.

IV. CONCLUSIONS

Two things are immediately clear on examining the status of existing federal coal leases and preference right lease applications: they may contribute significantly to meeting coal production goals in the regions where they are; and their administration may well require a significant share of the Department's manpower and resources that are devoted to coal.

Another point, however, is also evident from the preceding text: the administration of existing leases (and to a lesser extent preference right lease applications) is subject to substantial uncertainty until a number of legal and policy issues are resolved. Until a comprehensive road map to application of the diligence requirements on existing leases is developed, it will be difficult to predict when existing leases will come into production until mine plans are submitted for them. Until existing land-use plans in federal coal areas have been supplemented with updates that apply the Department's unsuitability criteria, it will

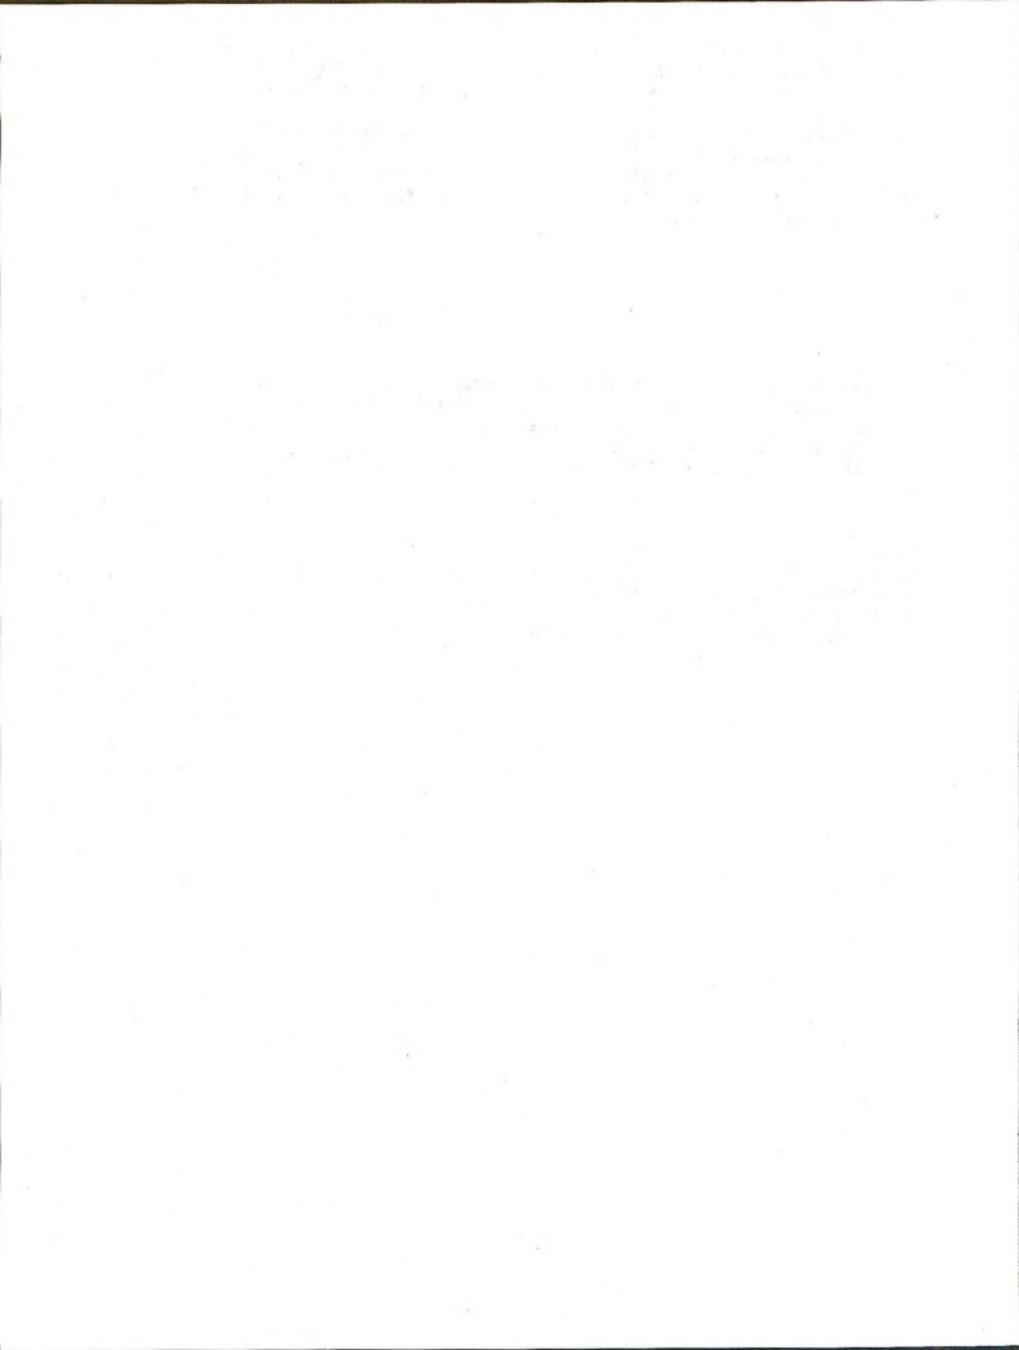

be difficult to predict how severely they will affect development plans and production potential from existing leases and lease applications, and what sorts of challenges may be mounted to their application.

The Solicitor's Office has been asked to give expedited consideration to the legal questions identified above, and this office will prepare any necessary decision option document on the policy issues that are outlined above, and that may arise out of the conclusions reached by the Solicitor's Office on the legal questions.

FEDERAL COAL PRODUCTION REGIONS BY COUNTY

FEDERAL COAL PRODUCTION REGIONS BY COUNTY

This appendix lists the counties which are located either partially or totally within the regional boundaries indicated in Figure I-1. These are the counties presently intended for the official description of the Federal coal production regions should the preferred program be adopted. Except for minor variations they are basically those listed in Appendix H, Table H-6 (the list of counties utilized in this statement for impact analyses). The Federal coal production regions were chosen on the basis of major coal basins, transportation networks, similar regional destinations, etc., after formulation of the CIEP impact matrices. The minor differences in counties would cause no, or extremely trivial, changes in the impact projections.

Washington, D.C. 20540
Comments on Draft Environmental Statement
Federal Coal Management Program

Gentlemen:

There is absolutely no way this company can afford the time and manpower to review the above "Draft". Neither can we afford to do anything less than to withdraw our offices minutes of coal. We are immediately terminating any and all existing participation or exploration in the coal industry.

Very truly yours,

Richard V. Wyman
Richard V. Wyman
President

BVN:tas

Acres and restricted acre land, but any land that might be considered for such use of some future date.

Another unnecessary restriction is in connection with leasing of coal under "prior lease lands." presumably because such land is more valuable to agriculture than to coal mining. This is not true. It is true that coal may be taken from the crust, but the value of agricultural production that might be lost is far less than the value of agricultural production that might be lost if the coal development would be only a small fraction of one percent. The oil fields in the West have been developed in this manner, and the agricultural production has suffered. It is absurd, of course, to assume that "prime" agricultural land can be replaced on an acre for acre basis by the existing otherwise potential.

A third unnecessary restriction is in the provision for allowing the surface owner to have final or irreconcilable veto over the proposed lease. This is another unnecessary restriction. This serves no one to give the surface owner a substantial though unmeasured part of the value of coal that ridge-top mining would produce. It is also unnecessary to give the surface owner compensation for any and all damages done by the mining process, but the final word as to whether Federal coal should be mined must remain with the particular state or local government.

The checkerboard pattern of coal land ownership as exists in many parts of the West further complicates the problem. A determined group of minority investors could easily buy up a checkerboard area and then lease it to no one. It is possible to mind who could effectively confine privately owned coal property in such checkerboard areas by framing the leasing of the Federal coal, thus leaving the checkerboard areas to the private coal companies.

In closing, I wish to state that I am not "wired" by any real company - I have no financial interest in either coal or electric power, except as a consumer. I am writing this letter as a concerned citizen and as a concerned citizen, desirous of lessening the burdens of society and the government with, desirous the lenience by strict mining without causing severe reclamation procedures. However, I do not believe that there is a place for the Federal Coal Management Program in protecting the public interest. There is no need for the Federal Coal Management Program to further restrict the utilization of the resources who are operating in areas where Federal coal ownership is common.

The reason why I object to certain elements of the plan is that it is almost every case the result of a lack of understanding of the nature of land use and on the basis of subjective judgment alone, without much attention to the practical or economic aspects of the matter. I do not believe that the Federal Coal Management Program should be continued if you think that it would be appropriate.

Sincerely yours,

Wallace McMorin
Wallace McMorin

Office of Coal Management [140]
Bureau of Land Management
14th and C Streets
Washington, D.C. 20540

Good Morning!

On January 10 in Bismarck, North Dakota, I had the privilege of hearing Steven P. Quigley and his associates discuss the principal features of the Preferred Program. I was particularly interested in studying some of the details of the program as presented in the draft Environmental Statement. I am particularly interested in the environmental aspects concerning our environment, with full recognition of the important role that protective and remedial measures play in the protection of the environment. I am also very cognizant of this concern. I feel compelled to comment on the proposed coal management program.

I believe that a well planned program is absolutely essential, because the nation's coal reserves are finite and we have to reduce our dependence on foreign energy sources. Since the Federal Government is a large part of the national coal reserves, its actions may have a significant impact on the market. In addition, I believe that a good program established by legislative and executive action would be preferable to one that grows like top and root. I believe that the proposed program, if fully implemented as drafted in the SES is in every respect more desirable than any of the alternative programs. I believe that the proposed program will best serve the public interest of the nation's need for the coal, or because they fail to fully protect the public interest in a valuable public resource.

Despite my general approval, I have some given reservations about certain parts of the proposed program. I want to contradict its basic idea, that is, to ensure that the Federal Government, through its fair share of the necessary coal reserves, its actions may have a significant impact on the market. In addition, I believe that a good program established by legislative and executive action would be preferable to one that grows like top and root. I believe that the proposed program, if fully implemented as drafted in the SES is in every respect more desirable than any of the alternative programs. I believe that the proposed program will best serve the public interest of the nation's need for the coal, or because they fail to fully protect the public interest in a valuable public resource.

Despite my general approval, I have some given reservations about certain parts of the proposed program. I want to contradict its basic idea, that is,

participation and input from each state and the mining and utility industries, and no one perspective can control the outcome. This fact must be recognized if the 1980's are to be successful, leading to more targets will fail to meet industry needs. This should be kept in mind.

Montes recommends that the Department include a timetable for the planned/track identification/evaluating environmental assessment process, to be completed by the end of 1980. This timetable will ensure that the process is timely and cost effective, and the end result will be a more acceptable plan. It is anticipated that this ambitious program will be carried out in a timely fashion.

Specific comments are listed below.

1. Figure 1-2. The boundary of the Star Lake-Mt. region is in error.
2. Table 1-5. Does not discuss how these federal lease areas distributed to reserved and more costly production of federal coal. NEPA is supposed to be objective, and objectivity demands that this be acknowledged.
3. Figure 2-1. This map is illegible. I suggest it be made into smaller maps.
4. Table 2-1. The proposed SEPA is left out.
5. Para. 2-5.1. Puts to disregard regulatory delays as a factor during the growth rate of surface power.
6. Para. 2-5,5,6. The last sentence mentions "other developments." Which ones?
7. Table 2-23. How were these MPA resources estimated? Are these "resources" available within legal environmental questions? Determination would be needed to see the methodology in the Appendix.
8. Table 2-26. Total surface-minable reserves in the San Juan Basin are approximately 6 billion tons, according to the San Juan Basin Bureau of Mines. Yet this table states that 1 billion tons alone are not recoverable. This figure is very questionable, and should be checked both with the Office of Surface Mining and the Bureau of Mines and with the San Juan Bureau of Mines.
9. Table 2-27. The NEPA's Proposed Action in the Star Lake-Mt. region indicates 28 million tons of coal available for surface production. Yet this table states that 32 million tons will be produced from non-federal lands in 1980. The methodology for assessing the number of recoverable tons in the San Juan Basin adequacy can be determined. This figure of 32 million tons is but one example of using an asterisked table figure to show that any leasing of federal land is unnecessary.

authority. This authority, by the way, is surely needed, and should be addressed as a means of reaching the goals of the Program.

19. Para. 2-3.4. This paragraph states that increased leasing may increase competition in the coal industry. But it does not state that until now competition has been the low level since 1970 and likely will remain so. The reason for this is that its cause, by the way, has been acknowledged by the Justice Department's Anti-Trust Division. Again, an objective NEPA should discuss this.

20. Para 2-3.5. The second paragraph is also confused and unclear.

21. Para. 3-1.1. I recommend 2 points to be added to this Preferred Program:

- a. Add an ownership authority to allow the Secretary to retain coal lands which may have other greater values.
- b. Allow selective competitive leasing to assure enough revenue for leases.

22. Figure 3-3. I suggest the Department acknowledge that this 5-point multipurpose planning process should include no additional steps.

- (a) "Terminal Areas acceptable for future leasing activity may be immediately established for mining due to its unique characteristics."

Provisions should be made to allow a lessee to have input to the needed size and location of a tract.

23. Para. 4-5.2. It is true that the economy of the San Juan River Region is closely tied to energy. But, according to the Star Lake-Mt. Regional Environmental Assessment, there is no employment, with 21,000 of regional employment and 24,35 of total employment. This figure is completely at variance with the data given in Table 2B-1.

24. Para. 4-5.2. The Draft Programmatic states that regional population is "presently" low; nevertheless it shows "significant" growth. Land conversion is shown as a major problem. The majority of land is private, in "rare" communities. Lack of housing is "severe" and "acute" in quoted words, and lack of housing is "severe" and "acute" in quoted words. Similar examples of the lack of environmental review can be found throughout this Draft SE.

25. Para. 4-5.3. This paragraph discusses water as a limit on development. It is true that water will be needed by the mid-1980's over 40,000 acre feet of water may be available from the development of deep uranium mines.

16. Table 2-27. The figure of 2,560 acres is used here and in Table 2-28. This is a large amount of surface land and is a contiguous block that could be developed. On January 19, 1979, a proposal was made to Deputy Secretary of the Interior Presidential that this figure be reduced to 1,000 acres. This is the current proposed or permitted acreage for stems coal in the San Juan Basin. At 1,000 acres, the figure of 2,560 acres is not correct. This figure of 2,560 acres was derived from Wyoming and Montana. This is the reason why the figure must be revised, as Mr. Presidential advised as it stands.

17. Para. 2-5.1. The Draft SE states that federal leases issued before 1976 and not in production by 1986 will be cancelled. Asmt. Sec. 27 of the NEPA states that leases would not be renewable if this failure to produce is due to environmental delay. The analysis should reflect this.

18. Table 2-28. This table was made using data from the NEPA Draft SEPA which was never changed. The timing and sequence of the various stages of development are not clear. I suggest the Districts be contacted to provide information on the timing and sequence. I believe the San Juan River Region is the best example. This table shows 1.5 million tons of stems coal in 1986, 1.5 million tons in 1990, and the total in column 3 is more likely to be 27 million tons.

19. Table 2-29. Column 3 gives a figure of 11.3 million tons. This figure is calculated using MPMS II which the NEPA's Albuquerque office has not yet reviewed and accepted individually, and is not without the development of adjacent route. This figure must be revised downward accordingly.

20. Para. 2-2.2. This paragraph does not acknowledge recent developments in the coal industry which appear to foreclose reasonable development opportunities.

21. Para. 2-3.2. This paragraph states that energy conservation should be pursued. But DOE's Policy and Evaluation Division is spending well over \$100 million per year on energy conservation imports as part of its MPMS coal strategy. So, how do exports fit into this national demand estimate? This should be addressed.

22. Para 2-4. The top paragraph on the left appears to have been carried in preparation or in printing. It is incomprehensible as written.

23. Para. 2-5.2. The third paragraph is misleading. The San Juan Basin is not the only place all of the coal-related employment would live in urban areas.

24. Para. 2-5.3. This paragraph should acknowledge that it is presently illegal for the Secretary to wake exchanges of existing leases, and that Congressional legislation is necessary to give him this

25. Para. 4-1.2. The paragraph also fails to mention the work force currently available from a 100% unemployment rate of 10.15 in 1978.

27. Para. 5-1.2.1. This paragraph should acknowledge that other resource developments (e.g., uranium in northwestern New Mexico) will increase base load energy demand by 2045 of more than 300 megawatts.

28. Table 5-6. No units of measurement are given.

29. Para. 5-2.3. This paragraph states that "surface mining operations would produce significantly greater genetic impacts than deep mining." However, your Open File Report (OFR) states that in the San Juan Basin, "the impact of deep mining is more genetically damaging if proper surface mining reclamation processes are not followed." This statement should probably be consistent with other Department of Interior documents.

30. Table 5-10. 1950 figures are the same for the San Juan River Basin as for the White-Southeast Utah region. One or the other is wrong.

31. Table 5-12. This table also provides water requirements for coal mining in the San Juan River Basin as 62,300 acre feet at the mid-1980's. But the San Juan River Basin Regional EIS states that this number will be only 14,000 acre feet at the mid-1980's level. This discrepancy must be addressed, for, much of the water will come from other Department documents despite being too high.

32. Para. 5-2.3.3. This paragraph discusses post-mining habitat loss and the effects of water behind gates which are likely with successful reclamation. Again, note that the inputs will be greater than they actually will be.

33. Figure 5-3 shows no coal being moved by rail from the Midway mine to the port or to market.

34. Para. 5-4.2. Figure 5-4 illustrates the Draft SEPA as all environmental groups. This was not the case and should be so stated. For the environmental groups that agree, the environmental groups make mistakes.

35. Para. 7-2. The 50% recovery factor conflicts with the 50% recovery factor given in Table C-1. These should agree.

36. Table 7-1. Production figures give miles conflict with those in the San Juan-Mt. Regional EIS.

37. Appendix A, Seepage requirement MPMS 1-1(f). Does this apply to windbreak companies of railroads?

13. Figure 5-5 shows 5,490 lb. between mining and reclamation. This conflicts with SDM Interim and Proposed Final Regulations.

14. Table 3-1. The figure of 1,700 tons per acre-foot conflicts with the figure of 1,100 tons per acre-foot given in the Proposed Final Regulations. See Table 3-1, Item No. 1, dated July 3, 1985.

15. The following data were extrapolated as arranged by Mr. Urna, Mr. Van der Valken, and Mr. Monroe on January 3, 1987 at the informal meeting in Durango, Colorado. These data will be corrected when the data are re-estimated from the two June surveys that simply are "from our records".

a. Table D-1, page 3-1. The figure of 11,100 ton/acre-foot is probably correct. The figure given by the BLM for the San Juan-Lake City District is 10,000 ton/acre-foot. This figure is probably correct. The figure given in the Proposed should be revised.

b. For sagebrush steens the Programmatic gives a figure of 1,000 tons per acre-foot. The San Juan BLM/Albuquerque District was unable to provide an accurate figure, but estimated that 1,000 tons per acre foot would be correct.

c. For Great Basin sagebrush, the productivity of 1,000 tons per acre-foot is given in the San Juan BLM's 1978 figure for intensive hay production in the San Juan Basin. The San Juan BLM's 1980 figure for the San Juan-Lake City District and presented by SDM presents only 2.96 tons of productivity per acre. To begin with, the San Juan BLM's 1978 figure is presented by the National of Administration in tabular form.

d. Table D-1 also gives productivity figures for corn, hay, wheat, and barley. The productivity of these crops are presently given on any potential coal lease in the San Juan Basin. The evidence presented by SDM does not justify giving productivity figures for these crops. However, certain is grown in New Mexico no farther north than Socorro, 60 miles south of Albuquerque.

16. Table D-2 says 27,000 people, or 16% of the population of northwestern Colorado, live in the San Juan Basin. The San Juan-Lake City District BLM states that only 3,000 people were coal-related in 1977, and that number has decreased since 1977. This discrepancy must be addressed, either clarified further in later tables 18 figures that conclude the analysis will be for greater than 10 years will be incorrect.

17. Tables D-2 and F-2 show the same discrepancy discussed in Item 16, above.

18. Table D-2 differs enormously from approximately similar tables in the San Juan-Lake City Regional BLM. The difference is 100,000 people. The San Juan-Lake City Regional BLM figure is 200,000 people.

Mr. Steve Jarrells, Director
Office of Coal Leasing Planning and Coordination
United States Department of the Interior

• 球形玻璃珠 •

Dear Mr. Chairman:

As a resident and up-leaf grower in Mitchellville, located in the North Fork of the Cache la Poudre River Valley, I have long been concerned for the future of our agricultural industry in Delta County. The magnitude of coal development projected is far more than what our area can accommodate and will certainly result in a loss of population and economic stability. ADD COAL companies alone will drag the county into a \$6,000,000 deficit annually. (Please see Vol. I, Chapter 4, page 20, *Lower Colorado River Basin*, a study of the proposed coal developments in the Colorado River basin areas at www.lcrb.org/coal/)

Respectfully yours,

John C. Johnson
Chairman, Lower Colorado River Basin Study Committee
P.O. Box 1200, Mitchellville, CO 80546
(970) 248-3111 ext. 100, fax 101, cell 303-222-1111

In the draft ES for the Western Coal Leasing Programmatic is a paragraph on page 3-61 which discusses financial, technological and socio-economic factors. For each a person or a governmental entity goes about requesting a financial, technological and socio-economic threshold study for the North Fork. If resources other than coal are to be preserved, such a study appears to be imperative.

The citizens of our North work have not asked for actions to stop coal development. They feel the coal could be mined if the country needs it, and they are also well aware of the job coal mining provides. What they desire is planned development over many many years, such a plan would allow agriculture and reforestation to continue, as well as to be used for future generations as well as for current generations.

Any help you can provide us on the requirements to request an economic-social threshold study would be greatly appreciated.

Sincerely yours,
Edwin Eastman
Mt. 2

- are *less* than 800 greater than the equivalent figures given in the RECOMMENDED E2E. These discrepancies must be addressed.

Table 1-1 shows reclamation efforts to be 82,000/ha/yr. Our experience has been that the best results are obtained at approximately 100,000 ha/yr. I suggest that this table be revised through conducting the surface areas operations in the field.

Table 1-1. The heading on the right-hand column is wrong. It should not be "Total," & errr."

Table 1-1 gives an average dollar cost/tonne of coal fines as \$6.75/tonne. This figure is probably too low. It should be \$10.00-12.00 per tonne. This table can also be easily revised without disturbing the surface area operators in the field.

Western Hemisphere: We have no objection to the Preferred Alternative. We have suggested, however, that we have the new language proposed in the following:

Sincerely,

George L. Boyce

ITS FOR THE RECORD CONCERNING THE DRAFT ENVIRONMENTAL STATEMENT
FEDERAL COAL MANAGEMENT PROGRAM DATED DECEMBER 1978, PREPARED
UNITED STATES DEPARTMENT OF THE INTERIOR, BUREAU OF LAND MAN-
AGEMENT.

In reviewing the DES for the Federal Coal Management Program we have been impressed by the thorough and conscientious manner in which the requirements of applicable Federal laws have been incorporated in the proposed management program. Both the DES document and the management approach could well serve as models for others. We commend the Department of the Interior for a major step toward management of the public lands for the greater public good.

While the technical aspects of administration and documentation are superior, we are concerned that the full potential of the proposed program may not be achieved because of questionable assumptions, biases, and weaknesses which must inevitably affect implementation. In essence, we feel that excellent tools will be applied to incomplete purposes. In the following paragraphs we outline our concerns and suggest corrective revisions to the

Our first three concerns arise from the fear that past excessive leasing and its various costs will be perpetuated under the Preferred Program, through perhaps a lack of understanding of the inherent latent market demand mechanism. We suspect that this deficiency in the Preferred Program can be corrected by three modifications: use of measures of real market demand rather than DDE production targets as a basis for lease offerings; continuation of the moratorium on competitive leasing through 1985; and progressive tightening of our acreage requirements to minimize the ratio of leased reserves to annual production.

Our first concern is that DOE production targets (which have little direct relation to economic need) are translated to forecasts and interpreted as demands which must be satisfied by production from old and new leases. Another way to describe this kind of "management" is to say that if leases are sold to

most DOE goals, then coal will be produced irrespective of market demand. This is neither good logic nor good economics and can easily lead to excessive leasing. The evidence prior to 1973 is proof that more leases do not necessarily lead to more production. In fact, the reverse is true. More leases do not stimulate demand which in turn would call forth greater production. Instead, attempting to stimulate demand by increasing supply is putting the cart before the horse. The Department of Interior must be prepared to respond to the lessening level. The Department of Interior is obliged to be ready to support DOE goals, and planning must include at least this potential, but the actual amount of production must be determined by market demand. If market demand -- not wishful thinking, A strong policy statement to this effect is needed.

Our second concern is with the large backlog of existing leases and PIRAs. The lease backlog is associated with the cash associated with the leases (section 2.1.1). The DGS has indicated that the backlog of existing leases will be reduced by 2010 as a result of the implementation of an aggressive lease program can be initiated. We feel that it is important that the backlog of existing leases be reduced as quickly as possible. We also feel that the backlog of existing leases should be reduced by 2010 as a result of the cancellation of leases, even though the leases have not yet been terminated. The backlog of existing leases, including short term leases, we conclude from the DGS report, consists of 1) existing leases; even though they have not yet been terminated, 2) leases that have been terminated, but have not yet been released, 3) leases and exchanges through 1980 (leases continuing the current rate of growth); and 4) leases and exchanges through 1990 (leases continuing the current rate of growth). The backlog of existing leases is estimated to be approximately 1.5 million leases in either 1980 or 1990. The DGS seems to suggest that cancellation of leases should be initiated in 1990. We believe that cancellation of leases should be initiated as soon as possible, but no later than 1990. The backlog of existing leases should be reduced by a substantial amount prior to that time. The backlog in this position may be reduced to approximately 1.0 million leases by 1990. The backlog of existing leases may be reduced to zero by 2010. This will likely happen naturally as new leases are issued.

The third concern is that lease holders will re-evaluate their future needs and reduce the backlog of existing leases. We believe that lease holders are likely to reduce the backlog of existing leases by reducing the number of leases "carried forward" through 1990 and beyond. A great advantage to continuing the present moratorium on new leases is that it will encourage lease holders to reduce the backlog of existing leases. The backlog of existing leases will be reduced as a result of the preferred Program (see Figure 3-12) to be established prior to diverting the remaining backlog of existing leases to the new lease program.

The final consideration is the elimination of the backlog of existing leases. The early disadvantage of this recommendation is that it will require further diversion of the backlog of existing leases. The long term advantage is that it will eliminate the backlog of existing leases. This could not be done under the current federal land lease area, but this should not have been a problem under the proposed preferred Program.

New consecutive leasing should only be resumed in conjunction with large

Our third concern is that the new rules for oil drilling which are now under way will have an intended purpose of keeping federal resource management in the hands of federal land managers. At issue is the ratio of the amount of coal reserves to outstanding leases to the amount of coal produced annually. This ratio is to be set at 1.0 by 1985. The effect of this will be to limit the amount of coal which can be mined in any given year. It is a built-in time delay limiting the implementation of new federal policies. Using leased resource figures from Tables 2-29 and 2-32 we find that the ratio of coal reserves to outstanding leases is currently 1.2. This high figure can be a serious restraint to resource development.

Our remaining concerns arise from the four that other potential benefits of public land use (both commodities and attorney) may receive inadequate consideration because of over emphasis on coal production. We suggest that this deficiency can be corrected by deferring decision on controversial aspects of controversial leases, by requiring environmental impact statements, by requiring impact mitigation, by uniform requirements for all operators, and by refinement of recommended Lands Usability Criteria, management guidelines, and regulation.

In the area of implementation, we feel two changes are necessary: the simplistic choice between applicable and suitable needs to be expanded to include a deferred category for which there is sufficient controversy to warrant further study (the "gray area"); and the time frame for tractable needs to be lengthened as much as possible while deferring more detailed analysis of the needs of the individual landowner until Management Resource Committees; coordination with and concurrence of other parties having land management responsibilities must be made mandatory, to include State and local governments, tribal governments, and surface owners as applicable (the gains being from intergenerationality of competing beneficial land uses and to identify controversial needs).

Our sixth concern is that the management program is seriously weakened by exempting certain governmental entities from full compliance. We feel that all coal mining should be conducted under the same rules irrespective of who does the mining.

Sur seventh and final concern is that a potentially autostarting management program will be critically compromised by undue haste in implementation. Some changes can be made through purchases of recommended LSCs in current land use plans; additional changes can be made as regulations are adopted without adequate public input and without adequate consideration of the long-term implications. We believe that the most appropriate course of action is to begin the process of change in the management program now but to bring competitive leasing into full compliance with new policies and practices. Each year, we will review the progress made toward this goal and make any necessary changes. The same examination and enforcement procedures and incorporating these matters into the same case that so successfully handled other planning and enforcement issues. We feel that the urgent need for more competitive leasing by 1986, we feel that the same case that so successfully handled other planning and enforcement issues. We feel that the urgent need for more competitive leasing by 1986, we feel that the same case that so successfully handled other planning and enforcement issues.

In summary, the generally superior quality of both the DES and the Preferred Management Program is compromised by weaknesses which are likely to lead to mismanagement through both excessive coal leasing and inadequate consideration of

competing land uses. We have proposed corrective revisions to the Preferred Program which, though seemingly minor in the context of the total planning and management efforts, are nevertheless critical to its success. Our most important conclusion is that the Preferred Program should be notified to continue the current moratorium on competitive leases through 1985, thereby allowing Department resources to be concentrated on refinement and implementation of other program aspects which may not necessarily preclude resumption of leasing.

Sincerely,
Dick Wigerson
Dick Wigerson
Chairman, Technical Committee

III. MDC vs. BREWSTER

Under the U.S. Constitution and the decision of Powers Doctrine, it is believed that Congress, if not unconstitutional, has the right to require Judge Brett to require the Executive Branch to address the question of the "need for leases".

- (a) The Executive Branch, by a number of acts of the Legislative Branch, has been granted both the authority and the responsibility to administer the lands and mineral resources owned by the United States of America.
- (b) Leasing of federal coal is the statutory responsibility of Interior. The Secretary of the Interior has the authority and proper responsibility of Interior as the agency designated to manage and administer the public lands.
- (c) The determination of the "need to lease, when, and in what quantities, and the determinations that cannot constitutionally be delegated to another branch of government, must be made by the Executive Branch even to inquire by the Judicial Branch as to the determination of the "need to lease".
- (d) Judge Brett acted improperly, if not unconstitutional, in requiring Interior to do something to see the "need for further leasing".
- (e) Judge Brett acted improperly, if not unconstitutional, in requiring Interior to do something to see the "need for further leasing".
- (f) Judge Brett acted improperly, if not unconstitutional, in requiring Interior to do something to see the "need for further leasing".

As an administrative agency, in carrying out its statutory responsibilities, acts "advisorially and opinioinarily" that is one thing. When that is alleged, the burden rests on the plaintiff to show by convincing evidence that such action is unconstitutional.

In short, it is an offense of the Judicial Branch to require Interior to determine the "need for leasing". The authority, the responsibility, and the power to determine the "need for leasing" remain with the Executive Branch alone. In short, it is an offense of the Judicial Branch to require Interior to do something to see the "need for leasing".

Thus the Executive Branch exercises its management authority and discharge its management responsibilities in, of course, another matter.

III. NEED FOR LEASING

Unless the Federal government (by incident or design) prioritizes the coal industry, the federal government cannot (nor can anyone else) competently qualify the need for leasing.

Local averages and global trade can be projected; low, medium, and high national coal production and projections can be made. However, coal (at present) is still mined by independent producers (large and small) making independent decisions to do so. And coal (at present) is still purchased

by large and small mining independent producers to do so. These producers and their clients may have no obligation under present law to sell or buy of businesses, or use cost or go out of business. Other producers or users may have several alternatives.

The decisions individual businesses make are usually based on economic considerations. These decisions are made when the needs must be met and the supply/demand market in advance of the time when the needs are known and the price is set. This is true of all industries. It is also true of the coal industry. Will there be coal slurry pipelines? Today Who will pay for them? Tomorrow who will do with the quality of the coal. The "who" could change. Will there be more coal produced in the West? Will there be alternative to the rapidly expanding railroads. Will there be technological breakthroughs in mining, processing, and delivery? Will there be a day when wind says are the economic parameters for studies, forecasts, and projections. Will there be a day when the market place and the individual producer, producer/leasing decisions are made to that individual?

Coal is sold mainly by individual producers because some national forgets says the nation's coal industry will produce a certain tonnage nationally. Coal is sold mainly by individual producers because some national forgets says the nation's coal acre will use a certain tonnage nationally. On the contrary, unless the federal government conceives nationalizing the coal industry, the coal acre will use a certain tonnage nationally. The "when" and where it uses will be mixed and marketed by individual producers at a profit compared to the federal government. The "how" will be determined by individual producers are willing to gamble on it at a profit rate, because the federal government estimates of their ability to market that production at a profit.

Similarly, coal will be purchased by others only when individual users determine they need STW's, and then decide the quantities they need and they will pay the price. This is true of all industries. It is also true of coal. Thus, a sale of coal to one user by one producer may proceed, or, perhaps, a sale of coal to one user by another producer, or increase each other producer's "risk" in going ahead with a sale or expansion of an existing mine.

There are many laws, rules and regulations impacting the individual business decisions to be made. These laws, rules and regulations, the government can predict in a meaningful way the many decisions the market place will make. These laws, rules and regulations can expand or contract, or eliminate, or discontinue or expand their use of coal. (For example: new plant limitations, and expansions of existing plants, are highly dependent upon

-4-
EPA/State air regulations. Where, who, and how large will future Clean Air Act be? What areas will become the "hot-spots" areas tomorrow or the next day? Who you know, and what your potential user has already been affected by the changes in the Clean Air Act of 1970.)

In **MDC vs. BREWSTER**, both the plaintiffs and Judge Brett made such of the following statement: "The coal industry is not a static industry. New reserves and new technologies can be made. However, coal (at present) is still mined by independent producers (large and small) making independent decisions to do so. And coal (at present) is still purchased

the following statement: "Preference Right Leases".

Whatever validity much estimates may have, that validity rests upon technological and economic assessments. ("Technology" having one the local, state and federal laws and regulations and sold at a profit). Today, technological and economic assessments lists us with deteriorating *recoverable* reserves. To be sure, we must be very conservative in our projections. However, it would be a profit to be considered for the classification of *recoverable* reserves. But, today, the following questions must be answered:

- (1) Is the leased coal legally *available* to mine?
- (2) Is the leased coal that is legally available to mine *legally*missible?

An acknowledged coal producer today recognizes, all estimates of "recoverable" coal reserves based only on technological and economic assessments, are not necessarily reliable. ("Technology" having one the local, state and federal laws and regulations and sold at a profit). Today, technological and economic assessments lists us with deteriorating *recoverable* reserves. To be sure, we must be very conservative in our projections. However, it would be a profit to be considered for the classification of *recoverable* reserves. But, today, the following questions must be answered:

As to existing leases and yet to be produced leases, the following questions whether he will be legally able to mine the coal leased to him will be asked of the local, state and federal permits in hand. Competent mining engineers and geologists can only say one thing: "It depends". Reserves which can be recovered with present technology. Reasonably reliable estimates of recoverable reserves are not necessarily reliable. However, no coal is *recoverable* today until it is known that the coal is *legally*missible to mine and *legally*available and that can not be determined until the following questions are answered: "Who, when, and *only* then can recoverable reserves be determined today."

No one, is or out of government, has applied all of the local, state and federal laws and regulations to the question of whether he will be legally be allowed to mine of the presently existing federal coal leases (which is not), and even if this had been done, no one is or out of government can provide assurance that no number of the public will challenge the conclusions reached by the federal government as to the question of whether that "found" to meet all of the local, state and federal laws, rules and regu-

lations making such coal legally available to mine and legally *missible*.

Of the approximately 120 presently existing federal coal leases located in the state of Wyoming, only 100 are currently being leased. Of these, 100, covering over 75,000 acres of the total of about 785,000 acres presently leased, cover areas under the *Surface Mining Control and Reclamation Act*. About 95% of the existing leases, covering about 745,000 acres, are located in areas that comply with all of the local, state and federal laws, rules and regulations. However, the following three leases are listed if the coal presently under lease is to be mined:

At a matter of fact, over 400,000 acres of federal coal lands were leased prior to 1970. In five years period, the following represent more than 80% of the total federal acreage under lease. Since 1970, a minimum was required to get from the "lease issuance stage" to the "lease operation stage". This means that the following represent the investment of all the laws, rules and regulations with which leases must now be issued. This is the reason why these leases are listed.

Generally the leases in original states prior to 1970 did not subject the lands leased to them to any knowledge. Once these leased lands could meet all of the requirements of all of the local, state and federal laws, rules and regulations, they changed in order to legally mine the coal they had under lease.

IV. LEASING

Interior's Program must comply with a number of laws created by the Senate and House. Interior's Program for leasing fails within the purview of WMA and NEPA. The following are the laws that must be followed as it does not depend upon fulfilling the "need to lease". Furthermore, leasing leases must be issued with a "fair" federal revenue return sufficiently affecting the human requirements".

Prior to 1970, the issuance of a federal coal lease granted to the lessee the legal right to mine the leased coal. The lessee had the legal right to remove the coal and to do whatever was necessary to extract the coal and its surface and minerals. (The lessee, of course, was obligated to pay any damages caused to the land's surface operations).

Because of the following of the Federal Register or transmitting a piece of paper. It is proposed to assert that the issuance of a lease today has any effect whatsoever on the rights of the lessee to mine the coal. Today, the issuance of federal coal under existing leases as well as under new leases, grants to the lessee the legal right to mine the coal and to do whatever the coal demand to him by reason of holding a lease to that coal. Today, the lessee has the exclusive right to try and obtain a legal right to mine the coal leased to him within a specified period of time or he will lose the right to mine the coal. The lessee has the right to sue for a successful in obtaining the legal right to mine the leased coal. The federal government makes no representations or warranties that the federal coal leased to the lessee is legally available to mine; or, is legally *missible* to mine,

that the leased coal is legally minable. No refunds are given the lessee if he is unsuccessful in obtaining the legal right to mine the coal leased.

With respect to Section 205 of H.R. 2000, see the House Report.

- (4) Upon issuance of a federal coal lease, the lessee will necessarily begin to do more drilling than was done by the federal government prior to leasing. The drilling will be necessary to prepare a leasehold for mining. This may include the preparation of a surface mine plan or reclamation plan. Before the lessee can drill on a leasehold, he must obtain the approval of the Bureau of Land Management (BLM). The BLM will require the lessee to submit a "Drill Plan" for review and approval. In addition, the lessee will require the approval of the U.S. Geological Survey (USGS) for the drilling program. The USGS will require the lessee to submit a "Drill Plan" for review and approval. In addition, the lessee will require the approval of the Environmental Appeals Board (EAB) from the Bureau of Land Management (BLM). The EAB will require the lessee to submit a "Drill Plan" for review and approval. In addition, the lessee will require the approval of the U.S. Geological Survey (USGS) for the drilling program. In fact, the lessee will require the BLM even if the surface is entirely owned by the lessee. The lessee will require the approval of the BLM, such as the "lein west," in the drilling process areas, and assuming no other restrictions exist, the lessee will require the drilling activities are excluded. Drilling can then proceed.

(5) Such drilling may or may not disclose a coal deposit forming a geological Mining Unit. "The theory" is that there will be no coal deposit forming a geological Mining Unit. The lessee will then have to decide what to do if the lease and interest will not be doing the mining nor will there be any coal deposit forming a geological Mining Unit. That way and the lessee certain inearable economic losses will develop whether or not a lease is issued, thus costing him the development of the lease.

(6) Even assuming the lease is an LGS, with a mining feasibility study completed, based on competent drilling data and extensive coal samples taken, the lessee will still have to determine where and how to mine the coal. This information is necessary in order to determine the cost of mining the coal. The lessee will also need to identify financing the capital investment in developing a mine. A realistic idea of mining costs and required selling price, as well as the ability to finance the capital investment, will determine the progression for marketing the coal if it is produced. Of course, the lessee will have to determine the cost of the leasehold, the cost of leasing to begin the service, if the lease fees, as well as might, the cost of the equipment used in the mining operation. Investing his capital in preparing a mine is not competitive with other producers. The lessee will have to determine the cost — and with other producers — to mine the coal.

(7) Assuming the lessor's proposed Mine is not ruled out by the economics of the selected place, the lessee then has the exclusive right to mine the coal in the area covered by the leasehold. The lessee will have the sole leasehold to him. This means the approval of a specific location for mining the coal is given to the lessee only. It also means putting the approval of various state agencies having

a legally adequate "site-specific" environmental impact statement must be prepared before the proposed mine plan will be approved. Therefore, it is the responsibility of the federal government of the mine plan, not the *礦業者* of a lease, that is today the "major federal action significantly affecting the human environment".

3.4 - THE PROGRAM

While the only alternative to a Program is no Program, the Program itself, as the Draft SS indicates, can have a number of variations and alternatives.

The following comments relate to the four areas of the Program which I feel are of greatest concern.

8a-2011-0026291C-00218X

On Page 3-33 of the Draft SS, the question posed is

How should the Department define and apply the phrase

THE BOSTON ECONOMIC SURVEY - 1989

*Calculate minimum economic recovery on basis of all assets in land (all assets which collectively are profitable must be minded) with consideration for social and

As any competent mining engineer knows, a mine plan is an ongoing process. As new data becomes available, as the operating game plan evolves, as operating procedures are modified, new ideas develop, new problems are encountered, new opportunities are presented. Given the very limited amount of drilling data that will be available at the time of the initial prior to layout, how can it be determined which areas are most profitable for mining? To make such a determination requires breaking (not guessing) mining costs, even though for the entire body of rock, the ability to design a mine to possibly mine both surface and underground seems, the market for the coal, the production rate of the mine, and a host of other factors pre-emptive to being able to justify the capital investment.

Interior will not mine the coal. Interior will not have capital at risk. Certainly Interior will not repayment and extract the same which collectively are profitable to mine. Interior will not underestimate the costs of mining should they turn out to be greater than Interior determined in arriving at its decision concerning mining costs. You will Interior underestimate the selling price if it turns out the coal cannot be sold at the price which Interior has determined to be definitive.

I am not suggesting that Interior should make such representations and warranties, and underwrite any errors in its determination of profitability. I am simply trying to point out the utter folly of presuming that the elements

isdiction. But, ignoring county and state considerations and confining this discussion only to federal laws, rules and regulations, the lessee of federal coal (whether it be an existing lessee or a new lease awarded sometime in the future) must convincingly demonstrate land frequently defend in court against a citizen suit that the lessee's mine plan and reclamation plan comply with ~~all~~ ~~at least~~ all of the following federal laws:

- The National Environmental Policy Act
 - The Clean Air Act of 1970
 - The Clean Air Act Amendments of 1973
 - The Clean Water Act
 - The Clean Water Act Amendments
 - The Coal Leasing Act Amendments of 1976
 - The Surface Mining Control and Reclamation Act of 1977
 - The Solid Waste Disposal Act
 - The Resource Conservation and Recovery Act
 - The Water Pollution Control Act
 - The Resource Conservation and Recovery Act Amendments of 1972
 - The Mine Safety and Health Recovery Act
 - The Mine Safety and Health Act of 1969
 - The Mine Safety and Health Act Amendments of 1977

(E) There are several dozen, if not hundreds, of federal laws (and state laws on similar subjects), and the federal agencies which administer those laws have regulations. There are many rules and regulations which affect coal mining. These include the U.S. Geological Survey (USGS), the U.S. Geological Survey (USGS), the President's Council on Environmental Quality (CEQ), the Environmental Protection Agency (EPA), the National Oceanic and Atmospheric Administration (NOAA), the U.S. Army Corps of Engineers (COE), the U.S. Fish and Wildlife Service (FWS), the U.S. Forest Service (FS), the U.S. Office of Surface Mining (OSM), and, most recently, the Office of Surface Mining Reclamation and Enforcement (OSMRE). These agencies are issuing new rules and regulations, and will, no doubt, issue interpretations of rules and regulations, whether coal is legally entitled to mine and legally mineable, whether some coal is inherently imprudent to mine, legally land and water rights, and so forth. The agency heads, as well as, and will be, administrative interpretations of rules and regulations, no doubt, judicial decisions regarding administrative interpretations of rules and regulations.

By reason of the foregoing, it can be stated categorically that no one, today, can know whether they will be able to move from a federal lease until after they have gone down the long, long road above described and have in hand all the local, state and federal permits required to be able to legally mine coal. There does not possibly be a significant impact on the human environment from a coal mine while there is in fact, coal that is legally available to mine and legally minable. That can not be known by the federal government, or by a leases of federal coal, until the lessee has in hand all of

Involves in what Ingegior is trying to do can be known prior to learning. In fact, the elements involved cannot be known even by the licensee until he has prepared a competent mining feasibility study and carried out a realistic market study and then, if both studies are favorable, convinced the Board of Directors of his company that the proposed mine offers a reasonable chance of deriving a satisfactory rate of return to justify risking the capital needed to develop the mine.

卷一 國際化與社會政策

What is "Fair market value"? With respect to Lease Sales, it is stated in Section 3.1.1.3 on page 3-5 that:

"Each tract selected by the Secretary for lease sale would be analyzed to determine the appropriate fair market value and its maximum sensible reduction."

Further on in that Section the Draft ES says: "In no case would bids for less than fair market value be accepted". It is also stated that "comment on the fair market value and maximum economic recovery would be taken before the sale".

One starts with the same premise that coal which occurs by chance and sold as profit has no market value at all. What, one can presume that no one will bid for a lease who does not have some reason to think that there is a reasonable probability of finding coal in the area and selling the coal at a profit. However, the lessor will not commit capital to the search for coal unless he expects to receive a return on his investment and sell the coal at a profit. The level of confidence needed to bet capital at risk is not acquired with the acquisition of the lease. Based on historical experience, the lessor's confidence in the potential for finding coal is determined in the mining claim and then extrapolated to the proposed mining project. This extrapolation is based on the "probability" of the proposed operation, depending what Integer thinks is a fair rate of return for the risk assumed. Integer's determinations are not always acceptable and the production company, how these determinations are made is not always clear. It is not clear if Integer's determinations are made by Integer's own engineers or by Integer's consultants or by any other engineer in the industry of actually producing coal. That any one can possibly think these determinations can be made with the limited information available to Integer is beyond comprehension.

Being realistic, I recommend no minimum bonus or, if there must be a "minimum", set a number (unrelated to "fair market value") and advertising it so everyone knows what the minimum acceptable bonus is. (There really is no need to have a minimum because Interior can reject any and all bids anyway.)

The "value" in coal is in its production, not in the house. The "royalty" should simply be a way of determining who gets the benefit. Since the real value is in the production of coal, the production royalty is what is important. On surface coal, like is now the statutory minimum. Interior is obviously tempted to increase that percentage by how Interior assesses the "profitability" of the proposed mine. As mentioned earlier, Interior

In closing, I would once again like to commend the Department for an effective effort to develop a comprehensive coal management program. We hope that these comments will be helpful in further refining that program.

Peter MacDonald
Chairman

RECOMMENDED MODIFICATIONS OF THE "EXAMPLE"
REGULATIONS TO PROVIDE FOR THE PARTICIPATION OF
INDIAN TRIBES IN THE FEDERAL COAL
MANAGEMENT PROGRAM

Proposed language changes are underscored

T. Part 3420 - Competitive Leasing

(3) 3420.5-2 Objectives

... and to ensure that Federal coal is developed in consultation, cooperation, and coordination with the public, States, local, and tribal governments, and involved Federal agencies.

3420.5-2.1 Consultation with States and Indian Tribes

Before making formal determination of land areas to be leased, the Secretary shall consult with the State Government and the State agency charged with the responsibility for managing the lands in question, and the Tribe or Tribes. In situations where a tribal government administer areas within or adjacent to the boundaries of a comprehensive license area, the Secretary shall consult with the tribal government. The Bureau of Land Management shall consult with the tribal government as advised by the Bureau's Office of Indian Affairs.

(3) 3420.5 Registered production targets

3420.5-1 General

The Secretary in consultation with the Secretary of the Department of the Interior, the State Governor, Indian Tribes, and other concerned parties shall establish ...

(4) 3420.5-2 Evaluation of Coal Needs

Add new subsection

(c) The Secretary shall discuss the preliminary regional coal production targets with affected Indian tribes within their areas about the anticipated impact of the proposed production targets on the Indians, particularly seek the tribes' views regarding the relationship between the regional production targets and potential environmental impacts.

The existing subsections c,d,e, and f would be renumbered numerically.

A-1

(3) 3420.4-6 Regional Tract Ranking, Selection, and Scheduling

3420.4-6(d)(1) The ranking, selection, and scheduling process shall be done by the authorized officer in close consultation with the Governor of the State or the State if the region is located and to consult with representatives of all affected Indian tribes and Federal surface management agencies.

(4) 3420.5 Final Consultation

... the Secretary shall formally consult with the State Governor or the Governor of the State if the region is located and to receive consideration. The Secretary also shall formally consult with any Indian tribe(s) that would be affected by any Federal coal lease plan ...

(7) 3420.5-3 Consultation with Governor and Indian Tribes

Add new subsection (e)

Before selecting a regional lease sale schedule, the Secretary shall consult with Indian governments which administer areas within or adjacent to the areas to be leased. The Secretary shall give the tribes a specified period of time to comment on lease sales by the end of 60 days before issuing a final environmental impact statement for affected Federal lands areas that would affect the tribes.

11. Part 3440 Environmental

3440.3 Criteria for designating land unsuitable for oil or certain types of coal mining

(1) (g)(2)(i) With the concurrence of the State or Indian Tribe to whom the site or area, or object of a regional or local significance only ...

(2) (N)(C)(i) the area or site is of regional or local significance only, with the concurrence of the State or affected Indian Tribe(s) or ...

(3) (j)(1) Lands containing habitat deemed critical or essential for plant or animal species listed by a State or Indian Tribe as threatened or endangered under the Endangered Species Act and which are essential for maintaining those priority wildlife species who are dependent on the habitat. Such lands may be considered unsuitable for coal mining.

(4) (j)(2) Federal lands which the land management agency and the State or Indian Tribe(s) believe are fish and wildlife habitat for threatened or endangered species. Such lands may be considered unsuitable for coal mining.

(3) (x)(C) a buffer zone of Federal lands necessary to provide protection for any adjacent areas designated as land unsuitable for mining operations. Such lands shall be designated as land unsuitable for coal mining.

(2) ... The buffer zone may be modified or eliminated where the Tribes, the appropriate agency, in consultation with the State or Indian Tribe(s), determine that parts of the area are not necessary to protect the designated area.

(7) 3491.4-1 Consultation with Local and Tribal Governments

Prior to designating Federal lands unsuitable for oil or certain types of surface mining operations, the Secretary shall consult with the appropriate State, local, and Indian agencies.

OFFICE OF THE GOVERNOR

WILLIAM P. CLEMENTS, JR.
GOVERNOR

January 22, 1979

U. S. Department of Energy
Economic Regulatory Administration
Office of Fossil Regulations
Washington, D. C. 20461

Gentlemen:

The Draft Environmental Impact Statement pertaining to the anticipated Federal Coal Management Program has been reviewed by interested State agencies in accordance with the National Environmental Policy Act of 1969. Your state Environmental Impact Statement Identifier Number is

The detailed comments of the Tennessee Department of Water Resources, the General Land Office, and the Tennessee Department of Agriculture are enclosed for your information and use.

The Budget and Planning Office appreciates the opportunity to review this document. If this Office can be of further service in this matter, please do not hesitate to contact us.

Sincerely,
Sam B. Rhodes, Director

Footnotes

Mr. Roy Hogan, Acting Director
January 9, 1979
Dear Sir:

TDR offers the following review comments with respect to the Texas Plan Region from the standpoint of TDR's statutory State-wide Functions, responsibilities, and interests relative to water resources planning, development, and regulation:

- Page 5-6, "Habitat, Fish, and Water"**

This invites attention to the following specific items in the HHS relative to water resources which impact significantly on the State of Texas:

 - a. The analysis of water availability is based on regional water potential to take into account conservative water use practices. The Water Resources Council (WRC) – the U.S. Water Resources Council, the U.S. Army Corps of Engineers, the National Water Resources Council, the Special National Committee on Water Resources, Washington, D.C., and WRI as prime sources. (See the following paragraph under the caption "Water impacts".)
 - b. The HHS presents water data, including water resource data, water usage data, and future water requirements data. The data include daily aggregated statistics (ASAS) 1100 (100 and 1000 cubic feet per second), data from the Trinity-San Jacinto River, 1200 (Frio River basin), 1600 (Colorado River basin), and 1200 (Guadalupe River basin).

(See Appendix E of the HHS at pages E-1 and E-4.)

Even though the said water availability data and the related projection methodology are presented with numerous conditions and cautions regarding the validity, applicability, and practicality of the projections, the Bureau nevertheless has chosen to rely to the use of the said NADD preliminary data. TBBG's review comments, suggested revisions, and point-by-point assessment relative to the use of the said NADD preliminary data ("Comments"), were presented in letter dated August 25, 1978 to the Secretary of the Interior. A copy of the said August 25, 1978 letter, which included the suggested revisions, was invited to comment on, is hereto attached as Exhibit B.

Austin, Texas 78701

Subject: U.S. Department of the Interior, Bureau of Land Management-- Draft Environmental Impact Statement -- Federal Coal Management Program, December 1978. (State of Texas Reference: LIS-8-012-018.)

Dear Mr. Hogan

In response to your December 14 memorandum, the Texas Department of Water Resources (TDR), has reviewed the subject draft environmental impact statement (EIS) which analyzes various alternative federal coal management programs, including the proposed alternative of the integrated coal management program, and to assess the environmental impacts of each alternative. The EIS is pre-grammatic in scope; it discusses statewide and interregional impacts associated with the federal coal management program. The assessment of impacts involving the proposed alternative is limited to the following areas: 1) surface mining, 2) coal storage, 3) regulation of the use of 3 production levels (i.e., low, medium, and high); 4) regulation of the use of 3 projection periods (i.e., 100, 150, and 200 years); 5) regulation of coal production, 6) life cycle, and 7) regional effects. The subject EIS is a cyclical document, and requires periodic revision and update. The subject EIS is a cyclical document, and requires periodic revision and update.

The vital aspect of the U.S. Department of the Interior's preferred alternative program is its proposal to relate the federal leases of coal to the federal lands and coal lease laws as an integral part of the federal law-use and activity planning process of the Bureau of Land Management, the Interior under the Federal Land Policy and Management Act of 1976 and the Federal Coal Leasing Act of 1976, and the Federal Energy Policy and Conservation Act of 1978 and the National Energy Policy Development Act of 1992. Furthermore, the federal coal leasing program would directly on the Department of Energy's national energy programs to establish the quantity of coal to be mined. The preferred alternative program emphasizes state, local government, and public participation in all aspects

in the program.

Mr. Roy Hogan, Acting Director
January 5, 1979
Dear Sirs:

Because the Texas Gulf Region is one of the eight coastal regions for which the Department of the Interior is preparing separate, detailed environmental impact statements, DOB 1015 at page 5-11, section 101(d)(1) of the National Environmental Policy Act, requires that final version of the substate programmatic environmental impact statement be prepared by January 1, 1974. DOB 1015 relative to the Texas Gulf Region also provides that the environmental impact statement will be used to determine the present and future effects of proposed actions on water resources, and that use of such uncorrected data in support of energy-related programs will be discontinued as soon as feasible.

motorists beyond the point of being useful. The generalized data tend to portray conditions as one

TMH believes that the environmental water resources impact analysis

- a. The consumptive use of water by energy or enhanced energy - related or industrial activities (e.g., electric power generation and chemical plants) may further degrade water quality in certain streams and rivers by increasing dissolved solids and salts. This may reduce the dilution capacity for other pollutants as a consequence of reduced streamflows.
 - b. Recent Federal regulations mandating the use of more efficient technologies on all new electric power plants will substantially increase both energy output and the amount of water-bearing sludge that must be disposed.
 - c. The cumulative effect of Federal regulations which increase water demands and consumptive extraction in energy-related activities, is cause for concern. In particular, the cumulative impact of portions of the Texas Game Region, as the national energy center, on water availability is unanticipated. TWR believes that the feasibility of alternative actions should be considered with respect to federal regulations.

flexibility to adapt energy-related activities to local needs, given the unique characteristics of citizens. For example, the revised national standards for thermal discharges from electric power plants do not specify a particular cooling system, but include for engineering flexibility the design of cooling systems using natural water bodies, water selection and use of cooling system (i.e., wet cooling towers, single-pass cooling reheat, once-through cooling, closed-loop reservoirs, streams, or estuaries, and dry cooling systems, etc.) which will allow the electric power industry to implement water conservation (including minimum water consumption) and reduce water use.

The recent Surface Coal Mining Control and Reclamation Act of 1977, and the proposed Implementing Federal Regulations 30 CFR Chapter VII, contain no stringent provisions which would limit the use of surface mining operations and mind-load reclamation measures which would affect the environment in the unique, local geological, climatic, and hydrologic limitations of the Illinois Lignite Coal Region. The administration has proposed to amend 30 CFR Chapter VII, in letter of November 9, 1978, to the Office of Energy, Office of Surface Mining, Office of the Secretary, Office of Management and Budget, Department of the Interior, through the Budget and Planning Office, different provisions.

TDRB appreciates the opportunity to participate in the interagency review of the subject document, pursuant to the provisions of Circular No. A-95, Office of Management and Budget. TDRB will continue to work closely with all agencies concerned to ensure that the recommendations of the Bureau of Land Management and water resource planning, development and management, within the purview of our statutory, state-wide responsibilities and interests.

Sincerely,
Cecil S. Adams
Barrett Davis
Executive Director

Henry Bush
Executive Director
August 25, 1978

The Honorable Cecil S. Adams
Secretary of the Interior
U.S. Department of the Interior
Washington, D.C. 20240

Dear Secretary Adams:

The Texas Department of Water Resources is providing the following comments regarding "The Nation's Water Resources - The Second National Water Assessment" by the U.S. Water Resources Council.

Our review of the proposed documents has identified certain problems which we believe will seriously impinge upon the usefulness of the assessment to assist Federal Program Managers, the Administration, and the Congress in developing programs to meet the water needs of the nation. Specifically, it is our view that if this material were used to establish and implement water policy, it would promote the welfare of people in Texas and not the welfare of the nation as a whole. This is due to the review of the various assessments reports, as well as our experiences and knowledge acquired at a regional level. We believe that the following observations and comments are in the best interest of the nation and the public welfare of the nation. Your attention is requested in assessing activities for the Colorado-White-Had and the Rio Grande regions and in formulating a water policy for the nation which pertains to Texas, as prevent the following observations and comments.

1. The twenty-one regional assessors that performed the study and developed information relating to the state/regional review report, did not have sufficient information to make a valid assessment. We understand that approximately one-half of the \$6.5 million assessment funds were allocated to the states and the remaining amount was spent in the specific problem analysis phase of the assessment, yet the reports reflect principally the federal view as well as the views of the states. This is particularly true in the assessment activities for the Arkansas-White-Had and the Rio Grande regions and in formulating a water policy for the nation which pertains to Texas.
2. A Texas staff regional report was prepared by the Texas Department of Water Resources under contract with the

DOE by TWRB (Contract # Austin Texas 78701 • Award No. 5010104)

The Honorable Cecil S. Adams
Page 2

Water Resources Council. The text of the original report was transmitted to the Council on November 14, 1977 and was accepted by the Council. The report was submitted as set forth in the Council's draft planning document entitled "National Water Assessment: The Second National Water Assessment for Texas" and free information supplied by ourselves and the Texas Water Commission. In addition, a copy of this report as issued by the Water Resources Council, was submitted to the Council. The report is not mentioned nor forth in the text and figures have been omitted entirely. It is our belief that the information developed in the regional report is not supported by the data and information contained in the original report. We note that the generally approximate areas are erroneous in many instances and in other instances are not supported and contradicted by the data and information contained in the regional report with the federally-developed information. We believe that the information contained in the regional report is significantly different data replacing the original information; i.e., the content of statements and the figures presented in the regional report are not representative of the information contained in the original report. To illustrate differences in the information, please see page 12-38 of the regional report. The regional report states that "Domestic withdrawals are projected to average 1,827 million gallons per day by the year 2000, an increase of 414 million gallons per day over the year 1975, or 1,413 million gallons per day (the state/regional value was 1,932 million gallons per day in 1975). The regional report also states that "we are 127 percent above the 1975 level." Examples of such gross errors are numerous throughout the regional report for the Arkansas-White-Had and Rio Grande regional reports where the state/regional data have been replaced by what we consider to be inaccurate information.

We do note, however, that Sections (C) Problems, (D) Summary, and (E) Conclusions and Recommendations regarding the federal role in water resources management, water supply, water use, and research, and institutional factors in each of the three regional reports listed above were based upon information provided by the states. We believe that the information is not conclusive since it is stated that the information contained in the regional reports is not supported by the data and figures, to avoid any confusion and to correctly inform the reader we strongly suggest the basis of the information contained in these sections of the regional reports be correctly identified.

The Honorable Cecil S. Adams
Page 3

3. The Texas half regional report also contains significant errors in the streamflow and water use data. In Table 1, page 11-46, line one, the "National Future" (N) estimate (streamflow) is 1,000 million acre-feet per year and the water use is 1,000 million gallons per day while the "State/Regional Future" (SR) estimate is 1,000 million acre-feet per year and the water use is 1,000 million gallons per day. The reason for this significant difference is that different probability levels were used in computing the national future. In computing the state/regional future, the factors to Table 1 indicate that the state/regional value was based upon a probability of 1.00 percent. The national future is based upon a probability of 0.99 percent. The water use is the same in both cases, however, it is not apparent from the table or the table footnotes why the water use is the same for both the state and the national future at the 0.99 percent probability level. This can only be determined from an analysis of the Statistical Appendices (Volume A), Part II, Chapter 1.

Also, the state/regional water withdrawal value and concomitant use values set forth in Table 1, page 12-48, were based upon average conditions and should have been based upon more exact conditions. It appears from the data that the values were not estimated.

In an effort to help correct this material and to aid the reader in understanding the usefulness of the state/regional estimates for inclusion in the final report, we have prepared three current tables (completing estimates). The first table is a comparison of the streamflow concerning conditions (or average, the 50 percent streamflow probability (the 50 percent exceedance probability) and the 10 percent streamflow exceedance probability for both the national future information and the state/regional future. The second table is a comparison of the corrected total "supply" and "use" requirements with the corrected total "supply" and "use" compared with "supplies" and "demands" with "average" the two extremes. The third table is a comparison of the Council's "supplies" with our "usage." Two of the factors which we believe are important in this comparison are the fact that we believe to be better definitions of the "National Future" and the "State/Regional Future." When calculating the "supplies" for the Water Resources Council's estimate of 1975 and most probable future conditions, we have deleted the word "more" because we believe the state/regional future estimates, we have exaggerated estimates

by regional assessors reflecting state/regional desires and objectives, to the regional manager's "Texas Inventory of Water Resources" estimates of 1975 and future conditions.

We recommend that these definitions and appropriate footnotes be adopted and included in the final version of the "Texas Inventory of Water Resources". In addition, we believe that all of the information pertaining to water supply probability levels cited above should be described and distributed in the "Inventory" for the Arkansas-White-Red region and for the Red River region.

4. An analysis of the streamflow values in each of the enclosed tables will also be made by the regional manager in conjunction with the assessment materials. Even though there is clearly a significant difference between the average annual conditions and the 90 percent probability conditions, it is felt that all of the assumptions and conclusions set forth in the written material can take into account the difference between the V and each of the three regional reports pertaining to Texas are based on the 90 percent probability. Thus, the average or arithmetic mean of historical conditions which occurs since there is no significant variation from year to year. Therefore, it is highly inappropriate to use the 90 percent probability values and deviations when arithmetic means, All such analyses and discussions were discontinued and have been appropriate measures of the variances.

We note the following statement on page 10, Part 2, Introduction of the report: "While it is clear that, in view of the report's techniques of extrapolation, there are limitations to the use of the categories and regions, there are limitations on its use. For example, the report does not attempt to predict the amount of river reflects problems of water usage while it is known that the tributaries may be prone to increased usage over time. Conversely, the balance, yet the analysis reflects very favorable water conditions." We believe that this statement is both useful as a warning to readers and potential users of the assessment report and to the diversity and usefulness of the estimates to which it refers. We hope that our congressional colleagues are perhaps aware, we have continually voiced our concern about the methodology employed in the assessment and its inception.

5. There are several points made in the Texas draft report (12) pertaining to specific problems which we feel are misleading and require clarification. These are:

6. Pages 12-18, Water Quality Problems -- Dallas-Fort Worth Area (Trinity River and Tributaries). - Texas (Panhandle) Water Resources Assessment. This section describes the problem; it fails short of telling the whole story. It fails to tell the reader what steps have been taken to relate solutions and programs toward these solutions. Accordingly, we request the addition of a summary paragraph as follows: "In the opinion of the authors, the high pH waters in the upper Trinity River basin have already significantly deteriorated. When the remedial actions are completed, we are expected to result in a significant improvement in the quality of the Trinity River."

7. Page 12-17, paragraph 2. The statement is made that: "There is a lack of truly reliable data showing a drainage that contain high concentrations of carbon, nitrogen and phosphorus that is suitable for reuse." It has not been proven unequivocally that certain drainage in the area are due primarily to wastewater sludge, we suggest that the sentence be changed to read: "Some sources of drainage that contain high concentrations of carbon, nitrogen, and phosphorus are believed to be wastewater sludge."

8. The state/regional information for the Texas Gulf region contained on the statistical summary on page 1-1 (economic, social, and environmental) was totally in error. The following information can be found in the Texas Gulf Specific Problem Analysis section of the report which was transmitted to the Council December 19, 1977.

9. We have serious questions about a statement which appears on page 33 of the draft document entitled "Our Water Management Future". The statement reads: "After reviewing surface water supply conditions of the nation it is apparent that there is a large number of areas where no truly excess water supplies to be transferred to the Texas High Plains and other ground water mining areas." This conclusion is based upon a review of records, or supporting evidence. Our studies and assessment of data and record information do not support this statement. We are led to believe the statement quoted above is inaccurate.

8. The map on page 46 of the "Summary Report" has been over-simplified to the extent that in our opinion it is inaccurate. Thus, we recommend that it be removed from the report.

a. Page 12-51, paragraph 2. The statement is made that: "The projected growth in the North West metropolitan and the City of Corpus Christi will exceed their water supply projections." Since this statement is not true, we request that the following sentence be inserted so that the word "smaller" be inserted between the words "lower" and "higher"; i.e., "lower smaller cities...".

b. Page 12-51, paragraph 2. The statement is made that: "Projected growth in the North West metropolitan area will exceed their water requirements to the year 2025, and unless additional water supplies are made available sooner, water shortages may occur." While strictly speaking this may be true, we giving a distorted view of the situation. We request that the following sentence be added at the end of paragraph 2 so that the reader will recognize, what is being addressed as existing local long-range water supply plans."

c. Page 12-51, paragraph 2. The statement is made that: "Projected growth in the projected needs, however, supplies available from existing reservoirs in the area, utilizing the existing transmission facilities, is in the adjacent Sabine River basin, and completion of additional transmission facilities will allow the region to just barely keep up with projected needs over time." The first question is "based on what projected needs?" This question is unanswered. We request that the following be replied with the following: "On the basis of state/region wide projected needs, supplies available from existing reservoirs in the area, utilizing the existing transmission facility from Lake Tawakoni in the adjacent Sabine River basin, and completion of additional transmission facilities will allow the region to meet its water needs to the year 2020."

d. Page 12-50, paragraph 2. The first sentence refers to the projected growth in the water supply facilities from Lake Tawakoni to the East but does not mention the proposed second raw water transmission line from Lake Tawakoni to Dallas/Ft. Worth. We request that the following be added as follows: "Construction of proposed additional raw water transmission line from Lake Tawakoni in the Sabine River basin and from Lake Tawakoni in the Trinity River basin to the City of Dallas will provide additional supplies when complete."

9. Another major concern with the draft report relates to the fish and wildlife upstream flow approximation. In the section entitled "Water Availability and Water Use, Volume A-3 Water Supply and Use Analysis", it is stated that fish and wildlife upstream flow approximations "are based on judgemental predictions of the effects of water diversion on upstream flows to maintain habitat for aquatic and riparian plants and animals." We request that the following be added to these "estimated" and "reassessments" they deleted from the table. We believe others apparently recognize their inadequacy and have clearly stated that they must be revised to obtain better data for state, regional, and subregional planning.

10. The United States Department of Commerce, Maritime Administration review of "Part III Functional Uses of Water", Chapter II, Water Requirements for Navigation (page 11c-11) revealed several conflicts with whom they disagree. Comments are quoted for your information:

a. "None of the material on page 11c is true and what points are oversimplified. The implication is that water transportation organizations are not responsible because they do not have to pay for the cost of water delivery. We contend that ports and waterway authorities are aware that they must pay for water to maintain their port and to provide economic benefits to the shipping area and to the fling hinterland. In so doing, they must consider water supply issues and costs. The waterway authorities have performed an excellent and worthy task at educating port and waterway officials on the importance of water in a single truth, however, that while ports occupy a very small portion of the water user's water footprint, their economic contribution is grossly overstated and insufficient."

b. "No misleading impression is possible on page 11c. The decline of water transportation did occur with the advent of railroads and motor vehicles, but it was not their water competitors and did not try to develop them. The period from 1910 to 1940 began the reversal of inland waterborne transport by diversions resulting from the ownership of the water carriers and by concurring authority of the states in the public interest."

c. "We take issue with the statement on page 11c. The water/way system of the United States is essentially

complete...and with the qualified prediction, 'A limited number of improvements in port and harbor approaches may be made.' A trading nation, even one with a favorable balance of payments, should not consider that it has attained the optimum in transportation technology. The possibility of improvement should not be written off.

'We also note that the energy saving aspect of water transportation was not mentioned. Decision makers should be aware of the comparison by modes.'

SHUs per ton-mile by mode	
Rail	500
Rail	750
Pipe	1,850
Truck	2,390
Air	6,300

"As long as inland water transport is free of non-compensatory competition, its economic advantages (and disadvantages) will be appropriately obvious."

13. The Conclusions stated on pages 49 and 50 of the "Wastewater Report" contain some statements that are unclear, some statements that are misleading, and some statements that we do not feel are supported by the data and analysis of the report. We are including our own analysis of the conclusions contained in the report and the conclusions are as follows:

 - a. Integration of Water Quality and Quantity Management:
It is our impression that water quality management requires major investments, regardless of the time frame it is adopted. We believe the misleading nature of this conclusion is somewhat misleading as it is now phrased.
 - b. Water Quality Management:
We believe the statement is misleading in that it goes further to the conclusion by asserting that "aggressive programs directed at water quality management should have been initiated earlier in time." We believe that as a result of industrial and agricultural development and urban sprawl, water quantity management was in some instances water quality management programs should have been initiated earlier in time, not so late to contradict the conclusion that water quality management might if this conclusion statement is reconsidered.

the federal government or any other entity to resist changes in such agreements or changes in the policies underlying the agreements. Such agreements impinge upon capital asset values, employment, income, and local community tax bases).

Endorsement Statement: This convention recommends a

e. Floodplain Management: This conclusion recognizes a serious problem. No reference is made as to the significant benefits that structural flood protection has produced nor does the conclusion statement recognize the need for improved forecasting of "Flash Flood" type storms, improved monitoring and warning systems for those areas prone to "Flash flood" threatening situations, or the potential problems and inadequacies of "...structural alternatives in the control and alleviation of flood damages."

f. Major Water Development: The conclusion that water development and management programs have contributed to sustainable development and environmental development should perhaps be the leading conclusion of the environmental report. It should be expanded to include recognition that water development has also contributed to improvements in the environment, including central areas of the system, the environmental, financial, and social dimensions where streamflow was previously intermittent, and made largely uninhabitable by people who would otherwise be crowded into the megapolises of the nation.

g. **Sharing of Responsibilities:** The implication is given that water resources programs are largely funded from federal sources. Since the assessment did not address this issue, the conclusion is not supportable. In Texas, for the period 1972-1976, more than 70 percent of average annual expenditures for fresh water supply development were supplied from local and state sources of funds.

b. Integrated and Comprehensive Planning: The opening statement, "except for some sections of the country, there is no water crisis," is highly misleading. During the 1976-1977 period, the entire western United States and large areas in the northeast suffered from a drought so severe that the Congress enacted special legislation that provided hundreds of millions of dollars for use in making drought relief loans and granting financial assistance to communities and individuals. Thus, we do not understand how the

Conclusions of this assessment can present a statement

The Honourable Cecil D. Andrus
Page 9

b. Environmental Quality: The assessment analyses procedures and data did not include methods whereby effects, "... in the planning and decision making process..." could be evaluated. Thus, we do not feel that the conclusion is supportable by the work of the assessment.

c. Integrated Ground Water Management: The following conclusion is drawn: "Major deficiency is the result of past failure to provide institutional arrangements and to plan for integrated management of ground and surface waters." Critical ground water problems have emerged in the High Plains of Texas north to Colorado and Nebraska, in central Arizona, and parts of California. The problems might have been avoided if interrelationships between ground and surface water had been taken into account."

Since the High Plains area of Texas has no major streams, and natural recharge to the Ogallala Aquifer from

4. Failure to Adopt (sic) Policies to Changing Conditions: The procedures and data of the assessment did not address this issue; thus, we feel that no analyses have been performed which leads to or supports this conclusion and it therefore should be deleted from the report. (Even though we do not feel this is an appropriate or acceptable conclusion of the assessment, we argue that it is only logical for those who enter into long or short term agreements with

Table Cecilia B. Andrus

such as that quoted above. We recommend that the problem of drought be explicitly included as one of the major problems of water supply to which water resources planning and development programs must be addressed.

4. The Future: The statement is made that, "Population has not grown at the rate anticipated, and the projections of future water requirements for this sound assessment are conservative." This is a misleading statement. It is misleading because it fails to recognize the major environmental changes that have occurred in the last two decades, especially in the arid and semiarid western United States, as a result of the energy crisis and associated economic development. These changes have led to significant shifts in major uses of water, such as agriculture, for other reasons than population growth.

12. Another of our major concerns with the usefulness of information set forth in the assessment materials lies at the original boundaries of the state. As defined by the National Resources Conservation Service, the boundaries of these areas were seemingly arbitrarily defined to accommodate a major river system. The boundaries of the major river system do not consider the boundaries of the smaller streams, so a state's water rights, or other political entity which had jurisdiction over the use and development of water. To our knowledge, no such political entity exists in the Arkansas-White-Red region, Texas Gulf region, or Big Creek region. The boundaries of the assessment materials, therefore, in some of these regions there are numerous local, state, and federal entities that are concerned with water resources. It is important that the boundaries of these areas of responsibility require water related information for their respective areas (state, tribal, city, etc.) to be able to fulfill their duty of legal responsibility.

by the Water Resources Council for each of the water resource regions in the state. The Council has made this information available to us as we could believe in the accuracy of the data. The tables presented below show hydrographic areas, which cross state lines, have not provided information to the federal, state, and local area planning and operations. To be useful for these purposes, the data must be collected and presented in development which recognizes the jurisdictions of political subdivisions.

The State of Texas, through its Water Development Board, has engaged in a vigorous planning and data acquisition program. We feel that the assessment and related information published by the State of Texas is reliable and accurate and, with accepted political boundaries, is acceptable for water resources planning and management purposes. The several agencies engaged in water resource planning and development act as the liaison to the Water Resources Council and this type of information for all areas is now being developed in our view. It is supported by the fact that for the past several years various federal, state, and local agencies have been providing the State of Texas detailed water and related information to supplement the data put out of the assessments and related tabulations which these agencies are required by the Council to use for planning purposes.

We believe that your timely consideration of the above issues is particularly called for increased state participation in the federal water resources planning process. In this regard, we look forward to working with you and the Congress to develop programs and information which will be beneficial to the federal, state, and local decision-making process.

Sincerely yours,

Henry Davis

Re: Draft Environmental Statement: Federal Coal Management Program

Dear Mr. Gordon:

Members of the General Land Office have reviewed the report on the Federal Coal Management Program. We favor the "preferred program" as compared to the alternatives considered.

This agency concurs with the implementation of this project and we have checked the Agency Review Transmittal Sheet accordingly.

Sincerely,

D. J. Bryan

**COMMENTS ON THE DRAFT ENVIRONMENTAL STATEMENT
FEDERAL COAL MANAGEMENT PROGRAM**

There are numerous comments I wish to make here, most of them addressing specific sections of the Draft Environmental Statement. First, however, I would like to make two more general comments on what I feel are serious inadequacies in the statement.

The primary, and I think most serious problem with the Draft Environmental Statement, is that it totally ignores the issue of cumulative impacts which I know face the San Juan River Coal Region and which I presume may be present in other coal areas as well. As you should be well aware, no development takes place in a vacuum. When an area faces extensive coal development on the one hand and extensive uranium development on the other, as the San Juan River Region does, any discussion of the impacts of one type of development is virtually useless without a thorough consideration of the other type. Treatment of topics such as water impacts, socio-economic impacts or air quality impacts are fatally flawed without analysis of the cumulative impacts of all development planned for one area. I will discuss further the need for investigating and addressing cumulative impacts in the specific comments I will make later.

The second general, but very important, issue I would like to raise is that although some very sound ideas are set out in the Draft Environmental Statement concerning the mitigation of impacts, especially social, economic and cultural impacts, through extensive planning and consultation with those affected by the proposed development, the

REC'D BY
DRAFTING
1/22/79
Subject: Draft Environmental Statement

COMMENTS

We have reviewed the Draft Environmental Statement for the Federal Coal Management Program and recognize the monumental task involved.

Considerable attention is given to the following issues in the impact on agricultural uses and land uses in the following subtopics: (i) That consideration be given to protect prime and unique agricultural lands in the initiation of new mining activities; (ii) That consideration be given to the siting of such facilities as generating plants which plan to utilize coal or lignite to fire their boilers; (iii) That some recognition of the possibility of "dead coal" should be given; and (iv) That emphasis be given to technologies which do not require "strip mining".

Person Conducting Review (Signature) *John H. Nichols*
Agency Texas Department of Agriculture Date 12-20-79

**LETTER REGARDING DSE
PAGE TWO:**

people of at least one area, the San Juan River Coal Region, have already been precluded from participation and will not benefit from these planning mechanisms because the Bureau of Land Management has already prepared and is ready to approve an Environmental Impact Statement for a large portion of that region, the Star Lake-Bisti region. In the preparation of the Star Lake-Bisti statement planning mechanisms such as those set out in this Draft Environmental Statement were not followed, and although the statement deals primarily with the construction of a railroad spur and transmission lines, it is a certainty that if the construction is approved and completed the Star Lake Bisti Region will effectively be designated as one destined for massive coal development. The large expenditure necessary for the construction of the railroad spur and transmission lines will make development of the area inevitable.

Unless the people in the San Juan River Coal Region are assured of the benefits of the planning process set out in this Draft Environmental Statement by the postponement of approval of the Star Lake-Bisti Coal Environmental Statement until compliance with the planning process of the final Federal Coal Management Program can be assured, serious problems of unequal treatment under the program are raised, especially as they relate to those people in the San Juan River Region.

I will now discuss some specific problems to be found in the Draft Environmental Statement, which I will take up in order of their appearance in the statement.

PAGE TWO, PARAGRAPH 3-1:

The listing and discussion of the unsuitability criteria contains no system for objectively ranking the various criteria as they apply to specific areas. As the criteria, and the application of them, are

LETTER REGARDING DES
PAGE THREE:

presented in the Draft Environmental Statement, an agency may make a primarily subjective decision as to the suitability of an area for coal mining without complying with any uniform system of determination. A system such as this, with no absolute standards for decision-making, is one that will result in unequal determinations dependent on such factors as personal preferences, local consensus or industry pressures. An objective ranking system should be instituted to insure objective, uniform decisions.

PAGE 3-18:

In discussing the planning mechanism used by the Bureau of Land Management in determining an area's potential for development the following statement is made:

"Areas may be eliminated (from coal development consideration) where surface owners indicate definite preferences against the leasing of the deposits underlying the private surface. Application of this final screen would be at the option of the local land manager, and it would not be applied where a consent had previously been granted by a landowner".

The Surface Mining Control and Reclamation Act of 1977 provides that the consents of the owners of private surface overlying federal coal must be obtained before surface mining may begin (Section 724). Therefore allowing the local land manager to essentially override the preferences of the surface owner in designating the land suitable for development, causes serious problems in the application of the law. By designating land, the surface of which is owned by people who oppose surface mining, as suitable for coal development consideration, the local land manager would create a situation where tremendous pressure to consent to the mining would be brought on the surface owners by

LETTER REGARDING DES:
PAGE FOUR:

industry and government agencies wishing to develop land already designated as suitable. In this way the owner's right to choose which is guaranteed by the Act is interfered with. The Surface Mining Control and Reclamation Act does not include a provision for the overriding of the surface owner's decision by any governmental agency. The spirit of the law is violated by allowing the local land manager to override the surface owner's preference in designating land as suitable for coal development.

There is also an inconsistency with the planning process mandated by the Surface Mining Control and Reclamation Act here. The surface owner must be consulted during the planning process and since there is no provision for override of the surface owner's decision on the final lease, it should be presumed that no opportunity for override in the planning process is allowed either.

A consistent interpretation and application of the Surface Mining Control and Reclamation Act is called for. Confusion and unequal application of the law will result if present Bureau of Land Management policies are not made consistent with the Act. The final Environmental Statement should reflect a resolution of this problem.

PAGE 3-21:

The discussion of Threshold Development Levels again raises a problem I discussed earlier here. The statement is made that the threshold concept would be "particularly appropriate when considering socio-economic impacts". The point is made that a certain area may only be able to support a certain level of development.

Certainly the San Juan River Coal Region is an area where threshold development is of vital importance. Yet by preparing, and presumably approving, the Star Lake-Bisti Coal Environmental Statement,

LETTER REGARDING DES:
PAGE FIVE:

The Bureau of Land Management has committed the area to massive coal development without employing any consideration of what level of development the area can accommodate. Again, the people of the San Juan River Region are being denied the benefits of a final Federal Coal Management Program.

PAGE 3-24:

Since virtually all of the owners of private surface in the San Juan River Coal Region are Navajo Indians who speak little or no English, some discussion of how the rights of these people under the Surface Mining Control and Reclamation Act will be protected should be included. Details about the translation of the actual results of a consent under the Act should be included in order to insure that these people really know what they are consenting to. No discussion of this problem appears in the Regional Statement and it is of such significance that it should be discussed in the final version of this statement.

PAGE 3-41:

The discussion of compliance with the provisions of the National Environmental Policy Act is troubling for the same reasons that I have set out above. While the plan is to provide a two-level system of Environmental Impact Statements, one national and interregional and one site-specific and intraregional, both applying the provisions of the Federal Management Program, compliance with the Act is threatened by the preparation of the Star Lake-Bisti Statement and the commitment of resources which will be the inevitable result of approval of that statement. Unless the final statement on this area is delayed and modified to comply with the final Federal Coal Management Program serious questions about the Management Program and its compliance with NEPA are raised.

LETTER REGARDING DES:
Page Six:

I will discuss the problems contained in the discussion of water impacts all at once, even though the pages I will be citing are dispersed throughout the Draft Environmental Statement.

PAGE 3-20:

Section 522 of the Surface Mining Control and Reclamation Act sets out certain standards for the protection of the environment. One of the standards set out is that the protection of all aquifers be provided for.

In the San Juan River Coal Region, especially in the San Juan Basin where most of the coal activity of the Region will take place, coal development will probably depend exclusively on water from the existing aquifer. However no discussion of how the aquifer will be protected is included in this section. Since aquifers provide the only water supply for much of this region, discussion of mitigation measures is imperative.

PAGE 4-31:

The statement is made here that "potential evaporation exceeds normal precipitation by a factor of 6 or more" in the San Juan Region. Certainly this factor has a direct relationship upon the recharge to aquifers used for coal development. Yet no discussion of the total effects of massive dewatering and minimal recharge is contained anywhere in the Draft Environmental Statement.

PAGE 4-31:

The statement is made here that water from the aquifer likely to be drawn upon in coal development are of "poor to fair quality". This is a mistatement, as the Heatwater Canyon member of the Morrison Formation which is the aquifer most likely to be used in coal development contains excellent drinking water used by the Crownpoint area,

LETTER REGARDING DEB:
PAGE EIGHT

Impacts to this aquifer will affect the only good drinking water available in the San Juan Basin. Substantial impacts such as this should be treated more fully in the final statement.

PAGE 5-11:

The statement at issue here is that water will be "a stringent limit on development". How stringent a limit water will be must be more fully discussed and here we run into the problem of cumulative impacts. Given the massive uranium development planned for the San Juan River Region and the equally massive coal development there is no doubt that water will be an absolute limit on development. Discussion of this limitation is imperative.

PAGE 5-11:

In the Coal Impact Estimation Program no mechanism for determining or mitigating impacts to water quantity is included. Since the reduction of water quantity in the aquifers of the San Juan River Region is a certainty given the development planned for the area, this issue should be addressed in any estimation of coal impacts.

PAGE 5-26:

Under the section dealing with water impacts the problem of cumulative impacts is very serious. According to the figures in Table 5-10 water demands in the San Juan River Region from coal development could range from 38,000 to 57,000 acre feet per year depending upon the alternative chosen. It is a fact that in the San Juan Basin, where most of the coal development in the Region will take place, the only water available for coal development will come from the Westwater Canyon aquifer. Claims that water can be obtained from the San Juan River are unrealistic and misleading. Information from the New Mexico State Engineer's Office and the United States Geological Survey reveal the following facts:

LETTER REGARDING DEB:
PAGE EIGHT

Extensive uranium mining is planned for the San Juan Basin during the same time period in which coal development is planned. The uranium ore in this area is located in the Westwater Canyon aquifer. Therefore water must be pumped from the aquifer in order that mining may take place. Dewaterring rates of 3,000 to 3,500 gallons per minute are common and rates up to 10,000 gallons per minute have been reported. The total quantity of water pumped out of the Westwater Canyon by presently proposed mines could exceed 40,000 acre-feet per year by 1983. The effect of this dewaterring will be to lower the water table of the Westwater Canyon by as much as 1,500 feet within a 50 mile radius of the mining operations. Artesian pressure will also be reduced or eliminated so pumping will become a necessity. Since the Westwater Canyon is from 2,000 to 3,500 feet below the surface to begin with, this lowering of the water level effectively makes pumping any water remaining in the aquifer to the surface an engineering and financial nightmare.

In the draft Environmental Statement a water budget of anywhere between 30,000 and 92,000 acre feet per year for coal development in spite of the fact that in the San Juan Basin uranium development alone could realistically deplete the aquifer. There is a very real possibility that there will be no water available for coal development in this area. Any discussion of water impacts without consideration of this fact is incomplete and totally unsatisfactory.

PAGE 5-31:

The discussion of water rights here should include the problem of Indian title to groundwater. The complexity of the issue, the problem of competing interests between the state and Indian water rights and the fact that no final determination of the ownership of the water underlying much of the coal in the San Juan River Coal Region

LETTER REGARDING DEB:
PAGE TEN

should be addressed in any discussion of the feasibility of coal development in that region.

PAGE 5-41:

As I have pointed out above no discussion of the availability of water for coal development in the San Juan River Region is sufficient without addressing the realities of the situation which are:
1) Virtually every drop of San Juan River water is already allocated and it is probable that none will be available for coal development.
2) Coal development in the San Juan Basin will have to depend entirely on water from the Westwater Canyon aquifer.
3) Cumulative demands on this aquifer will raise a very real possibility that no water will be available for coal development. The problems raised here with respect to the water impacts of coal development go to the initial question of whether the entire San Juan River Coal Region should be considered at all for any development. These impacts should be discussed at the national level and should be included in the final Environmental Statement for the Program.

These problems should also be discussed at the regional level. Again, the Star Lake-Bisti Coal Environmental Statement does not address any of these problems. If the regional statement is approved and implemented the area will be committed to development without the knowledge that there will be sufficient water to support that development.

I will discuss the problems in the statement concerning reclaimability of the land all at once even though the references to this problem are dispersed throughout the statement.

PAGE 6-22:

Although the Surface Mining Control and Reclamation Act mandates

LETTER REGARDING DEB:
PAGE TEN

reclamation of lands which have been mined, and although the statement here describes the soils of the San Juan River Region as "shallow, saline and erodible", no substantial discussion of the actual methods for reclaiming this type of soil is made.

PAGE 4-34:

The statement "all areas may be reclaimed if topsoil can be replaced and adequate moisture is available". This type of meaningless assertion makes a mockery of the whole process of mitigating environmental impacts. Of course all areas can be reclaimed if these conditions are present. By the facts stated in this Draft Environmental Statement, the San Juan River Coal Region is one of fragile topsoil and virtually no precipitation. The possibility that reclamation may not be possible should be discussed as well as the resulting possibility that with no, or minimal, reclamation coal development may well force the migration of all those people living in the area to be developed.

PAGES 5-1 and 5-22:

Here the statement is made that all mined land must be reclaimed. However by looking at the reclamation potential set out for the San Juan River Coal Region it is apparent that there is no certainty that reclamation may be achieved. By discussing the reclamation potential for the region in the number #s, a reader could be led to believe that there is some hope for the area. But an examination of the criteria used to reach that number combined with the realization that the scale of reclaimability runs from #0 to #4, reveals that there is a real possibility that land in this area will not be restored to its prior use, grazing. The possibility that land will not be reclaimed effectively must be included in the final statement or the people in this area will have only an apology as mitigation of this problem.

LETTER REGARDING DEIS:
PAGE ELEVEN:

I will now address several separate problems in the order in which they appear in the Draft Environmental Statement.

PAGE 6-34:

The San Juan River Coal Region is one of exceedingly complex land status. The discussion here should include a description of these various categories of land which include: Tribal trust land, Tribal fee land, Individual Indian allotments, Executive Order land (set aside for exclusive Indian use and occupancy), Public Domain land, Private Land and State Land. Each of these types of land is administered differently and by different individuals and agencies of the Tribal, State and Federal governments. To merely state that most of this land is "Federal" land is to minimize the difficulties inherent in land use planning in this area. The difficulties are so great that a tri-partite agreement had to be reached between the Navajo Tribe, the Bureau of Land Management and the Bureau of Indian Affairs for the management of the areas of proposed coal activity. This agreement and the problem which caused it to be adopted should be included in the final statement.

PAGE 6-50:

Any discussion of air quality impacts in the San Juan River Region must include the effect of the cumulative impacts of uranium mining and milling.

PAGE 6-52:

The discussion of impacted communities is inadequate in the following respects:

- 1) Although it is stated that a growth rate of more than 10% in small communities would require special planning, no discussion is made of what effects any population increase would have on

LETTER REGARDING DEIS:
PAGE THIRTEEN:

Citedas.

PAGE 5-94:

The evaluation of impacts to agriculture based on the dollar value of the productivity of an area does not allow consideration of the very real impacts to areas where people grow or raise only enough to support themselves. These situations must be addressed.

PAGE 5-14:

A discussion of who will bear the financial impacts of coal development in Indian communities should be included here. Much coal activity is planned for Indian areas which are not on a reservation and the issues of who will bear the costs is pertinent here.

PAGE 5-96:

Here again there is a problem of what will be done in Indian areas with no tax base.

PAGE 5-113:

There must be a discussion of the impacts of coal development in areas where there are no existing paved roads. The following statement points out the inadequacies of the Draft Environmental Statement in this regard:

"Perhaps the most important impact would be the perceived, rather than actual, impacts of truck traffic on a local community in terms of traffic volume, noise and vibrations, coal spillage and visual impacts".

This irresponsible statement points out that whoever wrote this Draft Environmental Impact Statement has no perception of problems outside the scope of suburban life where this statement might have some validity.

In the entire San Juan Basin, that area of the San Juan River Coal Region where most coal development will take place, there are

LETTER REGARDING DEIS:
PAGE TWELVE:

Areas where there are essentially no services, as would be the case throughout the San Juan River Region.

2) No discussion is made of impacts on communities where there are no services, no housing and no private land on which to build these things.

3) No discussion is included about the boom-bust phenomenon experienced in areas which have sudden development but which have no structure to hold the influx of people after the development is over.

4) No discussion is included about the effects of increased population on Indian communities, where English is not spoken and traditional lifestyles are dominant.

These issues must be addressed in the final statement.

PAGE 5-55:

The discussion of population increases is faulty because it does not take into consideration that population increases will most often take place in areas away from the major population centers. Especially in the San Juan River Region, the population increases will take place where there are no established communities, and therefore the impact of increased population will be much greater than estimated in the Draft Environmental Statement.

PAGE 5-54:

The evaluation of where the work force for coal development will come from is based on the assertion that agricultural workers will be available for the work. In the San Juan River Region there are virtually no agriculture workers to draw upon. Virtually all employees in the coal development will have to come from outside the area. This influx of outsiders constitutes a considerable impact and should be

LETTER REGARDING DEIS:
PAGE FOURTEEN:

two paved roads, neither of which comes near the areas to be developed. The impacts of traffic related to coal development in this area are tremendous and must be addressed.

PAGE 6-1:

The discussion of the implementation of the President's mandate on comprehensive planning through cooperation with the state governments points out a problem. Virtually none of the area to be developed for coal in the San Juan Basin is subject to state or strictly federal control. The absence of a mechanism to involve members of the Indian communities in the planning process effectively precludes these people from participation in the process. Mechanisms must be devised and implemented for this participation or the effect of the absence of such mechanisms must be addressed in the final Environmental Statement.

PAGE 6-1:

The statement is made here that the changes brought about by coal development will bring about long-term opportunities for impacted communities. In many areas the changes will actually spawn ghost towns and the eradication of traditional lifestyles. These end results should be discussed in detail in the final Environmental Statement.

This concludes my comment on the Draft Environmental Statement for the Federal Coal Management Program. I trust the points I have raised will be reflected in the final Environmental Statement.

Very truly yours,

Liza G. Omoe

COMMENTS
on the
PROPOSED COAL MANAGEMENT PROGRAM
and
DRAFT ENVIRONMENTAL STATEMENT

05B

This programmatic statement and the preferred alternative represent an improvement over previous coal management statements and programs. PLI commends the Department for recognizing the need for a Federal coal management policy and for integrating coal management with land use planning.

We strongly urge the Department to issue a new draft statement. This draft uses questionable assumptions for analyzing the need for leasing, contains no truly programmatic alternatives, and erroneously describes the environment and analyzes impacts. Because these problems are so massive, the reader and the decision-maker are mis-informed about the nature of the program and its expected impacts. Thus, the draft must be revised and public comment solicited once again.

Our comments are organized into a section which describes some inadequacies of the draft statement and preferred program, and a section which analyzes and revises the lands unsuitability criteria.

DESCRIPTION OF INADEQUACIES

Assessment of the Need for New Leasing

The analysis of national need for leasing is based on several questionable and illogical assumptions:

1. It presumes that national need can be determined on a regional level at a later date (p. 3-6, 8). However, Judge Pratt in the *MEPC v. BLM*.

Public Lands Institute

3.

not coal management -- which is the subject of this statement. Federal coal management can include leasing but extends to many more activities than coal leasing alone, such as land use planning, use of non-coal resources, management of existing leases, compliance with the National Environmental Policy Act, etc.

Following are examples of how the alternatives fail to be legal programmatic alternatives.

1. no federal leasing alternative (Sec. 3-1.2). This means no leasing until 1995. It is not consistent with the preferred alternative which is described as "should any leasing be contemplated" (p. 3-4, Sec. 3-1.1).

2. Progress outstanding preference right lease applications. (Sec. 3-1.3) The discussion states, "this alternative is not necessarily inconsistent with the preferred program or with the alternative of leasing to meet DOE production goals." (p. 3-7)

3. Emergency leasing. (Sec. 3-1.4) This is the same management as that in the "emergency leasing" phase of the preferred alternative (p. 3-4). The lease terms would differ slightly.

4. Lease to satisfy industry's indications of need. (This may be a true alternative but not enough information is given to determine how management would differ from the preferred alternative through all prelease steps. It appears to concern only lease tract selection.)

5. State determination of leasing levels. (Sec. 3-1.6) This is illegal because present statutes mandate the responsibility for leasing to the Department of Interior. This is admitted in the statement, "both structures would require Congressional action to amend the governing statutes, especially FLPMA and SMCRA." (p. 3-14). It offers only in one small aspect from the preferred alternative, state selection of the amount and timing of new leases.

6. lease to meet DOE production goals. The description states that the

Public Lands Institute

2.

specifically ordered the Department to consider the need for any leasing in the new programmatic statement. To be legal and useful to the decision-maker, the assessment must be on a national level first.

2. The analysis makes a circular argument. The DOE National Coal Model, which is the basis for the conclusion that Federal leasing is needed, uses a least cost model. One of the presumptions in that model is that federal leasing will be returned to make available least cost coal (p. H-7, Sec. H-2.1.10).

3. The statement justifies additional federal leasing and production of Western coal because of more rapidly increasing western demand for coal (p. 3-10). Yet the projection of production and consumption in Tables 8-2 and 8-3 show western production grows at twice the rate of western consumption between 1976 and 1990. State participation.

The preferred alternative sets up a special role for state participation in coal management (p. 3-26, Sec. 3-2.3). While the States would be "consulted" at many points, there is no discussion of their corresponding responsibilities. We believe that the States and governors should be given the same participation rights as the general public and industry, and no more. Although the statement is made that the states' role stops "short of providing them veto power over federal decisions," the "governor would also be informally consulted prior" to a decision to lease. In practical political terms they will assume a veto power over coal decisions. As the recent battle over water projects has shown, giving the states something for nothing establishes a habit that is almost impossible to change.

Alternatives.

The selection and discussion of alternatives in the statement is seriously deficient. Most of the so-called alternatives are not true programmatic management alternatives at all but are leasing plans that may differ slightly from the small leasing part of the preferred management alternative. They concern leasing only.

Public Lands Institute

4.

Department of Interior "would not call for any adjustment in those (DOE) projections," (p. 3-14) and the Department may make some adjustments in the DOE projection under the preferred program:

"Essentially the Department of Energy (DOE) updates its production projections every year. These targets would be submitted to the Department of the Interior. The Department would review and, if necessary, propose the appropriate changes to the production projections to fit the specific regions containing Federal coal." (Emphasis added.) (p. 3-6, Sec. 3-1.2.)

In conclusion, real alternatives were not chosen, and these chosen are not sufficiently described for the reader or the decision-maker to understand the possible courses of action.

Start-up Special Considerations. (p. 3-8)

The preferred alternative is based on the sound principle of integrating coal management with land use planning for all resources. While the principle is sound, the execution of that principle, as proposed, misses the mark and misses so badly that the principle is lost. The major problems with the preferred alternative are the hasty schedule, while calls for lease sales in mid-1990, and the premature use of the program now, without waiting for the proper decisions to be made. This hasty creates massive problems in all program areas. For example, this does not allow enough time for the District BLM offices to put into effect the new land use planning system.

Instead, adoption of the real, preferred alternative is put off and the "start-up special considerations" (p. 3-28) phase is substituted for up to 18 years, according to the proposed planning regulations (DOI 8-2(c)). This substitute is nothing less than the activities done under the old system, BLM (Energy Minerals Activity Recommendation System), ousted off and injected with life again.

As the basis for BLM's activities, land use plans for federal coal resource areas were hastily developed. BLM at that time worked under the policy

that promoting coal development on the public lands was its mission. During the development of these land use plans, coal was the prime resource, and many plans responded to industry notifications of proposed lease trusts. The management needs and uses of other resources were addressed only if they did not conflict with coal development. If conflicts arose after the plan was completed, then the plan was quietly altered to accommodate coal, at the expense of other resources. For example, the Williams Fork, Colorado, plan in its original version called for BLM to manage the Little Yampa Canyon of the Yampa River as a candidate for Wild and Scenic River status -- kept free of developments. When the W. R. Grace Corporation selected the canyon as its economically favored route for a railroad to serve its Galena coal mine, BLM altered the land use plan without public notice to accommodate the railroad. Other feasible and less damaging routes were available, but BLM saw its mission as serving the coal company's every whim. A canyon was destroyed.

The existing plans are based on information that is poor or lacking on some resources such as non-game wildlife populations and needs, and they deliberately ignore information on other resources such as agricultural values on private lands overlying federal coal.

The results of this land use planning are proposed to be continued under the "start-up considerations phase." The plans will be overlaid with the third wave of the lands unsatisfactory criteria. Lands unsatisfactory criteria is a much needed management tool which we fully support. As proposed, the criteria are weak and ignore important kinds of impacts, but these can be corrected with rewriting. However, their effectiveness depends on the quality of the land use planning system, which forms the foundation. Use of the criteria cannot address the deficiencies of the planning system. Just as one can't patch a crumbled foundation. Yet these criteria are being used now, before public comment and

rewriting, before a coal management system has been chosen, before compliance with the National Environmental Policy Act, and before new land use plans have been written using the multiple-use-sustained yield mandate of FLPA (Federal Land Policy and Management Act).

These problems are caused by the adoption of the 1980 lease schedule. Yet the Department is able to leases in situations of need under the court agreement now and lease sales could be held in 1980 under that agreement, if it was still in effect. The case for a rush is not justified and furthermore, the schedule prompts and undercuts the goals the Department says it wants to achieve.

Description of the environment and analysis of impacts.

The description of the environment and analysis of environmental impacts section are misleading, contradictory, erroneous and perfunctory. We have selected reclamation in the West to illustrate these problems, but another component would serve as well, such as socio-economics, wildlife, water, air, etc.

1. The optimism on the potential for reclamation success in the West defies the environmental facts. For example, on page 4-34, it is stated regarding the San Juan Region:

"All areas within the region probably will be reclaimed after disturbance... provided that topsoil is replaced as a plant medium and adequate moisture is available for plant growth and emergence."

This optimism is not backed by the facts presented in the statement. Water is in very short supply:

"Annual precipitation averages less than 10 inches for most of the region..." (p. 4-35), and "Groundwater in the region is generally too far below the surface to fair quality where it is available" (p. 4-35).

the topsoil is poor:

"The major limitations of the region's soils are shallowness, salinity and aridability." (p. 4-35)

and the climate is severe:

Potential evaporation exceeds normal precipitation by a factor of 6 or more." (p. 4-35).

2. The optimism on the potential for reclamation success in the West defies history. On page 5-22, a table entitled "Time Required to Reclaim Mine-Land (Western Regions)" states, by area, that very precise amounts of time are needed to reclaim to rangeland and cropland. For example, it states it takes 9.6 years in the Powder River Area and 14.7 years in the San Juan area to reclaim to rangeland. Neither in the text nor in the table are any areas cited as living proof of successful reclamation to rangelands, according to the standards of the Surface Mining Control and Reclamation Act regulations. "Hanspland" reclamation is not defined. It can mean introduced annual grass species; native perennial grasses, forbs and shrubs; regular applications of fertilizer, water, and/or herbicides.

3. Sources on western reclamation are misinterpreted. For example, the 1974 report by P. E. Packer is referenced throughout the reclamation sections. However, Packer looked at only three components: salts, precipitation and vegetation from the standpoint of stabilizing the site -- not reclamation -- and his work predated and did not include sufficient field trials to determine reclamation success according to SMCRA. His work represented an early effort and in no way attempted to be anything more than preliminary work.

4. The statement refers to wantonly disrupt the impacts of land disturbance and reclamation at other components. For example, the discussion of wildlife and reclamation on p. 7-8 is nonsequential. It does not describe reclamation using native species useful to wildlife, only "young stands of pine (5 to 15 years)," although pine would be inappropriate for many Western areas, such as the Powder River Basin.

The wildlife section purports to be part of an analysis of long-term productivity losses versus short-term use of lands (p. 7-4). It concludes that "any surface mining operation would result in a temporary loss of habitat for certain species." The implication is that the wildlife go into suspended animation or conveniently move away until their habitat or living space is reclaimed. They don't, they die. And some species may never re-inhabit the area.

Furthermore, the discussion of reclamation in the west to "hanspland" is based on the table on p. 5-22, discussed above, and the discussion fails to point out that reclamation to replace wildlife habitats in the west, if it can be done, takes 50-100 years. To date, it has not been done (oral communication, February 9, 1979, Harold Tyle, Office of Biological Services, U. S. Fish and Wildlife Service).

In sum, the sections on description of the environment and analysis of impacts are written in the philosophic vein of Polyanna. They should be completely rewritten to present the facts and present logical conclusions derived from those facts.

¹⁷See "Wildlife in America," by Peter Matthiessen, 1959, Viking Press. This is a comprehensive history of American wildlife that vanished or became so rare that last-ditch protection barely saved them from extinction. It covers the period since white man's arrival in North America.

Western Colorado Resource Council Inc.

Box 201 Meeker, Colo. 81419
Phone (307) 872-3962

February 17, 1979

Mr. Robert Moore
Director, Land
Office of Coal Management
Surface and Mineral
Department of the Interior
10th and G Streets, S.W.
Washington, D.C. 20540

Dear Mr. Moore:

The Western Colorado Resource Council, Inc., has reviewed the draft Federal Coal Leasing Program Environmental Statement (EIS), and submits the following comments. We enclose a copy of the testimony presented by Gary Park on behalf of the Resource Council at the January 24, 1979, hearing.

Our comments are directed toward those portions of the EIS concerning special leasing opportunities, surface owner consent, emergency leasing, the lands unsuitability criteria*, and other matters. Below is a brief summary of our comments.

Special Leasing Opportunities
Under Section 203(d)(2) of the EIS, there is no provision for special leasing opportunities for rural electric cooperatives, non-profit cooperatives, or small business concerns. Section 203(d)(1) of the General Coal Leasing Amendment Act of 1975 (P.L. 94-274) states that the EIS does not adequately analyze the impact of allowing such organizations this type of leasing will have in the preferred program.

When the Secretary selected the preferred program last June (See section 203(d)(1) of the EIS, and the Final Environmental Impact Statement for the Coal Programmatic Environmental Impact Statement), he decided that "public power" leasing would be included in the scope of the leasing "public power" that it would be encouraged.

The details concerning possible priority for special leasing opportunities and the percentage of leases to be offered to public utility are non-existent.

In addition, the system for considering and processing lease renewals and transfers must include end-use considerations. The Department seems willing to adopt a policy which

*under separate cover

059

February 12, 1979
Mr. Robert Moore
Dose

would consider end-use of the coal resources, but these end-use considerations could easily be considered in determining if a specific tract should be considered for a special leasing opportunity.

Surface Owner Consent

Surface owner consent is a major element in the preferred program and is of vital importance because of the fact that more than half of the federal coal in the West underlies private surface ownership.

A major objection to the surface owner consent policy described in the EIS is that the consent process continues up to and beyond the time the land is leased. This means that the surface owner can refuse consent and leave the coal under his surface.

Surface owner consent should be obtained early in the planning process so that if it is not obtained, the tract or area should be eliminated for further consideration for leasing. The surface owner's right to consent is well established in law. The benefit of leasing lands who do not want their land disturbed by mining. To allow split-waste tracts without SOC to proceed through the leasing process would be to put the company under extreme pressure on the land owner who may feel he has no choice but to finally give his consent.

Emergency Leasing

The so-called emergency leasing described in the EIS would perpetuate and expand the deficiencies of the various short-term leasing policies adopted by the Department during the last eight years. These policies have been characterized by lack of control, manipulation and speculation on the part of the oil industry. They place the burden of risk and responsibility on the public interest groups. Again it will be industry which dictates the time and place for federal coal development.

In western Colorado we have many examples where companies develop wells on federal lands, lease the land adjacent to large areas of federal coal in anticipation of receiving a larger federal lease. In the case of the coal, the companies involved in the properties do not justify the company's financial investment, they do assure that the mine will produce coal in an "emergency" lease which will be paid for by the federal government.

If the criteria required to obtain an emergency lease remain as proposed, we will be assured that the speculation will continue. Changes in the criteria dealing with the number of years a company

February 13, 1979
Mr. Robert Moore
Dose

must be in production prior to filing an application, the number of active production, certain circumstances, and the applicants inability to meet the need for federal coal acreage.

We feel that the lease tract would have the unsuitability criteria applied to it if it is nonresidential because of the broad exceptions and the lack of a clear definition of residential use. We also feel that the site is compatible with the use we plan to put protection at all, because the plans developed by the company are not compatible with the nonresidential uses.

Comments
We find the draft EIS to be totally inadequate in describing the need for leasing, the preferred program, the alternatives and the impacts that a coal management program will have on the area.

Thank you for your consideration of this matter.

Sincerely,

Gary Park,
President
Western Colorado Resource Council, Inc.

STATEMENT OF MARK WILSON on behalf of WESTERN COLORADO RESOURCE COUNCIL, INC.
Mr. Doug pragmatic environmental statement for the Federal Coal Management Program

Denver, Colorado

January 26, 1979

I. INTRODUCTION

My name is Mark Wilson and I am testifying here today on behalf of the Western Colorado Resource Council, Inc. The Resource Council is a membership organization based in Meeker, Colorado. We believe that the Interior Department needs to develop a responsible federal coal policy, and specifically, a policy which is responsive to the agricultural, social, and environmental values of the West.

My comments will be directed towards portions of the draft pragmatic environmental statement which address the issue of need for additional federal coal leasing. The Department appears to have accepted DOG projections when it is convenient, and disregarded them when they were not convenient.

In Section 2.0, the Interior Department seems to have concluded that need may be difficult to prove, but that it is better to lease too much than not enough.

In Section 2.0.1, the assumption is made that actual production of coal is not likely to occur until five (5) to ten (10) years after issuance of a lease. We question this assumption. In Colorado, we have numerous examples of mines producing coal within two years of receiving a lease. The lead time needed to get a mine in production is often exaggerated. An accurate lead time is needed in order to determine how long the lead time, the sooner the need).

This section quite accurately states that "... the failure of the Department to show a need for leasing was cited by the court in *Hughes v. Hughes*

as a principal defect in the previous coal leasing programmatic EIS."

Judge Pratt's Order and Opinion of September 27, 1977 requires that the Department justify the need for new leasing prior to the adoption of a new leasing plan. Department officials do not believe this view. This is evident from a statement made by Director of Coal Leasing Office, including the January 5, 1979 public information meeting in Grand Junction, Colorado. In response to a question regarding need, Mr. Ivan stated that "I don't think that the Interior Department has to be able to demonstrate need to lease lands . . . If the Department thinks it could promote competition, if it thinks it has better land than can be developed more than private land - you see think of lots of reasons in the public interest to lease." (Attachment 1)

As indicated by such statements, the need is merely a juggling of figures and exceptions of questionable assumptions needed to support its desired conclusion that leasing is needed.

III. PERTINENT PROBLEMS

The Resource Council is especially concerned about the reliance on the process of land management's land use planning system for making major decisions in the federal coal management program. In recognition of the importance of sound management in the planning system is required by Congressional legislation. A primary concern is the fact that the new Federal Land Policy and Management Act (FLPMA) regulations are being widely influenced by the prioritization of only two resources - oil and gas. Theoretically, it may be a good idea to use the same planning process for making decisions, but it is essential that the new land use planning process in the FLPMA regulations reflect the Secretary's priorities in leasing policy. The FLPMA regulations must take into account the use of all resources (agriculture, water, wildlife, timber, minerals, and others), contain adequate protection for areas of critical environmental concern, increase public participation, and generally reflect NEPA requirements. In addition, our plan must not be grandfathered.

Because the preferred program is based, in large part, on the current's planning system, we must ask - what is the real purpose of a land use plan, and how would a specific plan regulate the management of coal? Section 3(a)(1)

of the General Coal Leasing Amendments Act (PL 94-237) states that "no lease shall be held unless the land containing the coal deposits have been included in a comprehensive land use plan and such sale is compatible with such plan." (emphasis added).

Under the present land use planning system and the proposed FLPMA regulations almost any leasing proposal would be "compatible" with the plan. The reason for this is that the GCLA states that FLPMA provide guidance, not mandatory instructions.

I would like to cite an example, under the present policy, showing that probably any leasing proposal can be found to be acceptable within the coal plan.

In 1976, a short-term lease application for over 2,200 acres was filed in the North Fork Valley. At that time, the management framework plan restricted short-term leases to 400 acres or less. Yet, the Bureau of Land Management determined that the coal lease application was compatible with the plan.

Under the proposed FLPMA regulations, it is the same thing - because as usual, Section 1601(e)-(3) "Changing the Resource Assessment Plan, allows for the amendment so that specific proposals will no longer be conflict with the original plan.

The essential elements of good land use planning, such as the application of adequate sustainability criteria, multiple use management of resources, surface user consent, and the development of sustainable uses/benefits are unchanged and offer no protection if land use plans can be ignored or liberally modified.

The final FLPMA regulations must come to grips with this issue and recognize the real purpose of FLPMA. We strongly urge the Department to adopt regulations which require that land use plans be mandatory. If land use plans give general guidance only and can be ignored at the convenience of non-compatible proposals, then we will question whether coal development is controlled by land use plans, or are land use plans controlled by coal development.

VI. LAND USE PLANNING CRITERIA

The AS states that the critical decision during the land use planning process is the application of the lands availability criteria. We are in

complete agreement with this statement, but the present criteria are totally unacceptable.

Major problems with the criteria fall into two (2) categories:
A) the exemptions and
B) the exception of non-impacts.

A. EXEMPTIONS

The exemptions are so broad and vaguely worded as to cause some reading difficulties. The exemptions give too much discretion to the local office. The general exemption gives too much discretion to the surface impacts associated with underground mining. This exemption states that federal laws will be waived, where the mining will result in no surface effects, will be considered suitable. Now it is going to be determined that there will be no surface effects in any given area! The general exemption goes on to state that the categorical exemptions will be applied where underground mining will produce surface effects. A concise definition of surface effects is needed, and it should include the definition of "surface coal mining operations" of Section 710 of NEPA.

B. EXCEPTIONS

The criteria are limited to exclude non-impacting impacts. The criteria do not apply to effects on socio-economic impacts. This approach is extremely narrow and discriminatory. The AS does not believe that the criteria 1) suffice access and coordination problems for mining lease applications to provide necessary social services; 2) the "existing capacity" of an area; 3) water usage, and the possible diversity of agricultural, residential and industrial uses and may other social and economic factors needed to determine whether an area is suitable for mining.

Chapter 3 states that land use planning will be responsive to local resource needs and to the needs of the local community. This will prove impossible to achieve if off-trust impacts are excluded. We are told that surface cover consolidation and control, along with a multiple use analysis, will provide the opportunity to consider these off-trust impacts, but those of us in western Colorado are left unassured by this assurance, since Section 3(a)(1) states that surface owner comment does not apply to underground

Mining

We have little faith that the AS's multiple use analysis in the land use planning process will do more than briefly consider and then ignore impacts to other resources on a local community basis. The state of faith is based on our experience with the 1977 mineral revision of the San Juan FLPMA. The multiple use analysis resulted in a recommendation that many specific tracts be rejected for further consideration for leasing because of major resource conflicts and unacceptable impacts on local communities. The status of these "reject" tracts was later changed by the State Director so as to allow their development.

Through the Resource Council recognizes that all increasing of coal lands cannot take place in any one step of the planning process, we encourage the Department to make appropriate changes in the sustainability criteria to eliminate deficiencies identified in these and other areas.

V. SPECIAL SURFACE CONSIDERATIONS

The Resource Council is concerned about the legality of the special surface considerations described in Section 3.2.6 of the LN. The first paragraph of this section states that "each of the general resource inventory and land use planning required under procedures described above will have been completed or will be well begun by the date of publication of the final version of this statement."

In plain English, these start-up considerations include:

- A) use of existing land use plan;
- B) use of the implementation of the sustainability criteria; and,
- C) 1980 lease base date.

VI. EXISTING LAND USE PLAN

The Department should not rely only on existing FLPMA because many of them were prepared under NEPA. In addition, these plans were adopted without the benefit of FLPMA, and might remain that way for 25 years (MOL-3(h)(1)). It is probable that these plans did not comply with the 1960 series manuals, and none of the plans complied with NEPA. Also, many FLPMA have been criticized because of lack of data in the NEPA resource analysis, excesses of discretion, limitation time for preparing plans, and lack of public involvement. For these

STATEMENT OF MARK WELCH
January 25, 1979

and other reasons, it is obvious that the Department should take the old SFC and start with a clean slate.

B. PROPOSAL FOR APPLICATION OF UNUSABILITY CRITERIA:

The application of unsuitability criteria should be halted because of the following reasons:

1. The criteria are part of the preferred program and should not be applied until the criteria are in final form and in effect.
2. The criteria have been applied prior to the public comment period.
3. The final criteria could be different than the proposed criteria.
4. The Department is leaning toward the preferred alternative, and will be unable to seriously consider other alternatives.
5. The SFC does not have an approved date base.
6. The criteria are being applied to ten (10) priority leasing areas.
7. The criteria are being applied to approximately 900,000 acres of which could not have been approved.
8. Interior states that application of the criteria "...should, in effect, confirm prior planning conditions." (F.M. No. 75d, Oct. 13, 1978).
9. The criteria are being applied to (approximately 900,000 acres) acreage sufficient to result in at least forty (40) potential lease tracts in Colorado, Wyoming, Montana, and Utah (F.M. 75d, Sept. 21, 1978).

In the November, 1978 to May 1, 1979 schedule violates SFC, and the Director's Order in SEC. 2, Drafting (Attachment 2, Director's Letter of Nov. 20, 1978).

SAFETY LEASE DATE:

These startup considerations would not be necessary if the 1980 coal lease sale date was not so right. Both the public and the Department would benefit if this leasing date were postponed so that DOI could take the time to do the necessary environmental analysis and plan without frequently trying to meet political deadlines.

Unfortunately, as are countless that DOI will halt the application of the unsuitability criteria and abandon the other startup considerations. A draft instruction came from the Director to the State Directors concerning

STATEMENT OF MARK WELCH

-7-

planning for the preferred alternative since it perfectly shows how important it is to schedule lease sale schedules. A major portion of the schedule pertains to our regions to Powder River, Colorado-Western Utah, and Green River. In no part, The same reads, in part, "which also has been given permission to delete elements from the preferred alternative if necessary to hold a 1980 sale."

This move, the December 4, 1978 Federal Register notice for the unsuitability criteria, and the demands scheduling of areas for applying the criteria to the 1980 pitifully illustrates the lack of concern by the Interior Department official, leave no doubt as to which direction the Department is heading.

In setting my testimony, I would like to make something just as clear as all these Bureau members that the new program looks like a terrible idea. Or, as they call it to Washington, of course, and that is what we believe by Department officials. It is difficult to "fix" a bad idea, but what is going to happen to that idea little valley", as one only concludes that the Interior Department might be able to change a process, but is unable to influence the end result. So in whose hands does that rest?

Thank you for your time and consideration.

RE: STATEMENT OF THE COLORADO OPEN SPACE COUNCIL PAVING MEMBER OF THE
DRAFT ENVIRONMENTAL STATEMENT, FEDERAL COAL MANAGEMENT PROGRAM

These comments supplement the oral and written statements presented by the COOS Chair, Workshop at the January 25, 1979 Denver hearing.

I. OVERVIEW:

It is difficult to overestimate the importance to Colorado and the West of having a sound federal coal management program in place. We too long, federal land - and especially federal leases contain coal - we have been mired in a web of federal leases which has retarded the interests of user industries. Among other things, this has resulted in the issuance of hundreds of federal coal leases containing billions of tons of coal. These leases, of course, were issued at industry's whim and without much thought or environmental assessment. This has led to many changes in lease terms and lease charges in recent years. These changes are already happening in many areas as federally-approved leases are significantly reducing coal production, yet the Draft 3B predicts that this is only the start. Vast areas of coal production from times relating leases is slated to be nearly four times the 1978 levels by 1980 and almost six times its 1970 levels. As we are told with increasing frequency, this is due to the "new" coal leases which will be issued under the Draft 3B. Data underscores the need for a sound federal coal management program, especially in light of the Department of Interior's propensity to issue coal and to provide little control over the rate and timing of development from existing leases. The Department's premature implementation of the lands unsuitability criteria, the purpose of which is to prepare for lease sales next year, and such actions as proceeding with a Final West-Central Colorado SFC over though finalizing the major plans are invalid and should not be used as their administrative record. However, Interior's coal management policies and actions have remained the same.

This is the legacy which the Department must face up to if it hopes to build

a state-wide environmental coordinating council

public confidence in and acceptance for a coal management program. In effect what is needed is for high-level Interior officials to relook in the bureaucracy, while is comfortable doing what it always does - expanding coal development. Field personnel up to the Director of the Office of Coal Management, however, are always looking for another lease. They are looking for more land, and they the Bureau must do so. Old habits and accustomed ways of land management will not die easily, but we hope that it can be accomplished if Interior truly wants to see it done.

The formulation of a comprehensive coal management program for the public lands offers an opportunity and responsibility to reexamine the interests of the past, present, and future, and must be based on the following premises:

1) Coal is but one of the many valuable resources of the public lands. It is not the earliest resource and therefore for the public lands must not be allowed to revolve around it. Because of this basic concept, the coal management process should not predate or take precedence over the formulation and implementation of a process for managing the public lands as a whole.

2) The public lands are not the sum of the largest components of public land management; as is coal leases merely one component of total resource management. To lost sight of this fact and let either of these relationships get reversed would be a serious mistake. The upping of letting coal leasing dominate coal management or coal management dominate land management can only be to prevent the time it takes to get a sensible system plate.

3) The public lands are not the sum of the largest components of public land management; as is coal leases merely one component of total resource management. The upping of letting coal leasing dominate coal management or coal management dominate land management can only be to prevent the time it takes to get a sensible system plate.

Previous attempts to develop coal programs have failed because the Department tried to fight against those principles by having a wholly-partisan political judgment and by letting coal leasing take precedence over both coal management and land use planning. From the Draft 3B and the Department's related actions it appears that the current Administration is falling into the same trap.

There is no reason why the Department should let this happen again.

We therefore request that the Department:

- re-think its objective of federal coal lease sales and strive instead to have an acceptable system for comprehensive land use planning and coal development in place by then;

- fundamentally re-examine the question of the need for leasing;

- initiate further leasing, when it is shown to be necessary, only on the basis of a coal planning system in accordance with PLPA and only according to the strict standards under that system;

(After all, traditionally, the coal industry hasn't been that different from federal water policy in that both have caused headaches. But the Carter Administration was courageous enough to fundamentally change water policy, despite it's at odds with the ecological and economic realities of the present. The effort was successful. Now is the time for the Administration to similarly review federal coal and land-management rules. Congress, through PLPA and the Federal Coal Leasing Amendments Act, has cleared the way for the Department to take the necessary steps. Now it is only a matter of your will to do so. We stand forward to being active partners in that endeavor.)

III. THE ADDITIONAL FEDERAL COAL LEASING

At the Denver hearing we presented a brief analysis of the discussion of need for further leasing which is found in the EIS. Our conclusion was that the EIS' analysis of need was really inaccurate and unreliable, and that a reasonable alternative would require a fundamental revision of the study's conclusions. We will repeat our critique in greater detail for the Committee's benefit, but I must say that these documents can only begin to touch upon the problems under the EIS' analysis of need criteria.

As noted apparently the exception of the "no new leasing" alternative, all assessments in the EIS of real demand and supply are based on the full application of the EIS' "no new leasing" rule. Thus, the forecasts concern the manner to the maximum that coal production circularity is obviously unnecessary. An analysis of user needs as it truly exists, however, you need to know more about who you serve than just coal will be leased. It is not particularly likely, then, that the EIS' conclusion is correct. This means the assumption that the Department arrived with. This fact, as should be evident, is now part of the entire analysis of need.

B. The entire field of possible environmental constraints on coal production is omitted in the EIS' analysis of need. The DCE model is precisely useful to deal with this most important variable. The "environmental cost" which it considers is the effect when fuel gas desulfurization has on the price of coal. It is designed to deal with actual physical or environmental constraints on coal production. However, the total substance of environmental considerations to the economics of coal is not considered. By doing so, the model assumes that natural scarcity does not exist, and indeed, the EIS gives an indication that this will not be allowed to occur as a result of future Departmental decisions.

Not only does the DCE model fail to take seriously the effect of environmental constraints on coal production, but the remainder of the Department's analysis ignores this issue. As the EIS itself laid explicitly that it is a "general methodological assumption" (in boldface) that there is no conflict between coal development and other resources do not affect "development of other resources in the Federal coal reserves will not significantly interfere with coal development under the Federal coal management program" (p. 5-3).

This assumption of no environmental conflicts is transparently fallacious. If coal development will not "adversely interfere" with the development of other resources (wildlife, wilderness, scenic and aesthetic values, watershed, agriculture), then there is no environmental constraint on any phase of coal development since there would never be any actions associated with coal which would significantly affect the quality of the home environment. Such an assumption turns the world on its head and is the bane of the *Hawaiian Monk Seal* case. When Minnesota Duluth in *FERC v. Huyett* stated, "The environmental assessment of any national coal leasing program seems to be misguided..."

The EIS' analysis for leasing, though, attempts to do precisely that.

This results in a major omission made within the Drafts. We learn in one section of the EIS that there are no conflicts with the Drafts, arising from coal development and that this factor can be ignored in setting future levels of coal supply and demand, while in other parts of the document Interior gives us an information overload of the environmental effects of coal with table upon table of "findings". But the two apparently have no relationship to each other. In the EIS is far from clear concerning how it will use the kind of numbers which it has recorded. Because of this, even the EIS says that "research will be done" will occur if any venture coal mining even without additional coal development (p. 5-1, 5-4, 5-7), we are prepared to believe that

IV. CONCLUSION

grossly exaggerated findings will not be hampered by this fact and that it will not affect the cost of coal either from the regular, thereby shifting production to regions where the new EIS problem (such as the West). In this example, the necessary action will be to ignore the environmental or economic costs, or delay. To put it mildly, this analysis is not very responsible.

C. A further assumption of the EIS is that "Users, equipment, and capital efforts will be sufficient to dictate the projected rate or timing of the Federal coal leasing program." (p. 5-3). In other words, none of these factors will limit the rate or timing of coal production by 1985, when in President Carter's statement and one of many others, it was predicted otherwise.

Cancer sense, the Industry, and the Mining Commission Office all dismiss with this little bit of verbiage. For example, on Jan. 12, 1978, *Wall Street Journal* ran a front-page story entitled "Increasing Use of Coal as Presidents Previews Energy Policy; Issues Them: Price Control, Pollution, Transportation, and Industry's Resistance." The article stated that "First, President Carter has proposed to increase coal use significantly by 1985 seemed destined. In short, energy, in large almost impossible." Once again, it is typical that everyone recognizes real-world constraints as the demand and supply of coal except the Department.

The EIS' assumption that coal transportation will not be a problem stands in stark contrast to statements of industry spokesmen. Mr. Roderick Northern Chairman Lewis Cook has stated that his company, a leading transporter of coal, is "appalling about care and inaccuracy," and Ronald Hayes, President of Eastern Coal, has stated that "the limitation (on increasing Western coal) is getting coal to it end of the line." *Wall Street Journal*, February 15, 1978, p. 33.

Describing this problem, of course, is the huge expansion of capital which will be required to build up the railroad's coal haulage capabilities. We would also have a sizeable increase in Western coal production over the time period 1980-1985, according to the EIS, during that same period, coal miners will require an additional 100 million tons per year, from 110 million tonnes in 1976 to 197.5 million tonnes in 1985 (p. 10-10). To take this staggering increase into my financial or economic reality, "We," say the EIS analysis of supply and demand levels, "or," say other portions of the EIS and the railroad industry itself (e.g., 5-120 to 113). The most conservative estimate in the EIS is that the industry will require 137 billion just to make capital improvements for coal traffic alone (p. 5-121). This will not be easy

short for an industry whose financial acronym is called "losses" and which has a rate of return on equity investment of 2%.

Since coal transportation is a significant variable included in the DCE model, it is instructive to see how the EIS' analysis of need compares to the industry. First of all, we see that the "current" figures are based on 1977 EIS Peter enacted at an inflation rate of 5.5%. One does not need to be an economist to know that our current inflation rates are significantly higher, and that by 1985 the difference between the two could have an appreciable effect on coal production costs. If this is reflected in the DCE model as presently literature, furthermore, these increased costs would appear to the railroad industry, already inadequate to finance the capital expenses which they need. In early 1976, for example, Burlington Northern and Southern Pacific asked for permission to raise their own, railroad rates 32% on the Western to the Atlantic run. They argued that they needed the rate increase to be able to raise capital, but opponents said that such a boost would have a serious effect on efforts to keep rates down. In fact, it would stifle out competitive advances of railroads to other modes. *Wall Street Journal*, May 14, 1976, p. 17. The EIS makes no analysis of this argument, probably because it is not included in the DCE model. Should be reevaluated accordingly. Of course, even this will not solve the more basic problem that the model and the EIS analysis of need in general have not dealt with the issue of equipment shortages and rising problem of building storage areas, locomotives, and additional lines to increase coal hauling by road by 1980.

The EIS' analysis of the capital needs of the railroad industry to expand Western capacity, however, fails basic tests of the most basic literature. In U.S. Bureau of Mines study, for example, is noted in the *Wall Street Journal* as estimating that even to reach 600 million tons per year by 1985 (approximately equal to the "low scenario") would require a capital investment of \$35 billion. It would also generate the trackage of 734,000 new miles. *Wall Street Journal*, December 10, 1977, p. 26. This is an incredibly difficult task to fill in the next five years. The Mining Commission Office, however, has estimated that doubling coal production to 1.7 billion tons by 1985 is impossible, and that reaching even one billion tons would be very difficult.

Yet, the Draft EIS argues that achieving the higher of the two levels will entail no significant labor, capital, or equipment problems. It merely assumes these "hypothetical problem" out of existence.

The Report of the National Coal Policy Project, for example, lists three area estimates of 1970 coal production (in 100's 1000's):

ERS (1975)	569-1065 million tons
Marketed as Alternative Energy Fertilizers	726-944 million tons
DOE Department of Commerce	775-811 net tons

The mid-point for each of these estimates (20,000 for NCOs, 350 NFFs for WACs, 5000 for CAs) is the "true" \hat{N} because of $N_{\text{true}} = N_{\text{est}}$. The variances of these estimates are 200, 100, and 1000 respectively. The variance of the estimate for NCOs is 200 because many more units were used than the "few" 1000 strata in which the true N was most likely to be found, and thus the "estimate" is more precisely determined. The variance of the estimate for WACs is 100 because there were only 350 WACs in the population, and the estimate is less precisely determined. The variance of the estimate for CAs is 1000 because there were only 5000 CAs in the population, and the estimate is even less precisely determined.

At the *higher* reversion, adjusting the other reservation coefficients would seriously give a non-realistic view of the bipartite contract which we should be dealing with.

Given the 1970 "base scenario" in "Table 1" one would also have no impact on the 1980 numbers. If in fact production is likely to rise "only" to the level of 900 million tons or 10% from "the" million tons in 10^3 , it seems reasonable to expect that 1980 revenues will be zero in the order of 1.2 million tons, or less than 1% of the revenues which are in the current equilibrium. This prediction,

• 第二部分

must not and will not be subjected to the impacts of a federal licensing program on the basis of DOI rationalizations.

Interior servers had lesions could be removed because it's often microtumors and radiosurgery "decreased" for three times (e.g., 3-20%). The details of this admittedly small-surgeon approach are contained in Table 1 in three paragraphs of the EUS (Fig. 4A,B). However as strange, the Department tries to make a case that, it needs a full-scale lesion resection in order to issue PGACF. If that is true, then why is there a sensible alternative to the EUS issued PGACF? If a full-scale lesion resection really is needed to prevent and insure PGACF, then there could be no sensible alternative which would accomplish the same thing.

The writer has suggested resources for reduced bivalve control without scrapping the system. That learning is needed to increase numbers of development seems that Interier knew what integers it want in resources. The given indication that Interier knew can be contradicted. Without this, DCL cannot learn to develop. If the "development" is not to be stopped, then the DCL must learn to exist of the resources available when it is trying to "develop". It is clear that if the "development" knew what constituted an "improved pattern of development", that learning is the only, or the most desirable, way to achieve that goal.

Similarly, the argument follows that leasing is necessary to increase competition. It is not very clearly established that competition is a major problem in the coal industry. But if this were a concern of the government, here again, it has numerous means at its disposal¹ by which to resolve the problem. It could, for instance, require vertical or horizontal divestiture, prohibit mergers of a certain sort, use the powers established in Section 301 of FLSWA.

of course, cannot take the place of a detailed reading of the HHS numbers which are obviously called for, but it does suggest what reasonable ranges would be.

I agree that the Department left rights of its own perspective open to the curvilinear HCT computer. Common sense, however, dictates that the "medium" hardware should not represent the "upper limit of capacity" in view of the many studies which have found that it will be "impossible to reach such a level. Indeed, the "medium" approach should be the one most likely to develop. That is, it is not the case with the EM analysis of the HCT that the first instant stage is the upper limit of capacity.

Spells 5-2 and 5-3 never get selected.

Chapter 2 gives the impression that the new leasing law is not understood well enough to fully evaluate the effects of the 1990 "recess". "Achievement of steady and sustainable growth levels would require extensive development of new sources of demand and production...new Federal leasing would lead to major increases in sustainable oil production." New Federal leasing would also be greatly anticipated by the information in Chapter 3, p. 202 which states, "THIS STUDY WILL NOT LOCATE, PREDICT, OR ESTIMATE THE AMOUNT OF OIL WHICH CAN BE PRODUCED BY THE FEDERAL GOVERNMENT THROUGH 1990." The primary difference between the two is that leasing legislation and the 1990 "recess" is that new legislation would be more easily understood around the nation. 100 million fewer tons would come out of the Porter River section which would be 20% less than the 1990 "recess" alternative anyway, its production would be 90 million tons instead of 100 million tons in 1990. But this would result in an actual economic event if the 1990 "recess" was 1.5 billion tons, or 100 million barrels.

Navier thus failed to demonstrate an actual need for coal leasing; the Department next tried to justify the institution of a leasing program by using arguments which have no relationship whatsoever to the amount

Other recommendations
1) Create a more realistic picture of soil development;
2) Increase consistency in the soil industry; and
3) Be more responsive to changes in DSM.

These recommendations are a valuable resource for the writer, reader and speaker to use when discussing soil for business. There is no direct link between the two, and without consistency of need, these statements could be little more than generalizations and vague. But what I believe is true is that in a sense, generalizations and even somewhat pernicious ones can be useful, as are immediate and specific ones. In other words, we can either put it in a box or leave it open.

100-701

any "prior restraint" which would give applicants unfair executive advantage, since the Justice Department's statistical review of lists of renewals and re-considerations reveals substantial overlap between the Form 1000 and Form 1001 lists. The Justice Department's statistical review of lists of renewals and re-considerations reveals substantial overlap between the Form 1000 and Form 1001 lists, for the reason that the "Interest Letter" has been more recently exercised than the "Form 1000" application. Renewals made in these cases would appear to be more effective means of preventing competition than licensing. As described in the "Interest Letter" to entitlement if applied, for example, to the "Form 1000," would result in the filing of this notice before the date of the renewal application, so it would be made "absolute" without the need for an amendment.

If the Department is serious about seeking any of these extraneous arguments, it must at a minimum perform a rigorous examination of alternative means to achieve those goals and include that analysis in the Final RI.

In addition, the department must fundamentally revise its analysis of need as successive ECA events occur as well as those identified by experts. This is essential for making an accurate determination of the need for leases on a progressive level. It is not sufficient to assess these deficits during the preparation of the regional statements associated under the preferred alternative. It must be done now. Failure to do so will necessarily restructure the ECA's future. Leases of need will jeopardize just the present statement, but also future scenarios. ECA will move the date anticipated for the first lease out based on the experience of the last three years. The analysis of need must be based on the experience associated with the past three years. It must also articulate the specific projection of each e-valueship done by other responsible agencies and clearly state how they relate to the figures in the report as the reassess the differences. The determination of need is too important to leave to be decided on the basis of only one projection when many more are available.

III. SIGNIFICANCE OF PASTURE LEAVES

Despite the title of the proposed program, the "Federal Coal Leasing Program," the concept of management of federal coal lands - as opposed to the leasing of federal coal lands - has been given short shrift in the BIA. The major emphasis of the program should definitely be on the management of extensive coal leases because of the heavy acreage of federal land currently

under leases. The Department is well aware of the criticism regarding the production capability of its leased lands, and we will not repeat them here. Let us state the Department still has not freed up its responsibilities to mitigate tree losses. The treatment of the leases in four categories of the 10% (40 to 60) would be incomplete if it were to serve a serious and continuing problem. Although the breakdowns of existing leases can easily cause temporary reclassification, greater as needed to leased leases under a new review, DDC has shown no initiative or desire to develop a desperately needed plan to control the listing and distribution of leases.

The effort to write the proper provision in the HU is a leasing rather than a "management" provision as it really need to examine the alternatives put forth in the statement. The listed four forms of alternative to the preferred lease are: (1) "Leasehold," (2) "Management," (3) "Leasehold with option of lease to be issued or the transfer of the lease to another lessee," and (4) "Lease to be issued or the transfer of the lease to another lessee." The six area as lessee, lease (HUC 10), lease only "knowing" lessee, lease to satisfy industry, lease to satisfy states, and lease to satisfy DDC. The many alternatives found in the C are basically all initiatives in addition to those six. Greater attention should be given to "leasing policy issues." Here, there are the four that are outside the existing leases, i.e., the leasehold, leasehold with option of lease to another lessee, lease to satisfy industry, lease to satisfy states, and lease to satisfy DDC. The options for further extractive resources and due diligence are fairly clearly summarized by Paul Gosselin and include a federal lease option. It may even be added, but this is not clear, that the relinquishment of part of our enterprise to existing leases' discretionality or the part of the Secretary. Furthermore, those criteria are best applied to non-public participation and they were never intended to apply to public participation. In addition, the leasehold criteria are also included as alternatives, including a proposal for timber, 10% of which area is in the association. And, the Department's own interpretation within the C is seeking a "management" lease rather than a "lessee lease." What is known about timber only is the extent that leasehold resources are limited for now, likely, and only as far as the new lessee objectives.

For example, the DDC failure to separate the public and private coal markets is reflected and other "cage" issues, perhaps, are reflected since the C is "open" (particular). There is no guarantee or sense of review

environmental concern and how differing interpretations of that concept could effect existing leases. Perhaps most importantly, the EIS utterly fails to consider or propose possible mechanisms for controlling development on existing leases. The EIS indicates that little is left in the existing state and the DDC gives no indication as to what kind of level of environmental degradation for a certain right by. As noted above, the DDC analysis does not consider specific areas, even though they would obviously be inconsistent with the mandate of FLSMA which directs DDC to remove the public lease as the basis of multiple-use, meaning "...use optimization of balanced and diverse resource uses...and balanced and terminated management of the various resources without unnecessary impairment to the compatibility of the land..." (Section 10(d)). In addition, the DDC analysis fails to recognize the level of the "no new leasing" alternative as inevitable, and seems to suggest that virtually all new claims on existing leases will be found unacceptable.

Obviously, the process described in the ED is designed only to address a very limited concern of coal management - that of coal leases. In the ED's own words, "The unferred review is designed as a short-term study...system of 'orderly' development of new coalmines...by coal leases."

In addition, the DDC analysis fails to note that it cannot manage existing leases. This is best most clearly, perhaps, in the DDC's attempt to continue coal management of the basis of existing leases, i.e., the EIS. Therefore, according to the DDC, DCE, and the recently-proposed regulations to implement the land use/development of FLSMA, existing DDC would continue in effect for up to 15 years from now. In a climate portion of the coal section of the EIS, the DDC notes in 1997 or thereafter to implement the old DCESS and undergo more, if any, leases, the court has now found to be invalid. Yet DDC's processes to let these leases stand despite proposed data and findings and the order of the court.

Had a summary in immediate when the Department itself has acknowledged that most of the criticisms of the FFLA are true, an emergency task force of the "Department" necessarily studied the FFLA system. It assessed current usage, selector of coal development values, and the subjective or arbitrary, with other area values in the same area, and the resulting values for coal leases. These values are called "market value" and "public value" and reflect market lease values of coal proposals. These values are also different, particularly from the consideration of the agency

presently enacting, or attempting, with other area values in the same area, and the resulting values for coal leases. These values are called "market value" and "public value" and reflect market lease values of coal proposals. These values are also different, particularly from the consideration of the agency

5.2.4. Article 10. In addition, there are specifically to be assented from the area of the leasehold to be issued, the leasehold planning and management. It is very difficult to imagine that the leasehold area would be issued, because the plan is developed in conjunction with the leasehold area. The leasehold area is developed with the intent of multiple-use, however, in order to reduce the impact of mining on the leasehold area, to deal with social conflicts, individual circumstances, etc. The leasehold area is developed with the intent of multiple-use, however, in order to reduce the impact of mining on the leasehold area, to deal with social conflicts, individual circumstances, etc. The leasehold area is developed with the intent of multiple-use, however, in order to reduce the impact of mining on the leasehold area, to deal with social conflicts, individual circumstances, etc.

Many of these circumstances are already dealt with in the HU Appendix and restated by HUC 10. For example, the first section lists numerous areas that would be the result of multiple-use/extractive plan use. "New resources" are the baseline of which will give the greatest economic return and will sustain. (See, HUC 10(c).) The set aside streamflow and groundwater areas are the areas of the leasehold of the public lands, while the HU applies to the leasehold, leasehold, general provisions. Thus, the leasehold set aside for effective protection, protection of the leasehold, leasehold. For this to happen, the values must be determined and to have sufficient, passing lease left implicit, or will 10%. No areas that conflict with the standards and the Bureau's objectives. Interests outside the leasehold under the HU process or the needs for site and cost requirements remain, at least for several years.

This provision is both useless and misleading. First, it would be far more effective, for resource users, to establish in fact of their accounts, for the leaseholder to identify for the public resource areas under FLSMA in place before taking out groundwater decisions like new. "This would mean a reduction of surface water use for confinees."

It would also seem to be in the HUC 10 an extensive discussion of a new enforcement process, together with alternatives for that process.

IV. SUMMARY OF PROPOSAL

These areas will be dealing in detail with the lease compatibility

optimalities and to make only a few pertinent comments:

1. The leasehold discretion should be eliminated. The criteria should apply to all leases and areas. For new surface and underground mines surface effects could reduce exposure on the lease tract. The exact location would not be known until a title plan was submitted, but the criteria are edited so it enables future areas of the lease tract where subsection

of a mine plan.

2. The criteria should be consistent with the laws under which they are implemented. "In" of new rules concern with respect to the criteria when certain environmental review, role and no new mining, selection, and protection.

"3. The wilderness "can" be addressed through a number of methods. It would need to recent local hearings on what areas should be assessed free leases as well as under state law to determine the designation. Such leases to issues areas would immediately become their material for wilderness designation. This can occurred in Delaware under the HUC 10 process in which each lease, particular leases in the pre road test, those areas were deleted from the forest service's recommended wilderness process.

In addition, given the recalibration outcome in the HU as well as the proposed NC timber assessment rulebook for the wilderness inventory, the exception would be the office of the Interior the criteria itself. These areas are until 1997 to be removed areas for wilderness status. It is anticipated that Congress could first designate or even a state area and later propose for wilderness status over time, assuming that areas could be designated as late as 2000. The interior rulebook criteria that mining may be allowed if the resource is a forest product within five years after the wilderness designation - or at least as 2000 as the date of designation. Given the additional criteria of recalibration in the NC, status as the Green River/Hanover area of Colorado could continue up to 1999. A lot of areas could be done between now and then, especially if it were a single year, and the process is a 1 to 1 reader area. Thus, the intent of FLSMA could easily be disregarded if the area be declared invalid for conservation if the actual recalibration were not as successful as originally hoped - which is the likely outcome.

4. Application of the land compatibility criteria should be halted. See November 24, 1997 letter from Louis J. Terrie, on behalf of DDC and other organizations to Rep. Davis. Below is Part Two of the letter:

COMMENTS ON THE
DRAFT ENVIRONMENTAL PROGRAM
FEDERAL COAL MANAGEMENT PROGRAM
BY
NORTHERN PLAINS RESOURCE COUNCIL

061

The Northern Plains Resource Council (NPRC) endorses the objectives of the proposed coal management program as stated under section 101(a)(1) and 101(b)(1) of the example regulations. Coal leasing should take place only pursuant to a comprehensive environmental impact statement which includes all relevant safeguards designed to protect society and the environment.

The federal government owns 80% of the western coal reserves, and an additional 10% is held in lease by the federal government for production. Clearly the actions of the federal government in its management of federal coal will determine the fate of the coal industry. The environmental impacts of the proposed coal management program, will affect the lives of millions of western citizens.

With these in mind, NPRC has examined the proposed program and the draft environmental statement (DES) and has the following critical comments:

1) The statement fails to substantively address serious concerns about reclamation of western lands.

2) The proposed program relies far too heavily on the Department of Energy's production targets in assessing the need for federal leasing. The DES does not demonstrate the need for leasing until 1990.

3) The statement undermines the productive ability of western lands. This in conjunction with the inadequate assessment of the need for leasing, creates a vicious cycle of degradation of the long term loss of productivity and renewable resources.

4) The preferred program carries over the acquisition of surface owner consent until after the lease is issued. This goes against the spirit of the DES which calls for early assessment upon planning and environmental assessment, and finalization of landowners by large mining companies.

5) In the rush to meet a mid-1989 target date for lease sales, the Department of Interior is implementing the proposed program prior to receiving any public comment and Secretary's approval. In what amounts to a clear violation of the requirements of the

NPRC Comments Page Three

Attempts to achieve reclamability in Montana have been fraught with problems. High levels of siltation from buried soils have appeared in the streams (i.e. sweet grass, Little Belt, and the Clark Fork). Livestock, mostly cattle, can be wounded, suffocated and even die from an imbalance of the elements of molybdenum and sulfur.

Introduced species on strip mined land have failed to dominate on economically viable cattle carrying capacity. Exports remain at a minimum. The average weight gain for steers grazed on land leased for steers on native range. Further, while all of the steers were grazing over the same area, the cattle that were grazed on native range actually lost an average of .300 pounds per day.

Efforts to reclaim rangeland to a permanent diverse cover of prairie grasses have also been unsuccessful. The following photo shows areas the jury is still out. No doubts have been released in the state of Montana for strip mine reclamation.

Requirements on reclaimed strip mine land in Montana do not provide for application rates of 10-20 times as much fertilizer as is ordinarily used in non-mined lands failed to produce anywhere near the results seen for conventional agriculture.

Reclaimed strip mine sites do not fit the reclamation plots at the Western Energy Mine at Colstrip, Montana. The nature of the soil - lenses, unifferentiated profile, with poor capacity for infiltration - makes it highly unsatisfactory, once disturbed, to erosion.

The DES is biased towards western coal. A case in point is the proposed coal management program for the Western coal program to protect the agriculturally productive Eastern Interior and Western Interior coal regions. One need only turn the page to discover that reclaiming to cropland in the Eastern Interior coal region is not mentioned. This is despite the fact that annual precipitation, soil composition and demonstrations of success are identical to the Western Interior coal region referred to that statement. Yet, the preferred program would pass over this region in favor of the more easily strip-mined areas. This means very little to the coal or its products would be marketed in the industrialized and populous Western Interior and has little effect on the marketability of coal from strip-mined areas. It would probably obviate or substantially diminish the need for large increases in surface mining, anyway. It's merely to illustrate the incoherence of the analysis.) *

NPRC Comments Page Two

NATIONAL ENVIRONMENTAL POLICY ACT

6) The mid-1990 lease sale target date effectively implements much of the BMGS planning process by necessitating reliance on existing lease plans and industry leases.

7) While the mid-1990 target date for the preferred program, comprehensive land use planning, is an unknown variable at this point, this leasing pursuant to the Federal Land Policy and Management Act (FLPMA) is a well known variable.

8) The environmental statement does not adequately assess the social and environmental impacts of the proposed program.

9) The preferred program does not adequately provide for consideration of cumulative social and economic impacts of leasing federal lands. The DES fails to consider the effects of leasing on the environment of human health, even though this is a violation of performance standards established under the Nine Control and Reclamation Act of 1977.

10) The preferred program should include provisions for decreasing the number of leases issued if the DES does not demonstrate that regional production targets shall not be considered in establishing the areas acceptable for leasing.

RECLAMABILITY

The DES paints one of the rosier pictures of reclamation potential for western lands that we have seen to date. The Northern Great Plains is described as having the best opportunities for reclamation in the country. Assertions that cropland in the Northern Great Plains can be reclaimed to a high level of productivity are not supported as noted in one paper (pp. 8-17, p. 5-21) fly in the face of existing evidence. Reclamation has yet to be shown to be feasible in the Northern Great Plains. The areas most suitable for reclamation are those that are currently being used for grazing productivity in 5-15 years on the eastern Great Plains is currently under debate. The DES fails to recognize that it is difficult to implement a program to lease tens of thousands of acres of federal coal for surface mining in this area.

NPRC COMMENTS Page Four

The amount of cropland that would be disturbed in each region is estimated to be 10% of the total land available for production for the purpose of comparing alternatives to the preferred program (p. 7-17). As a result, the farm lands of the Northern Great Plains are not included in the comparison. The Powder River region, with 84,000 acres of cropland, would be disturbed to a high level of productivity according to this assessment would suffer a loss in agricultural productivity of 10% of the total potential.

The DES unrealistically assumes complete restoration to original productivity of disturbed lands in the Fort Union and Powder River regions by 1990. The statement is made that "it is striking that the growth in energy demand will likely be small in assessing the long term environmental consequences of the coal production program." *

The material on reclamation and the assumptions on which the environmental assessment is based grossly diminish the validity of the DES.

DOI PRODUCTION TARGETS AND DOI ASSESSMENT OF NEED

The Department of Energy coal projections target the Northern Great Plains (Wyoming, Montana and North Dakota) to become the largest coal producing region in the country by 1990. The DES does not appear to include a section on the effects of slight modifications and adjustments by the Department of the Interior nor does it include the relevant sections for coal production on the Ft. Union and Powder river coal regions. The DES does not include the effects of DOI's, according to the DES (pp. 2-23 - 2-25 and pp. 5-11 - 5-15).

MEDIUM LEVEL DEMAND PROJECTIONS - NUG COAL (Million Tons)

DOI	DOI Preferred Program
1985	234.6
1990	441.7
	441.7

DOI's coal production targets are based on national macroeconomic variables such as employment and income. The model takes into account effects of other energy sources and environmental regulation. The DES does not include the effects of energy imports to arrive at high, medium, and low levels of coal demand.

One of DOI's assumptions is high availability of cheap western coal enough to meet federal coal reserves. Ironically, DOI turns around and uses this model to demonstrate the need for leasing huge amounts of western coal.

The model assumes conventional production of 7-10 full size plants of synthetic gas (SG) and 10-12 small size plants which are all nil. At the most there might be one plant (American Natural Resources) in the eastern U.S. and one in the West. This point looks doubtful. This is particularly pertinent to western coal because it is the only industry which is viable and thriving still. Industry by 1985, technological and economic factors will indicate the likelihood of large scale SG production before 1990 if ever, with no other alternative.

There is no evidence that DOE's modeling has been tested by a technique known as "backcasting" to insure its reliability. Perhaps the best analogy is the energy future which is like the past, only the numbers are higher. Such assumptions are undoubtedly also credited by energy planners and forecasters.

Resource modeling, which is already being employed in several states, is another potentially alternative. The technique deserves attention and consideration by DOE and DOD. It provides by far the most accurate and responsive information on resource demands, which is particularly important in light of the rapidly changing environmental attitudes and a changing national energy policy emphasizing conservation.

The DOE econometric model inherently favors surface mining which is the least costly alternative. Environmental and social considerations are given short shrift. The question is, do these may affect the economics of energy production. Other costs, particularly those associated with surface mining activities, such as long term leases or productivity on mineral lands are not considered in the model.

A May 1978 study by the Montana and New Research and Development Institute estimates total federal coal production to meet both in-state and out-of-state market demands will be 40-45 million tons per year by 1985. This would be approximately one-half the 1985 medium level production figure for the entire country. The 45 million tons per year will be well below the 65.3 million tons per year projected in DOE's no-new-leasing, medium-level production scenario.

Finally, the DOE model assumes mine-mouth conversion for western coal. This is a potentially misleading assumption for coal. Much of that energy will be exported in the form of electricity and possibly sold to other regions of the country for actual consumption. The use of electric power to generate coal consumed in the West is misleading and biases the conclusions of whether and where to lease federal coal towards western regions.

The DES goes so far as to cheerfully suggest a public relations campaign (ED p. 4-5). In coordination with the few who enjoy an economic boom with industrialization, as a mitigation measure.

Since much of the federal coal lies in rural, agricultural areas, the DES (ED p. 4-5), in coordination with the few who enjoy an economic boom with industrialization, as a mitigation measure.

The concept of threshold limits, which is given short shrift in the OES (p. 3-21), is vital. Without this, some areas and regions [e.g., Juliette and Coalstrip] will carry an exorbitant burden in meeting production targets. The threshold limit is the establishment of a mining industry. Thresholds should serve to define the maximum amount of mining in a specific area, not only the effects of leasing a proposed tract. In addition, the effects of existing mining and industrialization should be a factor to consider in judging whether to lease further.

SURFACE OWNER CONSENT

Only 44% of the total federal coal acreage has federal surface ownership as well. Consequently, the role of the private surface owner is critically important in the Department's planning process.

The preferred program proposes that surface owners be compensated for the loss of their property rights. This is the appropriate step to consider surface owners' wishes. However, most surface owners indicate a definite preference against the leasing of their land. These lands should be removed from further consideration for leasing.

Allowing the land manager to screen such lands as he option and proceed to lease them without consent if it is considered important (IS 1-28) will contribute to a monumental waste of time and money.

It is incomprehensible that the surface owner who has stated a definite preference against leasing his subsurface minerals should see that land leased by the Department. Such an action is bound to result in exertional pressure on the landowner.

The Department of Interior will have spent months, possibly years, in comprehensive planning and compiling environmental assessments and leases. A lease valid when a staunch surface owner will not capitulate to a new lease will add to the cost of such an action to itself, confrontation and trouble for all parties.

The agency has strongly adhered to the position that once a surface owner has indicated his/her consent to mining, that land be screened from further activity planning.

SOCIAL AND ECONOMIC IMPACTS AND MITIGATION

The DES fails so substantively to address the problems of socio-economic impacts that the preferred program is the preferred program avoids establishing any guidelines or specific requirements to include these effects in decision-making.

The DES makes a complete misconception of the nature of the disturbance in the West. It fails to recognize the long-term opportunities for the communities in question, short-term disturbance and the more visible result. (p. 4-4) The long-term benefits of coal mining are substantial, especially by strip mining in an area where reclamation is dubious will very likely be the "cost" of unemployment and poverty.

COMMENTS REGARDING THE DETERMINATION OF NEED AS SET FORTH IN THE DRAFT ENVIRONMENTAL STATEMENT, FEDERAL COAL MANAGEMENT PROGRAM

:62

The Draft Environmental Statement for the proposed Federal Coal Management Program gives four reasons in support of an alleged need for renewed federal coal leasing. Only one of these reasons sets forth an actual need to develop coal resources; the remaining three are matters of policy.

1. **Leasing to Meet National Energy Objectives.** During development of the OES, we were assured that projections of coal production supplied by the Department of Energy would be scrutinized and modified by the Department of Interior. We see little evidence of such scrutiny in the DES or the "Memorandum of Understanding between the Secretaries of the respective Departments as described in Appendix E of the DES, while we realize that production targets may be modified in the face of environmental constraints, it is poor policy to think in terms of meeting production goals set unreasonably high by a production-oriented agency. In such a situation, failure to meet goals will be perceived as the fault of too many environmental regulations rather than a more realistic assessment of what was needed in the first place.

2. **Leasing to Promote More Desirable Patterns of Coal Development.** There seems to be an assumption in this section that because land is in the public domain, it is undervalued by homeowners and others interested in making a living for themselves on the western frontier. While this may have been true in the economy of the early West, much of the land over federal minerals in eastern Wyoming now supports viable ranching operations; moreover, this land is no less precious to those who live on it than land anywhere else in the

United States. What is described as a desirable pattern of coal development is, for all practical purposes, a designation of the Powder River Coal Region as a "national sacrifice area". If the higher projections for the Powder River Region are actually realized, offsite environmental and socioeconomic impacts will make it impossible for mining operations to continue in Campbell County. The effects of fugitive dust, water consumption, fragmentation of range from electricity and rail lines, and competition for labor and credit will put the ranchers out of business -- or take away their desire to continue trying.

There is also a statement in this section to the effect that because of the thickness of the Powder River coal seams, only one acre of land will have to be reclaimed per given quantity of coal, as compared to 5 acres in the East.

This statement implies that it is, therefore, more efficient to mine Powder River coal. What this statement ignores is the fact that it is much harder to reclaim that one acre due to mineral rainfall and other adverse conditions, especially wind, whereas in the East this reclamation might be accomplished much more easily.

3. Leasing for Legal and Administrative Purposes. We agree that the Department should have the flexibility to offer new leases to holders of PLAs situated in areas obviously unsuitable for coal mining. However, a new federal leasing program can be limited to just that purpose, rather than encouraging additional development of federal coal reserves.

4. Leasing to Increase Competition in the Coal Industry. It seems almost humorous to talk about competition in the western coal industry when nearly all of the mining operations are owned and operated by multinational energy corporations. "New" companies are not presently prevented from entering the market, because, as the SES points out, they can buy existing leases and PLAs from

their present holders. In any case, transportation of Western coal to its ultimate customer is handled through a regulated, monopolistic rail system, so the notion of a "private market function in the most socially beneficial manner" (page 2-6), i.e., the best product at the least cost, is essentially a myth. Within any one area such as the Powder River Coal Region, the costs of production from one mine to another will be pretty much the same, and the freight costs will even out the rest.

Further Miscellaneous Comments:

One thing that is particularly disturbing about DOI's reliance on DOI's production projections is the fact that these projects are based on a set of assumptions which do not include conservation measures. This is a serious omission in light of the emphasis which will be placed on conservation in the National Energy Plan II, and also when considering that we have now arrived at a level of scientific expertise which shows us that we are increasingly wasting most of our non-renewable energy resources. It is useful enough to think of the environmental and socioeconomic effects that decreased mining activity will have on the Powder River Basin; it is even worse to think that perhaps all that activity wasn't even necessary.

Earlier, the lack of DOI analysis of DOE production targets was criticized. Perhaps one way to deal with this problem would be to allow certain avenues of public input into the target-setting process. Presently, there is no opportunity for the public to study and comment on production targets during the formulation stages. A mechanism to solicit and release public input on this phase of the coal management process would provide a different perspective and make the final determination more reflective of real needs.

Finally, DOI relies on one sort of model, an econometric model, to assess the demand for coal production. There are other kinds of models, particularly erosive models, which generally produce different determinations. There is no explanation in this SES of the different models and the merits of each; we feel that such an examination should be carried out in the SES, because the federal coal management program hinges on the demand for coal. If there are different ways to assess that demand, then the public has a right to know about and to evaluate those ways.

In conclusion, I would like to state that we believe that a coal management program is necessary. However, we also believe that "coal management" is not synonymous with "coal leasing". The Powder River Coal Region is already suffering severely from the environmental and socioeconomic impacts of existing mining operations. If DOI plans to exacerbate that situation through additional federal coal leasing, then it must take responsibility for the cumulative effects as part of its management program.

Again, accurate determination of need is critical to the residents of the Powder River Coal Region, who will be the most severely affected by the implementation of this program, even in a scaled-down form. Therefore, we have to know that when additional coal leasing takes place in the Powder River Basin, it will be predicated on the most realistic assessment of demand and that all reasonable alternatives for meeting that demand have been exhausted.

Dear Sir:

These comments are submitted by Coastal States Energy Company in response to the Draft Environmental Statement for the Federal Coal Management Program. We are a subsidiary of Coastal States Energy Corporation, a diversified energy company, one end generates the Southern Indiana Power Company near Salem, Indiana. In recent years the Southern Indiana Power Company has increased its power output by 50% and has added two new generating units. Last year the plant purchased 1.1/2 million tons of coal, all from federal leases.

We have reviewed the Draft Environmental Statement and find it to be generally well written and thorough. We recognize the difficulty in assessing a large area such as the Powder River Basin. We also understand that while the statement covers the entire basin, there it needs only minor changes and that those who are responsible for drafting the statement are to be commended for doing a fine job. Some minor changes are suggested below. These changes are not to detract from the quality of the statement itself as it is with the complex system of federal lands in the Powder River Basin that the problems of the statement were formed to operate. These problems are discussed in more detail later herein.

Specifically, Coastal States expressively bid on a federal lease covering lands immediately adjacent to our STFRD mine and to we are well aware of the problems, difficulties and delays with respect to leasing federal coal and how these are currently being addressed.

The mining of this new lease from our existing operation would require no new portals, no new surface facilities and no new transportation systems. There are no significant environmental impacts associated with this specific application. In fact, there was widespread support. Since this is an underground mine, we did not have to address the removal concerns over mining equipment and materials. We are right in our position that the application as this was an application for a competitive sale under the so-called short-

new criteria. We were not guilty of holding huge amounts of federal acreage for a new mine. The mine was already operating and had been for more than 30 years. It does need additional reserves in order to maximize recovery of the total reserve, to replace depleted reserves, to maintain employment, to provide optimum utilization of existing facilities, to satisfy an increasing demand for our low-sulfur coal, and for overall sound management of a growing operation contained within lease boundaries largely unrelated to the geology of the

Even though the lease sale had widespread support, it required more than four years of effort from the date of the application to bring this tract to sale. Finally, the lease sale was held; we bid and won. After nearly three score months our lease was issued with an effective date of January 1, 1979, just 2 months preceding the date of our application. Presently we still cannot mine this tract because the Office of Surface Mining has not approved our mine plan. We do hope, though, that the OSM will do so.

The cause of our frustration is readily apparent. During the four years to bring this application to lease sale, we made numerous visits and telephone calls to various governmental officials. But it seems that those who are concerned and helpful, especially those in Utah, But it seems that those who are dedicated are hamstrung by an apathetic, recalcitrant, and uncooperative state government.

What obstacles hinder the dedicated governmental worker and what creates the nearly unusable system which we now have? We believe it is the vast array of new laws and regulations which are amended and revised even before they are clearly understood and implemented. The question then becomes how can we deal with these new laws and regulations to make a better system.

He would like to have seen considered as serious national policy options, such alternatives as seeking repeat or at least clarification of much of the environmental legislation of the past two years and also consideration of a policy that eventually would convert ownership of all federal coal from private hands. There has been much made over the "fact," the accuracy and validity of which is still in dispute, that a disproportionate amount of federal coal is under lease to the amount produced from federal lands. Further, the spokesman is ready to support a moratorium on federal coal leases for self-serving reasons. This line of reasoning may sound like the conclusion that consequently there is no need for any additional federal leasing

We believe this to be a gross misinterpretation of the situation and that the conclusion is in error. To us, the fact that 93.4% of national coal production in 1971 came from non-federal lands does not suggest we discontinue federal leasing. In fact, it strongly suggests that in order to increase production from Federal lands, the lands should be under non-federal control. Leasing is at least a step in that direction and the fact that only 791,000 acres are under lease of the 11.3 million federal acres within Known Recoverable Coal

One of the primary objectives stated by the Department of the Interior in announcing its intention to prepare a new Environmental Impact Statement for the Federal Coal Leasing Program last year was to develop such a document which would be legally defensible not only in terms of general NEPA requirements, but specifically to meet the objections to the earlier version of such a statement listed by Judge Higgin's in the HEW v. Hughes decision. This Statement could certainly seem to have met that objective very well and it is difficult to imagine how a successful suit could easily be brought against the elements of statement.

Unfortunately, the Statement would also seek to establish a leasing program which would usurp and institutionalize many of the unnecessary delays and inefficiencies which characterize the effective efforts over the past several years to establish and implement a national plan for federal land leasing. In fact, many of the delays and uncertainties placed on federal land leasing are not the result of the lack of political will or interest, but rather are the result of the bewildering array of federal legislation which has been passed in the last decade. The following elements are critical to the success of a leasing program for the public lands. Nevertheless, each of the following elements are criticisms of the proposed alternative discussed in the Statement which would serve to unnecessary delay and reduce the effectiveness of the program available for federal lands in the first instance while maximizing the delays and inefficiencies associated with the implementation of the program. The lease will not be issued in time and conditions which are reasonably acceptable to lessees. The lease will be issued in time and conditions which will deal specifically with each oilfield, it is anticipated to these leases will be issued in time and under such circumstances as may become of the need of land that would be available for lease and the time required to lease the land.

1. Designations by means not fully discussed and probably not quantifiable, of only those reserves of "medium and high potential" as available for leasing;
 2. Apparent reliance on existing Known Recoverable Coal Resource Areas (KRCAs) as defining the areas in which future federal coal leasing will take place, even though the present KRCAs include a very small portion of all of the federal lands that are known to contain the coal resources ADE.

Resource Areas, which in turn is only a small part of the approximately 100 million acres of coal rights owned by the federal government, borders on the frontier for nation hungry for domestic energy supplies. Just imagine the flavor if a private corporation would gain such dominant control of a resource and similarly refuse to allow it to be developed! And regarding speculation, we can think of no better way to encourage speculation than to withhold the major portion of a resource from the market—that is certain to drive up the price of remaining available lands.

We believe that coal leasing in and of itself is not a major federal action, because no environmental effects whatsoever, and therefore should not be the subject of an ongoing national debate. The many new laws, if they accomplish all that we desire, will ensure that any new mining proposal which survives will have to undergo environmental assessments and is lucky enough to someday become an operating mine is going to have to undergo an environmental impact. Accordingly, it appears that a federal coal lease has long since ceased to convey the full rights to mine coal. Rather, it is merely one of the first of a long series of requirements and by itself carries no

¹ It is heartening to see that under all the various alternatives analyzed and

The American public needs increased coal production, carried out in an environmentally acceptable manner at the lowest cost possible. We believe that lowest cost is obtainable through a competitive market system. Much of the increased production can be obtained from existing coal deposits. If this is not possible, then does Lease federal coal, even with coal royalties deposited. If this newly leased coal to be mined, adequate production levels will be maintained, if not enough coal is available, other mineral deposits such as in private coal companies can be used to help solve the shortage—possibly at greater cost, including environmental costs.

If sufficient coal is leased and a rational system of permit approval evolves, coal production will be increased as market conditions permit. Increased coal production will result in employment in economically depressed areas. For example, in Beaufort County, there are approximately 1,000 employees in coal mining operations; the per capita personal income increases from \$1,460 to \$3,200, an increase of 13 percent. During this same period, employment at coal mine intersections increases from 10 percent to 15 percent, the number of miners employed increases from 10 percent to 15 percent, and the number of persons employed in the mining industry increases from 10 percent to 15 percent.

3. Implementation of no less than 24 separate unsuitability criteria for elimination of otherwise qualified federal lands from any future consideration for leasing by lease will apparently be a much more uncompromising application of such criteria than is mandated by law and which has been enunciated in the next.

The preferred alternative would also seem to take every opportunity to minimize the delay in offering any leases or leases for sale even under the so-called "energy leasing procedure." Although some public hearings and the preparation of environmental impact statements are required by law, it should be evident that at various levels in any federal coal leasing program, it should be possible to shorten these procedures. In addition, statements and other procedures which are adequately descriptive should be allowed to be included in leases or increase the involvement of any particular person in a decision-making process. This can be done through the required procedures and not by consistently taking the position of requiring that all environmental impact statement or agreement or addition to an existing impact statement

At least one more general observation needs discussion at this point, particularly since it is not a subject that is directly discussed or referred to in the Statement. In reviewing the situation as a whole, it would appear that the Department is succumbing to the temptation to take a more liberal coal leasing program, in whatever form it might take, as a usual form of mineral use planning in the Western United States, perhaps partly out of frustration for not having received any legislation from Congress which would render such comprehensive planning even for the exploitation of all minerals, in the

public lands. It is sincerely hoped that this perception is inaccurate and a statement flatly to the contrary would be received with great relief by the Final Joint Statement.

Any attempt to use cost as really a rather limited lead use planning effort, although it can be used to set the framework for the much broader planning process. The use of cost as a primary consideration in the planning of the Western United States would be an effort doomed to result not only in failure of the specific planning program but to try to implement such a program. The use of cost as a primary consideration in the planning of the nation, however, can be used to help in the process of raising of such money as may be needed to be raised to implement the initial planning process. A federal cost lead use planning program can be used to help in the development of additional federal lead use planning programs for other countries, regions, or areas which are as environmentally acceptable as feasible. Any program so developed will be able to plan for new industries, possibly even existing ones, which have been unable, heretofore, to plan and mitigate adverse effects from other growing industries. It will also be able to help in the ability to achieve some of the important objectives of direct concern to the planning program.

We have enclosed herewith specific comments which address particular sections of the statement.

Very truly yours,

Loren A. Williams
LAW:DB

Coastal States Energy Company
February 12, 1979

most of the major areas where coal mining is planned or can be expected to occur during the next five years. This information will be updated annually as new areas that have either been completed or in some stage of preparation. Even with significant new leasing in any particular region, much of the information that has already been collected will remain valid. This information will be used for any new additional leasing in the area. This information includes general options such as climatic conditions, geological characteristics, and other pertinent factors.

It is felt that it will be clearer in the final prognostic statement that whereas possible, such information will be incorporated by reference and that ongoing regional lease statements will be fully supplemented or updated where new leasing occurs.

12. It is acknowledged that there could be instances in which no such activity has been reviewed in existing impact statements and no such activity is presented in a particular region that an entirely new environmental impact statement would be required. Regional environmental impact statements indicate that in all probability most new leasing in the region will be located in areas where environmental impact statements have been prepared for the area without the delay resulting from the preparation of an entirely new statement. Similarly, if a particular resource and having requirements of a full environmental impact statement is proposed, it would be appropriate to specifically consider establishing guidelines for the accelerated review of such a proposal. This is particularly true if such analyses are conducted in a timely manner and the environmental impact statement is prepared at an early stage in the preparation of a regional environmental impact statement.

There would seem to be an apparent reason for keeping an individual site specific analysis for each federal coal lease being offered, since the issuance of the lease itself is not an action which in and of itself results in the disturbance of any surface or other adverse impact on the environment. The environmental impact statement for each lease will only result in the application of effects and only very slightly delay when the same impacts have to be analyzed in and only very slightly delay when the same lease is analyzed or developed in an individual environmental impact statement. An environmental impact statement for the entire lease ought to be routine or if an analysis or impact statement is prepared for the lease, it should only be supplemented or updated to include specific or different impacts peculiar to the mining plan prepared which were not adequately reviewed at the time the

The last paragraph of Section 1.2.6 does suggest that the Department will be using most of the information generated by crossing regional impact statements

SPECIFIC COMMENT
TO THE DEPARTMENTAL
REQUEST FOR THE FEDERAL
CIVIL MANAGEMENT PROGRAM

9

The first paragraph of Section 1.1.2 refers to the solicitation of public comments as occurring not only throughout the evaluation of the draft environmental impact statement over several months, but also after the final version is issued. This is to ensure that additional comments after the final statement would be of no useful purpose since anyone interested in making comments would have had ample opportunity to do so during the consideration of the draft environmental impact statement.

Section 1.1.2 also describes the various alternatives briefly and reveals vividly in its narration of the preferred alternative that offering leases for leasing would be the last alternative after all other land use options have been exhausted. It is felt that this was not the case and that the Department's position is that it is the only logical development of coal in the Nation which the Statement acknowledges must, to some significant degree, be based on new federal leasing. If it is the opinion of the Department that some legislation amends the legislation so as to provide for a detailed discussion of that legislation. Furthermore, it would be most enlightening to have a discussion of what, if any, legislative authority there is for passing such laws as the establishment of exceptional areas above that of coal

The description of the preferred alternative in this Section also indicates that the production targets would be "derived from" the production goals proposed by the Department of Energy. This reference and other references in the Statement suggest that the production goals established by the Department of Energy, in apparent contradiction to the statement in the Statement of Executive Order, could be considered as requirements by the Department of Energy, the Interior, and could be modified by the Department or completely ignored. The Memorandum of Understanding in Appendix B to the Statement would be entirely inconsistent with this analysis.

Section 1.1.4 suggests that, although the Department will complete ongoing regional environmental impact statements, it contemplates the preparation of least an environmental analysis for each and every coal lease and mining plan which would probably result in the initiation of a full environmental impact statement for most such leases and plans as well as new regional impact statements and revision and updating of the programmatic impact statement. Such a procedure again requires unnecessary delays. As is evident from Figure 1-2,

Coastal States Energy Corp.

for the environmental analysis of any new federal leases to be issued in the same area in the future. If this is indeed the intention of the Department, as recommended in the above comments, then the Department should make this clear and should definitely state that it intends to maximize the reuse of such information as to minimize delays and duplicate efforts.

Section 1.3 deals with the "Energy in General." In reviewing this section, one has to be impressed by the inventory of strict controls which have been imposed by the Federal and State governments on the production and distribution of energy at all levels. At the same time, it is rather odd that the Department of the Interior has been given responsibility for the regulation of the production of coal, mining fees compelled to take the rather strict alternative of reversioned to the government, and the imposition of a 10% surcharge on the gross revenues of producers of energy products, while the Department of Energy is left to regulate the production of electric power by the various governmental agencies.

Section 1.1.2.1 described the Surface Mining Control and Reclamation Act of 1972 as an Act which would transfer to the States which properly qualify, the primary responsibility for administration and enforcement of the Act. An amendment was introduced by the Congress as reflected in the appropriate legislative history. However, we currently proposed final regulations limiting the Office of Surface Mining from issuing a general date of compliance for many mining activities, except those which are conducted as such at state or local lands, including coal strip mining, see only on federal lands but on private coal lands despite our authority as that authority is contemplated by the Act. It is hoped that the final proposed rule reflects this intent.

Section 1.3.3.1 describes the joint and separate responsibilities of the Department of Energy and the Department of the Interior as specified in the Department of Energy Organization Act. It is apparent from the brief description given in this Section that many more areas of conflict or potential conflict exist between the two Departments in exercising their relative responsibilities.

then just the area of production goal setting which is the subject of the *Memorandum of Understanding* in Appendix B. Therefore, it is certainly necessary that an effort be made in the final environmental impact statement to delineate the responsibilities of each agency involved in the processing of a license application. It is also necessary that the potential responsibilities of each agency for such responsibilities will be exercised as soon as to not result in any unnecessary delay in the processing of a license application. It is realized that the potential responsibilities of each agency will be delineated in the *Memorandum of Understanding*, but the difficulties inherent in the provisions of the Department of Energy Organization Act. Nevertheless, such provisions will have the effect of placing the responsibility for the protection of the environment on the determinate who in what Department should make what decision and when in the pro-

In the second paragraph of Section 1.1.1.3, reference is made to the fact that the Office of Surface Mining has the discretion to waive the provisions of that Act. Such a statement undoubtedly comes as a surprise to the drafters of final regulations for the Office and the critics of those regulations which have been hotly debated at this time. It would be the Office's position that such a development would be undesirable. The Office has always been a proponent of regulations and the Agency feels there is a lot more discretion in formulating regulations and implementing the various provisions of the Act than the drafters of this Statement and other critics of the Act believe. The Office of Surface Mining would need a lot of extensive litigation if the Department would, from the higher levels of the Department, work directly with the Office of Surface Mining to implement its policies. In its defense are listed within the tight extraction granted to the Office by Section 1.1.1.3.

Section 1.3.3.4 refers to the authority of the Forest Service to add terms and conditions to lease agreements on lands to protect resource and environmental values. The Forest Service would be given the authority to add terms and conditions to the final lease agreement, which would, if any, be subject to review by Congress. It might consider standard stipulations and the authority for the addition of conditions to leases. The Forest Service would also have the authority to determine exactly legal authority which would apply to responsibility of lands for mining and the imposition of required environmental protection terms in lease agreements.

coal well apparently came from coal-burning facilities in the West, it is indicated in Appendixes 2-3 (page 2-3) and in the accompanying Table 2-13, that the amount of coal used by the electric power industry in the United States can be estimated as follows: in the year 1960 it was 10 million tons; and in 1965, 229 million tons by 1966, with each figure representing a significant portion of the total coal used in the United States. The author believes that the delineate attempt in the recent Cain Coal Act Amendments to artificially increase the price of western coal by the imposition of stricture sulfur emissions standards will have little effect on the market price of western coal and will remain a significant influence before the expansion of western coal development in general. The sentence before the sentence quoted above from the Cain Act Amendments is as follows: "The provisions of this section shall not apply to power plants operating on line until after 1963." The author believes that this language will change the conclusion as to the severity of the effect of the sulfur emissions standards on the market price of western coal since many of the plants which are scheduled to come on line after 1963 are now in the planning stage. Including coalitions as to constructing

Section 2.3.5.1 (page 2-23) correlates with a sentence to the effect that uncertainty about legal ownership of coal seam reserves can affect production rights and lease terms. This is not the case in the West, especially, but in some points it is an opportunity for the federal government to determine within its existing authority whether newly issued federal coal leases or modified federal coal leases will include such goals and the right to produce it, thus mitigating if not eliminating future problems in producing such a valuable fuel from federal coal lands.

Appendment 2.7-1.3 also refers to the fact that some Professorships Right Leases Appended holders will never be issued a lease because they have failed to satisfy certain requirements set forth by the University or have violated certain lease clauses. This requirement is especially true on a recent amendment to the lease agreement between the relevant statements concerning professorships right leases and the University. The University has the right to decline a lease at the time of application. Additionally from the fact that this amendment was recently made, it is possible that the University may be challenged repeatedly by holders of applications rejected on this ground, it is only fair that the Departmental Board provides in the final appeal statement, that if the University declines a lease application, the University must give such holders of applications on with prior notice. Given this will be given an opportunity to present their case to the University and the University may change its mind.

Section 2.8.1 speaks in general terms of the anticipated time schedule from the issuance of a new lease to actual production under the new leasing program. It

• 1000

Section 2.2 Fig. 2-1 makes reference to the fact that although the vast majority of low-grade coal resources are in the western coal states, there are substantial in-situ recoverable resources of coal in the East. This fact has been mentioned earlier in this section. The coal in the West is generally more abundant than coal in the East. It is readily available and widely distributed among the states. Coal in the West is also of higher quality than coal in the East. The low-grade eastern coal is by and large of metallurgical quality and it should be used as such. However, the low-grade eastern coal is not of the best metallurgical quality and is made by slow combustion and produced thereby "explosive" qualities. The low-grade eastern coal is not of the best metallurgical quality because it is not of the same size as the parent coals. These coal sizes are not available for the use of the steel mills. In addition, heating oil is not available in the West. Therefore, the use of low-grade eastern coal would be undesirable. In any event, it would be folly to either ignore the potentialities of the coal in the West or to ignore the potentialities of the coal in the East.

On the same page of Section 2.2, it is stated that "the mining of Western coal will be concentrated in existing EBCDs." These Areas presently include only the 100 million ton areas of the Western Coalfield. The remaining 100 million ton areas will all be included as a total which is apparently the total area of the Western Coalfield at present time. It should be mentioned again, that since the Department of Energy has not yet issued its final regulations, no specific areas have been designated as EBCDs at present time.

This would be logical until it is realized that the areas which are presently included in the Western Coalfield were originally designated by the Western Area Council as being well past the 100 million ton mark. This is clearly shown in Figure 1-1 of the "Western Coalfield Plan". A comparison of Figures 1-1 and 2-1, showing the general coal fields of the Western Coalfield, clearly indicates that the areas which are presently included in the Western Coalfield were originally designated as being well past the 100 million ton mark. The experience and eminently distinguishable difference between the present sites of these Western Coalfields and the proposed sites of the EBCDs clearly indicates that the Western Coalfield Council was not ignorant or reasonably informed in their designation of the Western Coalfield.

By comparison with the EBCDs which are presently located in the Western Coalfield, the Department has already and without any detailed industry input, excluded at least one major coal field from the Western Coalfield. This is the coal field which will be recruited in the first input statement with appropriate recognition of the fact that we and the EBCDs can and will be kept separate to include any

Section 2.4 (page 2-10) discussed the effect of recent changes in federal air pollution standards for coal-fired power plants with the in-depth conclusion that: "(C)urrent standards for western coal will not be greatly affected by the new air quality standards, because most new demand for western coal will be from power plants and industries in the West." Although most demand for western

Coastal Shores Energy Company

is sincerely hoped that the time schedules for the approval of the mining plan will be as initial as the completion of land use and environmental planning are accurate. However, it must be observed that if they are to be, there must be a minimum of two years between the completion of the environmental impact statement and the promulgation of most mining plans and environmental analyses taking considerably longer than the schedules mentioned in this Section. It would be most appropriate if the environmental impact statement were to be the document that a permit would endorse in the final instant statement to impose some type of schedule concerning all the various public hearings, comment periods and other procedures. The environmental impact statement should be adopted and afterprobate before all of the federal authorizations are obtained to commence

On page 6-44, the observation is made that since western mining is expected to almost entirely stop mining in the Western-Greenbrier Coal Region, the production from the underground PRCA which can be processed under the WECB by surface extraction methods will not contribute significantly to the coal supply. It is recommended that the PRCA which can be processed under the surface extraction methods be included in the WECB as a separate emergency and by-pass leases, either directly or implicitly. Again with the goal of least impacting the environment, especially from the scheme effects of surface mining, the PRCA should be extracted as quickly as possible, perhaps by whatever methods best suit the extraction of the particular resources.

In general, Section 2.6.1 does a good job of supporting the need for additional federal coal leasing to the extent that such need is quantifiable. This support should be more than enough to satisfy the objections raised by the Court in Section 2.6.2. It is important to note, however, that the proposed rule ends it there. While the proposed rule is just that, and that the process will remain open, the new program, if such reduction is necessary, but also to be equally adaptable to increasing the number of leases if the need should prove greater than the

Unfortunately, however, Section 2.1.c. concludes with four paragraphs seeking to limit the effect of the balance sheet on the problem of inflation. It is not clear how many more conclusions on the balance sheet one would need to reach before future demands. It is concluded that when in doubt, the federal government would be better off leaving legal control of demand there. This conclusion is based on the assumption that the federal government can control its own fiscal and monetary policies. It is also assumed that the federal government can meet most actual future demands in terms of the increased price of electricity and virtually all consumer goods which would contribute significantly to inflation not only in the regions most directly affected, but throughout the

On the other hand, the disadvantages of leading more coal than what is needed to meet actual future demand are summarized in this section of Section 2.2.1.

The first such disadvantage is stated as a depression of the house-hold offers for such coal leases on the part of the government, fails to realize the fair market value of the coal. This is due to the fact that the government has no right to lease its own land, and can reasonably expect to obtain from any one lease as a compensation for the use of the land, the amount which it would receive if the government by leasing that land, in terms of production royalties and taxes collected. Furthermore, such house-hold will continue to be manifested in the coal mining industry, so long as the government continues to lease the land until the last coal is exhausted which was guaranteed it by reflecting the true value of the coal in the lease price. The coal mining industry, the Department spent a great deal of time discussing competitive bidding, and the result of this discussion was that the coal mining industry, in the opinion of the house, was partially achieving the fair market value of the coal.

whether it can give for deliberately protracted leasing more than what is necessary for the actual development is that such a procedure would give the federal government less control over where the coal is developed. This statement ignores the fact of life which gives the federal government the power to regulate mining in all areas of the country, and where and when of coal production, are the workers' leases. Certainly, any lease direct control over where and when those places would be leased, and any lease giving mining plan approval was indirectly through approval of, for example, rights of way in the construction of major transportation and communication facilities. The problem is that the federal government's role of diligent, systematic, and continued operation controls in a situation where an excess number of leases could easily outlast its existence, while the approach of no lease or project mining places may have a "red flag" whenever, would certainly approach

13 should also be noted that opting to rely on the suite of licensing framework
14 would not preclude the Minister from applying environmental impact
15 statement or environmental code which, as recommended in section 2.6.2, would
16 carry a host of potential scheme effects and would generally increase specificity
17 and clarity. The Minister could also apply the environmental impact statement
18 and environmental code provisions in addition to the basic environmental
19 statement. 2.6.2, 2.6.3 and 2.6.4 provide additional arguments and support of the basic
20 statement that it really is more advantageous to have more than one
21 environmental statement. It is also important to note that the environmental
22 statement need not be the same as the environmental impact statement.
23 In addition, the Minister will take account of the environmental impact statement
24 when giving serious consideration to making a decision for the proposed new
25 scheme. This approach is similar to the one adopted by the Minister for the Environment,
26 for these sections in the present form would probably make it less amenable
27 to challenge by critical environmental groups.

that it would seriously seek to balance new federal coal leasing with other land uses. It is hoped that in applying such criteria that the government will keep in mind that federal lands are not the only lands that were used in the extraction of all public lands available for multiple use in the West. In fact, that of all those federal coal lands, only a small portion will be offered for lease as needed to maintain any projected production goals. Therefore, the overall effect on, for example, the sage grouse population will be minimal.

In addition, a region should not be viewed as relative to the remaining federal coal land available for leasing but should be viewed in terms of all federal lands in the region available for wildlife habitat preservation.

Section 2.5 begins with a statement to the effect that it was the intent of Congress in the Federal Coal Leasing Amendments Act of 1976 that the new federal leasing board "is a more stringent means for the protection of the public interest than the Department's approach provides that it is better to lease less than what is necessary to meet those needs rather than to lease more." That Act certainly is reasonably made as an amendment by Congress to the Mineral Leasing Act of 1920, which includes the requirement of coal mining on any leases and the diligent development and construction of leasehold improvements which will compel the production from leased land. The new federal leasing board may in reality then require that leases be issued for less land than what may be actually

The third paragraph in Section 2.3 indicates that the Department's preferred alternative production goals are as low as they are primarily due to the Department's reliance on the EPA-mandated production goals announced by existing and long-term lessees. The parties' particular concern expressed in the Statement with the initial discussion of such production goals was indicated that the Department had, not without some justification, disrupted the industry. The industry should be allowed to continue its current level of production. The Department should reassess the production goals it has set for the industry, the lowering of production goals from new federal leases in reliance on the admittedly inflated production goals from previous

On April 2-3, 1961, the Senate Select Committee on Small Business held hearings concerning the continuation of the federal coal lease program. The committee, with assistance from public law experts, prepared a report indicating that the federal coal leasing program would have to wait for the completion of these planning procedures. As referred to in the Senate Report, the planning process is intended to provide a framework for the new federal coal leasing program particularly if long range studies such as the Bureau of Land Management's proposed study of coal resources in the West are completed. For the second time, it cannot be emphasized too strongly that the government would deal constructively in proceeding further with federal coal leasing in the areas where the coal is located. The Senate Report also states that the majority of the industry in the Department's namesake provinces in the Statement as to the schedule anticipated for federal coal leasing in general, and in particular, the date for the completion of the planning work is preliminary to any one coal lease sale.

Also, this part of Section 2.5 assures the reader that the numerous unavailability criteria based on the preservation of recreation areas, wildlife habitat, agricultural resources, etc., will be administered in a way to flexibly accommodate federal coal leasing. However, published reports (discussed in Section 3.4, p. 54-55) have indicated that the BLM has been unwilling to release up to one-third of its lands in Montana and Wyoming required in the acquisition of approximately one-third to one-half of all federal coal lands otherwise available for leasing. It would appear from this result that there is little if any real flexibility in the application of such criteria to the extent

Chapter 3

Section 3.3.1 describes the general characteristics of the preferred alternative for the proposed federal coal leasing program. In general, this discussion should satisfy the requirements resulting from the decision in *NOFC v. Babbitt* that any proposed federal coal leasing program be described in sufficient detail.

There are, however, several policy concerns which this program which are disturbing to industry. The primary problem is the vagueness of the standards which are being applied. The standards are not clearly defined at the local level and the application of the substance unreliability criteria and the relevance requirement trade-offs between the two are not clearly understood. The lack of clear standards makes the application of performance test, preliminary test identification and testing and evaluation of new lease programs difficult. In addition, the lack of clear standards in the use of millions of acres of land involved even if some coal leasing is restricted to existing leases, it is difficult to believe that the Department can reasonably justify the need for relocations of existing leases or the acquisition of new lands for the adoption of a coal leasing program. In fact, related land use planning efforts by the Interior Department, the Bureau of Land Management, the Forest Service, and the Fish and Game Service, concerning wildland designation would seem to indicate that the Department does not believe that there is a significant environmental impact statement which could be addressed and that the details of the proposed leasing program do not require such an environmental impact statement, with supporting illustrations which a company can accommodate.

In the same section on Land Use Planning, a very disturbing implication is left that the Department will indirectly engage in population control, presumably only at the instance of a state government request, by deliberately limiting

local production from a region regardless of other factors and of the market demand in order to accomplish an artificial maximum limit on population in that area. It is unknown what, if any, authority the Department could claim for such action but it would certainly be necessary for the Department to elaborate on this suggestion in the final impact statement and particularly to discuss what, if any, public input would influence a decision to so control a region's population even without the request of any state government.

The next portion of section 1.1.1.3 details the **Activity Planning Stage** of the process. This stage is concerned with the identification of the purpose, the process, the necessary and the objectives of giving ample opportunity for public participation. It is important to note that the final results could be obtained through a **cooperation** of public and private sectors. Public hearings are usually events in which little opportunity is given for review, discussion or debate. The following sections will discuss the constraints on each speaker.¹⁰ Furthermore, any of the speakers that are really interested in the proposed project should be given the opportunity to file the hearing instantly within written requests in which everything that was said during the hearing is repeated. In addition, the name and address of detailed information should be repeated in the relevant documents being considered. Therefore, it is required that, unless specifically required by law, the hearing should be held at least once every year, and as often as every opportunity. Instead, written requests must always be submitted within a relatively short time periods before the proposed decision or decisions are

The Environmental Planning discussion also refers to the preparation of regional environmental impact statements in which tract delineation, ranking and selection would be discussed. It is felt that it is equally important to involve public comment and especially industry participation, either by means of the same procedures used by the State of California for the preparation of environmental impact statements for oil and gas development on state-owned or controlled areas of oil and gas lands, or application of environmental criteria and resource trade-offs. However, it is anticipated that these additional decisions would require any of the above forms of comment or participation could be integrated with the consideration of the other elements of Activity Planning which will also be the subject of regional environmental impact statements.

Section 1.1.1 describes briefly the policy preferred for processing of Federal Right Lease applications. The standard variation of this process from procedure would be that these applications would be required to make a showing of commercial quantities of oil or gas before any lease stipulations could be imposed. This is the traditional approach. It requires a minimum quantity and a second time, after the economic effects of the environmental stipulations are established. It is indicated that these environmental stipulations are attached to the lease application. This is the standard approach by the Department of Energy. This approach may be modified by the Department to accommodate the requirements of the States. This approach may be modified by the Department to accommodate the requirements of the States. This approach may be modified by the Department to accommodate the requirements of the States.

Certain of the more potentially significant availability criteria deserve special attention because in some respects all or almost all of them are directly related to the question of whether or not a particular state with Federal Land Systems and facilities indicates that all federal lands which are available for lease under the National Forest Reservation System and Forest Reserve System would be automatically excluded from further consideration for lease by the National Forest Service. These lands would meet the same criteria as lands in National Forest Reserves, but under regular Forest Reserve status they would be excluded from lease. All lands would automatically be given no consideration for oil leasing as well as all lands which were not specifically set aside for oil production purposes and were being inventoried for review as wilderness areas. The Bureau of Land Management has been doing this for many years.

The criterion concerning Right-of-Way and Reserves, with certain exceptions, excludes portions of "Federal Land" as unsuitable for coal mining which would be available for other uses. The criterion concerning Surface and Underground areas says one. Since the term "federal lands" is used in the text to describe both surface and underground areas, it is assumed that the term "surface" refers to the regulation of this criteria would require initially the horrendous task of relocating all to private surface coal "leases" to qualify for mining. The criterion concerning Surface and Underground areas says one. This is a "fairly agricultural" area even by one who would not characterize it as greater surface land area. The criterion concerning Surface and Underground areas says one. This is a "fairly agricultural" area even by one who would not characterize it as greater surface land area. The criterion concerning Surface and Underground areas says one. This is a "fairly agricultural" area even by one who would not characterize it as greater surface land area. The criterion concerning Surface and Underground areas says one. This is a "fairly agricultural" area even by one who would not characterize it as greater surface land area.

The dual criterion related to State Lands Unfitable for Mining and State Proposed Criteria would seem to have the potential effect of requiring the Secretary of the Interior to consider the location of the mining of federal coal on State Lands to the State in which the federal coal lands are located. Again, there appears to be no legal justification for this outcome since it is contrary to the clear intention of Congress that the Secretary retain primary authority and discretion for leasing such Lands with considerable state participation but

The criteria concerning both federal and state designated endangered species would not seem to allow for the flexibility which has characterized the resolution of problems related to most applications of the Endangered Species Act since its enactment. Environmental groups and the Administration fought the amendment of the Endangered Species Act in the last Congress on the basis of statistics which indicated that of the thousands of instances in which the Act created a

Another feature of this process is the preparation of environmental impact statements on the issuance of the leases themselves. If the applicant satisfies the requirements set forth in the regulations, it would appear to be within the Department's legal authority to consider, in addition to the environmental impact statement, the standard no-action alternative as well as other alternatives to the issuance of the lease unless the Department believes it would be compelled to issue the lease by statute or regulation.

If the Department is referring to an environmental impact statement on a choice of alternatives between these stipulations and only as to the lease itself, if the Department is referring to an environmental impact statement on a choice of alternatives between these stipulations and only as to the lease itself, such a distinction ought to be made clear in the final impact statement.

Section 1.1.5-1 describes how an emergency leasing system to maintain existing mines or to permit the mining of otherwise beyond federal coal would be conducted. The emergency leasing process is to respond quickly enough to situations in which the emergency leasing process would result in the loss of coal supply, usually, to the point of economic collapse. It is important to note that since the emergency process could not proceed until the complete land use plan was completed, it would not be able to respond to emergencies occurring in the next few years; offices as required to deal with emergencies would be otherwise occupied. The reason for this is that the emergency leasing process is a planning exercise rather than a lending function, which is why it is often referred to as a very limited lease either in terms of time or amount of land used. It would be enough that in any region, there would seem to be no retribution.

The insistence that an environmental assessment be made for each such emergency lease, presumably with a public hearing requirement and resulting delay, is likewise unjustified. It would seem such a discussion of emergency leasing may be more properly allocated to such a system which completely replaces the emergency leases which are now used under the provisions of the agreement in NEEC v. Hughes. Serious consideration ought to be given to preserving that portion of the settlement agreement which now permits such emergency leasing rather than reducing essentially the same program in the form of a component of the long-term coal leasing process.

Table 3-1 describes in general terms the many-four separate vulnerability criteria all of which would be applied to each and every tract of federal coal land in the country. Let's now look at the proposed process. In reviewing this criteria it must be again stated that in the author's opinion the proposed new coal policy is what "When in the slightest doubt, don't lease." That is, if the collective implications of all the government officials and public interest groups conclude that leasing on the specific tract of federal land will cause such ecological damage or degradation to the environment and/or society as can be reasonably anticipated, then that tract of land will have an opportunity to be further considered for possible eventual leasing. It would seem that assigning what amounts to the lowest priority to all federal coal leases on any tract of unleased federal coal land would be the best way to proceed. The author believes that the best strategy is to greatly increase and expand for federal lands.

condition with development of any kind, including coal mining enterprises, the government, public interest groups and the private corporate interests which have been involved in the coal mining industry or the modification or prohibition of the development, when, as the consequence, the application of criteria only somewhat stricten when the criteria are applied to coal mining operations. The State of Wyoming, in its opinion, if coal lands in sections of Natrona and Sweetwater were unavailable for coal mining operations, the coal mining industry would move to other areas of coal, it would appear that these criteria are going to be applied in such a manner that they will not allow any range federal coal leasing program with the result that the coal mining industry will not be able to prevent the development of coal operations on the lands in question. If these criteria are applied to coal mining operations, the coal mining industry, in participating in this Statement, should be made clear and a justification given for the position held for departing from what has been a rather successful and responsible coal production program.

The last criterion which deserves particular mention is the one related to reclaimability. In the text the discussion of reclamation assumes unusually long time periods, up to 75 years, for reclamation to legally required levels. Apparently, the reclamation process will be slow and gradual. The land will not be completely compatible with surrounding vegetation in undisturbed areas for many years. The slow natural processes of grasses and other neighboring indigenous species tend to dominate the area. Other native grasses which are regulated by law to be planted in the disturbed areas may be planted in the early stages of the reclamation process. The operator or potential bidder would prove such reclaimability would require long-term tests that could greatly frustrate any interested federal coal leasing agency.

Section 3.7.3 briefly discusses the use of coal production targets. Although the Department prefers to place greater reliance on industry participation in setting targets, it recognises that such a target will not be set until after all other options have been considered. It will not even seek expression of industry intent in particular terms for this purpose until after all of the various criteria have been applied and the decision has been made to proceed with a target for coal production. This is, however, not likely to result in any significant delay in reaching a decision.

Also, there seems to be no reason why the use of production targets, which would already be known to the government through its land use planning process, could not be used to plan production. If the impairment is serious in treating coal leasing equally with other land uses, then the Secretary may find it necessary to make some adjustment in lease goals throughout the land use planning process so that the lease would seem to be appropriate. Also, it must be noted that several of the unsatisfactory criteria contain language which would indicate that the Secretary would have to prove and/or on proof that the mining would not adversely affect the environment in order for the Secretary to consider the lease to be acceptable. It is difficult to understand how the land use process is going to proceed to determine fairly what needs to be compensated for by application of environmental standards to the mining operation. There is also the question of what if any interest there is in conducting particular types of mining on tracts. The Secretary may have to take into account the potential impact of the degree to which potentially adverse environmental effects can be mitigated through industry measures for reduction of noise, dust, and waste. This would be the objective of the environmental impact statement, the pleasure to be located only on certain lands with unacceptable impacts on the environment.

Section 3.1.1 (p)-18 makes reference to guidance of the Federal Land Policy and Resource Management Act concerning the protection of areas of critical environmental concern. Such areas have been highly favored by some of the environmentalists as areas which should receive a priority in the leasing of lands in the battle over designation of lands for wilderness preservation. It is of course uncertain at this time whether or not the Secretary will accept such areas as areas which are impacted as a result of the designation as areas of critical environmental concern. However, the designation of areas of critical environmental protection is not specifically listed in any of the unsatisfactory criteria. Hopefully, this can be converted to certain areas of critical environmental concern which are not necessarily areas of the national parks or areas which automatically preclude new federal coal leasing. There is nothing in the statute which would prohibit the Secretary from designating such areas. It would be very helpful if the information made clear in the final impact statement on the subject of areas of critical environmental concern would be submitted for consideration for new federal coal leasing.

Also on Page 3-18 the land use planning process for excluding areas as unacceptable for consideration for coal leasing is again described. At this time it is stated that the Secretary would not consider areas which are clearly superior to new federal coal leasing. This statement is really just among the many statements which were taken on the contrary. The new federal coal leasing law does not say very much if, for example, priority among all other land uses. The final environmental impact statement should make clear the order of priority of land uses. New federal coal leasing will not be eliminated as a possible land use in favor of any other land use unless that alternative use is clearly superior to coal leasing.

At the end of Page 3-18 the final paragraph refers to the fact that the land use plan would be updated every five years to reflect the fact that the land use plan would be updated only every five years to reflect the fact that the land

were more effective than public hearings and do not work as much time.

Section 3.1.7 describes the emergency leasing system. The primary objective to this system is that there is hardly time to respond to true emergencies or life-or-death situations. Although some time-consuming planning is balanced, the safety of the industry is clearly given preference over other factors as long as a typical long-term new federal coal lease.

Section 3.1 discusses various issues and alternatives to decisions tentatively made in the proposed alternative for the coal leasing process. Much of the material in this section has already been discussed in earlier sections. However, some of the particular options considered deserve further attention.

Section 3.1.3 indicates that existing leases and preference right leases application times will be subject to revision if the Secretary determines that such an action is appropriate in the administration of part, or perhaps even all, of the leases for mining. Apparently, the Department would resort to codification by regulation if an existing lease was to be terminated or modified by the Secretary. This would appear to be the Department's policy as the answer to its continuing problem of terminating leases which have been issued by the Secretary and compensation from Congress despite repeated efforts. The Department should discuss in the final impact statement if, or any compensation for such termination, would be preferred to rights of participants in any lease which is terminated by regulation. The Department is reminded that although government bodies have had little success in terminating leases, the Secretary has the power to do so. It will be a fundamental principle that regulation which requires an outright prohibition or any use of property amounts to a condemnation requiring payment of just compensation.

Section 3.1.4 supports that in dealing with split-estate leasing the Secretary would attempt to regulate the amount of compensation paid for surface owned lands. This would be done by specifying the amount of compensation to be paid to the surface owner. The Secretary may find it necessary to include any regulatory stipulations to insure that all of the surface owners who had not yet given a consent but who would be willing to do so, would ask for an increase in compensation. This would be done by the time the final impact statement was already published. Such high compensation may totally cut off lease applications for the area. This would be a reasonable proposal simply because the Landbank in question had an unusually high bargaining power relative to the particular operating company.

Section 3.1.4 discusses minimum lease payments and states that the Secretary must have the authority to regulate that type of lease. These five definitions should be spelled out and explained with their relative advantages and disadvantages. The first four definitions are self-explanatory. The fifth definition, the preferred option of requiring minimum economic recovery of all coal seams which are collectively leased. Before leases can even go forward to the selection of this definition, it would be necessary to type out exactly what would be required, limited or unlimited and describe how this definition would be applied. It is

to be inconsistent with the long term four-year cycle of new coal leasing. Presently, new leases are issued every year and the Secretary would have to make update or replace the land use plan to reflect changed circumstances particularly as regards criteria which previously applied to selected lands from previous years.

Section 3.1.1.1 describes the unsatisfactory criteria. In the third paragraph of this section a statement is made concerning that Section 323 (a) of FLPRA does not contain specific criteria for determining lands unsuitable for coal mining. This is followed by a list of criteria which are not included which are described in the statement as including "exempted". This would suggest that the Secretary would have to make changes in the unsatisfactory criteria in another part of the statement to be square that these areas would automatically be exempted. It would be a waste of time and effort if this were the case. That is, if the Secretary would be required only if the area would result in a "severe loss of reduction of long-range productivity of water supply..."

Section 3.1.1.1 concerns the concern of threshold development levels. It is suggested that the threshold development level be set at 100,000 tons per year and fixed for all time if once made. Rather, it should be made clear that

with changing population patterns which may not be controllable through coal mining, the threshold development level should be set to whatever amount

industry believes is necessary to insure that the land use plan is not violated.

Section 3.1.1.2 concerns the concern of the number of regional production targets and refers to the number of regional production targets which would use the near and mid-term national

production targets already set or to be set by the Department of Energy. This statement is really just a restatement of the intent in the statute that the number of leases in the Department of Energy would be a part of the preferred alternative even though alternatives are repeatedly made that the Department does not prefer such a approach to the leasing process.

Section 3.1.1.4 lists several alternatives being considered for sale and bidding procedures for new federal leases. The sliding scale royalty bidding would harmonize the bidding process with the value of the coal. While this principle appears to response to P.L. 95-242, the Secretary would like to see that mineral deposits or areas of logical mining sites would be increasingly leased based on the value of the coal. This would be a good way to insure that P.L. 95-242 works for both the government and the operators since the government would receive a fair return for the coal and the operators would receive a fair return in mining new federal leases requiring an otherwise non-bidding process.

The fixed rental method would probably not reflect a return of fair market value to the government over the long run period.

Section 3.1.5.2 recognizes the general public participation in the proposed process. Again, it must be repeated that submission of written comments are

found that the Department will require the mining of thin seams relatively close to large seams which would greatly increases the production of waste rock. This would be a major problem in the mining of thin seams. The thin seam creates waste conditions both treat the fine and the surface directly or indirectly by the more extensive mining. In effect, the government would be subsidizing the mining of thin seams. This would be a waste of money for that of industry which has for decades functioned well to recover as much coal as possible from the coal seam. It is the opinion of the Secretary that the function of any government agency in this type of spiraling inflation is to encourage inefficient resource extraction so that the government can obtain as low a price as possible for the mineral as possible under general conservation principles.

Of all the dissenting provisions in the statement, section 3.1.7 clearly has the potential to cause the most damage to maintaining a competitive and efficient coal industry for this nation capable of responding to the ever needs of the public at large. This would be an excellent example of the negative aspects of the new federal coal leasing program. It is not so much that single leasing of federal coal in a manner to meet increased needs while doing so in an environmental manner is not a good idea. The problem is that the Secretary has only one objective for which the Department has any authority to pursue in this Statement. That is to insure that the coal is used in an efficient manner and the end use of the coal to be probed. The market place has functioned reasonably well in determining the prices of coal and the government interferes by placing restrictions such as those in the new federal leasing program. These restrictions are inevitably much worse than the problems sought to be solved. It is hoped that the Department will take into account the history of coal mining and the use of such of the natural gas resources in this country which for decades exceeded the maximum sustainable rate and realize that such end-use controls are not the best way to insure that the coal is used in an efficient manner and the continuation of a federal coal leasing program.

Section 3.1.9 concerns the relative detail of stipulations for environmental protection. The Secretary may have the power to lease property to sale and then to any mining plan submitted upon lands covered by that lease. The only comment on this procedure is that it would be a great disservice to the objectives of the statute if the Secretary were to allow any mining plan which was significantly different or more restrictive than those attached to the lease. A mining plan which is significantly different or more restrictive than the lease stipulations will not be as different from the lease stipulations or from the lease as the lease itself. The mining plan will be a sufficient quantity of the coal he had intended to mine is rendered unusable.

In Section 3.4 there is a brief discussion of numerous on-going studies which are described as clarifying procedural details and which will apparently not be completed until after the final impact statement is issued. The Secretary is not encouraged to increase the number of impact statements for any reason, it is felt that these studies are so important to industry and other public interests

that failure to at least provide an adequate public comment period for them could seriously jeopardize the legal defensibility of the entire Statement. It would therefore be recommended that as soon as possible in which time and brevity will allow, an area specifically being studied would be given the proper opportunity to influence the decisions of the Department.

-19-

CHAPTER 4.

Chapter 4 deals with a region-by-region description of the general environment in the several regions of the nation. Since otherwise it is primarily with the West-Southeastern that Coal Region, we will concentrate our comments on the section of Chapter 4 related to that region only.

It should initially be noted, however, that as regards the availability of surface water supplies, separate statements are made for the separate regions which indicate that enough brackish water has already been generated to prove that such water is available. This statement is supported by the information contained in the third full paragraph on page 4-3 to the effect that most of the regions are particularly fragile and that with proper land and vegetative management, there is no reason to believe that such water supplies will not be available. Presumably, the Department will not lose sight of this admitted fact in its subsequent planning and other reclamation programs.

At the end of Section 4.1.1 on page 4-3, the discussion is directed to the reclaimability of lands in general and particularly in the West-Southeastern Coal Region. In stating that the remaining process may take several years there is an implicit assumption that is not explicitly stated that the same assumption that mine areas are expected to have a water supply available for future reclamation purposes. This is a very important assumption which may cause confusion without an adequate water supply for every purpose including hydroelectric and other reclamation purposes.

The second paragraph on page 4-30 refers to the desirability of new mines in the West-Southeastern being supplied by domestic livestock and big game animals. Presumably, therefore, the Department will not be so sensitive to potential environmental damage from such mining operations as it is to predominantly underground coal mining which is expected to occur in the West-Southeastern Coal Region. Furthermore, it is hoped that this paragraph does not mean that new mines will not be permitted to be developed in the region if such reclamation costs are in order to compensate for such operating, much of which occurred not only with the present but the encouragement of federal land use agencies over the past several decades.

-37-

CHAPTER 5.

Section 5.1.2. discusses the assumptions made by the department for analyzing future regional impact of the proposed federal coal leasing program.

One of these assumptions affects the the production goals established by the Department. In the first full paragraph of this section of the Statement, the Department of the Interior indicated that it would not expect to meet these goals by its preferred alternative. Therefore, it would appear that the Department's preferred alternative is not the "best case" situation. Although typical of some environmental analyses, this statement is somewhat misleading since the Department has made it clear that the "best case" is not preferred and that the "worst case" is the preferred alternative with rather insignificant changes if any program is taken up by the Secretary.

Another one of these assumptions is that no significant delay will be experienced by operating companies in obtaining any and all of the aerial authorizations from State and local governments. It is also assumed that the Department will be able to believe this, but based upon past experience and the exceedingly complex process of the proposed federal coal leasing program, it ought to be apparent that such an assumption is not realistic. This assumption, however, does permit the Department to avoid focusing attention on the many instances in which the leasing process is delayed by something other than the Department's fault.

The Department is at present to be commended for the wide range of alternatives discussed in this Chapter based upon innumerable assumptions and recognition of the limitations of the data available. However, the approach taken by the Department which should tend to support the legal defensibility of the Statement. It was mentioned earlier that the Department has chosen to base its analysis on "worst case" projections for environmental impacts. Although such projections may now have become common to environmental analyses, it is important to stress that the Department has chosen to do this in order to gain a fair-leading implications as this Statement, that the Department repeat emphasis on the "worst case" scenario. The Department has chosen to do this because these outcomes are very unlikely to occur and are presented only for the sake of completeness. The Department has chosen to do this because it is the legally safest way and inadmissible analysis of environmental impacts. The Department has done this in several cases in Chapter 5. It can only be emphasized that the first and most important consideration in any environmental analysis is the outcome which we would be exposed to if leased federal lands the ability to quote statements which are not supported by the data available. The "worst case" projections are currently used in public hearings and discussions with even media in which the Department has chosen to do this because it believes that any coal developments in their area will have devastating consequences.

Section 5.2.1. discusses land disturbance and reclamation in general terms. Although this section is helpful in finally putting into proper perspective the potential environmental damage which may result from federal coal leasing, the coal regions relative to the rest of the country, it does conceal two distinctions and inconsistencies which should be corrected in the final impact statement.

-21-

On page 5-17, at the bottom of the first column, references is made to estimates of land which would normally not be reclaimed. Curiously, this estimate concerns land which is to be used for mining and coal combustion and generating plants as well as land which is to be used for irrigation and other purposes. It is noted that these lands are fully leased for reclamation and, in fact, that the salvage of the buildings required for mining and generating plants is to be done by the lessee. This being the case, the appropriate state authority or contractor working with the mining company would be responsible when the lease is terminated. It is also noted in such areas as unleaseable lands that the Department would expect a larger proportion of surface directly disturbed by underground coal mining to be returned to a condition which approximates the original surface prior to mining. There is no basis for such an assumption particularly since on the same page it is noted that the Department has chosen to do this in order to gain a fair-leading implication. It is also noted that the Department has chosen to do this and will be proclaimed. It would seem that this statement is directly contrary to the assumptions which are the basis for the estimates in Table 5-6.

Also on page 5-17, at the bottom of the second column, it is made that acreage available to lessees under federal leases would take as much as five to fifteen years. This statement is supported by citation to only one study which is not cited. It is also noted that the Department has chosen to do this and had been stalled or given adequate opportunity to demonstrate reclamation. While it is reasonable to make such strict reclamation requirements on the state and federal lands, it is equally reasonable to make such strict requirements in view of needless controversy concerning reclaimability as well as unnecessary expense and difficulty for questions.

In the second paragraph on page 5-24, the sixth full paragraph, it is made that irrigation rights on the six full paragraphs, "the West-Southeastern Coal Region" simply because water rights are "usually not available." This makes no sense since the West-Southeastern Coal Region is located in an arid region where rights are relatively expensive to develop or obtain anywhere in the West, yet it is assumed that the Department will be able to obtain such water rights either directly by purchase or by appropriation. Previously this statement was based on a misinterpretation of western water law and the realization that most states recognize that water rights are not fully appropriated thereby, which may be the case on paper but not in reality.

In the second paragraph of page 5-24, the incredible statement is made that "presently, there is no feasible way to reclaim land in the West-Southeastern Coal Region." It is believed that this statement is based on the premise that the surface in the area mined (subidence) to depths which vary from a few feet to several hundred feet. It is believed that such a great surprise to anyone in the industry to hear that the Department has chosen to do this and has recognized in substance of hundreds of feet. Even considering the very thick, extremely brittle rock layers which are found in the West-Southeastern Coal Region, assuming that somehow that coal might be mined by underground mining techniques not involving explosives, the resulting subsidence would be so great that the resulting land would lower the original elevation by hundreds of feet. Such seemingly impossible situations such as in other parishes are just the kind of statements which will be made and said by persons who are just the kind of statements in the West to try to scare those who might otherwise support new legislation. Furthermore, the very next paragraph of the Statement recognizes small

-22-

factors and discusses typical lowering which indicate that the Department, although using well factors which are lower than those usually experienced, recognizes that the effects of subsidence in changing surface elevations are really not that serious.

On page 5-25 at the top of the second column the statement is made that increased mining might result in uncontrolled fossil collection. This statement, although a general warning, is not specifically directed to the surface mine properties, for a variety of reasons, including the liability of the mine operator for the safety of the surrounding populace, are simple not left open for anyone to run across the property gathering fossils or otherwise having free access to pits, areas and other disturbed lands.

The first two full paragraphs or page 14 discuss briefly potential conflicts between oil and gas developers and coal mining. Unfortunately, it would seem to the author of this document that such conflicts will often be the case. The oil and gas industry has been around for over 100 years, while coal mining is a relatively new industry, having been developed over the last 100 years, yet the region has been and remains one of the prime coal producing areas in the country. It can be said that the oil and gas developers have had time to learn about the coal mining industry and vice versa. The other, however, is the Department of Energy and the Bureau of Mines have had little time to learn about the oil and gas industry. There are many established coal mines and there are many alternatives which can accommodate both sectors. This conflict is particularly important in the West, where many of the prime oil and gas producing areas in existence and that can be expected to disappear in the future are located in the same areas as the coal reserves. This is true up as "all-weather" battle between oil and gas interests and coal interests in the West. The author believes that some of these critical resources to both sides are the oil and gas and coal industries as a whole.

On page 5-11 is a discussion of the prospective requirements in the Upper Colorado River Basin. This discussion concludes with an observation that "the water rights which have been granted to date in the basin, and the figures related upon in the statement, are probably exaggerated by a 'double count' which includes the same user, perhaps more than once." The author suggests that the basin would benefit from a water allocation statistic based on effects to eliminate this double count. Failure to do so, even with express recognition of the problem, will result in continued conflicts between the upper basin and western basin development, in general the opportunity to capitalize on a basinwide water allocation statistic based on effects to all users will be severely impeded to lay the municipalities and agricultural community even though the basin is divided into 17 additional local basing concerns. Even though the basin is divided into 17 additional local basing concerns, it is felt that the basin would benefit from a water allocation statistic by decentralizing it along a percentage of lawfully issued total water availability. It is felt that the basin would benefit from a water allocation statistic to prevent this very sensitive subject from being misinterpreted.

In the third full paragraph on page 5-53, the implication is left that Western coal uniformly has more radioactive material in it than Eastern coal. We know

ently from the present uses which are primarily for the generation of electricity and secondarily for conventional industrial boiler use with negligible or no synthetic fuel development. There would appear to be no justification for making an exception to this general observation in analyzing population increases. To assume significant population increases from synthetic fuel plants can be unequivocally alarming to existing residents in regions to be impacted by any new federally coal leasing program.

In Section 3.4.4 (the second full paragraph on page 5-96), the basis for projecting fiscal impacts on state and local government agencies is described as being based on an adequately compensated population shift which means "increasingly more people in the state and fewer people in the county." This is misleading and frustrating for the Department to be making assumptions on our part and then challenging the assumptions with completely unpreserved data. The Department has chosen to use the "worst case" scenario for physical impacts in order to avoid any criticism that would arise if they were to fail to at least mention all possible impacts. It is hard to imagine that the Department does not know that the "worst case" the Department considers to be the most likely situation so that published projections are not based on the "worst case" scenario. The Department's new federal law hearing requests to make new laws and good government exists will not only align state and local governments' policies and programs but will enhance existing laws in preparation for problems

Again, in Section 5.3.5.1, the analysis of transportation impacts deliberately sets forth only the most common situation in which the vast majority of coal is moved by railroads with no accounting of maritime imports. The Department should try to develop again a "most likely" impact scenario because the worst-case discussions are relatively brief and it is clearly stated that they are on the worst case basis. A reader is likely to lose sight of this fact in attempting a detailed review of the handwaving segment of this section.

The last paragraph on page 5-113 makes the incredible statement that it was "not required to obtain any environmental impact statement or environmental impact report prior to receiving a certificate of public convenience and necessity from the federal government." In support of this statement is a footnote which refers to a publication based solely on one section of the Interstate Commerce Act. We are aware of no major rail lines that have been constructed or that are under construction without some kind of environmental impact statement or environmental impact report. In instances where rail lines have been built as our lines by our company, the construction was the subject of at least an environmental analysis or an environmental impact statement because it was associated with a large amount of money and a tremendous responsibility to the Federal government. Therefore, the fears expressed in this part of the Statement would seem to be wholly unfounded and unnecessarily raise problems.

As is noted in the closing sentence of this Section, such considerations have far-reaching social and environmental implications which can only be considered by Congress and not in an environmental impact statement on only one of a number of activities which will effect the population growth and result in environmental impacts in the West. This Section vividly portrays just a few

of no authorities to support this implication, and would suggest that the Department clarify this to indicate that since both eastern and western coals vary widely in quality and trace element contents, such a statement concerning radioactivity cannot be applied across the board to all western coal.

In section 5.2.4.1, a lengthy discussion is made of the assumptions used in projecting the population increases due to the new coal seam leasing and the resulting socio-economic impacts. On page 5-83 (second column) and near the beginning of page 5-85, are comments which indicate that these increases assumed are based on increases in population which combine short-term increases due to major construction as well as long-term employment in coal mines and supporting

Similarly, these figures are based on figures which do not reflect any assumption concerning the number of new people which would come into an area and the number of jobs related to new federal coal leasing which would be filled by those new residents. The same is true concerning the potential economic impacts of new federal coal leasing. This is particularly true in view of the fact that the environmental impacts of new federal coal leasing are likely to be relatively small compared to the environmental impacts which are likely to be experienced by new federal coal leasing and experiencing relatively high levels of employment and population growth. In addition, the environmental impacts associated with many of the related environmental impacts of new federal coal leasing may be rather sparsely populated areas. Therefore, it is argued that the potential economic impacts of new federal coal leasing are likely to be relatively small and that the environmental figures as to influence of populations resulting from new federal coal leasing are likely to be somewhat misleading. It is also argued that there is no way to show to what degree the replacement of existing residents in coal development areas will affect the potential economic impacts of new federal coal leasing. Any residents of the West are particularly opposed to any development of their area which would result in the displacement of existing residents.

The population increase figures secured by the Department are apparently in direct conflict with statements made on page 5-87, at the beginning of Section 5.3.4.4.3 to the effect that the principal source of labor for western coal development can be expected to be western workers in agriculture and to a lesser degree, in the construction industry. Here the Department is acknowledging that many existing residents of the West will be available to fill coal development-related jobs, thus making the exaggerated assumptions of the amount

Again on page 5-54 (bottom of first column), reference is made to Table 5-54 as containing projected increases in population due to construction of coal development facilities. The statement requires that part of the statement is on the assumption that there will be no new facilities but it also notes that the date is based on the assumption of the possible development of significant numbers of synthetic fuel plants. Earlier in the statement, the development clearly stated that, in general, its environmental impact would be minimal. It is also noted that the statement that the end uses of coal would "shape the affordable future, not vice versa" significantly overstates the influence of coal development.

of the many serious problems which would be created by any end-use control system so that it is difficult to understand why the Department is expending any effort in further consideration of this option.

Section 5.4.5 discusses diligence and continuous operation requirements. This section opens with a brief statement as to the advantages for strictly applying such requirements. It should be noted that the imposition of end-use controls would significantly decrease if not eliminate most of these advantages.

Also in this section, the Department continues to stress the fact that many existing leases are not producing. Although it is not disputed that some of these leases have been unable to produce to full capacity, it should also be noted that the majority of these leases are located in areas which are not major market incentive for the development of western coal in general. Furthermore, the Department has indicated that there is no reason to believe that any unit will make substantial or even area wide developments which would justify the issuance of new leases. The Department has also indicated that this list of constraints beyond the context of the leases of non-producing leases is not intended to be exhaustive. It is the intent of the Bureau that federal coal lands and the mines thereon be used as efficiently as possible, if at all, have been changing constantly and significantly. It would be wise to keep this in mind when considering the future of the coal industry concerning the long lead time to the operation of mines under the best of circumstances. The Department has also indicated that the Bureau and perhaps will remain so because of circumstances beyond the control of

Also on page 5-133, is a discussion of alternatives to the present diligent development and continuous operation requirements. It is puzzling why the Department of the Interior is concerning itself with such alternatives since it acknowledges at the beginning of this discussion that the authority to adopt any such alternatives is totally the responsibility of the Department of Energy.

Section 5.4.7 discusses the approach preferred alternative definition for "maximum economic recovery" which requires that recovery be based on the mining of the most valuable mineral veins in a property. While it is advantageous that a local company have the right to mine all veins within one property rather than having to compete with different companies for the same veins, this can be reflected, as noted in the third alternative discussion in this section, on search engineering practices which will be readily adapted to changing mining technology and market conditions. The approach of mining the most valuable veins may require large amounts of capital in its projects unless realistically he expected to act to reduce the return on that investment by failing to make the minimum economic recovery required by law.

expressly states in this section, it is assumed that the test route items studies and reports applying the draft criteria would be available to the public. These field tests as described in the third full paragraph on page 5-141 were applied in sections of Montana and Wyoming to indicate an evaluation of one-third to one-half of the available federal coal resources. This result is all the more

unrealistic and unrealistic when viewed with the fact that such exclusion did not apply all twenty-four unavailability criteria even though some of the criteria were specifically designed to protect the environment. As noted above, it would appear that the criteria, particularly those related to endangered species and wildlife habitat, is being applied most rigidly to coal development impacts on such aspects of the environment. It is hoped that the Department will take into account the environmental impact of coal mining when it attempts to evaluate the source of coal which would be excluded while writing the clear statements of relevant legislation. In the final statement, it is recommended that the draft unavailability criteria be applied so that the industry and public in general can have a clear concept of just what areas of the country are excluded from coal production from both nuclear, federal, and resource from development.

-27-

Chapter 6.

Chapter 6 discusses many of the adverse impacts already discussed and deals with mitigation of these impacts. A few of the statements made in Chapter 6 are in conflict with previous sections of the Statement which are supposedly being summarized in this Chapter.

On page 6-3 the statements in the second paragraph of the second column suggest that certain mitigation strategies be attached to a particular lease area. This lease area would be determined prior to the issuance of the lease. The lease area would include the area where the proposed mine would be located. The lease area would cover prior to lease sale as is only fair to the lessee bidders. This inconsistency should be clarified in the final impact statement.

On page 6-4 in the first column nine principal factors are listed which are to be considered in the evaluation of the proposed mine. One of these factors is labeled "cost internalization" and refers to the extent to which costs of energy consumption are passed on to the consumer through energy conservation. This statement perpetuates the popular myth that large corporations should be made to bear the burden of energy conservation. It is suggested that the cost of energy conservation simply add to the price of the coal or the product produced by the coal such as electricity and heat. It should not be the responsibility of the coal operator to shoulder the burden of energy-conserving public. This should be made clear in the final Statement so that members of the public are not eager to adopt or support legislation which would force the coal operator to shoulder the cost of energy conservation. It is also suggested that the statement be revised to reflect the statement belief that in doing their individual cost of energy consumption or of producing energy, the coal operator should bear the cost of energy conservation. It is true that these may be shifted into the operator's internal cost structure, so that such costs might be hidden from the public but it is suggested that doing so is not in the best interest of the public.

Near the bottom of the first column on page 6-7 is a statement to the effect that although consideration has been given to requiring operators to provide financial assistance to communities and communities through direct lease payments, the Department has decided that "it should not be required to be legally possible...." It is hoped that the Department will give no further consideration to such an obviously unlawful use of lease stipulations.

-28-

Chapter 7.

This Chapter reviews briefly the long term environmental consequences of the proposed coal leases. There are no surprises in this Chapter tend to be unscientifically and ignorantly presented such consequences. For example, in Section 7.1.1.2 the long term effects of mining on soils is discussed with the conclusion that long term reestablishment of soils is difficult and that the ultimate result of mining is irreversible fertile soils. This must assume that the disturbance of those soils will result from activity which will be clearly in violation of RCRA. This statement is also in conflict with the statement that "the long term stabilization of all soils on mined areas." Perhaps that statement is referring to the ability of the coal operator to stabilize the soils on the land which he controls by ownership corpuses. Under such circumstances, it should be made clear that this is not the responsibility of operating companies.

Again, such negative statements necessarily allow all others who are already involved in coal mining to do whatever they want to do in the name of agricultural interests. If space does not allow objective explanation of such statements, the first sentence of this section should be removed. Such statements are even more atrocious in view of other comments made in portions of the Statement. For example, in Section 7.1.2 (at the beginning of p. 7-1) it is flatly stated that "mining activities will not be allowed to interfere with agriculture." This statement cannot be reclassified and that boulding to insure reclamations would certainly convince after mining in areas where reclamations were particularly difficult.

In Section 7.1.3 (beginning of p. 7-2) a statement is made to the effect that the proposed higher wages for coal development areas would attract new people which would necessarily exceed the demand for coal miners. This statement is in conflict with the statement that "it would be contrary to all experience to due with coal development in the West." The final impact statement should explain on what basis the Department makes such a statement. It is suggested that in view of the present situation, coal developments would severely decrease current unemployment rather than result in increased employment.

Section 7.2 contains a statement at the end of the first paragraph of this section which indicates that the Department's policy of modern economic technology would provide reduce the natural limitations on conservation mining technology. What is not clear is how the Department would implement this policy. It is obviously very important to industry to know exactly what methods the Department would consider acceptable. It is suggested that the Department should consider requiring, for example, in an existing mine which acquires a new federal lease, that a completely new or significantly changed method of mining be used. It is also suggested that the Department should require that if a company is mining currently being used is reasonable in view of present technology, there is no need to require the wasteful investment in all new underground equipment.

-29-

to completely change to what ever or may not prove to be a technology for higher future production. In any event, such more detailed elaboration of this suggestion is necessary in the final impact statement or else the suggestion should be eliminated entirely.

Section 7.3 discusses productivity of coal as affected by reclaimability. Productivity of coal means the amount of coal which indicates that even though existing law requires adequate bonds to insure the ultimate removal of all structures erected on lands disturbed by coal mining, the coal operator may claim that the law does not require that the land reclaimed will never be reclaimed. It is not clear how or why the Department makes this assumption and it is certainly contrary to the intent of the law.

On page 7-7 (at the beginning of p. 7-7), statements are again repeated to the effect that reclamation will require from five to fifteen years in most areas. These statements are based on studies which were either conducted when there was little or no regulation of coal mining or before the implementation of the strict reclamation requirements of applicable laws. It is suggested that the Department should include in its final impact statement if for no other reason than that such assumptions left uncorrected can result in enormous burdens to operators of coal mines. It is also suggested that the Department should make clear, of course, passed on to the ultimate consumer of energy and products produced from coal.

Coastal States Energy Company

Chapter E.

Section 8.1 describes in part several records of understanding which are or will be executed by the various Federal agencies other than the Department of Interior in connection with the federal coal leasing project. Although no specific date is suggested for the acquisition and publication of these records, it would surely be highly desirable that such documents be made available for comment before or at the time of publication of the final report statement.

Respectfully submitted,

Director
Bureau of Land Management
U. S. Interior
Washington, D. C. 20240

Dear Sir:

Enclosed are the Resources Division of Burlington Northern Inc.'s comments on the Federal Coal Usability Criteria. Also enclosed is an extract from No. 2, "Letter to the Interior Department on Draft Environmental Statement of the proposed Federal Coal Management Program."

Department of Interior representatives have stated that suggested changes in the criteria will be within the constraints of the existing legislation and regulations. While our Company might prefer wholesale revision of some criteria, we recognize that the Department cannot seriously entertain such comments.

Consequently, our comments attempt to stay within the bounds of practical legislative and regulatory requirements of the existing criteria. We also very much urge that the criteria contain provisions requiring due diligence as to the environmental impact of the activities responsible for applying the provisions of the criteria.

Because of its ownership of Western coal, Burlington Northern Inc. is interested in the wording and application of the Federal Coal Management Program. The Management Program can best be implemented if these criteria are clearly stated and fairly applied.

Yours very truly,

E. E. Thurlow
Assistant Vice President
Coal and Minerals

Attachment

STATEMENT OF NORMAN M. LORENTZSEN

I am NORMAN M. LORENTZSEN, President and Chief Executive Officer of Burlington Northern Inc. My business address is 116 East Fifth Street, St. Paul, Minnesota 55101.

This statement is submitted in response to a request from the United States Department of Interior, Bureau of Land Management, for comments on the draft environmental statement for the Federal coal management program (FCM).

General Information

Burlington Northern Inc. is a major railroad which, including its subsidiaries, serves some 16 States from Chicago through the Midwest and North Central Plains to the Pacific Northwest and from Denver to Galveston, Texas. Burlington Northern is also a natural resources company too, in part, to the land holdings of one of its predecessor companies, the Northern Pacific Railway Company. This statement will separately address transportation and natural resources aspects of the FCM.

COMMENTS FROM THE PERSPECTIVE OF AN OPERATOR OF A MAJOR RAILROAD

From the perspective as a major Western rail carrier, Burlington Northern is vitally concerned with development of Western coal. In general, the OCS greatly overstates environmental

STATEMENT OF NORMAN M. LORENTZSEN

PRESIDENT AND CHIEF EXECUTIVE OFFICER

BURLINGTON NORTHERN INC.

impacts arising from the transportation of coal by rail carriers, especially in the West.

Coal Production Estimates

Comments on coal production estimates are limited to impacts arising from the Powder River Basin Region because it is this area which will have the most significant impact on Burlington Northern. Because of the limited time available to review this lengthy document, we have not attempted to analyze other regions.

Estimates of coal production from the Powder River Basin Region are considerably too high. The high probability placed on the "medium" level scenario for the preferred program (Table 3-2, page 5-10 of the DES) is overly optimistic. In planning for projected increases in volume of coal transportation, Burlington Northern conducts a comprehensive research effort to predict future coal traffic from the Powder River Basin. The basis for this planning effort is primarily utility demand as expressed by present and future customers beginning with rate quotation requests by utilities exploring the use of Powder River Basin coal. We also look closely at the plans of the mines we serve and the contracts in effect between mines and their customers. Such analysis convincingly leads to projections more in the range of the "low" scenarios mentioned in the DES rather than the "medium" level which is favored in the DES.

-2-

For example, our internal analysis predicts that total Powder River Basin coal production in 1985 will not exceed 175 million tons. This production may be as low as 133 million tons if full-control scrubbing requirements are promulgated by the Environmental Protection Agency. By contrast, the subject DES assumes a total of 205 million tons for the same territory in 1985 (Table 2-5, page 5-10).

Our projections are further substantiated by the most recent demand forecast (August 1978) issued by the National Electric Reliability Council (attached as Table 2B-1). This forecast indicates a total demand from all Western Regions of 290 million tons in 1985. In view of these forecasts, the "medium" projections used in this subject DES are highly illogical.

A further illustration of wide discrepancies and over-estimations occur in the supply-demand flows shown in Figures 5-4 and 5-5 (pages 5-107 and 5-108, respectively). These charts depict expected coal flows in 1985 and 1990. Figure 5-4 shows a total of 131 million tons in 1985 from the Powder River Basin. Figure 5-5 indicates production of 229 million tons in 1990. No evidence supports this tremendous 20% spur in demand in a five year period. The coal volume predictions used in this DES do not appear to give sufficient weight to a number of factors which affect the competitiveness of this region's coal vis-a-vis other fuels as well as coal from other

-3-

regions in the U.S. There are a number of developments currently in the offing which are now significantly tipping the competitive balance away from Powder River coal as may well reduce drastically even the "low" scenario.

Among these developments are laws pertaining to pollution-control, especially the "best available control technology" regulations currently being formulated by the Environmental Protection Agency (EPA) as a result of the 1977 amendment to the Federal Clean Air Act. The proposed regulations would require that all new coal-burning power plants be required to install expensive scrubbers to remove at least 95% of the sulphur dioxide produced. This requirement would apply regardless of the sulphur content of the coal being used. The DES, page 2-10, does recognize some impact of full-scrubbing regulations but dismisses the threat as unimportant to the West. The legislative history of the Clean Air Act suggests so soon that it was the intention of the Congress to foster the production of Eastern coal from underground mines at the expense of the Western surface mine production despite the fact that now the cheapest way for many utilities to reduce sulphur emissions is to use low sulphur coal from the latter source. If the new regulations go into effect, however, the attractiveness of Powder River Basin coal will be sharply diminished as higher-sulphur "local" coals could be used for mine mouth generating plants or would not have to be transported as far

to the power plant. This would no doubt result in major curtailment of planned mine expansion and new openings in the Western regions. The precise extent of this shift in fuel sources is not predictable until EPA settles on final regulations which it is required to promulgate no later than March 12, 1979 by court order. If they are comparable to those now proposed, the effect on Western production will be severe. Burlington Northern is presently planning on future coal movements to Texas, Arkansas, Oklahoma, Louisiana, Florida, Michigan, Indiana, Illinois and other eastern and southern states. Most of these moves are in jeopardy if low-sulphur coal is penalized by full-scrubbing provisions. As noted on page 2-10 of the DES, these utilities would likely turn to lignite or midwestern bituminous coal which, though higher in sulphur, are closer and thus cheaper to transport than coal from the Powder River Basin.

Legislation and regulations restricting surface mining could be a factor which will reduce production from the Powder River Basin. The Surface Mining Control and Reclamation Act of 1977 provides stringent guidelines governing surface mining of coal. These may well serve to restrict mining activities and reduce the amount of coal that could otherwise be recovered. Until implementation of regulations and state programs are established, it is not possible to predict what effect this Act will have on western coal developments. There is also concern that substantial delays could result from the complex environmental assessment, hearing and permit processes before mining could begin.

-4-

Financial considerations may also dictate against predicted development of Powder River Basin coal. Surface mining is capital intensive. Tremendous amounts of invested capital are needed just to begin operations. Mining firms may be very reluctant to invest in this region given the uncertainties surrounding the use and production of Powder River Basin coal.

Another potentially restrictive development is the recent proposal of the U.S. Department of Transportation that a 50-cent-per-ton surcharge be added to coal prices in order to help pay for (1) highway reconstruction at Appalachia to facilitate coal haulage and (2) rail-highway crossing improvements. If enacted into law, this would place a disproportionate burden on lower-priced western coal because of its relatively lower BTU-per-ton yield, and would affect the competitiveness price relationships with coal from other regions. Additional increases in western coal prices could be caused by the imposition of severance taxes by states. Western states are becoming much more sensitive to the depletion of coal reserves. Wyoming severance taxes are relatively low at present, but future tax increases would negate the competitive advantages of this coal-producing region.

Federal leasing policies will, of course, have some effect. Although the DSE recognizes these policies as a constraint and points out the high dependency of the Powder River Basin coal

-4-

on Federal lease expansion, the projections reflect an overly-optimistic outcome of Government policy in this area.

As stated, further development of Powder River Basin coal is strongly dependent upon its competitive relationship with coal with a higher BTU content or from regions closer to major markets. This relationship can be sharply altered by new technology in mining and in fuel-burning processes, by improvements in the availability of other energy sources and by new laws and regulations which are being developed and implemented. Any projections, especially those beyond 1985, should recognize these high potentials for diminution in production.

IMPACT OF RAIL CARRIERS

Inflated estimations of coal production from the Powder River Basin will cause a significant overstatement of impacts from coal transportation by rail carriers. Impacts attributed to rail operations in the Powder River Basin region are exaggerated throughout the DSE and presumably are high for other regions as well. Train capacity, gaseous emissions from combustion of locomotive fuel and other impacts are dependant on coal volume transported and the system for transportation. All of the above factors appear to have been calculated based on a unit train consisting of 100 cars. In actuality, most Burlington Northern unit trains are and will be comprised of 110 cars.

-7-

giving a train capacity of 11,000 tons. Ignoring for now differences in coal volume projections, the faulty assumption of a 100-car train leads to numerous erroneous conclusions. Track capacity, for example, is stated as the number of trains per day over a track segment before congestion occurs. Generally tonnage hauled is not considered. Thus, the amount of coal which could be transported over a given line segment per day would be greater in 110-car trains than in 100-car trains.

The DSE indicates that certain rail links may have shortfalls in capacity to haul future coal traffic. Table 5-42, Potentially Constrained Rail Links, page 5-10, specifically identifies two Burlington Northern routes which allegedly will be unable to handle expected traffic volumes. Because reference No. 77 was omitted from the resource list at the end of Chapter 5, we are unable to analyze the assumptions which lead to the "capacity shortfall" conclusion. The DSE does recognize on page 5-109 that the railroad industry has expressed willingness to expand link capacity to accommodate projected increases in coal traffic. Capacity on the Burlington Northern route east from Gillette to South Dakota border (through Clifton) is adequate for current traffic levels and additional track is planned for this segment in the near future. The second Burlington Northern route mentioned (from Francis Junction to Casper) is not on an existing or planned route for unit coal trains and, therefore, the expectation of a severe

capacity shortfall is puzzling. A portion of this route from Orts Junction to Wheatland, Wyoming is a coal route for which improvements to increase capacity are also planned in the near future. In light of the railroad industry's expressed willingness and plans to expand capacity of rail lines to meet projected coal traffic, Table 5-42 has only marginal significance. It would be more accurate and informative to include in this table information indicating track capacity after projected improvements have been made.

The DSE purports to compare energy consumed by various modes of transportation in moving coal from production facilities to other locations on the coal cycle. See pages 5-116 and 5-124. The estimations of operating energy expended by railroads and slurry pipelines are not only inaccurate but are completely out of proportion. The recent task report on coal slurry pipelines prepared by the Office of Technology Assessment predicts slurry pipeline operation would consume about 350 BTU per net ton-mile versus only 400 BTU for rail transportation of the same quantity. Office of Technology Assessment, 1978, A Technology Assessment of Coal Slurry Pipelines, Washington, D.C., Volume II, Part 2, page 205. Burlington Northern's own experience with unit coal train service indicates a figure slightly lower than 400 BTU per ton-mile. The DSE energy consumption of 470 BTU for rail carriers and 450 BTU for slurry pipelines are unsupportable.

-8-

The effect of these errors is cumulative. Overestimation of one aspect of rail operations creates error in the computation of other imparts and compounds errors that might be made in the letter case. This can be illustrated vividly by reviewing projections for air emissions from unit train operations. Fuel consumption is a major factor in determining gaseous emissions.

Paragraph H-11-13 Transportation, page H-34, states that typical train emissions have been estimated at 18.5 pounds of nitrogen oxides, 6.5 pounds of carbon monoxide, and 4.7 pounds of hydrocarbons per train mile of travel. Such casual use of national estimates does not provide a valid measure of locomotive emissions for a specific region. Fuel consumption and gaseous emissions are related to train speed, track grade, train load and many other operating conditions. This is particularly misleading when juxtaposed with the statement that transportation facilities are responsible for a large share of air pollutant emissions in many areas of the United States. This claim disregards the conclusion that rail carriers alone are responsible without help from automobiles, trucks, and other "transportation facilities."

A more reasonable and logical measure relates gaseous emissions to fuel consumption. The following factors were provided by the manufacturer of the locomotive most likely to be used in unit train service in the Powder River Basin region.

-10-

Unit of coal transported (50 gallons of fuel to transport 10,000 tons one mile by rail versus 0.02 gallons of fuel to transport 10,000 tons one mile by tug).

One transparently incorrect conclusion regarding environmental loadings from coal transportation is the assumption that coal slurry pipeline operations would not contribute to air emissions. See, for example, Table H-65 on page H-84 and H-89 on page H-102. Although a pipeline is powered by electricity and may not visibly produce emissions along its line, generation of that electricity does cause air emissions. Moreover, these emissions are localized around power generation facilities. Failure to include emissions from electricity generation necessitated by slurry pipeline operation, distort environmental impacts of the various modes of transportation.

Based on those factors identified above, all estimates in this DSE of air emissions from transportation as they relate to the Powder River Basin are suspect and should be given little weight. Regarding rail carriers, emission factors from locomotive combustion are inaccurate; fuel consumption estimates are contradictory, unit train length was shortened and total coal to be transported is excessive. The bottom line is not a "worst case" estimate of impact, but a totally improbable result.

-12-

$\text{SO}_x \quad 33.33 \text{ gm/lb. fuel}$
 $\text{CO} \quad 4.43 \text{ gm/lb. fuel}$
 $\text{HC} \quad 1.31 \text{ gm/lb. fuel}$

At a fuel consumption rate of 450 RTUs per ton-mile, gaseous emissions from "long haul rail" would be as follows:

Emission	Table H-22	
	Corrected (Long Haul Rail)	Long Haul Rail
NO_x	3.3 lbs./train mile	18.5 lbs./mile
CO	0.45 *	6.5 *
HC	0.13 *	4.7 *

It's safe to assume that all other estimates of emissions related to combustion of locomotive fuel in the DSE are similarly exaggerated.

Table H-22 is also subject to criticism because with very careful review it is highly misleading. It purports to compare air emissions from various modes of transportation but does not compare equal volumes of coal transported by each. Fuel consumption used for calculation of emissions is also inconsistent with relative energy consumption for the various modes stated on page H-116. It stretches credibility that one mode of transportation which allegedly consumes the same RTUs to transport a ton of coal as another mode (670 RTUs for rail and 460 RTUs for barges) suddenly consumes 2300 times the fuel volume per

* Calculation:

$$\frac{450 \text{ RTU}}{\text{Net ton mile}} \cdot \frac{11,000 \text{ net tons}}{\text{train}} \cdot \frac{1 \text{ lb. fuel}}{8 \text{ lbs. pollutant}} \cdot \frac{1 \text{ lb.}}{15 \text{ RTU}} = \frac{2200 \text{ gses}}{2700 \text{ gses}}$$

-11-

COAL SLURRY PIPELINES

The DSE makes only passing reference to slurry pipelines because certain constraints on slurry transportation are unresolved. This avoidance of slurry pipeline issues is hardly justifiable in a presentation which undertakes to foreseen such nebulous topics as coal demand and effects of coal demand in 1990. Slurry line proponents themselves represent that slurry line construction is a certainty in the early 1980's.

In light of the various environmental risks posed by slurry pipelines - especially the diversion of Wyoming's scarce water resource - careful treatment of these environmental impacts seems required.

COMMENTS FROM THE PERSPECTIVE OF AN OWNER OF WESTERN COAL PROPERTIES

Many years ago, the former Northern Pacific developed a surface mine at Colstrip, Montana, to provide coal for its steam locomotives. In 1971, the Company voluntarily initiated a reclamation program for the mine site although it was under no legal obligation to do so. This program, which involved approximately 1,000 acres of land, has now been completed and is generally regarded as being successful.

Burlington Northern supports reasonable Federal legislation and regulation which are designed to encourage energy

-13-

development inconsistent with sound environmental considerations. Wherever possible, we believe the States should be permitted to administer the specific programs within the national policy.

Burlington Northern does not mine its coal properties at the present time; instead through the years it has leased approximately one-half of its substitutional and lignite coal reserves to other companies under long-term contracts. The following comments are from the perspective of an owner of fee and mineral rights interests in Western coal that is intermingled with Federal coal properties.

President Carter's national energy plan, announced in April, 1977, listed seven National energy goals to be achieved by 1985 to end this Country's dependence upon foreign oil. The DHE, in response to the President's Plan and existing legislation, such as the Department of Energy Organization Act, the Surface Mining Control and Reclamation Act, and the Federal Coal Leasing Amendments Act of 1974, includes an elaborate regulatory framework for implementing a Federal coal leasing program to meet the expected and dramatic increased demand for principally low sulphur Western coal. The DHE also adds certain environmental criteria for excluding Federal lands from coal leasing which are not mandated by the numerous Federal laws listed on Table 1-1 of the DHE and it provides a comprehensive plan for Federal management of coal, including consideration and possible restrictions on where the coal may be sold.

-14-

The difficulty in centralizing the decision-making machinery in the Federal Government with respect to coal developments, which is admittedly a long-range process, and coal management can perhaps best be shown by two recent and conflicting developments. The problem in Iran today emphasizes the need to minimize the Nation's dependency upon imported oil. That unsettling event and others like it that may occur in the future cannot be predicted with certainty. Secondly, the newspapers have reported recently, including The Wall Street Journal on February 7, that the electric utility industry is not expanding as rapidly as had been expected. Among the reasons given for the lower expansion rate is the conservation of energy and the utilities' need for substantial new capital, environmental requirements, problems in obtaining rate increases, and new Federal requirements for scrubbers to meet air quality standards. These reports suggest that the demand for coal, especially low sulphur Western coal, will not be as great as stated in the DHE. These two developments, and others like them, prove how difficult it is to plan in detail the systematic development of coal production and marketing for the entire country.

We do not expect that Western coal production will increase as rapidly as the projections contained in the DHE. Therefore, we believe that a less elaborate regulatory scheme for Federal coal leasing can be developed which can be more responsive to the changing demand for Federal coal while at the same time

-15-

protecting the public's interest in competitive bidding, the environment, and expeditious development of Federal leases. We do not believe that it is necessary or advisable for the Government to inject itself into the marketplace for Western coal or to add another layer of discretionary environmental regulation on top of the existing environmental regulatory framework.

The initial step of the "preferred program," described in the DHE, consists of land use planning utilizing the planning systems already in existence in the Federal land management agencies. In this process, there would be a determination of the lands unsuitable for mining and a determination of lands considered more valuable for other uses. We believe it is imperative that the coal industry and private mineral interest owners be consulted during this planning process, in addition to the State Governments, because of the substantial effect the selection process will have on adjacent or contiguous private and State owned reserves. If Federal reserves are withdrawn from development without sufficient consideration of adjacent reserves or effects on those reserves, the remaining parcels may be fragmented or too small to be economically developed. For example, Burlington Northern has substantial ownership checkerboarded with Federal lands in Montana and North Dakota. Those reserves cannot be considered in many instances to be logical mining units without the adjacent Federal coal and the same

-16-

would be equally true for the Federal reserves if our coal is not developed. Thus unilateral Federal decision that the Federal coal is unsuitable for mining could make the mining of our coal uneconomic. To deny the opportunity to share in this decision-making process would be tantamount to confiscation of our property without compensation.

Congress in recent years has enacted several major pieces of legislation which are designed to protect the environment, not the least of which is the Surface Mining Control and Reclamation Act of 1977, which is currently acknowledged as being a comprehensive environmental protection plan. Since its passage, the issuance of a Federal coal lease does not guarantee the lessee the right to mine because it must still obtain a permit under the Act and comply with its stringent requirements. Burlington Northern recognizes that the Department of Interior in formulating the new program must comply with certain statutory provisions contained in that Act and other statutes which restrict its freedom of choice in specific areas. Nevertheless, several of the 24 criteria dealing with environmental matters contained in the DHE, any one of which can determine unavailability for leasing, have been added at the discretion of the Department of Interior. In addition to these criteria, there is a further selection process in which trade-offs on a site-specific basis are considered between coal production and other potential uses. Among the uses which would be chosen as being clearly superior

-17-

to coal production are prime reclamation sites or campgrounds. We question whether adding non-mandated environmental criteria is appropriate in view of the existing comprehensive statutory and regulatory safeguards. We also believe that several of the criteria should be modified to provide specific ascertainable standards for applying the criteria to minimize confusion and administrative delay.

Turning more specifically to certain of the 24 criteria, it is proposed that lands recommended or being studied for inclusion in National Recreation Areas, the National Park, National Trails, National Wildlife Refuge, National Wilderness Reservation and National Wild and Scenic Rivers System would be excluded from coal leasing. We believe that these lands should not be so arbitrarily excluded, or, alternatively, that the resource and applicable criteria should be considered as part of the normal study and planning process for such lands. The proposed environmental impact statement for any Federal leases within such areas should not be the principle vehicle for determining whether the Federal lands should be excluded from the leasing program. Further, the Company believes that the Federal land management agencies should exercise due diligence prior to negotiating and including additional Federal lands in the Wilderness system.

Similarly, the Company believes that it would be advisable to make the DEIS more specific to exclude scenic areas and historic lands and sites from coal leasing only if the areas are

actively under consideration for such classification. Criteria should be included to aid in determining which Federal lands are suitable for study as "natural areas," "National Natural Landmarks" and for determining "roost and concentration areas" for bald and golden eagles and falcon cliff nesting sites. The DEIS should also include defined terms for "high priority habitats" and "high Federal interest" for purposes of the criteria relating to migratory birds. Specific standards for determining areas deemed unsuitable for coal mining by Federal and State fish and wildlife agencies should be added to the DEIS.

With respect to the criteria relating to floodplains, the definition of "riverine" floodplains should be limited to streams which have a perennial flow of a specified minimum discharge. This would permit development of Federal lands which are dry or ephemeral streams since there would be no local dependence on the stream for irrigation, fisheries, water supply or navigation.

We believe that the criteria for establishing a buffer zone of Federal land adjacent to State lands designated by a State as being unsuitable for coal mining should be combined, and suitable guidelines added for selecting such lands.

Under existing mining reclamation laws and regulations, the mining of coal generally will represent only a temporary disturbance of the surface. Accordingly, we believe it is appropriate for the criteria set forth in the DEIS to include guidelines for identifying Federal lands having prime farmland soils and to

-18-

-19-

exclude only lands with soils which are not reclaimable that are actually under cultivation or planned for cultivation within a prescribed period of time. We believe that the portion of the criteria on alluvial valley floors relate to lands outside such valley floors which would materially damage the quality and quantity of surface and underground water systems supplying the alluvial valley floors. Such lands should be administered by a qualified organization such as the U.S.G.S. Water Resources Division, the Soil Conservation Service, private consulting concerns, or by means of joint studies by such entities.

The criteria relating to reclaimability provides that as information becomes available, Federal lands found not to be reclaimable pursuant to the Surface Mining Reclamation Act standards can be withdrawn. We believe that Federal lands should be judged by the data in existence at the time leases are entered into.

CONCLUSION

In summary, the draft environmental statement for the Federal coal management program as it relates to Western coal has greatly overestimated future production from the Powder River Basin region and perhaps from the entire Western region. Because of this overestimation of coal production and the use of erroneous fuel consumption and emission factors, the DEIS exaggerates environmental loadings and other impacts from rail transportation of Western coal.

-20-

The Federal coal management program itself should be redesigned to involve private landowners in the planning process at an earlier time than proposed. Environmental criteria used in site selection should be more clearly and definitively stated and limited to implementing existing statutes, preferably under the jurisdiction of one designated agency.

To provide a more accurate picture of Western coal production and transportation the final environmental statement should reflect the changes outlined above.

Respectfully submitted,

Thomas M. Hartman

Gentlemen:

Peabody Coal Company wishes to provide comment on the Draft Environmental Statement (DES) on the proposed Federal Coal Management Program published December 13, 1978. The comments contained herein are the result of the environmental, quality, legal, and corporate planning divisions of Peabody, as well as our Rocky Mountain Division staff.

While the Draft Environmental Statement appears to be adequate in most respects, Peabody Coal Company finds a number of deficiencies which are described in the attached chapter-by-chapter review.

In general, and with the corrections we note, we believe the statement is sufficient to support the implementation of the proposed program. We take this opportunity to comment on some aspects of the proposed coal management program which we believe are problematical, which we find troublesome and which may render the program unworkable in its present form.

The primary difficulties with the preferred program, from Peabody's point of view, include the following:

1. We believe the exclusion of early expressions of interest from potential bidders unnecessarily and needlessly complicates the leasing process of the affected agencies, with resulting manpower and budgetary implications. It will also contribute more time and expense which will be necessary under a more "focused" study effort.
2. The "unusability" and "resource trade-off" tests are not sufficiently objective and are not based in the absence of technical and market information which only industry sources can provide.

2

3. The proposed interest bidding process does not seem to account for relative differences in the costs of extraction, transportation, and conversion of various resources when comparing potential lease tracts.
4. The proposed application of the unsuitability test seems to violate the land-use planning requirements on existing leases. We believe that new leases would not be able to meet the same standards as existing leases seem to have a legal foundation.
5. The utilization of regional production goals has no rational relationship to coal market circumstances. We believe that market forces should be the driving force behind the proposed leasing system, but merely placing targets
6. The implementation of minimum economic recovery (MER) rates, as suggested in the DES, will require the Department to predetermine a rate of return on a prospective basis. As stipulated, the MER will apply to all coal seams which are collectively profitable. This would result in a loss of revenue and profit with market and productivity consequences.

Some of these program deficiencies can be corrected with a major revision of the preferred alternatives. We urge the Department to consider the following in which certain statutorily-mandated functions are carried out in a manner which is more compatible with the unsuitability tests prior to tract selection. We believe the Department should accept recommendations from the private sector to re-examine, prior to completion of the land-use planning phase, that all potential coal areas for which detailed coal-related environmental information is available are evaluated to determine the suitability or unsuitability of prospective lease areas. In addition, more detailed analysis and more detailed materials are offered the possibility of overcoming or mitigating some of the unsuitability standards which are proposed.

Along with the refinements suggested in our detailed comments, these two changes -- both well within the permissible limit of current law -- would go a long way toward

3

making the preferred program workable. Without the suggested change in sequence, and the corrections noted, we cannot see how the preferred program can be implemented without fulfilling the President's directive to "manage the coal leasing program to assure that it can respond to the public protection goals."

We request your promptity to consider the proposed Federal Coal Management Program and urge your careful consideration of the comments and recommendations contained herein.

Very truly yours,
Harrison Lorch

**CHAPTER ONE: INTRODUCTION AND BACKGROUND
ON THE COAL MANAGEMENT PROGRAM**

Peabody has found the background chapter to be historically correct, for the most part. The background information is presented in a succinct and readable form, so that readers not familiar with federal coal management can gain an elementary understanding of the program. The list of "Federal Laws Affecting Coal Development and Energy Conservation" (Table 1-5, page 1-17) does not list the Federal Land Policy and Management Act (FLPMA) or the Surface Mining Control and Reclamation Act (SMCRA), though both statutes are mentioned elsewhere in the statement.

Section 1.3.2 (Interagency Relationships in Federal Coal Management) fails to mention the role of the Department of Justice, which under the Federal Coal Leasing Amendments Act (FCLA) must approve each coal lease, prior to issuance. The Department of Justice is also obligated by statute (Section 8 of FCLAA) to report annually on the status of competition in the coal industry, with particular emphasis on federal coal leasing. An argument can be made that the absence of new leasing or unnecessary constraints on new leasing would have significant anti-competitive implications. The statement fails to discuss this issue, and does not mention the studies and approvals required by law which deal with the anti-trust questions involved in any federal coal management program.

3

and the time required to synthesize the collected data and complete engineering, it will take approximately eighteen (18) months, at a bare minimum, to prepare a mine plan for submission to the government.

The statement also estimates only one year for mine plan approval by the various regulatory authorities. The implication is that only "in some cases" does the approval process consume more than one year. Past experience has shown that approval within one year has been the rare exception rather than the rule. An average approval time of eighteen (18) months might be more realistic.

The estimate of time consumed between approval and "full operation" of a new mine is given as two (2) to three (3) years. This period of time may be reasonable if one is estimating the start of production, but it will require another two (2) or three (3) years from initial production to achieve the full planned level of production, especially for the larger Western mines.

A more realistic time frame from lease issuance to full production might be seven (7) to ten (10) years, rather than the four (4) to seven (7) years provided in the statement. The recent study on federal leasing conducted by the General Accounting Office* (GAO) provides an estimate of four (4) to fifteen (15) years from leases to full production.

Any miscalculations in the average time required to

*G.O. Coal Development: Promises - Uncertainties, U.S. General Accounting Office, September 22, 1977, page 4.11

**CHAPTER TWO: THE NATIONAL ROLE OF WESTERN
AND FEDERAL COAL**

The discussion of the role of Western, including federal, coal is reasonably objective, providing some data on the effects of various modes of federal coal management (i.e., issuing PMLAs, production from existing leases, etc.). Peabody has only a few specific comments to offer.

The tables on pages 2-28 and 2-29 (Tables 2-17 and 2-18) providing production and consumption projections for Western coal do not match. For example, in the 1985 high case, consumption of Western coal is estimated at 519.9 million tons, while production in that instance is estimated at only 507.3 million tons. We assume the difference is based on the fact that the production figures do not include the states of Arizona, Washington and Alaska. Perhaps the definition of "Western coal" in the consumption table (Table 2-18) should be clarified in the final environmental impact statement.

One of the more serious difficulties in the chapter concerns the estimates of time required to bring a lease into full production (2.8.1, page 2-43). The statement estimates that mine plan development will take from one to three years. In fact, new requirements under SMCRA may require at least one full year of data collection before an application can be submitted. Given seasonal work difficulties,

4

bring new federal coal leases into the nation's energy matrix will obviously skew the production estimates listed in Chapter Two (Tables 2-20 and 2-21) and the impacts of coal production provided in Chapter Five of the statement.

We strongly suggest a revision of the time estimates of the post-leasing activities.

**CHAPTER THREE: PREPARED COAL MANAGEMENT
AND ALTERNATIVES**

General Comments

In general, Peabody finds the Draft Environmental Statement (DES) and Chapter Three, in particular, to be a succinct description of the preferred program and its alternatives. Drafters should be complimented on a well-organized exposition of the proposed program.

The most serious failure of the program description is the lack of detail concerning the actual process for ranking and selecting lease tracts (3.1.1.1) after the land-use planning activities have been completed. Another shortcoming is the absence of definition concerning the establishment of maximum economic recovery requirements (3.1.1.2). As a result of these and other omissions, potential bidders are provided insufficient information about the circumstances under which new federal coal leases may be offered.

The statement does not provide estimates of the time required to fulfill each of the various steps in the leasing process. We are assuming that because of the new land-use planning process proposed by the Bureau of Land Management,

the implementation of a new leasing system, described as the preferred alternative, will take a considerable amount of time. There are at least two (2) environmental impact statements in the process: one for land use, and one for activity planning. With the other steps involved, the entire process could consume years, rather than months. If the leasing process is as lengthy as it would seem from the present description, then the impacts associated with the new system for the 1985-1990 time frame may be overestimated. We hope the final statement will provide an indication of the time frames involved in each step of the proposed process for leasing coal.

Specific Comments

3.1.1 - The Preferred Program

Peabody finds the major elements of the preferred Federal Coal Management Program appropriately described, though there is little indication as to who would carry out the functions listed in the flow chart (Figure 3-1, page 3-1). More information about which offices (BLM state offices, BLM Washington office, Secretary's office, etc.) are to carry out each of the major functions would help reviewers better understand the procedural aspects of the program.

3.1.1.1 - Planning System

The principal weakness of the discussion on land-use planning is the absence of definition concerning the screening process for coal leasing. There is no serious misunderstanding about lands not containing coal reserves with "high to moderate development potential" or lands declared unsuitable

for leasing under the provisions of SMCRA, though we have serious reservations about the latter. However, the statement that areas which "are considered to be of higher value for other uses as determined by multiple-use, resource management trade-off decisions" would be eliminated from further consideration for leasing does not provide an understanding of either the criteria or the mechanism by which comparative land-use values are to be judged. Clearly, economic considerations are not prominent in the trade-off, since much of the federal land containing coal has no other potential use rivaling coal development on economic grounds. Hence, the "higher value" must refer to environmental, social, or aesthetic considerations which are not spelled out in the DSE.

Unsuitability

Detailed comments on the unsuitability criteria proposed in Chapter Three will require more time than is now afforded, and Peabody Coal Company will await formal rulemaking proceedings to provide such comment.

In a general sense, however, we find the criteria seem to exceed the intent of Congress (SMCRA). Indeed, if tables in Chapter Five (page 5-154) are any indication, the criteria would prohibit coal leasing on an almost wholesale basis.

While there is some merit in reviewing potential lease areas for "unsuitability" before the lease is executed, it should be noted that relatively little technical information is available until a mine plan is actually developed. Hence,

until the latter stage, there is little or no available information which could or would form the base for mitigation of harmful effects of mining -- mitigation which would render an area entirely suitable for such activity, even though pre-lease information might lead to the opposite conclusion.

More importantly, by placing the unsuitability test in sequence prior to an expression of area interest on the part of industry, and, for that matter, even prior to any preliminary tract selection by the Department, the workload is grossly and unnecessarily compounded, especially with the detailed tests which would be required by the use of the proposed criteria. Moreover, the unsuitability test may well be resampled during the mine plan review phase after the lease is issued. Hence, the earlier unsuitability review could be duplicative.

Activity Planning

In the paragraphs describing Activity Planning, there are no criteria provided by which preliminary tracts would actually be selected. The statement says that the selection process would be "based primarily on considerations of technical coal date resource conservation considerations and surface ownership patterns." Further details are provided in Section 3.2.2.1, but in neither instance does the statement indicate how the considerations would be used to establish and delineate specific tracts. For example, we cannot determine whether "consideration" of land ownership patterns refers to Interior's stated policy of leasing only in areas where the government (or mining companies) owns

the surface, or whether it refers to leasing to form logical units for mining in conjunction with fee coal or state-leased coal.

While Section 3.2.2 does indicate that comments will be sought on the relative merits of individual tracts under consideration for leasing, there is little indication of the weight to be given to various tract characteristics (i.e., low sulfur content vs. wildlife habitat).

Section 3.2.2 also implies an effort to disperse rather than concentrate leasing. The statement is made that "selection of the first tract (in an area) might preclude selection, or lower the priority of, other highly ranked tracts." The long-term effects of a policy of dispersing coal development in the West could increase coal transportation costs, create socioeconomic difficulties, and exacerbate environmental problems (longer spur lines, duplicated service and support facilities). The implications of such a policy deserve additional analysis.

The process of ranking potential tracts on a region-wide basis "and not separately within each land use planning area," assumes that all land-use planning areas within the region have completed plans, with all the required NEPA statements, etc. Ranking and comparing tracts in a region is relatively meaningless if significant number of tracts (not otherwise declared unsuitable) are unavailable because

the planning is incomplete or inadequate. An early indication of market interest could be used to help schedule planning activities on the public lands. The preferred alternative precludes such indications until well after planning is presumed complete.

3.1.1.2 - Regional Production Targets

Perhaps the most troublesome aspect of the statement, and the preferred program itself, is the reliance on regional production targets as the driving mechanism for the program. The establishment of targets in the so-called "major production regions" implies that the coal market is cordoned into neat, autonomous market areas. In reality, there are many instances when coal from the West must compete with Midwestern and Appalachian coal, and even coal from Australia and South Africa. To discuss, in advance, as the preferred alternative proposes, that certain levels of production are desirable in each region simply flies in the face of reality. It will be disruptive in the coal market, impose additional, artificial costs in an already marginal industry, and it would seem to raise serious questions about the federal role in determining the level of economic activity in the various states. None of these issues is raised in the statement.

Moreover, even presuming the efficacy of setting regional production targets, it is not clear that such targets would in fact serve as the driving mechanism for federal coal leasing.

Not only does the statement indicate that the targets set by the Department of Energy would be subject to adjustment by Interinter (3.1.1.2), but that such targets could be adjusted according to the available tracts deemed to be suitable for leasing. Section 3.2.3 states that "the regional ranking and selection process should consistently indicate the optimum tracts for the desired level of development..."

Previously offered, but unissued, tracts are an obvious indication of market miscalculation and the need to adjust production targets. But the statement implies that, in many cases, the targets will be adjusted to meet the number of available, suitable leases. If that is the case, then the production targets serve only as a planning guide, not as the piston for coal lease sales. In any case, the role of the regional production targets would seem to require further description in the final impact statement.

Maximum Economic Recovery

The DES provides scant information about the maximum economic recovery (MER) requirements. Section 3.1.1.3 states only that such requirements must be set prior to a lease sale, implying that MER rates are set on a piecemeal, lease-by-lease basis. Section 3.3.6 indicates the Secretary has previously decided to require that MER rates be set in a way that "all coal seams which are collectively profitable must be mined, taking into consideration social and economic costs." While we understand the need to eliminate so-called

"high-grading" of coal seams, the determination of collective profitability of multiple seams is not a realistic possibility at the pre-lease stage. At that point, no selling price has been established, and mining cost calculations must await detailed engineering after a lease has been issued.

In its present form, all MER calculations must be established using hypothetical mining methods, cost calculations and selling prices. In "averaging" the return per ton, the Department is, in essence, establishing a "profit-control" system. We suggest further consideration of the so-called prudent man test as a means of preventing "high-grading" and assuming conservation of the resources.

3.1.1.3 - Management of Existing Leases

The DES states that the new land-use planning requirements which are to be applied to new leases would also be applicable to existing non-producing leases, "subject to valid existing rights."

We have reason to doubt the legal validity of imposing land-use planning requirements such as those described in Chapter Three on existing leases. The issuance of a lease would seem to be a determination of a land use; alternative and preemptive uses determined at a later date would seem to violate the lesseeholder's right, as long as the lease remained valid. We suggest that the final EIS qualify applications of new planning requirements to existing leases, or at least shed light on the legal vagaries involved.

Discussion of the Alternatives

The statement lists six (6) alternatives in addition to the preferred alternatives:

- 3.1.2 - No Federal Leasing
- 3.1.3 - Process Outstanding Preference Right Applications (OPRAs)
- 3.1.4 - Emergency Leasing
- 3.1.5 - Lease to Satisfy Industry's Indications of Need
- 3.1.6 - State Determination of Leasing Levels
- 3.1.7 - Leasing to Meet DES Production Goals

In general, the description of the various alternatives is adequate. However, there is little or no discussion of the legal basis for ranking PRAAs (3.1.3) or limiting issuance of PRAAs to the so-called "bypass" or "existing operations" criteria (3.1.4).

Also, the description of Industry's Indications of Need alternative (OPRAA 3.1) states that such a system could lead to excessive leasing (more leasing than is needed by the market) because of speculative interest in leases. The description fails to add that current requirements for diligent development preclude the speculative holding of leases.

We also call into question the statement on page 3-22 that "industry nominations ... resolve the question of leasing levels" in the alternative proposal to use industry's indications of need as the mechanism for coal leasing. Nominations serve only as a means of locating potential lease tracts and providing a preliminary indication of market demand. In

such a system, the actual acceptance of successful bids sets the level of leasing, not the act of nominating potential tracts.

3.2.4.4 - Intercept bidding

Intercept bidding, as described, provides for the comparative analysis of tracts on the basis of the amount bid per ton of coal, with some weight given for differences in coal quality. However, the system, as described, does not account for differences in environmental circumstances or differences in the costs of extraction, processing, transportation, and reclamation, since detailed engineering does not occur until after lease issuance. As a result, no true comparison between tracts is possible prior to leasing.

CHAPTER FOUR: DESCRIPTION OF REGIONAL ENVIRONMENTS

The description of the various regional environments in which federal coal exists are understandably general. We are not certain the descriptions are especially meaningful for decision-making purposes, but it is understood that additional studies of a more site-specific (regional) nature would be completed before leasing commences.

We have no objections or specific comments about Chapter Four except the following:

The tables showing population and economic characteristics for respective regions (Tables 4-1 thru 4-12) list employment in the various sectors in terms of thousands of employees. This appears to be a typographical error which should be corrected.

there is a lack of adequate data to qualify the impacts; and (3) those where there is a lack of consistent regional baseline data. The lack of available information points out the difficult task of developing and implementing the Federal Coal Management Program as outlined in the draft statement. It appears the lack of data may require the coal leasing and coal operating companies to delay planning until the federal agencies have completed their studies.

5.1.2 - Physical Impacts and 5.1.2.6 - Water Impacts

As a result of the lack of specificity in the draft statement, it is difficult -- if not impossible -- to evaluate this section. The terms are very general in nature, and it is difficult to assess whether the tables are adequate or meaningful.

-- Table 5-4, page 5-14, "Comparison of Potential Primary Productivity Loss." This table needs clarification and references. In addition, Tables 5-42, "Nitrogen Oxide Emissions," and 5-43, "Hydrocarbon Emissions," are difficult to interpret. A statement should outline the criteria on which the emission factors were generated and what kind of emissions would impact what areas.

-- Table 5-45, "Potential Threats to Endangered Species of Coal Regions," is extremely misleading. The column labeled "Most Serious Threat" to the endangered species is purely conjectural unless better referenced. It appears the most serious threat specifically related to strip mining is unfounded. For example, it states that mining is

It would be helpful if the drafters provided references for the demographic data in this chapter. Perhaps the most useful data in this chapter are the socioeconomic characteristics, especially employment. Yet without references, reviewers cannot tell how timely or accurate the data is. It is apparent that some of the data, especially coal mining employment, is not current, at least for the Powder River Coal Region.

CHAPTER FIVE: REGIONAL IMPACTS OF FEDERAL COAL MANAGEMENT PROGRAM ALTERNATIVES

General Comments

Chapter Five, Regional Impacts, is general in nature and very non-site-specific. As a result, the usefulness of the chapter relative to future leases development is limited.

5.1.2 - Assumption and Analysis Guidelines

The assumptions used in the analysis (5.1.2.1) are not realistic. The Department has assumed there will be no delays specifically related to compliance and implementation of current best practicable pollution control technology related to air and water pollutants. The assumption is invalid since the terms used, BPP and BACT, as used in the statement, have not been adequately defined.

5.1.2 - Impact Estimation

This particular section divides impacts into three (3) general categories: (1) those where knowledge of the specific location can be stated in specific terms; (2) those where

the most serious threat to the gray bat. This is unfounded, especially when the animal's normal habitat is limestone caves. Another endangered species, the black-footed ferret, is said to be threatened by strip mining. In fact, farming and farming practices are considered to be the principal cause for the degradation of the habitat. This also applies to the Utah prairie dog. Thus, Table 5-46 describes severe negative impacts as if they are solely resulting from strip mining.

-- Table 5-73, "Lands Unsuitable Field Test Summary." Without knowing tracts of land to be studied, it is difficult to determine the total impact of the suitability criteria on the total coal resource base. It appears, if these studies are representative, that most of the coal would be removed from federal coal leasing. It also appears, without an extensive environmental data base, that 10 percent of the coal in Montana would not be considered when using the "historic lands" criteria. In Utah, 64.8 percent would be removed from consideration as a result of "high interest habitats." Based on these conclusions from four study areas, and if they are to be considered representative, significant amounts of coal would be removed from development.

As a general note on Chapter Five, the impact section does not describe beneficial impacts from mine development;

and does not discuss the economic benefits received from coal severance tax money. In addition, the statement should also describe the positive economic benefits of developing coal tracts within a particular region.

CHAPTER SIX: MITIGATION OF MAJOR ADVERSE IMPACTS

Peabody has found a few errors and has a number of comments about the chapter on mitigation.

The first introductory paragraph on page 4-1 contains the statement that "The impact analysis in the previous chapter (Chapter Five) does not include those mitigating measures required by law or regulation" (emphasis added). As written, this is inconsistent with statements in Chapter Five, and we assume that a typographical error has been made. We believe the word "not" in the above sentence should be deleted.

We take issue with the contention on page 4-2 (second full paragraph) that "protective or mitigative measures ... will provide assurance that Federal coal development decisions which are made will be subject to less delay and uncertainty." The review process for potential leases and mine plan applications contains a number of opportunities for public participation -- opportunities which occur later in the process. Many of the potential problems may not come to light until then, and there is no guarantee that early consideration of possible mitigation will reduce the timespan of the process.

While we understand the interest in reviewing and

reassessing regional production goals on a continual basis (page 4-3, second paragraph), such continual reassessment is rendered almost meaningless because of the lengthy response time in the proposed system (up to 15 years). As in Chapter Three, the implication is left that the regional production goals will be reassessed solely on the basis of the prospective number of suitable tracts available, not on the basis of the need for leasing. "The leasing of an excess number of tracts" is not necessarily harmful, since due diligence requirements necessitate an early indication of the development prospects of each lease. Lessees not able to meet the diligence requirements are relinquished with no harm to the environment. This point should be expressed, or at least the statement about "excess" leasing should be clarified in the final statement.

The statement is made that "site-specific analysis of each tract would be conducted prior to ranking and an examination would be made for each selected tract to develop lease stipulations if necessary" (emphasis added) (page 4-3, column two, second paragraph). Given the level of protection afforded by SMCRA in setting mine permit requirements, and the fact that many of the "ranked" tracts may not be finally offered for lease, detailed analysis, prior to ranking, may be a waste of federal resources. At that stage, much of the work will be of no consequence and will unnecessarily contribute to a monumental workload problem for the agencies involved.

6.3.2 - Socioeconomic Impact Mitigation

The statement fails to adequately point out the full range of assistance available to impacted communities. Of particular consequence are the changes in the formula for distributing federal royalty payments; increases in state severance taxes; impact aid under the Federal Land Policy and Management Act (FLPMA); and payments in-lieu-of-taxes. Several, but not all, of the above programs are mentioned (6.3.2.9), but there is no quantification of the assistance available, or potentially available, to communities impacted by federal coal development. We believe the data will show a significant amount of financial aid is readily available which could reduce the socioeconomic impacts involved. In any case, further information should be provided.

CHAPTER SEVEN: LONG-TERM ENVIRONMENTAL CONSEQUENCES OF FEDERAL COAL MANAGEMENT PROGRAM ALTERNATIVES

It appears that the description of the long-term effects of the preferred program and its alternatives tends to disregard the mitigative effects of recent environmental protection statutes. For example, the possible disruptions to the hydrologic balance mentioned in the statement (page 7-2, first column, third paragraph) would not appear to be reasonable in view of the provisions of SMCRA which prohibit disruption of the hydrologic balance.

Adverse water quality impacts (page 7-2, second column, second paragraph) will be greatly mitigated by waste treatment

and erosion control requirements under the Clean Water Act and SMCRA. The statement seems to belie the effects of these statutes.

Basic coal mining operations do not require large quantities of water, as is implied on page 7-2 (second column, first paragraph). Some water is used in coal processing facilities, but the only water used at some mines is for dust suppression and sanitary needs. Frequently, pit water provides most of the water requirements for a mining operation.

7.1.1.4 - Paleontological Resources

Criteria and guidelines for the protection and recovery of paleontological resources have not been released; therefore, the public is unable to evaluate those resources and potential impacts.

7.1.1.2 - Ecological Resources

The statement is made that "Loss of habitat and reductions in population would occur as unavoidable consequences during the mining and use of coal." Wildlife studies conducted the past five years at Peabody's Big Sky Mine have not shown a reduction in population due to the mining activity. The size of population appears to be more dependent on climatic changes and its effect on vegetation. In addition, additional acreage of certain habitat types benefited to wildlife (i.e., reclamation areas and water impoundments) may be established.

The statement also says that "blasting, construction, and other noises associated with the mining activity would

be unavoidable and would frighten away some wildlife species." Wildlife species are adaptable to noise, as is man. Although animals may initially scatter at the time of a blast, studies have shown that a creature will generally remain within its territorial range.

Elimination of surface water bodies would adversely affect waterfowl, but changes made by the mining activity can also be beneficial to waterfowl. Big Sky Mine has increased the waterfowl population in the area with the creation of shallow reclamation ponds. In essence, temporary disruption may occur, but long-term benefits could ensue. The statement should reflect this possibility.

The statement remarks that "In most cases, however, the diversity, density, and composition of the new populations would be altered from previous conditions." Diversity, density, and composition are dynamic aspects of wildlife populations, and therefore constantly changing. Just because one of these aspects, or all three, may be altered to some degree does not necessarily mean that the impact is adverse.

Table 7-3 should include references. For example, we cannot determine whether the table represents potential productivity on an annual basis or in total. Some of the estimates for reclaimed land in Table 7-3 are as much as ten times greater than current empirical data would show for unmined land. For example:

	Forest	Range
Powder River (reclaimed)	0.44 tons/acre	5.5 tons/acre
(as represented in Table 7-3)		

Big Sky (reference area)
(Peabody Coal Co.)

The variation may occur because the Big Sky data shows productivity on an annual basis.

7.3.4 - Wildlife

In this section, revegetation of range in Texas is stated as taking three years, where in Section 7.3.3 the same revegetation in Texas is stated as taking one year.

— Table 7-5. When comparing this table with appendix

D-1, certain incongruities occur:

Powder River	1 game mammal/13 acres (7-5)
	1 game mammal/33 acres (D-1)
Green River	1 game mammal/13 acres (7-5)
	1 game mammal/48-250 acres (D-1)
Fort Union	1 predator/500 acres (7-5)
	1 predator/100 acres (D-1)
Denver-Eaton Mesa	1 game bird/5 acres (7-5)
	1 game bird/1 acre (D-1)
Denver-Eaton Mesa	13.7 acres/animal unit (7-5)
	1.5 acres/animal unit (D-1)

In reviewing the two sets of data, Table 7-5 and Appendix D-1 seem to imply that reclaimed land in the Powder River, Green River, and Fort Union Regions will support three (3) to nineteen (19) times the relative wildlife population said to exist naturally, while the Denver-Eaton Mesa will support a wildlife population five (5) to nine (9) times less than exist naturally. Explanation of this extreme variance is needed.

Washington, D.C. 20540

The Environmental Information Center submits the enclosed comments in response to the Draft Environmental Impact Statement Federal Coal Management Program. We are a citizens organization, statewide membership of Montana citizens concerned with the future of Montana's coal resources. We are composed of individuals who are members of the Environmental Information Center (EIC), and who have considerable experience in public energy issues, ranging from energy conservation and regulation of all phases of mining in Montana. Our comments range from the philosophical to the specific, reflecting a variety of diverse points. Charles van Hee, Public Law and Science Resident, coordinated preparation of comments.

Please accept our comments on our state's effort to represent the findings of our constituents to the Secretary of the Interior. We also are sincere in our efforts to further open the door for public participation in preparing the EIS and comment on Federal and State energy policies, now and in the future.

We look forward in working with the Federal coal management agencies in the future.

Very truly yours,
Dale Lundquist
Dee Blaustein
Staff Director

Programmatic comments

This comment by the Federal government to propose a management plan for S.E. centralized coal is similar to previous plans although largely different in scope. The intent of the proposed plan is to implement the policy of the National Energy Policy Development Act of 1974 (NEPDA) which is that the goal is to propose a leasing plan rather than discuss impacts of alternatives.

Montana citizens have, for the last decade, expressed many concerns for the State's agricultural/environmental future relative to coal extraction and conservation. Public opinion polls have demonstrated a reluctance to accept coal mining as a major economic factor in the State. Montanans have always predicated upon strict environmental protection, as accepted by the public, as a condition for continued coal mining. It is believed that the nation's highest state environmental law would serve to mitigate social problems. To date, the relevant environmental laws in Montana have been diminished, and the enforcement of these laws is in its infancy.

An essential tool of resource management that is not operational, but which is critical to the future, is the rural, agricultural Powder River basin area, have never been confronted with the rapid changes in land use, economics, and politics that result from large scale mining. The state as a whole has never been confronted with the loss of a major segment of its economy. The state has a unique structure capable of recognizing the resulting induced impacts of an enormous industrial project on the rural areas. While it is true that there is little authority or the experience available to govern such activity, the state has the ability to learn from other states. While the mining experience necessary to deal with large scale mining activities results in a large amount of information, the information available to the state to ready this situation has not yet been available. This circumstance in Montana supports the finding of the Environmental Impact Statement (EIS) of the Powder River Basin Project (pp. 2.1.3), and also in the National Coal Policy Project report not considered in your document.

The Montana experience, thus far, in dealing with the natural/industrial relationship, indicates that industrial activities may be impulsive but it is far short of comprehensive problem solving. An array of federal and incentive research programs research has been carried out at great expense, but little of this research has been directed toward the direction of or with funding from energy corporations and providing opportunities for the public to participate in the process. These inquiries have been supported by agencies such as EPA, but results are often not published in a manner that is accessible to the public. Research is piecemeal, poorly funded, or generally lacking in political support. There is as yet no federal agency charged with the responsibility of coal industry research concerning coal mining in Montana. The Montana mine reclamation law and the new Federal reclamation law in Montana, provide the framework for the environmental concerns concerning reclamation in the mineral west. To date, the extent and severity of impacts upon the soils, vegetation, air, water, and wildlife have not been clearly

deteriorated and may never be within our lifetimes. The suspension of mitigation in an extended exercise is logic under these conditions.

The issue at hand, which encompasses these observations of coal impact problems, is the federal government's apparent intent to further expand coal mining activities in Montana. This includes the national need for coal, which may be valid, but which becomes more dubious with such federal/industry efforts to quantify such need. Only through a careful assessment of the national need for coal, and the need to receive, should specific production areas be identified.

The rapid expansion of new mining activities in Montana will present significant problems to the state, the local communities, the public welfare and the Montana environment that may have to be mitigated. Increased coal production is made with the utmost care. It is also conceivable that the environmental impacts of increased mining activities will be disregarded or severely recognized in the federal planning process. A decision for the remedy in impact assessment still dictates recognition of the following:

- Successful reclamation of land and water to uncertain future fuel export mitigation are uncertain, and the heat use of those fuels is uncertain.
- Community and area level planning is currently incomplete and may be inaccurate.
- Accurate and timely identification of critical impacts is limited and may be inaccurate.
- Local human capabilities and natural ecosystems will be permanently changed, and the direction of that change is unpredictable and unknown.
- Continued expansion of large corporate energy activities in rural areas will increase the potential for conflicts between energy companies from public/agricultural/environmental concerns and toward greater protection of corporate territories.

It is recommended that environmental and social impacts be estimated in the process of siting new mining activities in Montana. The current experimental nature of mitigation of mining impacts in the watershed areas of the state, and the lack of scientific knowledge of mining activities and their effects in the only feasible strategy for reducing uncertainties, discussions in Section 3.4.1. This strategy for western coal mining editing is also covered in more detail in a paper presented to the House Resources Committee by the Dept. of Interior, "The Future of Coal," August 18, 1978, which should be studied by the Dept. of Interior.

In Section 3.4.1, "Decentralizing Federal Leases," several problems are pointed out regarding this strategy. In particular, the concentration of coal and air pollution. It would be beneficial to concentrate these issues as follows:

Federal Coal Leasing Policy Guidelines: "Where", "When", and "How"
Secty., Robert E. and Charles van Hook, Chairman of Energy and the Public Lands, Inc. Univ. of Colo., Fort Collins, Colo., Aug. 14, 1978.

Imports so that a more economical and effective program of monitoring and abatement could be utilized. The construction of one or only a few high quality water treatment facilities, for use by several companies, would be more cost effective than individual plant construction. Similarly, the joint use of coal abatement equipment and materials would be more cost effective than individual plant construction. Finally, the use of Montana involves serious violations of the regulations at every mining site, and the mining industry is sufficiently sophisticated to adequately assess the environmental impacts of its mining activities. The mining industry (with financial support from the federal government) will be able to identify the most effective methods of mitigating the effects of mining activities. Concentration of air pollution sources is the only way to effectively mitigate the effects of mining activities through monitoring and equitable enforcement, given the existing statutory constraints.

One inherent benefit in decentralizing development is that water and air pollution control efforts will confine damage to fewer air and water bodies.

Another problem which the BMS explores (in Section 3.4.1) would be related to concentration of Federal Leasing is hyperurbanization. It is unclear what kind of real estate could occur in the Northern Great Plains, where areas of Montana are considered to be underpopulated, regardless of what type of management plan is utilized. The coal industry has been instrumental in the growth of small towns in the Northern Great Plains, and the large number of company employees. The state and counties are responsible for the maintenance of these towns, and the cost of maintaining them is high. The outcome of hyperurbanization in this area is questionable and it is recommended that research is trying to accommodate it in a cost-effective manner. It is also recommended that the BMS should carefully consider the impacts of new population to the immediate areas. Furthermore, the BMS should consider the possibility of creating a town or towns near these areas, an efficient service center or resort to several other locations. It is also recommended that the BMS consider the possibility that the leasing strategy encourage the use of both oil/gas and the new form, oil shale, and that it make every possible effort to disseminate the information to the public about the benefits of oil shale. It is also necessary that both the leasing strategy and any allocation of funds for reclamation and mitigation be distributed among the towns and railroads through this rural agricultural area. It must be recognized that the BMS has the responsibility to provide services to over one hundred and fifty mines. These concepts require coordination of multiple agencies and programs. In a manner which will allow both removal of undesirable activities and protection of desired activities, the federal role in coal management and support structures are not comprehensive, the federal role in coal management is limited.

It is important that major companies are planning to open mining operations on non-federal coal with the intention of later forcing a Federal lease on the same federal coal. Such activities will probably have negative effects on the environment and the economy of the area if the Federal coal is ultimately obtained. Federal coal management must be aware of the potential for such operations to affect in protest the welfare of the general public as well as the land, air, and water.

If the federal coal management program cannot control all coal mining in Montana, then it will be rendered largely ineffective, perhaps to the point of being irrelevant to the economic and diplomatic for the nation as well as for Montana.

It is recognized that planning conserving energy and mining will not answer the shortcomings in reclamation experience, impact mitigation and environmental protection. However, the combination of federal, state, local, and federal political changes (all discussed earlier), and the continued development of energy alternatives, will reduce the degree of mining activity may be perceived as a national priority area to some degree and in some manner. Dispersing impacts throughout the region will be more difficult than consolidating impacts in one area. The whole region will be damaged in a manner which will be more difficult for the state to deal with.

The activities of concentrated or cluster development as a framework for mitigating negative impacts can also offer insight into the extra cost and effort necessary to deal with dispersed impacts. The extra cost and effort necessary to deal with concentrated or clustered mining in an area such as Eastern Montana.

1. A mining cluster will support a new town which is designed solely for the purpose of supporting mining activities.
 - a. The new town provides utility services, social services, residential, industrial, educational and recreational opportunities, and fire and police protection specifically oriented to a mining community.
 - b. Local utilities, power supply, sewage treatment, street maintenance, transportation, and communications can be arranged more efficiently and cheaply, with less impact.
 - c. Local mining, land use planning, government, educational facilities, and health facilities can be designed for the unique population and its needs.
2. The social and political activities in this town can serve the needs and reflect the needs of the mining oriented population without necessarily conflict with and disruption of other populations with different interests and needs.
3. The new town can be serviced with one highway, one railway, one port, and one airport, which will greatly reduce the cost of greatly reducing the costs and use of land in duplicating these facilities.
4. The monitoring, source identification, and abatement of air pollution can be done more economically with more sophisticated equipment and with permanent trained personnel. Enforcement is

more equitable and air quality problems will be confined if enforcement is not effective.

The monitoring, source identification, and abatement of surface water quality can be accomplished with use of a few treatment/reclamation facilities located in the mining cluster. The water quality problems will be confined to one drainage net if emissions and activities are not effective.

The mining cluster concept becomes more confinement can be served effectively by special wildlife management efforts necessary to preserve, relocate, or reestablish wildlife species that are affected by mining.

Ground water may be monitored more efficiently in a mining cluster, at least cost to each individual company, and area considerations will be easily defined for purposes of reclamation and monitoring. Should ground water be affected, the area of groundwater affected will be confined.

3. The establishment of a mining cluster and new town will provide economy, efficiency, and minimum resource to mining activities.

4. A cluster would be located in an area of thick coal seam containing high quality coal, sharply separating the area to disturbed and undisturbed areas, and providing the benefits and reducing the costs of reclamation per ton of coal.

5. Companies could share common facilities such as coal loading, power generation, power distribution, power transmission, power supply, and vehicle and fire protection; all of which will reduce the overhead costs and initial capital for each company and the mining cluster as a whole.

6. All load to the mining cluster would be switched for mining and associated disturbance (tow), thereby preventing problems with haul roads and associated damage to agriculture. Such a load and haul operation would significantly opportunity for removal of all coal by surface mining, and for joint mining methods such as longwall mining, which requires higher levels of technology of mining changes to allow maximum recovery.

7. Coordinating efforts between adjacent mining operations could greatly increase the quality of reclamation and reduce its costs by establishing a lead producer area; coordinating reclamation and monitoring, and area development. Such a coordinated effort would provide opportunity for removal of all coal by surface mining, and for joint mining methods such as longwall mining, which requires higher levels of technology of mining changes to allow maximum recovery.

8. Specialized equipment and skilled technicians could be shared in a mining cluster thereby allowing more efficient removal of coal,

better reclamations work, and more specialised community and industrial services than would be available to or could be afforded by an individual company.

A great deal of Montana's better coal deposits are located via the Federal government, State Lands and private coal companies. The coal production areas of the state are generally considered to have high quality, which can lead to the areas. A cluster development strategy would work well here and would probably occur regardless of Federal and State policies. Although it is unclear which companies or individuals will be leasing or leases, details are unimportant. What is important is that the potential cluster development is a very advantageous mining area. It is our intention to use the Custer area as an example for the following.

1. Planning (Industrial) In the area has located a potential iron ore site and has recognized a need for a new iron mine design to serve mining needs.
 2. The area has become very high and railroad.
 3. The resource industry efforts in this area exceed all other areas in terms of the size, and/or for the same or more resource data. Management Plan documents currently available.
 4. The time and money required to develop this area will be very long.
 5. The area has the initial adjustments to state activities, and federal activities continued to this area and managed properly, will cause a relatively lengthy impact.
 6. There have been several site-specific impact studies and area wide studies completed to date to current and proposed land mining activities in this area.
 7. The Spring Creek Mine proposal, current and proposed Baker Mine, current and proposed Hanes Mine, and the proposed mine at the area will require a viable cluster capable of producing more than enough coal to meet Nuttens' quota, whatever that is, without impacting others significantly.
 8. Our position is that there should be a confined surface cluster is predicated mostly upon the questionable assumption that expanded Nuttens production is feasible. Furthermore, we believe the Federal and State governments will likely extend a productive planning period resulting in a significant increase in the number of active coal mining operations in this area, extending mostly currently operating sites. We believe that the proposed mine will be a significant and important part of the total, but we expect policy makers to see creative efforts in order to accommodate the proposed mine and its effects on the environment and the quality of life in the community.

appointed by public interest groups (based upon membership size, relative to citizens representation), in behalf of environmental and conservation concerns. The EIC wants to participate in these governmental issues, and asks for support in this effort as it affects the State of Montana.

Comments on specific points in the DES follow, and are organized by chapter.

- 1 -

Page 1-2 states that part of the purpose of the DES is to "fully analyze the alternatives to the proposed program." It is debatable whether this editability goal has been fulfilled.

In Figure 1-2, the areas where states share responsibility and authority for preparing regional EIS's should be mentioned. This slight oversight makes one wonder whether later references to state involvement are sincere.

Table 1-1 (page 1-4) lists only one site-specific mining and reclamation plan. Two DEIS's already have been issued (Nesco and Peabody) for the Powder River Regional EIS.

卷之三

CHAPTER 3
Why are the northern Montana coal areas omitted from consideration
(p. 1-2). The Missoula River coal field and the Belt are currently held
out for development because of the relatively small amount of recoverable
reserves from which only a small private yield could significantly affect
regional production goals. Other areas of Montana also contain significant
private reserves, but the short distance to existing markets makes their
development less attractive. The coal resources in Montana outside the Fort
Union and Powder River Basin are considered, a more realistic appraisal
of which may be possible. While some of these resources add to the national
energy supply, others in these areas may eventually be very significant on a
statewide or regional scale.

The DOE does not explain how the regional coal production targets will be derived from the projections provided by DOE. Similarly, there is insufficient information provided to permit a critical evaluation of the model and processes used to derive the 1990 coal production targets. The 1990 coal production target is regarded as being adequate to serve a capacity assessment. This publication assigns a high 1990 Montana coal production target of 340 Mwtpy. The coal originally assigned a table indicates that the 1985-1990 coal production target was 300 Mwtpy. Considering the effect of "heat available control technology" and of Federal

One of the greatest handicaps coal mining has imposed upon the Montana public and other agencies in the industrial site planning process is the lack of any official draft or announcement of a new mine in areas where a mine was previously unexpected. Also, one of the most devastating social impacts built into the "grouped alternatives" is the reconsideration of leasing facilities at four year intervals. This provides no guarantee of security for the leasehold. The coal cycle is a rural, coal oriented economy such as Eastern Montana. Furthermore, the poorly constructed inventory surveys studies carried out by the BIA and the constant rewriting of input statements is an embarrassing waste of the government's and the public's time and money.

It is our belief that quality impact assessment is a necessary and essential environmental policy. It is our belief that planning a viable mining cluster, with a new town, could provide at least 40 years of production without an endless array of politically influenced assessments required to satisfy a single plan for a period of time. We proposed four year lease periods, cycle through the various fragments, institutions actuated of social issues will be better managed. In short, we want to see the planning, and we want to see the justification for this plan in terms of national coal demand strategy. It is also our opinion that the Western state governments will not feel confident in developing viable energy production strategies and policies until a clear long range Federal

It is also necessary to point out that the "preferred alternative" indicates frequent communications with the Governor's office as a means of determining a state's position relative to the proposed question. We believe that the most important role that the Governor's office can play is to determine the opinions and needs of the people of Montana. We suggest that the Secretary of the Interior solicit public opinion on how to gather public opinion in Western Montana. The processes called public opinion surveys are very difficult to determine by mail or telephone. We feel that the best way to obtain public opinion is to have it elicited through the Governor.

We ask that public representation we provided is Federal land use planning efforts, activity planning, setting regional conservation goals, and tract ranking and selection. Close monitoring by concerned representatives of the Governor's Office has been successful in insuring unbiased development proposals in Montana. For the State and Federal governments to realize public credibility in Montana it is necessary to involve representatives of public interest groups, as well as other concerned citizens from a wide range of special interests to the State.

Engaging citizens' representatives directly in the planning process allows for better public representation than do public hearings attended by people who are only marginally aware of the issues. In addition, the heat generated by citizens' representatives reflects the anger of the people, but, rather, the heat fortified and funded prevents groups from being heard. Since government is supposed to be one of the people's public servants, it is important that the public be involved in decision making operations. By incorporating ample positions for such representation into your normally closed sessions you can hope to alleviate the social tension and distrust currently present. Representatives to meetings should be

fuel, it was highly unlikely that economic conditions will shift, such that Montana coal will be sent to the East Coast. The methodology used to derive coal production projections may contain numerous erroneous assumptions, and several recent analyses have shown that the projections are subject to periodic and State level input and modification, especially if more specific information is available, as is the case in Montana. The BEA appears to specifically exclude State input from this part of the process. This is a serious omission since the regional coal production targets will drive the entire coal management program.

In Table 2-12, why are recoverable reserves of existing federal leases for Montana confidential? This makes a thorough analysis very difficult. This comment holds true for other tables in the DSE with data withheld.

It seems somewhat incongruous to hide the sections discussing the need for new leasing (Section 2.8) in the back of a chapter dealing with history and numbers. This section essentially forms the justification for coal leasing and deserves more prominence than given. This is a very interesting section in that adjectives and phrases stating the vulnerability and problems associated with making an accurate assessment of need are generally lacking.

The last paragraph of Section 1.8.1 (page 2-47) may be included as a desirable impact of leasing less federal cost than is NEEDED to meet national energy objectives, especially as it relates to areas of extensive Federal land ownership.

Chapter 3 discusses alternatives briefly and the proposed program in detail. Several problems are inherent in the preferred alternative.

1) The federal land use planning process is indefinite at this time, since proposed BLM planning rules are in a draft stage. The planning process is a very important step in Federal coal leasing. It is therefore imperative that well defined and formally adopted regulations be provided and disseminated as soon as possible. It is impossible to estimate that "the land management agencies' planning efforts...are to provide an initiative and focus for making of the principal decisions in the Federal land use planning process." This is a very important point.

cost management program" when the methods of these planning efforts are in line.

All areas to be considered for possible CHAI issuing would be subject to the most rigorous review pattern, based on results of the

subject to the new pricing system.

old process. The DSS states that proposed differences in the planned growth (PLG) areas designed to substantially improve the quality of land use plans. This implies that resource decisions are not nearly as good as new plans could be. This implies that resource decisions are as significant as real leasing should not be based on the lower quality existing land use plans. Decisions should be postponed until new plans are available.

- 23 The lands unsatisfactory criteria are a *p* since exceptions are
24 listed for virtually every criterion. It is not in the interest of sound
25 planning to have a large number of exceptions. Therefore, for
26 evaluating unsatisfactory lands should be included in the planning process.
27 It is stated that a responsible official would note his dissatisfaction with
28 the lands and would then make a decision as to whether or not the
29 resources available to prevent the land from "gaining". This is entirely
30 wrong. The responsible official should be given the opportunity to use
31 available methodologies to provide for a more evaluated of unsatisfactory lands in a
32 timely manner. The responsible official should be given the opportunity to use
33 available methodologies to provide for a more evaluated of unsatisfactory lands in a
34 timely manner. The responsible official should be given the opportunity to use
35 available methodologies to provide for a more evaluated of unsatisfactory lands in a
36 timely manner. The responsible official should be given the opportunity to use
37 available methodologies to provide for a more evaluated of unsatisfactory lands in a
38 timely manner. The responsible official should be given the opportunity to use
39 available methodologies to provide for a more evaluated of unsatisfactory lands in a
40 timely manner. The responsible official should be given the opportunity to use
41 available methodologies to provide for a more evaluated of unsatisfactory lands in a
42 timely manner. The responsible official should be given the opportunity to use
43 available methodologies to provide for a more evaluated of unsatisfactory lands in a
44 timely manner. The responsible official should be given the opportunity to use
45 available methodologies to provide for a more evaluated of unsatisfactory lands in a
46 timely manner. The responsible official should be given the opportunity to use
47 available methodologies to provide for a more evaluated of unsatisfactory lands in a
48 timely manner. The responsible official should be given the opportunity to use
49 available methodologies to provide for a more evaluated of unsatisfactory lands in a
50 timely manner.

- 1 -

1. Define the "region 'environmental residuals'" (p. 5).
 2. How is your coal cycle cyclical (p. 5-17)? Will money be generated from this "cycle" to support alternative, especially solar, energy development?
 3. The Department of Energy's coal demand projections could be revised downwards. What would be the impact of such a revision? 1) the cost of coal; 2) the glut of American oil which may be crossing Westons via the Northern Gas Pipeline; and 3) the potential influx of Mexican natural gas.
 4. What other goals for renewables are implied by the statement that "the major thrust would be to return disturbed land to the concern and use specific..."?
 5. The recognition that "an element of other resources in the Federal lands is significant" significantly undercuts the coal development under the federal coal management regime implies that coal is not a primary resource in the federal lands.

Certainly the latter would be of greater importance in defining a leasing policy. If not, why not?

14. The analysis of remanufactured items is a laborious process. How do you relate to used mining and to real leasing companies? What do you think about how they relate to used mining and to real leasing companies? Do you believe that the information presented here is sufficient within the various sections to prevent allowable FRS from being violated?

15. In conclusion, it would cases that information have been presented here in a redundant fashion without definition of impacts, or chair would be asked to provide additional information. In other cases, particularly strategic advice, he/she would be invited as an authority. The case would be presented to the committee, and the information would be made available; consequently, this section needs to be rewritten, and the original author would be asked to provide additional information, and replaced by qualified, competent professionals.

16. In the loss of potential productivity would have been acreage distributed, which would have been acreage distributed, which would have been acreage distributed. The impacts vary significantly depending on the definition (p. 3-7). Productivity losses would be measured at operating date. It would be measured at the time of the change in management and subsequent productivity is listed in the tables.

17. What, in either the Powder River or Bear Creek region, could be done to reduce the negative impacts of the proposed lease conditions, and the resulting impacts of dryland farming in the Powder River and Bear Creek regions? If so, it is known to date of this era "non-existent" (p. 3-7).

18. In your discussion of impacts to unseeded ranges of the Powder River region, where do priorities and values come? Neither the landowner nor the lessee can ignore all the information presented here as regards acreage as this (p. 3-7).

CHAPTER 5

- On page 6-3, it is stated that "The Secretary has also indicated that the Department should be responsible for determining, with reasonable certainty, that a specific tract can be developed without severe or permanent harm to the environment."

This research program aims at the assessment of coal losses in the Northern Powder River and Fort Union Coal Basins, as well as coal formations in other semiarid and arid areas, until the success of existing reclamation attempts has been thoroughly evaluated.

It is also stated that ENRIA "would provide site-specific reclamation data for use at the several decision points in the preferred program..." From whom would this data be obtained and which points in the decision-making process are being referred to?

the most important resource in the regions. This certainly negates the lands unsuitability program and could be interpreted such that agriculture, grazing, wildlife, water, etc. are secondary to real development. How does the Multiple Use plan relate to this implied policy. The assumption should be that "development of other resources could and should allow the soil conservation program."

6. How would changes in the transportation system affect your assessment that development of other resources would not interfere with coal development. Would you expect new roads to be built into areas that are currently undeveloped?
 7. What is the meaning of the last sentence in the last paragraph concerning compensating regional production adjustments?
 8. Have economic costs been used to determine landing policy?
 9. Having reclamation potential as Pecker's was very risky, particularly if the time required for reclamation and plant community establishment were as long as in a mountain region such as the Powder River Basin (p. 3-17).
 10. Page 23 (4th paragraph) says it is possible to determine whether reclamation of strip mining plant communities on relatively steep areas could minimize effects of reclamation on the environment over time? Sound like research had better be increased in this area.
 11. What are the potential physical injury impacts?
 12. Impacts of particulates are inadequately defined and addressed. The potential impact to the public health is significant, but no concern is expressed about the potential impact to the environment.
 13. If the estimates of 0.7 to 1 percent coal loss from tanks on p. 5-3 are based on the Neigert and Jensen report they should be considered unreliable. These numbers are not consistent. More than one source of information should be used. These numbers do not adequately reflect sediment flow from water tanks.
 14. The potential impact of acid rain on the environment under acid rain policy, if there is one, is unclear. Additionally, the impacts of acid rain on the environment are not well understood. Acid rain estimates from mines or power plants released to air quality standards are not available. The viability of standards should be addressed as well. Finally, the potential impact of acid rain on the environment under acid rain mitigation is not clearly stated.
 15. There are many impacts associated with those associated with health impacts. These include the potential for acid rain, acid rain mitigation, etc. as discussed. How do climate impacts, air quality, coal dust, power plant emissions, and acid rain mitigation begin to regimen and thus, how do they relate to the leasing policy?
 16. Why are愍sional controls standard for power plants addressed, and emission control for coal mining and coal transport not addressed?

It is stated that degradation of local air quality would occur even though best available emission control technologies are employed (p. 7-2). Why is this chapter assessing best available technology for impact evaluation when in chapter 3 best practice technology is assessed?

SER: Consent: Federal Coal Management Program

Dear Sirs:

Attached hereto please find comments to the subject draft environmental statement by Northern Minerals Company concerning the proposed federal coal leasing program. We invite them as a matter of record to be considered in the preparation of the final statement.

Very truly yours,

J. B. Smith
Chairman

AB/TE

II. Split Estate vs. "Federal Lands" (DEIS 3.2.4.1 & 3.3.5)

The current procedures (SNMC, Section 714-d) for the preferred split estate lands are acceptable for the majority of the split estate areas (i.e., federal lands per 3.2.1.1, p. 3-20, paragraph 21) lands where the estates owned by the same person or entity. The same reasoning applies to the tract ranking process (DEIS 3.2.22), such as action appears to be a conflicting point of interest on the part of the public land manager. This would result in the maximization of the total public estate (lands) and its most beneficial use as a single unit.

To exclude those split estate lands from recommendations on the basis of a single owner or entity greatly reduces the potential that certain lands will lead to a full profit to estate owners and result in higher mining costs and ultimately higher consumer costs due to the lack of economies of scale in production. In addition, if personal ownership of partnership may be a potentially more viable alternative than individual ownership, the split estate areas "intrinsically" or "interestingly". If excluded this effectively reduces the meaning and intent of the proposed DEIS regional procedures and the overall process.

In Northern's view and recommendation that all federal coal lands be included in the ranking process, the above criteria should apply.

The estate owner has a legal right to his preference and a legal avenue by which he can pursue claims against the BLM or the like. The BLM should have no part or influence involving these rights. Northern feels the federal government should enforce the laws of the land and not interfere with private rights and be concerned only with public lands. The definition of federal lands should be limited to those lands which are owned by the government and exclude any reference to private ownership of any estate.

III. Regional Tract Ranking, Section and Scheduling (DEIS 3.2.23)

The procedure to rank federal coal lands acceptable for further leasing consideration for mining would appear to insure the maximum protection of the environment and the public welfare. Priority would be determined as either low, medium or high in risk. Although not specified in the DEIS, it implies that all economic factors must be considered in the ranking process. These factors would be analyzed along with environmental and multiple use trade-off concepts.

Two serious faults in the DEIS ranking process exist. First, the priority ranking of the lands is based on the number of surface rights, other than surface owner consent, which would be applied to the criteria, other than surface owner consent, would be applied and to what degree such would count towards the final ranking. Economic factors such as market recovery and fair market value of the lands result from considerations of minability and price. These factors are not mentioned in the DEIS. On the basis of detailed mine planning and market availability. Without significant geological information on the coal deposits and mine planning, the true market recovery potential of a deposit in terms of profit can not be accurately determined.

Comments to the Draft Environmental Statement: Federal Coal Management Program

Dedication

Northern Minerals Company, a wholly owned subsidiary of Northern Natural Gas Company, offers its dedication to the appropriate agency for this opportunity to comment on the Draft Environmental Statement of the Federal Coal Management Program. We are requesting that our comments be received as soon as possible. We are also requesting that the agency consider the procedures for leasing of federal coal lands and the procedures that are "preferred" would seem to allow for future lease sales of federal coal lands in amounts of 100,000 acres or less. We believe that the amount of energy demand and rising costs, it is so the procedures and their implementation that we address in our comments.

Comments:

I. Emergency Leasing and Start-Up Programs (DEIS 3.2.7 & 3.2.3)

The preferred alternative program provides for federal leased and leased lands to be included in an approved Regional Lease Sale EIS and covered by an approved Resource Management Plan (DEIS 3.2.7). The emergency leasing and start-up programs although intended to provide for leasing in those situations where regional and BMP environmental impact statements have not been completed, would still require an environmental impact assessment. 3 years of prior production and development would be required before the lands could be leased in order to gain access to other coal deposits, presumably controlled by the applicant. Thus, criteria would be established by the agency for areas such as southeastern Montana, northeastern Utah, or the Namekagon area of Colorado and New Mexico prior to a natural gas lease sale. This would be done to prevent any possible legal delays.

Northern believes that the industry, has only recently entered into the coal industry and does not hold a major position in any of the eight regions not included in a regional environmental impact statement. It is likely to areas other than those of recent development. We are concerned about the ability to utilize existing infrastructure and facilities in these areas. The early development would contribute to the nations coal energy demands and help to reduce the cost of coal to consumers. The new areas now centered in the Powder River Basin and northwest Colorado.

Northern proposes the randomization of the lands available for leasing in the various regions in the Emergency/Start-Up Program. This would permit new mines to make application and receive a lease. The agency would then review the applications and review the lands applied for according to the suitability and random criteria. This would ensure that emergency leasing for mines, notably small in production and size, the entire leasing program could be developed and instituted.

-1-

Second, a tract considered to be low ranking in terms of quality, its thermal value, transportation costs, and other similar traits should be open to sudden changes in utility or other industry plant siting capabilities and market needs. Currently, the proposed regional environmental impact statement would not allow changes without significant time losses from reevaluation of tract rankings and potentially loss of the lease. This would delay in the execution of the environmental impact statement. Such delays in time would all contribute to increased costs of plant construction and the resulting increase in the difference between the market attractiveness of the source's resources versus other more costly fuel sources.

Northern recommends the system of free enterprises and competition be allowed to determine the ultimate use of federal coal lands. This would be based on sound economic principles of evaluation and mine design without impeding valuable surface acreage constraints upon the agency. This would be in accordance with the philosophy revealed in the form of higher costs of production and use.

IV. Surface Owner Consolidation (DEIS 3.2.1.3)

The heavy environmental considerations; primarily sociologic, included in the proposed federal leasing program prevent us from supporting the concept of surface owner consolidation. Only because of last apparent environmental impacts. Only "qualified" surface owners should be allowed to state their preference to the choice of mining method or land use.

The implementation of the "qualified" program will have several serious negative social and legal implications.

1) The procedure will be applied to existing nonconsolidating leases and PALA's. It will likely result in the destruction of existing leases and the loss of revenue to the agency. (see "Legal Consideration for leasing") of federal coal lands from existing lessees. Such objections, in favor of consolidating the lands, are based on the individual systems or a personal lifestyle of w/f will in turn ultimately result in depriving jobs and revenue to the local economy and the ability to maintain heat and/or power to homes, schools, hospitals and places of employment.

2) Qualified surface owners are those individuals who have legal title, through ownership or those obtained via lease agreements, to determine the ultimate use of "private" assets. For example, if a surface owner has a lease agreement, and preexisting interests infringe upon the law and rights of an adjacent landowner, the agency would be forced to terminate the lease. The termination of surface owner qualifications will most probably result in legal suits and deter the implementation of an effective program of coal leasing.

-2-

3) The proposed program has attempted to stress the reported impact of surface mining in favor of subsurface mining or reclamation. It is reported that free belt surface mining and from underground mining should be the preferred method of extraction as it already appears to have been done (...refrain... last sentence). The Bureau of Land Management (By) underground methods is Section 3.2.1.3, Paragraph 21.

V. In general, Northern authorizes high costs of implementing the "preferred" program both from the direct costs and those associated with the loss of revenue. These costs will be paid by the public. The Bureau of Land Management and the Geological Survey are currently employed in the U.S. Geological Survey and Bureau of Land Management. The Bureau of Land Management's productivity generated by coal fired plants or even synthesized fuel, the program, as designed, will significantly impact the cost derived from the program. The Bureau of Land Management will incur indirect costs in the form of taxes to administer and supervise the program.

Gentlemen:

CSG Exploration Company (CSG) is a corporation duly organized under the laws of the District of Columbia and duly authorized to transact the coal, oil, gas and mineral business in all its phases and all activities related thereto. CSG is owned by Cities Service Gas Company, a wholly owned subsidiary of Cities Service Gas Company.

CSG is endeavoring to provide additional gas supplies for the projected needs of the country to satisfy its long-term customer needs. It is our estimate at this time that the long-term natural gas supply picture reflects shortages and/or surpluses depending upon the market.

Cities Service Gas Company delivers natural gas to local distributors in 502 communities in Kansas, Missouri, Oklahoma and Texas. Notwithstanding its concentrated efforts to attract new suppliers and natural gas sources, Cities Service has been unable to contract for sufficient quantities of natural gas to meet its needs. It has sought available gas supply sources to assure long-term gas service to its customers. Cities Service has been unable to make the purchase of additional natural gas but even with reasonable success, supplemental gas supplies can be expected as new gasification will begin by the end of 1982.

To satisfy long-term customer needs utilizing projects which require long lead time, early plans and actions must be taken to provide prospective feedstocks. CSG applauds

station" August 31, 1978, speaks in terms of a surface owner consent or lease of the surface estate which is underlain by federal coal. It should be obvious that peripheral private lands will be required to mine coal from the mineral estate. This prospect for encirclement could cause a potential bidder to have grave doubts about the value of a consensus not including peripheral lands.

KNOW-IT-ALL/DO-IT-ALL

The Secretary's preferred coal leasing program places the federal government in a "Know-It-All/Do-It-All" position which is not practical, economical or in the public interest.

During the moratorium on federal coal leasing, state coal interests and coal operators continued to work and plan for the future. The substantial knowledge developed should and would be shared with appropriate federal planning personnel upon request and with conditions. The Bureau of Land Management received much valuable information in response to its call for coal lease nominations on June 1, 1978. A more selected call would obtain a more selected response.

It must be recognized, however, that none of the information developed is confidential. It is in the public interest to incorporate such confidential information in the planning process but the preferred leasing program turns its back on such information contrary to the public interest. Utilization of available knowledge should be an integral part of the leasing program, eliminating the proposed "Know-It-All/Do-It-All" approach.

Office of Coal Management
February 9, 1979
Page Two

plans for early federal lease sales which will provide the necessary feedstocks for Cities Service's coal gasification activities.

The Secretary's preferred coal leasing program does not appear workable, however, particularly in relation to surface owner relationships. CSG views natural resource development as a joint venture between the federal government and mineral. The proposed leasing program will function in the best interest of the public if this concept is accepted and adopted by the Secretary.

The various option papers prepared for the Secretary clearly recognize that much of the surface estate over which the Bureau of Land Management and the Federal Power Commission is already in the hands of energy companies. Peripheral reserves will be held in Minerals reserves. Leasing of these preferred reserves will not interfere with mineral goals. In general, the owners of surface or surface consents do not have the right to lease their land to others. Farmers and non-uniformed farmers and ranchers as inferred in the Secretary's preferred leasing program, however, will be allowed to lease their lands. Owners of the mineral estate will protect their respective property rights.

Additional comments are attached.

Very truly yours,

Comments of CHG Exploration Company
on the Secretary's Preferred Coal Leasing Program

Equal Surface and Mineral Estates

The Secretary's preferred coal leasing program fails to recognize the equality of the surface and mineral estates.

Nothing in the Mineral Leasing Act (MLA) or the Surface Mining Control and Reclamation Act (SMCRA) or any recent judicial determination suggests that the surface estate is inferior to the mineral estate. If all of the position papers prepared for the Secretary had kept this equivalence of estates clearly in focus, the multiplicity of options would disappear.

1. A consent to mine (lease) by either the federal mineral owner or the surface owner must be treated as comments with all the rights attendant thereto under the coal management program in order to preserve the judicial fairness doctrine.

2. Mineral and surface leases have similar provisions and requirements.

- a. A mineral lease issued by a railroad or the federal government or a state government or a local government or the mineral estate including but not limited to the bonus payment, title to the mineral estate, payment for the depletion of the estate, minimum production, maximum production, land operations, protection from waste products, reclamation, transfer without consent, and right of cancellation for failure to perform the above requirements.

b. A surface lease has similar provisions including a bonus, continuing payment, definite term or years, payment for damage or permanent impairment, hydrologic protection, lawful operation, title to the surface estate, and cancellation for certain failure of performance.

3. The Secretary is prohibited by the MLA from accepting any bid which is less than the fair market value of the coal, as determined by the Secretary. The preferred coal leasing program is developed on the premise that since the Secretary has the authority to lease, he has lesser implied powers within that authority to lease on only those terms and conditions that he deems appropriate, including compensation and transferability. Since the surface and mineral estates are equal, this line of reasoning would conclude that the surface owner has a corollary right to review the terms of the mineral lease, including compensation. The preferred mining plan does not offer the surface owner any such right of review; therefore, the surface owner will have problems permitting a federal review of his consents for the same "property right" reasons.

Compensation Mandate Ignored

The Secretary's preferred coal leasing program ignores the Congressional mandate of protecting the property rights of surface owners.

The Surface Mining Control and Reclamation Act (SMCRA) Section 714 provides for surface owner protection in event surface mining techniques are used. Subsection (e) constitutes

a Congressional mandate that "the Secretary shall not enter into any lease of Federal coal deposits until the surface owner has given written consent to enter and commence surface mining operations and the Secretary has obtained evidence of such consent. Valid written consent given by any surface owner prior to August 3, 1977, shall be deemed sufficient for the purposes of complying with this section". This Congressional mandate is clear and unequivocal. Although Congress considered amendments expressly limiting compensation to the surface owner, the bill ultimately enacted included no compensation limitation.

The department's Office of the Solicitor on behalf of the Secretary, attempts to circumvent this clear Congressional mandate by waiving a statutory Web from the "fair market value" requirements and the "competitive bidding" provisions of the Mineral Leasing Act (MLA). Through reliance upon such provisions, this advice futilely attempts to justify a right and power to limit the compensation which the surface owner can receive for the granting of his consent. Congress refused to permit the Secretary to limit such compensation. Through reliance upon MLA, the Solicitor attempts to carry out a right for the Secretary to require transferability of any consent in order for it to be considered "valid". Yet, Congress clearly refused to grant such powers to the Secretary.

The underlying reason why Congress rejected these restrictive proposals lies in the fact that surface owners enjoy property rights which Congress was not willing to take for public

use either with or without just compensation. Property rights cannot be dealt with in the cavalier fashion attempted by the preferred coal management program.

Indeed, the surface owner's property rights are, in the eyes of the law, no less than the rights of a sovereign state such as Montana — whose enormous coal severance tax rates will certainly have a far greater impact upon the fair market value of federal coal than could possibly be exerted by any Montana surface owner.

Timid Approach to Coal Leasing

The Secretary's preferred coal leasing program has been a timid approach to coal leasing which an aggressive approach is in the public interest.

The moratorium on federal coal leasing since 1971 has been a disaster to the coal business and contrary to public interest. Finally, an action is underway to reinstate coal leasing, but the action is timid and indecisive. The preferred program will further delay coal leasing rather than correct the primary problem, to lease and mine federal coal. Since the government's responsibility for managing federal coal lands in the public interest has been abdicated since 1971, an aggressive coal leasing program is needed to correct some of the problems already created.

Among other things, the preferred program is developed with the expectation that most surface owners will oppose

surface mining of federal coal. This is not true. As a practical matter, surface owner consent will not be a serious problem. The surface owner's primary concern is that their property rights will be properly recognized by the coal miners and the government.

The preferred program would expect surface owners to accept any conceivable successful bidder as the miner on his land without regard for competence, honesty or reliability. Nothing could be further from the truth. The surface owner will not be willing to grant his consent until he has had an opportunity to review and accept the successful bidder (or assignee).

If the surface owner is paid for his land rights and given an opportunity to approve the miner, most surface owners will welcome surface mining and this approach is in the public interest.

Paper Grading Exceeds Authority

The Secretary's preferred coal leasing program proposes to "grade the papers" of all pre-existing leases and agreements so that "grading" exceeds the Secretary's authority.

The Secretary expects and should receive confirmation of the surface owner's willingness to permit surface mining under preexisting consents. But, the Secretary does not need, nor should he expect, any additional information concerning terms and conditions of such preexisting consents. Assuming federal

lease terms are reasonable, which they should be, surface owner consents and transfers thereof can be acquired on a reasonable basis, consistent with the timing requirements of the leasing process.

The preferred leasing plan should recognize that many surface owner consents will be transferred several times prior to leasing without federal involvement or concern. Subsequent transfers, thanks to the wisdom of Congress, will be made with the same freedom.

Minority Federal Position Ignored

The Secretary's preferred coal leasing program ignores the possibility that federal coal may occupy a minority (perhaps insignificant) position in some attractive coal mining areas.

In many instances, particularly where federal coal ownership is on a checkerboard pattern, some federal coal will not be economically mineable. In these situations, the ownership of adjoining coal and surface will be of primary importance in establishing the value, if any, of federal coal.

Hopefully, isolated tracts of federal coal can be included in an LME and be mined in the public interest. With one strong owner holding the adjoining coal and surface, however, the proposed leasing program is not workable.

Not recognized in the papers prepared for the Secretary is the well-documented fact that coal underlies only a portion of any ranch or farm. The paper "Split Estate Leasing Implemen-

Dear Sirs:

We are pleased to submit the enclosed comments on the Federal Coal Management Program-DIS. The comments are focused on our major concern that of the emergency leasing component. We feel that bypass leasing should be considered separately from the emergency leasing component in the Program.

I hope these comments detail our concerns on this matter.

Sincerely,

MONTCO

Douglas A. Day

DATE: February 9, 1979

SUBJECT: Comments on the Draft Environmental Statement on the Federal Coal Management Program

These comments are prepared by MONTCO, a surface coal mining venture in Billings, Montana. The comments are not inclusive because of the length and complexity of the Draft Environmental Statement. MONTCO would like to reserve the right to make further comments and to comment on the proposed regulations for the implementation of the Coal Management Program.

MONTCO is specifically concerned with the description of the bypass leasing procedure as made a part of the emergency leasing system.

The emergency leasing system and bypass leasing processes are described in Section 3.1.c as alternatives of the preferred program. The Section 3.1.g description is predicated on the senseless assumption that the bypass leasing under the program must follow the rules established in NSMC versus Hughes, with regard to a consent agreement. There is no logic to this, and we can only conclude that the author did not intend that this alternative be seriously considered by the Secretary. Our specific objections to this alternative will be evident from the materials which follow.

The emergency leasing system and bypass leasing are also described as a component of the preferred program in Section 3.2.7 and was specifically referred to in the example regulations as "Subpart 3425". Section 3.2.7 is a general description of the specific regulations which are found in Subpart 3425 of the example regulations. The following points will be keyed to the example regulations:

- Bypass leasing should not result from "emergency situations". Bypass leases should result from well-planned mines at which the operator has an economically acceptable option to either mine or pass isolated parcels of Federal coal.
- By including the bypass situation in the emergency leasing system, bypass leasing is obscured. For instance, Section 3425.0-2 states that "the Secretary may issue a lease under" Section 3425.2(c) imposes the requirement that the coal be necessary to meet the emergency needs of the applicant". In reality, the applicant may not have a "need" for the coal, but only by bypassing the Federal coal with his mine.
- The true rationale for bypass leasing should be an effective national policy, as set forth in the FCLAA of 1976, to provide for orderly leasing and development and to promote maximum economic recovery of Federal coal.

years in advance of mining. Five year and longer planning is impossible if you do not know what Federal coal you own until three years before you are to mine it.

- The requirements of Section 3425.2(a)(2) that the mine operate for five years prior to application is similarly harmful potential. It is prudent to assume that an applicant may take two to three years on average--particularly if an EIS must be produced as suggested by Section 3425.5(b). Thus, it could be as long as five years after operation begins before the operator begins to acquire the isolated Federal tract. There are few situations where it would be economically prudent to start an operation on the isolated Federal tract or to move through the tract at an early date.
- Section 3425.2(a)(3) which requires that the need for the lease be "recurred from changes that were beyond the control of the applicant or could not have been reasonably foreseen or planned for. We feel a bypass situation would be foreseen in the planning stages by a careful operator.
- Section 3425.2(a)(4) language such as "without regard to the integrity of the normal leasing process" is vague and could provide the basis for meaningless and endless dispute. This terminology should be eliminated.

e. The losers in the case of bypassed Federal coal

- (1) The Federal and State governments of which will lose royalty income;
- (2) The operator who will have to absorb part of the cost of a less efficient operation and who can be affected by local legislation such as Montana's Coal Conservation Act;
- (3) The ultimate losers is the consumer, the American public, who will have to bear part of the cost of a less efficient operation and the loss of tax and royalty revenue to its governmental units.

When bypass leasing is taken out of the "emergency" mode and seen as a function of mine geography rather than foolishness or lack of planning by the operator, it is possible to identify several of the regulations now contained in Subpart 3425.2, which create artificial limitations on the Secretary's ability to grant bypass leases.

- Section 3425.2(a)(1)(ii), which requires a showing that some portion of the coal will be used within three years, is not responsive to the coal planning system. For instance, because of existing blending requirements, dedication obligations, equipment acquisitions and general mine planning, as may be required by the Montana Reclamation Act, it may be necessary to have mine planning and sequence established five or more

Under the preferred program, there is a distinct possibility that isolated Federal coal, which would be acceptable for leasing, would not be leased as part of the normal system. For instance, it could be held out for initial leases because of a sluggish development situation (Section 3.2.1.4) or because of the regional production targets (Section 3.2.1.3), which are satisfied, ironically, by mining the very few or static coal which is causing the bypass.

Thus, it can be seen that the bypass leasing procedure is an important enough element of the preferred program that it should not be bypassed as being an off-shoot of the emergency leasing system. Also, it should not be hampered by unnecessary time and production limitations which will limit the Secretary's opportunity to make intelligent and efficient use of the procedure.

Office of Coal Management
February 12, 1979
Page 100

shows that the Preferred Regulations more closely follow the very detailed and explicit language contained in Section 522 of the Surface Mining Control and Reclamation Act. In our opinion, the regulations should be identical and the language contained in the Preferred Regulations should be adopted in the mining lease because the Preferred Regulations more closely follow the statutory language and they were more recently promulgated than those in this area.

The Examples Regulations include criteria which are more appropriately addressed during the permitting process. While it might be appropriate to identify such areas during the pre-licensing-determination-process, it is certainly not proper to designate such areas mandatory because the GBN regulations designate GBN as the Regulatory Authority as the agency responsible to make such determinations during the permitting process.

It should further be noted that the northern have added some additional criteria for designating areas unsuitable which on the surface appear to have wide ranging application and little or no scientific justification. The first criterion is adopted as it appears in the example. Regardless, it is difficult to believe that there will be many logical mining units still available for consideration for leasing following the unsuitability determinations.

Another concern we have with the Bureaucratization is that they do not adequately address the problem of non-qualifying surface owner's consent. They could have included language which would allow the state as well as federal agencies to negotiate with the owner of the Federal Levee in anticipation of the necessary work. This would be a more reasonable regulation which will eventually negate their efforts. We would suggest that the regulations be revised to allow the state to negotiate with the owner of the non-qualifying surface to match the highest bidder's offer or granting surface owner's consent. This would allow the state to retain the right to accept or reject any bid from the public or private sector. Under these conditions we do not see how anything other than the highest bidder option would serve to dislodge others from the highest bid market value.

Office of Civil Management

appear the implementation of the Preferred Program has the potential to place more coal producing regions throughout the nation in a chronic "supply-exceeded" condition. Discretely, the coal industry will exist in a "demanded-supplied" market situation. If the preferred program does result in a "demanded-supplied" market in the western United States, it could, doubtless to no, have major social economic impacts upon those regions of the nation which are dependent on western coal.

Thank you for giving us the opportunity to comment.

Office of Coal Management
February 12, 1979
Memorandum

We also do not believe the problem of establishing a fair market value of a reserve has been well thought out, in a highly regulated industry such as coal mining many of the costs are determined to a large extent by government regulation. This is particularly the case in the west where the government controls 80% of the coal reserves. In other words, the government appears to have virtual control over the market value of coal in the west. Unless some mechanism is developed to subject fair market value determination to public scrutiny the determinations process will be virtually meaningless.

The concept of "maximum economic recovery" also presents some problems. History will prove that what is economical today may not be economical tomorrow and vice versa. The cold hard facts are that the issue of maximum economic recovery will have to be dealt with at several stages during the mining process. We therefore feel that it is important to influence regulations which will be easier to recognize and accept readily. The Enclosed Regulations pertaining to this area, REG 100-200, are quite flexible as they are to be realistic.

We note that the Dam Site Agreements require Environmental Impact Statements and Environmental Assessments at several stages. We believe none of these can be eliminated and others cannot be substantially reduced. We believe that virtually all the environmental process can be done away with. For example, we do not see the need or objective of preparing an Environmental Impact Statement or conducting an environmental assessment. The environmental process is a waste of time and money. Environmental harm will occur as a result of holding a lease sale or issuing a coal lease. Adequate safeguards can be put in place under the NEPA regulations to meet the NEPA requirements by way of environmental permits and approvals. A NEPA process meeting the requirements of the NEPA regulations is unnecessary and the recently revised NEPA regulations are flexible enough to allow federal agencies to interpret the NEPA process in the permitting and lease plan approval process.

We request you keep the record open for two more weeks for the limited purpose of securing more detailed comment from the Senate Production from interested parties.

We would also like to suggest that the Department of Interior prepare a Regulatory Analysis of the leasing process in accordance with Executive Order 12044. It would

Re: United States Department of the Interior Draft Environmental Statement, Federal Coal Management Program

Gentlemen:

Utah Power & Light Company, a Utah corporation, submits the following comment concerning the draft environmental impact statement dated December 19, 1978, for the Federal Coal Mine Tax Act.

Utah Power & Light Company is a public utility, providing electrical power to substantial portions of the State of Utah and to southeastern Idaho and southwestern Wyoming. It owns and operates, under contract, several underground coal mines in Emery County, Utah. It holds a number of federal leases and contracts with various companies, although some of the operations are being conducted on fee lands. It also buys coal from various sources as it made excess its needs at the present to produce coal. It has no coal reserves of its own, except in the mines it owns.

constructed several coal-fired generation plants and has several others either under construction or in the planning stage.

Alaska, UTAH, WYOMING.

KLUJ

Very truly yours,
Ralph L. Jerome

Section 2.8.2 of the E.I.S. discusses the question of Leasing to Promote More Desirable Patterns of Coal Development. This section places primary emphasis upon environmental and socio-economic impacts of coal mining, although it does discuss the question of inefficient development patterns resulting from bypassing unleased federal tracts. It does not focus on the question of leasing in areas where the coal, particularly of the proper quality and in an amount to provide adequate reserves, is needed. It is not sufficient to merely determine that the coal to be mined is sufficient in quantity to satisfy the needs of the country. In the near future, at least, the largest users of coal will be electric utilities. Environmental and other considerations require that power plants be built in certain defined areas. In determining what coal is to be leased, and thus in effect promoting more desirable patterns of coal development, this factor should be taken into consideration. The Department cannot merely determine that the nation needs so much coal. It must devote a substantial effort toward determining that coal of the proper quality and proper amounts is available in the areas where it is needed and that there is a method to insure that reserves in an area can be maintained for use over the life of a particular plant. It is clear that the nation's transportation system is not geared to shipping large quantities of coal from mines to distant power plants.

Even if this were possible, the added expansion of such transportation would result in large costs being added to the coal and would have a significant inflationary impact. Moreover, consideration must be given to the fact that considerable energy, most often in the form of source oil, would be utilized to operate the railroad or other transportation system. Locating the plants near the coal reserves would thus have a substantial savings effect on other forms of energy.

In **Section 3.9** it is pointed out that there is a substantial time lag between the decision to hold a lease sale and the actual coal production. Utah Power concurs wholeheartedly in that position and in the statement that federal leases expected to come into production from 1986 to 1990 should be issued soon. In fact, unless the leases to be issued is in conjunction with an existing operation, the leases would have to be issued now in order for more mines to be in production by that time. Utah Power believes that the most important comment it could make would be one which would stress the urgency of proceeding with coal leasing. The long moratorium which has prevented any significant new leasing has had a significant impact on development of coal reserves in this country and we would seriously urge that a logical and workable leasing program be under way without any further delay.

Section 3.1.1 discusses the preferred program of the

-2-

Department. Utah Power believes that of the various alternatives mentioned, the preferred program is, indeed, preferable. We also support the planning system delineated therein under which the procedure for determining acceptable locations for coal production would involve close communications with government, industry and the public. Another alternative mentioned would be Utah Power's second choice, that of "leasing to meet the coal industry's indication of need." We believe, however, that two of the other alternatives mentioned would be disastrous, that of "no federal coal leases until 1986" or that of "leasing only by-pass coal and coal needed to maintain existing operations." The adoption of such alternatives could do nothing but worsen an already serious energy shortage. This alternative would force development of coal resources ill suited to the use for which they are to be applied. It would maximize cost and have an adverse environmental impact. It would encourage holding of coal by speculation and be counterproductive of the goals of the coal leasing program.

In **Section 3.1.1**, it is indicated that under the preferred program the Department would rely on the various land management agencies' planning systems to provide the initiative for the making of principal decisions in the Federal Coal Management Program. This is an area where Utah Power strongly believes there should be initial consultation with and input by electric

utilities and other members of the coal industry, and that decisions should not be made by the land management agencies merely on the basis of statistical information. Such a procedure could result in agency decisions which would be hard to change on the basis of later industry consultation.

Utah Power is cognizant of the fact that the statement provides for industry to "submit expressions of interest in possible tracts," but, nonetheless, leaves a preliminary determination up to the land management agencies. We merely hope that their decision would not be cast in concrete by the time the industry expressions are considered. We would also hope that the ranking which is to be done only every four years would not be so inflexible as to preclude changes if the need therefor could be demonstrated by industry or others. Government action can frequently result in a change of planned location for a generating plant; i.e., the proposed Intermountain Power Project. In such case, that may also dictate a need to re-rank the coal supplies and location of coal supply.

Section 3.1.1.2 provides for the establishment of production targets after the country has been divided into twelve production regions. Utah Power, and to our knowledge other utilities, is fearful that setting of regional production targets again would lead to situations where coal of the quality needed for different purposes and in different areas would not

-3-

-4-

be available when and where needed. It would like to see sufficient flexibility and safeguards built into the system so that this would not happen. This is of special importance to the electrical utilities because before constructing facilities they must have reasonable assurance that a long-term coal supply for each facility will be available, not only nationally, but in the region where the power plants are to be built and operated. The specific location is of critical importance in order that design of the environmental equipment for the plant can be tied to specific soils whose ash content, sulfur content and other properties are known and can be related upon.

Under Section 3.1.1.3, relating to lease sales, it is noted that the method for conducting sales would vary from sale to sale, but that the responsibility for promulgating regulations concerning the bidding system to be employed belongs to the Department of Energy. It is assumed that the Department would have some input in this connection and we trust that the Department will consider the problems facing the electric power industry in raising capital to obtain the leases. These problems will be discussed under Section 3.2.4.4 below. Any system which requires large sums of front-end money will prevent utilities from acquiring coal and will simply put utility consumers at the mercy of coal speculators.

Section 3.1.1.3 provides that the Department will apply the

-3-

riggs of those preference right lease applicants for whom processing was accomplished prior to the coal moratorium. Utah Power is in this category and objects to the priority system proposed. If the coal moratorium had not occurred, the coal leases in such cases would have been issued long ago and such holders should not be penalized as a result of situations not within their control. We believe that a system should be established to process all Preference Right Lease Applications and issue leases therefor within a two-year period.

Section 3.2.1., entitled "Land Use Planning," strongly reflects a fault that pervades to some extent the entire E.I.S., that of undue complexity. One receives the impression, after reading that section and reviewing the various charts and figures that after the numerous analyses are applied and the areas affected thereby eliminated, there will be little left for leasing. Thus, we would hope that the process could be simplified and the basis for elimination be reduced. More importantly, the process presently described appears to adopt a negative approach--eliminating unsuitable areas rather than focusing upon those which offer the most potential for coal development. As an electric utility, principally utilizing coal in all of its recently constructed plants, Utah Power is particularly concerned about this problem. More emphasis, we believe, should be placed upon selecting quality lands for coal production than

-7-

same land use planning and unsuitability standards to existing, non-producing leases as are applied to new leases, but that "such application would respect valid existing rights and substantial financial and legal commitments. However, Section 3.1.1.4, relating to Preference Right Lease Applications, indicates that the Department would adopt a policy of applying to such P.R.L.A.s the same environmental planning standards as those applied to new leases. There is not the same indication that the Department will respect valid existing rights and substantial financial and legal commitments. Recent court decisions cited in the E.I.S. demonstrates that the Department does not have discretion to refuse to issue P.R.L.A.s where coal has been found in commercial quantities. These decisions should not be thwarted by overly rigid application of environmental standards, particularly where the applicant has, as is often the case, made a substantial legal financial commitment in connection with them.

Section 3.1.3 discusses another alternative, that of processing outstanding Preference Right Lease Applications. It sets a priority system whereby the processing of P.R.L.A.s would be in the following order: First, those in the least environmental damaging area; second, those in the areas where coal development needs are greatest; and third, those which have been on file for the longest period. This sequence ignores

-6-

merely eliminating those areas which various groups or segments could consider unsuitable for coal mining. It is suggested that the principal criteria in the selection of lands for use should be the quantity and quality of the coal contained in the tracts, together with the location of the land in relationship to the places where the coal will be utilized. It should also be recognized that minor differences in coal characteristics can require major design changes in power plant specifications. This observation ties in with several previously made that quantity considerations alone are not sufficient. Adequate consideration must be given to determining where and how the coal is to be used, that there is reasonable transportation and that neither cost of mining nor transporting the coal will be prohibitive or wasteful of personnel and other natural resources.

Section 3.2.1.1, relating to "Unsuitability criteria," is subject to the same observation and criticism. This is especially so when read in conjunction with Table 3.1. Utah Power would have no quarrel with the President's environmental message instructing the Secretary to lease "only those areas where mining is environmentally acceptable and compatible with other land uses." However, it is obvious that different people can review that admonition with drastically different ideas and could administer it with drastically different results.

Section 3.3.3.3 reflects an intent on the part of the

-8-

Department to involve the industry in all stages of land use planning and target setting process. Utah Power supports this concept and trusts that its implementation will be adequate and utilized to the extent that industry participation is not merely an idle gesture.

Section 3.2.4.3, fair-market value, indicates that no bid shall be accepted for lease which is less than the fair-market value of the coal in the leasee. The basic method, it says, of determining fair-market value will be a "discounted cash-flow analysis," which involves calculating annual costs and income resulting from development of property under realistic conditions. Utah Power believes that the bidding system itself will go a long way toward establishing a fair-market value. Theoretical concepts and complicated appraisal procedures, we believe, should not be allowed to slow down and interfere with the bidding process.

Section 3.2.4.4 describes various bidding methods and states that the sale and bidding system should be kept flexible, permitting the choice of method on a case-by-case basis. Utah Power would agree with this concept so long as it takes into consideration the needs of the electric utilities utilizing coal for generation. Six different methods for bidding are discussed. We believe that it is imperative that in situations where the coal is to be utilized by an electric utility, any

bidding system take into account the financial nature of the utility. One of the systems being proposed is direct bonus bidding. That system would be the least acceptable to Utah Power and many other electric utilities. It is well known that the electric utility industry is the most capital intensive of all industries in the country and that all of its income and expenditures are subject to strict regulation by the state and federal government. As a consequence, these companies would never be in a position to make large cash bonus bids because of the financial difficulties and various problems imposed by such regulations. This should be recognized in the final version of the E.L.S. If the electric utility industry is going to be able to compete with other companies, particularly the large oil and coal companies and other speculators, in bidding on any specific tracts, a royalty system would be desirable.

However, this should not be a royalty system based on profits, but rather should be based on the value of the coal removed from the leased tract. It would have to be considered that the coal will be consumed directly by the public utility, as lessee, and that as the costs incurred in connection with the mining operation, including rents and royalties, are reflected in the rates charged by the utility to its customers. We would be very concerned if the element of "profit" would be considered in the value of the coal which will be consumed directly by the

-9-

-10-

public utility, as lessee of the coal lands. In this connection, there is no feasible way to determine the element of profit when the coal is utilized by a utility. Emphasis should be placed on payments in connection with production and of requiring high maximum payment if lease is not in production in ten years from the date of lease.

Section 3.3.3, concerning management of existing leases, indicates that in the case of non-producing leases, the Department's preference is to apply the unsuitability criteria to the area of the leasehold at the time the lessee submits a mining plan. Utah Power would strongly object to this procedure in that substantial investments are often required in the preparation of a mining plan and the lessee should have some indication prior to risking such substantial investment that much of the property will not be determined to be unsuitable for mining. It believes, in most cases, that adequate information would be available to the various agencies involved to make a preliminary determination as to unsuitability. We suggest a procedure whereby an application for a preliminary determination could be made and an early response received as to whether there is any reasonable chance that any of the lands involved in the mining plan would subsequently be declared unsuitable for mining. The same section indicates that outstanding F.R.L.A.s would be examined for acceptability for mining, using the same unsuitability

criteria, but this process would not depend upon applicant initiative. This would appear to indicate that there should be some process by which existing leases could be examined, preliminarily at least, without the cost, expense and time in preparing a mining plan from the first instance.

Utah Power is, in fact, extremely concerned about the procedure which may be followed in eliminating the so-called "lands unsuitable for mining." While we recognize that the Department's choices are limited by statutory and other constraints, the opportunities for abuse are so extensive as to be staggering. In reviewing the numerous bases for classifying lands as unsuitable for mining, it becomes obvious that once coal lands in the West could be classified unsuitable (if the rules were to be stringently followed) than would be available for mining. While this is an area which might better be discussed in another forum, Utah Power strongly urge that great restraint be followed in applying the lands unsuitable for mining criteria. Otherwise a situation could arise not only where extensive tracts would be unavailable for mining, but where those tracts left after elimination would be of a nature that economical mining there would not be possible. Moreover, it is imperative that an adequate system be devised to compensate lessees for the financial losses which would naturally occur to them if lands upon which they have made substantial

-11-

-12-

legal investments are subsequently declared unsuitable for mining and the lessors are precluded from utilizing them for this purpose.

Section 3.3.6 touches on the question of maximum economic recovery, but does not deal with the problems in an adequate manner. It is obvious that more consideration need to be given to this factor. The statement that "the Secretary prefers that M.E.R. be calculated the way that all coal seams which are collectively profitable must be mined" is too broad and general to be of value.

Section 3.3.7 deals with "end use considerations." This section points out that the Secretary prefers not to adopt end use stipulations as his authority to do so is unclear. Utah Power would agree that in general there should be no end use requirements. However, in determining tract selection, there must be some type of system which assures an adequate supply of coal of the proper type and quality where needed. This would, as noted earlier, require some type of end use consideration, particularly as it relates to the tract selection and bidding process.

In other words, we believe that the Secretary should not dictate the end use that is to be made of any coal, but he should, during various phases of the planning process, take into consideration the intended end use.

ATTENTION: Charles Sech

The following are the comments of the Ad Hoc Public Body Leasing Committee, comprised of representatives from the American Public Power Association (APPA), National Rural Electric Cooperative Association (NRECA), National Rural Utilities Cooperative Finance Corporation (NRCFC), Western Power Association, Inc. (WPA), and Intermountain Power Project (IPP), with regard to the United States Department of Interior Draft Environmental Statement (DES) on the Federal Coal Management Program published in December, 1978.

While we have read and examined the entire DES, we would like to restrict our comments to the "public body" leasing program which has been outlined in the DES, pursuant to Section 2 of Public Law No. 94-377, cited as the Federal Coal Leasing Amendments Act of 1975. It is clear Congress intended to accord a preference to those "public bodies" enumerated therein in the Federal leasing program.

The Secretary of the Interior has indicated his preferred alternative for public body leasing to be "a major program which actively responds to the energy needs of public bodies." We commend the Secretary for this decision and respectfully prefer the following comments which we believe would assist the Secretary in [redacting] writing his preferred alternative.

In Section 3.7.B, **Public Body Leasing**, the statutory term "reasonable number" is used without any defining language. This is also true in Section 3420.1(a)(x) of the Sample Regulation. In order to truly make public body leasing a major program, we believe the term "reasonable number" should be defined as the number of leases which would meet the long-term cost needs of qualified public bodies, as determined by continuing survey.

We believe the program created by this definition would not cause a massive market displacement in the U.S. coal industry because: (1) the coal requirements of public bodies will constitute a small percentage of total U.S. coal production; (2) a substantial portion of those requirements are likely to be met from non-federal areas; and (3) some public bodies may find it more attractive to obtain a portion of their coal supply from existing Federal leaseholders.

We urge the Department to undertake a survey of public bodies to determine their existing and future requirements for coal. NECA and AFPA will provide the Department with lists of public bodies useful for this solicitation. In addition, NECA will supplement the Department's efforts, if desired, with information from studies having performed on coal demand and supply regions for its members. AFPA has plans for similar studies, the results from which would be provided to the Department.

Another statutory term which will require clarification is "definite plan." The provision in the law in which this term appears insures that the coal offered for lease to public bodies would only be used to produce energy for their own use or for sale to their members or customers.

Because of the overall threat of the proposed coal leasing program of matching actual coal demand with Federal coal leases, we respectfully urge that the term "definite plan" simply remove the certification of the governing

entity of the public body that it has made a decision to construct generating facilities which could utilize the coal from Federal leases. It should be remembered that other features of the Coal Leasing Amendments Act cause the realignment of any Federal lease which is not developed within a specified period of time.

In addition, we make the following recommendations:

1. It is essential that my coal offered for lease to public bodies at a minimum be comparable in quality, i.e., high Stu, low sulfur, with coal made available for leasing under any general leasing program. Moreover, these coal resources must be accessibly recoverable, valuable for mining, and within reasonable proximity to transportation facilities.

2. The DOI should permit groups of public bodies to bid together in a joint action project which would bid for one coal tract. The reason for this is the relatively small size of most public bodies in relation to the coal reserves in one Logon Mining Unit.

In addition, public bodies should be permitted to bid for a coal tract under the special leasing opportunity program for their preexisting coal requirements in a joint public/private generating facility.

3. Any departmental determination which would result in a limited or no leasing policy for general leasing in any specific coal region should end, in application, provide opportunity for public body leasing from federal reserves in that region. Public body coal leasing should be a program separate from the general leasing program where intent is to ensure that qualified public bodies have the opportunity to compete for a fair portion of federal coal resources. If Federal coal from any coal region can be made available economically on an interested public body, then we believe this coal should be offered for lease under the special leasing opportunity provision regardless of the standing of general leasing for that region.

4. Because most public bodies do not have readily available sources of front-end financing, deferred house bidding should be employed for the public body leasing program.

5. We note that Section 3420.1(a)(1)(i) states: "Only public bodies with a definite plan for producing energy for their own use or for two or more of their members or customers shall bid for leases designated as special leasing opportunities for public bodies." We suggest that "two or more" be deleted, leaving the Section to read: "Only public bodies with a definite plan for producing energy for their own use or for their members or customers shall bid..."

We appreciate the opportunity to present our views on the draft EIS for the Federal Coal Management Program. Removal of an environmentally sound Federal coal leasing program is essential if this country is to achieve any semblance of energy independence. For public bodies, in particular, removal Federal leasing - with an active special leasing opportunities program - would be most welcome. For these systems being forced to convert from oil and gas to coal generation, an active Federal coal leasing program is their only hope for reasonably priced coal supplies.

Mobil Oil Corporation

Robert W. Tracy
Vice President
GENERAL ENERGY DIVISION
DEPARTMENT OF ENERGY
Washington, D.C. 20240

February 13, 1979

83

Cordial:

In this letter, Mobil Oil Corporation wishes to comment on the December 1978 Draft Environmental Statement (the "Draft Statement") on the proposed Federal Coal Management Program. These comments are directed primarily to the environmental aspects of the preferred program, (the preferred program), as it is described in Chapter 3 and Appendix C of the Draft Statement. Mobil Oil is strongly opposed to both the procedures incorporated in the environmental approach to leasing reflected in the preferred program.

The procedures call for a rigid and highly regulated approach which presumes that all lands in the West are suitable for coal leasing on a regional basis. The concept appears to be to minimize land availability for leasing and to regulate competition. In examining the Draft Statement, however, it is apparent that the preferred program will result in non-leasing instead of encouraging competition in the coal market. This is the position of the Western Energy and Mineral Mining Congress, as stated by Mr. J. Allen Overton, Jr., in his testimony before the congressional hearing.

The general approach of the Department of Interior (DOI) in the preferred program is to sift and study all lands in its west inventory to select a few tracts that may or may not then be available for leasing. This process will result in considerable lengthy delays and considerable expense. Both the delay and the expense will result in a lessening of the mining rate and leasing efforts on specific tracts that are known to be of value. In addition, the preferred program would lead to a lessening of the coal market. This is the position of the Western Energy and Mineral Mining Congress, as stated by Mr. J. Allen Overton, Jr., in his testimony before the congressional hearing.

The general approach of the Department of Interior (DOI) in the preferred program is to sift and study all lands in its west

energy requirements. For these reasons, Mobil urges DOI to give further consideration to a process that incorporates a leasee-nomination process.

A fundamental and recurring problem in the preferred program is the unrealistic underlying assumption that DOI can acquire the amount of land necessary to meet the nation's energy needs by the time the setting of production targets and determination of the need to lease additional land are made, based on the type of analysis used. Considering the long lead times between lease acquisition and actual production and the considerable delays and uncertainties involved in environmental impact statements and review processes under the Surface Mining Control and Reclamation Act, it is clear that the preferred program will not work. Any current leasing decisions will only be reflected in production many years hence, and it will be necessary to expect DOI to be able to predict when there will be a need to lease additional federal lands when it is not possible to know how much of the land already being held will be needed to meet the projected demand for coal, environmental, access, and economic problems. If DOI's forecast is in error, the result will be either an unnecessary waste of money or a misjudged demand or production levels to be achieved. By then, it will be too late to compensate and we could be faced with situations which could have been avoided if the Secretary had been more foresighted.

The Draft Statement fails to consider the socio-economic effects of a failure to lease additional land.

After production targets and necessary of leasing determinations have been made, the planning processes contemplated for the preferred program will result in a detailed environmental impact statement for each tract of land leased. The Draft Statement gives little indication how this process will actually occur, but there is no question that it will be a complex and time consuming exercise over coal leasing and that the coal industry will have little input into the process. We believe that the coal industry will be faced with difficult choices in the future, but the preferred program will still be subject to challenges by various interest groups.

In many cases, the DOI may not even be aware of a coal resource exists. According to Section 1.3.1 of the Draft Statement, almost half of the surface areas identified in the preferred program are prospective bidding areas indicating that about half the areas of interest to private industry were not known by the Secretary at the time sufficient coal resources were identified for leasing. Under the preferred program, such lands would not be leased. A pragmatic program must recognize the impact of industry to determine which lands are suitable for leasing and to encourage evaluation of potential coal properties.

The procedures for obtaining the surface owner consent outlined in the preferred program are unnecessarily complicated. The same purpose could be served by requiring a successful bidder to obtain a consent from the surface owner after the lease is made. The same procedure could be followed as contemplated in the preferred program if the Secretary considers a tract "impure". Adoption of this procedure for all leases would eliminate unnecessary confusion.

DOI's contemplation of placing any use restrictions on coal mined from federal leases without prior environmental justification and has no place in the federal coal management program.

The cost of the preferred program in terms of its impending coal development in the US and thus forcing more reliance on imported oil for domestic energy needs and the security of imported oil supplies, the proposed coal management program provides little comfort.

Again, Mobil strongly opposes the enactment of the preferred program. We urge the Secretary to consider the intent of the Interior to reconsider the objectives of such a program. Early industry input is essential to any leasing system. We believe that this type of leasing system on federal lands by potential lessees promises to be much more workable than the preferred program.

Very truly yours,
W.H. Marshall
W. H. Marshall

WMM:mv

In addition to these general problems, the preferred program raises a number of questions for which it fails to provide answers. The Draft Statement does not give any estimate of the time or cost required to carry out the preferred program, nor does it compare the costs of the preferred program with the costs of other forms of alternative programs and the Draft Statement gives no indication how tracts that are eliminated from leasing considerations at any stage in the process would be reconsidered.

The preferred program contains no procedure under which a potential lessee can obtain consideration of specific traits of federal land that may be unique to that tract. The potential lessee may find necessary federal land may never even be available because it is considered to have low potential for mining. This is particularly true in areas where there are many acceptable alternative sites, because it is considered unsuitable for mining under a mining lease. Even so, the potential lessee may be forced to pay a premium for leasing by public bodies or small business, or because DOI is leasing only alternative sites, as described in the Draft Statement. Finally, the proposed emergency leasing system will provide little relief if the potential lessee cannot conclude with its lessee the lease terms and conditions beyond its control or which it could not reasonably foresee.

The Draft Statement does not provide any mechanism for coordinating the study of individual tracts with the preferred program, so that it will not be required by DOI to USGS as the lessee attempts to develop a site. The potential for wasted and expensive duplicate use of geological information is significant. The Draft Statement also provides for the preparation of four different environmental impact statements prior to leasing.

Mobil specifically objects to DOI's attempt in the preferred program to subject existing leases and preference right lease applications (FRLA) to the same standards as new federal leases. The Draft Statement indicates that such change in the meaning of "commercial quantities" in connection with existing FRLA and would affect the value of existing leases. Such a situation would make FRLA rights cannot be changed by the rules developed for new leases without raising serious legal problems.

The definition of "maximum economic recovery" specified in the preferred program may result in fewer tracts being developed. The preferred program is designed to maximize the overall project, not necessarily economic, as long as the overall project is profitable. This definition will severely limit economic returns and will make some federal tracts less attractive than comparable private lands.

SUNOCO ENERGY DEVELOPMENT CO.

February 9, 1979

Office of Coal Management (140)
Bureau of Land Management
19th and C Streets, N.W.
Washington, D.C. 20245

Comments:

Sunoco Energy Development Company, a wholly-owned subsidiary of Sun Company, engaged in the acquisition, development, and marketing of coal, uranium, synthetic fuel, and geothermal energy, comments on the proposed "Preferred Coal Management Program" as set forth in the Draft Environmental Statement on a Federal Coal Management Program, dated December 13, 1978.

General:

We consider the sections of the DEC treating evaluations and assessments of regional environmental impacts to be comprehensive and of such quality and scope as to properly address all relevant environmental factors. We do not share the concern, however, about the Preferred Coal Management Program described in Chapter Three. In our judgment, this proposed program has several potential problems:

1. We are concerned that some of the laws upon which the program is based do not properly recognize the balance of the environment's environmental, social, and economic goals.
2. The land use planning system, as proposed, goes far beyond the President's intent regarding environmental protection and potentially jeopardizes attainment of coal production goals.
3. The inherent uncertainties associated with utilizing long term projections of coal supply and demand could result in underestimating the levels of leasing necessary to meet our nation's future coal requirements.

4. The potential consequences of a more centralized form of Federal coal management, the exclusion of industry input to the land use planning process, and the prospects of underleassing of needed coal resources on our nation's energy and economic goals have not been adequately addressed.

Specific

Land Use Planning

Our principal criticism relates to the Secretary's preferred option (No. 3, page 3-30) which states, 'Do not use industry information until areas acceptable for leasing have been

We suggest that industry's input is vital to the land use planning process.

- (1) in determination of coal potential
 - (2) in using unsuitability criteria to screen out certain land areas from further consideration for coal leasing
 - (3) in making intelligent multiple-use resource

As proposed, application of the unsuitability criteria goes far beyond the President's intent regarding the objective of environmental protection, and seriously jeopardizes attainment of the environmental quality standards.

We suggest that the unsuitability criteria must be considered with full knowledge, including industry's input, of the coal potential of the lands in question, in addressing whether coal mining might be achieved in an environmentally acceptable manner.

We believe the Final Environmental Statement should not only permit, but specifically provide for, input and use of industry information in the land use planning process. A possible means to this end might be a process similar to the ILM proposed Regional Technical Working Groups in various outer continental shelf areas which will address the entire planning process for OCS leasing.

resource base is adequate to meet maximum levels of future production. In this regard, we believe the BES does not treat adequately the potential consequences of leasing less federal coal than is needed to meet national energy objectives.

Thank you for your consideration of our views.

Sincerely,

Lamont C. Lau
Manager, Exploration
and Acquisition
Western Coal Division

UCL/ehc

could be established for various coal leasing regions, specifically providing for industry representation on each of the boards.

Production Targets

We have two principal questions regarding this phase of the proposed program:

- [1] whether meaningful production targets can be established
 - [2] whether production targets should be used to

We would like to emphasize that uncertainties in both demand projections (e.g., the complexities of transportation infrastructure development, population growth, evolving regulations affecting conversion and use, and supply projections (e.g., geologic unknowns, changing mining and environmental regulations) incomplete data sets, and lack of information on extraction levels and P/LR's without mine plan) place a high degree of doubt concerning the reliability of such estimates for five, ten, and 15 years into the future. It is particularly important to note that these targets are to be utilized to establish long-term "if/then" scenarios.

As a specific suggestion regarding the estimates of production from existing leases and PRA's, we urge that in the required review of the production goals by the Secretary of the Interior, the Secretary should make a finding of understanding between the Department of the Interior and the Department of Energy concerning the establishment of production goals for the production of oil and gas on Federal lands. Appendix B, DOE, states that the substantial level of information available to the Secretary of the Interior should be carefully and reasonably evaluated and conveyed to the Department of Energy. An evaluation of the information available to the Secretary of the Interior and PRA's would be to facilitate the development of reasonable laws and regulations concerning diligent development of oil and gas resources.

Finally, if this information is to be utilized, it would seem advisable to examine ranges of production targets

THE RIO GRANDE CHAPTER OF THE SIERRA CLUB

**Division of Coal Research
Bureau of Coal Production
U.S. Department of the Interior**

FIG. 1. \overline{P}_1 vs. \overline{P}_2 for $\alpha = 0.1$, $\beta = 0.01$.

We are particularly following carefully the response to the draft environmental impact statement prepared earlier last December. We feel that the proposed program is an improvement over our past leases; however, as far as national carryover is concerned, we do not feel that the proposed program is adequately compensated. In that it is anticipated that the proposed lease will be subject to a new environmental impact statement, we believe that there should be opportunities for public participation in the preparation of such statement. We believe that the introduction of lease incompatibility criteria, where certain sites can be excluded from consideration for leasing on environmental grounds, nevertheless, will face serious inadequacies with the real

Firstly, the deal has not been new federal coal leasing and therefore not designed to meet the needs of the coal industry. The new lease program will not affect the development of adequate lease land use plans. According to estimates given in the environmental impact statement, the new lease program, if implemented, would have no effect on national coal production before 1985 or 1990. Before 1985, the new lease program would increase coal production by less than 1% compared to the current BLM outstanding federal coal leases which contain no leases. In 1990, the new lease program would increase coal production by an estimated 17 million tons per year. This is a small amount of coal and is not likely to be grown in the future; however, a delay in the procurement target date will allow the coal industry to develop lease land use plans and, therefore, to expand its use of coal in the future.

First, the mere exemption of applicability to some particular sites give the local land managers too much discretion in applying these criteria. Determination of applicability which becomes highly subjective as well might result in a situation where the criteria would have no effect at all. The exemption applied to the areas near residential clusters would also widen the local land managers' discretion that local mining would not "significantly damage or destroy" the area. The exemption of areas "where mining activities are highly subjective, are phased, and constitute such a temporary use would apply with more definitive guidelines. Furthermore, the exemption would be passed on to the federal government and to the Bureau of Land Management, which is responsible for the lands in question. But anyone can file a permit for a particular site.

There are other exceptions which negate the very purpose of the criteria. One example is the criteria dealing with bald eagles. Under this criteria, bald eagles may be killed with a gun or trap if they are seen to be a threat to the safety of humans or property. However, real mining should be prevented at all times within buffer zones and not while during the breeding season. Even the BLM really believe that these birds are immune to disturbance because the remainder of the year, or even during the breeding season, they are not active. This is also true of the peregrine falcon. The BLM has issued a permit allowing the killing of peregrines, although requiring strict rules. Wildlife Service approval, seems to lateralize every my somewhat logic profession to support environmental and wildlife protection. This exception should be eliminated.

Other examples are exceptions 1 and j to the criterion dealing with natural areas. The first of these would allow mining in natural areas if the local land manager determines, "with concurrence of the state,"

that the area or site is likely to remain a local environmental concern. Depending on the nature of agency petitioned for concurrence, this may include a range of activities from simple monitoring to detailed valuation for their natural contribution to local residents. The third step is to decide what criteria will allow winds in natural areas if the land being managed is to be considered sustainable. This is a difficult task, however, because as potentialized or archetected it takes. It must be pointed out that no new scientific methods and standards are continually being developed in the field of renewable energy and, accordingly, the question of what constitutes a sustainable wind farm is likely to change over time, as well as to answer many specific questions, rather than recovering these resources incrementally, largely consistent with the local environment.

The exceptions to the criterion dealing with floodplains are somewhat similar. The first would allow zoning of riverfront, coastal, and special floodplains if the local board determines that "floodplains are the only practicable alternative." This language entirely eliminates leases which might be sought on sites where zoning interests do not consider it "practicable." These exceptions should be eliminated. The

*This comment also applies to the same exception included in the
criticisms dealing with interstate lands and cities.*

Subject: Comments Upon Draft Environmental Statement, "Federal Coal Management Program"

Dear Mr. Green:

El Paso appreciates the opportunity to comment on the subject SES. The positions offered are divided into procedural and technical issues addressed in the proposed regulations for the SES program. Implementing regulations for the program will be reviewed and comments offered at such time as these regulations are formally proposed.

13. Pemco is concerned particularly with the application of the preferred
Programme to the management of current non-producing leases and leasehold
interests to apply the new "unsatisfactory criteria" to the area of
leasehold as the time of Mine and Exploration Plan submitted. Any
initiative by the BOS to change or modify the terms and conditions of
the leases held under the preferred programme should be considered
as a serious destabilization.
14. In Pemco's view greater obligations of
responsibility should be imposed upon the holder of an existing,
non-producing lease than is represented by the requirement of compliance
with the performance standards of the Office of Surface Mining and any
other applicable laws and the absence or disapproval of a Mine and
Exploration Plan, M&EP, basic approvals.

same exemption would allow mining where permitted for here to people or property owners and the financial values of royalties could be increased. The word "mining" in our opinion, should either be removed or the above quoted sentence should be changed to read "allowing."

Finally, the exemption to the criterion dealing with threatened and endangered species should be modified. As it now reads, mining would be allowed if the land manager "makes every reasonable effort to reduce habitat destruction and disturbance to the development." This is in conflict with the current wildlife service. This should be changed to read "to meet habitat requirements with the Fish and Wildlife Service and adequate public hearings." The same comment applies to the exemption to the criterion

dealing with migratory birds.

We find, as another shortcoming of the proposed project and the draft EIS, that no consideration was given to strip mining as opposed to underground mining. This is inconsistent with DOI's Coal Leasing Rule's recommendations that emphasis be placed on underground mining in order to minimize environmental and social impacts. The reasons cited by this group were that strip mining would be more efficient and less expensive than underground mining on the east margin of the available coal resources which are farther underground, to keep required production levels due to the higher energy content of deeper coal and to provide the smooth growth and expansion of coal associated with underground mining, as opposed to the irregularities associated with strip mining. The strip mining recommendation of DOI's Coal Leasing Rule is:

our final concern on the proposed coal management program deals with the question of residual coal production levels, i.e., the Δ (p-2) versus the Δ (p-1) question. We have assumed that the coal production levels for an indefinite period of time has not been approached. The Δ (p-1) value states that coal production levels will drop to zero power if the coal production levels for a specific mine decline so fast that the long-run effects from such plants employing western coal would be significant. These are very important points, but it is not clear from the literature whether or not there is any evidence to support the Δ (p-1) claim. This is a critical point in our proposed coal management system. There are definite disadvantages to setting high production goals for western coal, and, in the longer range, offset the obvious advantages of setting low production goals. However, we have not yet determined exactly what level residual production levels goals are set.

El Paso supports the position of the National Coal Association and its detailed comments on the DSS and the Preferred Program and urges the OMB to give due consideration to awarding the Preferred Program accordingly.

Technical Setup

The twelve cool regimes are not sufficiently delineated. A map of each region should be included in the description of regional environments in Chapter 4. For example, the Black Mesa area in Arizona is shown on Figure 1-1 as being a part of the San Juan River Cool Region. However, the textual description of that region does not include any part of Arizona. The Navajo Indian Reservation comprises most of the San Juan Basin,

However, the Noveskes are mentioned only in a historical sense.

On page 3-73 and Table 3-44 the term is *meaningsless*. Productivity, being a rate measurement, is a function of time; however, no explanation of the time interval involved is given for the data. Because production rates are inherently different among the four regimes, the procedure to this section of comparing productivity differences among regime is invalid. The validity of the productivity levels and throughout the

On page 2-12, reference number 15 is interpreted erroneously. Aldon and Springfield (Ref. 15) do not state nor infer that irrigation "may be necessary in subsequent years of extremely low rainfall." In fact, the reference publication states "At present, research and planning for irrigation purposes is limited to the first year only." The research results as reported in the publication show that, although precipitation in the 12 months following termination of irrigation was only 3.27 inches, a good stand

of needed options were obtained.

The references cited for the sources of the information in Table D-11 are those which were used in the preparation of the table. In some cases, state-specific studies should be cited. Much of the data were obtained as values for an entire state and used as regional values. For the Ben Lomond Basin, however, the data were extremely local and specific. The area would be 11.0 square miles, or 7,200 acres, which would translate to 132.46 acres/annual unit, a more believable figure (USGS, Soil Conservation Service, 1977). Technical Guide, San Joaquin River Basin, California, U.S. Soil Conservation Service, 1977, p. 10. The value of 132.46 acres/annual unit of Table D-11 is 3.2 times the value/year (Table H-15) is far too high. The Soil Conservation Service estimates productivity for several major

February 12, 1978

the official New Mexico Agricultural Statistics, 1974, produced by New Mexico State University list average irrigated crop production in San Juan County, New Mexico at 1,000 bushels per acre for all crops. The productivities of all crops for which values were found in the literature were below the values used in this document. All regions listed in the literature had higher productivities than those that also appear in Tables H-15 and H-17. The calculation of potential loss of productivity due to coal leasing is based on the assumption that allocation of land to various land-use categories; the values are calculated on the basis of the productivity of the land under each category. Tables D-3 through D-16 are therefore assumed due to the questionable values used in the calculations of potential losses of plant and animal productivity due to coal leasing. A conservative estimate of potential losses does not negate the importance of using a proper data base.

I. INTRODUCTION AND SUMMARY

The comments on the Draft Environmental Statement prepared by the Bureau of Land Management (BLM), Department of the Interior, concerning the Federal coal management program are submitted on behalf of the Natural Resources Defense Council, Inc. (NRDC). For the reasons discussed below, we believe that both the Draft Environmental Statement (DES) and the Department's proposed program for management of federal coal are seriously flawed, and must be revised in order for the Department to achieve its paramount objective -- to ensure that

"all future leasing must not only conform to, but be a product of, a planning and regulatory process designed to be protective of the environment and other resources and interests." (p. 2-51) ¹

NRDC is a non-profit environmental membership organization with longstanding and well-known concerns regarding the environmental and other problems associated with the Department of the Interior's management of all publicly-owned resources, including coal. Since its inception, NRDC has engaged in a variety of activities, including litigation, the submission of comments on proposed regulations and impact statements, and consultation with various agency officials in order to ensure that environmental values are fully considered by the Department in its management of

-2-

coal and other resources. Indeed, the preparation of this DES was required by court order as the result of NRDC's successful challenge to the adequacy of an earlier Environmental Impact Statement on federal coal leasing prepared by the BLM. NRDC, et al., v. Hughes, et al., 437 F. Supp. 981, 993 (D.D.C. 1977); as modified; 454 F. Supp. 149 (D.D.C. 1977); appeal pending, No. 78-1656 (D.D.C.).

As the Department of the Interior recognizes, this draft statement "comes at a critical juncture in a long history of starts and stops for a federal coal management program...." (p. 1-1) As indicated, this statement represents the Department of the Interior's second attempt to comply with the National Environmental Policy Act of 1969 (NEPA) in the development and analysis of the coal management program and alternatives thereto. In NRDC, et al., v. Hughes, et al., Supp., the District Court for the District of Columbia ruled, NRDC, et al., that the final coal programmatic impact statement released by the Department in 1975 failed to adequately describe the management program with which it dealt, that it failed to consider reasonably available alternatives, and that it failed to address the question of the need for a new leasing program in light of the magnitude of coal already under lease. 437 F. Supp. at 988-991. Consequently, the court enjoined the Department of the Interior from "taking any steps whatsoever

directly or indirectly to implement the new coal leasing program except under certain specific circumstances, and ordered it to prepare an EIS which fully complies with NEPA. Id. at 933-934.

In addition, the program with which this impact statement deals, i.e., the "preferred alternative," constitutes the Department's third attempt since 1970 to develop a comprehensive coal leasing program to replace the uncontrolled and passive leasing policy of the past and to avoid the adverse environmental and other impacts which had resulted therefrom. See Comments of NEDC on the DOE's proposed Federal Coal Leasing Program (DHS 74-53) (August 2, 1974), p. 17. The first attempt, ENRAS I, was an ill-described program, id., pp. 23-27, in which the Department would relate "inventoried Federal coal resources to national projections of coal-derived energy needs." NRDC v. Hughes, 437 F. Supp. at 984 n. 8. The Department subsequently replaced ENRAS I with its second attempt at a comprehensive management program, ENRAS II. Under ENRAS II, the coal industry was to nominate the areas and tracts to be considered for leasing. The substitution of DOADS II for ENRAS I was made "without [the]... proper explanation." Id. at 933.

Finally, the currently preferred alternative and the instant draft impact statement represent the Department's first comprehensive attempt to respond to the broad requirements of three major statutes recently enacted by Congress -- the Federal Land Policy and Management Act of 1976 (FLPMA), Pub. L. 94-579, 43 U.S.C. § 1701 et seq., the Federal Coal Leasing Amendments Act

of 1975 (FCLA), Pub. L. 94-377, 90 U.S.C. § 161 et seq., and the Surface Mining Control and Reclamation Act of 1977 (SMCRA), Pub. L. 95-247, 90 U.S.C. § 1201 et seq.

The preferred alternative described in the DES presents the structure of a rational approach to the management of the Nation's coal. It integrates coal management decisions into the broader context of resource management. It establishes a cyclical process for the evaluation of the need for the leasing of federal coal. It describes procedures intended to assure the development of that coal first which will cause least damage to the environment and to prevent development of coal which would cause irreparable environmental harm.

Closer scrutiny, however, reveals that the preferred alternative is full of flaws and ambiguities. The machinery for its implementation, to the extent it is visible through the DES, is ill-construed. It leaves discretion where it should set standards. It relies on the products of previous management systems when it should start anew. It seeks, above all, to assure that more than enough coal will be available, although the President's Environmental Message of May 23, 1977, FLPMA, FCLAA and SMCRA mandate that first consideration be given to the environment.

The DES as a whole fails either to meet the specific requirements imposed by NRDC v. Hughes, or the broader mandates of FEDA.

A programmatic impact statement represents a task unique in Federal policymaking. It imposes a nondiscretionary duty upon federal officials to think in a certain way about discretionary acts. The programmatic impact statement is a vehicle for introducing human environmental values into the decisional process. It is designed to affect and inform that process from its earliest stages, yet is required to be made public, subjected to public scrutiny and comment, and to be responsive to public view. The programmatic impact statement requires an agency to consider values outside its mission at the very moment it develops the basic policies for carrying out its mission. It requires comprehensive analysis which ranges far outside the normal orbit of an agency's responsibility. For this reason the programmatic impact statement is unique and essential. It is virtually the only process for effectively addressing such broadscale human concerns.

For more comprehensively than its predecessor, the DES addresses critical issues. But the analyses begun are often left incomplete. Discrete topics are described but remain isolated, unconnected by analysis. The treatment of the need for leasing is critically deficient. The description of the preferred alternative is inadequate. The description of the environmental and other impacts which will result from the development of federal coal is inadequate. Important issues, including the rehabilitation of mined lands, are treated only

cursorily. The alternatives considered are not genuine alternatives, but rather fragments of alternatives.

The flaws in the preferred alternative and the DES are overshadowed, however, by the frantic drive to prepare for a mid-1980 lease sale. These preparations are proceeding in a manner inconsistent with the preferred alternative. They have left the DES and the decision which it is designed to inform far behind. Therefore, we turn first to the coal leasing program which is already being implemented.

II. PREPARATION FOR A MID-1980 LEASE SALE UNDERMINES THE DES PROCESS

Memoranda written by the Director of the Bureau of Land Management (BLM) and the Directors of the Western Coal State Offices of the BLM reveal a strenuous and systematic program to prepare for a mid-1980 lease sale. The program, directed specifically toward the identification of forty lease tracts in time for the 1980 sale, requires updating of MFTs prepared for coal management under ENRAS II and the application of the draft Land Suitability Criteria. The 700,000 acres of land to be reviewed as part of this program have not been selected pursuant to comprehensive resource planning. There has been no intraregional evaluation of competing values. The criterion by which the selection was made was simple. "Focus on planning areas where completed MFTs delineate areas potentially suitable for coal leasing to meet short-term (1980) leasing goals."

A major step in the preparations for a mid-1980 lease sale is the application of the draft Lands Unavailability Criteria. See 43 Fed. Reg. 57642, 55 MSC (Dec. 8, 1978); 44 Fed. Reg. 2201-2202 (Jan. 10, 1979); DCR, p. 5-141. Although the criteria are an integral part of the preferred alternative, they are being applied before they have been formally promulgated, and exposed to public review and comment. The Department has characterized the application of the criteria as a "test" and asserted that, because it can "change the NFPA if necessary to comply with the final regulations," the "process does not irretrievably or irreversibly commit any resources." 43 Fed. Reg. 57644 (Dec. 8, 1978).

The urgency of the Department's efforts to prepare for a mid-1980 lease sale renders that assertion ridiculous even if technically correct. Substantial changes in the criteria would require major revisions; major revisions that would have to take place during the summer and fall of 1979. The Department's planning documents state that in order for the mid-1980 lease sale to take place application of the criteria must be completed by April 15, 1979. Facsimile Message 78-45, September 21, 1978, p. 2, and revision of the NFPA must be completed by June 1979. See Instruction Memo 78-381, July 19, 1978. Thus, any meaningful change in the criteria would render leasing in 1980 impossible.

The consequence of the massive effort to be ready to lease by mid-1980 is that a coal leasing program is being implemented, once again without prior consideration of the need for and effects

that the EIS was inadequate. It found both the explanation of EMADS II and the consideration of alternatives to be insufficient. The court specifically referred to the necessity that the Department consider the need for any leasing at all, and ordered the Department to prepare a new draft Impact statement and the Secretary of the Interior to

personally revueolate federal coal leasing policy, based on information contained in the new draft EIS. The court also directed that "any new leasing program shall be instituted and, if so, what kind of program it should be."

National Resources Defense Council v. Hughes, 437 F.Supp. at 994 (emphasis added).

Until that task is complete, the Department is enjoined from taking "any steps whatever, directly or indirectly, to implement the new coal leasing program" 437 F.Supp. at 993.

The Department has apparently concluded that the provision of the Court's order, as modified, which permits the "preparation of comprehensive land use plans," 434 F.Supp. at 121, forbids only implementation of EMADS II and the identification or leasing of tracts. 43 Fed. Reg. 57643 (December 8, 1978); Memorandum from the Deputy Solicitor to the Director of the Bureau of Land Management "Planning and Data Collection Efforts Under NRDC v. Hughes," at 1-2. Such a conclusion is incredible in the context of the decision of the court. The order of the court explicitly bars implementation of "the new (emphasis supplied) coal leasing program; the point of the order is to compel the Department to properly complete the EIS process before it adopts, let alone implements, a new program.

of leasing. However careful the analysis in the final programmatic impact statement may be, it will come more than a year too late. It is inconceivable that the program, already forging ahead on the tight schedule, with an enormous commitment of resources, will be canceled or significantly modified in response to the comments on the draft RS not yet even submitted.

Because of the demand for haste, the ghost of EMADS II stalks throughout the process. The lands being reviewed are those subject to nine existing MPAs. Those MPAs were prepared and updated for use under EMADS II, not the sustained yield, multiple use mandate of FILPNA, or the environmental requirements of the President's Environmental Message and SMCRA. The data they provide were collected to answer questions asked under EMADS II, not the "preferred alternative."

Finally, most of the important decisions for the mid-1980 sale will have been made without public participation. The process will have been underway for nearly a year before the public has even commented on the draft programmatic impact statement. The lands unavailability criteria have not been published for comment except as a part of the draft statement. By the time the EIS planning regulations and the coal program regulations are resculpted, the mid-1980 lease sale will have progressed to the point of tract identification.

The issue in NRDC v. Hughes was the adequacy of the final Environmental Impact Statement prepared on the Energy Minerals Activities Recommendation System (EMADS II). The Court concluded

The language which permits land use planning to go forward is addressed to comprehensive planning which incidentally involves consideration of coal. Yet the Department has initiated planning activities directed only to the leasing of coal.

We regard the Department's violation of the court's order as an complete as to render the Programmatic Impact Statement functionally irrelevant. The Department's memoranda and actions suggest that the decision to lease and to lease soon was made before the basic tasks imposed by the court were even addressed. The Impact Statement will inevitably turn into an effort to justify that decision rather than a means to inform the decision-making market.

This is particularly distressing because the evidence is so strong that early leasing is unnecessary. See Section III.A., infra. Indeed, the principle justification suggested in the EIS is that additional leasing may be necessary by 1990 and bureaucratic and start-up delays may be such as to cause up to seven years delay (DCR, p. 2-61). Even this figure would not justify immediate leasing, and most of the delays referred to in the EIS will be eliminated if the Department simply goes forward with systematic resource management decisions, unhampered by leasing pressures.

Such an approach would permit comprehensive review on the basis of adequate data. It would allow the Department to effectively gauge the effects of diligent development requirements and changing energy demand trends.

The time needed to establish and implement a sound and comprehensive management system is available to the Department. The Draft Environmental Statement reveals that adequate supplies of coal are available to meet short-term needs. It shows that potential production from existing leases and planned production from private lands will be sufficient to meet low and medium projections of demand through 1985, and to meet the low projection of demand through 1995. As we discuss more fully below, the higher demand projections presented in the statement overestimate future coal demand by a substantial amount. Furthermore, the Department's estimate of planned and likely production does not include the production potential from existing preference right lease applications. It is therefore most unlikely that additional Federal leasing will be required in the near-term future to meet the nation's demand for coal.

It is equally clear that the Department should take the time needed to ensure proper management rather than attempt to meet its arbitrary 1980 deadline for new leasing. As we stated in our comments on the previous draft coal programmatic EIS:

"Coal is an important, irreplaceable natural asset that must be conserved judiciously if we are to meet our energy requirements in the most responsible manner" as required by NEPA. Although the United States is relatively oil-rich, with coal estimated to be the fuel of the 21st century, the Department made this resource so abundant that we do not have to be concerned about its rate of use or how it is extracted and used. Because coal is

the nation's major potential source of hydrocarbon fuels, from the basis of synthetic materials, including plastics and pharmaceuticals, to coal as a major industrial fuel, it is particularly important to generate policies that may rely heavily upon coal for the long term. This reliance on coal is especially important in light of the relatively limited availability of massive hydrocarbon resources such as natural gas and petroleum. Thus, on this basis alone, the Department's proposal to expand mining and utilization to the lowest practicable level is unacceptable.

Also, there are important health-related reasons why coal should not be used directly for production of electrical energy. There are the same reasons that most utilization of coal has declined since the early 1970's. The arrival of the "energy crisis," had little effect on coal use until the late 1970's.

Earlier surface-mined areas have not been adequately "rehabilitated" and proposed areas for leasing in the West may not be capable of being rehabilitated at a reasonable financial cost. Coal-fired power plants produce sulfur dioxide, which pollutes air and causes acid rain. They also pollute air for oxides and toxic trace minerals. And, as noted above, coal contains mercury. It is these very undesirable aspects of coal utilization that should argue strongly for minimizing the leasing and mining of coal.^{1/}

^{1/} NWCC Comments, pp. F-9 (footnotes and references omitted).

III. THE INADEQUACIES OF THE DES

The Department asserts that this DES corrects the defects in the previous final coal programmatic EIS that were identified by the *Hughes* court and responds to the major issues raised by commentators on both the draft and final versions of that statement. (p. 1-12) Although the DES is an improvement over the earlier versions in some respects, it suffers from the same kinds of fundamental problems from which they suffered.

A. The DES Does Not Adequately Assess the Nation's Needs for Coal.

1. An order issued Judge Pratt in NWCC v. Hughes pointed to the importance of performing a thorough analysis of need for coal in making the determination of the appropriate federal coal policy.

An important issue in Judge Pratt's consideration of the adequacy of the Final Environmental Impact Statement on the Proposed Federal Coal Leasing Program (FBS 75-80) was the question of whether additional leases were needed in order to provide enough coal to meet the nation's energy requirements. In our comments on the 1974 DES, we argued that the requirements could be met without additional leases. Judge Pratt concluded from these arguments that,

"In light of these statistics, [showing that coal then under lease could meet demands for 1985] the court should question as to whether the proposed policy is even necessary should have been adopted in 1974 and as to whether NWCC et al. v. Hughes, 437 F. Supp. 991 (emphasis in original).

Obviously, Judge Pratt considered the issue of coal demand to be fundamental to the evaluation of federal coal management policy options.

As the Department of Interior itself admits in the DES,

"The failure of the Department to show the need for leasing was cited by the Court in its decision as the most serious defect in the previous coal leasing programmatic environmental impact statement...." (p. 2-42.)

While the Department has attempted to comply with the Hughes order by addressing the question of the need for additional leasing in the new Statement, its discussion of this issue is little more than a rationale for the preferred program. Once again, the Department has failed to establish that there is a need for the coal that additional leasing would provide. Thus the "threshold question" as to whether the preferred program is needed has not yet been answered. We believe this failure is a major inadequacy of the Statement.

2. A review of the projections of coal demand in the Statement shows that new leasing is not needed to meet near-term energy requirements.
- a. Both the Department of Interior and the Department of Energy admit that demand can be met through 1985 in the "low" and "medium" scenarios, and through 1990 in the "low" scenario, without new leasing. In response to a request by the Department of Interior (DOI), the Department of Energy (DOE) prepared a range of projections of production required to meet demand for coal in 1985 and 1990. DOI then compared the DOE projections with its own estimates of planned and likely production as a basis for judging the need for additional Federal coal development. The comparison shows that total planned and likely production for 1985 exceeds the DOE low projection by about 120 million tons; the medium projection is exceeded by over 30 million tons (p. 2-45). Similarly, the low 1990 projection is exceeded by about 50 million tons. (p. 2-46.)

This conclusion is given added weight by the fact that DOE's estimate of the gap between likely production without new leases and coal requirements was significantly greater than that of DOI.

In short, initial inspection of the coal need projections and the DOI estimate of total planned and likely production suggests that immediate resumption of federal coal leasing is far from a necessity. Furthermore, the DOI comparisons tend to exaggerate the need for additional leasing, due to the exclusion from the comparison of additional potential coal production and to the overestimation of future demand for coal. Our analysis below of the assumptions used in making the supply and demand projections displayed in the statement show that there is little evidence to support the Department of Interior's contention that there is an urgent need to establish a program for the immediate resumption of Federal coal leasing.

- b. The estimates of demand used by the Department in its analysis of the need for leasing are unrealistically high. The draft Environmental Statement contains two sets of need projections, the first of which were developed by the Department of Energy in the study referenced above, and the second of which consists basically of the DOE projections as modified by the Department of Interior. Since the two sets are based on similar assumptions regarding total demand levels, we restrict our comment here to the initial set of projections prepared by DOE. Due primarily to unrealistic

The Department of Interior admits that,

"With the addition of likely production from existing federal leases not now included in the total, the coal available would be little difficult in achieving the DOE low 1990 projected demand. This is because federal leasing of all planned production materializes." (p. 2-44.)

On the other hand, the high DOE projection for 1985 and the high and medium projections for 1990 exceed the DOI estimate of total planned and likely production for those years. However, as the Statement notes,

"The fact that currently planned and likely production, together with the amount of coal available under existing leases, is not sufficient to reach high and medium 1990 projected demand does not mean that these projected levels could not be attained without new federal coal leasing." (p. 2-44.)

In the study from which the production projections were taken, the DOE also concluded from its own comparison of production expected to take place regardless of future federal leasing actions with the need projections that:

"It must be emphasized that these projections do not indicate that new leasing is needed. Rather, the shortfall could be met by an expansion of approved mining operations, development of non-federal coal resources, expanded development of non-federal coal, additional leasing of any / combination of these policies." (p. 2-45.)

* PERA production potential is not included in the comparison discussed here.

¹ Federal Coal Leasing and 1985 and 1995 National Coal Production Projections, Planning Policy Development Office, Department of Energy, June 1978, Executive Summary, pp. 10-11.

assumptions about the rate of growth in electricity demand and the consumption of western coal in the West, we believe that the DOE production projections are based on exaggerated estimates of demand. These issues, along with a number of other factors which resulted in inflated demand estimates, are discussed below.

The DOE projections of several coal demand indicate that the electric utility sector will continue to dominate coal demand, representing 68% of the medium case demand in 1985 and 66% of the medium case demand in 1990. (p. 2-28.) Thus, the assumptions regarding growth in electricity demand are key to the analysis of total demand requirements.

The DOE projections assume that electricity demand will grow from 1977 to 1985 at the rates of 4.4% per year in the low case, 4.8% per year in the medium case, and 5.8% per year in the high case. The level of population growth, estimates of future cost of electricity to the consumer, and amount of conservation underlying these projections are not specified, making it difficult to perform a detailed analysis of the projections. However, a comparison with the actual rate of growth in national electricity demand which has occurred during the period following the oil crisis of 1973, 3.5% per year,^{3/} indicates that the DOE assumption represents a relatively high

^{1/} Calculated from data for 1972 and 1977 in Monthly Energy Review, Energy Information Administration, Department of Energy, December 1978, p. 55.

estimate of future growth in electricity demand, rather than a realistic range. Considering the fact that much of the reduced electric demand growth rate in the past five to six years was due to the institution of conservation measures which could be achieved easily on a short-term basis and in response to price increases small by comparison to long-term prospects, we believe that the long-run response to increasing electricity prices has only begun to emerge, and that, as a result, overall demand growth rates will continue to drop.

As the draft statement points out, the DOE projections of demand are based on a macroeconomic analysis which relates energy use to variables such as income. (p. 2-25). The Statement also notes the existence of an "alternative approach currently ... employed in California." (p. 2-25) The alternative approach referred to, known as end-use analysis, produces forecasts of energy demand which are much more consistent with recent trends than does the economic approach used by DOE. The Department of Interior claims that:

"To complete the comprehensive inventory ... the survey method used in California would take considerable time and resources." (p. 2-25)

The fact is, however, that much of the preliminary work needed to perform such an assessment on a national basis has already been done as part of a study by the National Academy of Sciences' Committee on Nuclear and Alternative Energy Systems, in which a great deal of data was collected on national energy consumption by sector. Although this study has not yet been published in entirety, the demand analysis results are

summarized in an article entitled "U.S. Energy Demand: Some Low Energy Futures" (Science, 14 April 1978, pp. 142-152.)

The Department of Interior stated that,

"it should prove desirable, if it will be possible for the Federal government to undertake the kind of study required to evaluate California or other alternatives to the preferred program's current projections." (p. 2-25.)

In view of the importance of reliable demand projections in formulating a rational Federal coal policy, we believe that the Department should re-evaluate its need projections using this methodology, before establishing a new leasing program.

The DOE production projections cited in the Statement also overestimate the extent to which western coal will be used to meet future demand for electricity. While the Department of Interior states that "the most important sources of increased demand for western coal are in the West itself," (p. 2-25) western production is projected to grow much more rapidly than western consumption. For example, under the preferred program, medium production of western coal in 1990 would be more than six times greater than the amount produced in 1976. (p. 5-11.) In contrast, western coal consumption would only triple in the same period. (p. 5-13.) Western production in the preferred program medium projection would exceed western consumption by 445 million tons. The draft Statement is therefore somewhat misleading in alleging that,

"... new demand for western coal will be from power plants and industries in the West. The growth in demand for coal will be higher in the West than in any other region of the country." (p. 5-13.)

While the Department's figures indicate that western coal demand will grow at a faster rate than eastern demand, the absolute increase in consumption is projected to be far greater in the East than in the West. (p. 5-13.)

The extent to which western coal is used in the East will depend largely on the strictness of the New Source Performance Standards, to be promulgated soon by the Environmental Protection Agency. The medium and high coal demand projections assume that the New Source Performance Standards will require a lower level of flue gas desulfurization on low sulfur western coal than on eastern coal, (p. H-4) which would lower the cost of western coal and increase eastern demand. Only the low projection is based on the more realistic assumption that 95% flue gas desulfurization would be required on all new plants, regardless of coal type. While it is not certain that EPA will adopt the stricter standard, all new coal plants located in Prevention of Significant Deterioration (PSD) areas will be required to use Best Available Control Technology, which the states can interpret to be greater than the lower desulfurization levels assumed for the medium and high demand projections. For example, in California the Air Resources Board and Pacific Gas and Electric Co. have agreed that the proposed "Fossil" coal plant, if built, will meet a

95% flue gas desulfurization limit.^{5/} If eastern states follow this trend, there will be little incentive for eastern utilities to burn western coal.

The DOE coal need projections used by the Department of Interior are also overstated because they are based on underestimates of the costs of using western coal. The DOE model used to project coal demand and supply is structured so as "to minimize the total delivered costs of energy to the demand sectors in all regions. . . ."^{6/} However, the approach used resulted in an underestimate of the costs of coal production and transportation. Although "economic criteria were used to determine the relative cost of coal production from each regional production area,"^{7/} it does not appear that the Department of Energy has taken into account explicitly the additional costs which will be imposed by environmental protection actions required by the new Federal leasing program. The DOE model also underestimates the transportation costs of providing the amount of coal considered in each projection by assuming that railroad hauling rates will rise only at the same rate as the general inflation rate of the overall economy. It is difficult to believe that the high

^{5/} Stipulation re BACT in the Matter of Notice of Intention by Pacific Gas and Electric Co. to file an Application for Construction Permits for the Fossil I and II Project, L70-779,ocket No. 77-HO-24.

^{6/} DOE, pg. 51A, p. 56.

^{7/} Id., p. 64.

capital investments which will be required to expand the existing transportation system are factored into this assumption.

The DOE model therefore appears to have under-estimated the costs of both producing and transporting coal, an error which will result in unrealistically high estimates of demand for the coal.

Another factor which will result in the likelihood of demand levels lower than projected by DOE is the recent authority granted to the EPA to require the use of local coal. Provision for such authority was included in the Clean Air Act Amendments of 1977; but:

"Given that the fate of this provision is unclear, it was not included in any of the [DOE] scenarios."^{13/}

Subsequent to the preparation of the DOE report, however, the EPA was indeed granted such authority, and has already proposed in at least one case to issue an order to require Ohio utilities to use Ohio coal.

"Resolution of this precedent-setting 'local coal' case may well determine the marketability of coal from other sources, such as Illinois."^{14/}

Finally, we believe that the DOE demand projections are overstated due to inflated estimates of production requirements for industrial consumption, synfuel production and exports.

^{13/} *Id.*, p. 162.

^{14/} *Western Interstate Energy Board Newsletter*, 3 January 1979, p. 6.

The DOE mid-range and high industrial demand projections expressed in terms of Btu's are expected to more than double between 1973 and 1985.^{15/} The largest regional industrial demand would be from the West South Central region, which includes Texas, Oklahoma, Arkansas, and Louisiana. Industrial demand in this region is expected to increase by a factor of over fifteen. Given the recent natural gas glut, it is preposterous to assume that conversion of existing industrial facilities will occur at the rate required to result in such a fantastic increase in coal demand.

The DOE estimates of coal required for synfuel production and exports, while only a small part of the total demand projection, are similarly overstated. For example, the low projection for 1985 was based on the assumption that seven (presumably liquefaction) plants with a capacity of 10,000 barrels per day each will be in operation by 1985; the medium and high projections assume thirteen and twenty-seven plants respectively.^{16/} In view of the extensive Federal funding which will be required to make such facilities available on a commercial scale in the near future, we question the realism of these estimates. While DOE is anxious to encourage these technologies, it is currently having difficulty obtaining adequate funding from Congress for even a limited number of liquefaction and gasification plants. *See The Energy Daily*, January 30, 1979.

^{15/} *Id.*, p. A-5.

^{16/} *Id.*, p. 103.

We therefore believe that a projection of seven plants by 1985 would be optimistic even for the high demand scenario.

We also question the assumption that exports will increase by nearly 50% between 1977 and 1985 as is indicated in the DOE projections. (p. 2-26) First, if demand is to grow domestically at the rate assumed in this analysis, it would be more likely that exports would be displaced to meet domestic demand. Second, it seems inappropriate to us that foreign demand for coal should be included in the consideration of whether to lease additional federal lands for coal mining. In any event, the assumptions which determine this estimate of demand should be disclosed.

c. The estimates of planned and likely coal production used by the Department in its analysis of need for additional leasing are too low. The Department of Interior's estimates of total planned and likely production with which the DOE need projections are compared include planned and likely production from mines on existing Federal leases, planned production from Indian Lands and planned production from wholly non-Federal mines. (p. 2-45) Not included, however, is the production potential from outstanding Preference Right Lease Applications. Thus, the estimate of total coal supply likely to be available in the late 1980s without new Federal leases is significantly understated.

The Department gives no explanation as to why it excluded preference right lease application production potential from its estimates of total coal availability, although it does state that:

"It is unlikely that many preference right lease applications could be processed and put into production before 1980. However, the potential of preference right lease applications is of importance, especially in understanding 1980 coal requirements." (p. 2-46)

While we would not argue for rapid processing of preference right lease applications, it appears to us that they could be developed just as rapidly, if not more quickly, than could new leases. Although the Department acknowledges, as quoted above, that preference right lease application production could contribute to meeting 1980 coal requirements, it does not even include preference right lease application production in its estimate of planned and likely production for that year. We therefore suspect that the production potential from preference right lease applications be considered on a par with the rest of the planned and likely production used by the Department for purposes of comparison with the need projections.

In order to have a clearer picture of the total availability of coal without new Federal leasing, we review the Department's estimates of preference right lease application production potential. Total annual production potential from applications about which there are no legal or environmental questions is estimated to be 255.8 million tons, which represents over half again the Department's estimates of total "planned and likely production." In the table below, we add the preference right lease application potential to the planned and likely production and display it beside the low, medium and high DOE need projections for 1985 and 1990.

**COMPARISON OF POTENTIAL COAL PRODUCTION
WITH THE DOE DEMAND PROJECTIONS**

Planned & likely Production	PLRA potential	Total potential Production	DOE Projections		
			Low	Medium	High
1985 421.2	250.8	673.0	299.8	391.1	426.7
1990 419.3	250.8	670.1	364.5	659.7	922.1

The table indicates that, with the development of the potential from existing preference right lease applications, new Federal coal leasing would be conveniently required only to meet the high DOE demand projection in 1990. All three demand projections for 1985 could be met without additional Federal leasing, as could the low and medium projections for 1990.

d. The Department of Interior's position regarding the need for new leasing under a low demand growth scenario is incorrect. As indicated above, the Department explicitly acknowledges that the planned and likely production levels would be adequate without additional Federal leasing to meet the DOE low and medium demand projections for 1985 and the low demand projection for 1990. It states that new leasing would be required nevertheless even in those cases, due to the fact that low demand growth would result in a failure to develop many existing leases in time to satisfy the diligence requirements. In contrast to the implication elsewhere throughout the statement that coal demand will grow rapidly, the Department contends that, "(the most important potential constraint [on planned production] is lack of demand." (p. 2-30)

3. The draft environmental statement does not give adequate consideration to alternatives for meeting the nation's energy demands.

As we pointed out in our comments on the draft programmatic statement issued by the Bureau of Land Management in 1974, the statement must contain a thorough consideration of the existing national energy alternatives to the proposed...program.^{15/} We also suggested in our earlier comments that it may be preferable to have the comparison of alternative energy options on a careful consideration of the tradeoffs between different energy sources in a programmatic environmental impact statement for the National Energy Plan. In the absence of such a statement, it is incumbent upon the Department of Interior to provide as thorough an analysis of the alternative energy options as possible in order to develop a rational Federal coal leasing program which will best suit the needs of the nation.

Rather than performing such an analysis, the Department of Interior appears to have accepted with little thought the assumption that expanded use of coal represents the main avenue for achieving the goal established in the National Energy Plan of reducing projected increases in imports of foreign oil. A brief examination of the Statement's discussion of the availability of other energy resources points out its inadequacy in this regard.

The discussion of production trends in oil and natural gas ignores a number of recent developments which will affect national energy policy regarding coal use as well as the demand for coal. First of these is the impact of Alaskan oil production

^{15/} NRC Comments, 02 CII., p. 65.

The Department argues that if demand is not strong enough to stimulate development of existing leases by 1985, the enforcement of diligence requirements will result in the cancellation of these leases, necessitating new leases in order to meet demand by 1990.

"As noted the enforcement of diligence requirements will aside from expansion in already operating mines, increases in production of 11.5 million short tons from new Federal leases.^{16/} (pp. 2-30, 2-31 (emphasis added))

The argument does not make sense, however, in view of the fact that the Secretary of the Interior has discretion to extend that period for five years.^{17/} Furthermore, if demand is insufficient to stimulate production on existing leases, we do not understand how it can be so great as to require new leasing. We therefore disagree with the conclusion that,

"... the only forecast that leads to a major increase in coal production is achievement of 1985 medium or high projections. This projection is followed by a sharp downturn in demand resulting in little if any further increases in production to 1990." (p. 2-44)^{18/}

^{15/} This is not to argue that such a policy is desirable. Indeed, we recommend that the Department move as quickly and aggressively as possible to determine whether existing leases can and should be renewed. If this assessment determines that coal demand does not grow as quickly as anticipated, it may make sense in many cases to renew existing leases rather than to cancel an existing lease and subsequently issue a new lease.

^{16/} It should also be pointed out that such a scenario is not at all unlikely, since the full impact of many new conservation programs will not be felt on demand levels before 1985.

on the California energy situation. California, which now has a surplus of crude oil due to the new Alaskan supplies, is currently working with the Federal government to allow greater use of oil. This development, combined with other factors, makes it unlikely that California will be in the market for many coal-fired power plants within the next decade.

Another important development is the Department of Energy's recent recognition of the vast Mexican reserves of oil and natural gas. While there is still a great deal of uncertainty as to the amount of these reserves which would be available for use in the United States, Mexico appears willing to negotiate with us. Moreover, the Department of Energy appears to consider Mexican imports in a somewhat different light than it does imports from other foreign countries. Finally, an important point overlooked in the discussions of the natural gas production trends is the recent increases in availability of natural gas due to the deregulation of prices resulting from the new Natural Energy Act.

The Statement's discussion of potential energy from hydroelectric power and geothermal reserves is even more scanty than that of oil and natural gas. The Statement acknowledges the possibilities for expanding electrical capacity at existing dams to increase hydroelectric production, but gives no estimate of the potential. In light of the fact that this option represents a potential capacity of 47,000 megawatts nationwide,^{19/} for which

^{15/} Blueprint for a Solar America, Solar Lobby, January 1979, p. 25.

the equivalent coal-fired capacity would require the mining of 140 million tons of coal per year, we believe the Department of Interior should have considered this alternative more seriously. The Department's analysis of geothermal applications is likewise deficient. No mention is made of the California geothermal potential of over 15,000 megawatts.¹⁷ The estimate of the contribution which could be made by solar energy is also unduly pessimistic. The statement cites forecasts which "suggest that as much as one percent of U.S. energy needs could be met by solar sources." During the period between the year 2000 and 2020, (p. 2-23) Other forecasts have estimated that as much as 20-25 percent of the nation's energy needs could be met by solar energy by the year 2000.¹⁸

As the Department of Interior acknowledges, an important means for addressing the problem of growing energy demands is to curb those demands by greater use of energy conservation measures. (p. 2-24.) The Statement's discussion of energy conservation, however, indicates that the Department does not consider energy conservation to be a serious alternative to substantially increased coal utilization. After listing a variety of conservation measures, it is stated that,

"The various conservation measures could reduce demand by 1990 if they were major technology advances." (p. 2-24.)

^{17/} California Energy Commission, *Status of Alternative Technologies*, January 1979, p. 35.

^{18/} Council on Environmental Quality, *Solar Energy Progress Under Franklin*, April 1978, p. 4; Solar Today, DEC 81, p. 2.

No analysis is provided, however, as to which measures would have to be undertaken in order to achieve such a reduction. While the Department admits that, "in many cases, conservation measures might well be more cost-effective than development of new energy sources," (p. 1-24) it has not made a serious attempt to quantify the potential demand reduction which could be achieved by cost-effective energy conservation measures, nor of the specific impact on future demand for coal that the implementation of such measures would have. In light of the fact that the low coal demand projections do not appear to contain a conservation component, the lack of serious consideration of conservation as an alternative energy source is of particular concern.

5. The draft statement does not consider the effect of the preferred program upon demand for coal.

By accepting the demand projections prepared by DOE as given, the Department of Interior has overlooked the issue of the effect of the preferred program on overall demand for energy and, more specifically, demand for coal. In particular, analysis is needed of the impact of the preferred program on average coal price. This evaluation can then be used to determine the relative demand impacts of private versus federal coal development.

The Department has also brushed aside the potential problems which would be created by over-leasing with the following statement:

"Should demand be significantly lower than was projected, additional development regulations would assure that leases not currently in existence would be returned to federal ownership." (p. 2-32.)

Thus, the Department has arbitrarily excluded nearly 150 million tons of annual production potential from consideration as an alternative to meet coal requirements. This figure includes nearly 144 million tons which could be deep mined in the Powder River region. (p. 2-31.)

7. The Department of Interior's claim that it is not basing its assessment of the preferred program on the DOE production projections is not credible.

The Department maintains that

"... the need to operate a federal coal management program does not rest on the premise that the market will not support projections of future coal supply and demand... sound long-run projections are needed to provide certainty and not assume that today's forecasts may be appropriate for long-run production decisions of the future." (p. 2-32.)

The implication is that, even if it is proven that the DOE projections are invalid, the preferred program is needed in order to provide for the uncertainties inherent in the forecasting process. The merits of this argument are discussed elsewhere in these comments. The issue at hand is the extent to which the Department of Interior is relying upon the DOE projections in support of its contention that the preferred program is needed. The indications are that the Department of Interior takes the DOE projections seriously. If such is not the case, why have the projections been discussed at such length in the draft statement? Moreover, DOE indicated in the study it performed at the request of DOI that

"These forecasts are to be an integral part of the Department of the Interior's comprehensive review and redirection of the federal coal leasing program." AF

^{19/} DOE, SEC. 810, p. 1.

Thus, it would appear that the Department of Interior considers the DOE projection an important argument for the need for a new leasing program.

Of greater concern is the fact that these projections appear to provide the rationale for instituting a leasing program as soon as possible, despite DOE's assertion that new federal leasing is not necessary. The Department of Energy also pointed out in its study that there is presently a great deal of uncertainty in the variables affecting the coal market; at the same time, DOE expects that much of this uncertainty will be resolved in the next few years.

The wide range of values reflects the substantial uncertainty surrounding numerous variables affecting the coal market. These variables are likely to change considerably in the next several years, likely to affect both federal and private leasing policies.¹²

We therefore recommend that the Department of Interior delay establishment of a program for immediate resumption of additional Federal leasing until such time as it has resolved some of the uncertainties in demand raised above and given serious consideration to other energy supply options as an alternative to additional coal development.

¹²/ Id., Executive Summary, p. 18.

of the application of the Lands Unsuitable Criteria and revision of existing Management Framework plan, 43 Fed. Reg. 57662 (Dec. 8, 1978); 44 Fed. Reg. 2201 (Jan. 10, 1979), and the many option papers prepared by Departmental task forces. Even searching all these sources only suggests approaches which the Department has considered. How the separate procedures interrelate is often ambiguous. The role of the states, the public and other federal agencies remains unclear. The standards for resolution of crucial issues are either untested or unrestrictively general.

Of course it is inevitable that a Draft Programmatic Impact Statement must examine policies and processes which have not been put in final form. But it is crucial that the description of the proposed action (and alternatives) be accessible and sufficiently explicit to permit analysis. As we discuss in the following paragraphs, we do not believe the DEIS meets that standard.

B. THE DEIS FAILS TO CONTAIN AN ADEQUATE EXPLANATION OF THE PROPOSED FEDERAL COAL MANAGEMENT PROGRAM

In finding the final coal programmatic EIS inadequate, the District Court in *HNR v. Biggs* stated that it failed to contain a "detailed" explanation of the then-preferred management program ENRMS II, and noted that this failure prevented informed public comment. 437 F.Supp. at 990. Although ENRMS II is no longer the preferred alternative, it is clear that this programmatic EIS must contain a detailed, comprehensive description of the program the Department proposes to adopt, if the Secretary determines to lease additional Federal coal. The DEIS purports to present a "detailed description" of the major components of this program, p. 3-14, -- id., those components which will ensure that the adverse socio-economic and environmental impacts of the development of western coal are mitigated to acceptable levels. See, id., p. 4-2. These components include: (1) the land use planning process; (2) the lands unsuitability criteria; (3) the ranking process; (4) the procedure for setting regional production goals; (5) the NEPA process; and (6) the start-up procedures to be used for leasing in the near term.

The description in the body of the DEIS provides no details at all with regard to the six component processes which constitute the preferred alternative. To find more explicit information, one must look to the sample regulations in Appendix A of the DEIS, the proposed Bureau of Land Management planning Regulations, 43 Fed. Reg. 58764 (Dec. 13, 1978), the announcement

Land use planning constitutes the basic component of the proposed management program. According to the DEIS, the BLM's planning system is to provide the "initiative and the forum for the making of the principal decisions in the federal coal management program." (p. 3-13). In particular, the planning process is supposed to identify "areas acceptable for further consideration for coal leasing" as well as the "area-wide constraints and multiple use coordination [requirements necessary] to guide coal program activities." (p. 3-13). It is also supposed to serve as a major vehicle for public participation. However, as the draft statement acknowledges, the Bureau's planning regulations are currently undergoing revision. On December 13, 1978, the Bureau published draft planning regulations which differ significantly from its existing land use planning system. Department of Interior, BLM, "Proposed Rulemaking," 43 Fed. Reg. 58764 et seq., as well as from prior draft planning regulations prepared by the agency.

The comment period on the draft regulations does not end until April 1, 1979. No date has been publicly set for their promulgation in final form. The degree to which the final regulations will or will not resemble the proposed regulations is unknown, as is the degree to which the final procedures will enable the agency to make "balanced judgments" about resource uses. (p. 4-2), and guide the development of subsequent activity plans. In their current form, these draft regulations do not fulfill these objectives or the requirements of FLPRA. Thus, while we believe that the Bureau's existing

planning process is fundamentally inadequate, we also believe that the proposed planning regulations must be drastically revised if they are to ensure environmentally sound management of publicly owned lands and resources. See pp. pp. 8-9, infra.

According to the DES, the public would have an opportunity to comment on the lands identified as acceptable for consideration for leasing, and participate in the resources trade-off decision." (p. 4-3) The degree, quality, and effectiveness of such participation will depend on the planning process which has yet to be established.

As far as future coal leasing is concerned, the lands unsuitability criteria constitute the major addition to the land use planning process. The application of these criteria is supposed to resolve resource conflicts and ensure that future leasing takes place in "environmentally acceptable" areas. (p. 3-20) The lands unsuitability criteria were published in "interim" form on December 6, 1978. 43 F.M.R. Reg. 5742. Apparently, they will not be published in formal form until after the Secretary decides whether "to adopt a new coal management program in June 1979. . ." (p. A-1) although the draft statement asserts that "unsuitability criteria would, in some form, be applied to all new leases" as well as existing non-producing leases and preference right lease applications. (p. 3-20) (emphasis added). The degree to which the final version of these criteria will resemble the version discussed in the draft statement is unclear. They have already been drafted at least once. It is clear that the criteria in their present form will not permit the "consistent, uniform" identification of lands which are unsuitable for coal leasing. Id. See pp. 8-9

infra. We believe that they, as well as the planning regulations, must be drastically revised, if the Department's intentions in promulgating them are to be realized.

The ranking process, (p. 4-2), is supposed to ensure that the tracts leased are "optimum" tracts for coal development. (p. 3-23). According to the DES,

"because of the probability that, in many regions, there may be several areas which could be leased that would be necessary to lease, the Secretary has had these revised criteria so that first time leases can be made to those areas which are not excluded from leasing by other environmental compatibility standards or other environmental documents. This will insure that the optimum could cause the least environmental, social, and economic damage." (p. 6-2)

This process too has yet to be fully formulated by the Department. According to the draft, in the ranking process, criteria relating to a number of factors including, for example, "soil erosion, ease of reclamation, . . . and socio-economic and other environmental concerns would be employed." (p. 3-22) However, the draft does not reveal how these factors will be weighed or utilized in ranking the areas identified during planning as suitable for leasing. It does acknowledge that "standardized procedures [are] needed for judging the relative attractiveness of potential lease tracts." (p. 3-21) Such procedures have not yet been developed, although the DES states that a study "will" be conducted to develop them. Id. Until they are supplied, it is impossible to assess the degree to which the use of this process will achieve the Department's intended objectives.

The descriptions of the remaining key elements of the preferred process, the procedure for setting regional production goals and the NEPA process, are unclear and unsatisfactory. According to the DES, the procedure for setting regional production goals is supposed to ensure that the need for coal leasing is continually reassessed. (p. 4-3.) Under the preferred program, the total amount of Federal coal needed will be determined in the first instance by subtracting the expected production of non-federal coal from the national coal production target set by DOE. According to the DES,

"the Department would review . . . and if necessary, adjust the total coal dispositions for each region to meet its continuing federal coal goal. This review, which would be conducted annually, processes would take into consideration statutory production caps, environmental requirements, the analysis in the Federal Coal Management Programmatic Environmental Impact Statement, and any subsequent post-programmatic statements . . . industry input, and information provided by other institutions and organizations." (p. 3-23).

However, neither the so-called "detailed" description of this procedure, nor the example regulations, give any indication of how these factors will be weighted in deciding how much Federal coal, if any, should be leased and where such leasing will take place. In the absence of such information, it is impossible to judge the effectiveness of the process as an accurate method of assessing the need for Federal coal and of allocating such needs on a regional basis.

Until the precise procedures and standards for setting regional production targets are defined, it is impossible to judge whether they will give adequate weight to the environmental or socio-economic impacts of proposed leasing in setting regional targets.

Although the DES purports to explain the relationship of this impact statement to subsequent EIS's which will be prepared in connection with future federal coal leases, its explanation is unclear and confusing. The DES indicates that its interregional analysis will be updated, p. 3-23, and that supplements to it may be prepared, p. 4-3. However, the draft does not indicate what procedures will be followed in preparing these updates or supplements. Nor does it identify the specific circumstances which will trigger their preparation. In particular, the draft does not reveal whether the supplements will be prepared pursuant to formal NEPA regulations or whether any additional programmatic statements will ever be prepared. The example regulations do not appear to recognize that any supplements will be prepared. Moreover, although the text indicates that regional EIS's will be prepared in connection with proposed lease sales schedules (see, id., p. 3-23), the example regulations refer only to draft and final environmental assessments (p. A-14).

Finally, only a single paragraph of the DES describes the so-called "start-up Special Considerations" (p. 3-28). Yet, as we discuss elsewhere in these comments, there is evidence that during the coming decade, for the major coal areas of the West, the start-up considerations will be, in fact already are

the leasing program. The preferred alternative will have little significance if major new leasing developments have begun under an interim program.

In sum, it is apparent that this draft impact statement, like the previous draft and final programmatic impact statements, fails to contain a "detailed" explanation of the proposed preferred management program. While the number of pages devoted to explaining this program undoubtedly exceeds the number of such pages contained in either of its predecessors, it does not present a comprehensible and comprehensive picture of the manner in which coal leasing decisions will be made. Thus it effectively prevents readers from making an informed judgment regarding the degree to which this program will achieve the Department's expressed goals.

"the impacts attributable to the Federal coal management program would be only a small fraction of those resulting from [existing] national coal leasing programs." (S-8)

For example, the Department's assertion that the preferred program will not result in significantly greater environmental impacts than a no new leasing alternative is contradicted by its own projections of the relative regional water impacts of the two main alternatives. The Statement's comparison of the water consumption (evaporation) impacts of the various program alternatives shows that, while the total water consumption for the preferred program will be almost identical to that of the no new leasing alternative in 1985, the preferred alternative will result in more water losses from western rivers. (p. 4-59) Because of lower average streamflows, greater streamflow variations, and over-committments to other uses, the ecosystems of western rivers will be less tolerant of water loss than would be those in the East. Thus, in the case of water, the preferred program is likely to have significantly greater impacts than the no new leasing alternative.

a. The draft statement does not provide an accurate, thorough analysis of the environmental impacts of the preferred program.

a. The Statement is overly optimistic about the ability to reclaim mined lands, and thus underestimates the land use, soils and water impacts of coal development in general and the preferred program in specific. In our comments on the Draft Environmental Statement prepared by the Bureau of Land Management in 1974, we raised a number of questions regarding the Bureau's assumptions about reclamation potential of the arid, western lands to be mined under the proposed

C. THE DRAFT ENVIRONMENTAL STATEMENT DOES NOT ASSESS ACCURATELY THE FULL ENVIRONMENTAL IMPACTS OF THE PREFERRED PROGRAM OR THE ALTERNATIVES.

1. The Department mistakenly concludes that the environmental impacts of the preferred program will be little greater than those of the no-project alternative.

As we have discussed above, a major flaw in the Draft Environmental Statement is its failure to examine realistic alternatives to the preferred program. The alternatives examined in the DEIS, not leasing, emergency leasing or leasing to meet industry, state or DOE requirements, are not independent coal management programs. They are ways of answering one of the questions which a coal management program must answer: how much to lease. The most significant alternative which the Department failed to consider is a program whereby new leasing is deferred until such time as it is clearly needed to meet future energy requirements, and whereby existing leases are managed in such a way as to balance environmental and economic concerns. It is likely that the environmental impacts of such a program would be quite different from those of continuation of the status quo, termed by the Statement as the no-project alternative.

Because there are a variety of no-project alternatives which would have lesser environmental impacts than the "no new leasing" alternative discussed in the statement, the Department's comparison of the environmental impacts of the preferred program with those of the no new leasing alternative gives the misleading impression that the impacts of the preferred program will be only marginally greater than those of a program which is explicitly designed to ensure full protection of environmental values in the development of Federal coal. We therefore believe the Department states erroneously that,

Federal coal leasing program. While the instant draft statement addresses some of these concerns, it does not provide an objective assessment of the extent to which reclamation attempts will be able to mitigate the impacts of strip mining of western lands.

A major problem with the Department's approach to this issue is that it fails to define the term reclamation. Instead, it relies upon the standards set in SMCRA and other laws, assuming that those standards will assure complete reclamation. Since there is controversy over both the definition of reclamation and over whether various levels of reclamation can be achieved, the Department should state more clearly its assumptions in this regard. Instead, the Department has neatly sidestepped this critical issue by assuming in its assessments of the environmental impacts of the proposed program that only those lands which can be reclaimed will be mined (p. 3-13) and that all mined lands will be successfully reclaimed (p. 3-17). In light of past reclamation failures and the uncertainties associated with future reclamation attempts, we question the validity of these assumptions. Furthermore, we believe the lack of discussion of these problems is a major inadequacy of the statement.

Given the Department's optimistic assessment of the reclamation potential of the lands which will be disturbed by its proposed program, we conclude that it is relying upon a fairly broad definition of reclamation. We believe that the Department must be committed to ensuring that full reclamation of Federal coal lands is achieved, meaning the return of a

site to a state which approximates its original conditions closely enough that it can support vegetation compatible with the climate and develop soils over periods of time beyond which it is managed by man. As we discuss below, there is considerable uncertainty as to whether such a goal can be achieved on western lands.

Most studies on reclamation of strip mined lands in the west indicate that the success of reclamation is dependent upon many site-specific factors, and that much more research needs to be completed before reclamation potential is known.^{22/} For example, the recent report of the National Coal Policy Project found that,

"On the Northern Plains, the goal should be to restore native grasslands to a viable condition. This requires a long-term approach which should be without future droughts (this could be done without reliance on conservation measures). It is not certain, though, know whether it will be possible to attain this goal."^{23/} (emphasis added)

The Draft Environmental Statement must therefore emphasize the uncertainties in the optimistic assertions it makes regarding reclamation potential.

The statement is also less than informative on the subject of past reclamation attempts. For example, it does not describe the unsuccessful reclamation efforts in the Four

^{22/} Rehabilitation Potential of Western Lands, National Academy of Sciences, Ballinger Publishing Co., Cambridge, Mass., 1974.

^{23/} Wheat vs. grass, National Coal Policy Project, 1970, p. 13.

arbitrary scale was derived and of the basis for the reclamation time estimates. Nor is there any reason to believe that a direct correlation exists between the two scales. Success so little (if any) reclamation has proven successful in most of the coal regions, the "A" to "E" ratings are relative only to each other, and should not be correlated with any other scale. There is also some question as to whether the reclamation potential scale is based on the same concept of reclamation as that required by SMCRA, which states that land must be restored to

"... a condition capable of supporting the uses which it was capable of supporting prior to any mining." (§ 5101(d)(1)).

The assumption that the maximum time required for reclamation is fifteen years is not borne out by other studies in this area. For example, it was observed that natural revegetation of abandoned farmland in the Northern Great Plains takes about fifty years.^{24/} Similar timescales will be required before strip mined land can be restored to and maintain its natural state without the assistance of man.^{25/} Furthermore, the time required for reclamation in the Western Interior, Eastern Interior, and Texas coal regions was determined

^{22/} Lang, R. M., "Some Vegetative Changes During Natural Succession on Abandoned Farmland in Eastern Wyoming," Thesis, University of Wyoming, Laramie, 1974.

^{24/} Curry, Robert K., "Practices and Problems of Land Reclamation in Western North America," in Land Reclamation in the Federal Energy Program, report of the Executive Energy Resource Group of the Risk/Impact Panel of CONEX, National Academy of Sciences/National Research Council, forthcoming.

Courses 661 on 4/1/ Furthermore, the statement fails to indicate the extent to which its conclusion that reclamation will be successful rests upon future management with sustained inputs of water and fertilizer.

While such practices may result in fine-looking stands of vegetation, the "reclamation" may not be sustainable if the treatments are ended. The use of fertilizers and water for irrigation may in turn cause unpredictable environmental impacts, a possibility which is ignored by the statement.^{26/} We believe that, even if sustained management is assumed, successful reclamation of western lands is not the certainty implied in the statement.

Another factor in the Department's overly optimistic conclusion regarding the reclamation potential of western lands is that it incorrectly assesses the land impacts of coal mining by assuming a direct correlation between an arbitrary scale of reclamation potential and estimate of reclamation time. (p. 5-17) There is insufficient explanation of how the

^{25/} National Academy of Sciences, 98-93.

^{26/} In relation to the use of fertilizers, it is important to realize that the use of fertilizers is widely variable. Some treatments, for example, will increase the yield of plant production, but decrease the nutritional value. Since an individual plant can obtain only a limited quantity, the net result may be negative.

If irrigation is required for successful reclamation, it will involve treatments which are not mentioned in the statement, the environmental effects of which are discussed in another context infra.

Another potential problem is the synergistic effect of salts, acids, alkalies and irrigation water. Addition of fertilizers and moisture in excess of naturally occurring amounts will change the leaching characteristics of the soil, thereby accelerating the development of the soil profile such that the mobility of trace elements such as boron and cadmium can be greatly increased and potentially toxic plants produced.

on the basis of only three personal communications. (p. 5-17) Because reclamation in most areas has not been demonstrated, reliance on such limited authority is irresponsible.

The scale used to further the relative reclamation potential of coal regions is further inadequate because it cannot reflect the wide variety of lands underlying coal in the United States. In the Fort Union and Powder River Regions alone, for example, there are seven precipitation zones, seventeen soil associations, and nine broad vegetative types.^{27/} Another problem with the scale is that it is partially based on mean precipitation, (p. 5-17) when the critical factor is rainfall variation. Most of the western coal land is subject to frequent drought years, which are critical periods for reclamation. Assessment of reclamation potential should therefore consider the effects of the drought years.

Finally, the statement attempts to give a single estimate for reclamation potential in each coal region. (Table 5-8) For comparative purposes an attempt must be made to aggregate the large amount of data, but the statement should also attempt to define those lands where reclamation does not seem possible. The use of a single estimate carries the implicit assumption that reclamation will be successful for all mined land. As discussed above, we challenge the validity of this assumption. In light of the past history of reclamation efforts

^{27/} Effects of coal Development in the Northern Great Plains, Northern Great Plains Resource Program, Denver, Colorado, April, 1979, p. 52.

and the uncertainties regarding true reclamation potential, the Department must give some indication of the way in which the reclamation it states will occur can be achieved.

b. The statement's evaluation of the extent to which the preferred program will result in land disturbance is inaccurate. In estimating land disturbance, the statement claims to use a figure that includes land committed to mining and conversion, although an adequate description of the derivation of this figure is not given. (pp. 3-17 and H-26) Estimation of other quantities of land was considered beyond the scope of the document due to site-specific factors. (p. 5-17) Since

"[p]rospective environmental impacts of economic development and population growth resulting from the extraction of stripable coal in the West are likely to far exceed the impact of surface mining alone,"²⁵

some estimate of the amounts of land which would be disturbed by roads, pipelines, and residential and commercial structures should be made. It is possible to identify a range of estimates within which the probable amount of land needed for these developments would occur, given a specific level of coal-related development. One could then bracket a subset of the range of estimates for each region based on factors such as estimated population increase, average amount of land required for a residence, and a ratio of commercial to residential acreage.

²⁵/ National Academy of Sciences, *op. cit.*, p. 107.

In discussing the effects of overburden bulking, (p. 5-24) the statement does not assess the consequences of the long-term effects of bulking on drainage patterns and other topographic features. It also does not assess the consequences of lowered topography in areas such as the Powder River Basin, where the overburden to coal ratio is less than the bulking percentage. Thus the claim that

"... backfilling and grading of the overburden could restore the approximate original contour of the land..." (p. 5-24)

is misleading at best.

The discussion of soil disruption in the statement is superficial; it does not address many of the factors involved and does not assess the consequences of the impacts. Soil disruption affects soil moisture relations, infiltration rates, water holding capacity, bearing capacity, soil structure, soil texture, chemical composition, and soil fertility. The end result of disruption by mining is the formation of new soils with characteristics different from those of the original soils. Capped segregation reduces but does not eliminate these effects. The example of the wide variability of soil types that is presented in the statement (p. 5-26) also indicates the high degree of difficulty that would be encountered when attempting to restore the soil to conditions that are similar to pre-mining conditions.

The statement recognizes that soil loss will occur even with measures to minimize erosion:

Some characteristics of the data presented concerning land disturbance are not clearly explained. Table 5-5 indicates that, for the low and high coal development scenario, the preferred program would lead to more acres being disturbed than the "no new leasing" alternative, but would lead to less for the medium level of coal development. (p. 5-18) It is not clear what factors are responsible for such conclusions.

c. The Statement provides a misleading assessment of the preferred program's impacts upon topology and soils. There is insufficient discussion of the unavoidable destruction of topographic and geologic features that would inevitably result from coal mining activities in certain areas. (pp. 5-24, 25) For example, in the Northern Great Plains, the badlands, the floodplains and adjoining breaks, and much of the ponderosa ecosystem have topographic and geologic characteristics that preclude restoration to pre-mining conditions.²⁶ The "microrelief features" (p. 5-24) mentioned in the statement are unique features of topography in many of these areas and are often essential to the existence of particular biota in the coal regime (an example would be the dependence of ponderosa pine and other conifers upon outcrops of the sandstone, shale and clinker in the Powder River Basin).²⁷

25/ Effects of Coal Development in the Northern Great Plains.

Op. cit. at 21-12.

26/ Draft Environmental Impact Statement of Eastern Powder River Coal Mine, volume I, Department of Interior, 11 May 1974, Cheyenne, Wyoming, p. 2-276.

"The Surface Mining and Control Reclamation Act contains several provisions designed to control and minimize the soil loss. With regard to the first two items, however, in some areas of the arid West, particularly the more arid regions, hundreds of years could elapse before the soil becomes suitable to reestablish fertile soils." (p. 7-1)

This remark emphasizes the long periods of time required for soil to form naturally in arid regions. What the DES does not point out is that even areas where soils are not lost but merely disturbed will require long periods of time for the development of new soils. As stated in the Draft Environmental

Statement for the Eagle Butte Mine, Campbell County, Wyoming:

"...the area to be mined, the destruction of all topsoil and subsoil, and the removal of material which have been developed over long periods of geological time cannot be avoided. The existing soil biota will be destroyed, reduced through mixing and burial and, in soil stockpiled areas, may be lost entirely. Once mining is completed and the area reclaimed, soil development will begin again. It will take all over again as the mixed materials used as topsoil." (p. 7-1)

Of importance to the reestablishment of soil development is the ability of the soil to sustain vegetation which can withstand the extreme climatic conditions of the arid West. However, the vegetation must be able to survive unaided in order to provide the proper nutrients to result in soil development over geologic time.

27/ Draft Environmental Statement, Proposed Mining and Reclamation Plan Eagle Butte Mine AMAX Coal Company Coal Lease N-311773, Sweetwater County, Wyoming, U.S. Dept. of the Interior, Geological Survey, October 1978, p. 2.

"The degree of success in reestablishing such a self-sustaining system cannot be known at this time. It is largely unknown for the long term."^{32/}

Furthermore:

"Current experimentation with native species suffered from the lack of information available to the critical relationship between degree of soil development and degree of survival of native seedlings. The critical question of use of native seed sources is assumed by many to be answered by the ability to withstand droughts or other stress periods without understanding how a reseeding task can be necessary to accomplish this task."^{32/}

Given the factors discussed here, the statement should acknowledge that soil loss is an unavoidable adverse impact for which mitigating measures are still being developed and that there is some doubt as to the ability to reverse conditions which existed prior to mining.

d. The statement does not consider the long-term effects of unsuccessful or partially successful reclamation efforts. By limiting its scope to the period before 1950, the statement ignores the cumulative effects of long-term mining on Federal coal land. Dependence upon coal during the 1950's will create pressure to continue mining that resource in the future. A comprehensive environmental statement must consider the cumulative effects of unsuccessful reclamation efforts, or at least consider the possible effects of continual coal mining activities over a time period that is sufficiently long to ensure steady-state conditions (*i.e.*, the amount of land being successfully reclaimed equals the amount of land being disrupted).

^{32/} *Id.*, p. V-3.

^{32/} Curry, *op cit.*, p. 5.

Furthermore, the statement makes no attempt to assess the impacts of major surface water diversions, groundwater withdrawals, and new reservoirs which would be required under the preferred program.

The statement also fails to assess the consequences of the impact of coal mining-related pollutants discharged into streams whose flows have been reduced as a result of coal development. The water flows predicted in some regions during periods of low flow are small, indicating that the impacts of chemical and sediment loading on streams is likely to be significant. The statement does discuss surface water shortages during periods of low flow in the Texas, Powder River, Denver-Baton, Green River-Laramie Park, Uinta-Southwestern Utah, and San Juan Coal Regions (*pp. 1-3* to *5-47*), but again it neglects to discuss the consequences of these shortages or of the impacts of measures taken to avoid them (*i.e.*, the construction of new reservoirs).

Finally, the Department's approach does not provide an adequate comparison of the water impacts of the preferred program with those of the no-project alternative. First, the statement glosses over the difference in regional water impacts resulting from each of these options.

Because the statement assumes *a priori* that all reclamation will be successful, neither of these alternatives is considered.

e. The Statement's assessment of the water impacts of the preferred program is inadequate due to the use of incorrect assumptions in some cases and to the failure to explain assumptions in others. Because the presentation of the Department's analysis of the program is overly general in a number of respects, it is difficult to determine whether the assessment of impacts is complete.

For example, the estimates of future water consumption are not broken down into uses, making it impossible to compare water usage associated with coal development to water usage for other activities. There is also no description of the assumptions that were used in estimating future water requirements (for example, the annual amount of water used by a standard-size coal generating plant).

Some of the data indicate extraordinary assumptions: for example, conservative water use decreases in the Denver-Baton coal region between 1970 and 1990, and in the Powder River Coal Region between 1980 and 1990. (Tables E-6 and E-11) Present trends in both of these regions indicate growing water demand. Another inadequacy of the analysis is that estimates of available water in each region are taken from streamflow data of major rivers at the downstream end of each region. (p. 5-57) Using these data as estimates of water availability ignores the problem of water distribution within the region. Examination of this problem in the statement is totally inadequate.

Second, the estimate of the water impacts under the no new leasing alternative, taken from an independent analysis prepared by the Water Resources Council, is likely to contain implicitly at least a portion of the water requirements for future Federal coal development. (p. 5-3)

The Department contends that this approach results in a double-counting of water needs and thus exaggerates the estimate of the impacts. In fact, however, it may be masking the total impacts of Federal coal development on western water supplies. In order to determine the latter, it is necessary to know the extent to which the Water Resources Council data assume coal development which would occur only through the opening of new Federal leases.

f. The Statement's discussion of air quality impacts of the preferred program is insufficient. Because the Department assesses air quality impacts within the coal production regions only, the full end use impacts of the program on national air quality are not considered. Since much of the coal will be burned *outside* the coal production regions, the Department's region by region comparison of total emissions does *not* provide, as alleged,

"...a comparison of the emissions associated with the Federal coal management program alternatives assuming no new leasing base case." (p. 5-50)

We also question the Statement's proposal that

"...a comparison of the total emissions for each alternative is the most meaningful measure of relative air quality impact available." (p. 5-50)

Since the impacts of a specified level of emissions in some regions would exceed the impacts of the same level of emissions in others, the proposal is not necessarily correct. For example, the impacts of a strip mine or a coal-fired electric generating plant is more likely to have a noticeable impact on air quality within an air basin in the Northern Great Plains or Four Corners Region than would a mine or plant of the same capacity if it were located in the Eastern Interior or Western Interior Region, because of the differences in ambient air quality of these regions.

g. The statement does not assess the long-run impacts of the environmental stresses which will be imposed by the preferred program. The statement acknowledges that the preferred program and any other alternative involving significant amounts of coal development will create serious environmental stresses in the regions where coal is mined. However, it does not attempt to estimate the impacts that these stresses will have on those regions. We believe that an evaluation of the long-run consequences on particular species and ecosystems within each region is also essential to any decision concerning Federal coal leasing policy.

To its credit, the statement does attempt to address the issue of ecological impacts. Unfortunately, the assessment is too superficial to be meaningful; moreover, it relies once again on some questionable assumptions. For example, the statement estimates plant and wildlife losses by multiplying plants and wildlife densities by the estimated number of acres directly disturbed by coal development. (p. 5-26) As discussed

Furthermore, the statement completely ignores long-term and cumulative ecological effects; no consideration is given to impacts after 1980. (p. 5-31) Although it is difficult to assess long-term ecological effects of specific stresses, new concerns can be made regarding potential consequences of coal development. For example, strip mining thick beds with shallow overburden can significantly alter drainage and erosional patterns. Mining can alter the quality and quantity of both surface and ground water, alter soil characteristics, and change the topography and geology of the land. Gels in arid and semi-arid climates recover very slowly, so loss of productivity could be a significant factor,³⁷ while the statement assures a return to original productivity, alteration of the environment may prevent it.

Thus, the numerous environmental changes associated with coal development could diminish the ability of an ecological system to reestablish itself. If reestablishment is not attained after some period of time, then the fragile, low-density food web of most western coal regions become very susceptible to disruption. As can be seen from the statement's list of endangered species in the western coal regions, (pp. 5-77 to 5-80) flora and fauna in these areas are already stressed; additional burdens caused by coal developments may make extinction a real possibility.

³⁷ Final Environmental Impact Statement, Alternative Fuels Demonstration Program, U. S. Energy Research and Development Administration, ERDA-1347, v. 1, Washington, D. C., September 1977, p. V-15.

earlier, the estimates of total land disturbance are subject to challenge. In addition, this method of calculating plant and wildlife loss neglects the fact that certain habitat zones support wildlife from a much larger area. For example, bottom-lands cover only four percent of the land surface in the Northern Great Plains, but they provide winter and summer forage for wildlife that ranges over a much larger area.³⁸ Habitat characteristics vary within each coal region and in some cases the wildlife within different habitats are interdependent, so the loss of one type of habitat could upset the balance in another.

The statement also fails to deal adequately with the ecological impacts of increased human population and easier access to previously undisturbed areas in the coal regions. The increased population resulting from coal development would exacerbate impacts due to hunting, fishing, off-road vehicles use, and other human outdoor activities. New roads and right-of-way for pipelines, transmission lines, and aqueducts could open remote areas by providing a pathway for penetration into the areas, possibly disrupting fragile environments and faunal migration patterns. The most significant effect of increased human activity may be that it could drive certain species out of large areas, reducing their habitat by a much larger area than is represented by the estimates given in the statement.

³⁸ Effects of Coal Development in the Northern Great Plains, Northern Great Plains Research Project, Denver, Colorado, April 1975, pp. IV-5, 6.

In short, the statement's discussion of the environmental impacts of the prepared program does not fully assess the consequences of Federal coal leasing to the natural ecosystems of such regions. In order to provide an adequate analysis of the total environmental impact of the proposed program, the statement must relate its estimates of the "loading" upon the environment to the long-run ecological consequences of such disturbance.

IV. THE CHARACTERISTICS OF THE DEPARTMENT'S PROPOSED COAL MANAGEMENT PROGRAM

A. The Statutory Framework

Recent statutes clearly impose upon the Department of the Interior the obligation to develop and implement a sound management policy for all publicly owned resources and lands and to conduct any leasing of federally owned coal pursuant thereto. In addition, the Department is now required to assure meaningful public participation in the development of the land use planning process as a whole, as well as in the development and revision of individual land use plans.

FMLPA. In enacting FMLPA, Congress established fundamental policies for the management of federal lands and resources and provided specific authority for their implementation. Management policies established by the Act include environmental protection, § 101(a)(9), multiple use management pursuant to land use planning, § 101(a)(7), public participation, § 101(a)(5), and the establishment of comprehensive rules and regulations to provide, inter alia, for "objective review of initial decisions and expeditious decision making." § 101(a)(5).

The Secretary has been given full authority to implement these policies: Section 103(a) incorporates environmental protection in the definition of multiple use and § 302(e) directs the Secretary of the Interior to manage the public lands pursuant to principles of multiple use and sustained yield in accordance with land use plans. Section 202(a) provides that land use plans are

to be developed, maintained, and when appropriate, revised, with public involvement. Utilization of an interdisciplinary approach in planning is mandated. § 202(c). The Secretary is directed to promulgate rules and regulations for management of the public lands, § 315, and the public is guaranteed the opportunity to participate in "rulemaking (and) decision making" as well as planning. § 103(d). In particular, the public is to be given the opportunity to "comment upon the formulation of standards and criteria, for, and to participate in, the preparation and execution of plans and program for, and the management of, the public lands." § 303(a).

FCMIA. FCMIA requires the Secretary to obtain fair market value for all coal leased by him and forbids the leasing of coal unless "the lands containing the coal deposits have been included in a comprehensive land use plan and such sale is compatible with such plan," except in limited circumstances. § 3(a)(ii).

SMCRA. SMCRA sets minimum environmental standards for surface coal mining operations. § 515, requires the promulgation of a Federal Lands program. § 533, and mandates procedures for determining whether lands are suitable for surface mining. § 522. SMCRA is intended in part to "protect society and the environment from the adverse effects of surface coal mining operations" and to "assure that surface mining operations are not conducted where reclamation . . . is not feasible . . ." § 102(a) and (b).

B. The Proposed Program

To its credit, the Department of the Interior has attempted to integrate the various overlapping and related requirements of these statutes and to establish a framework for land use decision-making in general and coal decision-making in particular. The Department's "preferred alternative" has as its goal the integration of coal management with land use planning. (p. I-32.) It not only establishes some opportunities for public participation, it also recognizes the need for a coal management policy. Moreover, it distinguishes between the need for such policy and the need for future leasing. Finally, it provides for an ongoing assessment of the need for future leasing.

Despite the incorporation of these and several other highly desirable features, however, the preferred alternative suffers from two critical problems. First, as indicated above, in order to permit leasing by mid-1985, a completely different process is being used to plan for lease sales in areas including major coal resources. As the result of these rapid schedule, the development of a coherent planning policy is being bypassed or distorted. Second, in developing its preferred program, the Department has failed to include clear and specific standards and criteria which are needed to guide decision-making at all levels as well as to guide public participation in the decision-making process. Unless remedied, these critical problems will fundamentally impede the realization of the Department's paramount objective -- that "all future leasing must not only conform to, but

be a product of, a planning and regulatory process designed to be protective of the environment and of other resources and interests." (p. I-51.)

As indicated, we fully support the Department's decision to utilize land use planning as the basic component of the federal coal management program. Indeed, we believe this decision is required by law. Clearly, the success of this approach as the means of determining whether it is in the public interest to lease and mine specific coal deposits depends on the quality, soundness, and adequacy of the land use planning process in general and of the resulting land use plans in particular. Based on our experience with the BLM's existing planning process, we believe that changes in it are urgently needed "to substantially improve the quality of land use plans" (p. I-18), to respond to the mandates of FLMIA, and to enable the Bureau to meet the ever-increasing demands being made upon the public lands and their resources. Unfortunately, the changes in the planning process which the BLM recently proposed, 42 Fed. Reg. 38784 (1st Imp. (December 15, 1978)), fell far short of complying with FLMIA and of creating the kind of planning system to which the making of land use decisions can confidently be assigned.

1. The Existing Planning System Fails to Provide an Adequate Basis for Decision-making.

In our view, the major defects of the existing planning system include the following:

1. It does not provide sufficient guidance to local managers for use in making land use decisions. See, G.L., Department of the Interior, Coal Task Force 2, Final Report/Land Usability Criteria, pp. 30-31 (Sept. 11, 1978).^{15/}
 2. It does not resolve conflicts between resource uses, despite the fact that this is one of its fundamental objectives:
 3. It is not based on adequate information regarding the resources, existing resource conditions, and capabilities of the lands involved;
 4. It does not incorporate environmental considerations as an integral part of the planning process. American Society of Planning Officials, Improving the Bureau of Land Management's Planning Process, p. 13 (May, 1978) (hereinafter "ASPO Report");
 5. It does not ensure meaningful public participation; ASPO Report, p. 12;
 6. It is not responsive to current legislative directives. See, G.L., DEP, p. 5-15; Department of the Interior, Bureau of Land Management "Statement of Policy," 43 Fed. Reg. 57662 (Dec. 8, 1978); ASPO Report passim; and
 7. Land use plans or management framework plans ("MFPs") as they are now called do not guide the development of subsequent resource or activity plans, although this too is one of the system's major objectives.
- ^{15/} As a result of the broad discretion given to the field decisions embodied in land use plans are inconsistencies within districts as well as such districts, state, nationally, as the result of such discretion, different land use processes are followed within districts, between districts, and between states.

In sum, the Bureau of Land Management's existing planning system does not make "balanced judgments about resource use" (p. 6-2), and its products are not "comprehensive multiple use land use plans." (p. 3-11.)^{16/} Nor are they "complete, accurate, and environmentally sensitive." 43 Fed. Reg. 57662. Moreover, some of the existing approved MFPs are "plans" in name only and do not even comply with the requirements of the current planning system. Although the Department has acknowledged the inadequacies of existing MFPs, it nonetheless has determined to "supplement" nine^{17/} existing plans, i.e., involving 700,000 acres in five states and to utilize them as the basis for identifying areas which could be leased in 1980. 43 Fed. Reg. 57664. We submit that the deficiencies of these MFPs cannot be cured by this "bandaid" approach, and moreover, that the actions undertaken by the Department to implement this approach violate the Hughes order.

^{16/} There are, of course, a number of reasons for these fundamental deficiencies in the Bureau's existing planning system. For example, it was developed prior to the time of the Land Management Act.

In addition, the bureau does not now prepare environmental impact statements for land use plans; however, the agency does not mandate adherence to them in the development of subsequent activity plans. Finally, it has not promulgated need policy directives.

2. The Proposed Land Use Planning Process Will Provide An Adequate Basis for Decision-making.

The draft planning regulations, 43 Fed. Reg. 58744 et seq., propose to establish a comprehensive land use planning system pursuant to which the future management of public lands and resources will take place,^{18/} as is mandated by PLMIA, § 102(a)(5), 202(c)(andif).

The proposed regulations reflect a significant improvement over the existing system in several respects. Notably, they are regulations rather than manual provisions; they require an EIS to be prepared on management framework plans, § 1601.6(e); they set forth the planning principles mandated by PLMIA, § 1601.6(b); they specify some opportunities for public participation, see § 1601.3; and they grant at least a limited right of appeal of land use plans and certain land use plan amendments. § 1601.6; 1601.6-3(b)(2).

However, although the proposed regulations require adherence to PLMIA's planning principles, they supply no guidance for translating these principles into a comprehensive land use plan that will in fact resolve conflicts, be flexible, and meet all other requirements of law. They do no more than require that unspecified kinds and amounts of information be obtained and considered in planning. They contain no rules that are standards against which decisions and on-the-ground actions can be measured.

They contain no rules to ensure that an acceptable level of resource

^{18/} This discussion of the proposed land use planning measures only concerns those regulations as they relate to future federal coal development. It does not include initial comments on the draft regulations which §§ 1601.6(d) submit prior to the close of the comment period. These are referred to by the draft as "interim" regulations. They are intended to allow "any person adversely affected" by any land use plan decision to file a petition for review and to appeal. They should also at least allow appeals to the Secretary at his discretion.

protection would be achieved. Finally, although they indicate that new rules may be established and two policy directives will be developed at state and national levels, 53 Fed. Reg. 57663, they provide no processes or deadlines for their establishment. Thus the proposed regulations perpetuate fundamental problems of the existing system, specifically, in particular, its failure to provide criteria to guide the development of land use plans, decision-making, and public participation. In addition, they fail to provide adequate public participation opportunities generally. Finally, they completely distort the unqualified mandate of PLMIA to use an interdisciplinary approach in the development and revision of land use plans. § 212(c)(2).

As a result, the proposed planning process does not comply with PLMIA and will not adequately fulfill its key role in future resource management.^{19/}

^{18/} Comparison of the proposed regulations to the prior draft planning regulations (which the Bureau had deliberated) and respectfully decided to restrict, is instructive. Specifically, the draft proposes an interdisciplinary approach to planning at all levels and gives the Bureau the authority to require the participation of the Director, Washington Office Division Chiefs, and State Directors, the Directorate, Land Resource Division, and the Office of the General Counsel. The Director, "Overseas Program for International Cooperation," and the Director, "Program of Regulation Development for Inventory and Planning Under Section 203 of the National Land Policy and Management Act (PLMIA)" (February 23, 1978).

The extraordinary degree of discretion given field employees is obvious upon even a brief review. For example, although the regulations require that an interdisciplinary approach be used in planning, the determination of this approach is left entirely up to the discretion of district managers. See § 1601.2. Similarly, no standards are supplied for the inventory on which plans are to be based or for monitoring their implementation. §§ 1601.5-3, 1601.5-9. Although the planning process by definition is supposed to make "allocations of resources between uses and/or levels of use," 42 Fed. Reg. at 58744, the draft regulations contain no mention of resource conflicts and no directions for resolving them except through application of the lands unsuitability criteria, the inadequacies of which are discussed below. Given these deficiencies, there can be no assurance that future resource management plans, amendments or revisions will be based on adequate data and reflect the required approach to decision-making.

More guidance is given by the proposed regulations, it is patently inadequate. For example, the regulations direct district managers to develop "planning criteria" which in turn will be used to determine the contents of each resource management plan, the collection and use of data, and the degree to which each is "tailored to the resources, issues, concerns and opportunities involved." §§ 1601.5-2; 1601.5-7; 1601.5-9. The regulations provide that these criteria are "generally" to be based on a number of factors including laws, policies not yet developed, "public issues," and the planning principles

managers to limit their exploration of available, comprehensive alternative management plans and possibilities.⁴⁷ In coal areas, in particular, they may well bias local planning toward coal development.

The draft regulations also supply inadequate guidance regarding the use of the resource management plan. First, they fail to require that such plans be binding and that subsequent activity plans be based on and consistent with them. Indeed, the regulations contemplate that actions will be aligned which are neither "specifically provided for in the plan" nor "clearly consistent with" its terms and conditions. § 1601.5-3(c). Consequently, they fail to supply any assurance that future land use plans will in fact determine all future uses of the resources involved and effectively control their management.⁴⁸ See DSR, pp. 3-18, 6-2. In this regard, it should be noted that the DSR also fails to supply this essential assurance. It mentions two possible "constraints" on subsequent coal development -- "preferred area designations" and "threshold development levels." pp. 3-15, 3-21. However, the former are explicitly described as "advisory only," p. 3-18, while the inclusion of the latter is left to the discretion of the local managers.

⁴⁷ The minimum required alternatives appear to be inconsistent with NEPA's objectives as well as the EPA regulations promulgated recently by the Council on Environmental Quality. See § 1302.4 42 Fed. Reg. 19396 (Dec. 29, 1978).

⁴⁸ The case with which the draft regulations would allow plans to be modified contradicts this lack of consistency. The regulations define an amendment as a "significant revision" of the original (§ 1601.6). They would allow minor changes to be made on the basis of environmental assessments only under § 1601.6(i). Equilibrium changes in management plans should be permitted without an EIS.

of PLMRA, § 1601.5-2. However, they give no indication as to how these factors are to be used in preparing the planning criteria. Additionally, the regulations fail to require the evaluation of the planning criteria by anyone other than the District Manager prior to their inclusion in the draft impact statement on the preferred plan and alternatives despite the fact that they are the only tests authorized for selecting the preferred alternative as well as the ultimate resource management plan. §§ 1601.5-7, 1601.5-8. Given the central importance of the planning criteria in the planning process, it is clear that the lack of guidance for their development will have a direct and critical effect on planning quality.

Similarly, the "minimum" guidance provided for the development of resource management plan alternatives is insufficient. This is one of the most important parts of the planning process. The regulations direct that, in addition to a no-action alternative, a plan be developed which "shall be as responsive as possible" to public, governmental and other concerns, as well as "established guidance," § 1601.5-5. They also require that additional alternatives for "portions" of the plan be developed "where reasonable resource management alternatives exist". Id. (Emphasis added.) At best, these directives are meaningless. At worst, they will encourage district

As indicated, the draft regulations also fail to comply with PLMRA's requirement that "systematic, interdisciplinary approach" be used in the development of land use plans. § 202(e)(2). This directive is absolute and unqualified. Compliance with it mandates the utilization of such an approach throughout the planning process. As mentioned above, however, the proposed regulations allow district managers not only to define the meaning of the statutory phrase but also to determine how the approach will be utilized in planning. § 1601.2. Moreover, they direct district managers to perform certain functions including the development of planning criteria, the analysis of the management situation and the development of alternatives, §§ 1601.5-2, 1601.5-5, which can -- and should -- be performed by an interdisciplinary team in order "to achieve integrated consideration of physical, biological, economic and other sciences." PLMRA § 202(c)(2). In this regard, it should be noted that the prior draft planning regulations not only established minimum requirements for the composition of interdisciplinary teams but also required such teams to perform these and other functions in the preparation of land use plans, as well as in the development of state-level policies. See Instruction Memorandum No. 78-555, DSRCA, n. _____, §§ 1601.2; 1601.6-2; 1601.6-4; 1601.6-5. Unless the final planning regulations contain much requirements, the ability of the Department to actually integrate all alternative resource uses, including coal development, and make rational trade-offs between them will be seriously hampered.

As stated above, another major defect of the draft regulations is that they fail to provide for adequate and meaningful public participation. FLMRA requires such participation and the Department has asserted that it is a "vertical" part of the planning process, 43 Fed. Reg. at 58765, as well as the preferred coal management program. (DEES, p. 6-3). However, the regulations contain no provision for public participation in the development of "guidance for resource management plans [which] shall be provided by the Director and State Directors." § 1601.120. Although the regulations state that public participation "shall be strongly encouraged at the early stages of issue identification and development of planning criteria," § 1601.3(b), such participation at these stages is not required. Indeed, it is only required at a later stage, "upon starting preparation or revision," of land use plans, § 1601.3(c). Although 15 days notice is required for "a meeting of some sort," § 1601.3(e), the form of that notice and the kinds of "public participation activities" that will be provided at the different planning stages are left to the discretion of individual Director Managers. § 1601.3(h). The absence of a formal, generalized process for public participation will hinder the realization of the Department's goal of ensuring that the public will always be well represented throughout the entire leasing process, including land use planning (DEES, p. 6-3). The history of BLM planning and policy formulation has not been one of openness to public participation.

portion.^{53/}

In enacting FLMRA, Congress set forth a number of objectives for future public land management, but did not describe in detail the means by which these objectives were to be reached. Instead, Congress directed that the Secretary of the Interior "shall issue regulations necessary to implement the provisions of this act with respect to the management, use, and protection of the public lands" FLMRA, § 303(a). It is clear from the policy provisions of the Act, 102(a)(5), and specific statutory provisions, see, e.g., § 303(a), that Congress intended

^{53/} The role afforded state and local governments in the proposed planning process contrasts dramatically with that of the general public. The regulations contain extensive provisions for consultation with state and local governments, but require "guidance for resource management plans and the like" and require "consultation as far as possible with" official governmental plans and policies. The regulations also provide that state and local governments must be consulted "as far as possible" with "consistency requirements," § 202(e)(a), and it is important for the Department to recognize that state and local governments do not have the same policies to be followed in land use planning. The proposed regulations do not make this essential fact clear, but also appear to invite this result.

The resulting regulations to create specific guidelines and standards to be met in planning and decision-making. As demonstrated above, however, the draft planning regulations do not create specific and enforceable regulatory guidelines which will ensure the environmentally sound management of public lands and public resources. Instead, some of the draft provisions defer the establishment of standards to future planning or decision-making. Some create pseudo-standards by requiring action within parameters so ill-defined as to be impossible to implement. Others disregard specific statutory mandates. Finally, the regulations set forth laudable but general goals without elaboration of the means by which they are to be accomplished. We do not believe that the proposed planning regulations establish the basis for fair, consistent and informed resource management decisions. Rather, by vesting local land managers with enormous discretion, they both leave him unprotected from local political pressure and invite him to infringe into planning decisions his own views on policies which should be determined on a national level.

In addition to failing to comply with FLMRA, the proposed regulations are inadequate in several other important respects. First, the proposed regulations authorize BLM state directors to file BLM's on land use plan and eliminate participation by the Office of Environmental Policy Review (OEPR) in their preparation. See 43 Fed. Reg. 58755. In our experience, DEPA has had a major, positive

influence on the quality and contents of EIS's prepared by the BLM. Elimination of OEPR review is totally inappropriate in light of the critical nature of these land use plans as the foundation for all Bureau programs, including, for example, areas of critical environmental concern (ACCECS) and wilderness review as well as coal management. In addition, we are concerned about the treatment in the proposed regulations of "situations where action can be taken based on another agency's plan or a land use analysis." § 103.64. Given the extensive acreage throughout the West which potentially may be involved in these situations, we believe that such actions must be carefully considered in order to avoid unwise and indiscriminate environmental impacts. In general, the draft regulations direct that proposed actions be "envisaged," but provide no standards for determining whether they should be "taken." In the case of coal, they specifically contemplate that actions will be taken based on single use planning, rather than comprehensive planning. Such planning is obviously undesirable and must be allowed only in limited circumstances. The Federal Coal Leasing Amendments Act specifically restricts such planning to circumstances in which coal resources involved "are insufficient to justify the preparation of a Federal comprehensive land use plan." FCIAA, § 3(a)(1). The draft regulations, however, fail to include this requirement. Moreover, in cases where another agency has prepared a plan, they fail to require an evaluation of the adequacy of that

plan, §§ 1401.6-4(b) and (d), or the degree to which it is in fact a "comprehensive land use plan." § 1401.6-4(c). In addition, they fail to require that actions based on other agencies' plans must be consistent with Departmental policies.

3. The Land Unsuitability Criteria are inadequate.

A primary requirement of any federal coal leasing program established by the Department of the Interior is that areas to be leased are environmentally acceptable. This principle is contained in President Carter's Environmental Message of May 22, 1977, and is explicitly mandated by both SMCRA and PL93-274. The Lands Unsuitability Criteria ("Criteria") are the major tool in the preferred alternative to assure that this goal is met.⁴⁵ DEIS, pp. 3-4, 5-140. They are an appropriate tool, but as presently structured they are inadequate. We have already stated our view that the Department's decision to utilize the draft Criteria to complete planning activities necessary for a mid-1980 coal lease sale violates both the order of the Court in *MEPC v. Hughes* and the statutory mandates for the adoption of the Criteria. In addition:

⁴⁵ Our review of the unsuitability criteria in the DEIS has been greatly hindered by the lack of any single discussion of what constitutes an "unsuitable area." The term is used in three different ways in Table 1-1 in Chapter 3, Table 3-7 in Chapter 5 and Section 5405 of the DEIS. These three uses of the term "unsuitable" do not signify an evolution of the criteria based on interagency review and field testing conducted by the Task Force. The term "unsuitable" is often only said to be an indication of what final criteria may look like, yet the Task Force has already developed criteria for tens of thousands of acres. The DEIS should describe the reasons for the modification of the criteria field-tested during the summer of 1978, and for the ongoing application of the new criteria.

1. The Criteria fail to provide explicit standards of support and quality of data necessary for a decision whether a criterion applies or is vague.
2. The Criteria contain provisions specifically required by the Secretary.
3. The Criteria include exceptions which exceed the authority of BLM.

The Draft Final Report of the task force which prepared the Criteria acknowledged that, while provisions which allowed local land managers broad discretion would permit flexibility, they would also foster inconsistency. The draft Criteria suffer from exactly that vice. There is no indication of what degree of support is necessary for a decision under the Criteria, nor how a local land manager should regard a lack of data. BLM Instruction Memorandum 75-78 suggests that for the present, unless the local land manager is "quite certain that the area would be judged unsuitable," he should treat the area as acceptable at least until the activity planning stage. The DEIS gives no hint what level of "certainty" will be required for unsuitability determinations under the preferred program. SMCRA requires that the application of unsuitability criteria be based on "competent and scientifically sound data and information," § 523(a)(1). Although the results of the field tests, as described in the Task Force I final report, indicated major information gaps in the test areas, the DEIS contains no directive for a completed data base as a prerequisite to applying the criteria. It is essential that minimum data requirements be defined.

Still greater discretion is given local managers by the exceptions to the Criteria. The DEIS states that "the intent of the exceptions is to give maximum flexibility" at the level of the local land manager (p. 3-28). The language in the President's Environmental Message, the Surface Mining Control and Reclamation Act, and the Federal Land Policy and Management Act do not mandate flexibility; they mandate resource protection. In essence, the exceptions to the criteria would allow land managers to rationalize mining in virtually any area regardless of its non-coal resources and values.

Even when the local manager applies an exception over the objections of another federal or state agency with special expertise, no explicit burden of justification is imposed on him by the Criteria. Many of the Criteria (and exceptions) address resource values, responsibility for which the Congress has lodged in agencies other than BLM. Yet the exceptions do not even require the concurrence of those agencies when applying the Criteria. There is not statutory authority provided to the Bureau of Land Management which allows these resources to be threatened or lost by mining activities, or which allows the Bureau to take over the responsibilities of other agencies. The statutory authority for any exception must be clearly established. If no such authority can be established, the exceptions are illegal and the Criteria subject to challenge.

If a statutory basis can be established allowing exceptions for certain Criteria, the Criteria should contain specific standards that the land manager must use in applying the exceptions. Such standards are necessary to ensure that exceptions were applied uniformly and not arbitrarily to federal lands.

On page 5-140 of the DEIS, the description of the unsuitability criteria states that the Secretary would have the discretion to declare lands unsuitable if mining would cause significant damage to "natural systems in fragile or historic lands." However, no criteria are proposed which address natural systems or the cumulative impacts of leasing on systems. Parts of systems, such as floodplains or wetlands, are listed, but the integration or various components of ecosystems is not fully addressed. Major omissions are in the area of water supply, water quality, and air quality, particularly the problem of the visibility requirement of the Clean Air Act and fugitive dust from mining operations. Water supply is mentioned as a general criterion (p. 5-140) but is only addressed in the specific criteria as municipal watershed. As water supply is perhaps the key to alternative lands used in the West, it should be treated separately in these Criteria. It is unclear as to why water resource criteria contained in the Task Force reports have been completely eliminated in the DEIS.

Criteria listed in section 523 of SMCRA are omitted from the draft Criteria. The Criteria as presently drafted do not have the capability to assess whether operations will "affect fragile . . .

lands in which such operations could result in significant damage to important . . . values and natural systems." § 522(a)(3)(B). Sections 522(a)(3)(C) and (D) require that renewable resource lands, particularly aquifers and aquifer recharge areas and natural hazard areas, be declared unsuitable. Although the Task Force I report initially included criteria on aquifers and unstable geologic features, they were subsequently deleted from the proposed Criteria. This deletion is unacceptable. Proposed regulations must include criteria covering these subjects if statutory obligations are to be met.

SNCRA declares lands in the National Forests to be unsuitable if other resource values are of greater value than mining. The Criteria address the exception for deep mining in the Custer National Forest but do not address other resource values of National Forests, except in the context of wilderness review (d). We recommend that additional criteria be added which address the other resource values of National Forests as required in Section 522(e)(2).

With regard to the specific provisions of the Criteria as they appear in Appendix A of the DEIS, we have the following comments.

b. Rights of Way and Easements

The large number of exceptions included with this Criteria essentially negates the Criteria itself. We suggest that any exemption require the acceptance of the parties involved in the right of way or easement (iv). This cannot be one of many exceptions. We oppose exception (v) which would allow any activity

to go forward, unless the specific stipulations which would be used are subject to public review. As written, the local manager could allow exception (v) with virtually no guidance on what kind of stipulations would be required.

c. Buffer Areas

Exception (iii) allows an owner to an occupied "building" to permit mining closer than 300 feet. This exception runs counter to the statute which specifically refers to "dwelling."

d. Scenic Areas

The Criteria is completely undermined by the exemption which allows a discretionary decision by the local manager. We strongly oppose including this exception in the criteria. Again, no standards are provided to guide a land manager's use of an exemption. An additional problem with this criteria is the assumption that lands would have been evaluated for their Class I or II status at the time the criteria would be applied. We suggest that the criteria be amended to require that such an analysis be completed prior to subjecting an area to review using this criteria.

e. Scientific Areas

The Criteria have gone a step beyond the Surface Mining Control And Reclamation Act which allows areas to be exempt if

mining would significantly damage scientific values, by requiring that areas are being used for scientific study to be declared unsuitable. We suggest that the Department reevaluate the statutory basis for this criterion and appoint a scientific study group to evaluate the scientific potential of proposed areas. We recommend that the exemptions be allowed only if both (i) and (ii) can be met.

g. National Register Sites

We suggest that exception (iii) require the concurrence not simply consultation of the Advisory Council on Historic Preservation. This tracks the language of Section 522(e)(3) of SNCRA.

h. National Natural Landmarks

The exemptions for this criteria essentially negate the purpose of the criteria. Exception (i) is unacceptable if the areas have been designated as a national landmark; exception (ii) contains no guidance as to what constitutes "appropriate mining technology"; and exception (iii) is unacceptable because no standard is provided to make this determination. Any criteria addressing national natural landmarks should require joint review and concurrence by the Heritage Conservation and Recreation Service.

i. Endangered Species

Exceptions to this criteria must require the concurrence of, not consultation with, the Fish and Wildlife Service.

j. State Endangered or Threatened Species

The exception must require the concurrence of the appropriate state agency.

k. 1. Bald and Golden Eagle Nests

The 1/4 mile buffer for active nests is an arbitrary judgment based on no standard. Because we believe that this will guide a manager into making a limited decision rather than using geographic information about a particular nesting site, we suggest that this arbitrary limit be eliminated in favor of a requirement that a buffer be selected based on site determination. We strongly oppose the exceptions listed in these criteria. We believe the statutory authority for protecting eagle nesting sites is sufficiently strong to prohibit exceptions which would jeopardize their complete protection. If any exceptions were to be included, they must be subject to the the concurrence of the Fish and Wildlife Service.

k. 2. Fallen Cliff Nesting Sites

The same comment as above applies.

n. Migratory Bird Habitats

This criteria must require the concurrence of the Fish and Wildlife Service if mining is to be permitted.

o. High Interest Fish and Wildlife Habitat

As this criteria assumes that the high interest areas will have been identified by a state wildlife agency, we suggest that exceptions (i) and (ii) are only acceptable if the state concurs.

p. Wetlands

The problem with this criterion again lies in the exemptions. There are no standards given which would guide a determination under exception (iii). There is no requirement that a land manager would have available the necessary information to make a decision under exception (iii). We recommend that these exceptions be deleted, unless a responsible agency or task force be appointed on a nationwide, state or regional basis with the expertise necessary to make this determination. As presently written, this criterion does not fully meet the intent in the President's Executive Order on Wetlands (E.O. 12890). We recommend that this criterion be redefined to track the definition of wetlands contained in the Executive Order.

q. Floodplains

The first exemption in this criterion assumes that an area must be leased. This exception is even broader than used in other criteria and we do not see the need for including it here. We recommend its deletion. Exception (ii) makes a judgment that mitigation is possible but as with other exceptions provides no standards for making such a determination. Specific standards must be included to ensure compliance by the Interior Department with the President's Executive Order on Floodplains (E.O. 12880).

a. National Resource Waters

It is unclear how the land management agency would have the jurisdiction to determine that "it is not necessary to protect the National Resource Waters." This exception is totally unacceptable, and must be deleted.

t. Prime farmlands

This criteria has defined prime farmlands as being related to crop yields. It is unclear in the language of the criteria whether crop yields implies both planted crops and vegetation yields in grazing lands. We recommend that this criteria include grazing lands in its definition as prime farmlands as much of the area where leasing could occur is used primarily as grazing land. An alternative would be to include a separate criteria to protect productive grazing lands from disturbances from surface mining.

u. Alluvial Valley Floors

This criteria is specifically geared to the requirements of the ESEA of 1977. As such, we recommend that the criteria require that the land management agency must have completed an inventory and review of alluvial valley floors at the time a land use plan is prepared. Furthermore, this criteria must be geared to guidelines developed by OSN for identifying alluvial valley floors.

v. Reclaimability

This criteria indicates that information on reclaimability is not now available. It requires using this criteria as the information becomes available, but does not explicitly state that the information must be available prior to an assessment based on the criteria. We suggest that this be amended to state that information on reclaimability must be available at the time the assessment is made.

w. State Criterion

In an earlier criteria, we suggest that any exception of the state criteria must be done with the concurrence, not simply consultation, of the state.

x. Buffer for state lands

Any exception to this criteria must require concurrence, not consultation, with a state.

4. Subpart 3425 - Emergency Leasing

Subpart 3425 outlines a procedure for emergency leasing of federal coal which would circumvent the normal leasing process. The key element to these provisions are the criteria that would be used in determining whether an emergency leasing situation exists, as outlined in Section 3425.2. Conditions of Acceptance. These conditions as proposed do not require demonstration of true emergency situations. Rather they open almost limitless opportunities for special treatment. No ceiling is placed on the size of an emergency lease. Section 3425.2(e)(1) almost invites the formulation of an "unforeseen" contract to justify an emergency lease. Section 3425.2(e)(1) fails to define "by-pass." Virtually every mining operation in the Powder River Basin borders on additional coal. Section 3425.2(b) even permits emergency leasing to initiate a totally new operation so long as it is "in the public interest." If there is a broader standard it is difficult to think of.

The only real limitation on the Emergency Leasing Provisions is the requirement that "the integrity of the normal leasing process" not be violated. Literally applied, that provision would nullify the entire section. Since it is obviously not to be taken literally, it is incurably ambiguous. If emergency leasing provisions are necessary, the department would do far better to stick close to the provisions agreed to by the parties in *HDR v. Hughes* which have proven workable and are known to NM and industry.

5. The Process for Setting Regional Targets Does Not Guarantee Adequate Environmental Protection.

As indicated above, the DEE and the example regulations fail to provide the needed assurance that this significant element of the proposed coal program will, in fact, afford adequate consideration of the environmental and socio-economic impacts of coal leasing and subsequent development within the eight regions containing federal coal. See pp. 73-75 Supra. Indeed, it is entirely possible that, in adjusting DSW's national coal production target, the Department could increase the targets and still maintain that it had considered such impacts. Moreover, although the DEE states that the preliminary targets will be flexible, "with the final targets actually being developed as part of the analysis in the ranking and selection process," p. 3-21, the description of the use to which the preliminary figures will be put suggests that the process will inevitably be self-fulfilling. Thus, the draft states that they will be used "to set data gathering and planning priorities to ensure that a sufficient number of tracts are delineated for the desired level of development." Id.

region, it apparently is not going to take any action to ensure that the tracts are developed in the order in which they have been ranked. Thus, the DSW states:

"[T]he selections are made of individual tracts based on the original rankings of the remaining tracts might be different than the selected tracts could not necessarily correspond to the relevant order in which the individual tracts were originally ranked." Id. [p. 3-22.]

The expressed reason for this result, which will be further assured where intertrack bidding is used, is that "the potential environmental and social impacts resulting from developing one or any tract in the same areas would be cumulative (and therefore,) the selection of the tract with the highest priority or lowest priority will affect other highly ranked tracts." Id.

This rationale appears patently inadequate. The cumulative impacts which would result from development of any tracts in a given region should be revealed in the EIS and reflected in the final order of selection. Therefore, we believe that selection of tracts, as well as the order in which they are leased and developed, should directly correspond to the final ranking.

7. The Role Of The NEPA Process In The Program Must Be Clarified.

As discussed above, the DEE's explanation of the relationship of this EIS to subsequent EIS's on future federal coal leases is unclear. See pp. 77 Supra. We believe that the Department should clarify this explanation and, in particular,

6. The Ranking Process Does Not Ensure Adequate Environmental Protection.

As indicated above, the Department has not yet developed the standard procedures needed to ensure that the ranking of tracts within regions is conducted in an objective and balanced manner which will fulfill departmental objectives. See p. 73-77 Supra. Even assuming that the standards developed for ranking are objective and comprehensive,¹⁴ the proposed ranking process poses several clear problems. First, since the object of ranking is to determine the "optimal" tracts for leasing within each region, p. 3-21, all multiple use plans within a region should be on the same schedule. In order to achieve this objective and avoid skewing the process, The Department, however, does not intend to require any such regional coordination.¹⁵ Further skewing will result from the Department's decision to allow nomination by the coal industry to play a "critical" role in preliminary tract delineations. (p. 3-4.)

In addition, although the Department proposes to rank tracts to identify those lands most suitable for mining in each

¹⁴ We believe that the criteria for ranking should include the following in addition to those mentioned in the Department's Draft Statement: (1) least soil productivity; (2) least effect on vegetation and water quality and supplies; and (3) conclude earliest in development.

¹⁵ Including areas not yet delineated as preliminary leases in the ranking process, p. 3-23, will mitigate this problem only partially since such areas could not be leased even if they were superior to all others.

indicate precisely what its intentions are regarding future programmatic supplements and statements. We believe that it is impossible for inter-regional tradeoffs to be considered in regional impact statements. Therefore, we hope that the Department will confine itself to the preparation of formal supplements or, where necessary, complete EIS's in connection with the setting of regional production targets.

E. The Provisions For Surface Owner Consent Are Inadequate.

Section 724 of the Surface Mining Control and Reclamation Act prohibits the Secretary from issuing a coal lease for surface mining purposes where the lands over the federal coal are privately owned, unless the "surface owner" has given "valid written consent" to such mining operations. Because 6 million acres of the 9.7 million acres of federal coal lands are overlain by private surface, p. 3-24, the requirement of surface owner consent will be a significant element of any future Federal coal leasing program. The treatment of this requirement in the preferred alternative is inadequate.¹⁶

The Department's preferred alternative includes the surface owner at two points prior to a lease sale. It includes "surface owner consultation" in land use planning as one of the preliminary screens which will be used in "the delineation of areas acceptable for further consideration for coal leasing."

¹⁴ We agree, however, that even if the owner consents to surface mining, the Secretary of the Interior need not lease the lands involved. See p. 3-14.

p. 3-4. However, the inclusion of such consultation in planning is entirely discretionary with the local district manager. See pp. 3-16, 3-21; Example Regulation at A-18. Moreover, even if the surface owner indicates a definite preference against stripmining, his or her lands need not be removed from further consideration. Id.

The preferred program also provides that the surface owners written consent will be obtained in the pre-sale and sale stages. p. 3-24, after tracts have been delineated, analyzed and selected, EIS's have been completed, and public hearings held. Even if the surface owner refuses to consent at this point, however, a tract can be offered for sale "if it was considered important." (p. 3-25) In such cases, the coal company will be given a specified period of time after the sale to obtain consent. If this consent cannot be obtained, the sale would be voided. Id.

The problems with this approach are obvious. District managers and state directors are given unrestricted discretion to ignore the surface owners' refusal to consent to surface mining up to and including sale of a tract. Id. At the same time the need to obtain consent to the lease stage, the process will necessarily result in severe and often intolerable pressure being applied to the surface owners by companies and neighbors. Moreover, the Department admits that this approach could result in wasted time and money. (p. 3-17)

We believe that consultation with surface owners should be required during the land use planning process and moreover, that planning for a lease should be prohibited where the surface would be voided.

owner expresses a definite preference against stripmining. In addition, we believe that those tracts should be put up for sale unless all required comments have been obtained, regardless of how "important" those tracts may be.

9. The Objectives Should be Clarified.

Section 3420.5-2 states the objectives of the leasing program. Language should be added to specify that coal shall be leased only pursuant to comprehensive sustained yield resource management planning.

10. The Process For Evaluating Coal Needs Should be Clarified.

Section 3420.3 sets forth the process for the cyclical determination of the need for leasing and the establishment of production targets. This process is too important to be left nebulous. Clear requirements for early public involvement should be included. Criteria for the Secretary's determination should be set forth.

11. The Regional Tract Ranking Process Should be Clarified.

Section 3420.4-1 sets forth the process for regional tract ranking. It implies but does not delineate the parameters of a sharing of the Secretary's power with representatives of the state governors. We believe such a sharing of authority is inconsistent with the obligations of the Secretary to manage the Nation's lands. However, if it is to take place, it should be within explicitly stated binding limits, when, where, how and within what limits the authority is to be exercised must be defined.

CONCLUSION

The DES suggests that the Department has confronted important issues and has lined the broad outlines of a logical resource management policy, but the details of the policy fail to fulfill the promise of its form. Similarly, the DES itself raises but does not resolve major environmental and social issues. The value of both the proposed leasing policy and the DES is rendered wholly ambiguous, however, by the Department's inexplicable determination to hold a mid-1980 lease sale.

We urge the Department to discontinue its efforts to prepare for an early lease sale and to turn its efforts solely toward the development of an effective and environmentally sound resource management policy.

Office of Coal Management (140)
Bureau of Land Management
14th & I St., N.W.
Washington, D.C. 20242

Dear Sir:

Western Fuels Association, Inc. submits these comments on the Draft Environmental Impact Statement on the proposed Federal Coal Management Program (DCMP) which was issued in December 1977.

Western Fuels is a nonprofit corporation organized under the laws of Wyoming, the members of which are numerous MM coal producers, stockholders of which are distinguished from investor-owned utilities. Most of Western Fuels' members are located west of the Mississippi River, primarily in the active coal producing West Gas Cooperative which serves practically all of Louisiana; in

addition, a number of members are located in the Midwest.

Western Fuels was organized because the publicly-owned sector of the utility industry was finding it increasingly difficult to obtain assured coal supplies at reasonable cost. The electric power industry, which has the responsibility to supply all the coal needs by the Missouri Basin, has been unable to do so. The Missouri Basin is located near Wheatland, Wyoming. The coal demand of this plant will total 7,000,000 tons of coal per year at peak production.

Western Fuels has acquired applications for preference right coal leases in the East Powder River Basin of Wyoming and the Powder River Basin of Montana. Energy Resources Company which also has acquired preference right lease applications in the East Powder River Basin under the name of the Powder River Basin Coal Company, has applied coal mined by El Paso for Western Fuels' account.

99

February 13, 1979

Page 2

Because of delays by the Department of the Interior in issuing preference right leases, Western Fuels has found it necessary to go on the market and acquire fuel supplies to meet its obligations under contracts with its members now under construction. Western Fuels, therefore, has been directly affected by the proposed Federal Coal Management Plan.

Western Fuels Board of Directors has formally adopted principles and goals for the organization. The first two of the principles and goals state:

"To ensure a reliable supply of energy is vital to our health, economy and a decent standard of living for all."

In supplying this need, the energy industry must take into account both the existing and potential negative impacts it may have upon the environment.

It is in this spirit that these comments are submitted.

Two general points on the tone and premises of the DEIS are made which are relevant to specific comments on particular portions of the DEIS.

First, the tenor of the DEIS reflects an apparent attitude by the Interior Department of uncomfortable acceptance to the concept of federal coal development to serve the nation's energy needs and an equally uncomfortable acceptance of the environmental impact which will be utilized in the process. This nation is extremely fortunate to have such a plentiful supply of energy. The rational development of our energy resources should be continued to gradually but must be undertaken optimistically, perhaps even cheerfully.

Particularly in light of recent events in Iran, the

DEIS has previously exhibited its interest in federal coal matters by active participation in end user coal programs. In addition, the DEIS has sought to intervene as a defendant in the lawsuit between the State of Wyoming and the U.S. Army Corps of Engineers over the proposed coal lease at Yucca Flats which involves the DEIS' programmatic DEIS. Western Fuels is currently before the Supreme Court of the United States in the review of a denial of intervention into that lawsuit.

February 13, 1979

Page 3

Mobile nature of the world energy market has again been underscored. To the extent that coal development can place added rationality and assurance into our national energy policy, the DEIS is a welcome document. The Interior's National Energy Plan which was released in April 1977 places great emphasis on the development of our native resources -- particularly in the West. In this regard, federal coal development, the DEIS should reflect a firm disposition toward federal coal development and environmentally sound development of our coal resources.

Western Fuels makes three recommendations for review of the DEIS. First, the section "Federal Energy Policy" should be substantially expanded. Second, a fuller statement of the present and projected need for coal should be included in the DEIS. Third, the tone of the DEIS should reflect a desire to maximize economic coal development consistent with sound environmental regulation.

The second background issue concerns the analysis of the federal laws now in effect which are designed to minimize the environmental impact of federal coal development. These laws are summarized at section 1.1.1 of the DEIS. A further analysis of the impact of these laws on federal coal development, including calculating the impact of the preferred program and alternatives to the preferred program, is recommended.

Minimally, severe abuses of natural resources has occurred in surface mining of coal. These are still visible, particularly in the Appalachian region. However, these abuses are not unique to federal coal development. The passage of the Surface Mining Control and Reclamation Act of 1977, and the subsequent regulations, will greatly assist federal development will impact to the reader of the DEIS an understanding of the environmental impact which will appear in the preferred program, or whatever alternative is chosen. These are not the only regulations in existence. The program must be considered in the context of the entire federal coal management system, but rather as one part of a multi-faceted federal system which will permit rational utilization of federal coal assets.

Comments on specific portions of the DEIS will now be considered.

At section 2.4 of the DEIS, a discussion is had concerning the Impact of the Clean Air Act Amendments of

Office of Coal Management

February 13, 1979

Page 3

1970 and 1977 on power generation. This section of the DEIS is conclusory in style and should be expanded. Specific examples of the efficiency certain eastern utilities are achieving through the use of low sulfur coal should be included. A summary of litigation engendered by these standards would also be helpful. The reader of the DEIS should be made pressing need for the development in timely fashion of western federal coal resources.

Section 2.5, particularly section 2.5.1, should be expanded to fully consider the relative cost of the interior peripheral market. The DEIS, at this section, states that "the market for federal coal is limited by regulatory directions." The President's National Energy Plan referenced the relationship of federal coal to peripheral coal markets. The alternative sources of energy referenced in section 2.5 should be expanded to include the potential opportunity to underscore the availability of federal coal to meet the nation's energy needs.

The opening paragraph of section 2.7 of the DEIS

states:

"The DOE forecasts of future coal production will assume that federal coal and non-federal coal resources would be fully available to meet the demands for western coal."

However, in the DEIS was there a full analysis of the impact on the DOE forecast of the availability of federal coal to the coal industry. Such an analysis is necessary for the reader of the DEIS to understand the importance of western coal to the nation's energy plans.

The DEIS does make clear that decisions made on the basis of the coal will not have immediate effect on the amount of coal available under the PRL system. It states at section 2.8.1 that the regulatory and industrial aspects of the PRL system are separate from the leasing process. The nature of a decision today to lease federal coal will not affect the leasing of mining until, perhaps, seven years into the future. A full analysis of the impact of this status is necessary to fully apprise the reader of the DEIS of the potentialities of the PRL system.

An expansion of this section could include a more detailed developer of federal coal and an analysis of the developer's

Office of Coal Management

February 13, 1979

Page 3

activities in opening a mine, including financial activities, the fabrication of necessary mining equipment, etc.

Section 2.8.2 of the DEIS at page 2-48 indicates that a decision to lease federal coal will not affect the federal coal could result simply in a shift to the development of non-federal coal. The full impact of the impact of the development of non-federal coal as opposed to federal coal resources is necessary to fully apprise a reader of the DEIS. Federal coal should be included in the expanded analysis. The reader of the DEIS should be made aware that federal coal resources in the confines of the "checkerboard" configuration should be clearly aware that additional federal plans and environmental controls are placed on federal coal development. The reader of the DEIS should be given grounds for a refusal to allow federal coal to be leased if federal coal is to be developed. The reader should realize that the potential exists for more, not less, environmental disruption.

Also, it is noted to 2.8.2 of the DEIS, at page 2-49, reference is made to the fact that a decision to lease federal coal could result in a shortfall of coal in the market. The reader of the DEIS should be made aware that shortfalls are treated in the DEIS in currency fashion. Expansion of the dimension of this impact is necessary.

Section 2.8.3 of the DEIS reflects the Interior Department's position that the PRL system is not designed to process preference right lease applications (PRAs). In addition, the PRA system gives preference to the Interior Department to the rights of preference lease holders similarly situated who have filed a PRA application and effort in reliance upon the faithful discharge by the PRA holder of his/her obligations under the law. Western Fuels has expended substantial monies in activities related to the PRA system and the development of federal coal. The PRA system was a substantial part of the federal coal leasing system during the forty years of Western Fuels' position, regardless of the alternative system chosen for federal coal leasing, i.e. that Western Fuels holds a legal right to timely lease federal coal.

Section 2.8.4 of the DEIS reflects the fact that federal coal leasing can stimulate competition in the coal industry. Western Fuels subscribes to this analysis and views expansion of this section in the DEIS.

Office of Coal Management
February 13, 1973
Page 4

In section 3.1.1 and 3.1.1.6 of the DEIS a discussion is set of the interrelationship of the preferred program for federal coal leasing and the PMIA treatment of lease issuance. A much fuller discussion of PMIA treatment must be undertaken. In particular, the following areas require further consideration:
1. The application of environmental and planning standards to PMIAs, the procedure to be followed by preference right lessees if they desire to issue PMIAs.
2. The impact of PMIA treatment on the application of a Department and the legal basis for any non-issuance of a preference right lease if the lessee does not meet regulations. Appendix A to the DEIS, 2/ are of some assistance, but they do not fully delineate the impact of this treatment of PMIAs.

As is clear from the entire tenor of the thesis comments, Western Fuels opposes the "federal leasing" alternative. Western Fuels' position is that under PMIA's estimation, this alternative would violate Western Fuels' rights as a preference right lease applicant and could result in the denial of the first right to lease of coal necessary to supply the nation's energy needs.

The preferred program for coal development is described in section 3.1.1.6 of the DEIS. This section states that PMIA's primary concern with the preferred program involves industry participation in the leasing process. First, the preferred program is designed to be a "market driven" both little and late. As is clear from sections 3.1.1 and 3.1.1.6, the market driven approach will not occur until after the basic land selection decisions have been made. In undertaking the initial selection of tracts to be considered for lease, PMIA will balance the availability of determining needs and balancing those needs against the market needs. This is a reasonable approach initially. In the final analysis, it is industry which develops federal coal resources. Indigenous input is necessary and appropriate at the earliest stages of the planning process. That input must occur prior to initial selection of lands.

Further, the level of industry input is too small. In the DEIS, the following statement is made: "Under the proposed interest are permitted. Western Fuels submits that industry should be permitted to submit nominations, rather than merely expressions of interest."

- 3/ It is Western Fuels' understanding that these regulations are not yet proposed. When and if they are proposed, Western Fuels will comment fully upon them.

Office of Coal Management
February 13, 1973
Page 7

The expressions of interest described in the DEIS at section 3.1.1.6 are market driven. The industry's expressions of interest apparently must include maps, geologic data, mining methods, proposed transportation systems, and other information developed by expending great amounts of time, energy and dollars, can in many cases be extremely sensitive. Protection of the leasing system must be made either to keep the submitted data confidential or to give the entity which develops the data the right to lease the land in question. In either case which calls for the submission of substantial data which can be used to develop federal coal resources, the preferred leasing status will not evoke substantive industry input.

In sum, basing the preferred program upon government input to select the tracts to be offered assumes both a level of funding, a level of capable staffing and an efficient process. These factors are not available for an "impossible dream." Why the market and private demand cannot be entrained with the initial nomination process is simply not explained.

In section 3.1.6 of the DEIS, the special leasing opportunities for public bodies and small business are discussed. Western Fuels supports the inclusion of a separate section of the discussion in the FEIS to include a consideration of the amount of coal land which would be available for these opportunities and the precise procedures which should be utilized.

In Chapter 5 of the DEIS, there is not sufficient discussion of the impacts of a federal coal leasing program, such as the preferred program, on the economy without the increase of the development of non-federal coal sources. The impact of the preferred program on the economy should be discussed in the FEIS.

Section 3.4.1 and Tables 5-72 and 5-73 discuss the unsuitability criteria utilized by the coal task force in the DEIS. The task force's unsuitability criteria which were published in the December 6, 1972 Federal Register are not included in the DEIS. The body of unsuitability criteria discussed in the DEIS. The body of the FEIS should reflect the new proposed criteria and should contain the same level of detail as the DEIS. The FEIS will show what areas of federal coal lands will be denied for development due to unsuitability and what areas of coal will be excluded from consideration for development by utilization of each criterion.

Office of Coal Management
February 13, 1973
Page 8

Finally, although an in depth discussion of the example regulations has not been undertaken here, one specific item will be discussed. Example Regulation 4) of the DEIS states that certain lands which otherwise will not be applied to lands on which surface mining operations are being conducted or lands where supplemental findings of legal commitments to the operations had been made prior to January 4, 1977. This language is not consistent with the language in the DEIS which states the applicability of the criteria to lease lands. Similar language in the DEIS was removed by the Office of Coal Management in the 1977 Amendments to the Clean Air Act have expedited substantial litigation. A similar effect here could be avoided by drafting explicit requirements for this exemption.

Sincerely yours,

Edward Weisberg

DOE RENEWAL PROJECT

February 12, 1979

Federal Coal Management Program -
Draft Environmental Statement

822

The Honorable Frank Bragg, Director
Office of Coal Management
Room 3610, Hale Office Building
Washington, D. C. 20540

Dear Mr. Bragg:

The Carter Oil Company welcomes this opportunity to submit comments on the Draft Environmental Statement for the Federal Coal Management Program - Renewal Project. These comments are submitted in accordance with the invitation for review and comments published in the Federal Register.

At this time we have specified the problem areas within the preferred program project that concern us substantially. Our comments upon the preferred program are organized in response to these concerns.

1. Areas Unsuitable Criteria Must Be Revised
and Publicized

At present, the areas unsuitable criteria would be applied to include lands from potential coal leasing, without giving consideration to underlying coal resources. We strongly recommend that all lands be evaluated for potential coal resources before the leasing process. To adequately protect the public's valuable resources, the value of those energy resources must be weighed and considered together with the cost of extraction. This means before a determination of unsuitability is made.

Compatible uses should be encouraged. Placing limitations and/or restrictions on lands which are not suitable for coal leasing, but other potential land uses is preferable to the alternative of ruling out mining on only rich federal lands. Consideration also should be given to the possibility of using the lands for reclamation purposes, and to the ability of mine operators to reclaim and restore the affected lands. We believe that the Office of Surface Mining's reclamation standards assure that lands will be properly reclaimed concomitant with mining activities.

297

Under the preferred program, there is little or no opportunity for public input in the areas unsuitable decision-making process. The President's recent State-of-the-Union message sent to Congress, recently endorsed measures that would give the "Administrator" broad authority to make "government owned coal available for lease" without notice to lessees, pursuant to more formal procedures, notice should be given and opportunities provided for the public to be heard prior to any determination of unsuitability. The agency should also be compelled to support the agency's decision. Such procedures would be consistent with the law, which would require the data on which the agency's decision is made.

We acknowledge the necessity to apply mandatory unsuitability criteria prior to future leasing, but call your attention to the need to provide for public participation in the process by existing leases and preferred right lease applications. Applying mandatory unsuitability criteria to new lease applications and to existing leases potentially constitutes inverse incentives, requiring compensation to owners denied use of their leases. This is analogous to the concept of "ineligibility" in analogous with zoning out existing nonconforming uses. Application of the proposed criteria to preference rights, however, would be contrary to the MOC. Second, such provisions would be clearly contrary to the MOC, if the second provision, which held that the Secretary of the Interior "may" disapprove a request for a right lease, was applied on purely environmental grounds.

In the event that unsuitability criteria nevertheless are applied retroactively, we believe that existing and proposed right lease applications should be reviewed for consistency with your request. Your review upon mine plan submittal or lease application will be critical to ensure that the proposed lease force property owners to incur substantial additional expenses in the preparation and submittal of mine plans and applications.

It is essential that the criteria for unsuitability as proposed should be revised in line with statutory authority and as not to exclude a valuable public resource unnecessarily. At the initial hearing on the proposed program, we urged you to carefully refer you to our comments submitted to the Bureau of Land Management in response to that agency's December 8, 1978, Federal Register notice on this subject.

487

III. Opportunities for Public Input are Inadequate or Present

It is inappropriate for the federal government to examine reliable, timely forecasting data made available to it by a variety of sources, including the coal industry, to determine production volumes and set its production targets on the basis of the best evidence available. The importance of such production targets cannot be overemphasized. They are critical to the federal government in an imbalance of supply and demand, which could be difficult if not impossible to predict. It is equally important that the public have ready to obtain permits and approvals to open a coal mine. Such information can be obtained by providing the opportunity for the public, as well as the coal industry, to participate in the process. The opportunities for participation in the land-use planning process, too, opportunity for participation of LSC members in the process, and the opportunity for the public to participate in assessing land use and to improve the quality of decision making.

We therefore urge that the preferred federal coal management option be revised, in line with Executive Order 12004, to facilitate public participation and also to provide for public initiated leasing.

III. Surface Owner Consent Should Be Required of Non-Qualified Owners

The surface owner that does not qualify pursuant to Section 2(a) of the Surface Mining Control and Reclamation Act of 1977, should be required to consent to the lease. This is the consideration wherein mandated by Congress ("nonqualified surface owners" are those who do not meet the requirements of the SMCRA). To avoid this problem from occurring, the transferable consent of the nonqualified surface owner should be required to the lease. This is analogous to the transferable leasehold affecting his tract. Is held, just as is required of qualified surface owners, the transferable leasehold of the nonqualified coal. The appropriate reimbursement to the nonqualified consenting surface owner will be fair market value, payable by the federal government to the holder.

The preferred program should be revised, in accord with the provisions of the Surface Mining Control and Reclamation Act of 1977, to provide for the transferable leasehold of coal, and to consult with surface owners regarding their willingness to consent to coal mining after transfer. Land held in name for another should not be leased in this manner. Tracts of land overlapping public energy reserves will not be removed from consideration unnecessarily early.

587

IV. The Single Tract Sales System and Competitive Bidding Methods Should be Used

The public interest is best served by the use of the single tract sales system, whereby to lower user costs, administrative efficiency in the planning process and a more equitable distribution of revenues among lessees. The single sale system insinually forces conversion of bids on different tracts, because adequate consideration cannot be given to particularities of mining, processing, transportation and reclamation expenses.

The cash bonus bidding method, of the five methods of bidding determined by the Office of Surface Mining, is the most cost effective for the consumer. The cash bonus bidding mandates strong incentive for development on the part of this successful bidder. The cash bonus bidding method, however, is the method otherwise required by the federal government. Royalty and performance bidding methods, on the other hand, encourage lease speculation.

V. The Federal Government Should Not Designate End-use

End-use decisions should be left to market forces. Designations of end-use by the Department of the Interior would be contrary to the intent of the SMCRA and the intent of the President's Directive, in his January 23, 1978 State-of-the-Union address, to fight inflation... by reducing government dictate in the economy and letting the market decide.

VI. The Definition of Maximum Economic Recovery Must be Revised

The proposal to define maximum economic recovery as "restrictive profitability" would increase the cost of coal to the consumer by requiring the recovery of coal that the robust operator would not extract. This proposal is contrary to the charge the U.S. Geological Survey's current vigorous enforcement of open-pit mining regulations. As the Office of Surface Mining has chosen to do in its proposed surface mining regulations, rather than to increase the consumer's costs, the proposal should be rejected.

Furthermore, maximum economic recovery as proposed could require production of coal that the consumer cannot readily use because it is not in the form desired. This proposal would be contrary to otherwise fulfill contract requirements for the market's coal needs. Finally, the impact of the definition as proposed would be to increase the cost of coal to the consumer. This is set forth in the President's recent State-of-the-Union message, and cannot be refuted. We refer you again to the message, on "the advantages of letting the competitive market, rather than government, control industry performance."

487

The Carter Oil Company thanks the Department of the Interior for this opportunity to comment on the Draft Environmental Statement for the Federal Coal Management Program. We urge the Department of the Interior to revise the proposed program and the preferred program necessary to assure that the federal coal management program that is adopted will best serve the public's energy, environmental and economic needs.

Sincerely yours,

747

Steve N. Narveson
Administrator

STATE OF UTAH
OFFICE OF THE SECRETARY
SALT LAKE CITY
84111

February 9, 1979

The Honorable Cecil D. Andrus
Secretary of the Interior
Department of the Interior
Washington, D.C. 20580

Dear Cecil:

I want to take this opportunity to commend you, Guy Martin, Steve Quarles, and the rest of your coal leasing staff for the outstanding manner in which you have handled the draft environmental statement. In my opinion, the new Draft Environmental Statement represents a substantial improvement over past federal efforts. It is well written, clearly organized, and presented in a logical fashion and written in a very readable style. Of particular importance is the same emphasis placed by the draft environmental leasing issue on qualitative justifications for renewed leasing, when taken together, offer a compelling justification for having a system of coal leasing. I believe that a system of coal leasing under this new leasing system will give us the capacity to significantly improve the way in which federal coal management processes, from both environmental and economic perspectives.

It is necessary to qualify my optimism with several caveats. First, the Department of Interior must continue its present efforts to make the new local government planning activities a priority and its coal leasing activities in particular. Second, we must make clear to the President, the White House, and Congress that the new leasing system is only a first step to the Congress that land use agencies must have significantly increased funding to efficiently and expeditiously handle the new responsibilities. Third, we must make clear to the Congress that it is clearly congressional and Presidential intent that public lands and resources be managed in a manner that protects the environment and values without significant environmental damage. If the coal leasing program is to operate to help meet the Presidents goal of doubling coal usage by 1985, it must be done in a responsible manner that seeks to spread fewer dollars over more and more programs.

Finally, I must reiterate a point that I made to the white house staff during a briefing on representative proposed for the Federal coal leasing system. The success of this system will depend on stamping out coal leasing, as we erect, the success of this system's stamping, or coal leasing, as we erect, the success of this system's

The Honorable Cecil D. Andrus
February 9, 1979
Page 2

operation will depend to a large extent on the quantity and quality of information readily available by which to guide the specific decisions. I am sure that you are aware of the difficulties involved in integrating the disparate and duplicative data systems in each of the various federal land and resource agencies. But, I would like to add that there is a top priority in this regard and is so reflected in the resources provided to carry out the effort many of the key decisions will continue to be delayed until such time as sufficient information is available.

What are your specific comments on the Program end the DES. If you can be of any further help in meeting this program to please let me know. Thank you again.

STATE OF UTAH
COMMENTS ON THE DRAFT ENVIRONMENTAL STATEMENT
FOR THE FEDERAL COAL MANAGEMENT PROGRAM
STATEMENT OF PHILOSOPHY AND PERSPECTIVE

The implicit assumption of this draft environmental statement is that state governments have failed to express a preference for an alternative program in which states would control the quantity, location, and timing of coal leasing. Let me assure you that this is not the case. We have been clear from the State of Utah's perspective. Let the record clearly show our belief that at the state and local levels, governments should be allowed to control the development of their natural resources and to plan and carry out a comprehensive, state-wide, if the infeasibility results of federal control of such a program, a state-controlled program should be developed. This is the basic policy -- specific comments on the "Preferred Alternative". Let us take this opportunity to express our belief that without adequate resources provided to the states, first, in the form of the new leasing system, and without discipline and restraint in the Washington, D.C. offices to not meddle in the day-to-day operations of the states, the new leasing system will become no more than a lengthy chain of federal regulations inhibiting the mineral industry in Utah.

STATE OF UTAH
COMMENTS ON THE DRAFT ENVIRONMENTAL STATEMENT
FOR THE FEDERAL COAL MANAGEMENT PROGRAM

WILDLIFE CONCERN

This document reflects the extensive state-federal coordination and consultation that has occurred over the past year. It generally addresses the potential impacts on wildlife in a satisfactory way; however, there are some points of concern. These are discussed sequentially by chapter, section and page number.

Chapter 2 - The National Energy Role of Western and Federal Coal

Section 2.0 emphasizes that "...new federal leasing is needed to ensure that future western coal development is carried out as efficiently and with as little impact on the environment as possible." The EIS does not agree with this basic concept for coal leasing. The relative abundance of coal offers an opportunity to focus development in those areas that are least environmentally damaging. The leasing process can ensure accomplishing this objective.

Chapter 3 - Description of the Preferred Coal Management Program and Alternatives

We agree with the approach outlined in the preferred program but are concerned with the process for NEPA compliance. As we interpret Section 3.1.1.7, page 3-10, the process involves three major steps: (1) environmental, regional and planning steps; and (2) site-specific impacts. The Preferred Alternative Program described in the EIS does not make this distinction. Instead, the entire environmental impact analysis will be performed prior to approval of the mining plan. This is required by the Surface Mining Control and Reclamation Act (SMCRA).

In Table 3-1, page 3-10, the criterion for State Resident Fish and Wildlife must be met. The second paragraph of this portion should read:

Examples of such lands include:

- Critical breeding concentration areas (dancing grounds, strutting ground)
- Migration corridors for big game
- Critical big game winter ranges

In Table 3-1, page 3-10, the CATEGORICAL and EXCEPTION portions for Falcon Cliff nests are listed as pages 3-99 and 3-100. The last sentence of each was apparently excluded in copy. They should read as follows:

CATEGORICAL "Consideration of availability of habitat for prey species shall be included in the determination of buffer zones."

EXCEPTIONS "Buffer zones may be increased or decreased if the land managing agency determines that the active falcon nests will not be adversely affected."

to get development of federal coal resources going -- not at any cost, but at the lowest cost. This is the best way to insure that the public interest is protected. It is also the best way to insure that the public interest is protected. To extract maximum return off each lease can be motivated by a bureaucracy deftly misreading Congressional intent, or greedily misreading Congressional intent. The former is the most likely motivation, the latter is the least. Whatever the motivation, an insistence that "fair market return" is a license to pursue maximum return will result in the loss of revenue to the public and relegates returns to the taxpayer from that development. These charges for front-end royalty bids will inevitably be passed back to the public in the form of higher prices. This is the friction that prevents the public people experience a net gain from heavy front-end royalty bids or royalties.

PUBLIC BODY LEASING

The program for public body leasing should be carried out under the supervision of the joint state-federal coal selection and ranking team in each production area. The use of such teams should be allowed to review and approve any lease sale of coal under the public body provisions to a public body from another state.

PUBLIC BODY LEASING

The program for public body leasing should be carried out under the supervision of the joint state-federal coal selection and ranking team in each production area. The use of such teams should be allowed to review and approve any lease sale of coal under the public body provisions to a public body from another state.

Office of Coal Management (140)
Page Two
February 9, 1979

Santa Fe generally endorses the Department's preferred alternative as best designed to enable the Secretary to exercise maximum flexibility to determine when, where, in what quantity and to whom federal coal should be made available for lease, based upon economic, environmental or national market demands. Our endorsement assumes that the Secretary's rejection of the DEIS program does not mean that the DEIS program is rejected. We believe that the coal industry, as well as other segments of the public, in reaching leasing decisions, should understand from statements made by the Secretary during his appearance before the House Coal Leasing Policy, in his role as chairman of the hearing panel that presided over the Washington hearings on the DEIS on February 14, 1979, that there was no intent to terminate or minimize industry contributions to the entire coal management program. That should be made abundantly clear in the final version of the DEIS.

With respect to the various planning stages leading to a lease sale, (Fig. 3-1), there should be timetables projected for each identifiable step so that the total timetable could be met. The DEIS provides for a minimum of 18 months for the application, particularly for relatively new entrants such as Santa Fe. These timetables should then be further broken down into the detailed process steps defined in Figures 3-2, 3-3 and 3-4.

On page 3-18, Col. 1, the DEIS describes proposed planning rules and regulations by both the Forest Service and the BLM. However, there is no discussion of how the two agencies will coordinate their actions to insure that they are in line in the event of conflict. There should be specific discussion of the Department of Interior's plans to avoid stalemates in areas of multiple agency control.

Section 3.1.2 - Tract Identification and Industry Experience. This section discusses the designation of coal tracts for lease based on factors including technical and data. In the absence of prospecting permits, there should be a list of factors to consider data. Section 3.2.2 - Regional Tract Ranking, Selection, and Scheduling, also discusses the possibility of this

Re: Comments on the Federal Coal Management Program, Draft Environmental Statement

Gentlemen:

Santa Fe Mining Company ("Santa Fe", formerly The Cherokee & Pittsburg Coal and Mining Company) offers the following comments relative to the Development of the Interior's Draft Environmental Statement (DES) on its proposed federal coal management program.

Santa Fe has been actively involved in the development of western coal reserves for the past several years and needs to be considered in the development of the federal coal reserves of Santa Fe's reserves has been the holdings of an affiliated company which is the successor in interest to several million acres of federal coal reserves in the Western United States. The affiliate currently retains fee simple title to only 150,000 acres and title to the mineral estate in 4,000,000 additional acres.

Most of the affiliate's present and potential coal reserves are interdispersed with federal, state, Indian and privately-owned lands and coal in the familiar checkerboard ownership pattern which characterizes the West and parts of the Eastern United States. A drilling program is currently underway to identify other coal prospects among Santa Fe's holdings.

With that background, we turn to our specific comments on the DES.

Office of Coal Management (140)
Page Three
February 9, 1979

technical data insufficiency, but does not propose positive action to remedy the problem.

The lack of sufficient technical data could be remedied by a number of sources prospecting permits to industry operators, thereby permitting more meaningful tract recommendations.

Santa Fe's principal concern is with the DES's treatment of mixed ownership areas, particularly the so-called "checkerboard" areas. Article 3.1.2 of the DEIS discusses the use of the coal bonds by Santa Fe and its affiliates. The historical reason for the checkerboard areas is recognized in the DES (p. 1-7):

"Another factor of some importance is that Congress granted extensive lands to railroads in the West. To settle the West, the railroads' presence was essential. But to build a railroad was a costly venture, and railroads could not build railroads in what was then virtual wilderness without financial assistance. The grant of land by the government to the company was that inducement."

Typically, Congress granted the railroads 100-foot-wide right-of-way sections on both sides of the proposed railroad right-of-way, extending back a distance of five miles or 20 miles on each side of the railroad. The even-numbered sections were not conveyed to the railroad, continued to be in the public domain. By granting the odd-numbered sections, and retaining the even-numbered sections, a checkerboard effect was created, although Congress probably intended that

Office of Coal Management (140)
Page Five
February 9, 1979

the granted land would be sold by the railroads to other citizens, until all of the lands were taken up by the original grantees. The resulting checkerboard land pattern would make future coal development continue to influence western coal development, particularly in Colorado, Montana, Wyoming, and New Mexico." (Emphasis added).

The underscored statement may leave the impression that Santa Fe's affiliate had not disposed of most of its original grants lands. In fact, the railroad has sold only a small portion of these grants, of the many millions of acres of original railroad grant lands held by Santa Fe's affiliates, that company owns approximately 1.5 million acres of mineral rights reserved and some 4 million acres of mineral interests reserved when the surface was disposed of. The retention of these mineral interests is consistent with the historical policy of the Federal Government in its disposal of mineral lands for settlement purposes and is reserved under the Mineral Leasing Act as under the Stockton-Hannestad Act. The Federal Government currently holds reserved mineral rights on over 1 million acres of land which it has disposed of the surface.^{1/}

The DES includes salutary recognition of the fact that the development of large tracts of non-federal coal in checkerboard areas is vitally dependent on the availability of relatively small areas of intermingled federal lands.

"Besides helping to meet national energy objectives, new Federal leasing is needed to ensure that future coal development is carried out as efficiently and with a little damage to the natural environment as possible. Because

Jemez River Coal Region appears somewhat less dependent on new federal leasing because of the presence of federal coal and other factors which limit available non-federal coal." (p. 2-8). On the contrary, Santa Fe's remaining unleased mineral reserves can only be developed in the most economically efficient manner if relatively small areas of intermingled or adjacent federal lands are made available for leasing. Consequently, Santa Fe respectfully requests that the Office of Coal Management take care to see that federal leasing in the San Juan Basin checkerboard areas be carefully re-examined.

Santa Fe emphatically rejects the "rule-of-thumb" of "not leasing in checkerboard areas" (3-12). The DES presents no practical justification for such a policy. There is no logic if ever, any rational basis for arbitrary, rigid policy absolute in surface development. The potential economic and environmental consequences of the "no checkerboard leasing" are particularly pernicious. The DES recognizes that "more rapid development of the coal land in both the Federal and non-Federal portions of the checkerboard areas where the railroad control of the land under lease is retained will be the practical result if development of the non-federal coal is attempted without the federal coal. Also, there will be severe economic and environmental consequences if the railroad's control of these lands is retained." The report states that the environmental consequences of this subincentive "are difficult to estimate" and "not clear" (3-13). Santa Fe believes that the environmental consequences will be significantly adverse and unnecessary. If the policy of the Federal Coal Management Program is to allow for the maximum amount of coal production, then "no checkerboard leasing" alternative should be rejected as a programmatic objective.

In its discussion of the checkerboard areas the DES also states that certain advantages accrue to the non-federal coal owners vis-a-vis other applicants in a competitive lease sale, a problem that it recognises. However, the DES also admits that it will share resources information with others" (3-13). Santa Fe has previously made it clear to the Department that it will not share resources information with the Railroad on a confidential basis (if other lease applicants will do the same) and that it would

Office of Coal Management (140)
Page Seven

of the large Federal ownership of western coal, a major expansion of the checkerboard pattern throughout the availability of Federal coal, even if it were possible, would result in a significant loss of coal development, almost certainly a less efficient and environmentally attractive method of development. In short, the key consideration in mine site selection would become the ability to avoid the cost of developing coal, rather than the basic economic and environmental desirability of the site.

For many years, patterns of land and mineral ownership caused by early settlement policies have created a complex division of ownership and jurisdiction between the Federal coal intercessed with private, state, and Indian coal. Because individual tracts of land are too small to justify investments, development opportunities for non-federal coal in these areas would be limited unless adjacent Federal coal would also be made available for lease. This adds to uncertainties about production potentials, because theoretical production rates for individual areas in fact be achievable without development of Federal coal, and, conversely, a desire to develop Federal coal development of specific amounts of Federal coal may in fact lead to production of greater non-Federal reserves."

However, this recognition may be diluted by what appear to be erroneous factual assertions about the need for federal leasing in those areas in New Mexico where Santa Fe's known coal reserves are located. We cannot agree that the "an

Office of Coal Management (140)
Page Seven

be unable to grant access to its properties to the Department for testing purposes.

The analysis of the "no checkerboard leasing" sub-alternative also refers to the May 1978 report of the Justice Department on "Competition in the Coal Industry" and its recommendations to the Department. The report states that "that the railroad's control of these [checkerboard] lands will not have anticompetitive effects" (3-13). Santa Fe wants to emphasize that the Justice Department's report is very specious and superficial treatment of the role of railroad-affiliated coal companies in the coal industry. The coal industry is dominated by two railroads, the Union Pacific, Topeka and Santa Fe Railway Company. Santa Fe is an eager applicant for new entries into the United States' coal market and is determined to have a dominant position in the western coal fields. Santa Fe intends to file a detailed rebuttal to the Justice Department's study sometime in late April. Attorney General John Doar will file in the fall, requesting that the Department (1) correct the factual errors and misinterpretations contained in the Justice Department's report and (2), reconsider its recommendations in light of the information and policy arguments that Santa Fe will present. Santa Fe will also file comments of its own to the Secretary of the Interior. Accordingly, Santa Fe respectfully requests that the Justice Department re-examine its recommendations and that the Justice Department give no credence to leasing policy decisions until Santa Fe has made its presentation to both Justice and Interior.

In conclusion, Santa Fe urges the Office of Coal Management to implement these recommendations in making a prompt final decision on the checkerboard areas of the Federal Coal Management Program. Santa Fe believes that recommendations will promote the goals of domestic self-sufficiency in energy as expressed in the National Energy Policy.

Sincerely,

R. T. Zieting
President

V. COMMENTS ON THE PROPOSED REGULATIONS	69

-3-

Friends of the Earth, Inc., a national environmental organization committed to the preservation, restoration, and rational use of the Earth and its natural resources, respectfully submits these comments and requests that they be entered in the records on the following:

- (1) The Draft Environmental Statement (DES) on the proposed Federal Coal Management Program; and the program and specific regulations described therein;
- (2) Proposed land use variable criteria as described in 43 CFR 37460; and
- (3) Proposed fisheries regulations under the Federal Land Policy and Management Act (FLPMA) as described in 43 CFR 38764.

We will submit further comments on the proposed planning regulations prior to April 1. These written comments will expand upon previous written and oral comments made at hearings in Washington, D.C. and various regions impacted by the proposed program.

I. INTRODUCTION

The Draft Environmental Statement outlines the history of the Federal coal program (DES 1-7 = I-14). During this entire period, the Department of the Interior administered a coal leasing program, not a coal management program. It resulted in the hundred leasing of billions of tons of coal at least fair market value, with little energy production and a significant adverse environmental impact.

The preparation of a programmatic impact statement on the Federal Coal Management Program is a significant step in the institution and establishment of a national and orderly Federal policy concerning the leasing of coal and its effects on other land uses.

Some 25 million acres in six Western States will be directly affected by the proposal -- they contain lands which will be eligible for consideration for future leasing. In addition, vast areas of Federal non-coal lands, Indian lands, state lands and private land will be profoundly affected by the

program. Decisions made by the Department in its implementation of the coal management program will determine the location and size of population centers, traffic flows, the quality of air and water, the location of certain industries, the viability of western farming and ranching, and the type of lifestyle enjoyed throughout the six state region and beyond.

During the past seven years, the Department has been effectively out of the coal leasing business. However, the coal industry has managed to grow, particularly in the West, without any appreciable problems. It is feasible -- though not necessarily desirable -- in most all but the most optimistic foreseeable coal demands with resources on private, State, and Indian lands, as well as from Federal leases outstanding and FPLMA's.

The same time span has seen the imposition of legal planning requirements on the Department. The Federal Land Policy and Management Act of 1976 established a land use planning system for the public lands administered by the Department. These PLPA land use plans will gradually supersede the off-the-ground Management Framework Plans developed by the Department in the late 60's and early 70's.

At the moment, the Department's land use planning program and its coal management program seem to be in a collision course. In order to get the coal management program off the ground in time for a 1980 lease sale, the Department is proposing short-cuts in the land use planning process.

The environmental analysis of the Department's proposed program raises many issues -- a good number of which we comment on below. But the central issue raised in the Draft ES and the major issue facing the Department is the decision it must make between rapid implementation of coal leasing and its land planning responsibilities.

Environmental Coal Management Goals

The Department proposes four goals to govern the development of its coal management program. For the most part, we would agree with these goals. (3.1.1). However, they should emphasize consultation and cooperation with the public, not just with state governments. The importance of meaningful public involvement is not just a necessary part of any good administrative practice, but is also enshrined in the principles and instructions of the Federal Land Policy and Management Act, e.g., sections 102, 202, 204, etc., and the Federal Coal Leasing Amendments Act, e.g., section 2. As such, the principles governing the program should explicitly sentence public involvement.

Also, no acceptance of the objectives of the National Energy Plan can not be made without qualifications. While we supported the aims of the plan as proposed by the President in April 1977, several elements crucial to the program—particularly several energy conservation measures—have not yet been enacted. To the extent that the “National Energy Plan” referred to in the proposed goal either establishes or arbitrary coal production target or does not include vigorous and effective enforcement of energy conservation goals originally proposed, we cannot accept it as the basis for a coal management program. Therefore, we would propose that the second coal management goal read:

“ensure that sufficient quantities of Federal coal are produced to meet the demand for such coal under conditions of maximum implementation of cost-effective energy conservation measures.”

Likewise, the fourth goal should read:

“Include consultation and cooperation with state governments and the public in planning the management of Federal coal.”

Unfortunately, the Department cannot meet even the goals as it has defined them. Coal policy outruns resource planning. Coal decisions dominate resource decisions. The Department has plans to continue to short-circuit the most important environmental protection activities included in its proposed program.

We support the goals stated by the Department with the changes suggested above. We feel the Department can better meet those goals.

have not been convinced by its argument.

The Department's argument that new leasing is required to promote desirable patterns of coal development. This argument assumes that private coal development patterns will be undesirable, a premise unsupported by any evidence in the DCG. It also designates existing federal and state efforts to control and regulate the effects of development on private land, contradicting assumptions in Chapter Five of the DCG that such regulation will adequately mitigate environmental and other impacts. The analysis in chapter five, as we will discuss below, fails to compare the preferred alternative with other alternatives, including mundane private land development; to confirm whether it will, in fact, lead to more desirable coal development patterns.

Finally, the DCG proposes that new leasing will improve competition. We do not believe that the department or the Justice Department's 1978 study cited by the DCG supports this conclusion. The Justice Department's analysis was largely based upon its comparison of 4-firm concentration ratios for control of coal reserves between “total reserves,” which includes unleased federal land and “uncommitted non-federal reserves,” which includes existing leases and private fee lands, in the Southeast and Northern Plains.

Concentration Ratios	Northern Plains	Southeast
Firms with 100% interest	14.7	22.1
Uncommitted non-federal	14.7	39.8
Including existing leases	46.9	70.2
	66.3	90.6

Source: Department of Justice, *Competition in the Coal Industry*, May 1978, p. 83

* Concentration ratio is a measure of competition; the lower the ratio, the greater the competition—in this case, the competition for coal reserves or production.

Resolving vs. the “need” for New Federal Coal Leasing

The DCG correctly states that “The failings of the Department to show the need for leasing were cited by the court in DCG v. [when] as a principal defect in the previous coal leasing programmatic environmental impact statement.” However, the response by the DCG to correct this deficiency is less than adequate. Not only is the Department's analysis of coal demand and supply inadequate—an issue we examine in detail below—but it attempts to justify the adoption of the program on the basis of undocumented and speculative “benefits” which have nothing to do with the determination of need for new competitive leasing. Judge Pratt was very clear in asking “whether the proposed policy is even *sound*” based upon reserve, demand, and production statistics, *not* on factors such as competitive, administrative convenience, or presumed better patterns of development. We feel it is unfortunate if the Department's views correspond to those of Mr. Bob Evans, who in quoted in the *Great Junction Sentinel* (4-1-79) as stating “I don't think the department has to be able to demonstrate need to lease coal. . . If the department thinks it has better land that can be developed more than private land—you can think of a lot of reasons in the public interest to lease.” Unfortunately the DCG ignores this point of view in section 2.B.

It is essential to compare two questions. One asks whether various factors such as competition and environmental protection require the need for a particular form of resource management policy or another. The other question—the one asked by the court in DCG v. [when]—asks whether, on the basis of supply and demand considerations, there is a need to resume leasing. If the DCG were to fully answer these two questions, we would have no complaint. Indeed, we believe that environmental protection and resource law enacted for that purpose both require a resource management policy in which coal management decisions must take place. However, the DCG evades the question after failing, we believe, to definitively address demand and supply.

Even if the Department were correct in its legal interpretation, we

Justice suggested that there was an arithmetic possibility of decreasing the 4-firm and 5-firm concentration ratios in non-federal reserves by leasing additional federal reserves. This is a theoretical possibility. However, it ignores the entire history of the leasing program. The high concentration ratios resulted in part from the federal leasing program prior to 1970. The 4-firm concentration ratio for ownership of federal leases (on an acreage basis) is 21.1^{1/2}, compared to a combined 18.12 4-firm concentration ratio for all Northern Plains and Southeastern total coal reserves, and compared to a national concentration ratio of 13.3. Although acreage is not exactly comparable to leased reserves figures, it is noteworthy that the competitiveness of existing federal leases does not approach the theoretical limits which are the basis of Justice Department recommendations. Moreover, Department of Justice figures also indicate that a 4-firm concentration ratio for actual coal production increased during the period of federal coal leasing between 1970 and 1970, but decreased since the imposition of the leasing moratorium in 1971.² Similarly, production concentration is the least for acreage in the eastern coal producing region. (Dept Justice, p. 43). The General Accounting Office found that changes in production concentration of coal were more closely related to general economic changes than they were to ownership patterns. (GAO, II-5). One additional argument supported Justice's recommendation of increased leasing to promote competition. That was the survey of coal producers, coal consuming electric utilities, and utility commissioners in the Southwest, hardly an unbiased basis for a federal coal management policy.

The overwhelming evidence is that federal leasing prior to the present has been entirely uncompetitive, leading in low bidder bids and ultimately Congressional reform. Moreover, the fundamental conclusion of the Justice Department was that regional coal markets “are weakly competitive.” To justify a coal management program on this analysis, which furthermore ignored the history and nature of leasing activity, is unreasonable.

^{1/2} Based on Council on Economic Priorities, *Miner Control*, Table II-13, p. 37
² GAO, *The State of Competition in the Coal Industry*, p. II-4, 1977

II. THE NEED FOR FUTURE FEDERAL LEASING

Chapter One of the Draft EIS, "The National Energy Role of Western and Federal Coal," addresses the question of need for a Federal coal leasing program. As the EIS notes, this is a central issue, "The failure of the Department to show the need for leasing was cited by the court in *MEPC v. Bushkin* as a principle defect in the previous coal leasing programmatic environmental impact statement." (DCE, p-43)

Rented leasing under the preferred alternative is justified by the Department primarily as a means "to give the Nation greater assurance of being able to meet its national energy objectives." (DCE, 2-4) To be sure, there other positive benefits from the assumption of a new Federal program are also mentioned: the promotion of more sustainable patterns of coal development; providing additional legal and administrative flexibility to handle problems which will arise in any event with PLPA and existing leases; and to increase competition. However, these three areas are given only cursory treatment in the Draft EIS. They are discussed in less than two and one-half pages, so supporting data is provided, nor is there any analysis of alternative ways to achieve these goals without new leasing.⁴ In the final analysis, the Department fails in justification for adopting a new coal leasing program on the perceived future need for vast amounts of federal coal.

We do not question the need for a new Federal coal management program in terms of the kind of program to be instituted, an appropriate program must

⁴ Furthermore, the Draft notes that competition in the coal industry is a problem, relying on a memorandum from the Department of Justice, and suggests that new leasing may alleviate the problem. There is no mention of the Sherman and Clayton acts, or antitrust laws, or the potential for anticompetitive effects in the market (assuming that most anticompetitive effects are manifested in the sale of coal for utility use) to respond to this alleged problem.

Because of these consequences, some of which are already occurring during the comment period on the Draft EIS, it is necessary to subject the supply and demand projections used in the DCE to the greatest possible scrutiny. Our analysis indicates that the numbers generated by the Department of Energy in "Federal Coal Leasing and 1985 and 1990 Regional Coal Projections: Forecasts"⁵ and subsequently adopted in the Draft EIS are simply wrong. They do not provide a reasonable basis for decision making. They are inconsistent with later projections using the same model. At a minimum, the DCE must be supplemented with an adequate analysis of coal supply and demand before any final action is taken.

DOE Supply and Demand Projections

There is an aphorism in the forecasting business that while there are no magic numbers, numbers are magic. They give a false sense of precision and provide a decision maker with an easy handle on difficult issues. All documentary presentations of energy forecasts are hedged about with qualifying statements which indicate that the forecasts are basically worthless. (See DCE, 3-47) Needless to say, these tortuous cautions which are always trotted out when projections are attached, do not prevent the affected decision makers from relying on the numbers in question. If stretched on the validity of the projections, they say "Well, we said right there in the document that it wasn't perfect," rather than correcting the error. Then they go right along using the wrong numbers.

There are several severe problems with the coal supply and demand projections developed for the Draft EIS by the Department of Energy. The model inherently overestimates both energy demand and supply. The National

is responsive to the real needs for future coal development, not imagined or speculative needs. For this reason the discussion of the role of Western and Federal coal in the Draft EIS is of crucial importance. The methodology on which this discussion is based becomes a matter of concern and seemingly arcane considerations of modeling theory attain some importance because they have an impact on the picture of the future adopted by the Department in developing its program.

Projection of coal supply and demand play a critical role in the development of a coal leasing program. If properly done, they can help provide answers to four questions: Whether to lease at all? Where to lease? What magnitude of leasing to undertake? When to lease?

Without the much overgeneralization, the projections adopted by the Draft EIS give the following answers: Leasing must be undertaken. The bulk of the leasing must be in the Powder River Basin Region. Immense amounts of leasing are needed (By 1990, the Northern Great Plains Region might have to produce more coal than is currently mined in the entire country). And, due primarily to the magnitude of the projected need, the leasing must commence as soon as possible.

The implicit conclusion of the DCE on the questions of magnitude and timing of coal leasing pose the greatest threat to the rational and orderly planning process mandated by the Federal Land Policy and Management Act. The prospect of overwhelming need, particularly as set forth in the "1990 High" scenario, is used by the Department to justify the steps it has or will take to alter the PLPA planning process, to continue relying on existing MFT's as the basis for coal use planning and to further reduce the commitment to immediate identification of Areas of Critical Environmental Concern.

Coal Model used by DOE also appears to significantly overstate the demand for Western coal as a portion of total coal demand. In addition, the particular iteration of the model used for the Draft EIS contains unrealistic assumptions which skew the projection towards even higher coal demand. These three characteristics of the DOE projection effort inevitably lead to forecasts of higher Western coal demand than are credible.

The first step in the development of the DOE projections was the use of the Project Independence Evaluation System (PIES) model to provide forecasts of the domestic energy system in 1985 and 1990. The PIES model has been subject to a good deal of criticism. PIES is a demand-based equilibrium model. In plain English, this means that the PIES routine first establishes a likely level of residual energy demand — based on a general macroeconomic projection (in this case the DRI TRIM90 model) — and proceeds to meet that demand. The fact that the projected supply can't or won't be forthcoming is of little consequence to the model⁶; if there is a demand, there will be a supply.

Although the Draft EIS notes that there are alternatives to "traditional modeling of the energy sector of the economy, as reflected in the DOE coal model!" (DCE, 3-13) citing to a California study which projects energy consumption based on a detailed survey of households, businesses and institutions, it does not choose to use such methods. (The California study, incidentally, utilized for future end-use energy planning.) "Craig et. al., *Revised Energy System in California's Future: Issues Report*, 2 volumes, MC-PT905-01/02, U.S.

⁴ A classic example of this can be seen in the continued popularity of all DOE models, including this one, to project a thriving energy demand market for coal. Given the DOE's own projections, the market would have expanded by 1985, and to 25 plateau by 1990. Given lead times, financing and other considerations, these projections are absurd — there may be too little (and too little money) — but because the demand exists, the world is created, on paper.

Department of Energy, 1970"). Yet does it choose to discuss the flaws inherent in traditional econometric models.

The major flaw in the PIES model is that it consistently overstates energy demand. In 1974, the Energy Research and Development Administration predicted that primary energy demand in the year 2000 would be 140 quadrillion BTU's, an increase of 220% in 26 years. In 1976, the EEDA forecast had been reduced to 124 Quad. By 1975, the Energy Information Agency, which had taken over that EEDA function, was forecasting between 110-115 Quad for the year 1990 and had given up forecasting for the year 2000 altogether. In each instance, the PIES-based forecasts utilized by the nation's chief energy agency had been reduced after a broad consensus developed that the demand forecasts were too great.

In an interesting display, Avery Lovins has shown how government projections of energy demand have increasingly declined as we give more information about the ways in which energy is used. (See TABLE ONE ON NEXT PAGE)

Lovins indicates several areas in which long-term econometric equilibrium models like PIES may be in error:

"**Price elasticity of demand**--Many analysts minimize or ignore the effect of higher costs--especially for new facilities--on demand, or consider only the short-term component of price elasticity."

"**Inventories price elasticity of demand**--Many projections are based on periods in which real energy prices fall: for example, the average real price of U.S. residential electricity fell fivefold during 1960-1970. Apart from short-term fluctuations, this seems unlikely to recur, since in most energy systems, marginal costs have exceeded historic costs since about 1970.

"**Substitution**--Many traditional growth models may be constrained by physical extinctions. The UK has well-reasoned assumed that space-heating demand is a linear function of income, but the rich way out with to root. Car traffic is

EVOLUTION OF APPROXIMATE FORECASTS OF U.S. PRIMARY ENERGY DEMAND IN THE YEAR 2000, (a/y = 10¹⁵ BTU/Y - (J/y))

G1972-8 RATE: CA. 75 Q/Y

YEAR OF FORECAST	SOURCE OF FORECAST			
	BEYOND THE PIES	HERBRY	CONVENTIONAL MISSION	SUPERSTITION
1972	125	140	160	190
Lovins	Sierra Club	AEC		Edf/McCormick, FPC
1974	100	124	140	160
EIA (ZEB)	EIA (TF)	EEDA		EEI, EPRI
1975	75	89 - 95	124	140
Lovins & Williams / Faraffa		EEDA		EEI
1976	33	63 - 77	96 - 101	128
Steinbeck (for 2050)	CORES Cons. & Dem. / IEA (Povel for 2010) / (Weinberg) (II) (III) (IV)	Povel / Lepp		Lepp

(Note that this matrix has considerable predictive power. For example, DODD's 1972-73 Departmental Policy Review forecast for 2050 was 95 q with 852 bbl oil--an estimate that is very close to the 1976 EIA projection. And Lovins's "Parrot" forecast, made two years earlier--one 114 and 121 q for 2050--was 850 bbl oil respectively, averaging to 123 q and implying an "exponential" decline, since such low prices presumably stimulate consumption.)

Sources: Avery A. Lovins, "Is Nuclear Power Necessary?" Groups de Bellarive Colloquium, "Nuclear Energy--Implications for Society," Geneva, 1979

"**Prohibition**--In most countries, rapid demand growth, especially in such fuel-intensive sectors as electric-resistance space heating, have been heavily promoted by advertising, special rates, etc., now mostly being reversed.

"**Subsidies in basic oil**--Many studies rely on projected and excessive increases of population, labor force, labor productivity, and other factors underlying projections of economic activity. Some countries have unique distortions: for example, the US annual energy growth rate in the 1960's was increased one or two percentage points by the Vietnam war leading to an enormous surge of entrepreneurship for several years.

"**Definition**--Most projections are made in terms of primary energy. But with the economy assumed shift towards electrification and synthetic fuels, more than half of the officially projected growth in the next few decades (for example, in the U.S., Germany, France, and the UK) will go to conversion and distribution losses, thus masking such slower growth in consumption at "end-use energy". Failure to account in end-use terms often leads to significant distortions.

"**Schedules**--The most recent and central question to be raised is how far past, present, and projected energy use might be inflated by the pervasive public subsidies in the energy system rather than reflecting true internal costs. Recent studies in the U.S.--the only country, to my knowledge, in which decent studies of energy subsidies are publicly available--have revealed that the tax and price subsidies are currently of order \$100 per year, not including large electric subsidies. These subsidies are also unevenly distributed between various forms of energy, leading to further distortions.

"These arguments are all important, but last, at least in the short run, to be inconclusive owing to the infinite speculative combinations one can assume for future levels and rates of change of the many key parameters--monetary and composition of economic activity, prices, price elasticities, income and other elasticities, etc.

While it is clear from the literature that most scenarios of growth over historic rates can be reasonably justified only by assuming dramatic increases in real energy price, many analysts are coming to prefer a more conservative mode of argument that cuts more quickly in the heart of the matter: physical analysis of potential efficiency improvements (based for their economic attractiveness) combined with physical contraction of end-use needs "from the bottom up". Such an explicit and disaggregated treatment requires the analyst to take responsibility for saying just what the energy will be used for. This type of analysis has the virtues of being simple, transparent, verifiable and repeatable."

Lovins then summarizes a series of examples which indicate the development of non-econometric energy forecasting, including the California study--almost all of which reach credible results that imply significantly less energy usage than occurs under traditional econometric modeling. The point here is not that the Department must undertake such forecasting--though that would certainly be desirable--but that the Draft II should display onogenesis that the PIES results will most likely overstate energy demand.

The DOE projections are developed from the base demand figures supplied by the PIES model through two routines designed to indicate industrial and utility demand for coal.

The "DE model" (for Energy Environmental Analyses, Inc.) is used to determine the industrial demand, by type, for coal. Precious little documentation or explanation of the EEA model is provided in either the Draft II or the LDO study, as it is difficult to criticize. However, it is implied that the equilibrium price of natural gas is an important factor--the model's "bottoming" a population of industrial combustors. (DPO, p. 43) As will be discussed below, the values for future natural gas prices used in the model were wrong.

* In addition to the Climate Change Council, the National Research Council Committee on Energy and Alternative Energy Sources (NERC), Panel on Energy Demand and Conservation, the Oak Ridge National Laboratory Energy Division, and the Energy Conservation team at Lawrence Berkeley Laboratories have all developed national and regional energy forecasting models.

THE ICF MODEL

The critical third "r": In the DOE projection was the development of utility demand forecast and final industrial demand figures under the ICF Coal and Electric Utilities Model. As the LDOE states "The basic ICF model structure is conceptually straightforward in that it equates via a transportation network provides coal to satisfy the demand for both utility and nonutility consumption at lowest cost." (LDOE, pp. 44-45) ICF is probably a state-of-the-art model, but it does have its flaws, which are highly relevant to the questions the Department was to address in the "new" section of the Draft EIS.

The ICF model overestimates Western coal demand. Some reasons for this will be given later but there are no doubt that the overestimation is a salient feature of the model. When compared with models developed by Argonne National Laboratory and the Stanford Research Institute, the ICF model consistently projects greater Western coal usage—even when all three models are in remarkable agreement on total national coal demand (Argonne National Lab., NRFS Project Report, # "Impacts of MPPS Revision on Regional Coal Production", # "The Effect of Alternative New Source Performance Standards on Regional Production of Coal").

In a situation where there is disagreement among forecasters, the question is to say "A player on all your teams" or to wonder how to differentiate among them. However, in this instance, there is almost complete agreement that the ICF model has been seriously in error—at least in the short term if we have some certainty is possible. Referring to a late 1977 ICP estimate of coal demand, Argonne Report #4 states:

as a future source of supply. The DOWE projections, drawing on the methodology developed in Western Coal: Prospects or Production by Pyne and Baker, assume underground mining to the west, over when prices exist to mine the coal.

Two examples from the DOWE show the underestimation of the potential for underground mining. Table 2-2 shows 47.7 million tons of planned production from the Illinois-Southeastern Coal Region by 1985, plus an additional 23.3 million tons from mines without mining plans for a total of 70.5 million tons of production by 1985. The DOWE projections show a high demand of 36.3 million tons. We assume that somebody must want that entire 43.7 million tons of coal and that the companies spending hard cash to develop it have not taken leave of their senses.

In Table 3-30, which summarizes planned, potential and projected production for year 1980, the DOWE shows a maximum potential production of 30.8 million tons per year (the DGE projections are 304.5, low: 450.7 medium; and 622.1, high). The DOWE draws the following conclusion:

For 1980, there could be some, but probably not a large need for additional coal to reach the projected production levels. On the other hand, achievement of medium and high 1980 production levels would require substantial increases in the number of western coal mines, particularly in the Powder River, Green River-Western Park, and San Juan River Coal Regions.

This conclusion might be more meaningful if we look at Table 3-30 initially ignored the 100.9 million tons a year potential underground production from subsurface right leases it set forth in Table 2-23. With this potential added, the maximum potential from existing leases—new 970.4 million tons a year—becomes essentially equivalent with the 1980 medium demand. Such equivalence would not necessarily eliminate the need for more Federal coal leasing, but it certainly would have an effect on the magnitude, timing and location.

"The DOWE production estimate for the Northern Great Plains (428 million tons/year) is the highest I have ever heard of. The 1976 production in the Northern Great Plains was just over 88 million tons. I find it very difficult to believe that the production estimate for that area is just like that. The feasibility of such dramatic increases can be questioned because:

1. The U.S.G.S. has explained that the surface production of coal in the Northern Great Plains (either leasing has been indefinitely suspended) will be less than 200 million tons by 1985. It is doubtful that the remaining 200 million tons of coal reserves can be profitably exploited by itself, support some an additional 73 million tons of production.

2. The most recent FPC information on utility demand for the Northern Great Plains indicates that the projected growth of contracted demand between now and 1985 for newly constructed power plants:

"Planned" mine openings reported in the Wyoming survey for 1985 indicate that there are about 305 million tons, less than those needed to achieve the ICP production forecast. In fact, total western coal production is projected to be 265 million tons/year by 1985. Moreover, it should be emphasized that the keynotes do not include the impact of the proposed coal export facilities. Given the 1970 development time for a new mine, it represents an upper calling on Western mine capacity.

Without further details on the regional markets, this production is intended to be a conservative estimate on the likelihood of demand exceeding for over 400 million tons by 1985.

LEAST COST METHODOLOGY

One cause for the tendency of the ICF model to overestimate Western coal demand, particularly surface coal demand may be found in its use of a least cost method to determine future mine sites.

The least cost nature of the model shows the location of mining and the method of mining. The model examines all possible supply options and chooses the least costly alternatives. Minimizes price differences dictate environmental, social and other considerations. One result of this is the choice of underground mining

Underground mining is undoubtedly somewhat more expensive than surface mining. It is an open question whether that additional cost can be justified by social and environmental factors. A model which makes no allowance for the possibility that one might want to choose slightly more expensive mining methods, or a matter of public policy, is seriously deficient in decision-making.

ASSUMPTIONS AFFECT FEDERAL LEASING

One final area in which the DOE model contains an inherent flaw is its assumption that the cheapest federal land will be leased. Just which land will be leased, of course, is precisely what is at issue in the Draft EIS. The LFOC states:

"For all three scenarios in both 1985 and 1990, it was assumed that the federal government would lease enough coal resources such that the resources chosen to mine (represented by the areas indicated in the maps) would be sufficient to meet the needs of minimizing overall national costs of coal production, transportation, and consumption." (LDOE, p. 202)

By lowering the costs of Western coal, this assumption inflates demand. The inflated demand creates the need for an inflated supply as set by the least-cost Western coal, e.g. Powder River surface coal.

SPURIOUS ASSUMPTIONS IN THE DOE MODEL

The inherent flaws in the DOE model give rise to serious doubts concerning its fitness as a tool for decision-making. These residues are compounded by the choice of assumptions and inputs employed in the particular iteration of the DOE model adopted in the Draft EIS.

In large part, the assumptions are faulty because of a timing problem. The DOE projections were developed last spring, prior to passage of the National Energy Act. They contain some guesses about the ultimate shape of that legislation that proved to be wrong. In addition, the spring run also attempted to guess at the results of other important regulatory processes, most notably the New

Source Performance Standards for Coal Fired Power Plants, again, with what appears to be little success.

Many of the flaws could easily be corrected if only the Department will attempt a further iteration of the HSC model later this year, when those critical variables about which concerns were made will be known exactly. The end date for a final decision by June 1 should give way to a moment of humility. There is no reason in having the Secretary make a decision based on data which is wrong, when a few months of delay will give the Department a chance to do it right--*once*.

A brief look at the eleven exogenous variables used in the FTSB-HSC run shows a host of errors. Most, although not all, lead to higher coal demand and supply figures.

(1) **Credit Oil Prices**--the 1985 law (which in 1975 prices)

has effectively removed oil from the domestic price index.

(2) **Residual Oil Prices**--all countries are wrong for both 1985 and 1990. Low numbers indicate a continuation of previous regulation, medium and high numbers equate with price of fuel oil.

The data is also wrong, starting by being off by 10 percent or more.

(3) **Electricity Growth Rate**--the 5.0% HSC projection to 1995

is not credible in light of recent growth rate trends.

(4) **Environmental Regulation Utilization**--who wants FGD on low sulfur coal is the most critical variable in the model. See discussion above.

(5) **Coal Conservation Regulations Utilization**--assumption of regulatory program passed by conference committee does not take into account either the stringency of the regulation proposed by HSC or the cost of the public interest exemption for gas-fired plants as accepted by DOE.

(6) **Gas Conservation (Growth)**--there is no industrial user tax.

(7) **Appropriate Fuel Productivity**--1985 and 1990 numbers do not correlate with announced industry plans. Likelihood of any plants by 1995 is small.

(8) **Local Coal**--Section 125 of the Clean Air Act is operative. It is not accounted for in the model. This was due to a pending amendment to the provision which would permit and change amendment. There remains a provision in the law.)

Many of the problems noted in this brief list could be alleviated if a new model run were attempted today, using current information about energy pricing, demand and the National Energy Act. It would, of course, take some weeks to develop appropriate programming instructions for some of the more complex variables. However, a winter review could not cover the single most important variable in predicting future coal use--the New Source Performance Standard.

At the outset there is some difficulty in determining just what version of the HSCD are being used in the projections. The Table of HSC assumptions in both LPMO and the Draft ES describes the option as follows: low "WRI PEG on all new plants"; Medium "ESG PEG in the East, 40% PEG on low sulfur coal"; High "same as mid-range" (LPMO, pp. 78, 79; DSC H-2, B-3). However, the description in the text of Air Pollution Control Regulations varied from this:

Air Pollution Control Regulations

Best Available Control Technology (BACT) is defined as 90 percent SO₂ removal, except that partial scrubbing would be permitted if annual average SO₂ emissions were reduced to a specified floor:

Scenario	ESG
Low	0.0
Mid-Range	0.5
High	0.5

(LPMO, p. 96, DSC, B-4)

An indication of the importance of the final NSPS--and of the variability of energy projections--can be seen by looking at a series of Western coal demand projections, under various assumed NSPS regimes, done on the same HSC model subsequent to the June 1978 DOE projections used in the EIS.

In Further Analysis of Alternative New Source Performance Standards

See Coal-Fired Power Plants, Preliminary Draft, September, 1978, EIS Inc., and analyzed several alternative HSCS regime under a single set of assumptions = tables (e.g., there was no low, medium, high, just one energy demand scenario which was very close to the DOE model). For 1990, Western coal demand varies by nearly 200 million tons per year, depending on which NSPS alternative was chosen.

September 1, 1978 Projections

Region	Exogenous	1990 Western Coal Demand
0.0	Y	325.2 M/T/Y
0.2	N	322
0.5	N	322
0.67	Y	322 -- equivalent to DOT High NSPS scenario
0.8	Y	326
	DEA High	322.1
	DEA Medium	326.7

Further forecasts, released in a subsequent preliminary draft on December 12, 1978 indicate even lower Western coal demand figures for a new array of potential NSPS options chosen by EPA, DOE and NIEC. None of these options substantially total Western coal supply in excess of 700 million tons per year in 1990.

While this assemblage of predictions and projections may seem confusing, it does show two very important things. First, NSPS alternatives have a major impact on the total Western coal demand. The particular set of NSPS alternatives included in the DOE high projection produced Western coal demand numbers significantly higher than any other NSPS outcome, even when all other variables were held constant. Second, as greater concessions on variables were relieved -- in the December 12, 1978 run, all coal demand projections decreased.

In light of this uncertainty, we strongly urge the Secretary to hold off any decision on the need to issue until after EPA has reached a final decision on the NSPS and EPA has an opportunity to analyze the coal demand impacts of that decision. A wait of no more than a few weeks will allow Interior to make a much sounder decision based on the right information.

PRELIMINARY ASSESSMENT OF THE 1985 ENERGY PROJECTIONS

The coal demand and supply projections used in the EIS give a set of signals to whether, where, when and how much to invest. The signals which come through in the EIS are wrong, the product of inherent flaws in the DOE model and independently determined exogenous variables.

It is easy to remedy most of these defects, if the Department wants to take the time and effort to do it. At a minimum, it should reevaluate the HSC data using variables which adequately reflect the current law. To do an adequate job, however, the Department must wait until a decision has been made on the New Source Performance Standards -- the single most important variable determining the magnitude and location of Western coal demand.

These steps have an importance beyond that of rectifying some computational errors. There is no doubt in our minds that an honest and rational analysis of future coal demand will show the Department that coal leasing is not a problem requiring an immediate solution, necessitating the effective destruction of land planning process, as well as the Powder River Basin. More dispassionate analysis will clearly show that the real coal demand can not be met by leaving after a sound land use planning program, including designation of some of critical environmental concern, is in place, not before.

The Department must take its time to properly assess the difficult issues involved in determining the need for leasing. A failure to do so will lead to the implementation of a program based on the GCOO principle well known to all energy forecasters—"garbage in, garbage out".

One other task that the Department could undertake, while fixing the kinks out of its econometric model, would be to expand its shamefully brief discussion of "Nontraditional Energy Sources". The Draft ES devotes one paragraph to unconventional sources of natural gas, one paragraph to solar energy and three manufacturer paragraphs to energy conservation.

It is not necessary to adopt a millennial attitude towards these sources to realize their relevance to future demand for coal. The major projected sources for unconventional natural gas are in the gas-saturated areas of the Gulf Coast and the Rocky Mountain overthrust belt. Thus, such sources are perfectly situated to service the same region which will be receiving the bulk of Western coal (Figures 3-4, 3-5 show Texas, Western Interior and Other East (the Midwest) receiving the bulk of Western coal). There is also a good transportation network already in place. No mention is made of any of these facts.

The discussion of solar energy is totally without substance. The Draft ES adopts a low estimate of solar potential. Because it has failed to evaluate the end uses of the projected coal usage, it is not possible to analyze which solar technologies might compete with which potential uses of coal in the regions served.

Finally, the evaluation of energy conservation is laughable. Western coal will be used to generate electricity and for some industrial process heat uses. These are two of the areas in which energy conservation has the greatest potential, yet the latter receives one sentence, and the former, one-word phrase. Price

and technology-sensitive trends in electricity usage are not discussed at all, no sonic literature is ignored and only one source (EIA's energy data estimates) is cited in the Draft ES for all of these sources.

This is in keeping with the tone of Chapter Two which provides a status quo, back-hander-looking analysis of the future. Coal has obviously replaced nuclear power in DOE's forecasting hierarchy. It will grow—regardless of competing energy sources, financial, technical, environmental and resource (including water) constraints, or a general decline—the growth of energy use—become it is programmed to grow. The fact that it is best suited to meet only coal can use categories, electric generation and large scale industrial energy needs is conveniently overlooked.

Coal Production without New Leasing

A singular irony in Chapter Two in the different fates turned towards existing and future coal leases. While LPD develops sound figures that strain credibility and easily come up profit in mining the subsurface, DOE projects resigned inaction by the holders of existing leases or PMLA's—many of whom received their rights for a song.

Obviously, many of these leases will not be developed. Some can't meet BOMCA requirements, some are in the wrong place, some are too small, some just plain have poor deposits and won't ever be economical. Nor is Friends of the Earth particularly anxious to see any of them developed. The leases were issued, by and large, without appropriate planning or environmental analysis. The development of many of them would constitute environmental tragedies. We will strongly support any efforts by the Department to curb their growth.

But the sad fact is that many of these leases may well be developed and it is best to know just how many so that we can limit the amount of additional land put in jeopardy to that minimum required to meet legitimate energy needs. Unfortunately, the Draft ES is woefully inadequate in its assessment of potential

development and utterly fails to provide quality data to help determine just how much coal will be mined from over three thousand existing state and federal leases.

Let us start with the positive. The Draft ES provides summary statistics for planned production from about 223 Federal leases for which mine plans were approved or pending approval. These mines alone indicated a planned 1985 production of 360.6 million tons a year, approximately double 1977 Western production.

The next category, existing Federal leases without approved mining plans, is subjected to analysis of a more problematic nature. To some extent, this is only appropriate. However, the methodology employed, review by Geological Survey mining supervisors, "taking into account demand for the coal type, environmental problems of the lease sites, transportation availability, mining costs, lease size and other factors" (GSI, 2-30) leaves much to be desired. Why did the Department, which has been receiving significant criticism over its handling of existing leases, not make a major effort to develop more information about these mines? Why weren't other professionals called in to assist the GS mining supervisors in assessing questions about national demand, transportation and other matters not normally within the purview of the GS? Why was there no update of the March reviews which were generally referred to in the agency as the "telephone survey"?

Without back-up data, the assigned likely production figures for existing leases without mine plans raise some interesting questions. Nearly 91% of the resources under lease in the Powder River Basin are assessed not to be developed. This is extraordinarily high considering the generally favorable geologic and economic factors which obtain in this area. Are these leases all in aluvial valleys? Are they narrow areas, despite the fact they were generally set at

the lessees' request? Does SE have different views on the potential demand for coal and/or SE, which finds that the sky is the limit? The Draft ES gives no clue.

The lack of clarity continues in the review of the 172 outstanding PMLA's. The Draft ES accurately notes the significant reserves associated with PMLA's and that does its best to discount the potential. Table 2-23 indicates a significant production potential from PMLA's without legal or environmental qualifications. Table 2-30 ignores all underground production from PMLA's in its "summary of planned, potential, and projected production, 1980".

If underground reserves in PMLA's in the Powder River Basin—4.3 billion tons in the dryline, or richer, deposits—the Draft ES says "97 percent of PMLA reserves without legal or environmental questions are underground reserves in the Powder River Coal Region where DOE projections show an underground mining occurring." (GSI 2-34). There is no explanation of why the holders of these PMLA's would choose them, no indication that the DOE model considers the strong likelihood that these un-permitted coal mines, gathered without basic permits and subject to relatively few restrictions, might make their owners quite wealthy. Nor does the developing of the Powder River PMLA's square with the oft expressed fear of Department officials that they will be hit with a flood of demands to process PMLA's from Powder River as soon as the *Hughes* injunction is lifted.

The potential of Indian leases is similarly underdocumented. In 1977, Indian coal represented nearly 13.8% of all coal mined in the West, by 1980 the Draft ES expects that figure to drop to between 2% and 5% (Table 2-30) despite the fact that Indian lands could support nearly 600 million tons a year of coal production (Table 2-24). While no one expects anything like that

amount of production, it seems inconceivable that Indian coal production will stand still. Because of the large existing blocks of Indian coal, which can be leased without acreage restrictions, the opening of a handful of new mines could move tons of millions of tons a year of additional coal production.

Finally, the Draft ES tracks non-Federal, non-Indian coal, which includes 2,055 outstanding state leases plus free coal. The Draft ES states a projected 1980 production from these lands of 35.7 million tons, based on LPD regulations. (Table 2-28) The LPD non-Federal coal production forecasts are contained in a particularly opaque section of the LPD report. Also, the figures cited in Table 2-28 do not appear anywhere in that report. It appears that information on LPD existing and planned mining was derived by LPD from three sources: DOE mining plans, the DBC survey of utility company contractor and FMA's Western Coal Development Monitoring System. (LPD pp. 60,41) Here a low range and a high range were developed. The low range was based on mining plans filed with Interior; the high range was based on a slight modification of a 1977 National Coal Association survey of new mines and major suspension plans. (LPD, pp. 61, 62) These ranges—which are not listed in the LPD report—were then used to develop projections about where type sizes would be located. The figure of 35.7 million tons in 1980 from non-Federal mines does not appear to play any role at all in the final calculations.

Despite over this mysterious figure increase when it became obvious from checking through the multitude of charts, that this represents a significant *decrease* in non-Federal, non-Indian coal production. Total Western coal production in the six Western states for 1977 was 118,400 million tons (Table 3-5A). Federal production was 51,000 million tons (Table 2-24), Indian coal production in the six Western states was 21.5 million tons (DOI Table 3-26), state coal leases produced 7.6 million tons (Table 2-28)—it is not clear how they are categorized.

Private coal accounted for either 35.3 or 47.9 million tons—depending on how state leases are categorized. Yet in 1980, in the midst of the great coal boom, private coal production in the six Western states is projected to fall by nearly 20 million tons a year.

After the Draft ES skims through the derivation of these estimates, they are summarized in Tables 2-29 and 2-30. Table 2-29 shows that total planned and likely production for 1985 is in excess of the 1985 medium scenario and within 14 million tons of the 1985 high scenario. In Table 2-30, the picture is markedly different for 1990. Total planned and likely production now falls below the 1985 high projection.

This shortfall seems significant. But further analysis of the supply figures casts serious doubt on the size and significance of the shortfall. Production potential does not exceed approximately 160 million tons per year from underground FMA's without legal or environmental problems (Table 2-23). When some increase of this potential is added, the shortfall under the medium scenario is significantly reduced.

Even underground FMA's leave a major shortfall in meeting the 1990 high projection. Above, we have indicated some reasons why that projection is not credible. Not assuming the existence of conditions which call forth the demand for such huge amounts of Western coal, it is ludicrous to imagine that private and Indian production (today a majority of production, with 66.8 million tons) would stand still while total regional production was growing by a factor of seven.

AN OVERVIEW OF COAL SUPPLY AND DEMAND

The analysis in Chapter Two suffered from two fatal flaws: future demand is overstated, supply from existing and non-Federal leases is underestimated and misconceived. Thus, the analysis presents a picture of the future which is

highly skewed and suggests action based on that skewed vision of coming events. It portrays a future in which demand for Western lignite and must be met from new Federal leases.

The Final ES would benefit from a significant reworking of both demand and supply projections. At a minimum, DOI model runs should be undertaken with greater assumptions and the DOE analysis should take into account the inherent biases of the DOI model and make appropriate corrections. The supply projections merit a wide-open discussion of existing Federal leases and FMA's (this need not be published in full, summary statistics and explanations will suffice, but the background material should be available). In addition, better methods are needed to secure reliable information on Indian, state and private production.

11. IMPACT ASSESSMENT OF PROGRAM ALTERNATIVES

Chapter Five of the DOI supports to evaluate the environmental impacts of the preferred alternative and several other options. We believe this analysis is deficient for a number of reasons. To summarize:

- (1) There is no rational basis described or explained for converting DOI production projections into regional prediction projections under the various scenarios. The adjustments are arbitrary and lack rational rationale which make up most of the assessment of the alternatives.
- (2) The description of alternatives is incomplete and inadequate.
- (3) The actual environmental assessments are sometimes faulty.
- (4) Alternatives cannot be compared because of these faults and the lack of rational cumulative analysis.

DRAFT-DOE "DISAGREEMENT" has no rational basis

The principal component of chapter five's environmental assessment is the determination of environmental residuals which result from various coal production levels and patterns identified by the Department in Table 5-2 and Appendix H. These production projections are somehow derived from Department of Energy projections. The process for converting from DOI to DOI projections is entirely conjectural. Appendix H could not explain the basis of the conversion, and Departmental personnel were hard pressed to explain it in public meetings. One of the reasons for the adjustments is well justified—the inaccuracy of the DOI projections as described in these comments. *However*, however, the adjustments do not reflect what we believe are rational attempts to correct DOI's errors. For example, Powder River production projections are unchanged by DOI's adjustments, except for the 1985 High Powder River estimate, which is actually 70 million tons *higher* than DOI's estimate.

Further comparing Tables 5-2 (DOI projections) and 2-19 (DOI estimates), we find that Interior's estimates for 1980 production exceed DOI's forecasts in five regions and throughout the West by 145 million tons (high level). In 1990, the DOI medium and high estimates each exceed DOI's in three regions and throughout the West by 94 million tons for the high level. When asked about these inconsistencies

at the Denver, Colorado HES hearing, Departmental personnel indicated that the Coal Management Office had arbitrarily adjusted some of the projections in order to observe what would happen to the environmental impacts. Based on this explanation, we believe that the projections do not actually indicate the regional production which could be expected under the preferred alternative, or for that matter, any other program. Hence, the environmental findings which result from application of the Coal Impact Reduction Program (CIRP) to these production projections do not represent the environmental impacts of the preferred program. Prior to analysis of the preferred alternative, the Department must more clearly explain the process for disaggregation and conversion beyond the description provided in B.I.2 to allow a more accurate picture of the actual regional production targets and thus the impacts resulting therefrom.

Alternatives

The analysis of alternatives is insufficient in a number of respects. The most crucial is that alternatives to the preferred alternative are not "whole," or "integral" programs but only pieces of the preferred alternative. It is more likely that some combination of alternatives must be applied because of various federal laws and court decisions. The most likely option which does not require immediate leasing is a combination of the no leasing alternative with a variant of the preferred alternative, in which the department attempts to upgrade land use planning and multiple-use resource data during an initial no-leasing or even emergency leasing-only period.

The proposed alternatives principally address the question of "how much coal to lease?" Additional alternatives must evaluate alternative methods for environmental protection and land management. The DES makes a brief visit at this analysis, but fails short. (E.g., 3.0) It establishes such extreme subalternatives as to preclude meaningful evaluation. For example, it suggests controlling the method of mining on Federal leases to require the use of deep mining or alternatively proposes no mine plan controls at all. As a result, it impinges on a legal debate

instead of evaluating a legally acceptable alternative which would fall somewhere between these two extremes. For example, it could suggest the leasing of a certain mix of lease properties to result in greater deep mining than is likely to happen in an unregulated market. The DES points out that by 1990, under the no-leasing scenario, only 8% of western reserves will be developed (p. 5-127) despite the fact that deep reserves make up 34% of the resources available in the West. (See Table 2-3). Evaluation of credits in some western production regions would probably reveal even more extreme discrepancies. The DES does not consider the leasing of credits which would lead to future mining equivalent to 34% of production.

Similarly, the discussion of control of coal and use gets begged off in a legal argument, avoiding any substantive discussion of the pros or cons of end-use regulation. Even if the department's case stands in proper, it should evaluate the option, since CDR guidelines require the evaluation of alternatives even outside the jurisdiction of the decision-making agency. Moreover, the DES ignores that the Department may have jurisdiction to control end-use in many cases. This would occur, for example, where the lessee or a customer proposed micro-mix generation or energy conversion using the leased coal, where such conversion facilities would require rights-of-way on federal surfaces. Conditions could then be placed not only on the leases, but also on the right-of-way permits.

There are several alternate or proposed subalternatives which could be evaluated which are not. These might include some or all of the following:

- (1) Purchase or condemnation of existing leases.
- (2) Use of enhanced authority in SMCRA for alluvial valley floors.
- (3) Use of lease use management tools to protect areas of critical environmental concern in existing leases. In particular, PLPA did not protect restoration of such areas to valid existing rights; thus, such protections may be required if they do not amount to the taking of property. (4) The revision of lease terms for environmental protection or other purposes for lease renewals prior to 1988.
- (5) Reassessing the invalidation of family ownership PLPA. This possibility is raised, but it is not included as an integral part of the

preferred alternative. In addition, the DES does not evaluate the possibility of applying existing or new PLPA land use plans to existing leases in which existing lease conditions provide for maximum productive land manner densities and may allow the application of new land management priorities.

Another alternative is offered by section 205 of PLPA. In order to efficiently develop State leases and leases held in checkerboard land, the Department could explore the exchange of lands, in a program coordinated with each state, so as to create logical mining units where present lease holdings are not appropriate for economic development. Potential benefits of such a provision would be increased flexibility, distribution of unavoidable social impacts and costs, and a possible tool to alleviate the need for leases. This option, upon evaluation, may not be an appropriate basis of a coal program or even feasible, but it and other alternatives should be addressed.

Questionable environmental analyses

In addition, the assumptions on which the environmental analysis is based are inadequate. Most serious, the Pucher study of success in reclamation is extremely questionable. Pucher's estimates are spurious at best, for several reasons. First, no derivation for Pucher's time-frame estimates is presented, either by Pucher, or in the DES ("1-17"). This may be due to the fact that Pucher's study was written in early 1974, and according to Pucher, the earliest reclamation efforts were begun in 1954, and abandoned in 1971, due to lack of success (Pucher, p. 22). The second oldest, and longest-running effort was begun in 1957, less than seven growing seasons before the writing of the study. Second, as was done on the nutritional value of the plants that had been produced, and no grazing had been allowed on any significant areas. No mention is made of the fact that artificially fertilizing soils may result in their premature exhaustion of usefulness. There was simply no basis on which to determine either the value of the "rehabilitated" areas as rangeland which is capable of supporting animal use, or the long-term productivity of the rehabilitated areas.

Information on these vital aspects of rehabilitation is conspicuously absent from the Draft EIS. The Surface Mining Control and Reclamation Act requires that land be restored to "a condition capable of supporting the uses which it was capable of supporting prior to any mining..." (§513(b)(2).) Pucher's objectives for rehabilitation were not that broad; they were

primarily the restoration of vegetative conditions, with no end-use considerations specified, Pecker states that almost all surface mined land can be rehabilitated within 15 years. But the Study Committee of the National Academy of Sciences found that rehabilitation of the older sites - > 1000 deacres, or even centuries to occur naturally, with the evolution of a stable succession. And, as the NBS pointed out, "rehabilitation of mined lands, however, requires more than achieving a stable growth of plants. If environmental degradation is to be avoided, the plants themselves should be a mixture of native species capable of sustaining the former native animals....Environmental protection also requires finding ways to avoid the impact of surface mining on surface water and ground water. Pertinent data for rehabilitating mined land in ways that will protect wildlife, aesthetics, erosion control, and water quality are virtually nonexistent. The necessary research has barely begun." (Global Assessment Potential of Western Coal Lands, National Academy of Sciences, 1974, pp.2-3). The study committee concluded that some sites could be rehabilitated "with a high probability of success," some with lower probabilities of success, and some "cannot be rehabilitated at all on the basis of what we know today." (p.53).

In relation to the use of fertilizers, it is important to realize that the value of soil moisture is widely variable. Some treatments, for example, will increase the yield of plant production, but decrease the nutritional value. Since an animal will only eat a limited quantity, the net result may

be negative. Further, the relation of one element to another, and of all elements to all others, is critically important. The potential for rehabilitation is dependent on local, site-specific factors. The DCE's attempt to determine rehabilitation success on a regional basis, therefore, can have little meaning.

The time estimates for reclamation, based on Pecker's unrevised derivations, are presented quite optimistically. It is generally agreed that available moisture is the biggest limiting factor in reestablishment of durable plant cover in many areas, and especially in the Northern Great Plains and Southwestern areas. Should drought occur, as is virtually certain, the losses may be extensive. "Because precipitation is small, and potential evaporation is great, this area is always delicately balanced, even in wet years, on the brink of drought." (Dercy, Dohore Geological Survey: Geologic, Hydrologic, and Geochemical Concepts and Techniques in Overburden Characterization for Mined-Land Rehabilitation, by Norm, Greenwood, and Cherry, 1976, p.11). The data used by Pecker, and the Department of the Interior, are for precipitation. But precipitation does not equal available moisture for plant use. (Release, 25-11-1 (1970, Water Resources Series #19, Consumptive Use of Irrigation Water in Wyoming, Water Resources Institute, U. of Wyoming) note that fewer than half of the years achieve mean precipitation. Does that indicate that fewer than half of the reclamation estimates are credible? About 30% of the annual precipitation is never absorbed at the

ground surface to become effective soil moisture, due to sublimation of snow, interception of growing season precipitation, and runoff from thunderstorms.

Considering that actual input to soil moisture is three-four 30% less than the figures used by Pecker, and only that such in good years, the rehabilitation potential estimate are certainly skewed in favor of the coal industry. For instance, Pecker states, on p. 13, that Campbell County, Wyoming, has stripable coal lands which receive 16 inches of precipitation in the range of 69,395 acres, and 29,778 acres which receive 15 inches of precipitation, 166,375 acres, the remainder of the coal lands in the county, receive 14 or fewer inches. But from the plan's point of view, this means that 69,395 acres receive 11.2 inches, 29,778 acres receive 10.5 inches, and the remainder receives 9.0 inches or less.

Because of the lack of experience at the time Pecker's study was written, it is clear that he was forced to rely on theory. In fact, one of the purposes of the study was to test the theory against the available experience. It did fairly well, if one does not include as factors the extensive use of fertilizers and irrigation. Even now, there is a maximum of 11 growing seasons from which to extrapolate, and the majority of those areas which have been reclaimed (or not, depending on the definition applied) have been treated in some way, judging by Pecker's study.

One of the issues overlooked by the DCE

is the lack of understanding of the effects of the use of fertilizers and irrigation. As an example, it is well known that trace elements are mobile to varying degrees in soil, and one of the factors which is most important is the pH of the soil water, and the quantity of the soil water. Boron and cadmium, very immobile as a function of pH. In the neutral and alkaline soils, these elements are relatively immobile, and do not comprise a hazard to grazing animals. But addition of fertilizers and moisture in excess of naturally occurring amounts will change the leaching characteristics and rates, hydrogen ion concentrations, and the development of the soil profile such that elemental mobility can be greatly increased and potentially toxic plants produced. But we do not know what the chemical characteristics of mine spoils are, as is pointed out elsewhere in these comments, and we do not know whether the acidification of soil may in a given case be desirable, to decrease the mobility of elements which are more dangerous at higher pH. Nor do we know the effects of the interactions between the fertilizers and the trace elements that may be present. (Cherry, 1975). Soil acidification can result in many ways that are not readily predictable, and can have significant effects upon future productivity. An example of this is interaction between nitrogen-fixing bacteria and nitrogen added as fertilizer. The resulting increase in hydrogen ions may force release of available nutrient cations, such as calcium, magnesium, and potassium, from storage sites. This could produce greatly stim-

ulated plant growth at the time of occurrence, and may result in depleted soil values subsequently. Then, another application of fertilizer is required, and the vicious cycle is underway. (Curry, Biogeochemical Limitation on Desert Reclamation - The High Northern Great Plains Example, pp. 18-47 in Practices and Problems of Land Reclamation in Western North America, Nelson K. Hall, Ed., 1975).

Another important factor is that fertilizers and irrigation may change the botanical composition of the areas of affect. This may result in fine-looking stands of vegetation for publicity, but they may not last if the treatments are ended. Then the artificial support terminates, adjustments will be required, possibly in direct proportion to the amount of time elapsed under the artificial stimulation, or possibly shorter or longer. We don't know. It is probable that some sites will be delayed in restoration by current applications of artificial support, with resultant development of anomalous levels of production and depletion of soil nutrients which may be in very short supply.

The extent of knowledge and experience with reclamation techniques will not support the statements made. It is closer to the truth to observe that the question of whether any areas can comply with the requirements of SNCRRA is still open.

Desalination potential is not the only shortcoming in the DEB's analysis.

The use of Water Resources Council (WRC) projections for water use leads to major problems which negate the usefulness of the entire water consumption assessment. In particular, the WRC projections include a certain level of development of western energy resources which may or may not include that related to the development of federal leases. As result, there is the difficulty of "double counting" water consumption impacts, rendering WRC data useless. It would be possible to only evaluate water consumption residuals, comparing them among the various scenarios and program alternatives. However, without a baseline water consumption and supply analysis, there is no way to evaluate the effects of the alternatives on existing and projected water use outside the energy sector. At the very least, though, the WRC analysis of "Calibration/Flow with Normal Development," appearing on Tables 5-13 [and ANN], indicate that there are reported water deficits even without double counting the effects of energy development in some western regions at least during dry years. This would essentially mean diversion of water from existing or historic uses during such periods or the requirement of new water storage construction, a scenario not evaluated by the DEB. Without, however, some method of disaggregating energy from non-energy data in the WRC model, there is no meaningful way of evaluating and comparing alternatives on the basis of water consumption.

Desiccation impacts are relegated to insignificance by the environmental residual methodology of the DEB. By their very nature, these impacts are local and extreme. The DEB prefers to ignore the isolation of extreme impacts to very local populations, preferring to use population and employment impacts over vast tracts of land which have no relevance to the evaluation of social impacts. For example, the Powder River region includes thirteen counties, but residents indicate that most development is concentrated and can be expected to concentrate in the future as Campbell county, The Denver-Boulder area includes the Denver metropolitan area, yet most of the industry interest is in the Eastern Mesa area in relatively underpopulated southern Colorado, certainly outside of the major portion of the

1.9 million population attributed to the coal producing region. In such case, comparing coal related population increases to a 1975 baseline which includes the entire region makes absolutely no analytic sense. Any population impacts should be compared to baseline population in the locally affected communities, separately. A pragmatic statement may not be able to evaluate each and every community, but could certainly indicate likely impacts in the more important communities in the affected region.

Similarly, impacts on state and local expenditures have failed by considering only the impact in comparison to total budgets of all state and local governmental units. A 1980 impact on government expenditures in Colorado seems minuscule, but in real terms the \$25 to 30 million will be mostly spent by local communities with budgets which are presently almost invisible.

In a related factor, only land disturbance caused by the presence of mining operations, beneficiation, conversion, use and transportation of coal has been considered. This is unacceptable. Surface mining of coal necessarily requires heavy construction, as reflected in projected population increases. However, areas which will be temporarily or permanently disturbed for residential, commercial, industrial and governmental structures, ancillary support structures, retraction, and corridors for the service and utility of such populations have been ignored. Stating that the "multiplicity of site-specific factors which would dictate changes committed to such developments" renders justification "beyond the scope of this document" is a statement of environmental Impact. It may be noted that residential development has traditionally taken place on the best agricultural lands, because that is where towns have been historically located. Expenses of existing urban areas to serve energy needs will only expand the agricultural losses.

On Trace Elements

Although the draft DEB for the preferred program mentions their existence four times and supplies a table of air pollution emission factors for 22 of them, trace elements are basically ignored. Their effect on the environment, however, may be as large as any other offset, and may well be more devastating in the long run. Trace elements are single chemical elements. Some elements are very seldom found in a pure isolated state; they are usually nonmetallic and ionic, and are found in compounds. Some compounds, such as organic mercury compounds, are far more toxic than others, such as inorganic mercury compounds. But there is great variation in this. The extent of our knowledge of trace element chemistry and biochemistry is minuscule, despite episodes such as the mercury poisoning in Minimata, Japan. A complicating factor there was the unknown biological transformation from inorganic to organic forms of mercury. But it must be emphasized that most of the damage done so far by trace elements is never identified; sub-clinical basic damage, for example, is almost impossible to diagnose (and it is also irreversible).

The unknown, and currently unknowable large mobilization and release of trace elements which will be a necessary result of the proposed coal scheme will have affects at both ends of the process. First, unknown quantities of trace elements with unknown affects will be exposed to the biosphere by mining. Second, unknown quantities of trace elements with unknown affects will be exposed to the biosphere

by combustion of coal and the resulting air emissions and by dispersions from other wastes, such as various types of ash and scrubber sludge, and so forth.

The critical points are that: (A) we do not know how much of a threat is posed in the short term or the long term; (B) trace elements, by definition, do not degrade or go away - they may be attached to other elements or compounds with varying effects, but the only mitigation of the threat is immobilization in such a way as to take them out of circulation; and (C) as a hint of things to come, it follows from the table on p. 5-54 that the burning of one million tons of coal will result in the air pollution emission of 1,377.8 tons of the 22 trace elements in the table.

A table of selected elements and their toxicities is reported by Gough and Shacklette, U.S.G.S., 1976, much of the data is in parts per million, abbreviated ppm. To grasp the idea of a part per million, visualize a football field, 30 by 100 yards. Then build a rectangular swimming pool that size and fill it to a depth of five feet. To add one part per million to the pool, add very slightly more than one gallon.

The possible effects of trace element poisoning are inextricable at this time. Contamination of soil by air, surface water and groundwater pollution may have beneficial effects, or no effect, or may permanently damage the soil for use by plants or by animals consuming the plants. Contamination of plants, regardless of soils, may be toxic to animals. Contamination of ground and surface waters, by direct exposure due to mining or atmospheric pollution may be toxic to irrigated lands, either immediately or in the long

-45-
run, and to animals feeding on contaminated vegetation, as well as to humans thru water supplies. It has been proposed quite seriously that the Roman Empire's decline and high rates of subnormality, especially among the upper classes, may have been due to widespread use of lead in pipes, the lining of aqueducts, and cooking and drinking vessels. We simply do not know what the effects may be.

It is also known that almost all of the trace elements are affected, in terms of availability, by such factors as soil and water pH. Further, the synergistic toxicity of these elements is a factor that is known to exist, but known to the extent of prediction of possible consequences of proposed activity. The research needed to determine the effects of this particular proposed activity is sorely lacking. The draft RS apparently takes the position that two populations should be the most severely affected guinea pigs. These groups are the stockmen and farmers of the West, and the urban air-breathers of cities with coal-fired power plants. Of course, there is no group that will not be affected, as measurements of lead levels in Arctic and Antarctic snow fall demonstrate, but it appears that these two groups will be the first and hardest hit. No effort is made to inform the public of this, by the DSS.

A LOOK AT AVAILABLE INFORMATION

What we don't know is truly impressive. The U.S.G.S. has undertaken the Geochemical Survey of Western Energy Regions to try to determine the geochemistry of the area: overburden, surface

-45-

materials, ground and surface waters, and plants. The first major goal is to determine the extent of sampling required to perform the task, and that has been a major goal in itself.

The importance of this information is tremendous. As illustrated by the table p.3-54, we have an idea of the air emissions from coal fired power plants. The U.S.G.S. appears to be the lead agency in the determination of impacts in areas near coal mines. Information on the chemical character of coal overburden is especially important for two reasons. First, the available information for one mine, the Black Thunder mine, which may be the only available information of its kind, shows that the coal itself is relatively low in trace elements compared to the strata directly above and below the coal seam. (This mine is in the Gillette, Wyoming area.) Therefore it is critical to know if this is the case at other mines, and if so, whether these strata should be isolated from groundwater, as well as surface leaching and revegetation attempts. Second, mining of the coal will alter forever the existing aquifer structure. Aquifers may reestablish themselves, but they will not be separated by the coal seam. Aside from the loss of seeps and springs flowing from the upper aquifer, we must find out what will be present in the surviving aquifer. We do not know what the long-range effects of the aquifer's use will be. We do not even know what would be significant. Further, the chemistry of groundwater and surface sediment is extremely complex and appears to be largely unknown for trace elements.

The variability of naturally occurring trace elements

-46-

is quite wide. This is due in large measure to the variability of their occurrence in the parent rocks which are transformed into soils, as well as other factors. In soils of the Powder River Basin, there is fairly small variation between surface soils (>1.5 cm. depth) and subsurface soil (15-20 cm. depth) (Anderson, Keith and Connor, 1975). But there may be significant differences between the A and C horizons of the soil (Vidwell and Severson, 1976). The number of samples required to map the variation in soil levels of trace elements at the A and C horizons ranges from 5 to indefinitely large, for relatively small areas. This means that there will have to be extensive sampling in any mine site to determine the levels of trace elements in the upper soil horizons alone.

In terms of availability to plants, it is reported that little success is achieved in the use of standard agronomic extraction techniques for the measurement of soil characteristics. (Severson, McNeal and Gough, 1978.) Therefore, either a technique breakthrough is required, or standard, low-cost analyses will have to be supplemented by full-scale chemical analyses.

The chemistry of water associated with coal areas is highly variable, as is the amount of trace elements in sediments of surface streams. (Keith, Anderson, McNeal and Roeringen, 1976; Van Voast, Hedges, and McDermott, 1978, U.S.G.S. Water Resource Investigation 77-60, 1977.) There has not been sufficient time to determine the long-range effects of destruction of aquifers and their reestablishment in radically altered chemical environments, such as may be found in mine spoils.

Mine spoils will be used to reclaim land, and therefore questions have been raised concerning the suitability of this material for revegetation and reforestation to the full use of the land which occurred prior to mining, as required by SEMRA. To determine the trace element concentrations and variability in mine spoils from a particular mine, it may be necessary to take more than 30 samples within a 25 square meter area (Severson, 1978), or as few as five samples for some elements. Only then would one have an idea of what was actually present in that specific area.

Note that simply cowering the mine spoils with topsoil may very well be inadequate. There is no solid information on the long-range success of this technique, in terms of SMCRA-level rehabilitation, although topsoil dressing of spoil piles may produce vegetative cover and minimize erosion. Water movement within mine spoil piles is not well understood, but it is known that water moves upward, as well as downward, and laterally in mine spoils (Minnesota Agricultural Experiment Station, Report No. 114, 1973). Mine spoils vary significantly from mine to mine; indeed, there is even variation between different areas of the same mine (Erdrum and Ebens, 1975).

The molybdenum content of sweet clover growing on mine spoils was measured. "Coal mine spoils are geochemically anomalous when compared to naturally occurring surficial materials (Sandvol and others, 1973). Despite the increasing practise of top-soiling constructed spoil banks, we find evidence that these anomalies are being reflected in the element composition of vegeta-

The U.S.G.S. studies of power plant trace elements pollution of surrounding soils and plants. Kig eukbuk, lichens, and Indian ricegrass growing downwind from coal-fired power plants have all shown increased levels of various trace elements, although the extent of information on this is quite limited. (Connor, Anderson, Keith and Borron, 1976; Anderson and Keith, 1976; Connor and Erdman, 1976; Connor, Keith and Anderson, 1976.) Several base-line studies made preoperational power plants will allow collection of more data in the future, but the techniques for determining the effects of power plant emissions are still being developed. In fact, knowledge of trace element behavior in power plants is still embryonic.

Overall, what we can say is this: There are still considerable uncertainties regarding the total impacts and specific quantification of three elements. However, much is already known regarding the trace element contamination of some western coalfields. Also, there is sufficient information available to draw some conclusions regarding the biological impacts of the dispersal of such toxic materials. The GES does not address this topic with sufficient detail. It does not even indicate the uncertainties which may mandate the need for specific baseline data accumulation for trace elements and lead when planning responsive to such data.

This discussion raises the question of need for more extensive baseline data studies on other environmental impacts and conditions. Such data, largely deficient today, would include water and groundwater chemistry, hydrology, meteorology, geology, soils, and like factors necessary for adequate land planning.

tation growing on the modified substrates." It is concluded that the molybdenum concentration in sweet clover growing on mine spoils is "probably sufficiently high to induce metabolic imbalances in cattle and possibly sheep in subclinical, if not acute, levels assuming the animals were to feed predominantly on this legume." (Freudenthal and Elson, 1976.) A later report stated:

It is difficult to arrive at a consensus from the literature for critical levels of Mo and Mo:Cu ratios, but five ppm for Mo and a ratio of 2:1 are reasonable as being critical for cattle. It thus seems that at least five [of the eight] mines [surveyed] could present some management problems with regard to cattle operations.

Sweet clover is a very popular plant for rehabilitation use because of its high nutritional value, and high rate of success, among other factors. The most popular plant for reseeding, in 1960 and probably to date, is crested wheatgrass. It dominates the revegetated spoil banks at many sites and was sampled from reclaimed spoils, as well as comparatively normal soils, at the Deva Johnston Mine in Converse County, Wyoming. Concentrations of cadmium, cobalt, fluorine, uranium, and zinc ranged from 140% to 400% highest in the spoil-grown wheatgrass than in the control areas. Conversely, phosphorus in the spoil-grown grass was only about two-thirds that of the control. "It is clear from these results that a substrate of reclaimed spoil material can affect the trace element chemistry of crested wheatgrass." (Irdman and Ebens, 1976.)

A final hint of things to come is supplied by

TRACE ELEMENT EMISSIONS FROM COMBUSTION OF ONE MILLION TONS OF COAL, DERIVED FROM FIGURES GIVEN ON PAGE 5-59 OF FCOM 0010.

Agricultural Losses.

Losses of agricultural potential and productivity are not addressed effectively in the draft EIS. The amount of arable and productive land in the United States is decreasing rapidly. Colorado alone lost 1.6 million acres in the last ten years, and is now losing approximately 300,000 acres per year. *Rocky Mountain News*, Jan. 16, 1979, p. 3. Losses in more inherently fertile states, such as California and New Jersey, have been astronomical. The majority of towns, villages, and cities in the United States were settled where they are because of the agricultural productivity of the areas in which they are located. Obviously, the huge expansion of urbanized areas has resulted in enormous losses of agricultural land of the best quality. This crucial development may have been overlooked, in the light of our successes with irrigation and petro-chemical fertilization of semiarid agriculture. But the availability of petro-chemical fertilizers is rapidly decreasing, not only because of the depletion of petroleum supplies, and the increasing dependence on the super-intensive energy use which has characterized our economy, but because of the increased cost to the farmers of these imported luxuries. There appears no reason to suspect that this trend of dwindling supply and use will reverse in the future. At present, we have no agricultural surplus, but for how long? Would we have short surplus without cheap electricity for water transport, and cheap petrochemical fertilizer?

fertilizers and other chemical amendments, which would, in turn, further degrade the water quality.

Finally, the effects of air pollution are not known. The trace element content depends on the combustion of one million tons of coal amount, for the 22 elements for which figures are given for emission factors, on p. 5-34, to 2,750/25.5 pounds. Trace elements are discussed elsewhere in these comments; suffice it to say here that their effects on agricultural productivity are not known, nor is their pattern of deposition from air pollution sources, or water sources.

The effects of even sulfur dioxide pollution on agricultural productivity, and agricultural product quality, are not known. (Final Environmental Statement, Powder River Coal Region, U.S. Government, 1973, Vol. II.) It should be noted that prevention of significant deterioration air quality regulations will force most of the new power plant production farther away from demand centers than traditional location. This means, in fertile areas as well as marginal areas, is not clear. But between prevention of significant deterioration for heavily polluted areas, and preservation of pristine areas, the middle ground is all that is left. There will be new sources polluting a great amount of farmland, with unknown effects.

2. Permanent losses. The creation of new roads, railroads, and aqueducts, and other fenced corridors will result in significant losses. Severance of agricultural lands may

It should be noted that our agricultural surplus is very important in stemming the rising deficits in our international balance of trade.

But most important is the apparently overlooked fact that agriculture is life. There is no hesitation in the choice between eating in the dark and lighting, the problem of being without sufficiently affordable food. The loss of agricultural productivity may be due to temperary and reversible factors, or it may be due to irreversible permanent damage to land. The following is a brief discussion of some effects of the proposed coal scheme; it is by no means exhaustive, and does not reflect the depth of study that might be available from institutions, such as the Department of Agriculture, which was apparently not consulted in the preparation of the EIS.

1. Permanent losses. The effects of soil contamination with toxic trace elements, and other substances, such as high levels of salinity, are often irreversible. If the land can be restored, it may be at such a high cost that the majority of potentially recoverable acreage will not be recovered because of economic inefficiency. The figures given on "agricultural opportunity costs" substantiate this.

Channel-change related losses will also include losses due to irrigation with degraded water. The cost of water and its availability are going to be radically increased, and the water left for agricultural use may be drastically less useful than current supplies. This would, in turn, prevent the use of

render the use of these lands least economically inefficient, with the consequence of conversion to other uses, or abandonment. These cause serious problems for livestock, as well as wildlife which is compatible with livestock. The losses from fires alone are significant already. Transportation corridors also create serious problems of access to other lands, such as BLM grazing lands, and access to water. (Final Environmental Statement, Powder River Coal Basin, 1973, Vol. II, pp. 1-583 - 515.)

3. Possibly permanent losses. The pattern of land tenure in coal areas has already been drastically altered. Ownership of grazing land, and concentrations ownership of BLM grazing rights, is changing from family ownership to corporate ownership. The purchasers have little or no interest in agriculture; they are interested in the land as an investment in future coal mining. Although they may not have received the land from agricultural use yet, their tenacity in maintaining that use is more dubious than that of persons involved in ranching. The PES on Powder River Coal Region development in 1973 reported that 50 + 100,000 acres had undergone this change in the four or five years prior to the writing of that statement (p. 1-153, Vol II). As discussed below, economically marginal operations will be the first to sell necessary water, which may seal the fate of a great amount of the land held by speculators.

4. Temperary Losses? The vast demands for water which are projected will create increasing demands for a smoothly functioning water market. Water rights are property rights, and

within the limitations of the substance itself - i.e., the nature of return flow, and evaporation, water rights are property rights. Current agricultural economics are hardly favorable, and the price paid for water will inevitably rise. Thus, the agricultural productivity which depends on reliable water will decline. Coal mining companies will have to acquire water, and so will municipalities. Whether removal of water from land which depends on that water for its current agricultural productivity will depend on whether the loss results in irreversible damage to the land itself. This may be expected in areas where a previous phenomenon in the 1930's caused erosional losses. Some of that land has been returned to productivity, but much has been returned only with addition of fertilizers and extensive investments in irrigation and other treatments. Therefore, a third category of losses should properly be considered - losses which can be undone on a temporary basis only. On the other hand, much of the land which is removed from grazing may benefit from a period of relief from grazing, so the pasture is not all black.

3. Temporary losses. As a consequence of the high wages paid to miners and construction workers, a potentially serious proportion of the agricultural labor force will be drawn away from its present vocation. Because of mechanization, much of the lost labor could be replaced by modern implements, but the marginal operations will not be able to support the capital costs of such equipment, and land will go out of production. The opposite side of this coin is that operations which cannot afford equipment cannot afford to pay laborers or more skilled

-56-

personnel the wages that are being paid in the energy-development industries. Assuming that conditions may eventually stabilize within the same societal structure as presently exists, these losses might be temporary.

In summation, agriculture is necessary, and the deprivations which it is suffering currently will be exacerbated by the proposed coal scheme. Losses will be permanent in some areas, and temporary in some areas. Long-term losses will also be created in less noticeable ways, such as yield decreases in response to air quality degradation in areas which are now relatively clean. The draft EIS fails to address these impacts.

On uranium

Recent evidence suggests that western soils contain considerable trace amounts of uranium. The dispersion of uranium in respirable particulates is a serious problem, especially due to its alpha emissions which will affect the lungs. This is a serious impact of any program which shifts coal production west; it should be addressed but is ignored by the DRS.

-57-

On "Mineral Preemption".

On page 5-23, the term "preemption" of minerals is used where the meaning is "waste and dispersion" of minerals. In reference to the example of uranium in coal, the U.S.G.S. Bulletin on uranium in Western coals tabulates the amounts in thousands of tons of U308 (See, e.g. U.S.G.S. Bulletin 1077-5). In terms of trace elements, which are primarily metals, there is an interesting sidelight. We acquired, in 1974, 100% of U.S. strontium requirements from Mexico, Britain, and Spain; 100% of our columbium came from Brazil, Malaya, and Zaire; 98% of our cobalt from Zaire, Belgium, Finland, Norway, and Canada; 90% of our manganese from Brazil, Gabon, South Africa, and Zaire, making imports from those countries particularly attractive. Other figures of interest are: Chromium, 91% imported; Aluminum, 85% imported; Phosphorus, 80% imported; Mercury, 85% imported; Nickel, 73% imported; Sodium, 65% imported; and so forth. (Keller, Environmental Geology, 1976, p. 313).

Our massive dependence on imported rare earths and metals does not militate in favor of a national plan to disperse millions of tons of them into the atmosphere, with unknown effects.

-58-

Alternatives inadequately compared

If a major requirement of a pragmatic assessment is to compare alternative programs, as we believe it is, then this DRS has failed. We can identify essentially two levels of analysis. The first is to identify the principal mechanisms for determining the level of demand and establish both the level of leasing activity and its distribution. The DRS attempts to identify a limited set of protection/disturbance schemes and the impacts of such actions, but fails because the environmental analysis is faulty, as described in greater detail above. It also fails because the impact estimation methodology obviously ignores most secondary and higher level impacts. It does not attempt to evaluate cumulative national impacts or even make regional tradeoff judgments which could form the basis of determining which program alternative or combination thereof is in the public interest.

The second level of analysis should identify the alternative program elements which specifically relate to land or resource management and the mitigation of environmental impacts, regardless of the level or distribution of coal production. It is this level of analysis to which most details of the preferred and other alternatives should be subject. However, this is entirely omitted from the DRS, with the exception of a few subalternatives which receive short shrift because of extreme assumptions. The DRS study does not evaluate the comparative environmental impacts of alternatives to land-use/alteration criteria proposed by the DRS or other major components of the land management components of the program. This level of analysis also fails because the description of alternatives is incomplete, particularly alternatives which relate to land management issues.

IV. AMENDMENTS IN THE PREFERRED ALTERNATIVE

There are several components included in the Preferred Alternative (PA), which include, very briefly, the following:

- (1) Land use planning
 - identification of coal lands
 - environmental finding using lands unsuitable criteria (LUC)
 - identification of resource tradeoffs
- (2) Activity planning
 - establish regional production targets
 - identify proposed lease areas
 - rank tracts
 - propose areas of regional EISs as part of activity planning
- (3) General procedures
 - EIS strategy
 - public involvement
- (4) Start-up considerations

With a few exceptions, we will comment on these procedures and process components.

Land use planning

The Federal land use planning process will be—indeed, PLMIA requires that it must be—the basis for all resource management, including coal leasing decisions. This process will help identify coal lands, lands unsuitable, resource tradeoffs, as well as provide the information necessary for the ranking of tracts and preparation of the regional area EISs. The process and the data and resource inventory which is part of the land use planning process can be taken lightly. It is the very foundation on which any coal management program must be built or will fail. Unfortunately, there is little public confidence in that land use planning process as it exists today. The application of sophisticated vendors on a sprawling foundation provides no protection to the Lands or to the public interest. There are three primary failings of the existing land use planning:

First, the data and resource inventories which support the existing management framework plan (MFP) is outdated and unreliable. It was collected as part of EISs or before. It clearly does not take into account the raw data

requirements under the provisions of PLMIA or ENCCA, particularly resources inventory or other baseline data which would identify areas unsuitable for mining or not recoverable under ENCCA or areas of critical environmental concern protected by PLMIA. Indeed, the Act both now offer the collection of existing data. The GIS does not indicate the level of data deficiencies which have been anticipated or discovered in the “test” applications of LUC, but we anticipate, given our experience with MFPs that such deficiencies are considerable. The Final EIS should report the level of data deficiencies and indicate the steps necessary to cure them prior to implementation of the PA. In addition, we are told by colleagues in the Northern Great Plains and in Western Colorado that surface renewable resource data is often severely missing from resource inventories if the surface is split estate in a federal. The district offices in question respond to citizen complaints indicated that they only were required to inventory and plan for federal multiple uses, thus consequently converting coal into a nonresource.

Second, citizen involvement in the development or revision of MFPs has been superficial at best. Often MFPs are unscientific or unnecessary—many times existing only in the form of meeting files. In addition, public meetings are far give a strong flavor of meaninglessness. For example, a 1977 meeting on four Colorado planning units was held after only four days notice. No copies of the MFP were available and numerous requests from public participants for comment extensions were denied because the Colorado MFP office wished to make decisions on lower tracts within ten days. At one 1979 meeting on the South Park Colorado MFP, off-road vehicle enthusiasts who participated in the meeting before inadequate MFP personnel called and compile comments and concerns received by all participants, conveniently forgetting (individually omitting) may conservationist concerns in the transcription process. Meeting participants have never found any evidence that over this information, which included several important and valuable comments, was ever used by the MFP. We often get invitations to attend meetings on MFPs which include no list of MFP agenda or otherwise suggest the purpose of the meeting.

Often we are aware of good faith, genuine efforts to use sophisticated visual or audience-based aids or innovative group interaction techniques. However, they often fail because of a basic misunderstanding of the nature of public involvement in the administrative process.

Most of all, the plans, including any components resulting from public involvement, are discretionary. For example, a northeast Colorado MFP recommended management of the Little Thompson Canyon as a candidate for Wild and Scenic River status, but the BLM allowed construction of a railroad in the canyon anyway. In west central Colorado, a 2200 acre short term lease resulted despite an MFP recommended limit of 480 acres for such leases. Friends of the Earth, together with the Western Colorado Resources Council and several other organizations have opposed the revision of the North Fork (Colorado) MFP, which administrative appeal details many problems we perceive in the existing land use process, and which appeal we hereby incorporate by reference.

New Resource Planning Requirements In The MFP Rule Problem

Unfortunately, the proposed planning rules do not solve many problems. Section 1601.15-2 states that district managers “shall prepare criteria to guide development of the resource management plan . . .” (AMP). In other words, for each of 136 MFPs, the district managers create new instructions. These are supposed to be based on all applicable laws, executive orders, and regulations. Not only does this put an unfair burden on district staff, but our experience gives us little confidence in the detailed legal knowledge of local BLM offices. Even worse, the planning criteria shall be based on “available inventory and planning budgets and time available before resource management decisions must be made.” We believe these rules together will eliminate any legally binding weight carried by the requirements of PLMIA and will elevate all consistency.

“¹

The plan will not be plain. Amendments will be allowed which respond to conflicting use applications and modify the effect of resource planning. (proposed rule 1601.15-1(j)).

Amplia of resource management plans (1601.15-1(e)) are available only to those individuals who are “directly affected,” thus favoring resource developers over numbers of the public, and such appeals are only grants which do not reach the Secretarial level for review.

Records are supposed to be maintained which only “support” conclusions of the MFPs. (1601.15-1(f)). Directly conflicting data may be discounted. There is no requirement that MFPs will be distributed from interested members of the public. (1601.15-1(g)).

PLMIA and its legislative history make perfectly clear the high priority Congress placed on “minerals” or “mining” resources to areas of critical environmental concern. Yet, had we not read the Act, but only the preferred alternative and recent departmental documents, we would have guessed that PLMIA required the prompt and immediate identification of most later tracts. Indeed, despite a preferred departmental need for MFP procedures, the proposed planning rules actually shortchange this congressional priority. The procedures outlined in draft guidelines are skeletal at best. For example, there are no procedures established for public petition. Secondly, the draft places an additional criteria of “potentially” as MFP identification, a factor somehow tattered out of the Act and its history. It implies that areas not possible or economically feasible to prevent shall be classified. This precisely reverses the act, which clearly states that where management attention is required, an area must be protected.² The guidelines are still in draft form and have not been proposed as regulations. Moreover, they come as an afterthought in the PLMIA regulations and after coal management program decisions. Interior simply has not responded to the urgency Congress expressed in the Act and sense of place in its legislative history.

We believe that at the very least, the PLPA planning regulations must include provisions criteria and procedures for the identification and protection of areas of critical environmental concern. They must also specify in considerable detail the non-discretionary procedures which district personnel must follow in preparing SDSs and making land use decisions in such MPAs. The SDSs must be substantially binding on resource decisions and coal resource planning which follows its adoption and should not be subject to flip-flop amendment. In addition, specific other weaknesses identified above must be corrected. We will make more complete recommendations at a later date.

Lands Unavailable Criteria

The cornerstone of the Department's preferred alternative is the lands unsuitable criteria. However, vagueness, exceptions, and lack of correspondence with SNCA handling this tool. Several exceptions will be proposed, for example, and the burden of proof for identification of lands which are not reclaimable is probably opposite of that intended by SNCA. Specific substantive comments on the criteria will be included below with comments on the example regulations.

We must comment, though, on what we believe to be an illegal and unfortunate premature application of the lands unsuitable criteria. As part of the startup considerations (p.3-20), ten target planning units have been identified in which the proposed LUE will be applied. The Department has attempted to diminish this effect by calling this exercise a "field test" of the proposed criteria and claiming that if changes result, the supplements to target MPAs resulting from the first "field test" of the LUE will again be changed to reflect changes in the LUE. This, unfortunately does not correspond with instructions to State Directors from BLM to prepare supplements to target MPAs based on application of LUE "to be ready for a possible coal lease sale in mid-1980." Nor does it explain the urgency of the BLM or several other documents which propose an accelerating march to a 1980 lease sale.

standoffs which militate against coal development. It will be addressed in our comments on example regulations. Suffice it to say here that the concept as outlined in the DES somehow seems to override what should be the statutorily required function of comprehensive land use plans under PLPA. Moreover, the provision as proposed gives short shrift to non-coal resources.

Setting Regional Production Targets

The lack of specific detail with respect to setting production targets in this DES, the proposed process for future program cycles, poses basic problems in the BLM projections which drive BLM's production goals as discussed in other sections of these comments. Also, there are comments on the example regulations.

Treaty mining and Regional EISs

These will also be addressed in comments on the example regulations. The most serious problem is a lack of definitive criteria by which tracts will be zoned.

EIS strategy

In response to a question by Thachy at the 3 January 1979 public meeting in Denver on the DES, Assistant Secretary Guy Martin and other department officials indicated their "hunch" that EISs would not be necessary at the mine plan stage. It was explained that the department intends to prepare a "good enough" regional EIS to anticipate the site-specific impacts on each lease. We do not believe that is possible. As several industry representatives pointed out at the same meeting, it is impossible to propose a mining plan, reclamation, or even auxiliary facilities until it is possible to obtain more definitive coal resource information necessary to do engineering and reclamation planning but which is unavailable prior to actual leasing. There is considerable BLM case law which indicates that significant technical changes in proposed actions between regional or programmatic EISs and site-specific are legally sufficient to trigger site-specific EISs. Such impacts as hydrological impacts, air quality, water quality, subsidence or success of reclamation, and other equally fundamental impacts all depend on site-

The premature application of LUE is in violation of section 102(i) of SNCA which requires "public participation in the development . . . of programs established by the Secretary" under the act. The proposed LUE had not received public scrutiny prior to Instructions (A) (F) 57842 to State Directors to supplement MPAs. The BLM currently has no regulations in effect which relate to the designation of lands unsuitable and the promulgation and application of the LUE violate PLPA's requirement of public involvement prior to agency actions. (a., Secs. 102(i)(C); 103(d); 202(a),(f); 309(e); and 310).

The DES clearly states that "the key activity added to the land use planning process in the preferred program is the application of lands unsuitability criteria." Thus, the application of LUE to the target MPAs constitutes the implementation of the program and is a violation of the HDR v. Hodel order. However, we believe that application of the LUE prior to the finalization of this EIS is a violation of NEPA. The LUE has been proposed under the authority of SNCA section 323(d), PLPA, and various environmental protection laws, regulations, and departmental policies (see DES, Table 3-3). The Department claims that the LUE are exempt from NEPA because of SNCA section 323 (d). However, we have yet to see any reasonable opinion which explains how section 323's exemption of SNCA section 323 also exempts section 323, PLPA, the preferred program, or any other authority for the promulgation of the lands unsuitability criteria. We believe it is essential to fully investigate and evaluate the proposed criteria, including a complete analysis of alternatives in the DES—which is oddly lacking—but that it is inappropriate for the department to proceed with the implementation of the preferred alternative in the manner it has already done.

Resource Graphics

The third screen established in the PA is the identification of resources

specific mine and reclamation plans. The different nature of the federal actions and alternatives involved at each level also strongly indicates the need for separate EISs. For example, at the regional scale EIS stage, the department is evaluating how many and which tracts to lease on a regional basis; the alternatives analyzed at this point include different tract rankings and lease conditions. At the mine plan stage, however, the decision is the approval (or federal lands only) of mining and reclamation plans; the alternatives evaluated at that point include approval or disapproval, approval with conditions, and various technological environmental mitigation measures which are clearly beyond the scope of any regional scale EIS.

Finally, we would point out that the principal problem which a leases may encounter is not the simple requirement of an additional environmental statement, but rather significant levels of uncertainty. We believe that the only way to eliminate that uncertainty is to require a rigorous statement for all mine plan approvals on Federal lands.

Otherwise, the proposed EIS strategy is acceptable with some minor but essential clarifications and sharpening. Specifically, the programmatic (national) EIS should assess interregional tradeoffs based on environmental criteria. Instructions for preparation of regional EISs should include the requirement that regional, cumulative impacts of proposed and existing activities, including estimating mine plan approvals be analyzed. In addition, EISs should not be required only for BHP adoption under the PLPA planning regulations, but also for BHP revisions and adoption or revision of land use analyses under 16101-8-5(g) and 1601-4-4, as proposed.

Finally, as we indicate in several places throughout these comments, baseline data and resource inventories must be adequate for all environmental analysis and planning, including EIS preparation.

Public Involvement

We will discuss public comment provisions in more detail at future opportunities. At this time we wish to simply point out several basic principles

which should govern public involvement programs. First, the opportunities for public involvement should be formal and well-defined. The groundrules should similarly be explicit and well understood by all participants, including HSI personnel. We feel that strict internal public involvement activities—while they should also be encouraged—can lead to frustration if used exclusively, so believe public participation are likely to participate more productively if the groundrules are well understood in advance. In addition, public outreach to encourage participation must be affirmative. It should include multiple methods of adequate public notice, dissemination of background information (such as DRAFTs, meeting agendas, etc.), and access to additional information or technical assistance if necessary to ensure intelligent dialogue. The participant must know that his or her participation has an impact both through feedback and through the process. Finally, an appeals process is required to the most politically accountable level, the Secretary, which allows anyone adversely affected by a decision the right to make an administrative appeal.

Resource Reallocation

Program design has various shortcomings, but even with the recommendations included herein, the program is management if its major environmental protection will not apply for several years. The real tragedy results because of the Director's own to commence leasing in 1980, despite considerable evidence that such early new competitive leasing is unnecessary. The short cuts proposed to meet early lease sales later include:

Application of the EIS before their final version.
Use of existing resource inventories and DRAFTs for land use decisions
DRAFTS planning regulations will be used for the first five years
A shortened regional scale AT&T time frame.

The most serious of these off-premises application of LUC, which we have already discussed, is the use of existing land use plans and data. On the latter point, where the FLPMA planning regulations allow the use of existing plans for up to fifteen years (1601.4-3(e)), the lesson we would recommend is establishing a

1. COMMENTS ON THE EXISTING REGULATIONS

Through three elements on the console regulations, Friends of the Earth¹ intended to illuminate and expand on some of the points raised elsewhere in our response to the Draft RS. We are therefore concentrating on a few selected portions of Parts 3400, 3420, 3427, 3427, 3430 and 3441. Failure to discuss any portion of these regulations does not imply approval.

PART 3400 - CRITICAL MANAGEMENT - GENERAL. We are pleased that the Department has seen fit to draw together all responsibilities relating to oil and leasing in one section and to set out clearly the responsibility of various departmental offices.

3400.0-4(d)(2) We do not believe that the Fish and Wildlife Service can adequately meet its responsibilities under 3400.0-4(d)(1) to "exercise the authority of the Secretary to protect and conserve endangered and threatened species, migratory birds, aquatic, other fish and wildlife" if it can only "recommend" lands unsuitable for leasing "due to fish and wildlife and related ecological values." The statutory responsibility of the Secretary, delegated in FLPMA requires that it granted the authority to designate lands unsuitable where the "protection and conservation" of fish and wildlife is involved.

3400.0-5(p) The last sentence should be dropped. The first sentence adequately describes fair market value and neither compels nor denies the consideration of payment to a surface owner for consent to lease. The reduction of payments to the United States because a mineral operator has paid for the right to enter raises a host of legal and policy questions. Improperly allowed, it can lead to a situation in which competing resource values on land proposed for lease are totally ignored or undervalued. Consider, for example, a situation in which Trust 1 has real values of X and other resource values of Y (presumably less than X). But in this instance set at .4X, Trust 2 has real values of .4Y and

maximum five year deadline for the initial revision of existing RFTs and adoption of new RFDs. In addition, the department and the DOI should evaluate the alternative of delaying competitive leasing until new RFDs have been adopted and resource inventories have been completed, relying in the interim on emergency short-term or bypass leasing subject to existing RFTs and the additional land use cap.² ² added by the preferred alternative after the finalization of the EIS.

We now turn to analyze the preferred alternative in more detail through comments on the Example Regulations, DOI, Appendix A.

other resource values approximating 0. To appear to be in the public interest for Trust 1 to continue without making any for Trust 2 to be minded. The total social value of this patch is 1.7X (.4X from Trust 1 and .7X from Trust 2). If no allowance for surface owner payments is made, this will sitte be in the mine operator's interest he will now his margin of profit on a total resource of .7X from Trust 2, whereas he would only keep that same margin of profit on a total resource of .4X from Trust 1 -- the real resource value of the trust minus a payment to the surface owner for the true value of the resource forgone. If Trust 1 is minded the total social value will be only .4X -- the value of the coal resource made available minus the value of the competing resource forgone. However, if the mine operator is allowed to deduct the cost of paying for surface owner consent from his costs, then it becomes in his interest to lease Trust 1, because he is able to earn his profit on the entire coal resource value without having paid for the loss of the other values that payment is made up out of money he would have paid the United States anyway, i.e., the government subsidizes the destruction of resource value Y from its own revenues.

This example is simplistic, but it does indicate some of the problems involved in allowing payments to surface owners to be considered in assessing the fair market value of the lease. Unfortunately, because the issue has generally been cast in the context of a greedy land owner holding out and extracting payment, there has been little realization, and no discussion in the Draft RS of the function that surface owner payments perform in indicating the value of alternative uses of a prospective lease site.

We believe that no allowance to reduce the fair market value of a lease to reflect payments to surface owners should be made absent the development of an explicit set of rules and an economic and environmental analysis of the effect of the application of such rules.

3400.3-5 (c) This section should also contain a definition and explanation of the structure of the "negative consent" described in 3400.3-5(d)(1).

3400.3-1 This section, which we fully support, seems to be anomalous in conflict with 3400.3-2(d) which only requires BLM consultation with the surface management agency "to obtain its recommendations as to the acceptability for further consideration for leasing of the land that the other agency administers." The latter section should be amended to indicate the discretionary authority of the surface management agency to refuse sites for leasing or planning for leasing on land which it administers.

3400.3-3 This provision can be improved in two ways. The first is to require a formal finding by the Secretary of Agriculture for decisions under 3400.3-3(b)(2). The second is to provide some method of appeal or protest, within the Department of Interior, when it is alleged that the finding can not be sustained. An alternate way of achieving the same result -- providing review of facts in contention when the decision is made by another agency -- might be to allow DOI to lease under those conditions only when such leasing was in accord with a program plan developed under the Forest Management Act, thereby allowing the issue to be contested within the context of DOI's planning rules. What we wish to avoid is a situation in which a potentially noncompliant decision, to lease in a National Forest for strip mining, is made without a requirement of environmental analysis or an opportunity for review.

Subpart 3400 - Competitive Leasing: This subpart provides a mechanism for implementing most of the Preferred Alternative. It is subject to criticism in two broad areas: first, when it implements aspects of the Preferred Alternative which we found flawed, second, where it fails to implement properly important aspects of the Preferred Alternative.

-73-

of Section 3400.3-5(q). Certainly, it would otherwise be impossible to undertake BLM's in the Powder River Basin or Western Appalachians where BLM manages the bulk of the surface estate.

We are utterly opposed to the use of a short-term, single focus process to drive the bulk of the Department's lease planning process. In most instances, there will be sufficient time developed during the residency of the DOI/BLM program. The simple intent of DOI/BLM was to eliminate this type of single resource oriented planning and replace it with multiple-use planning accomplished in the open with a maximum amount of public participation.

In a perfect world, no coal should be leased unless a post-1976 PLPA plan has been prepared. An important world may require short-term, but they must be carefully budgeted and clearly limited in time and scope. Until the Preferred Alternative and the Proposed Regulations fail to do that, leases covering billions of acres and stretching into the decade after 2000 could be governed by DOI's under the proposed Parts 3400 and 3400. There is no warrant for such action. If there is a need for "stay-up" criteria -- which we doubt -- that need should be fixed in time and extent. There should be some point outside of which DOI's will not be an acceptable alternative to Section 202 plans; there must be a maximum acreage which can be subject to coal leasing under such limited planning efforts. Be specific and let the Secretary know that such limitations are anticipated in the Proposed Regulations to be issued next month.

Furthermore, the Proposed Regulations should contain a full description of exactly where the LSA's are not required to meet the full requirements of Section 202. We are most concerned with the public notification and participation aspects of the land use planning effort. It is noteworthy that 3400.3-3(h)(2) requires public participation

3400.3-3 The term "land use analysis" is nowhere defined in this part.

A definition of the term is found in Section 1001.5-5(g) of the proposed planning regulations to replace the Federal Land Policy and Management Act at 34 CFR 507.65 (December 15, 1978):

"Land use analysis" means the process undertaken in the Federal Land Policy and Management Act which identifies an environmental assessment requirement to include all data relevant to a decision. It is used only when public lands are involved. It is not used when private lands are involved. It is generally limited to a rural area and where very limited public land resources are involved. It generally covers one or two types of public land resource uses and does not require a public planning and resource requirements of Sec. 202 of the Federal Land Policy and Management Act.

Section 1001.6-4 of the same proposed regulations is entitled "Litigation where action can be taken based upon another agency's plan or land use analysis." It deals with those specific situations where DOI administers only the mineral or subsurface estate and the surface is administered by another Federal agency; where DOI administers only the subsurface or mineral estate and the surface is non-Federal; and where DOI where surface and/or subsurface estate with another Federal agency, as in a military withdrawal.

A reading of the two proposals together -- and they were published at the same time -- would indicate that "land use analysis" could only be used in very limited circumstances. Presently, in all other cases a comprehensive land use plan, as defined by Section 202 of PLPA, would be required before a lease could be issued.

However, it is clear from the actions the Department is taking in running "tests" on sustainability criteria and preparing for the issuing of up to forty leases by next summer, that it intends for "land use analysis" to have broader use than would be indicated by the language

-74-

where the Secretary applies unsatisfiability criteria to lands covered by another agency's plan. 3400.3-3(h)(1), covering the application of the unsatisfiability criteria within the PLPA planning process contains no such explicit statement. Of course, during a full-blown Section 202 planning effort such participation is mandatory. But what about during a LSA? Or during the "tests" of the unsatisfiability criteria right now going on for use in the first lease areas? The Proposed Regulations do not give clear answers, either to the public or to Congressional employees who will be charged with administering the process.

Likewise, nearly every element of the Preferred Alternative, no matter how admirable in concept is subject to questioning and doubts about its efficacy to implementation, because there is a legitimate question concerning just which aspects will be operative during the residency of the LSA's. The Proposed Regulations must provide some definitive guidelines.

3400.3-3 Lease accessible for further consideration for leasing: This section embodies the heart and soul of the Preferred Alternative -- the four "Necessities" which were the subject of so much discussion during the last year. The concept is admirable and worthy of strong support. We are deeply supportive of the idea that certain essential environmental and social factors should be used to eliminate lands from consideration before any energy resource considerations are even applied. Clearly, if there is a resource for which such treatment can be justified, it is one which is in such abundance.

Unfortunately, the four screens, as sturdy as rhetoric, have been torn and beaten in their regulatory mouths. The lands accessible criteria will be discussed at length below. We find them to be easily突破 in earnest.

The draft states, "multiple use trade-offs, has been most severely navauged. Originally presented as a way of guaranteeing that other valuable lands would meet our full vision to the need for relatively abundant coal resources, it has been reduced to a mere nullity." Multiple land use decisions may be made eliminating coal issues from further consideration for further leasing to protect other resource values of a unique, area-specific nature not included in the unsatisfactory criteria discussed in paragraph (1) of this section."

The Draft IS presents an even harsher test. After first falsely asserting that the lease unsatisfactory criteria would address more major conflicts between coal and other resources, it goes on to say "The adjustments at this stage in the land use planning process would be made to accommodate unique, area specific resource values ~~clearly requiring~~ to real..." (IS, 3-21 emphasis added) Not only is this true now, but it seems to be illegal, flying directly in the face of the multiple-use concept underpinning PLPA.

Coal has become a monoculture. Unless a resource can be shown to be clearly superior, it will not be protected, regardless of the fact that the resource might be relatively rare or not easily replaced while the rest would easily coexist just as much.

It is doubtful that 3420.2-3(c) could remain so restrictive in the Section 202 planning process. The imperative of PLPA demand a *whole* test. Its effects under LIP planning, however, could be quite disastrous. The situation is much worse because the Activity Planning regulations nowhere explicitly address the issue of resource trade-offs.

3420.2-3(d)(2) manifests a weakening in the fourth screen, surface over extract. The expression of a preference against leasing by a significant

number of surface owners is no longer sufficient to bar surface leasing in the area, if it is needed to meet regional production targets. Need on the type of regional projections displayed elsewhere in the Draft IS this criterion could effectively justify overriding surface owner preferences throughout large areas in the West, particularly in the Powder River Basin. This would seem to contradict the spirit and, perhaps, the letter of Section 7(a)(d) of F.L.-93-87 which states that, "The Secretary shall, in his discretion but to the maximum extent practicable, refrain from leasing coal deposits for development by methods other than underground mining techniques in those areas where a significant number of surface owners have stated a preference against the offering of the deposits for leases."

One final comment on the land planning mechanism depicted in part 3420.2 is that it seems to have eliminated the Department's recent policy of ignoring its responsibilities under PLPA for the "prompt development" of regulations and plans for the protection of public land areas of critical environmental concern (Section 3420.2(11)) and the priority protection of an inventory of public land values "giving priority to areas of critical environmental concern" (Section 202(a)). The sequence of the LIP process, along with the failure to confront the issue in the PLPA planning regulations, leaves serious questions in my mind as to how well the enhanced planning affect LIP efforts to insure the protection of these important areas.

3420.2-4 Because the land use and energy decisions involved in the coal leasing program are national in scope, the places "who may be severely affected" should be defined. Section 3312(f) of PLPA establishes public involvement procedures with no section of such a unit.

3420.2-5 As noted in our earlier comments on 3420.3-1 there appears to be a conflict. While we would hope that other agencies would cooperate

mine coal leasing does not seem inconsistent with the statutory guidelines under which they administer the surface, it seems result-inappropriate to plan for the mining of such land where the agency will be able to deny any leasing. It also might lead to some distortion of the process down the road if states were included in the planning process as potential coal lease sites when there was no possibility of that occurring.

3422.3 "Regional production targets" The regulations on the formulation of regional production targets and their role in the tract selection process are well-considered. However, because the targets developed in this Draft IS struck us as unattainable, we believe that several explicit changes in the process by which they are developed may help produce better results in the future.

Target setting is essentially a computer exercise; once the rules are done it is difficult and expensive to take another route or examine other alternatives. We suggest that the following paragraphs be inserted in appropriate places in the regulations:

"Prior to undertaking any projection of regional coal needs, the Secretary shall solicit from the public, industry and professionals comment and suggestions on the best modeling techniques to use, appropriate assumptions and relevant data which may have a bearing on regional and national coal needs."

"In determining regional coal needs and projected demands, the Secretary shall endeavor to develop data based on actual end-use needs and on the broadest feasible survey of major sources of production and demand and their use-related plans."

"The Secretary shall develop Information to indicate the economic social and environmental impacts of failing to meet given regional

targets or exceeding them, wherever it appears likely that combined Federal and non-Federal actions, including the development of existing leases, etc. likely to achieve either result for a region."

3420.4 *Activity Planning*: If, as seems likely based on conversations with Department officials, the four screens in the delineation of lands acceptable for future leasing do not remove a high percentage of the 25 million acres that will be subject to the coal management process, thus the activity planning process will have the most significant land use legitimacies. We do not believe that the existing procedures embodied in the activity planning screen of the program are well designed to assist in rational land use planning.

3420.4-1 The expression of interest should provide for negative nominations. This is particularly important if leasing has been reorganized under LIP procedures and if the multiple land use decisions harmonize reasonably. Negative nominations should be reflected after industry submissions.

3420.4-2 The preliminary tract identification should consist of discovery of existing and potential uses of the tracts.

3420.4-4(d) The description of the tract ranking process is vague and too short. It does not indicate who shall do the ranking. It does not indicate whether the ranking is a management decision implementing a land use plan (assuming there is one) and thereby governed by the PLPA regulations, including those as oppose, or some other type of decision. It gives precious little guidance on how the rankings shall actually be done and which criteria are utilized.

3420.4-4(h) The ranking process seems to be an appropriate point at which to apply the *threshold criteria* discussed at 3.2.1.4. The Draft IS notes that "It is not necessary to specify threshold in the land use plan," (IS 3-21) and we agree that while it might be desirable, it is not by means always possible to do so. The threshold criteria are specified

In a land use plan, then they should be concentrating on tract selection. We would appreciate the Department's views on whether this suggestion is correct or what degree. But if there are no threshold criteria in the land use plan (or where a threshold issue exists that can not dealt with in the plan), then it is necessary that the process specify some point in the process where the Federal Land Manager faces an affirmative duty to consider threshold issues... It seems reasonable and appropriate to make decisions on threshold issues just prior to or concurrent with the selection of tracts to offer for sale.

We hope that the Department will take the lead in further investigating the complexities associated with threshold issues in the coming months. We believe that the Final ES will benefit from a fuller discussion of this issue and that such an investigation may also shed some light on the best way to integrate such decisions into the coal management program.

3420.4-1(d)(2) That data should also be made available in Washington D.C. It is high time that the Department started to centralize important land use data.

3420.4-3 Environmental Assessment: This section apparently contains directions for all environmental assessments in the coal management program other than the programmatic environmental statement which is covered in 3420.3-4. The following principles should govern the environmental assessment strategy of the coal management program:

1. There must be site specific environmental assessments (which we presume would almost always indicate the need for an environmental statement) for each mine plan on Federal lands.

2. The regional lease sale environmental statements should evaluate regional and cumulative impacts based on proposed and existing activities, including the mine plans.

3. There must be environmental statements at all MPP revisions, particularly those undertaken in response to the coal management program.

4. The regulations used to present standards for the collection of baseline data and for the compilation of Section 201 inventories that will be adequate for land use planning and the preparation of environmental statements. Special standards should be developed to deal with data needs which will arise in the updating of MPP's originally prepared before the passage of PLMFA and PCLAA.

It is not necessary that every step in the coal management program require an environmental statement or that each environmental statement must seek out and assess new horizons of information. A comprehensive environmental assessment strategy will facilitate the tiering of environmental statements and promote a pattern of decision making dependent on the existence of appropriate data generated under an ongoing process.

In our view, NEPA and PLMFA clearly mandate the preparation of environmental statements when land use plans are developed or significantly altered and when mine plans are approved. The coal management program may and should supplement these statements with regional lease sale environmental statements. But we see no Congressional authority which will allow the regional sale ES to substitute or replace land management environmental statements or environmental statements on the approval of specific mine plans.

Sound environmental assessment strategy can reduce the burden on the Department and the public by integrating the data collection and presentation functions performed by these statements, but it can not eliminate the requirement that environmental assessments be undertaken at these three separate points in the coal and resource management program of the Department.

3427 Surface Rights General: The rights of a surface owner of land overlain with coal were among the most bitterly disputed points in the long battle to pass adequate stripmining legislation. The example regulations contemplate the review of Section 7(a) preexisting in several places, for example in 3420.3-3(d)(2). Another valuation of the protection of surface owner rights is found in 3427.1(d) which allows the State Director to conduct the sale of a lease for coal on split estate lands where no consent has been granted.

We can set overruled the importance of deleting this pernicious provision. This subject provides ample opportunity for prospective lease purchasers to negotiate the purchase of covenants. If they are not able to do so within the stipulated time frame, then the tract should not be subject to lease sale.

Section 7(a), on its face, would not only allow a lease sale in situations where the surface owner has not expressed a final preference for or against selling his rights, but also where a definite expression of a desire not to consent has been indicated.

It must be remembered that 3420.3-3(d)(1) does not *require* that lands for which a negative covenant is given be removed from consideration for surface mining, our own 3420.6 require the Secretary to honor such indications when establishing the regional coal lease sales schedule. If, by the date thirty working days before the scheduled sale, a prospective lease purchaser is not able to secure a written covenant or, at the very least, a written statement that the surface owner has no objection to the sale going forward, then it should not take place.

3441. The Federal Lands Program: Lands Usability Criteria.

The lands unsuitability criteria are the backbone of the environmental component of the coal management program. A well-defined and designed process for designating lands unsuitable for mining could ensure the exclusion of most lands containing other important values from consideration for leasing. Presumably, the aesthetic application of the criteria would enable even environmentally sensitive land managers to make the proper choices.

The criteria presented in the Draft ES fail to tell the ends suggested in the preceding paragraph. They are set forth in vague terms and subject to equally vague and generally broad exceptions. They provide neither certainty nor the protection of valuable resources. In some instances, there are inexplicable limitations on protections.

The vagueness, the exceptions and the limitations might, in some instances, be justified, but there is no information in the Draft ES on which to make any judgment. The public is left totally in the dark as the likely extent and impact of many of the criteria. How many National Recreational Lands or inland lakes are located within NEPA/PLMFA? This information -- or at least a good approximation -- could have been gathered and presented in the Draft ES, but was not. This makes it much more difficult to critique the criteria or to understand why some are presented as they appear in the Example Regulations.

The following aspects of the proposed criteria need change:

1. In criteria #1, there is inadequate development of the notion of an "appropriate buffer" area. While some buffer zones must be determined on a case-by-case basis, it is not unreasonable for the Department to establish more general guidelines and put them out for public comment. For example, the Department might consider establishing, by regulation,

minimum but, if areas around parks and wilderness areas based on mine size.

4. We find no justification for the establishment of new leases in wilderness study areas. There should be no exception.

5. The value of this criteria depends on the volume and quality of visual resource management analysis. It does not seem feasible that surface mining would not "significantly diminish or adversely affect the scenic quality" of any Class I or Class II area. We recommend that the exception be deleted.

6. Exception (ii) should be deleted. It is not clear what experience BLM has to second-guess a nonrecurring researcher. As the studies only last for the duration of a permit, this would not result in permanently removing land from consideration for leasing. They would become available when the existing research was completed.

7. It is a comfort to believe that mining may entitle historic lands and sites of nearby local or regional significance only if the State consents. Presently exception (i)(2) applies only to the establishment of a buffer zone, e.g., the consideration to ever how close the mining can come, not over whether the mining uses that place or the site itself. This should be made clearer.

8. Exception (iii) should be deleted. The theory of this exception seems to be that the operators of game marsh swamps and riprap will be able to get paleontological resources. This is nonsense.

Exception (i)(3) should require the emergence of the authority responsible for the designation in the finding that the mining will not have significant impact.

9. The determination of critical habitat must be made by the Fish and Wildlife Service alone. It is not BLM's job to determine what is and what is not critical habitat. The exception must be revised to require FWS determinations.

10. The criterion should require the initial classification of all lands which meet the DBCIA definition of "prime farmland" plus any additional lands the land management agency and DBCIA agree should be preserved. Requirement (ii) should be deleted.

11. This criterion should be reworded to make it clear that any mining operation, whether within or outside an AEP, which has an adverse impact on water quality is prohibited. Not only should the exception reflect this, but it should also specify what constitutes interruption, discontinuation or prohibition.

12. This criterion appears to be incorrect. It implies that leasing will go forward until such time as it is demonstrated that reclamation can not be achieved. In the present situation, a requirement that Northern reclamation be demonstrated right will bring any Federal coal leasing program to a screeching halt. However, this criterion should require more than passive acceptance of ignorance on the part of the lessees.

The Department should seriously consider establishing certain mandatory criteria for declining land assessable based on rainfall, soil type, terrain etc. and then indicate that it is willing to consider programs that land covered by such criteria is, in fact, reusable when preparing land use plans for the affected region.

13. In both cases we believe that where a State has established a procedural structure to protect its lands, any Federal action on Federal lands which threatens that level of protection should only be undertaken with the concurrence of the relevant State authority.

Friends of the Earth would like to stress that this is one of the most seriously flawed criteria. It is not credible that mining will not affect habitat. The exclusion of land from mining or the writing of lease terms to minimize potential harm requires the application of professional expertise which resides with FOSC. Any attempt to place decisions on critical habitat elsewhere in the Department would be a serious error.

14. We believe that consistency with the State agency is required.

15. The decision on adverse impact should be made by the Fish and Wildlife Services.

16. We would delete the joint determination, leaving it to FWS. Similarly, any exception should require congressional.

17. As with the previous criteria, we have difficulty supporting a joint determination of critical habitat. Both exceptions are badly drawn. Excepting (ii) posits the existence of a situation which is impossible; exception (ii) does not provide an adequate role for the State agency.

The wording of exception (ii) may also render the criteria meaningless. With the exception of species which now exist only in remedial parks, almost no area desirable for coal mining is singly and uniquely so important that its use for mining will adversely affect the species. The language should be changed to indicate that there will be no adverse impact on the animal population which the State has chosen to protect.

18-19. These four criteria pertaining to water resource conflicts raise serious problems concerning the role of BLM in resolving water-related conflicts. Exception (ii)(14) should be deleted. Exceptions which give BLM the authority to permit leasing if it determines that the action will have no adverse effect on water resources assume a great deal about the consequences of BLM to assess hydrology. We suggest some formal role for U.S.G.S. and the Water Resources Council in any such determinations.

NATIONAL COAL ASSOCIATION

One Building, 1120 Seventeenth Street, Northwest Washington, D.C. 20004 (202) 223-4220

Frank Gregg

Honorable Frank Gregg
Director, Bureau of Land Management
Office of Coal Management, Room 3610
Federal Office Building
18th and C Streets
Washington, D.C. 20240

SUBJECT: Comments on Draft Environmental Statement Entitled "Federal Coal Management Program".

Dear Mr. Gregg:

I attach hereto the comments of the National Coal Association upon the draft environmental statement "Federal Coal Management Program," published for comment by the Department of the Interior on October 1, 1978.

In accordance with the suggestions appearing at pages 1-2 of your letter dated October 1, 1978, I am enclosing the statement itself (the "DES") and the "preferred program" (the "Program") which it describes. Although we drafted in the DES a number of recommendations added as Appendix "A", we will comment in greater detail when the DES is published as a final document.

We have also reviewed selected documents used during the development of the DES. These include the Secretarial issue papers, narrative descriptions of the ongoing process prepared by Departmental staff of the Bureau of Land Management in January 1978, from your office to several Bureau of Land Management State Directors, and a copy of the "Statement of Federal Lands Review," published on December 8, 1978 at 43 F.R. 37652 AF 865. Our comments address these also.

We find discrepancies between and among these various documents which we feel are important to resolve in order correctly to understand the Program. This is

During the Coal Industry Study (CIS)

especially true with respect to such significant elements as the proposed mechanisms for designating lands unsuitable for surface coal mining, the timing and effect of industry input to the planning processes, the role which production "targets" will play in determining leasing levels, and the nature and use of the concepts of "fair market value" and "maximum economic recovery."

CHRONA COMMITTEE

At the outset, I would like to congratulate the Department of the Interior ("DOI") on the publication of the EIS. It is a thoughtful and conscientious attempt by the draftsmen to set forth a proposed program, the nature of the alternatives thereto which were considered by the Agency, the environmental impacts of the proposed action and other impacts as are required to be set forth in order to comply with applicable laws and regulations. These include Section 102(2)(C) of the National Environmental Policy Act, the Council on Environmental Quality ("CEQ") Guidelines of the council on "Environmental Quality," and CFR Part 1500, as amended. F.R.: the relevant

I must also note, however, that in our view the DES is in its present form in considerable part does not adequately consider the full range of possible consequences that would result from adoption of the Program. Some alternatives to the Program which were considered by the Secretary should be more fully described, and there are other available courses of action which should be considered by the DOI. These should be more clearly articulated as discrete alternatives to the Program or the elements thereof.

Our attached comments identify these and other deficiencies in greater detail. We believe they are the inevitable result of the fact that the document is only a "draft" environmental statement, and that the overall consideration given to the Program and its alternatives constitutes full compliance with all legal requirements applicable to such a document.

We also feel that the adoption by the Secretary of any or all of the recommendations set forth in our attached comments, accompanied by appropriate explanation in the final statement, would fall well within the range of alternatives covered in the DSS, and would comply in all respects with the requirements of NEPA.

We believe that the specific deficiencies of these program elements, and more efficient administrative alternatives, would have been immediately identified if the Office of the Secretary had followed the President's Executive Order No. 12044 dated March 22, 1978, and conducted a Regulatory Analysis of the Program. We further believe that if the Office of the Secretary had implemented this Order, compliance would closely be related to the performance ranking published on May 25, 1978 at 43 FR 22273. (See, especially, proposed 43 CFR Part 1000, which provides for a performance ranking of administrative mechanism choices to the success of any new program.) Regulatory analysis should be conducted on a regular basis.

2003-03-03

We do not believe the Department to have the authority assigned to it by Congress to apply its new "reusability" criteria to existing leases. We believe that leasehold rights to the preference right lease applications (PRLAs) now pending before the Department. To the degree that the Program would cause to modify an existing lease or to end the lease of a valid existing right, we believe that this issue is currently in litigation, and adoption of this Program element should await judicial resolution of the issue. We believe that the Department's proposal that the Program proposes the exchange or substitution of other rights for any so taken, it would appear to exceed existing statutory authority. At a minimum, specific statutory authority would have to be provided for the alternatives thereto considered in the final statement.

The preferred Program represents an unprecedented degree of management and control at the Departmental level of federal coal resources. Many specific elements of the Program are unworkable. If implemented, we believe it would be impossible for the Department or the private sector to achieve in timely or responsible fashion any realistic goal of resumed federal coal leasing.

The unworkable aspects of the Program appear in virtually all respects to be actions or choices within the discretion of the Department. They are not mandated by external constraints of law or national policy. As a result, the Program would appear to represent the conscious adoption by the Department of a land management policy which is systematically biased against federal coal development.

We do not believe that this result is consistent with the intent of the President, the public interest or the national policies established by the Congress in relevant legislation.

Our attached comments address in detail the following major difficulties which we have with the preferred Program:

Tetrahex 1000

As now drafted, no timely or meaningful input would be available to the industry to identify those areas of federal coal lands which may most desirable for immediate development. The coal industry will continue to be the developer of whatever land areas are leased (GSR 5.1.6). At the same time, the industry's input would be critical, which would serve to focus DOT's attention on those areas which should receive priority review for lease potential. This would be especially important in the early rounds of leasing, within the first two years, to allow for the definition of the Department's other or subsequent planning responsibilities.

Departmental Resource Limitations

We believe the land use and activity planning processes of the Program exceed the DOI's current or foreseeable data and resource requirements. We also do not believe the Program could be implemented in any reasonable timely fashion. These elements which would be particularly troublesome are, moreover, either unnecessary for successful implementation of a leasing program, or might be substituted for by other available alternatives.

Specific Tumor Responses

We believe several specific elements of the Program are either unworkable or needlessly complex. These include, among others,

- Lands unsuitable procedures and criteria.
 - Multiple use trade-off procedures.
 - Split estate treatment, and private surface owner vesa power over leasing.
 - Incentive bidding mechanisms and tract ranking procedures and priorities.
 - Impossible requirements for the determination of specific lease terms end conditions, including fair market value and "maximum economic recovery".

We urge the Department to reconsider and amend the preferred Program, so that the nation may have the benefit of the timely, orderly and environmentally sound development of the vital domestic energy resources represented by unleased federal coal lands.

We look forward to the efforts the Department will be making in this regard, and would be willing to assist you or your staff in any way possible. If you have any questions or comments upon the enclosed detailed analysis, please do not hesitate to call upon us.

Very truly yours
John B.

DETAILED COMMENTS
OF THE
NATIONAL COAL ASSOCIATION
UPON
DRAFT ENVIRONMENTAL STATEMENT
FEDERAL COAL MANAGEMENT PROGRAM
AND
STATEMENT OF POLICY.
"COORDINATION OF FEDERAL LAND REVIEW"
(43 F.R. 57862, DECEMBER 8, 1978)

DETAILED COMMENTS OF THE NATIONAL COAL ASSOCIATION
UPON THE DRAFT ENVIRONMENTAL STATEMENT, THE FED-
ERAL COAL MANAGEMENT PROGRAM, THE STATEMENT OF POLICY,
AND THE POLICY OF THE DEPARTMENT RELEVANT THERETO.

I. GENERAL COMMENTS

Achievement of national environmental, economic and energy
goals will require the continued development
and use of domestic energy resources, at the lowest unit
energy cost, consistent with other national policy.

There is now a demand for new federal coal leases,
evidenced by the responses in 1978 to the call by the
Department of Federal Coal Leasing Initiatives. Federal
authorities by the Department of Energy and the Federal
Trade Commission have affirmed the anti-competitive
effects of the current moratorium.

Existing federal laws and applicable Departmental regu-
lations ensure the development of future federal
coal leases will occur prudently, and only under
acceptable environmental conditions.

Resumed federal coal leasing is thus, presumptively in
the national interest. Valid reasons exist for the
continued moratorium on federal coal leases. A program
which would resume federal coal leasing must efficiently
implement the issuance of new federal leases.

Unfortunately, and as set forth more fully below,
the proposed program (the "Program") set forth in the draft
environmental statement (the "DES") would appear to
restrict the development of coal in a manner which unfairly
incorporating a systematic bias against such federal coal
development. This would result in the inefficient and
inequitable use of federal lands, and would be inimical to
the development of all other resources found in
coal bearing federal lands.

-2-

Many of the major deficiencies of the Program derive in
our view from a conscious or unconscious effort by the
draftsmen to use the mechanism of the federal coal lease
to implement the policy of the DES. This is evident by
the inevitable inconsistency conflict between such a
competing national goals and policies. To impose such a
necessity upon a single federal mechanism or device
is simply not possible.

As exemplified in the Program, such an effort would in
fact frustrate any goal of timely, resumed federal coal
leasing. It would impose unnecessary costly and in-
efficient administrative burdens on the industry, the
lessees and, through the consumers of the energy resources
involved, upon the general public.

Our comments are intended to identify those aspects of
the Program which most seriously inhibit its
implementation. We also propose specific
changes in or administrative alternatives to the Program
which would not violate the intent of the policy set
forth in the DES, but which would comply with
applicable laws and the national policy and which
would reduce or eliminate these adverse effects. Adoption
of such changes would not affect the policy which would
be within the scope of the alternatives and issues covered
in the DES but of varying degrees would require explana-
tion or amplification in the final statement.

For brevity, throughout the following comments major
issues will be referred to by their commonly accepted acronym. These are: the Federal Coal
Leasing Act of 1976, P.L. 94-377 (S. 307), 90-8.C. 181, note, as amended; the Federal
Land Policy and Management Act of 1976, P.L. 94-379 (S. 307), 90-8.C. 181, note; the Federal
Control and Reclamation Act of 1977, P.L. 95-87 (H.R. 3),
93-8.C. 101, note; the "NEPA"; the Department of Energy
Organization Act of 1977, P.L. 95-31, 41 U.S.C. 1601

SPECIFIC COMMENTSA. LAND USE PLANNING PROCESS

Section 3.2.3 of the CES, "Land use planning," discusses the three step process by which lands we planning would occur under the Program. After correctly noting that PLMPA requires a similar multiple use planning process, the CES fails to note that the discussion in this section describes a three step process whereas the PLMPA requires a four step process of identifying and enhancing each resource¹ before proceeding to the second step of "Identifying land uses plans identify preferred land uses, or combinations of uses, for the area and serve as a guide for the third step of the process. These plans establish the nature, extent, and objectives for future actions and programs on BLM-administered lands." (ibid.)

1. The Program Involves Unnecessary Delay in Leasing.

At the outset, we assume that if the Secretary should determine in his final determinations that the recommissioned interest is best served by addition of a leasing program which will be able to be implemented in the most efficient and timely manner.

In this light, we strongly question the wisdom of affording the Secretary the option of having federal land areas be subject to review by the SLM at the beginning of coal related review in the management framework plan, or, if the Secretary so desires, by the appropriate resources of the Department or, for that matter, of the Federal government itself are limited.

Section 202 of PLMPA requires that the management of federal lands be accomplished through a detailed lease planning system. Article 3 of the PLMPA amended Section 1(a) of the Mineral Leasing Act so as to provide in new language that the lands containing coal may be held "unless the lands containing the coal deposit are leased." Ultimately, therefore, comprehensive planning for Federal lands, including coal related planning for federal lands, must be required by the PLMPA. However, neither PLMPA nor other relevant Federal statutes, for that matter, provides for its override delocalizations. That analysis noted:

"S. 391 essentially codifies [the Department's existing coal evaluation program] by directing the Secretary to issue regulations concerning recoverable coal." The size and timing of this evaluation and the resulting lease offer or denial decision. The program would not preclude the Secretary from issuing coal leases without first obtaining accurate information about the nature and extent of the coal resources and the amount of known Federal coal reserves be evaluated before any coal is leased." (ibid at 135)

Following all of the above, each House voted to override the President's veto, and S. 391 became Public Law 94-377 on August 4, 1976.

Since each House voted separately to override the President's veto, and since the two chambers of the Congress of the United States, each such expression must be read as fully ratified by the Congress itself. The legislation was clearly intended to indicate that Congress did not intend recommissioned federal coal leasing to wait completion of all land use planning.

The Program as now described would, however, require that all federal coal lands be reviewed and evaluated for their suitability for leasing, and that the same set of criteria for designating lands unsuitable for mining, before any lease offering may be made.

The completion of the evaluations and screening processes contained in the Program will be the critical factor in determining whether the land use planning process outlined in the Program is both unnecessary and contrary to the intent of the Congress. The time required for the completion of the Program's process involves the detailed analysis of lands, as to which there is no significant interest on the part of potential lessees. It is both unnecessary and premature.

including the PLCAA, requires that coal related planning for all federal lands be completed before a coal leasing program is initiated or a specific coal leases offering made.

To the contrary, the legislative history of the PLCAA indicates that it was the express intent of the Congress that the Secretary would not be required to await the completion of land use plans for all federal lands, or even for all federal coal lands.

On June 21, 1976 the Senate passed S. 391 of the 94th Congress, and during the period of Public Law review, the principal proponents of the legislation in both the House and the Senate were asked to present forth their views with respect to the intent of the Act by letter dated June 24, 1976. The House and Senate Committees also specifically addressed several concerns which had previously been expressed by the House and Senate Committees. These concerns included the fear that if completion of land use plans were required before a specific coal lease could be issued, the entire recommissioned federal coal leasing could take place, any such leasing would be significantly delayed.

The Congressional sponsors assured the President that S. 391 was designed to "insure development of Federal coal resources in a timely manner." (Senate Report No. 94-377, Hon. Harry T. Mink, to the President, June 14, 1976, at Committee Print, 94th Congress, 1st Session Ed., June 19, 1976, reprinted in "Senate Publication No. 77," "Federal Coal Leasing Policies and Regulations" (January, 1978).

Moreover, in introducing this letter for the record, Senator Hruska stated on the floor of the Senate on June 19, 1976, that:

"I wish to make it very clear on record, Mr. President, that at no time in the history of this country has there been any intention by the Congress to prevent new leases being issued by the Secretary until all federal lands have been evaluated. The unmistakable purpose of this bill is to insure that new leases are issued from Federal lands in a manner that is fair to both the public and the private sector, to the public who owns the coal...there is no requirement that all known Federal coal resources be evaluated before any can be leased." (ibid.)

This latter and expression of Congressional intent is especially compelling in view of the fact, in light of subsequent events, notwithstanding the direct appeal and reassurance of Senator Metcalf and Mrs. Mink, on July 1, 1976, that "the House and Senate Staff analysis of the President's veto message was prepared, for use in the House, before its override deliberations, that analysis noted:

"S. 391 essentially codifies [the Department's existing coal evaluation program] by directing the Secretary to issue regulations concerning recoverable coal." The size and timing of this evaluation and the resulting lease offer or denial decision. The program would not preclude the Secretary from issuing coal leases without first obtaining accurate information about the nature and extent of the coal resources and the amount of known Federal coal reserves be evaluated before any coal is leased." (ibid at 135)

At least in so far as the initial round of leasing under the PLCAA is concerned, the intent appears to be served by requiring the detailed review of all eligible lands, and significant efficiency would be enhanced if the number of lands deemed to be so reviewed could be reduced.

2. Allowance for Industry Input.

At the same time, we note that individual companies and entrepreneurs have been participating recommissioned federal leasing since the 1970-71 moratorium on programmatic federal coal leasing. In fact, many of the same lessees have had the opportunity to review and evaluate both federal and non-federal coal lands and have in most cases expressed industry preferences and priorities for the development thereof.

This process of preparation and anticipation of resumed coal leasing received concrete expression in 1976, when significant areas of unleased federal land were marketed for lease, and lease sales to be conducted under the EMAS II program.

It would appear to make no sense for the Department to plan for and conduct lease offerings based exclusively or primarily on the basis of the economic desirability of federal coal lands independent of or inconsistent with concrete expressions of interest by those entities who will in fact be developing them.

We respectfully suggest that the Department now possesses a detailed and accurate database for the review and analysis of lands to be subject to the first round of lease sales. The lease selection at this point in time which is based on a stratified interest in research leasing would maximize the resources available for research leasing and leasing in a timely fashion, without sacrifice of other public policy considerations.

It should be noted that we do not in this regard propose the adoption of the EMAS II program as it has been developed by the BLM. The EMAS II program is based on a programmatic basis only exclusively upon industry interest in research leasing, and not upon potential lease tracts. While this result would not appear to be inconsistent with the provision in Section 1 of the PLCAA that the Secretary may offer lands for leasing, ibid.

request of any qualified applicant or on his own motion." (emphasis added) This provision would insure that the lease decision ability of a Program whereby the Department would review, analyze and offer a lease area as an alternative to the private sector, would not be limited by what might have occurred. This would insure that in those instances where the Department's interest in lands is greater than that of the private sector, the availability of such lands is superior to that of the private sector, the availability of such lands will be brought to the attention of potential lessees.

Similarly, we do not suggest that a concrete expression of interests in a particular area might in any way reduce or eliminate the degree of review and analysis which the program committee may initially conduct before a specific area is subdivided and some or all of the resulting areas are offered for lease. As indicated earlier in more detail below, we feel that the degree, complexity and redundancy of the various activities involved in the proposed Program are excessive. We do not suggest that by providing for separate review and analysis of the individual stages of the land use planning process any appropriate subsequent review steps might be curtailed or bypassed.

(E) RECOMMENDATION:

It should be expressly provided in the new Program that those areas previously nominated under EMAS II, and those areas which are to be specifically identified by the Department, shall automatically and on a priority basis be advanced through the planning process and be subject to review under the activity planning process.

Moreover, we suggest that on a continuing basis the orderly development of the nation's coal resources would best serve by providing in all instances that the coal industry be given the opportunity to nominate and an opportunity to focus the attention of the Department upon particular land areas for consideration for division into tracts and offering for lease.

(4) Coal Potential

First, the Program would exclude from further consideration areas which are not considered to have "high" or "medium" coal development potential. This fails to recognize that in specific cases coal located in areas not considered to have "high" or "medium" potential for development in order to aspects or stimulate coal resource utilization. In addition, the Program fails to recognize that the process of discovery and evaluation of undeveloped coal resources is ongoing and incomplete. Practical classifications of coal deposits are commonly considered to be inadequate. They may not in fact reflect the true potential of the area for the quantity of coal in federal lands. The automatic elimination of all areas which are not considered to have coal resource areas ie., therefore, arbitrary and could prevent the orderly development of the coal necessary or desirable for a specific potential market.

We strongly suggest that the determinative question should be whether a prior decision by the government has determined that no further development is in the public interest. The Program should also provide for recognition of the existence of a potential lessee who, because of concern on behalf of the public interest, may in certain circumstances, needs and would expeditiously develop such coal.

(E) RECOMMENDATION:

The land manager should be required to consider formal application for mining rights in areas which have been brought to the attention of the Bureau. These areas should be considered for lease if they are not located within high or medium coal potential areas.

(4) Criteria for Designating Lands Unavailable for Mining

The next stage in the land use planning process involves application to those previously determined areas of coal development potential of the so-called "criteria" for designating lands as unsuitable for mining.

(A) General Criteria for Application of Criteria

Specific provisions whereby the criteria would be applied are vague and poorly drafted. The result would appear that neither the land managers, the public, nor the industry would have any meaningful opportunity to understand in advance how and to what areas they might be applied.

3 - Specific Details of the Program Tools

The DES states that under the preferred alternative,

"The principle coal resource decision in the land use planning process is the determination of which areas are acceptable for further consideration for coal leasing."

In fact, the process described as the preferred Program consists of screening all federal lands through a series of successive reviews the sole purpose of which is to determine the areas which are acceptable for further consideration of the lands involved for federal coal development.

The process itself and the sequence of the decisions in the Program systematically occurs according to all other articulated environmental, social and natural resource development requirements. The specific criteria required to be made in the absence of adequate information concerning the nature or desirability of federal coal resource development are the same as those which are made of such resources in comparison with other competing environments. These decisions are sequentially followed throughout the stage of the planning process.

However, both industry and the Department might have a specific need for the coal involved in any given area. In order to meet this need, the Department might choose to make an otherwise undesirable logical mining unit of federal or non-federal lands. It is important to note that coal from a given area is required to fulfill one of its production targets (see discussion, below). In either such case, the area involved in the mining unit, there would be no opportunity to identify such specific needs.

(a) Exclusionary Determinations

The sequence of the determinations of unacceptability for surface coal mining as set forth in the Program are:

- o alienation of areas not previously identified as having "high to medium" coal potential;
- o designation of areas based on applicability of the "lands unsuitable" criteria;
- o elimination of areas based on "multiple use values identified and analyzed after conflict resolution";
- o alienation of areas "where surface owners indicate definite preferences against...leasing". (Ibid)

Each step will be discussed in detail.

This process is purportedly set forth in Instruction Memorandum No. 79-6, dated December 1, 1978, published at 43 F.R. 37862 et seq. (December 8, 1978), as so described, however, it contains no final administrative instructions and is not a formal administrative document. There would thus be no meaningful opportunity for industry to challenge the validity of the criteria, or challenge thereafter, the validity of the legal manner of interpretation and application of the criteria involved.

In addition to the Instruction Memorandum, the Department has issued a "Memorandum of Understanding", Register Notice, a document purporting to set forth a mechanism for "definition of Functions and Responsibilities" among the various bureaus and their respective authorities under the direction of the Secretary of Energy. The Memorandum, however, is unclear as to how and under what circumstances application of the criteria possible exceptions might occur.

For example, in "Step V" the Memorandum has directed NM State Directors to apply the criteria, without exceptions, and to make a decision as to which areas are acceptable and anticipatory conclusions in advance of actual data. No similar preconclusions are provided for "Step VI" in which specific areas are to be excluded from mining. Virtually all of the exceptions require application of practically the same criteria as the areas which are to be excluded themselves. As a result, the effect of allowing the application of the criteria in "Step V" is to preclude any meaningful availability of exceptions at the time of implementation of "Step VI".

Steps "V" through "VII" provide guidance as to how the final product should be drafted, but also do not appear to authoritatively define the process. In Step VII, the officer is directed to prepare "a statement for the areas on which the criteria would exclude mining based on the specific criteria and the applicable laws and regulations (original)." In Step 11, he must "make a decision on which areas should be excluded from mining based on the criteria and multiple use trade-offs." The remaining areas are acceptable for further consideration for coal development."

While the memo notes under "Format and Documentation Requirements", Section "F", at 43 F.R. 37664, that the "Updated Plan" should be a "reproducible supplement" that "should be clearly delineated from the original developed during the application of the criteria and exceptions," no specific reference to the method of preparation or the content of the plan is made. It is not deemed unsuitable indicates the status, or the manner of review, of recommendations for acceptance.

Finally, the memo directs under "Record of How the Unsuitability Criteria Was Determined" that "the record that is kept or printed "showing all exceptions identified in Step 5, the rationale in determining the terms or stipulations required."

Nowhere, however, is it indicated what the ultimate effect of the determination made in Step 5 might be.

The "Division of Functions" is similarly unclear and confusing:

An operational proposition, centralizing and confounding unsuitability determinations would have positive advantages. Operators and the public would benefit from a thorough review of the surface mining lease application process. In fact, mine plans and operations may therefore be undertaken with more care and concern. The public would also benefit from an orderly and early determination of areas which may or may not be used for mineral development. Such areas could be identified and removed from the orderly leasing program may be matched with National energy policy, and lands freed for other uses.

At a final general observation, it is obvious that clearer lines of authority and responsibility are needed in this proposed program. Appendix B purports to represent such a division of functions. However, the scheme proposed in this scheme creates a virtually unworkable interagency responsibility for planning, reviewing, and acting upon all unsuitability matters.

The functions which would purportedly be delineated, include "Determining the mineral characteristics and values of the land and the potential for mineral development."

Subsection "A.1" relates to the decision process following a petition by interested persons for designation of federal coal lands as unsuitable for surface coal mining. After notice of the petition, the Office of Surface Mining (OSM) has the responsibility for "issuing a decision." This decision is created when OSM has sole responsibility subject to administrative review based on non-concurrence by a surface managing agency.

We suggest that rather than assigning clear responsibility, Appendix B appears instead to delineate responsibilities and inability to separate lines of authority. No agency would appear to have lead responsibility at all. For any phase of the process, there is no clear delineation between the mechanical function of receiving petitions and screening them for completeness, and the substantive function of providing input or critical review. Any number of "surface managers" could be involved with this substantive review function over an extended time period. This creates confusion. Then, once the partitioning, review, input, and hearing process is completed, the responsibility for the final decision is only shared in the entire decision being bucked up to "Headquarters" (43 CFR 3-20, section A.1.c.4.)

We agree with the Department's interest in applying all appropriate emergency sources of information during the review phase. However, as proposed, this system will not provide for a timely and effective review of the well-reasoned decision. Instead, the system is rife with potential conflicts, conflicting inputs and recommendations, and would be subject to challenges if the Department's stated intent to expedite land use decisions.

The uncertainty and procedural irregularities of the entire land use process are compounded by the lack of clarity and the above supplementary materials, as highlighted by the language appearing at 43 CFR 3-20, as follows:

After compilation of the land use plan, the Department will consider the plan for its potential impact on the consideration for leasing when warranted by new information without formally revising the plan.

There is no indicated mechanism on "safeguards whereby this right is to be exercised." It would be reasonable to assume of an intention to allow ad hoc, undelineated actions by the different bureaus, which could have a potentially similar effect to formal designation of lands unsuitable for mining.

No such authority should exist, or may exist consistent with the operative provisions of the relevant statutory authorities responsible for the land use planning and leasing process or the Secretary's stated intentions to implement the Program only with adequate public participation.

RECOMMENDATION:

We recommend that the procedural aspects of the unsuitability criteria application mechanics be substantially clarified. It should be clearly delineated from management activities such as resource use trade-offs, and all reference to extremes and intense criteria such as surface owner "preference" should be deleted entirely from this stage of the planning process.

There is, however, no statutory authority for such petitions, and they would have a devastating effect on the Program and national energy policy.

Only one of the many statutory authorities cited to support the proposed unsuitability criteria provides for such petitions. Specifically, 43 U.S.C. 3712(d)(1) authorizes the Secretary and the Secretary plan who is charged with reviewing and designating federal lands as unsuitable for oil or gas production under the Mineral Leasing Act. Under section 521(c), which applies to non-federal lands, this subsection authorizes the Secretary to designate the portion of federal lands as unsuitable. To introduce such a procedure would be to ignore the intent of the statute, the review and designation process, and the role of operators and land managers in a continuing state of uncertainty as to the permanence of the designation.

Even if such authority did exist, moreover, the result set forth in Subsection "A.2" would be inconsistent with the requirement of Subsection "A.1" in conflict with the intent of the federal coal lease review required by Subsection 521(b) of SMCRA. NM is no apply criteria resulting in the determination of lands as unsuitable for coal mining. The ultimate decision, assigning responsibility to ELM, is itself unconstitutional. The authority to designate lands as unsuitable for coal mining is delegated similar responsibility for such determinations with respect to non-coal mining, and (with subsequent decision by the Secretary) for oil and gas production (Subsection "A.5"), preparation of lease terms and conditions (Subsection "A.6"), preparation of lease terms and conditions (Subsection "A.7"), and consultation with qualified private surface owners (Subsection "A.8").

The memorandum is similarly confused in Subsection "E", dealing with "petitions for administrative functions".

In this Subsection, OSM and the U.S. Geological Survey ("USGS") are jointly delegated the function of determining whether a proposed use of federal surface over federal coal lands is appropriate. The right to determine is also given to USGS.

This is inconsistent with the responsibility assumed by the state directors of ELM under Instruction Memorandum No. 79-76. This IM specifically delegates to the state directors multiple resource trade-off processes, utilization of resources, and coordination with federal coal development (including, of course, issuance of leases). The authority to determine whether a proposed use is appropriate is given to USGS. This is particularly problematic in this sub-section since this a preferable (i.e. higher) use might be allowed, then the prior determination by the ELM and the coal leases itself becomes meaningless.

Finally, the directions contained in Memorandum 79-6 provide for the application of an environmental criterion which the Department has publicly maintained was deleted from this mechanism.

Step 8 of the Memorandum requires the determination that an area is unsuitable if the ELM officer receives "negative comments from the intended lessee of the concerned surface land owner" in this context, but application of a "determination of unsuitability" is not mentioned. This included as a specific criterion in previous drafts reviewed by the Department. See Final Report, Coal Test Force 2, Land Unsuitability Criteria, September 11, 1979, at 61.

Because of the unacceptably adverse results obtained during field testing of these earlier draft criteria, this specific element was eliminated. Now, however, compliance with Step 8 would effectively create an absolute surface owner veto over federal coal mining.

Moreover, since surface owner consent is no longer set forth as a specific criterion, no exception mechanism whatever would be available for relief from the application of this determination.

The DES notes in significant detail at 5-124 at best, the mechanism to achieve consequential to this, this criteria will not have access to the development of federal coal under surface estates in private ownership. We strongly believe that the ELM should be given the authority to make these arrangements. The lease selection patterns should be given by the land manager until the time the actual lease tract selection and offering, so as to encourage negotiation with surface owners as planning continues.

RECOMMENDATION:

We recommend that the procedural aspects of the unsuitability criteria application mechanics be substantially clarified. It should be clearly delineated from management activities such as resource use trade-offs, and all reference to extremes and intense criteria such as surface owner "preference" should be deleted entirely from this stage of the planning process.

Provision for petitions to designate federal lands unsuitable for mining should be deleted from the Program.

(3) Procedural Confusion - Exception Mechanism

Moreover, the crucial and ultimate scope of the criteria themselves is completely confused by virtue of the uncertainty as to what constitutes an "exception." In effect, the "exceptions" to the application of such criteria might be so broad as to render the criteria themselves virtually useless to contradict the criteria themselves. In other cases, the necessary finding that would enable the exception to be made would be so difficult to establish that it would be virtually impossible to implement (e.g., "it is impractical to remove the coal from the area because the potential for harm...can be minimized"; "is not necessary to prevent"; and "a significant adverse impact").

Literal application of the above quoted language would, in effect, require the party to receive a negative description of the absence of the stated adverse impacts. A conclusive determination to support or deny an exception would be impossible or, at the very least, subject to immediate legal challenge.

Further, we presently drafted the exceptions will likely be limited to the relatively few proposed developments. This is so because at the point in time when an unsuitability determination is made, the tracts before the agency for leasing by the party is likely to be so small that the effort and expense of demonstrating that an exception is warranted may well be impossible to make such a showing at that time.

Reference to the exception from the Migratory Bird criteria is instructive in this regard. Under the proposed "exception," leasing may be allowed:

Where the land management agency, after consultation with the Fish and Wildlife Service, determines that coal mining will not adversely impact the migratory birds during the period when such habitat is used by the species.

Assuming that neither the land management agency nor the Fish and Wildlife Service would be able to make such a showing and ignore this task must devolve upon parties interested in long-term leasing of the area. This would prove to be increasingly problematical.

In the first place, temporal limitations such as "during periods when such habitat is used" are meaningless in the context of an ongoing mining operation. It simply cannot seriously be argued

(B) Substantive Defects of Criteria

General Comments

Detailed comments with regard to several of the 24 individual substantive criteria are provided below. The first three states these criteria as they appear in the "Preferred Program," ranging from statutory mandates such as those found in SMCRA and the Surface Mining Control and Reclamation Act of 1976, to "as feasible" and "as practicable" standards such as those found in 33 U.S.C. § 1331 et seq., as amended, to such less definite references as "adequate," "de minimis," "proposed" and "proposed legislation."

From a substantive standpoint, the specific criteria appear uniformly to far exceed the letter or intent of the statutory provisions. The criteria are, in effect, standards which, where appropriate, designated to be unsuitable for coal surface mining operations.

More specifically, the Congressional direction on designating lands unsuitable for mining is contained in the Surface Mining Control and Reclamation Act of 1977, P.L. 95-87, 30 U.S.C. 1277(b), which states: "The Secretary shall, by regulation, promulgate the standards set forth in subsections (2) and (3) of section 522(a) of this title, for the designation of areas unsuitable for surface coal mining if 'reclamation is not feasible or is impractically expensive and uneconomically and environmentally feasible.'" Subsection 522(a)(3) directs that such areas "shall be incompatible with existing non-federal land use plans, or would affect fragile or historic lands...," affect "renewable resource lands" or be "natural hazard lands..." with certain prescribed results.

The operative terms "fragile or historic lands," "natural hazard lands," and "renewable resource lands" are central to an appropriate determination of the intended congressional scope of the authority to designate lands unsuitable for mining. These terms are defined in the SMCRA and the lands which are intended to be subject to protection pursuant to this statute. The Congressional intent of this particular direction is thus addressed to the character of land areas which are fragile or have special effects which coal surface mining operations might produce. The terms "fragile" and "natural hazard lands" are defined in SMCRA and see especially, comment to "Federal lands review" of "classifications of lands" under "power to regulate operations, in SMCRA Statement of Policy, 43 F.R. 37662 at 83, December 6, 1978.)

that a major mine should, or could, cause operations while even the rarest of birds fly by. Even if these were not the case, however, effective review of the availability of an area for coal mining would be dependent upon the location of coal resources in the subject area. However, under the Program proposed exceptions would be ruled upon before the area was identified as a coal resource and review required by PLAA or Section 322(d) of the SMCRA.

An interested party would thus be required either to go on extensive surveys to determine the location of the recoverable resources involved, or face the prospect of conducting an exploratory program for the area in question. Even then, however, determining the size and location of the area proposed for designation, its value in relation to a large number of other areas, will not be known until the overall area to be leased is identified.

In short, there is virtually no way that the interests of mineral development can be fairly represented under operation of the proposed program. It is thus necessary to provide a full and timely presentation of the data necessary to support such a ruling.

RECOMMENDATION

The process of defining and applying exceptions to otherwise applicable criteria should be clarified. As in the case of the SMCRA, general guidelines which are or could be determined to be subject to exceptions remain available for further consideration in the planning process.

By contrast, many of the criteria set forth in the preferred Program do not address such physical conditions or effects. They relate instead to a wide range of different environmental effects. They may relate to the prevention of environmental degradation, the prevention of undesirable impacts upon other values related to the land itself.

As a result, we seriously question whether the criteria as now proposed do not at least exceed and, in many respects, contravene the federal policy set by the Congress. This is particularly true in view of the fact that these criteria are not related directly to the condition of the land involved, and are not necessarily statutory.

With regard to Subsection 522(a)(3), SMCRA does not, itself, define the terms used to set forth the scope of the program for designating lands unsuitable for coal mining. The Congressional intent, however, is clearly evidenced by related previous legislation to avoid damage to the environment. The specific language of SMCRA above derives from and is a direct quotation from legislation introduced in the 95th Congress in 1977, S. 1133, "Surface Coal Mining and Reclamation." Specifically defined the operative language later adopted by Congress, "impractically expensive and uneconomically more narrow than would justify or support the criteria now proposed by the Department."

The "fragile or historic lands" were defined as those "where unique ecological or irreplaceable development...will result in irreversible damage to important historic, cultural, scientific, and aesthetic features and natural systems which are of note than local significance."

"Natural hazard lands" were defined as those where such development "could unreasonably endanger life or property..." "Renewable resource lands" were defined as those where such development would result in the loss or reduction of continued long-range production of timber, water, food, and fiber requirements of more than local concern."

As applied to determine the scope of Section 522, such definitions indicate a Congressional intent to create a degree of protection and control over land areas which is much more narrow in scope than this element of the preferred Program.

We support on principle the concept that irreconcilable conflict with specific, unique and higher resource values will render some land areas unsuitable for surface mining. We believe, however, that the most effective and sound public policy is best served if the application of such mechanism as the pre-lease test is limited to those circumstances where the lease of such specific land area could not, under any foreseeable circumstances, be reasonably expected to result in significant or irreparable damage, to unique or irreplaceable values or resources, or otherwise subject to specific statutory creation or limitation.

Under the Program now proposed, the issuance of a coal lease does not in and of itself create any right of development.

In all cases of doubt or where reasonably foreseeable changes in technology could enable development to occur, the lease should be able to be granted.

RECOMMENDATION:

Final or formal determination that a land area should not be leased, or even the possibility of the later issuance of a lease should be made available to the public through notices where no possibility of development consistent with other national policy is possible.

Moreover, our concern on this general point is not based merely on the above rationale, but supports the lands unsuitable mechanism as now proposed. We strongly suggest that other competing uses of federal lands may well depict its own unique and constrained nature and preserve its integrity as contemplated by its implementation. These criteria which involve protection by statute of lands which are not suitable for leasing, or other mechanisms implemented by other federal agencies, and which are not specifically mentioned in the bill, are by definition inflationary. The creation, maintenance and implementation of this added federal regulation may be necessary to adequately fit the particular needs of the values involved. Its discretionary inclusion in the Program is without justification from an economic or policy standpoint.

RECOMMENDATION:

These criteria within the jurisdictional responsibilities of federal agencies or bureaus other than BLM should be implemented by the agency or bureau which has the authority to do so.

All specific criteria are created in the BRR and Instruction Memorandum 79-76 as if incorporated under the authority designation program of Section 521 of the Surface Mining Act of 1977, if applicable.

In those few instances in which specific Congressional authority other than ENRCA is cited as support for a proposed criteria, the legislation, as cited, in fact discusses the use of such authority for exceed the purpose and intent of the statute itself.

For example, as drafted, the proposed migratory birds subsection of the proposed section 521 of the SMCRA at 3-10, would bar oil and mineral leasing as a surface land use when such federal lands are "high priority habitat for migratory birds, including those listed under the Endangered Species Act." The statutory authority cited for this criterion is the Migratory Bird Treaty Act of 1918 (16 U.S.C. §703 et seq.). This act, however, prohibits the actual or attempted pursuit, hunting, taking, killing or trapping of migratory birds protected by international treaty agreements. However, rather than a restriction against the use of federal lands, the proposed provision, by contrast, extends to the habitat of such fowl, and presumably would include plants and animals which are migratory song birds. We submit that this is a much broader level of protection of a much different kind than may be intended by the drafters. The intent and scope of this provision is left unclear through use of such indefinite language, such as "high priority habitat." The resulting criterion is thus subject to widely varying interpretations, and, thus, to potential abuses.

With respect to the specific criteria, we note the following:

1. **Federal Land Systems.** By statute, certain federal lands cannot be used for mineral development purposes because they are held for a particular legislative classification. ENRCA set forth several major subcategories.

However, criterion number "I" overstates this protection by including all lands.

First, even ENRCA acknowledged that valid existing rights to minerals on these lands should be recognized. Second, rather than being limited to the lands held for a particular purpose, mineral prohibition are allowed under ENRCA for any natural resources, including timber, water, and the Secretary of Agriculture. Finally, no authority or administrative power would appear to make any particular assessment of the lands to be incorporated in buffer zones* around these lands, or for extending this process to lands which are not currently being recommended for inclusion in the stated categories.

2. **Right-of-Way and easements.** There appears to be no need for a restriction. Federal lands which are in fee simple legal title may have existing easements on surface leases which have existing written restrictions on the use of the land as a mineral estate. In the absence of any such restrictions, departmental policy statements should not be allowed to limit the rights of lessees to lease upon any contested property rights involved.

3. **Buffer Zones Along Rights of Way and Adjacent to Roads.** There appears to be no need for a restriction. Federal lands which are in fee simple legal title may have existing easements on surface leases which have existing written restrictions on the use of the land as a mineral estate. In the absence of any such restrictions, departmental policy statements should not be allowed to limit the rights of lessees to lease upon any contested property rights involved.

4. **Wilderness Study Areas.** Although there is statutory basis for requiring a wilderness inventory, it is not clear that wilderness study areas from leasing, there is no basis for imposing a wilderness inventory criteria.

Further, the proposed criteria, as drafted, appears to require the interpretation that an existing EIS may be required for each lease in wilderness study areas possessing the characteristics of a wilderness study area. While other approaches may be contemplated for the criteria, the EIS requirement should clearly be made prospective only.

5. **Scenic Areas.** Although visual resources analysis may be a valid consideration when reviewing other uses of federal lands, it is not appropriate to introduce esthetic quantification as an independent basis for denial of mineral leases. Such a provision is not the stated statutory source for this provision of highly questionable validity. The proposed provision is also open to the argument that such a nebulous criterion is unworkable. Retention of this provision would lead to endless debate and delay in the leasing process.

6. **Lands Used for Scientific Studies.** As in the case of the proposed right-of-way provision, this proposed criterion is not supported by any statutory basis. It appears to be the management agency for scientific studies which has the authority to issue permits which convey that permission creates rights and would govern the restrictions on any alternative uses of the lands. Such a provision, if capable of implementation, would represent a valid approach to dealing with this issue without creating an additional basis for uneasiness.

7. **Naturalistic Lands and Sites.** Although all of the cited varieties of lands and sites are eligible for protection and preservation of areas of historic or archaeological value, there is no basis for a restriction on the mining of such areas. This restriction, however, extends only to those areas included in the National Register of Historic Places. The areas so targeted by recognition of valid existing rights to the mineral estate are not necessarily eligible for protection. We appear to have disregarded the provisions and limitations of the scope of this provision to include areas eligible for historic protection, as well as buffer zones around such areas.

We seriously question the wisdom, propriety or effect of this provision, and the manner in which it is made by the land manager of the BLM in the land use planning process.

8. **Natural Areas.** The obvious question raised by this provision is (1) what are "natural areas," and

(2) by what authority are they singled out for special departmental protection? The only source of illumination as to these inquiries are "Departmental

policy" -- unidentified -- and proposed legislation. The definition of Congressional districts, states, and the like are no subdivisions of the federal lands which is at issue.

Moreover, if any implication of Congressional districts, states, and the like is that the reclamation which has not been enacted, it would be that Congress did not intend the result expressed in the legislation. Until such time as the House and Senate can agree on a date for unenactability, rulings is premature and should be delayed.

9. Federally Listed Endangered Species. As previously noted, while the vast majority of these proposals the statutory authority for this criterion is quite clear. It is also clear that the criterion is not substantiated by interpretive court decisions that vegetation and habitat protection of plants and animals shall be provided from action of federal agency action. The destruction or adverse modification of habitat, however, is clearly prohibited by the terms of the lease on mining as a surface land use exception. This is true because of the available developing technology for mitigating the impact of mining on wildlife habitat; surface mining reclamation efforts can actually enhance habitat. Surface mining can be a preferable land use from this point of view.

10. State Listed Endangered Species. It is particularly inappropriate for federal land managers to attempt to apply a narrow and perhaps scientifically unsupportable method to determine which species are endangered species legislation. Such questions are particularly appropriate for state environmental agencies, and inappropriate as determinants of federal policy. For example, it is not unusual to find a particular species protected by one state while not being protected at the same species is subject to open hunting rules. As pointed out above, the use of state lists of species may well prove to be beneficial as a result of rationalization of habitat protection. The state species protection, would be on the basis of the surface user's ability to protect and enhance the subject wildlife habitat. This is a task which can be easily accomplished as a part of the permitting process and not, as suggested by the proposed program, long before tracts are considered for leasing.

- indicated that coal mining reclamation technology is capable of producing land which has negative value with regard to habitat preservation. This criterion, however, focuses solely upon protection of habitat from mining activities over the vast surface area involved in mineral development. It does not focus on habitat protection of the various species of migrating fowl which traverse the continental United States. The area of land which is fly-way habitat protection would need to be neither identified nor identifiable and yet a non-use criterion.
15. State Resident Fish and Wildlife. As noted regarding the expanded state endangered species criterion, inclusion of these types of considerations in federal legislation is not appropriate. To try to accommodate the various and varying state decisions on habitat protection, the states would be integrated into the federal planning process which is unnecessary and unnecessary there are legitimately no responsibilities or habitats which have not have been identified independently and isolated for specific protection. Thus, this separate criterion shall be unnecessary.
 - 16./17. Wetlands/Floodplains. These two criteria, taken together, represent the depths of detrimental interpretation from unwillingly existing interpretations. In the first place it must be recognized that the authority for wetland protection lies in Executive Orders which interpret authority granted under the various environmental laws. However, by ignoring these interpretations and applying the prohibitions with regard to land use decisions, the result will be that the authority for wetland protection will be diminished to that which is not reflected from the basic prohibition which is allowed.
 - 18./19. Municipal Watershed/National Resource Waters. While it is difficult to argue with the legitimate need for protection of water resources, the criteria, or of their importance as a "national resource" is equally difficult to interpret and apply in scope. Because of the absence of clear definition of protective intent, these criteria stand to undermine the intent of the proposed program and use planning decisions. It would seem more appropriate to use the word "protection" rather than as these on a more individualized basis rather than as a prohibition of national application.

11. Bald and Golden Eagle Nests. As with the research being done on habitat enhancement generally, this proposal is based on the premise that the objective research into and practical application of nest mitigation techniques and other techniques are widely and commonly used for rare bird surveys nests and, to a lesser extent, for bald eagles as well. This proposal is intended to provide for protection single nests. In view of these developments, the flat prohibition of protection of all bald eagle nesting of any such nests is an unnecessarily over-cautious restriction. Again, with most of the exceptions noted, without leasing, protection of bald eagle nesting areas is obtained. It is highly unlikely that the proposed criterion will be applied to the necessary technical showings for such a permit well in advance of the lease being selected. Therefore, as with other criteria, the criteria of the state agency appropriate to valid land use decisions should be made available to the public as soon as possible as part of a mine plan permit application.

12. Bald and Golden Eagle Nest and Concentration Areas. Protection of bald eagle nesting areas and areas of activity, if applied correctly, should not exclude unnecessarily broad areas from leasing consideration.

13. Falcon Cliff Nesting Sites. In view of the existing rules and regulations which are designed to protect birds considered to be endangered, i.e., the Part 101 Partrigine Falcon -- it seems unnecessary to carry out an additional rulemaking to provide for protection of these many species of falcons which exist in abundant numbers. This proposal is unnecessary and inappropriate. We do note that language from preliminary draft regulations referring to raptor nesting sites has been deleted. This is particularly important since it was because of the exceedingly broad category of birds which were included in the proposed rule which which extends to all species which grasp their food pectorally, i.e., all owls, hawks and vultures.

14. Migratory Birds. As previously noted in the interpretation section, it is not appropriate that this proposed criterion and the basic purpose of the underlying legislation be interpreted so broadly that protection involved here specifically protects birds and habitat as habitat as proposed herein. If habitat protection is in fact the intent of the draftmen, we have previously

20. State Lands Unusable. This proposal further exceeds the unwarranted use of buffer zones to banish certain uses of lands which are otherwise suitable for use. To the extent that such federal land protections are to be carried out, they should be on a site specific basis and the process for establishing such areas should be conducted on a site specific basis excluding federal lands from development eliminate.

21. State Proposed Criteria. This proposal has absolutely no authority in law. States inputs are not required by law. They are valuable decision-making items, but cannot have any compelling value in terms of federal action. Only the federal government has the authority to affect the use of lands in the public domain.

22./23./24. Prime Farm Lands/Alluvial Valley Floors/Reclaim- able Lands. This proposal is a clear violation of the Surface Mining Control and Reclamation Act and is explicitly covered by the Surface Mining Act, and no other existing statutory authority is applicable to the protection of prime farmlands. According to that Act there is no prohibition on using prime farmland surfaces and no provision of these classifications. The legislative history behind this Act makes clear that no restriction on prime farmland is intended. The primary thrust of the recent surface mining legislation was to provide for a more rational permitting and operating procedure to take into account these lands areas. These three criteria should be deleted as absolutely unnecessary along with the sole statutory authority which addresses these issues.

Moreover, SMCRA clearly provisions the delegation of determinations of technological and economic feasibility to the Office of Surface Mining. To require that such determinations be made to be made at the prelease stage is not required by SMCRA. The use of prime farmland surfaces has been demonstrated in recent years, especially since the introduction of new technologies resulting increased unit costs of energy, conditions of mining technology and market conditions determine the viability of prime farmland surfaces in this context. Changes in each such condition can necessitate a determination as to whether such a determination can and should be made at the time of mine plan submission and approval. This is a function of the Office of Surface Mining and SMCRA, and would constitute a determination whether or how to "condition...mineral entries."

The specific criteria should be redrawn as submitted.

As an alternative to the above recommendations, we have the following specific suggestion. Under all relevant constructions of the need for a mechanism to determine land unsuitability for leasing, the required result is only land unsuitable not in fact but rather in law. The early and clear application of specific criteria would lend a desirable degree of certainty to the balance of the land unsuitable program. This would also reduce the potential abuse of the system by persons who might seek to "game" the system for federal leasing as the principle element of unworkability contained in the proposed program is the lack of a clear process and the assured opportunity to challenge the decisions of the manager during the lease application process.

The adverse consequences of the program as now described would be greatly reduced if the formal effect of the initial application of whatever criteria might ultimately be adopted were otherwise than as now described.

-RECOMMENDATIONS-

The effect of application of a criterion for designating lands unsuitable for mining should, in the absence of statutory mandates to the contrary under SMCRA, be limited to creation of only a rebuttable presumption against leasing.

The BBS implicitly defends the policy set forth in the proposed Program by reference to the instruction by the President in his May 24th memorandum to the Secretary to lease "only those areas where mining is environmentally acceptable and compatible with other land uses." (emphasis supplied)

In fact, the test set forth by the President, and now adopted by the Secretary, that any development of a federal lease must be "compatible with other land uses" is a flat and direct violation of the policy set by the Congress in the Mining and Minerals Policy Act of 1970 and the Multiple Use Sustained Yield Act. It is a violation of the policy set forth in NEPA itself, which provides in relevant part:

"The Congress . . . declares that it is the continuing policy of the Federal Government . . . to use all practicable means and measures . . . to foster and promote the general welfare, to create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans . . .

It is the continuing responsibility of the Federal Government to...plan and coordinate Federal resources so that the Nation may...obtain the widest range of beneficial uses of the environment /and/ achieve a balance between population and resource use which will permit the healthiest of living and a wide sharing of America's amenities." Sections 101(e), (h), 42 U.S.C. 4331.

In this regard, the BSE as now drafted fails completely to address the adverse environmental, social and economic impacts of the Secretary's policy preference against federal coal leasing and in favor of all other federal resource development. The clear and obvious effect of this proposal is to delay the implementation of the BLM's long-term land use plan until after completion of the land use plan and the completion of the process of elimination from eligibility for leasing of all areas which are not "compatible with multiple uses." This will result in significant delays and assessed in any final environmental statement upon a program which produces this result.

Classification of land areas as unsuitable for mining would permanently and for all practical purposes irrevocably eliminate such areas from the then current leasing cycle. If, instead, the effect of such a determination were merely to postpone a substantive action against leasing that would be subject to later review during the activity planning process, some of the advantages of early identification of potential bidders and

6.1.1 Multiple Resources Has Trade-Offs

Elimination based on most multiple use values is expressly stated as an adjustment to be made to accomodate "unique, site specific resource values clearly superior to coal but not included in the unsuitability criteria. A prime recreation site or campground might be an example." (ibid.)

It would be difficult to imagine or describe a more systematic bias against the development of a single resource, coal. Implementation of the planning process as described simply cannot honestly be characterized as a coal management process. It is precisely the converse: a process whereby all other resources on federal lands will be managed and given priority over coal, even to the point of deliberately underdeveloping coal in the numerous prime reclamation sites on federal lands should control over developing a coal

With respect to this specific example, it might be noted that the multiple resource trade-off decisions will occur independent of and subsequent to the application of the specific criteria for designating land unsuitable for mining. Those criteria themselves exclude federal land systems traditionally associated with mineral uses. As a result, the affected areas will eliminate those areas as eligible to receive reversion excess not denoted by the Department or the Congress worthy of inclusion in one or more of the indicated land management systems.

environmental interests alike would be put on notice that the possibility exists either that the land will not be used or if it is used, that, if so desired, specific conditions might be established thereto. This would have the effect of focusing the attention of both the government and other interested parties upon the lands in question and insure that a final determination concerning all aspects of the planning process would be based upon the maximum possible data and information.

Adoption of such a mechanism would, in addition, significantly reduce the administrative and economic burden to the government that is represented by a requirement to evaluate each individual land parcels for the purpose of applying the lands unsuitable criteria. To the degree that the result of such a simplified screening process would be to identify the majority of the lands involved, the administrative formality and the underlying data base requirements could be significantly reduced. This would result in the feasibility of timely completion of the screening process and simultaneously and appropriately place the burden of the lands unsuitable criteria basis for final decision upon the private sector.

Such an approach would, finally, serve to ensure that a final determination of unsuitability occurs as a specific, well defined point in the administrative process. It would enable judicial or other challenges to the final decision to be made with the greatest efficiency, and minimise the possibility of protracted, redundant litigation.

- RECOMMENDATION -

Decisions made during the multiple resource use trade-off phase should create only rebuttable presumptions against leasing. Where no permit or grant of authority exists which would create an enforceable right to an absolutely incompatible land use, all land areas subject to resource trade-off should be allowed to continue to be reviewed for coal use.

(iv) Exclusion Based on Surface Owner Consent

Finally, the directions contained in Memorandum 79-6 provide for defacto application of an exclusionary criterion which the Department has publicly maintained was deleted from that mechanism.

Step 8 of the Program requires the determination that there is no reasonable chance the BLM officer receives "negative comment from the surface land owner." There is no indication of the intended meaning of the term "negative comment." The cost of conducting a determination of a determination such as required by this step was fully justified by the potential environmental impacts reviewed by the Department. See, Final Report, Coal Task Force 2, Land Usability Criteria, September 11, 1985, at 61.

The DOE notes an significant detail in 8-13a, at sec. the above results obtained during field testing of the earlier draft criteria and the scope of the impact which this criterion would have on the use of the land. The use of the criteria would result in a cessation of federal coal production on lands in private ownership. As a result of these negative findings, this criterion was deleted from the final version of the draft. Step 8 would effectively create an absolute surface owner veto over federal coal mining.

Moreover, since surface owner consent is an option set forth as an alternative to an exception mechanism, wherever would be available for relief from the application of this determination.

We strongly suggest that consideration of surface owner-surface owner consent be given by the land manager until the final action draft criteria are issued. This would, so as to encourage negotiation with surface owners, as planning continues.

-RECOMMENDATION-

All reference to extraneous and informal criteria such as surface owner "preference" should be deleted entirely from this stage of the planning process.

The entire activity planning process is thus controlled by a direct function of the setting of "production targets" which will be set and used by the Department to decide how much coal should be made available in any given lease offering.

Both the manner of intended application of regional production targets and the timing of their use presents production difficulties.

(a) Use of Targets

We seriously question the utility of regional production targets as determinants of the levels of future coal leasing.

Under the Department of Energy Authorization Act, the DOE is directed to develop proposed national energy production goals and production targets based upon the recommendations provided by the DOI or developed by DOE, as adjusted for changes in applicable laws and regulations, technology or recovery methods.

The proposed Program would convert these goals, as further modified by the Secretary, into specific production quantities and timing for each federal coal leasing and production requirements will be served.

In fact, however, the impression of accuracy and reliability conveyed by the DES description of the regional production target setting process is seriously misleading. Coal markets are highly volatile and subject to significant change over relatively brief periods of time. Long term trends are difficult to predict. Moreover, the most recent available data regarding potential production from existing federal leases indicates that planned production levels are known to be in general unreliable. New and uncertain reliability.

The market condition in the coal industry is, for instance, depressed at this time. Some mines have been closed, and the opening of others significantly delayed due to the absence of assured markets for future production. Data on coal production released recently by the National Coal Association in many respects no longer accurately reflect the actual conditions of major production activity previously planned.

B. ACTIVITY PLANNING PROCESS (DES, PAGE 3-4)

As now described, the "activity planning" for each federal resource in the planning area would follow completion of the land use plan itself.

"Regional production targets" would be set for coal. Preliminary tracts would be identified, ranked and schematized for referring, and regional lists prepared.

In this process, industry would be invited to submit requests for participation in the activity planning. After these "preliminary tracts" have been determined, the potential environmental impacts related to each tract would be reviewed.

The sole discussion of the possible adverse consequences as follows:

"This component, to incompatible with the industry indication of need alternative which will be developed for each tract in the question of leasing levels. Similarly it is incompatible with the lease to meet DOE production goals. This will be the development of leasing levels alternatives which rely on DOE and industry input to determine the appropriate levels of development." (DES, at 3-33, 34.)

In fact, however, each element of the Program causes difficulties.

(1) Regional Production Targets

The leasing areas of the country have been divided into twelve primary regions, eight of which contain significant federal coal reserves. Under the Program, these resources would be managed largely as a separate coal production unit.

National coal production targets would be set annually by the Department of Energy, pursuant to the NCA Act and subject to modification by the DOI. The number of leases to be issued and the amount of coal to be leased and the proposed timing of their sale would be determined by the departmental target and the target established for the region involved by the Department.

Estimates of production from other federal leases for which no plans have been prepared are even more speculative. Demand-based modeling such as is currently used within both the government and the private sector is in part based on the assumption that the magnitude of the effects thereof of such variables as supply, demand, and price on the market and the contribution of competing domestic energy resources and past and future aspects of market changes in the governmental control of the market, production, transportation and consumption of coal.

The number and relative significance of the variables involved preclude any single decisionmaking entity from being able to assess future levels of production and use with any degree of certainty. This is particularly true in the implementation of the Program. In this past this has been approached by the Department of Energy and the federal government to model the private sector of the economy. Serious problems have already been identified with the models used by the Department and the instances which would disaggregate supply and demand and seek to estimate future market conditions are more difficult.

The nature of the coal industry, the markets and the extraordinary volatilities to which it is subject produce a demand-supply situation of such complexity that the use of standard economic modeling techniques cannot approximate future realities.

The consequences of the DOI reaching too high a regional production target would merely be that too many leases might be offered or issued. As noted above, existing regional production targets would probably result adverse effects of such a result, and competition would be increased.

The Program, however, contemplates only production of targets below DOE recommended levels. The Secretary rejected all options that would tend toward higher target ranges. (DES, at 3-34, 35.)

Moreover, as now described, in the event that the federal leases target applicable to a particular region exceeds the production capacity of the highest priority federal tracts, the regional production targets itself could be re-evaluated and modified. (DES, at 3-4.)

The consequences of error on the low side in reaching target levels would be significantly worse from a developmental perspective than from a financial perspective. Serious disruptions of all planning would occur in corrective efforts. Anticipative and inflationary market pressures would also threaten energy goal achievement jeopardized.

Neither of these facts or consequences are adequately discussed in the DES.

Where settled national policy establishes the clear need for an enhanced utilization of domestic energy resources to fulfill the nation's future needs, such future demand will be reflected in the leasing process. The specific decision criteria in the Program should not operate as the actual determinant of specific levels to be reached for federal coal production. Such a criterion for such purposes is neither required by applicable law nor is it rational or justifiable in light of our domestic energy needs.

There is only one entirely accurate indicator, as any assessment in time, from which a specific need for increased federal leasing levels can validly be inferred by the Secretary. This indicator is the number of willing potential lessees. If there is no such willing application for a federal lease, moral justification of supply and demand does not result in the issuance of a single new federal lease.

By contrast, if there is such a willing potential lessee, and a policy to encourage increased or accelerated utilization of domestic energy resources remains a national priority, then the inference of a valid argument against the issuance of the lease.

This theoretical argument in fact reflects the current market situation with respect to federal leases. Recent reports by the Department of Justice and the Federal Trade Commission indicate that the recent sharp rise of demand for new federal leases and the adverse effect on prices of specific leases have removed market entry possibilities within the industry with the current leasing moratorium has produced.

We see no reason why the proposed Program should provide that the Secretary may set or adjust regional production targets, or prohibit such production between the regional and local levels. Such a provision would potential leases of the opportunity to develop federal coal for which there is no market demand. It would also impose arbitrary limitations upon leasing under the present

circumstances would have the inevitable inflationary effect of sustaining a high market price in a tight supply demand market and tend to inhibit enhanced competition in the market place.

Either result would be in direct contravention of clear national policy. Under the current system of environmental protection and controls, and in light of existing federal, state and local laws, the environmental and socio-economic consequences of development, no valid public policy justification for restraints upon the level of renewed coal leasing could appear to exist.

-RECOMMENDATION-

We recommend that specific target levels not be set as determinants of federal coal leasing. The determination of production levels should be made by the federal government be viewed only as the ultimate outcome of the production demand. Appropriate levels of reserved future coal leasing should be chosen determined by the characteristics of potential lessees and the levels of production represented by such proposed leases. Such decisions should be the prerogative of interest by industry, state and local governments.

We emphasize that in making this recommendation we do not suggest that the Department adopt a program such as is described in the Draft Environmental Assessment known as DRAFT II. As described in the DES, such a system would be highly problematical. The government would be less desirable and appropriate. Adoption of a system such as DRAFT II would be a violation of the federal government's clear responsibility to exercise discretion with respect to leasing.

As proposed by NCA, however, the determination by the Department of the existence, warrant and geographical location of specific areas of federal lands where developers would be a major but not necessarily unique starting point for the analysis and balancing stage is acceptable. Additional areas of leases. All other appropriate review, analysis and balancing stage could still be conducted. A system such as DRAFT II has been adopted which would simultaneously both establish the preconditions for federal leases and active more effectively to focus available federal attention and resources upon specific areas or regions.

(b) Timing of Setting Targets

serious problems are presented also by virtue of the fact that the assignment of regional production targets occurs under the Program only after the completion of the land use planning process. This is directly contrary to the planning process. As a result, there is no opportunity for the Secretary to take into account the actual quantities of coal which will be required to be produced from the lands identified as suitable for coal development. In the ranking process whereby lands might be declared unsuitable for coal development, the Secretary will be faced with the task of committing federal lands to other uses inconsistent with coal development; no coal value of the lands involved will be realized. The loss of value of the lands involved in such lands for coal development can therefore occur.

Moreover, the DES does not discuss the adverse impacts that will result from the completion of the ranking process prior to the initiation of the planning process. The application of the statutorily mandated principle of "multiple use" to the ranking process will result in the Regional Production Targets," merely replace the manner in which the lands are used.

It further notes only that they would be used by federal and state governments "as at the earliest opportunity and planning process" to ensure that an adequate number of contracts would be delineated and that adequate site specific information would be available. The DES states, "The ranking and selection process workable" but immediately adds, "They would be flexible...with the final target set as a result of the results of the ranking process in the ranking and selection process." (DES, at 3-23.)

-RECOMMENDATION-

Any production targets to be used by the land manager at any time in the planning process must be identified and referenced to a specific Region as well as to the specific area(s) of the leasing process which assesses values or assigns priorities to or among competing resources uses.

(c) Tract Selection and Ranking

Although NCA separately tracked in Chapter 3 of the DES, production tract selection and ranking of tracts and the ranking of those tracts in a subsequent lease offering has been addressed by the Secretary and preliminary findings have been issued in the Preliminary Report of Delimitation, July 17, 1978, Issue B-2 and Item 3-B.

Under this element of the Program, industry interest would for the first time be formally solicited. This will occur through the preparation of a lease proposal which will be winnowed down by (1) land use planning for all other requirements of the extraction and (2) by deletion those "unattractive" for mining.

Of remaining areas, industry will be allowed to indicate which are the "best" leasing tracts, but not proposed lease boundaries. The Secretary will then rank the areas in unknown fashion upon the amount of coal "needed", the public body elected to make the extraction decisions, any veto authority given to the state, the opinion of Attorney General upon anticompetitive results, etc.

The "ranking" of these areas will, after completion of both the ranking and the lease proposal, be the delimitation of the lands unsuitable criteria would appear constitute one last procedural step would be the preparation of a lease proposal for extraction and leasing based on "State desires, reclaimability, coal economics, etc." Moreover, Departmental regulations will be developed to implement this ranking. Planning is now well advanced, even this limited opportunity to propose a lease proposal for the first time, the DES will in fact be re-reviewed according to the new "suitability" criteria.

Moreover, each of the indicated elements that go to "ranking" will appear to be the province of other bureaus or other procedures than NCA's leasing process (e.g., "reclaimability" will be prepared by a different agency than USDI and GSA, at the earliest, in plan submission).

Concessions by DOI that "sealing" may only be possible at the area level instead of the smaller tract unit based upon data in the lease proposal will be a problem. The Program in the real world already notes through these concessions, not nearly as well known about all the details of the lease proposal as the Secretary is believed to have been made, much less "ranking" in the detail here proposed.

-RECOMMENDATION-

"Ranking" mechanics should be substantially clarified, and opportunities for industry to determine lease boundaries provided earlier in the Program.

C. OTHER COMPONENTS OF THE PREFERRED PROGRAM

In addition to the above mentioned concerns regarding the land use policy of the Department, the processes described in the DES, we believe there are several other elements of the preferred Program which would be unacceptably difficult to implement. These include the Secretary's determination to resume federal coal leasing. These issues are discussed below. In addition, there are the contents of a proposed lease under the federal program, the manner by which lease sales might be conducted eventually, the potential impact of the environmental screening and management processes to be applied to existing leases and preference right lease applications (PRLAs).

Not all of these issues are of equal importance or would have equally adverse effects upon the success of the proposed Program. Therefore, they are addressed in the order in which the specific questions arise in the DES.

Finally, we note the effect of the Program upon the applicability of NEPA to coal leasing.

- (1) **Split Estate Leasing and Surface Owner Consent.** The respective rights and responsibilities of the federal government and the surface owner where a federal coal lease has been retained in government ownership after alienation of the overlying surface has been one of the most contentious issues in the debate over federal coal leasing in recent years. It resulted in the enactment of Section 106 of the DES, which provides that no federal coal lease shall be issued for surface mining unless the surface owner, if qualified, has consented thereto. This clause is intended to protect the rights of the people who have, for at least three years prior to the proposal of a lease, resided on or had a significant interest in the land surface, and have either had their principle place of residence or personally conducted or received significant income from farming or ranching activities on the land.

As described in the DES, the preferred Program would extend the protection of the Act to qualified surface owners. Realize that other surface owners might be entitled to protection under the Act, but the legislation utilizes regulations to be issued under the Mineral Lands Act to police the actual form and content of surface owner consent.

If incorrect bidding were to be utilized, the effect of such a transaction could be seriously to reduce the capital available for the bid, and thus the lease value. It is also possible that some federal coal leases might be lost or federal coal bypassed due to incorrect bidding if a potential bidder can compete on an incorrect basis with another potential bidder not so financially constrained.

By the same token, requiring that the consent be transferable or the original coal could operate immediately where a lease is in good faith obtained a consent at some time in the past and the market value of the coal will increase as a result of market conditions. In such case, the lessee could then submit a bid for the lease at the same site at a price significantly less than the market value and thus lose the coal involved and the true value of the original consent as well.

RECOMMENDATION:

Provisions for transferability of a consent should be modified so as to provide for transference only if the lessee submits a bid reflecting the fair market value of the consent at the time of transfer.

(2) **Lease Stipulations.**

As described in the DES at page 3-25, the Department would propose to include environmental stipulations for each proposed lease sale. The Secretary expressed the desire to express a preference that the Department reserve the right to add additional lease terms and conditions as further information and circumstances become available. (DES Table 3-3, at page 3-32.)

There would appear to be no statutory authority whereby the terms and conditions of a lease as originally issued could be subject to the unilateral imposition of additional requirements or terms other than those of the original amending statute.

In addition, there would appear to be no need for the reservation of such authority, either in the regulations or at matter of contract between the Department and the lessee. The degree of specificity of the environmental information might delineate the need for the formulation of such requirements. The Secretary's proposal of such requirements may most effectively be reviewed and evaluated through the mechanism of the approval of the mine plan.

fails to distinguish between private surface owned by a coal company, which would not be eligible for protection under the Act, and private surface owned by DMSA, and private surface owned by a qualified owner.

No preferences should be set for federal surface ownership lands over those lands in which a coal company had purchased outright the surface estate. To establish such a preference would be discriminatory. It would encourage those companies which have prudently continued to attempt to purchase outright the surface estate during the leasing of mineral rights to retain the rights to the surface and resume federal coal leasing. In such cases, such conduct would be contrary to the intent of the Act to efficiently and quickly to develop the federal coal resources involved. As such, the Act should be established and an adequate return to the government should go public interest is served by creation of a bias against the issuance of such a lease.

RECOMMENDATION:

No preference for federal over company surface ownership should be included in the Program.

Other discussion in the DES of each of these issues is confusing. As we understand the preferred Program, the above mentioned review and Secretarial constraints would apply only where a qualified private surface owner is involved.

In such circumstances, the form and content of the consent would be reviewed and no lease sale would be conducted unless by its terms the consent were transferable. The transfer provisions of the lease would then be considered "transferable" only if it provides for payment or receipt of amounts appropriate, in the amount of the purchase price of the consent.

We question whether this provision might be subject to abuse. On the one hand, a market could develop whereby surface owner consent would be granted at artificially inflated prices. For the sole purpose of subsequent bidding at an inflated price, a bidder might negotiate to acquire the coal involved to complete a logical mining unit.

The stated purpose of this review would be twofold; to insure that the financial considerations involved in the consent are fair to the lessee and to insure that the market value of the lease, so that a fair market return is received by the government. In this regard, to insure that the competitive nature of a potential lease offering is not jeopardized by the existence of such consent.

In this regard, the DOI assumes that where a surface owner consents to a lease or leases his or her land to someone other than the owner or grantee would bid on it. In such cases, the Secretary would be prepared to explicitly disallow discretion not to conduct the lease offering.

We strongly disagree with this inference that the existence of a surface owner consent precludes a competitive lease sale. We believe that the question of the existence of such a question is irrelevant to the question of competitive status in the real world.

RECOMMENDATION:

Where a consent has been issued, the Department should infer only interest in the tract, and encourage development by offering such area for a lease.

In addition, the decision documents we have reviewed indicate that additional lease terms may be imposed in the DES. On June 30, 1978, the Secretary reported to the Department to have expressed a preference that lease terms be imposed for federal coal first, state second, federal surface first, coal company owned surface second, and private surface third. See "Secretary of Interior's Preferred Alternatives," July 18, 1978, at p. 9.

The DES does not appear specifically to address the decision by the Secretary to rank potential leases so that federal surface would be preferred to "coal company owned surface." The DES does state that federal surface would be accorded tracts where the surface is federally owned and the lease is for federal coal first, state second, ownership (other factors being nearly equal). We respectfully submit that this language does not adequately describe the preference expressed by the Secretary. It

-RECOMMENDATION-

The Program should provide that changes required for changed conditions should be provided for in the mine plan, and at the time of approval thereof.

(3) **Fair Market Value.**

In addition to economic reservation as to the validity of the use in all cases of discounted cash flow analyses to evaluate the fair market value of coal reserves as proposed in the preferred Program, it would require the preparation of a complete zero sum financial statement prior to the issuance of a lease. This would take into account under which a property might be developed could change drastically between the time of the financial statement and actual development. In addition, previous experience with discount cash flow analysis has produced significant variations in results between the calculations by Departmental officers and those of the producers, and widely different bids on proposed leases involving substantially similar quality and quantities of coal.

-RECOMMENDATION-

The discounted cash flow analysis should be set forth as one method only whereby fair market value might be established, and explicit recognition should be made of the fact that other methods of calculating the same may be used at the request of a potential lessee.

(4) **Maximum Economic Recovery.**

Of all the specific decisions potentially reached by the Department, the most important is that each lease by its terms identify and require the "maximum economic recovery" of the coal within the proposed leasing tract. This is discussed in detail at page 3-41, without elaboration or explanation.

As so described, this element of the preferred Program would be impossible to implement. It would assume that the Department would be able to determine what lease boundaries are needed to insure the quantity and quality of all coal reserves in the lease, but also the actual market price which would be paid for such coal by the lessee. As adopted by the Secretary, each lease would require the mining of all coal areas which are collectively profitable. (MIS at 3-41; Table 3-41 at 3-42.)

The PLCAA separately provides in Section 3 (now Subsection 3(1)(C)) that before issuing a lease, the Secretary

"shall evaluate and compare the effects of recovering coal by deep mining, by surface mining, or by other methods, and shall determine which method or methods or sequence of methods will result in the maximum recovery of the coal within the proposed leasing tract." This evaluation and comparison by the Secretary can be done only after the lease has been issued. The issuance of a lease, however, is binding upon the lessee to commence mining as soon as possible to achieve the maximum economic recovery of the coal within the tract." (emphasis supplied)

By this provision of the PLCAA, Congress created two distinct mechanisms relating to "maximum economic recovery."

The first, and the only such mechanism applicable to the term of the lease, is the legally defined requirement for the accurate determination of which and by what sequence of methods the coal within the lease boundaries will be extracted to extract the maximum amount of the federal coal resource involved in the lease. This will clearly narrow the boundaries of the proposed lease, and the absence of such a finding "shall not prohibit" leases issuance.

The second and clearly distinct mechanism relates only to the approval of a plan of operation. In this context, it refers to the time of the long-term lease, and the provision in Departmental regulations that, in the approved plans, the operator will be required to submit a plan so that the federal coal resources are not left in the ground as a result of "highgrading" the deposit so as to extract only the lower cost coal.

In the proposed Program, the Department blurs all distinctions between these two concepts by allowing the lease boundaries and requirements will be the required maximum economic recovery. The Department ignores the separate and distinct nature of the two concepts of the above statutory provisions: the division of land into lease tracts, and the determination of the best methods to recover and minimize the bypassing of federal coal; the determination as to which mining method will maximize the recovery of coal within the lease boundaries, and the traditional application of discretion in the mine plan issuance process to determine the maximum recovery of specific coal areas based upon the economic conditions existing at the time of mining.

This element of the program has been adopted in ignorance of the fact that coal is mined and sold. It is not possible, in many cases even during the operation of a mine, to determine with specificity the price which any given area of coal will bring. Consequently, where multiple seams are involved, multiple contracts will be executed over the life of the lease, and the prices will fluctuate which reflect the actual cost of the mining of the specific coal involved in each contract. "Collective" profitability, absolutely no way to determine "collective" profitability.

Of perhaps greater importance, from a philosophical standpoint, is the fact that the Secretary amounts to direct federal control over the level of profits which a company developing a coal lease will be able to make. This would give the Secretary the power to direct control over the price at which the coal will be sold, and represents an impossible task for the Secretary to accomplish on this segment of the energy industry. Such a requirement is neither required nor supported by statutory authority.

The concept of maximum economic recovery as now proposed is derived from the Congressional intent by establishing such a concept, and the manner in which the Congress intended that the goal which it did articulate would be implemented.

In the PLCAA Congress made two important distinctions, which must be recognized and should be distinguished in the Program.

First, the PLCAA provides in Section 3 that in subdividing coal lands, the Secretary shall do so in such manner as the size of such tracts so as to "permit the mining of all coal which can be economically extracted in such tract."

The clear intent of this language is to ensure that tract boundaries are not set at levels which would be required to assure maximum economic recovery taking into account federal and non-federal coal which may be involved.

The Congress clearly did not intend the result that would occur under the Department's proposal. Indeed, the legislative history indicates a Congressional intent that the appropriate methods to produce coal otherwise unprofitable to mine, by means of a reduction of the other costs of production, be determined by the Mineral Leasing Act of 1920, which was not amended by the PLCAA. The PLCAA does not permit the Secretary to exceed as extending even to a case in which the Secretary might lower a royalty, even if the mining of the coal would be unprofitable for the purpose of encouraging the greatest possible recovery of coal." See, Correspondence of Sen. H. P. Ellsworth, Congressmen Mink, June 21, 1978 to the President, KUTR.

As now proposed, provision for determining and requiring maximum economic recovery as defined by the Department would be impossible to implement. Unreasonable to require and in excess of the reasonable interpretation of the term as employed by the Congress.

-RECOMMENDATION-

Requirements for provision in the lease for a determination of maximum economic recovery should be deleted from the Program.

(5) **Sale and Bidding Methods (MIS at 3-25).**

The preferred Program would contemplate the use of intertract bidding to supplement the individual lease bidding system of offering. Although not aesthetically described, we understand the concept of intertract bidding to mean that bids would be publicly employed by the Department on an apertorial basis in connection with the sale of the federal coal resources. As so employed, it would involve the awarding of leases based upon a comparison of the value of the coal areas involved by all bidders in different tracts.

As so understood, we seriously question whether this mechanism could be successfully employed. It would require a greater knowledge than the Department is known to possess concerning the other federal coal resources which would be contained in each of the tracts involved.

Moreover, coal lease offerings are significantly different from oil lease offerings in that the physical and chemical characteristics of coal may differ greatly between and among tracts and even within a single tract. In contrast, oil leases are usually homogeneous and would commonly involve the tapping of the same geologic oil reserves.

The Secretarial decision documents indicate that some adjustment might be allowed in comparing the per ton value of bids submitted in an intertract competition based on environmental and chemical qualities of the different coal involved. This would, however, be adequate to compare validly the respective bids, taking into account the cost of mining and delivery of production, including environmental and transportation costs, and production costs of the coal, but which would not be adequately accounted for in the calculation of the per ton value. As a result, application of the bidding rules would not be affected by the fact involved between or among tracts would have the effect of allowing bids for coal of greater value than lower cost coal, or greater rather than lesser degrees of environmental risk.

RECOMMENDATION:

Provision for intertract competitive bidding should be deleted from the Program.

- (4) **Special Leasing Opportunities.** (OES, at page 3-27) The Secretary has the authority to issue special leases set aside lease offerings to encourage the formation and entry into the coal production market of small business entities. The example requirements described in Appendix A (Sections 3429.1-4(a)(3) and 3472.2-2(e)) provide a general framework for this authority. The Secretary will further understand the Department to intend by this provision that the Secretary may issue special leases as forth in the Small Business Act, 15 U.S.C. et seq. unless that the federal government should attempt to ensure that "a fair and reasonable price" is paid for the use of government property" be made to small enterprises.

First, this question is now raised for the first time by the OES. It does not appear to have been the subject of any Secretarial decision document or process. (See, "Initial Assessment of Options," July 1, 1976, and "Options, Secretary's Preference," Table 3-1, at DES 1-33 & ESAL.)

In any federal leasing program, Section 1 of the PCLAA amended Section 2(a) of the Mineral Leasing Act, 30 U.S.C. 201(a), and requires in relevant part that

No less than 50 per centum of the total acreage offered for lease by the Secretary in any one year shall be leased under a system of deferred payment.

This explicit provision for "deferred bonus" bidding was contained in the bill introduced by the Congress to be an accommodation of concern over existing smaller entities to enter the relevant market or compete with those entities. It was supported by Senator Metcalf, the principle sponsor of S. 391 in his remarks upon the introduction of the bill, as follows:

"S. 391 would foster competition in the bidding for leases by requiring that 50 percent of all acreage leased in any one year be under a system of deferred payment which would allow a sort of installment plan for paying the bonus, thus reducing the front-end capital outlay necessary for entry into the market and corporations to compete with the giants...."

/Sures provision/ will guarantee against the possibility of a bidding war. It will also help to keep in mind the disadvantageous positions in which smaller companies will find themselves. A diversified group of independent smaller entities would fester, is certainly in the public interest." (See, "Initial Assessment," July 1, 1976, as reproduced in Senate Public-Works Committee, Federal Coal Leasing Policies and Regulations, with Hearings, Part I, "A" & GF Correspondence, Senator Metcalf and Congressman Mintz to the President, June 24, 1976, *ibid.* at 123.)

RECOMMENDATION:

Special leasing opportunities for small business entities may be contained in the Program as finally presented to the Secretary for decision.

We note again that the above quoted Example Regulations are specifically stated in the DES to be put forth for illustrative purposes only, which is reflected in the title of the document. They do not constitute a statement of Secretarial decision-making.

A DES or final EIS under NEPA does not itself constitute a formal proposal for federal action. Under NEPA and guiding principles of federal judicial determinations, any proposal for federal action must be presented to consider the consequences and alternatives of that particular proposal. Since this element of the Program would not appear to be a formal proposal, its disclosure for discussion at this time is inappropriate.

This is particularly important since the origin and respective arguments for and against this proposal have not been publicly disclosed. As a result, of course, it follows that the Secretary would not be able to present any of the consequences or alternatives of that particular proposal. It would be appropriate, however, to discuss in the final EIS what would have already disclosed to sufficient public comment under NEPA, as applied to the Department in *Hughes v. Hughes*, *supra*.

Even if this were not the case, and without any insight into the decision-making process within the Department on this issue, it would appear that the concepts of "fair market value" and "maximum economic recovery," however defined, would be violated if the government, would necessarily require preferential and thus discriminatory treatment of small business entities. This would clearly contravene the intent of the Secretary as expressed in his decision with respect to public body leases, *supra*, Decision of June 20, 1976, decision at DES 1-33 (see, *ibid.*).

However, we do not agree with the apparent assumption by the Department that the issuance of a federal coal lease constitutes a "sale" of government property within the meaning of the Small Business Act. The issuance of a right to develop federal coal, and treatment of the legal consequences of such issuance as a "sale" would violate the intent of the Small Business Act as to its subsequent power to control, adjust or amend the terms and conditions under which development may occur.

Finally, and of perhaps greatest importance, the program also provides for the first time by the DES is necessary because of the unique nature of the specific provisions of the PCLAA expressly designed by Congress to ensure appropriate participation by small entities

(7) Management of Existing Leases and Preference Right Lease Applications

The Department would not propose to apply new criteria to determine the "suitability" of leases development to existing non-producing leases, and to preference right lease applications (PRAs).

Decision on the "suitability" for the development of a lease, including the cancellation of existing leases, not be made until the time of submission of a mining plan. July 1, 1978, *supra*, section 3-11.

This represents a major advance beyond previous Secretarial approaches. The extensive new "suitability" criteria will be developed in the context of the Program whereby new leases would be issued. It would reflect more social, economic and environmental constraints to the extent possible.

PRAs and leases are considered "valid existing rights," the cancellation or major restriction of which would arguably be a right which entitles the holder to compensation. The Department would propose legislation to implement the new leases which would broaden the scope of protection against existing rights.

The issues involved in the element of the Program is subject at this time to pending litigation to the degree that the Program could anticipate the outcome of this litigation. It is anticipated that the litigation would be decided.

Moreover, this policy would be particularly undesirable with respect to existing leases. It would encourage the lessees to undertake the lengthy and costly process to challenge the new leases. After such investment of time and effort would the Department seek to apply the new criteria.

RECOMMENDATION:

The Program should contain no provisions with respect to the imposition of constraints upon the valid existing rights represented by existing leases and preference right lease applications.

Applicability of NEPA Requirements to Leasing

We understand the policy of the Department to be to seek to implement the environmental impact statement of NEPA in the total manner and scope of environmental impact statements prepared with respect to federal coal leasing. We believe that it would be appropriate for the Department to be implementing a policy whereby a preexisting EIS may be utilized upon the issuance of the lease if it is determined that the need for or scope of the statement of environmental analysis required by the plan has been met.

The overall intent of the Program as described in the DES is to reduce significantly the rights and privileges which would be afforded to future lessees. The DES approach to environmental impact statements and EIS's would give the lessee or right holder the opportunity to develop the information necessary for the approval of the lease. It must be obtained for all developments the approval of which could reasonably be construed to constitute a "major Federal action." This is consistent with the guidelines and regulations of the CIN and the Department.

Section 701(d) of SMCRA does not exempt approval under Sections 503 and 523 of a reclamation plan for operations on federal lands from the environmental impact statement requirements of NEPA.

As a result, we now suggest that the mechanism which would be created by the Program eliminates the need for an environmental impact statement upon a specific lease offering.

With respect to the new Program, the DES and the subsequent final administrative rulemaking will be subject to review under NEPA and by Order of the Court in *Hughes v. Hughes*, supra. The environmental and other considerations will be analyzed in the context of the lease, not on a specific, identified geographical area, and the coal and other resources contained therein. The regional EIS's would treat the impacts of coal lease issuance within and among the areas covered by the EIS. The regional EIS's treatment with respect to all geographic areas in which leases are issued will be determined by the time that subsequent leasing was contemplated in areas not so treated, new regional EIS treatment or supplements would be developed.

Thus, the mechanism of the programmatic EIS and the regional EIS's fulfill completely the requirements of NEPA applicable to a lease offering.

For economy and efficiency, the letter and spirit of NEPA should not be altered if an environmental impact statement were not to be required on a lease offering, but the requirements of NEPA fulfilled by preparing a preexisting EIS or by conducting an environmental analysis in lieu thereof at the time of mine plan approval.

-RECOMMENDATION-

The Program should expressly include and provide a Departmental undertaking that EIS's under NEPA will not normally be performed upon a lease offering.

CONCLUSION

The preferred Program represents an unprecedented degree of management and control at the Departmental level over federal coal lands. The specific elements of the Program are unacceptable. If implemented, we believe it would be a violation of NEPA and would not be successful in achieving in timely or responsible fashion any realistic goal of resumed federal coal leasing.

The unworkable aspects of the Program appear in virtually all its major components and are the result of the position of the Department. They are not mandated by external constraints of law or national policy. As a result, the Program must be rejected. It must be replaced by adoption by the Department of a land management policy which is systematic, timely, and responsible.

We do not believe that this result is consistent with the interests of the President, the public interest or the national policies established by the Congress in relevant legislation.

We urge the Department to reconsider and amend the preferred Program to make it timely and responsible for the timely and environmentally sound development of the vital domestic energy resources represented by unleased federal coal lands.

COMMENTS OF THE

DRAFT ENVIRONMENTAL STATEMENT

ON

THE FEDERAL COAL MANAGEMENT PROGRAM

GARY KIDDER

February 13, 1979

Presented copy page

INTRODUCTION

The Department of the Interior is to be congratulated for its efforts to put together a comprehensive coal leasing program. The Draft Environmental Statement (DES) on the Federal Coal Management Program published by the Department represents a significant improvement over past documents on the federal coal leasing program. Among the important issues that this document addresses which were previously ignored are 1) the recognition that there is a difference between the need for a coal management program and the need for increased leasing; 2) the recognition of the need for a coal management program based on land use planning policies; 3) the acknowledgement of the need to actually involve the public in the decision making process and 4) an indication of the concept of threshold limits in the program. The Citizens' Coal Project (CCP) of the Environmental Policy Institute, however, does have concerns about several major components of the DES.

NEED FOR NEW LEASING

The first concern is whether the need for more federal coal leasing is adequately assessed. This is very important because the determination of the extent to which more federal coal needs to be leased will have a tremendous impact not only on the development of western coal but on the development of midwestern and eastern coal as well. The CCP is concerned by what it perceives to be weaknesses in the DES in both its analysis of mining and future energy supplies from sources other than coal and in its specific analysis of the projected demand for coal through the year 2000.

The CCP agrees with statements in the DES that as other fossil fuels become scarcer and more expensive to obtain, coal, and potentially western coal, will play an increasingly important role in the United

States' future energy scenario. There is a question, though, as to how much and how fast the demand for coal will grow. The demand for coal is intimately related to the growth in the demand for electricity, because the most rapidly growing market for coal is in its use for electrical power generation. So, the question becomes, how much will the demand for electricity grow and how much of that growth will be supplied by coal?

ELECTRIC POWER DEMAND

The DES does not adequately discuss the predicted growth of electric power demand. There is no discussion of the recently depressed rate of construction for new electric power plants nor are there any tables illustrating the demand trends the Department clearly anticipates. This clearly illustrates the basic problem with the analysis used in the DES. The DES uses a traditional model for demand projections which does not adequately address the issue of whether or not the projected need for western coal development should reflect recently changed marketplace demand trends or be based upon econometric models which merely use past consumption rates to extrapolate future electricity needs. Recent developments in the markets for coal and electricity make reliance on whatever analytical process increasingly untenable. For example, in the Eastern Coal Region, coal production has dramatically decreased due primarily to the unanticipated drop in the market demand for coal. In the January 1, 1979 issue of *Coal Week*, the Tennessee Valley Authority, considered by coal companies to be the "vanguard" of "last resort," reported that this year it had received the largest number of coal bids in nearly four decades of buying coal. According to market analysts, "...this event confirmed that coal operators may be producing for the coal coal."

Between 1970 and 1973, projections of total energy growth through the turn of the century were reduced from approximately 140-200 Quads to

a range of 100-135 Quads (with at least one major model projecting a low growth rate of less than 80 Quads). In the electrical sector, which represented more than 65% of the total coal consumption in 1973, utilities have reduced projections of needed capacity additions each year since 1973. A recent article in *The Wall Street Journal* (February 7, 1979) reported that since 1973, the Pacific Electric Power Company has reduced its projections for new generating capacity for 1982 from 4.4 million kilowatts down to 1.2 million kilowatts. Its growth rate has dropped from 8% annually (1973) to 3%. This is set against a just-to-be-released study by Arthur D. Little, Inc., *Revisions of Lower Electric Power Growth Through 1990*, concluded that the annual growth rate for utilities through 1990 will be 4%, a significant drop from the DE predicted a few years ago. This figure is also lower than the electric power annual growth rate predicted by the Department of Energy (DOE) model used by the Department of the Interior (DOI) in this study, which was 4%, 4.8% and 5.8% for the 1985 low, medium and high projections, respectively (p. 3-24). Clearly, we are in a new era in which we cannot rely on historical extrapolations. The continued failure of econometric models such as the PIES model (used by DOE to formulate the demand projections for the DES; Chap. 1-2) to predict power-growth patterns have forced analysts to acknowledge the feasibility of current modeling techniques to predict future demands.

MODELING TECHNIQUES

As CCP recommends that the Department reevaluate its demand models and consequently its determination of the need for more coal leasing. First, we recommend that the current modeling technique be tested by "backcasting"; that is, taking data from previous years, plugging it into the model and

comparing the model's results with the actual coal demand figures for those years. The results from these tests should be made publicly available.

Second, we recommend that DES project forecasts of electricity demand based on an analysis of future uses of electricity. This methodology is an analysis of each major "end-use" of electricity in the residential, commercial, manufacturing and agricultural sectors. An analysis of "end uses" affects the most direct basis for projecting the likely long term growth in consumption and the opportunities for increasing the efficiency with which electricity is used in each instance. The advantage of using this methodology instead of an econometric analysis is that an econometric analysis does not allow explicit consideration of the impact of regulations and standards which require improvements in the efficiency of electrical energy uses. (Dovers, Roger & Lantz, Terrell, *Planning an Electrical Energy Future for the Pacific Northwest: An Alternative Scenario*, Energy Research & Development Administration, Washington, D.C., January, 1977, pp. 13-15) As acknowledged on page I-22, California is currently using this analytical technique and, while the CCJ recognizes that such an analysis is extremely expensive, nevertheless, we believe that it should be done because the inaccuracy of the traditional model would lead to greater costs to society in the long run.

ALTERNATIVES TO COAL: OIL, GAS, SOLAR AND CONSERVATION

OIL AND GAS

Also, in chapter 2, the DES inadequately analyzes the future energy supplies from sources other than coal. The Natural Gas Act of 1938 has succeeded beyond all expectations in releasing gas from the interstate market, where there was an oversupply of gas, to the intrastate market, where there was an undersupply. This has led DOE to encourage utilities to keep burning gas for an indefinite period of time rather than encouraging

them to convert to coal, as was past policy. Also, while it is true that the production of oil is declining, there has been a decrease in the rate of decline. Moreover, the DES fails to mention an area of great potential for conventional oil and gas discoveries, the Overthrust Belt in Colorado Rockies. In the western states, these emerging oil and gas supplies will compete with coal for the industrial and power plant markets and with electricity for the end use consumer market, precisely the markets in which it is anticipated that federal coal and electricity derived from coal will be sold. The DES also fails to adequately analyze the impact of Mexican and Canadian oil and gas on future coal demand. In section 2-3-2, Canadian gas is not even mentioned as a potential source of fuel, although recent discoveries in Alberta have greatly enlarged Canadian gas reserves. In short, there is insufficient analysis to determine how coal demand would be displaced by the additional oil and gas supplies which currently appear to be more available than was anticipated even a year ago.

SOLAR

In respect to Nontraditional Energy Sources (2-3-3), the DES discusses the potential for solar energy to supply a significant portion of our total energy needs is inadequate. The DES suggests that by the year 2020, 10% of our total energy needs could be met by solar sources. The President's Council on Environmental Quality, however, in its April 1976 report on solar energy, *Using Energy Efficiently and Painlessly*, held that "... under conditions of accelerated development and with a serious effort to conserve energy, solar technology could meet a quarter (25%) of our energy needs by the year 2000." (p. 1-iv). And a soon to be released Federal Solarized Policy Review Report on solar energy, ordered by President Carter

on May 1, 1978, suggests that an aggressive federal program could lead to production of 20 Quads per year. This would be 20% of our total energy demand if demand were to reach 100 Quads by the year 2000.

CONCLUSION

A more rigorous analysis in the DES of the potential role of energy conservation is also necessary. Such factors as the recently enacted federal guidelines for electric utility rate setting policies and practices and other initiatives in this area are likely to reduce the growth in the demand for electricity below acut projections based on a very different historical context of regulatory policy. And the rising price of oil may simply reduce consumer demand and encourage conservation rather than force conversion to coal as has been assumed by DOI. Because electricity is the highest cost form of energy, consumer reductions in demand due to increasing energy prices are likely to be especially reflected in reduced demands for electricity and therefore have a significant impact on the continuing demand for coal.

Until a more thorough analysis is done of these basic assumptions used to justify the need for acts federal coal leasing, the CEP will not support additional leasing of federal coal.

DESIGNATION OF LANDS UNUSABLE

In areas of great concern to the CEP is the process and criteria used for designating lands unusable. The CEP strongly supports the concept of requiring areas to go through two designation processes: one a regional designation process administered by the Bureau of Land Management (BLM) prior to leasing and the other, a site specific process administered by the Office of Surface Mining during the review of the mine plan. We also support the inclusion in the criteria of the concept of an "appropriate buffer zone." This allows a determination to be flexible and take into account various factors such as differing geography or individual species habitat needs.

The process described in the preferred alternative, does not require an inventory analysis or a cumulative impact review to be done after the specific criteria have been chosen for an area. The CEP recommends that there be a requirement for a comprehensive analysis, which would review the overall cumulative impacts of all the chosen criteria after the process of designating lands unusable is completed. And there should be specific directions, with clear standards, given to the land manager as to that at the end of a review, if there is a challenge to a decision, the mechanics for appealing that decision is understood by everyone. The CEP also recommends that after land has been designated unusable, each land manager should be obliged to make available to the public information regarding what date was used (with minimal requirements for the date base) and how the decision was reached.

THE CRITERIA

The following are comments on the specific criteria and exceptions.

We do not agree with the general exception under underground mining. Underground mining has surface effects such as subsidence and impacts on water quality and these should be included in any review of the impacts of mining in an area.

Federal Lands Criteria: We concur with the criterion and the exception. **Rights of Way and Leases:** We concur with the criterion. In the exception, comment should be obtained from all parties involved for all the exceptions. The second exception should include a phrase saying it was "granted for that time of mining."

Public Roads: The criteria should reflect the language of SMCRA and read "public building, rather than 'occupant' building." The exception should also reflect the intent of SMCRA by including the language of section 522 (e)(4) stating that the public road may be reselected only after public notice and opportunity for public hearing in the locality where the road is located and the rights of way of the public and the landowners affected thereby will be protected.

Wilderness Study Areas: The CEP concur with DOI's interpretation of PLPA in the criterion and the exception.

Native Grass: The CEP concur with DOI's interpretation of PLPA, sections 201 & 202 & section 522 (e)(3)(E) of SMCRA. The exception, however, gives the land manager broad discretionary power which does exist in the law.

Lands Used for Scientific Studies: We concur with DOI's interpretation of SMCRA & PLPA. Again, the exception allows for broad discriminatory authority not specified in the law.

Historic Land & Sites: We concur with the DOI's interpretation of SMCRA 522(e)(5). The language of the section for the exception should comply with the language in SMCRA 522(e)(5) which allows for an exception only if

"...approved jointly by the regulatory authority and the federal, state or local agency with jurisdiction over the park or the historic site."

Natural Areas: We concur with the interpretation of the Historic Site Buildings & Antiquities Act of 1935 criterion. We do not concur with the assumption, and the Archaeological & Historic Preservation Act of 1974 which are not founded in law and only serve to weaken the existing protection for these areas.

Federal Endangered Species:

State Endangered Species:

Bald & Golden Eagle Nests:

Bald & Golden Eagle Nest & Conservation Areas: We concur with the criteria proposed for the protection of federally endangered species, state endangered species and Bald & Golden Eagles. In all four of the criteria, however, the exceptions are based on statutory authority and only serve to weaken existing law protecting the wildlife.

Polson Cliff Hunting Sites & Migratory Birds: We concur with DOI's interpretation of the Migratory Bird Treaty Act for the criteria and the exception.

State Resident Fish & Wildlife: We concur with DOI's interpretation of the Fish & Wildlife Coordination Act (16 USC 661-667(a)) for the criteria.

We concur with the interpretation of Executive Order 11960 for the criteria. For the exception, we suggest that the exceptions comply with the language of the Executive Order and allow mining to occur in a stream when there is "no practicable alternatives." The burden of proof for the "practicable alternatives" and for the determination of significant values in exception I should be with the industry.

Endangered: We concur with the interpretation of Executive Order 11960

for the criteria and the first exception. Again, we suggest for the second exception that the burden of proof lie with the industry.

Mineral Withdrawals: We concur with the interpretation of the SMCRA that the Act permits the municipality to grant an exemption where it determined that such an exemption will not "result in an unreasonable risk to health" (42 USC 3003, Section 5(c)(3)) the exception must comply with the language of the statute and require 1) a schedule of compliance by the public water system with each enforcement level and treatment technique required and with respect to which the exemption was granted and 2) implementation by the public water system of such control measures as the state may require for containment.

Prime Party Lender: We concur with the interpretation of SMCRA for the criteria and the second exception. We find no language in the Act, however, which allows for an exemption on the basis of a negative determination, as is required in the first exception. This exception should be eliminated.

Alberta Valley Planter: We concur with the interpretation of SMCRA (5)(A) (4)(D) of SMCRA for the criteria. The language of the exception, however, should be narrowed to reflect the intent of SMCRA (5)(A).

Reclamation: We concur with the interpretation of SMCRA for the criteria. The hosts exemption, however, narrowing the decision making process should be that the land is not reclaimable until proven otherwise.

CONSISTENCY WITH SMCRA

The EIS criteria to be consistent with SMCRA should include standards for protecting aquifers, aquifer recharge areas and natural hazards lands.

MULTIPLE USE HABITAT

A shortcoming in the criteria is that they do not consider uses for land other than coal development. In the Federal Land Management and Policy

Act of 1976 (P.L. 94-579), under section 202(c), the Secretary is instructed to develop and review land use plans using the "priorities of multiple use and sustained yield." The lands unsuitable criteria in the preferred program do not reflect this mandate. Alternative resource values, such as the use of the land for grazing purposes are neglected due to the overemphasis on coal production. The OCP urges DOI to revise the criteria to reflect this broader mandate of PLPA.

SURFACE OWNER CONSENT

Negative Response

The EIS has two concerns regarding the description in the preferred program and the sample regulations for surface owner consent. The first of these is that in the preferred program a negative response from a surface owner as to whether or not he/she wants to lease his land has the effect of a non-bidding response. Unlike positive responses, which are treated as permanently positive answers, a negative response is treated as a conditional response which will be subject to continued responses to all or lease and will continue to be part of the coal development plan despite the negative response. In the planning process described, even if a surface owner indicates that he is open to offering his land for lease or sale, he may still find that the coal reserves beneath his surface are still being offered for sale. All through the system, it is apparent that "no" is treated by the department as a prepositioned "yes." On page 3-31, section 3.2.1.3, description of surface owner consent, the DES says:

"The Department would, to the extent practicable, refrain from leasing land or interest in land that has been offered for lease or sale unless a surface owner consents to the offering of the deposits for lease. Although sections of the land may be leased or sold to other parties, further consideration for coal leasing, the land use plan would contain the recommendation that the individual surface owner be given the opportunity to lease alternative local areas available to meet an agreed upon target for the amount of coal to be produced. The individual surface owner indicated a definite preference against the leasing of the deposit under his surface that deposit ~~may~~ be eliminated from further considerations for leasing."

The preferred program, even after a negative response from a surface owner in the land use planning stage, continues to allow the surface owner to be subjected to additional requests to sell or lease during the activity planning stage.

Again, in section 3.2.4.3 (page 3-35) the Secretary is allowed to "...determine to continue a tract without consent if it is considered important." In the regulations the first sentence:

"... any determinations to withhold the action of lease sale and conduct the sale for coal deposits situated in split estate lands without consent if it is determined that no tract comparable to the affected tract can be found to offer it as its place..." (33037.2, p. A-18)

IMPACT OF COMPETITIVE BIDDING

Section 3427.2 (e) (1) (ii) provides for the successful bidder, after the lease sale, to be reimbursed by the agency which first obtained the consent for the purchase price of the consent. This provision provides for the reimbursement of the purchase price of the consent, but excludes reimbursement for the costs of obtaining the consent of the surface owner. It appears, therefore, that Section 3427.2 (e) (1) (ii) undermines the competitive bidding process intended by Section 202 (e) (1) of the Federal Coal Leasing Amendments Act of 1976 (P.L. 94-377).

Under the preferred program's procedures for reimbursing companies which have obtained written consent, only those companies which are deemed to be successful in the bidding process or which have a special interest or decisive advantage over competitors in the bidding process are likely to assume the risks and costs associated with obtaining the consent of the surface owner. DOI has addressed the problem of administrative costs associated with obtaining consent of surface owners in Section 3.2.4 (Split Estate Leasing Lease-Surface Owner Consent). But, just as DOI appears to have opted for another party ("the industry") to assume these costs of obtaining surface owner consent, it seems that "the industry" would share the more discriminatory cost to assume these costs, unless there existed particular conditions of advantage leading to success in the bidding process.

PROTECTION FOR SURFACE OWNERS

There are no provisions in the preferred program or the sample regulations which protect the surface owner from harassment or from incomplete, inaccurate or misleading information by "the industry" representative who solicits the written consent. A surface owner is ultimately assured greater protection, or at least a greater opportunity of redress, in cases of abuse and harassment when the responsibility rests with the government "the industry." The preferred

Rebates in the preferred program is a negative response enough to stop the leasing process from occurring on that specific tract of land. This is contrary to the intent of Section 714 of the Strip Mine Act (PL 93-67). The CCF recommends that a negative response from a surface owner during the land use planning stage be accepted by DOI as the surface owner's definitive decision unless otherwise notified by the surface owner.

ACQUISITION OF CONSENT

The Project's concern is the process in the preferred alternative for the acquisition of written consent. The preferred program sets up a multi-tiered process for the purpose of obtaining surface owner consent. First, DOI consults with the surface owners of split estate lands during the planning process. This, in theory, forces a screen to identify lands that should not be leased (section 3.3.1.3). Then, in the activity planning stage, "Industry" is specifically identified by DOI as the party responsible for acquiring surface owner consent, whether or not a surface owner has indicated a preference for leasing (section 3.3.4.3).

The procedure is set found in the law. In 714 (c) of SMCRA the first sentence states:

"The Secretary shall not enter into any lease of federal coal deposits until he has received written consent from the surface owner to conduct surface mining operations and the Secretary has obtained evidence of such consent."

In the "Definitions", section 701 (22) the "Secretary" is defined as "the Secretary of the Interior, except where otherwise described." The Secretary in Section 714 (c) is not "otherwise described." The intent of Congress in this section is clear: the Secretary, not "the industry," is responsible for obtaining surface owner consent. The first sentence of Section 714 (C) contains two conjunctions, rather than disjunctions, thereby making it impossible to conclude that any party other than DOI has been charged with the responsibility of obtaining the written consent of the surface owner.

program creates an atmosphere which encourages harassment of the surface owner. Even under those circumstances where "the industry" is presenting the surface owner with complete and accurate information which is not misleading, the surface owner under the preferred program is defenseless against persistent requests by "the industry" to sell land despite repeated negative responses.

Paragraph (e) of section 3477.3 of the sample regulations set out fails to protect surface owners but without question violates the letter and intent of section 714. There is no foundation in section 714 or its legislative history for the exception provided in paragraph (e) that:

"...the State Director may determine to publish the notice of lease sale and conduct the sale for coal deposits situated in split-estate lands if the surface owner consents if it is determined that no tracts comprising the affected tract can be leased separately and that the successful bidder may be able to negotiate successfully for written consent from the surface owner following the lease sale and before execution of the lease."

SPECIAL LEASING OPPORTUNITIES

DOI is compelled by statute to "reserve and offer a reasonable number of coal lease tracts as special leasing opportunities." (3.2.4.) The CCF recommends 2) that there be a stipulation in the regulations which provides for a preference in exclude public bodies from bidding for coal for power plants in which investor owned utilities are participating, and 2) that "reasonable number" be more clearly defined. The determination of "reasonable number" should be tied to the utility boiler requirements for the generating capacity of their public systems.

REQUIREMENTS FOR ENVIRONMENTAL IMPACT STATEMENT

In the preferred program, no requirement is made for a site specific environmental impact statement (EIS). Rather each regional sale statement will include an analysis of both the site specific and retrogressive cumulative impacts of the proposed leasing programs. The CCF urges DOI to comply with the regulation promulgated by the President's Council on Environmental Quality in November 1978 and, specifically, to comply with all the criteria for an EIS. The CCF considers the construction and operation of a road mine to be a major action on federal lands and, as such, requires an EIS.

CONCLUSION

The CCF considers the preferred program described in the DSE to be a good base for a comprehensive leasing process. As discussed in these comments, the CCF is concerned by several major weaknesses in the program. We are also concerned by the time frame in which the program is being implemented. Already certain aspects of the preferred program are being

implemented even though the Secretary has yet to officially pick a program and finalize regulations for it. Undue haste in implementation can only emphasize the weaknesses in the program where a broader time frame would give DOI an opportunity to carefully consider the many alternatives and to choose the best program to manage federal coal in the decades to come.

**RE: Comments on Draft EIS
For The Proposed Federal Coal Management System**

Our size

After reviewing the draft environmental impact statement on the proposed Federal Coal Management Program, we, at Peter Kiewit Sons', Inc., feel that the draft EIS is inadequate in its discussion of coal lease exchanges, particularly the Department's policies and procedures concerning exchange of federal fee coal located within oilfield valley floors.

Since the Office of Surface Mining has issued guidelines and proposed regulations for identification of alluvial valley floors which have resulted, in effect, in the identification of alluvial valley floors in the majority of proposed coal operations in the West, the Department of the Interior should address the exchange issue more thoroughly than it has done in the draft EIS.

The inadequacy of the discussion of the exchange is particularly disturbing in view of the express mandate of Congress that such an exchange program be developed. Section 510(b)(5) of the Surface Mining Control and Reclamation Act of 1972 (30 USC 1606) directs:

"It is the policy of the Congress that the Secretary shall develop and carry out a coal exchange program to acquire private fee coal precluded from being mined by the restrictions of this paragraph (5) in exchange for Federal coal which is not so precluded,"

The first area of concern that we have is the initiation of an exchange and the timing of such a proposal. Specifically, who should initiate the fee coal exchange? Will the Department of the Interior, through the Bureau of Land Management's land use planning efforts, approach the fee coal owner and/or lessee concerning an exchange? Or will the fee coal owner and/or lessee have the burden of initiating the exchange?

Director (140)
Bureau of Land Management

Number of tons commercially minable in the coal export area¹ will the
sum of all the fees the coal and the Federal coal will be
charged. With the existing lease arrangements between the Federal
operator and the lessee, the lessee will be required to pay a fee equal
to 10% of the AVE or Federal coal needed for mining
the coal. This amount will be determined in determining the economic value of
the AVE coal.² Will the same amount be paid by the lessee if the lessee
applies to the Federal government for a permit to mine the coal? Will the
proposed Federal coal exchange cost³ will the cost of assessing
the economic value of the coal to be exchanged? Will the lessee
take into account when determining the economic value of the coal
that the lessee has been granted the presumption of the Federal coal to
the lessee's current operations? Will the lessee be required to pay the
operator's costs associated with the assessment of the economic
account? If the owner/operator has already extended his existing
leasehold interest beyond the term of the lease, will the lessee
will this economic factor be included in determining the value of the
AVE coal? Will these changes be included in the determination of
the economic value of the coal to be exchanged? Will the lessee
cost⁴? Will the Federal coal that will be exchanged be coal that can be
mined in the coal field in which the proposed project to be implemented, standard
regulations concerning the mining of coal that each of the three issues
concerning the mining of coal must be adopted. These economic criteria
should be part of the minimum economic exchange criteria for the AVE
coal and for the Federal exchange coal.

A strong problem area that we foresee concerns the extent to which coal will be subject to the ETS. We believe that coal which is currently or currently leased Federal coal within an alluvial valley floor is subject to the ETS. Coal which extends beyond the boundaries of an alluvial valley floor, however, may not be subject to the ETS. The coal which is located within an alluvial valley floor could be exempted if it can be shown that the coal is not the primary source of particulates. In addition, we believe that the coal which is located within an alluvial valley floor could be considered in determining whether that coal is associated with the AFV coal. If the coal is not associated with the AFV coal, it would not be subject to the ETS. In the case of few areas of concern, including the alluvial valley floor, we will approach program exchange under the mineral exchange program. We believe that the first question addresses the same basic question of which coal will be subject to the ETS. We believe that the second question addresses this issue. We think that the final EIS must address this issue.

Director (140)
Bureau of Land Management
February 12, 1975
Page 2

Our position is that both the fee coal owner and the fee coal lessee, as well as the BLM, should have the right to initiate coal exchange procedures. The fact that a fee coal owner or lessee initiates the procedures should not mean that they must automatically bear the cost of the exchange procedures.

In conjunction with the above, the Department of the Interior has not made it clear in the draft EIS as to how the coal exchange program

Peter Kiewit Sons' position is that exchange coal should not be included in reaching final production targets for Federal coal deposits or for tract releases of Federal coal. The rationale is that the Federal exchange coal is replaceable. Any coal that would not be subject to production restrictions under the Act, on the other hand, "...or used in accordance with Federal exchange coal should undergo the availability review in order to ensure that the exchange coal will be mineable." Furthermore, Kiewit Sons' would adopt procedures for emergency exchanges of A/F coal when such an exchange is required by the fee owner or lessor/operator's contractual or other financial commitment.

II.
Another area of concern that we have is how the two tracts of coal, i.e. the fee coal within the alluvial valley floor and the Federal coal which is proposed for exchange, will be appraised for economic value. Our specific questions are: What criteria will be used in determining the value of the fee coal and the Federal coal involved in the exchange? Will the BTU, sulfur, ash, moisture content, etc. and the

Director (140)
Bureau of Land Management
February 12, 1979
Page 4

We are also concerned about the possibility of exchange rights to be coal within an eluvial valley floor for the right to lease Federal coal. We believe that our management officials are considering an alternative to the issuance of legal title to coal as title to Federal coal. The question we have is that in the event that we do not get coal as legal title, can coal lease within an eluvial valley floor be issued? If so, what would be the terms and conditions imposed? Our position is that the few leases issued and royalty will be imposed upon that lease and what lease terms and royalty will be imposed.

A final concern is whether as owner of fee coal or the lessee of federal coal within an alluvial valley floor must submit an application for a mining permit and have that application rejected before being allowed to participate in an exchange program. The specific question

Director (140)
Bureau of Land Management
February 12, 1979
Page 5

We have one: what kind of studies must be done prior to an exchange in order to show that the coal in question exists within an alluvial valley floor? Is there a specific area or area(s) which must be examined? Who is responsible for such an alluvial valley floor study? If an application is made for an exchange, will the coal in the alluvial valley floor be turned down by the regulatory authority or more than just federal valley floor considerations, will the coal still qualify for exchange? In the event that the coal in question does not qualify, what authority plays in the exchange program? Will a state specific EIS be required for the exchange? Will the Bureau of Land Management be responsible for carrying out such an EIS? Can fax or Federal coal in an alluvial valley floor in one state be exchanged for coal in another state? Can fax or leased Federal coal be exchanged for a number of tracts of federal coal which cumulatively have a value less than the value of the tract being exchanged? Can several tracts of AFV coal be exchanged for one tract of Federal exchange coal? Is there a limit to the amount of AFV coal which can be exchanged? What should be required? The fee owner/operator/lessee should be able to go to the regulatory authority, whether State or Federal, present its situation and request an exchange. This would make the process eligible for exchange. This would eliminate the need for submittal of a mining plan for exchange. The exchange would be based on the value of the coal in the draft EIS on the Federal coal management program does not provide any basis for an exchange program, I am sure.

We would appreciate any effort that the Department will make to clarify the above questions. In the EIS for the Federal Coal Management Program, we do think that all of those concerns need to be addressed. We would like to do our best to help the Department in this regard. As to how the Department is proposing implementation of the congressional mandate cited above fits into the "preferred alternative" for the coal management program.

Thank you for your consideration of these comments.

Yours truly,

PETER KITTELSON, SNC

Donald L. Stump

Vice President

DLS/MAC/dg

toward the development of a program for new leasing and has few resources available to grapple with issues concerning leases.

4. A program for new leasing cannot be implemented until a clear need for coal from unleased land is established.

5. Return to #1 recent indefinitely.

This trade-off will continue to pervade federal coal leasing as long as Interior is intent on development of a program for new leasing rather than a program which resolves the problems created by the existing leases. The new leasing program in federal land use management practices initiated this decade, has been a failure. It has not provided the opportunity to implement sound leasing. It also had the intent. But its purpose was to implement a program which completely upside-down. It assumed that the problem lies with the existing leases. The leased or a public in road in the face of a program that is designed to be a success, will not be successful. It must act as an instrument well, growing in height, chewing away at the base of the mountain. Its preferred program must be dismantled piece-by-piece and the pieces rearranged to manage the rest of the road to sound western resource management.

There is a concept bit of "what's thinking" on the part of the Department of Interior which underlies the rationale behind its proposed new leasing program. It is that the reason for the preferred strategy, according to the ES, is that "new leasing would provide a means to promote a more desirable pattern of coal development and to improve the quality of lands available for pre-lease land use planning, tract selection, lease sale, and lease administration." The problem is that the ES does not do anything to improve the development pattern resulting from existing leases. In fact, the first section will continue to dominate development patterns for the next five years. The little need for new leasing, except in one regime, the Green River-Western New York Coal Region. For 1980, there is no projected need for new leasing. The time to reach the 100 projected production levels. (p. 2-47) Several pages earlier the report reasons that the first lease sale will occur in 1980 and will not occur 4 to 7 years after the sale is held and a lease is issued. In 2-47 it is stated that the first lease sale will occur in 1983 at the earliest—seven years before demand might start to outstrip supply. The time between now and 1983 is too long for Interior to implement components of its ten-year program on existing leases and gathering more information to justify the scope of additional leasing needs if any.

February 12, 1979

To: Frank Gregg, Director, Bureau of Land Management
From: James Conon on behalf of the Council on Environmental Priorities

COMMENTS ON THE DRAFT ENVIRONMENTAL STATEMENT: FEDERAL COAL MANAGEMENT PROGRAM

The Department of Interior has been struggling since 1971 on unmet challenges of the leasing of federal lands. The leasing of federal lands has been created by over half a century of mismanagement of an inadequate and increasingly antiquated leasing mechanism. It has achieved breakthroughs in the last few years. The Statement of Environmental Impact proposed new leasing program in that a government study finally acknowledged that the current leasing system is not working in the public interest. Unfortunately Interior has made some false assumptions and has jumped to conclusions far outside those indicated from the data presented. The proposed leasing program is not a "preferred" leasing program will not satisfy its stated objectives and is likely to be a machine created by circular, "classic" logic which is not "real".

Interior simply has picked the wrong program from the host of options available to it. In its zeal to develop a leasing program created by erroneous logic, it has chosen a program which is not working and which primarily aimed at new leases. But this program will not serve the public interest. It will not meet the needs of existing leases, not advancing non-productively for many years. The tradeoff represents a "partner" of the machine created by circular, "classic" logic which is not "real".

1. No new leasing program is potentially useful until Interior can demonstrate a need for western coal from unleased lands. The proposed new leasing program does not do this and lacks data concerning the potential contribution of coal from existing leases.

2. The lack of data on mining questions because leases do not receive attention to study coal reserves and protection potential from existing leases or to regulate actions by present lessees.

3. Interior does not have a strong program to regulate existing leases because it is focusing most of its efforts

84 P.O. Box 48000 • New York, N.Y. 10016 • (212) 651-8550

4

whose chief "marketing card" for trout with respect to coal leasing is the incredible mismanagement it has exhibited in the past. Pressured by a mythical constraint that we must "use up" what little coal there is, Interior has "leashed" the "leash" of the program without first testing the many individual parts which comprise the leasing system. The proposed new leasing program is the perfect testing ground for the components of the new leasing program and the proposed new leasing program is the perfect testing ground for the components of the new leasing program. Interior should provide the experience we need to fine-tune the program before taking off on new leasing.

Interior declines the opportunity to implement components of the new leasing program which are not working, preferring the more grassroots, but fumbling approach instead. This strategy concerns the existing leases. The existing leases are the foundation for the new leasing program. Interior's preferred path, therefore, is like building a house on sand—on sand—on sand. The new leasing program is the house. The old leases, represented by the existing leases, are the foundation. It is planned to be blown away by the first storm. There certainly have been indications that the new leasing program is not working. One would think to have continued Interior in the impracticality of sweeping the old leases "under a rug".

Holding exhausted the repertoire of elated metaphors to describe the proposed new leasing program, the remainder of this report will focus on the environmental impacts of the proposed components of the ES and shortcomings in the preferred alternative.

THE ES DOES NOT DEMONSTRATE A NEED FOR ADDITIONAL LEASING

The need issue is at the heart of the Environmental Statement, yet it fails to convincingly demonstrate that a coal supply shortage will occur unless more federal land is transferred into the private sector.

Interior's own analysis belies the argument that additional leasing is necessary during the next five to eight years. The conclusion of the report is that the coal supply will be adequate to meet the little need for new leasing, except in one regime, the Green River-Western New York Coal Region. For 1980, there is no projected need for new leasing. The time to reach the 100 projected production levels. (p. 2-47) Several pages earlier the report reasons that the first lease sale will occur in 1980 and will not occur 4 to 7 years after the sale is held and a lease is issued. In 2-47 it is stated that the first lease sale will occur in 1983 at the earliest—seven years before demand might start to outstrip supply. The time between now and 1983 is too long for Interior to implement components of its ten-year program on existing leases and gathering more information to justify the scope of additional leasing needs if any.

Unfortunately the need issue can not be discarded so quickly. However, not because Interior has another more compelling argument, but because the process of determining the need for leases is likely to permit concrete conclusions about western coal supply and demand. The coal supply and demand analysis is required by section 101 of the National Environmental Policy Act. The ES could be made accessible to the public and used to provide the information and data needed for the information required to make informed decisions about leasing needs. This process admittedly could take several years, but it would be better than the present situation of no analysis at all.

The supply component of Interior's need analysis deals mainly with estimating coal production from existing leases. Currently approved or pending mining plans call for an additional 100 million tons of coal to be produced annually over the next 20 years. Before approval of the submitted mining plans, for example, Interior proposed to require miners to submit environmental impact statements, authorized by Section 507A of the Surface Mining Control and Reclamation Act. These statements would include information on off-leases or they could generate with the opposite result.

The problem with the unsatisfactory criteria—in relation to the need question—is that we just don't know what its impact will be. The Interior's own environmental impact statement proposed criteria last summer found that 65% of the coal land in the study area would be available for leasing under the new rules. At the time the study was to be released, however, Interior had issued only one of the 21 standards. Interior now has issued 10 of the 21 standards. Since then, current proposals are thought to affect only 5-10%.

How much and when land will be affected is not known because the criteria have not been finalized and have not been tested in the field. The new rules are not yet finalized, so cannot finalize the unsatisfactory criteria before they are finalized. The test would be if a test lessee under a new leasing program, but it cannot start until the new rules are finalized.

Unpublished and untitled regulations define "reduced economic recovery" of coal could also affect coal supply from pending projects. These regulations, authorized by Section 101 of the Federal Coal Leasing Act, would require that coal companies pay a royalty rate based on maximum yield. Royalties would be calculated on a per-ton basis and would be calculated in a way that still coal seams which are collectively producing less than 100 percent of their maximum potential MEF would be exempted. Royalties would be applied to coal which is not environmental costs." (p. 2-4) Once FCR regulations are put into concrete terms and applied, it is impossible to predict coal output from pending mining plans from this one vague statement.

an another 90 leases and the total difference here amounted to nearly 1 billion tons. The new rules do not affect the ability to lease coal-gathering capabilities, but there is little reason to believe that any changes were made before the ES was completed. (The 600 leases were actually published after the completion of the ES survey).

The Department of Interior has established an "automatic data extraction" system which allows the Bureau of Land Management to extract each lease. A review of a partial printout from this computer system in September 1980 revealed a number of leases in the data base which were not included in the ES. This is a statistic from a five year old and highly discredited test findings volume.

The methodology behind the assessment of coal production from pending leases is not explained in the ES. It is not clear what that for

existing leases, yet the ES provides no explanation for the figures on Table 1-2 (entitled Production Potential) from which the numbers in the table are derived. The table lists a forecast of the title which reads it full "cannot be disclosed because it is confidential". (p. 2-3)

It is unclear from the ES how Interior's "Revised Potential" projection for leases which will probably be issued under the currently prospective "short term leasing program" appears to a forecast.

Interior claims that 100 million tons of coal could be added to 26 leases could be issued under this program which could produce 1.6 billion tons of coal by 1990. (p. 2-3) This is a forecast.

Treatment of these leases should be more clearly explained in the ES.

A projection of the test summary data in Federal coal supply for 1980 and 1990 without new leasing (Tables 2-2 & 2-3) is as follows:

1980: 1.6 billion tons
1990: 2.2 billion tons

It is expected to drop by 1990 to 1.65 billion tons.

There is an interesting, but surprising decrease. The footnote to the numbers for 1990 reads:

"Table 2-3 is entitled 'Recoverable Coal Reserves in Existing Federal Coal Leases' and does not include data which would allow a prediction of production in 1990."

The coal supply tables call for 57.0 million tons from leases

and 1990. This assumes that all leases which are on lease

production will do so at full capacity by 1985. Intelligence

is that the first major coal production will be initiated by June 1, 1988—not full production

by 1985. This is a projection under certain circumstances.

It seems unlikely that production from this category will not change between 1980 and 1990.

The "areas of critical environmental concern" designations authorized by Title 2 of the Federal Lands Policy and Management Act of 1976, provide another example of a new land management program which is not fully developed. The ES does not explain why it is too early to assess their impact because the designations have not been made. Some argue that access to unassessed criteria defining "salvial resources" will provide the answer.

Similar and new problems are discovered when examining Interior's production potentials from the 331 existing leases for which no preference right lease applications have been filed. The right lease applications—the ES states that 1985-1990 million tons will be produced from the former category (p. 2-32) while the latter will have a production potential of 281 million tons annually (p. 2-36).

These projections are unacceptable for the same reasons cited for leases without mining plans and to PLAs. The quality of the data backing up the conclusions is not fully clear. The data is based on the contributions from existing leases which were made in 1970 by 65 existing operators, taking into account the location, type of coal, and the cost of production. The data, transportation availability, mining costs, taxes and other factors are not considered. The lack of information supporting behind this seemingly comprehensive assessment is explained. Given the positive stand of Interior toward existing leases prior to the release of the ES, it is reasonable to assume that the data is a thorough review past government budget writers, or the Interior's own staff. The lack of information is compounded by a complete absence of the study approach, time schedule, and rationale. It is reasonable to assume that the validity of its conclusions be accepted.

Perhaps this bit of skepticism is unwarranted, but the track record of Interior in collecting complete and accurate data concerning coal production is not good. The Office of Energy Information and Accounting Office has been a frequent critic of Interior's data collection. In 1979, the Office of Energy Information and Accounting Office released a report disclosed that reserve figures for Federally leased coal have been revised downwards. The 219 leases examined were more than double the estimates put forth by lessees. Departmental estimates were lower than those of lessees.

5

The table of 3500 coal supply contains a column for production from pending preference right lease applications. There is no explanation of what these numbers represent. They are listed except for a footnote which reads "figures obtained from Test Lease 1980-1990 is estimated based on 1983 Production from approved pending leases in Test Lease 1980-1990." (p. 2-32) The table is entitled "Test Lease 1980-1990"

The coal "demurrage" side of Interior's analysis in the ES is merely a statement that "no further work will be performed, nor by Interior, by a newly formed test force within the Department of Energy." This is the first step in the process of getting rid of the leases. It is not clear why Interior would place so many eggs in this basket until its analysis is completed. It is not clear why Interior would risk the translation between DCE and Interior, but the Leasing Task Force has done this for years. On each agency has formed only short term leases. It is not clear why Interior would risk a few months ago and has not done this for a proven translation of accurate and speed communications.

THE ES DOES NOT EXPLAIN THE NATIONAL IMPACT OF EXPANDING WESTERN COAL SUPPLIES THROUGH THE PREFERRED PATH

There is a puzzling sentence in the ES which reads: "The principal consequences of leasing less federal coal than is needed to meet national energy objectives would likely be to alter patterns of energy production and consumption." (p. 2-32) At least on the basis of computer projections, it appears themselves that total national coal production would greatly increase.

If Interior does not lease to meet the national objective of increasing coal production (it claims it will have little impact), then it is not clear why the ES is concerned. If Interior does lease 1.7-2.0 days, it help needed is certainly going to little to foster energy conservation. First, given an ES, it is likely to encourage the use of coal to displace oil, natural gas, or solar energy (p. 2). In fact, it seems that a new coal program by itself would not be able to meet national energy objectives by "creating a demand for coal which could compete to the exclusion of other forms of energy to meet national energy goals." The ES should examine this question thoroughly.

Interior explains that a new leasing program will promote a more rational development pattern in the West, but it admits that the new leasing program will not be able to control leasing decisions will affect interregional shifts in coal development patterns—presumably by altering production in the western influences coal fields—and that end-use considerations should

6

Cause unknown impacts. The ES states "cause of most of these interrelated issues. However, concerning end-use considerations, for example, the ES states "The Secretary preferred not to accept the leasehold interest in lands as a resource to be used in the Department's authority for such action." (p. 3-42)

THE PREFERRED PATH WILL NOT AFFECT LEASING IMPACTS OR PROMOTE MORE SOUND DEVELOPMENT PATTERNS

With its emphasis on no leasing, Interior will be forced to turn its back on efforts to develop more sound development activities by existing leases. The focus of the proposed land use planning system is directed toward selecting land not currently under lease. This will result in a loss of revenue to the government. The emphasis is placed on developing a system to manipulate decisions on land use through computer models. In the end, the decision will rest in the public interest. The existing leases represent a norm out of the past and special attention must be placed on the leases to prevent abuses typical of the past from continuing.

The major focus of the new program would be to investigate the use of leases and to determine what changes are needed in its power to regulate their actions. Full use of present and newly acquired powers to control lease assignments, activity, leases, and leasehold interests will be the primary objective of the new leasing process.

Interior would realize, surely, that it does intend to be regularly involved with renegotiating existing leases. It stands unlikely, however, that it will be able to pursue existing leases and develop them in a timely manner. This is a major concern of the former. The former are creating real and avoidable impacts today and are not prepared to take any steps to mitigate those impacts tomorrow. Obviously, the way to mitigate the impact is to have the public interest to solve present problems first before risking the creation of new ones.

The parts of the proposed plan can be seen by example. Historically, leases have been issued without concern for the environment, for the economy, or for the public interest. The new leasing process has the opportunity to correct or adjust lease term provisions at 20 year intervals. Between 1971 and December 1979, a backlog of 400 leases was created because the new lease term provisions had not been accumulated. This backlog was the result of Interior's preoccupation with the energy crisis. The backlog of leases has now increased to over 24 million in royalties free production on leased federal land adjustments which were permitted to operate under the old royalty structures. New rates will be approximately \$1.00 per acre-foot.

When Interior finally began processing these leases for adjustments, two leases appealed to the Land Hearing Board saying that Interior had exceeded its authority in changing lease terms without notice or delay. If these appeals are upheld, the public will lose millions of dollars in royalties over the next twenty year period for each lease.

A similar instruction to the administration of existing leases makes Interior's attitude toward overseeing lease assignments and through various other ramification of its "public interest" to exceed its authority. The public will lose one quarter of all federal leases charged taxes through the assignment market between 1980 and 1990. The public will also be denied information on the competitive implications of any of these transactions or transfers. The public will be denied information on the fact that the present provision represents a major obstacle to use planning in the West by creating a constantly changing set of leases and no clear direction for the future. As Interior has found no time to deal with this issue.

Interior's disinterest in existing leases is countered by its insistence to leases new leases. The new leases will rely heavily on the present "management resources planning" process which is still in its infancy. The new leases will be based on the best available data, audited or inaccurate data. If Interior plans to lease in the West, it must have the best available data. The public must have most of the guidance available to the agency. The preferred path, therefore, if it includes leases new leases, will be to do so in a timely manner, to accumulate leases from existing leases, but will not minimize the chances for adverse consequences from new leases.

Finally, the planning process itself appears too weak to adequately protect the environment or existing populations and industries. No consideration is given in the ES, for example, of the effect of new leases on existing leases. The new leases will be based on the best available data, audited or inaccurate data. If Interior plans to lease in the West, it must have the best available data. The public must have most of the guidance available to the agency. The preferred path, therefore, if it includes leases new leases, will be to do so in a timely manner, to accumulate leases from existing leases, but will not minimize the chances for adverse consequences from new leases.

There is always a great deal of uncertainty involved in ordering a new venture. All the best available data, audited or inaccurate data, will be utilized. The public is to have only with confidence that you are putting your best foot forward. The preferred path, probably to move forward far too quickly, risk too big of a leap,

E

B

In the wrong direction. Interior would be well advised to postpone its leasing proposal to incrementally adopt leasing reforms on existing leases first in order to minimize negative impacts. The new leasing process will be a long and continuing process before undertaking new leasing. By not aiming every follow-up proposal to the public interest, Interior could easily not exceed the limits of its authority over existing leases to re-lease, to not let other new regulatory controls to a standstill, and to not be compelled to take steps available to pre-empt legal challenges and further damage from the actions of environmentalists, citizens, and industry groups alike.

Tri-County Ranchers Association

Street, Missoula, MT

John Conn
Chairman
T-105

105

Montana's Tri-County Ranchers Association, Inc., was organized in 1978 to represent the interests of ranchers in three counties in south central Montana. The association is composed of 100 members, mostly cattle ranchers, who are dedicated to the protection of their natural resources and the promotion of their economic interests. The association is involved in a variety of issues, including land use planning, water rights, and energy development. The association is also involved in community service projects and educational programs.

Montana's Tri-County Ranchers Association, Inc., was organized in 1978 to represent the interests of ranchers in three counties in south central Montana. The association is composed of 100 members, mostly cattle ranchers, who are dedicated to the protection of their natural resources and the promotion of their economic interests. The association is involved in a variety of issues, including land use planning, water rights, and energy development. The association is also involved in community service projects and educational programs.

3. Planning Process

As we have stated earlier we have serious misgivings regarding the future of the Bureau's Land Management old growth forest policy. These cutbacks are based on vital information (Secker-Walker) from draft to summary has admitted an important deficiency and have acknowledged lack of scientific information (Secker-Walker April 1974, p.73, p.76, p.77). The Bureau has provided no new scientific policies toward old growth forests. In addition, they are unsure what they are still inadequate. It is our opinion that in order to attack the goals put forth in the old growth forest policy, more complete assessments are in order. Revision of the old laws with new covers and supplements will not suffice.

A.I. Assessment of existing lesson

John still maintains that it is important to consider the needs of coal available in existing leases. Selection, he believes, must be carefully evaluated for development first from the standpoint of the economic value of the coal to the lessee. In addition, he believes that the lessee must be informed as to whom such new coal is necessary by either offering a suggestion for further exploration or giving a suggestion for mining existing coal.

John will also indicate the level of interest in the coal available in existing leases. This information is important in determining the potential market for oil on the surface of surface rights to existing leases.

John's last point concerns the need for a leaseholder to consider whether that interest in coal will have total value to him. He believes that the best way to accomplish this is to speak with leaseholders.

Welt, Bande Hauptstaatsanwälte.

The above uncertainty criteria and concepts must be applied to all areas which have a potential for coal mining. Adding an exception to each individual area makes it almost impossible to determine that any land is suitable for extraction without being arbitrary. A question whether an exception is necessary for each one of the areas, little or no discretion should be left to the local BLM. Socio-economic, cumulative and off-site impacts must be included in the LUB.

*Report #115 "Plant Response & Forage Quality for Controlled Grazing on Coal Mine Spoils", published Aug. 1977 Montana Ag. Experiment Station

IV. Thresholds of Development

The concept of thresholds of development is basically useful, but it must be used with care. The concept is not specific enough to be meaningful. It does however tell us that there are certain acceptable thresholds of development in the principle areas of economic growth. The first area of concern enables cumulative impacts to accumulate over time. This means that we must observe the cumulative effects of developments in certain areas of our environment over time. These effects range from minor influences which can be parallel to major influences which can be cumulative and overwhelming of our broader environmental concerns. In this context, the word "threshold" can be used to mean a point at which a particular environmental impact becomes unacceptable. In establishing thresholds one must consider the degree of sensitivity in a particular area.

var several concern in
open areas. These areas

facilities able to accommodate any exponential population increase. The acceptable threshold for such an area would obviously be very low.

referred to as the criterion for determining acceptability. The section on thresholds frequently refers to land use plans and planners. These are not defined clearly. By "land use plan" is meant AL alone; the existing "use" by "planners" does not mean local planning officials or locally appointed committees. The AL should specify just who does the planning. Thresholds are also referred to as the plans and

We would like to submit some comments to the Department of the Interior regarding the water rights of the Colorado River Basin. We believe that the Bureau of Reclamation has done an excellent job in its administration of the Colorado River system. We have no objection to the old Management Framework. It was used by the local Bureau of Land Management offices as best for their local needs. These local offices have been given the authority to administer multiple uses and appropriate to federally administered resources.

We believe that the Bureau of Reclamation has done well for putting together these plans. The money goes toward the "the real heart for water" as the Bureau puts it, the study. We believe that the Bureau of Reclamation has done a good job of what has been presented—the use were not all gone, again, concentrate here or there making local decisions. This was written even though there was no concern at hand of information about the water use in the basin, especially in the areas especially regarding water. In the water delivery study, changing the water use is hardly mentioned. Treatment of the socioeconomic problems are essential. The effects of early drought, we do not know. We do not know if the water use will be affected by a letter option by Mr. Raymond C. Gold as printed in the newspaper. We do not know if the water use will be affected by expression of the complaints and frustrations which we have in the basin. We do not know.

With the exception of the MADDI report, we thought we had

seen the last of these poorly done studies. However, in my opinion, the local IMA offers published "Ecological Management" and environmental impact statements which are far superior to those applications for new nuclear and other electric generating stations. These were even worse than the JTF's—certainly not better. The poor handling and treatment of the Becker ZIA prompted a letter of complaint to the Board of July 24, 1978, from Mr. Guy Martin from Tri-County Developers Association, July 24, 1978.

The above complaints regarding the JTF's and the IMA are meant to illustrate and emphasize our position regarding the use

County, Mo., a national sacrifice area. Even optimistic industry projections are lower than the ones on this table.

HOW TO IMPLEMENT PREFERRED PROGRAM

The DSS states that "the key activity added to the land use planning process is the application of unsuitability criteria to lands unsuitability criteria." However, the lands unsuitability criteria are not being applied to select federal coal lands (associated land use planning). Instead, they are being applied to all other considerations.¹ The idea of initiating a major cornerstone of the preferred alternative without applying it to the lands seems to me to consent on the DSS appears to violate the National Environmental Policy Act. In addition, the application of unsuitability criteria refer to public involvement in their development probably violates the Land Policy and Management Act public participation provisions.

Interior seems so convinced that its preferred alternative will be approved and that the unsuitability criteria won't be applied that it is preparing to issue a proposed environmental impact statement for this rush appears to be the politically-motivated decision to leave the public behind.

Another problem with the premature application of unsuitability criteria is that they will be applied to old existing management plans that were written for old DSSA industry-dominated coal leases. One of the main problems with the preferred scenario is that it attempts to look at all coal lands and weigh coal mining against all other uses. This approach is underway when old DSSAs tracts and old coal-dominated MPFs are rolled on for the first round of leasing.

Under proposed rule 100-100, the application of the preferred alternative to vital components -- the Forest Service and Bureau of Land Management land use planning processes -- still aren't in final form. It is hard to put faith in a process that is in flux. The Sierra Club will be working to moderate comments on the proposed land use planning processes.

Ideally, to implement the preferred alternative, Interior should start with the unleased lands. Once a plan is adopted and the lease is in place, the unsuitability criteria should be subject to full public review. Once the public has had a chance to comment, new coal resource dominated should be gathered for new MPFs, and then coal leasing proposals should be run through the preferred alternative flow chart.

Ideally, to implement the preferred alternative, Interior should start with the unleased lands. Once a plan is adopted and the lease is in place, the unsuitability criteria should be subject to full public review. Once the public has had a chance to comment, new coal resource dominated should be gathered for new MPFs, and then coal leasing proposals should be run through the preferred alternative flow chart.

(5)

measures might easily satisfy the exceptions freely. Someone not subject to local review should make the subjective decisions on a mine's impact on sensitive areas.

Lands Used for Scientific Studies: with conditions, not one or two or three areas, but the entire area in question is granted.

National Parks: We need to believe that coal mining could enhance information recovery. Any drilling would probably destroy more than it could ever uncover. In fact,

National Monuments: The U.S. Fish and Wildlife Service and the state wildlife agencies are in the position of giving an exception here even though it does not guarantee concessions.

National Forests and Monuments: Is there any scientific basis for this? National forests and monuments are the cornerstone of our recreation system. These areas should just be avoided.

Migratory Birds: Again, wildlife agency concurrence, not just consultation, is essential.

State and Federal Fish and Wildlife: Why is deer, antelope, and elk vulnerable? What is the habitat? What is the range? Why only elk migration corridor? The Fish and Wildlife should conduct the federal override in exception number 2 is courageous.

Wetlands: Exception number 2 is too subjective to be useful.

Floodplain: Exception number 1 is meaningless. There is always an alternative to leasing a floodplain -- leasing under the floodplain or just not leasing.

Water Quality: These areas should be off limits to leasing. Why let the City fathers to sell out their water supply to appease local industry?

State and Federal Water: Why should the agency be allowed to decide if freshwater is needed? Resource water is necessary! This is another area that should be off limits.

State Lands Management: An excellent criterion, but there is no need to apply it to the entire DSSA. The state should again be required.

State Promoted Criteria: The grandfathering in exception number 1 should be dropped.

Alloy Valley Project: There is no need for the exception since the criterion cites the definition and standards of SMCRA. If an

(4)

LANDS UNSUITABILITY CRITERIA

The proposal to come up with a list of lands unsuitability criteria -- and applying them at the earliest stages of the land use planning process is commendable. I trust that this effort is being carried out with the best of intentions. But the criteria are too general.

Basically I am pleased with the criteria, but dismayed with the loosely written exceptions that in many cases negate the criteria. I realize the need for some flexibility to take into account local exceptions, but as it stands, the proposed exceptions are too flexible to guarantee meaningful protection.

Exceptions should be granted only when there is sufficient evidence that the lands are unsuitable, but as it stands, the criteria with leases as it would be if no leasing occurred. Exceptions should be uniformly applied and not subject to industry pressure.

I was disturbed to read in the October 8 Federal Register that the DSSA is considering a new designation for lands that "too much coal would be excluded from development by this criterion." I hope that the DSSA will not go this route. It is important to achieve the desired environmental protection goals. For instance, I'm curious about the origin of the 1 mile buffer around active mine, reclamation, and reclamation sites. The DSSA says that after field tests showed that too much land and too much coal would be excluded from development by this criterion.

It is unclear to me who will apply the criteria and grant the exceptions. Is an area manager? A district manager? A state director? It seems to me that local managers ought to apply the criteria as part of their land use planning process. Local managers' land use exceptions should be sent to the national director who should be the conservator of the criteria. This would assure consistency in application of the criteria exceptions and would help guarantee that exceptions don't become the rule.

Unsuitability and Wilderness: The exceptions, especially number 5, appear to be discriminatory.

Unsuitable Lands: The Wilderness Act (Section 4(d)) allows for discriminatory leasing and mining, but clearly coal mining would be incompatible with protection of wilderness values. Why not designate lands as unsuitable for coal mining? This would allow mining on leases until Congress decides that the area should be designated as wilderness. If DSSA doesn't intend to use the exceptions, they should be dropped.

Snowy Crags: The exception eases the criterion. This is an example of a category where a district manager under heavy local

(5)

pressure is spelled out. It should also cite the prohibition on disturbance of the hydrologic integrity.

It might also be advisable to include unsuitability criteria on minor substances, cumulative impacts of mines, and socio-economic thresholds.

In summary, there is such an abundance of federal, state and private coal lands that it seems folly not to offer tighter protection for our most sensitive lands.

ALTERNATIVES OVERLOOKED

The DSS offers a wide range of alternatives. The only alternative that is seriously considered and examined in detail is the preferred alternative.

The alternatives mentioned include different ways to set leasing levels, but different ways to run a coal management program are never mentioned.

The DSS should examine when to apply the unsuitability criteria, alternative unsuitability criteria, alternative demand models, alternatives to relying on land use planning by the agencies, alternative places to locate decision making process to allow more executive powers and alternative ways to rank lease tracts. Some of these alternatives may not be feasible, but the DSS should consider them. These decisions, like the decision to adopt the preferred alternative, were made long before the public had an opportunity review of DSS.

I think the DSS should also examine the use of several alternatives. For example, one constraint on alternative that I believe for a continuation of leasing under the short-term criteria is the lack of data. The DSS should consider what kind of basic data is gathered to aide in preparation of new MPFs, unit plan and lease plan. The DSS should consider what kinds of lease terms and processes are in place the preferred alternative could be initiated. This approach would help the DSS to produce more accurate unit projections and better lease terms. This would lead to better lease plans and MPFs. Such an alternative would keep existing mines going, allow the opportunity for new leases to be issued, and ensure that the first round of new leasing is done right.

OTHER ISSUES

The DSS talks about the need to review outstanding leases but doesn't integrate such a review into the preferred alternative. There has to be a formal review and cancellation of all undeveloped leases, and PRAs and cancellations where existing leases are incompatible with new acceptability standards.

mining method. Instead, it would be more appropriate to substitute an apparent commercial quantities test. My logic for suggesting this alternate test is that data on commercial operations of many new coal technologies are just theoretical estimates since empirical numbers are not available.

Very truly y

Feedback: 1.8%

Mr. Frank Gregg, Director
Bureau of Land Management
Office of Coal Management (140)
18th and C Streets, N. W.
Washington, D.C. 20240

Dear Mr. Gre

The attached comments coupled with my testimony of January 24, 1979 represents the position and formal response of the State of Montana concerning the future leasing of federal lands for coal mining in Montana. The attached comments are specific in nature in contrast to the general comments of my testimony. They represent not only an academic review, but also a public concern for maintenance of our treasured quality of life in Montana.

The Federal Coal Leasing Program will have major significant impacts on Montana's future economy and upon our natural environment. One of our major concerns is the potential conflicts with state policies and goals. We have adopted numerous laws over the past few years to cope with energy development and to protect and preserve a quality of life we have no intention of losing. We believe that coal development must be compatible with our basic agriculture industry regarding land and water use. We will not destroy the future of agriculture in Montana to provide for coal development. With wise use and conservation we are confident that we can and will have both.

The attached comments address these concerns. Some are specific to Montana and others may apply to other coalitions. Regardless of the nature of the comments we trust that you will give them your consideration and incorporate them in your final analysis. The involvement of this state in the decision making process is critically important and necessary for any viable decisions involving federal coal management in Montana.

THOMAS L. JUNKE
Governor of Montana

THOMAS L. JUDGE
Governor of Montana

The following are the State of Montana's comments regarding production targets and their apparent inadequacies.

The Department of the Interior (DOI) has not specified the process or provided the numerical data in the EIS to show how the coal production quota will be determined or how it will be enforced. It is important that the nature of the adjustments be clarified because the DOI's coal management alternative provides for "not all of the coal" to be managed alternately and produced. This is the form of interrelated transportation "in certain areas." (A-3-2) The EIS does not provide any information on how the quota will be held to ensure that national energy demand goals are met (A-3-2). The EIS also does not provide any information on how the coal targets indicate that NEP coal production goals are not met to determine coal demand. Nevertheless, DOI's high 1995 national coal demand projection of 1.2 billion tons per year is based on the assumption that the President's proposed coal production goal of 1.2 billion tons per year will be met. The question is whether this coal quota is actually attainable or what the best option for meeting energy needs has been questioned by the authorities, including government, industry, and environmental groups. The 1.2 billion tons per year of effective same is attainable for the market and of

Certain steps and input factors which DOI considered in its production target "adjustment" process are listed in Appendix H, Section H.2.2., p. 47; however, demand for the coal does not appear to be included. The following statement indicates that the actual probable demand for the coal of any certain mining region.

"The algorithm utilizes an origin/destination coal flow matrix upon which are superimposed preexisting western coal production levels. The O/D matrix is restructured so that regional energy demands are satisfied and the level of coal consumption for each region identified." (p. H-7, emphasis added)

The EIS does not clearly explain how the total production projections were divided among the producing regions, although least cost appears to have been the primary determinant for all factors considered. Demand for Powder River Coal in 1985 and 1990 is therefore linked to the economic efficiency of mining the region's thick coal seams, as indicated by the following statement:

...Within the Western regions, the greatest fluctuations in absolute terms (between the various leasing alternatives) would be

Given the Powder River Coal Region's land ownership patterns and the economic desirability of the coal resources, this disparity is to be expected. The coal industry, as an private enterprise,

seeks to maximize profits by minimizing costs. Producers are attracted by the Powder River Coal Region's fisheries in Wyoming and Montana with their thick coal seam are relatively thin seam thicknesses to maximize recoveries. The economic projections are based on the assumption that linear programming will be the primary alternative which depends on these projections similarly emphasizes production from the Powder River Coal Region. On the other hand, a policy of no leasing would restrict available production both by reducing the number of producers and by reducing the number of miners affecting the economic viability of private coal development upon adjustment. Federal reserves for coal development. The Powder River Coal Region is highly dependent on Federal leasing to expand production beyond

are currently planned levels." (p. 10, emphasis added).

In Chapter 2 DOI apparently calculated its planned production estimates for Powder River for 1985 in terms of the amount of coal that it believes actually will be produced. This results in a smaller tonnage number than production capacity of existing and newly approved mines. In Table 3-201 anticipated production rates for production capacity is compared with actual production rates for existing and newly approved mines. The projected rate for 1985 will be determined by the new leases. This could be interpreted as a weakness in the argument for the "need" for future leases.

The EIA recognizes that the primary demand for Montana's electric power will come from coal-based generation. At least one Montana utility has proposed coal-based "Electric Utility Coal Demand Scenarios for the Montana Energy Model". This scenario contradicts the presumed need for new power generation in the state. The EIA estimates that the Powder River Basin will be producing in 1990 and 1995. The Montana study is based on a projected rate of growth of 2.5% per year. The EIA estimates that the Montana/Wyoming coal market area and estimates derived from individual energy demand forecasts and data. The EIA acknowledges that coal production in the Powder River Basin will increase rapidly (pp. 44-45). The Montana portion of the Powder River Basin, the 1985 production figure of assistance, and currently approved Montana plans appear greater than the EIA's projections. The EIA also states that "the electric utility as well as its coal-based requirements through at least the early

Since the EIS does not include the origin-destination matrices which predicted coal flows between 41 production areas and 63 consumption areas, it cannot precisely examine whether the projected market areas demands for its coal are realistic. A preliminary version of regional coal demand is included in a separate document entitled, "Federal Coal Production Forecast 1965 and 1980 Regional Coal Production Forecast" (DOE, 1978), but even

The coal production targets are the primary determining factor underlying proposed coal leasing policy and management framework. Considering the important role new federal leasing would play in the Powder River Basin and other western coal producing regions, greater accountability for the targets

production forecasts would not be responsible in light of the potentially massive impacts subsequent coal development decisions will impose on the West.

Appendix F presents coal production projections by state and includes projected in-state coal consumption as well. However, the process used to derive these numbers is not indicated. The manner in which Appendix F supports the conclusions of the EIS is not clear. The EIS does not explain why the Appendix, although referenced, may exist in the body of the text. The Montana and Wyoming coal and natural gas production numbers are summarized as follows (from Table F-2 and F-3) in million tons per year (cgsy):

	1976	1980	1990
Montana	25.9	36.5	206.8
Wyoming	13.8	118.4	123.3
Total			
Powder River	37.4	205.0	400.0
Consumption	1976	1980	1990
Montana	1.34	12.37	16.8 ^a
Wyoming	4.09	3.83	7.83

^aAll steam generation

^bIncludes 11.5 steam and 8.55 low Btu syn gas

^cIncludes 1.56 steam and 6.22 high Btu syn gas

There are several obvious problems with this data. In 1976 Wyoming power plants consumed approximately 7.5 million tons of coal (mt) in electric generation. This is a significant amount of coal and it is not clear why coal use is not clear why Wyoming consumption is projected to be lower in 1980 than in 1976. The same is true for Montana. The EIS also indicates that coal use has increased since most coal-fired generating projects are already in operation or scheduled for construction by 1980. Total state coal consumption projections are not consistent with those of the national coal consumption projections for members of. However, if the BLM coal gasification by 1990 is among facility cost-effective, then the national coal consumption projections will be significantly confirmed.

On p. 2-74, three actions are specified which will be undertaken at the national level to address the problem of growing energy demands; these include expansion of coal use, coal imports, and expansion of oil, gas, and greater energy conservation. We in Montana would like to further refine and add, namely, to alleviate the necessary support and research efforts required to increase reliance on renewable forms of energy.

The following are specific comments and questions which relate directly to

determining exceptions to the criteria is included in only one of the 24 criteria namely the "reclaimability criterion". To ensure a smooth process of lease issuance by the federal government a subsequent strip mining permit will be issued under the coal lease. A similar provision could be imposed for all the criteria by adding to each exception "after consultation with the appropriate state agency and after compliance with all applicable laws and regulations." This added stipulation might suggest successive leases could be issued under the same criteria and might administratively solve potential storage and conflicts of future state and federal program compatibility.

Important also in the uncertainty overuse criterion is the assumption that present methods of estimating coal reserves are accurate. Unless lease stipulations are extremely precise and specific in relation to mining methods, it is difficult to determine what specific mining methods are going to be selected in the lease stipulations to assure that the exception criteria apply.

Some more specific criteria/allowances can be applied to situations noted in the EIS. These are briefly summarized as follows:

There are several errors in the descriptions of the Powder River Coal Region Environment. On page 4-19 the Powder River rather than the Tongue River is described as having a heavy mineral base. On page 4-20, peacock chickens are included as a rare species in the area. However, it is very doubtful that any of this species occurs in the Powder River Coal Region. It is also stated that the area contains the largest herd of the shovelnose sturgeon chub. Actually, there is no such species. The authors are probably referring to the white sturgeon or a sturgeon chub.

In Table 4-10 (page 4-20), it is stated that the Powder River Basin Region productivity in an aspen forest (8.0 tons/acre) is greatest there than in a wetland/buttermilk forest (5.4). Also, it is difficult to believe that regaled produces 8.7 tons per acre and pasture land only 1.7.

Some of the productivity data in Table 4-10 appear to be questionable. If we reduce the productivity of the aspen forest to 7.0 tons/acre (as in Table 4-2) we get 5.4 tons for floodplain and higher than this for prairie (1.7), hardwood forest (1.6), and spruce forest (0.0). That it seems as though the availability criteria would include more than just the floodplain type.

Tables 7-9 and 7-4 are also very misleading. They seem to indicate that regaled produces 8.7 tons/acre and pasture land only 1.7 tons/acre. This is the exact opposite of the fact that regaled is by no means as successful living in the arid areas of the West as it is in the East. This is why it is difficult to put much faith in Table 7-5 where estimates of wildlife populations that could be supported on reclaimed lands are made.

coal production, supply and demand which have not been presented in the EIS.

1. with the first EIS iteration the approach to production projects in terms of regional development which mitigate possible damage for coal (i.e., Mexican gas, Canadian gas, etc.), fossil fuel, biomass, Canadian crude restrictions, Alaska gas, etc.)
2. Statement on p. 2-17 indicates that national installed hydroelectric capacity will increase from 1970 to 1980. This statement is incorrect. National aggregate power decreased.
3. What is the source of the Appendix F data?
4. Does the action to suspend the effective date of the strip mining rules affect the cost? (Leaving EIS?)
5. How does the BLM anticipate improving its data base (to a level capable of making tract specific leasing decisions? (In most of the EIS, the BLM states that they will not expand mining in the areas associated with or adjacent to existing mining.)
6. According to the EIS, "general participation" apparently means that the BLM will not exceed its authority to alter the overall production targets (e.g., p. 3-26). Also, Section 3.3(b) indicates that "the state's" use of and control over its lands will be used to create, reallocate and disaggregate its regional production targets. The EIS also states that the BLM will not exceed its authority as set forth in the EIS. The BLM should not be limited to input focused solely on impact mitigation. States should be allowed to use their own data bases to set the targets based on available market information and forecasts.

The sustainability criteria proposed for coal leases cover a broad range of issues and generally include the majority of possible environmental/coal mining conflicts. The following is a list of the 24 sustainability criteria recommended in the EIS. The first 10 are commendable in intent. However, in several cases the criteria are not clearly defined and lack specific language and potential loopholes. Each of the 24 criteria carries with it a logical and reasonable approach to executing the BLM's mandate. The following lists the 24 coal mining criteria and provides a brief explanation of the logical approach to each alternative.

1. - Imprecisely to also an executive of the Right-of-Way and Surface Rights Division, "What is the best environmental practice or is it simply an economic constraint? It appears to be an economic constraint which should be addressed but in a context other than here."

However, of ever greater concern is the fact that it most causes the agency to not recognize the fact that it must more stringent regulation to meet the sustainability criteria. This is particularly the case in Montana where we have broad powers to allow or deny mining under state law and regulations and under the Mineral Leasing Act. Recognition of approved state programs including state regulation in

4

While the above-mentioned errors and comments are rather minor, they do seem to indicate that these sections were written by someone unfamiliar with the area and apparently were not even reviewed by someone from the agency. However, these sections still represent a vast improvement over previous efforts.

The discussion of fallowing River water availability on page 5-34 could be greatly improved by including the following information provided by the Montana Board of Natural Resources and Conservation. This question deserves further attention and respect alike on the discussion of coal in the Fort Union Coal Region.

The Section on Ecological Impacts beginning on page 5-27 appears to contain some conflicts. On page 5-27, the following statement appears: "since the habitat of the species is not precisely known, it is not possible to indicate the exact habitat which would be lost." Several potential species are mentioned in the EIS. However, the discussion of potential big horn population reductions which would occur due to habitat loss, etc., (as previously stated) to indicate the exact habitat which would be lost is not possible. The potential population reductions which would occur due to habitat loss be calculated?"

It is not clear what is meant by "species" in the above statement. It is a very unusual one and is in desperate need of clarification and/or definition.

Under the wetlands criteria, it should be specified whether the CFS is an average flow or a minimum flow. The discussion of the CFS in the EIS

Nesting Site Criterion (page 3-17) is not printed properly in the table - a portion of the table is printed on page 3-18. Apparently page 3-12 should come between pages 3-3 and 3-10.

The following are comments primarily focused on the social and economic needs of coal development. The Department of Interior is to be commended for its concern over the social and economic needs of coal development. However, the resources available to forestall or alleviate adverse impacts, however the following are recommendations for further consideration.

The draft implies a certain responsibility on the part of the federal government for providing what we consider to be highly appropriate financial assistance to assist in mitigating the effects of coal development. The task of providing legitimate relief impacts, with states and private landowners has been taken in the action in assuring its responsibilities toward the coal areas through the BLM. The BLM has chosen to take a more conciliatory approach to assisting impacted communities through the Montana Coal Impact Mitigation Fund. The BLM has chosen to do this because we are continuing to evaluate our role and to explore new possibilities. Management of the fund is currently being developed. The fund is currently subject to challenge by the energy industry. We, therefore, find it important to keep the fund funded and strengthened in view of existing federal aid, the department of interior should continue to work with severely impacted states such as Wyoming and Montana could seek to raise revenue through taxes, for example, through the imposition of an increased coal severance tax.

6

It is time for the federal government to make adequate provision for the coal industry in the Powder River and Fort Union Regions. It is recommended that with regard to adverse social and economic impacts from federal coal leasing, the Powder River and Fort Union Regions would be the most appropriate areas for federal intervention. This is particularly true if the report recognized the importance of timely information and effective planning as well as the need for a more comprehensive approach to energy development.

The report does not give sufficient attention to the fact that current federal alternatives do not fully recognize the social and economic impacts of coal mining. The report does not give sufficient attention to the fact that current federal alternatives do not fully recognize the social and economic impacts of coal mining.

The long range plan for the Powder River and Fort Union Regions could probably be totally unworkable if it were funded, both because it would infringe upon the state's budgetary priorities and because the state could probably not implement the plan due to the lack of political will and the lack of public desirability. The one value of the act is that it recognizes the state and local need for the planning, construction and maintenance of public facilities and provides for the funding of such facilities. In other words, the act is not the only answer to the state's loss of extracted natural resources but it provides a good starting point for further action.

Unfortunately this draft fails to recognize, as does federal legislation, that those communities which experience the most severe adverse impacts may not be the same as those which accrue the most benefits. The long range plan for the Powder River and Fort Union Regions could probably be totally unworkable if it were funded, both because it would infringe upon the state's budgetary priorities and because the state could probably not implement the plan due to the lack of political will and the lack of public desirability. The one value of the act is that it recognizes the state and local need for the planning, construction and maintenance of public facilities and provides for the funding of such facilities. In other words, the act is not the only answer to the state's loss of extracted natural resources but it provides a good starting point for further action.

Advisory committees are both responsible and pressing, particularly if they are to reflect the pattern of criteria existing in federal funding programs.

The discussion of road-rail crossings and of trailer hazards indicates that dangerous crossings in rural areas probably cannot be avoided by any feasible means. The report suggests the use of crossing protection devices. "In smaller communities, the local traffic volumes are often too low to justify the installation of crossing gates. In many instances, even flashing warning lights or crossing gates," we find very disturbing the implication that in the federal eye the life of a rural American is less important than that of an urban American.

Although the draft addresses the problems associated with hauling coal

by truck or by train, it does not recognize the severe adverse effects on the environment and the economy of the region resulting not only from motor traffic but also from the hauling of heavy equipment to and from mine or facility sites. This site and the construction of new or relocated roads can cause significant ecological damage.

It seems questionable whether the section addressing loss of agricultural lands and productivity represents the situation fully -- for example, the impact of coal mining on agriculture cannot be measured by the direct impact on agriculture because it does not take into account the potentially extensive and extremely detrimental disruption of the region's assemblers or suppliers of agricultural products and services by the coal industry. These must be matters of concern to us as an agricultural state and as a state with a large number of small towns and cities.

On page 8-97, it is stated that "adequate transportation systems are not labor intensive, employment growth in transport coal would not be as dramatic as for mining and oil and gas." This is opposite the findings of the Callahan Report.

Despite these and other concerns of considerable consequence to us, we applaud the intentions, expressed in this document, that the Department of Energy should lead both state and local governments in developing criteria for land acquisition and disposition of specific suitable sites, and in ensuring the timely availability of acreage for energy development. We believe that the involvement of all sectors with state, local and tribal planners and decision-makers is critical. This involvement will be a meaningful part of an effective process of optimal mitigation of the adverse social and economic effects of energy development.

Re: Federal Coal Management
Program Draft Environmental
Statement

Dear Sirs:

In compliance with the National Environmental Policy Act, Office of Coal Management, U.S. Department of Energy, and the Wyoming State Review Procedures, the State of Wyoming has completed its review of the Federal Coal Management Program Draft Environmental Statement. State Agency comments are attached.

In addition to these comments, my own testimony was presented in Cheyenne, Wyoming, at a public hearing held on January 21, 1979. This testimony should be considered a part of the State review.

Thank you for providing the opportunity to review the Program.

Yours sincerely,
Gerry Beach

RECORDED

THE STATE OF WYOMING
Department of Environmental Quality
LAND QUALITY DIVISION
STATE OFFICE BUILDING
TELEPHONE 307-777-7798
CHEYENNE, WYOMING 82001
MEMORANDUM

To: Robert Dunfee, Director
From: W.C. Acherman, Administrator # 6
Date: December 27, 1978
Subject: Staff Comments on Federal Coal Management Program, a Draft Statement Prepared by the U.S. Department of Interior.

Enclosed are specific comments on the referenced DEIS.

1. SE: Abbreviations Index

Because of the large number of abbreviations used, the document should be prefaced by an "Abbreviations Index".

2. SE: Section 2.7.3., Non-Federal, Non-Indian Coal

The draft statement assesses the development potential of non-Federal non-Indian resources with a cutoff at 1,260 acres (assumes size of viable mining operation). However, the State of Wyoming presently has four pending applications for sites with areas greater than 1,260 acres. It is recommended that the mining operation will be much smaller than the cutoff utilized in the statement.

WYCO Paul - Subsidiary of Kansas City Power and Light - Produces 4 millions T/yr. for a total mine area of 51 acres.

Sheridan Enterprises - Welch Mine, Production of 1.05 million T/yr. for 11 years with total mine area of about 220 acres.

Duchesne Coal Mine - Production of 250,000 T/yr. for 53 years with a total mine area of 600 acres.

Pont O'Brien Coal Mine - Production of 1.2 million T/yr. for 12 years with a total mine area of 415 acres.

All indications are that these operations constitute viable operations. Thus, it can be concluded that the DOI has considerably underestimated the development potential of non-Federal, non-Indian coal for the Powder River basin region.

3. SE: Section 2.8, The Need for New Federal Coal Leasing

Within the introduction to the draft statement (Chapter 1, Section 1.1) a question concerning the need for additional Federal coal leasing is posed. This question, perhaps originating from the NGO's vs. Right-to-Sue, is apparently addressed in section 2.8 of the draft. However, the Department of Interior (DOI) appears removed from the process of preparing the draft statement. No date or no substantive date or logic have been presented within the document which supports the need for new federal coal leasing. This is a very important question of the whole Federal Coal Management Program has not been answered. It is recommended that the DOI be asked to provide information on what DOI should provide logic and an objective data base for their projection of future energy needs.

4. SE: Section 3.1.1., The Preferred Federal Coal Management Program

It is recommended that the Planning System, as described in Sections 3.1.1. and 3.1.2., be used to develop a preferred federal coal management program. The initial screening of land by resource planners, the results of which will designate certain tracts of land unsuitable for leasing consideration.

should be guided in the initial stages of the planning by industry expressing interest in coal as mineral development. This approach was followed through negotiations as was conducted in the DMAs II program. This approach will provide the opportunity for the DOI to identify the most suitable coal reserves/prime system which will be indicative of where coal reserves could potentially be developed.

5. SE: Chapter 4, Sample Regulations, Section 3425.1-15d and (d)

Concerning oil & gas, referenced sample regulations indicate that a split lease may not be issued if there does not exist "complementary leases" as prepared by the State". In the State of Wyoming where land use planning has been done, the State has indicated that the term "complementary" in a comprehensive land use plan does not exist for the State, the impacts on coal development are considered to be such that the term "split lease" is more appropriate. It is recommended that the term "split lease" be defined and where the term is applied for both federal estates, the State be delegated the authority to issue split leases. It is also recommended that this definition be broadened to qualify various resource plans and activities as criteria for leaseability.

SUBJECT: Comments on Draft EIS for Federal Coal Management Program
State Identifier Number 78-12 D

1. The bulk of the discussion on transportation impacts dwells at length on the impacts to the railroad industry. However, discussion of impacts on people due to railroad transport of coal is so brief that the reader is left with the impression that the railroads are the only railroads/highway crossing obstacle, community disruption, and financing artifacts. These resources warrant discussion in character with the rest of the text.
2. One important aspect that is understated and cloudy is that the preferred alternative and its various options is a means of mitigating the effects of coal production. The preferred alternative is not a mitigated impacts is controlled by the market for coal. With a no-lease policy existing, the market will dictate the amount of coal produced. Consequently, the impacts of coal production will occur regardless of the federal program selection. On the other hand, a sound federal management program can serve to alleviate the impacts of coal production by a management strategy that can serve to mitigate the impacts of a no-lease policy.

No reference is made in this management program to the Great Divide Basin in the description of the Green River, Heart Mountain Coalfield area. This is a unique ecological phenomenon containing several land forms, plant types, animal species and bird species peculiar to that area. The basin area contains many areas of ecological significance which have been identified by studies done for the National Park Service. These areas include the Green River, Heart Mountain, and others. This area is richly endowed with paleontological and archeological resources. The Great Divide Basin, per se, deserves some type of mention in this study. The Great Divide Basin, per se, is given a cursory mention in conjunction with a comprehensive discussion of the coalfield area.

Moreover, each environmental statement should address not only how the project will effect the recreational use of the land itself, but also how the project may be the impact of people could hinder or enhance the quality of the environment. The impact of needed recreational areas and/or facilities to cater to an increasing population should be considered in this Federal Coal Management Program.

Finally, we would like to reiterate that an site specific proposal should be developed at the earliest possible stages of planning. This very contact process will insure that future cultural survey work and personnel satisfy the minimum guidelines and procedures adopted by our office in cooperation with certain federal agencies.

If you have any questions, feel free to contact the SHPO.

Sincerely,

[Signature]

TESTIMONY OF

GOVERNOR ED RESSCHLER

TO

THE DEPARTMENT OF THE INTERIOR
ON ITS COAL MANAGEMENT PROGRAM
ENVIRONMENTAL STATEMENT

CASPER, WYOMING

JANUARY 23, 1979

INCLIDED BY: ALAN E. BRECH
NATIONAL HERITAGE CONSERVATION
OFFICE OF THE STATE PLANNING COORDINATOR

I WOULD LIKE TO BEGIN MY TESTIMONY BY
ACKNOWLEDGING THE STATE'S ROLE AS A (PARTICIPANT) IN THE
DESIGN OF THIS FEDERAL COAL MANAGEMENT PROGRAM AND THIS
ENVIRONMENTAL STATEMENT. SINCE LAST APRIL, OFFICIALS
FROM WYOMING AND OUR SISTER STATES IN THE COAL
PRODUCTION WEST HAVE HAD THE OPPORTUNITY TO COMMENT,
CRITICIZE, AND SUGGEST, REGARDING ALL ASPECTS OF THE
PROGRAM. THIS IS NOT TO SAY THAT I AM COMPLETELY
SATISFIED WITH THE PROPOSAL, OR EVEN THAT THE VARIOUS
AGENCIES OF WYOMING STATE GOVERNMENT AGREE ON ITS
VIRTUES AND DEFECTS. BUT I DO THINK THAT THE PROPOSED
PROGRAM BEARS THE STAMP OF THE STATES--PRIMARILY A
SHIFT TOWARD MAKING DISCRETIONARY DECISIONS AT THE
STATE OR DISTRICT LEVEL, RATHER THAN IN WASHINGTON.
AND I CAN SAY THAT I FEAR MORE TO LIKE ABOUT THIS
PROPOSAL THAN MANY OF ITS PREDECESSORS IN THE PAST
EIGHT MONTHS. PERHAPS MOST IMPORTANT, WE ACKNOWLEDGE A
DEGREE OF RESPONSIBILITY FOR THE FEDERAL DECISIONS THAT
ARE ENCODED IN THE ENVIRONMENTAL STATEMENT.

THE PUBLICATION OF THIS DRAFT ENVIRONMENTAL
STATEMENT IS IN MANY RESPECTS A MOMENTOUS OCCASION. IF
NOT DISMANTLED OR SUBSTANTIALLY MODIFIED BY JUDICIAL
REVIEW, IT MARKS THE ESTABLISHMENT OF GROUND RULES FOR
FEDERAL COAL MANAGEMENT FOR THE GENERATION TO COME. IT

ALSO MARKS THE CULMINATION OF A PERIOD OF REVISION THAT
BEGAN EARLIER IN THIS DECADE; AND I THINK IT IS FAIR TO
CHARACTERIZE THIS PERIOD AS A DECLINE OF THE
ROLE OF THE FEDERAL GOVERNMENT IN DEVELOPING
FEDERAL RESOURCES. IN BROADEST TERMS, RECENT
CONGRESSIONAL INITIATIVES HAVE:

- (1) LIMITED THE PERIOD THAT PRIVATE INDUSTRY CAN
HOLD FEDERAL COAL FOR DEVELOPMENT, HENCE REDUCING THE
ROLE OF LONG-TERM PRIVATE PLANNING AND SPECULATION;
- (2) PROVIDED FOR A MUCH HIGHER ASSURED RETURN TO
THE FEDERAL TAXPAYER FOR DEVELOPMENT OF FEDERAL COAL;
- (3) INCREASED THE ROLE OF FEDERAL LAND USE
PLANNING IN THE DEVELOPMENT OF FEDERAL COAL, THIS
REDUCING THE CHOICE OF PRIVATE INDUSTRY IN SPATIAL
DISTRIBUTION OF DEVELOPMENT;
- (4) PROVIDED MINIMUM STANDARDS FOR MINED LAND
RECLAMATION, THUS REDUCING THE ROLE OF PRIVATE POLICY
IN PROVIDING FOR ENVIRONMENTAL PROTECTION;
- (5) INTRODUCED FEDERAL PRODUCTION TARGETS UNDER
THE AUSPICES OF THE DEPARTMENT OF ENERGY, PROVIDING A
BASIS FOR NOT ONLY INCREASED FEDERAL MONITORING OF THE
MARKET BUT ALSO FOR A REVISION OF THE TRADITIONAL
RELATIONSHIP BETWEEN PRIVATE INDUSTRY AND THE
DEPARTMENT OF THE INTERIOR.

-1-

-1-

-2-

THE IMPLICIT RESULT OF THESE STRUCTURAL REVISIONS IS TO STRENGTHEN THE ROLE OF THE FEDERAL GOVERNMENT IN WYOMING, AND MORE SPECIFICALLY, THE ROLE OF THE BUREAU OF LAND MANAGEMENT. FURTHER, THERE WILL SOON BE MORE FEDERAL COAL PRODUCED IN WYOMING THAN ANY OTHER STATE IN THE UNION. THE GROWTH AND STABILITY OF WYOMING'S ECONOMY WILL DEPEND IN LARGE MEASURE ON THE DEVELOPMENT OF THAT FEDERAL COAL. I MUST CONCLUDE THAT THE PROPOSED PROGRAM IS MORE IMPORTANT TO WYOMING THAN ANY OTHER STATE. WE MUST, THEREFORE, BE EXCEDEINLY CONCERNED NOT ONLY OF THE TERMS OF DEVELOPMENT OF FEDERAL COAL, BUT OUR RELATIONSHIPS WITH THE FEDERAL GOVERNMENT AS WELL. IN FACT, WE SHOULD SPEND LESS TIME WORRYING ABOUT THE NATIONALIZATION OF FEDERAL COAL, AND MORE TIME WORRYING ABOUT THE NATIONALIZATION OF WYOMING.

WITH THIS PERSPECTIVE IN MIND, I WOULD LIKE TO PRESENT A BRIEF OVERVIEW OF THE PROPOSED SYSTEM.

ANY REASONABLE REVIEWER OF THE CIRCUMSTANCES SURROUNDING FEDERAL COAL LEASING WILL CONCLUDE THAT SOME MODERATE DEGREE OF LEASING IS THE SENSIBLE CHOICE FOR AN OVERALL POLICY. FUNDAMENTALLY, THE EXTREME POTENTIALS FOR FEDERAL POLICY DON'T MAKE SENSE BECAUSE THEY IGNORE TOO MANY CONSIDERATIONS--MARKET DEMAND, NATIONAL ENERGY NEEDS, AND THE AUXILIARY COSTS OF COAL DEVELOPMENT. TO NAME A FEW. FOR EXAMPLE, THE POLY OF

-3-

MARKET DEMAND CLEARLY MAKES NONSENSE OF THE NO-LEASING ALTERNATIVE: EXISTING LEASES WILL NOT YIELD PRODUCTION IF THERE IS NO MARKET DEMAND. THE DEMAND FACTOR CAUSES A SIMILAR PROBLEM WITH THE ALTERNATIVE OF LEAVING TO MEET THE DEPARTMENT OF ENERGY'S OPTIMISTIC PRODUCTION GOALS; BECAUSE MORE COAL UNDER LEASE STILL WON'T INCREASE PRODUCTION IF DEMAND IS NOT THERE. BOTH OF THESE ALTERNATIVES ARE CONSIDERED IN THE ENVIRONMENTAL STATEMENT.

SO THE CHALLENGE FOR CREATING A FEDERAL PROGRAM HAS NOT BEEN THE SIMPLE BUSINESS OF DECIDING THAT A MODERATE LEASING PROGRAM IS JUSTIFIED; INSTEAD, THE CHALLENGE HAS BEEN TO CREATE A NATIONAL PROGRAM FROM AN AWESOME TANGLE OF FEDERAL STATUTE, JUDICIAL DECISIONS, AND ADMINISTRATIVE DISCRETION. CHAPTER ONE OF THE ENVIRONMENTAL STATEMENT ROUGHLY SUMMARIZES THESE CONSTRAINTS. IT IS WORTH EMPHASIZING THAT MANY ALTERNATIVES OR POLICIES WHICH WOULD SEEM SENSIBLE TO WYOMING CITIZENS ARE SIMPLY NOT AVAILABLE AS ELEMENTS OF A MODERATE LEASING PROGRAM. ONE CANNOT, FOR EXAMPLE, IGNORE THE STATUTORY REQUIREMENTS THAT, FOR OUR DILIGENCE, EVEN THOUGH SOME OF OUR STATE OFFICIALS BELIEVE THAT IT IS UNSOUND POLICY. THE PRACTICAL BUSINESS OF CREATING A SOUND PROGRAM HAS BEEN FURTHER COMPLICATED BY THE FACT THAT, WITH THE RECENT AND SUBSTANTIAL CHANGES IN UNDERLYING CONGRESSIONAL LEGISLATION, THERE IS NO SUCH

-4-

THING AS AN "OLD HAND" WITH RELIABLE ADVICE. WE ARE, THEREFORE, LIKELY TO YIELD ALL SORTS OF UNPREDICTED PRACTICAL PROBLEMS WITH THE Emerging PROGRAM, AND I AM SURE THAT WE WILL BE LOOKING FORWARD TO SEVERAL YEARS OF ADJUSTMENTS EVEN IF THE OVERALL PROPOSAL PROVES SUCCESSFUL.

THE PROGRAM WHICH HAS EMERGED AS THE PREFERRED ALTERNATIVE ACTUALLY CAN BE SUMMARIZED QUITE SIMPLY: IT IS LARGELY A MATTER OF SCREENING OUT UNDESIRABLE OR LESS DESIRABLE ALTERNATIVE TRACTS, TO REACH A LIMITES POOL THAT WILL BE OFFERED TO INDUSTRY FOR DEVELOPMENT ON A COMPETITIVE BASIS. WHILE INDUSTRY IS OFFERED AN OPPORTUNITY TO EXPRESS ITS INTEREST, THE SYSTEM IS DRIVEN BY THIS SCREENING PROCESS.

THE FIRST LEVEL OF THE SYSTEM IS THE LAND USE PLANNING PROCESS OF THE BUREAU OF LAND MANAGEMENT. THIS PROCESS HAS BEEN REVISED IN A FASHION WHICH MAKES IT MORE SUITABLE FOR THE PURPOSES OF FEDERAL COAL MANAGEMENT, AS WELL AS OTHER PURPOSES. DRAFT REGULATIONS WERE PUBLISHED IN THE FEDERAL REGISTER DECEMBER 15. THE SECOND LEVEL OF THE SYSTEM IS THE APPLICATION OF CRITERIA DESIGNED TO ELIMINATE LANDS WHICH, FOR A VARIETY OF FREEDOMINANTLY ENVIRONMENTAL REASONS, SHOULD NOT BE OFFERED FOR LEASE. THESE CRITERIA WERE PUBLISHED ON DECEMBER 3. THE THIRD LEVEL

-5-

OF THE SYSTEM IS THE PROCESS FOR RANKING AND SELECTING TRACTS. A DETAILED DESCRIPTION OF THESE PROCEDURES IS NOT AVAILABLE, AND HAS NOT BEEN FINALIZED. IT IS AT THIS LAST LEVEL OF THE SYSTEM THAT MODIFIED PRODUCTION TARGETS OF THE DEPARTMENT OF ENERGY ARE USED TO DETERMINE HOW MUCH COAL SHOULD BE OFFERED FOR LEASE.

TO SUMMARIZE, THEN, WE ARE LOOKING AT A COMPLEX PROPOSAL OF GREAT MOMENT FOR WYOMING. WHILE IT DEMANDS A RESPONSE, A RESPONSE MUST BE CAUTIOUS, SINCE THE PROPOSAL IS NOT ONLY COMPLEX BUT ALSO INCOMPLETE. UNTIL I SEE ALL OF THE FINAL DETAILS, AND UNTIL I HAVE A CHANCE TO SEE IT WORK, I MUST RESERVE JUDGMENT ON MANY OF ITS ASPECTS.

DESPITE THIS CAUTION, I CAN STILL MAKE A NUMBER OF PRELIMINARY JUDGMENTS BY ASKING A NUMBER OF QUESTIONS WHICH REFLECT WYOMING'S INTERESTS IN THE PROGRAM. I HAVE SIX SUCH QUESTIONS TODAY, AND I MAY HAVE MORE IN THE FUTURE. I BELIEVE THAT THESE QUESTIONS, AND OUR TENTATIVE ANSWERS TO THEM, EFFECTIVELY ILLUSTRATE THE STATE'S POSTURE WITHOUT OVERSTATING OR UNDERSTATING OUR SUPPORT FOR THE PREFERRED ALTERNATIVE.

FIRST: HAS THE FEDERAL GOVERNMENT ADEQUATELY DISCLOSED ITS INTENTIONS FOR THE DEVELOPMENT OF FEDERAL COAL IN WYOMING?

-6-

ONE OF THE STRONG POINTS OF THE ENVIRONMENTAL STATEMENT IS ITS EFFORT TO FULLY DISCLOSE THIS PROSPECT. IT APPEARS THAT I CAN RELIABLY SAY THAT WYOMING, AND PARTICULARLY WYOMING'S POWDER RIVER BASIN, WILL BECOME THE PREDOMINANT PRODUCER OF FEDERAL COAL IN JUST A FEW YEARS.

OUTSIDE OF THE CONFINES OF THE STATEMENT, IT APPEARS THAT I CAN ALSO MAKE SOUND GUESSES ABOUT THE SCHEDULE FOR LEASING. IN THE EVENT THAT SECRETARY ANDRUS ADOPTS THE PREFERRED ALTERNATIVE, WE ARE LIKELY TO SEE A HIGHEST LEASE SALE IN MID-1990. TRACTS WOULD COME FROM NORTHEASTERN WYOMING, NORTHERN COLORADO, AND SOUTHERN UTAH. TO MEET PROCEDURAL REQUIREMENTS, THE 1990 SALE WOULD FORECLOSE NEW INDICATIONS OF INDUSTRY INTEREST, STREAMLINE PUBLIC PARTICIPATION, AND PROVIDE FOR A VERY LIMITED NUMBER OF NEW LEASES IN A HANDFUL OF LARGELY UNCONTROVERSIAL LOCATIONS. THE FIRST LEASE SALE, THEN, WILL SHAPE UP AS A SORT OF TEST OF THE PROGRAM.

I WILL FURTHER MENTION THAT ONCE THE SYSTEM HAS begun to operate, MANY OF THE DECISIONS ON FUTURE DEVELOPMENT WILL BE DECENTRALIZED, TO THE LEVEL OF THE COAL SUPPLY REGIONS AND BELOW. IF THESE STRUCTURAL ASPECTS OF THE PREFERRED ALTERNATIVE ARE IMPLEMENTED, WYOMING WILL BE IN A POSITION TO MODIFY FEDERAL INTENTIONS BY INJECTING

ITS OWN. IF THIS COMES TO PASS, IT IS UNDOUBTEDLY WORTHY OF MY SUPPORT.

SECOND: WILL THE PROGRAM WORK? WILL IT PROVIDE A STABLE FRAMEWORK FOR THE LONG TERM? ARE THERE NOTICEABLE HEAKNESSES WHICH MUST BE CORRECTED FOR EITHER SHORT-TERM OR LONG-TERM SUCCESS?

THIS INTEREST EMBRACES THE ASPECTS OF PROGRAM DETAIL WHICH MUST BE COMPLETED BEFORE REGULATIONS CAN BE PUBLISHED, AND PRACTICAL DIFFICULTIES WITH PROGRAM ELEMENTS THAT ARE ALREADY SETLED. WITH A PROGRAM OF THIS COMPLEXITY, THE LIST IS POTENTIALLY LENGTHY, SO I WILL ADDRESS POINTS WHICH ARE ILLUSTRATIVE RATHER THAN EXHAUSTIVE.

(1) ONE CONCERN IS VULNERABILITY TO LEGAL CHALLENGE. CHAPTER 2-B OF THE ENVIRONMENTAL STATEMENT EXPLAINS THE RATIONALE FOR FURTHER LEASING. IT IS AN IMPORTANT CHAPTER BECAUSE A DEMONSTRATION OF THE NEED FOR REHEDGED LEASING WAS CRUCIAL TO THE LAWsuit WHICH STOPPED THE LAST FEDERAL LEASING PROGRAM. THE NEW CHAPTER IS AS STRONG AS POSSIBLE GIVEN THE AVAILABLE INFORMATION, AND A SOUND PRESENTATION OF THE APPROPRIATE CONSIDERATIONS.

(2) I AM NOT ENTIRELY SATISFIED WITH THE DEPARTMENT OF ENERGY MODEL WHICH HELPS DRIVE THE

-7-

-8-

PROGRAM, AND DIRECTLY AFFECTS THE LEVEL OF LEASING. THE MODEL'S STRONG POINTS ARE THE CRITICALITY OF ITS REGIONAL ALLOCATION OF PRODUCTION, ITS EMPHASIS ON COAL AS UTILITY FUEL, AND THE INSIGHTS PROVIDED BY ITS SENSITIVITY ANALYSIS. ITS WEAK POINTS ARE ITS DERIVATION OF DEMAND AND THE FACT THAT IT IS NOT RELIABLE BELOW THE REGIONAL LEVEL.

THE POSSIBLE CONSEQUENCES OF THE WEAK POINTS ARE DISTURBING. THE WEAKNESS IN DEMAND FORECASTING MEANS THAT ONE MUST BE PARTICULARLY CAREFUL TO AVOID TREATING IT AS SOME KIND OF MIRAGE; THIS WILL BE DIFFICULT SINCE NEITHER INTERIOR NOR WYOMING HAS ANY COMPARABLE CAPACITY TO FORECAST PRODUCTION. I STRONGLY SUPPORT THE PRINCIPLE OF COLLECTIVE MODIFICATION ENDOCTED IN THE EXAMPLE REGULATIONS; THAT IS, THE IDEA THAT THE DOE PROJECTIONS CAN BE MODIFIED TO SUIT ALTERNATIVE ESTIMATES OF DEMAND.

THE FACT THAT THE MODEL IS UNRELIABLE BELOW THE REGIONAL LEVEL PRESENTS ANOTHER KIND OF PROBLEM: SHOULD PRESENT SCHEMES FOR TRACT RANKING AND SELECTION ON A REGIONAL BASIS FAIL, IT MAY BE DIFFICULT TO DESIGN AN ALTERNATIVE WHICH INCLUDES THE DOE PROJECTIONS IN THE SAME WAY, SINCE PRODUCTION TARGET DECISIONS FOR SUB-REGIONAL AREAS WOULD BECOME A GREAT DEAL MORE ARBITRARY THAN THOSE PRESENTLY SUPPORTED BY THE MODEL.

SAILING AT THE REGIONAL LEVEL MAY, THEREFORE, MEAN FAILING ENTIRELY SINCE PRODUCTION ALLOCATION IS A MAJOR FACTOR IN THE SYSTEM. WE CAN ONLY HOPE THAT SUBSTANTIAL DIFFICULTIES WITH THE REGIONAL SELECTION SYSTEM DO NOT ARISE.

(3) I AM CONCERNED THAT THE CONCEPTUAL IMPLEMENTATION OF STATUTORY FAIR MARKET VALUE REQUIREMENTS MAY BE TOO COMPLICATED TO BE WORKABLE. THE TRANSFORMATION OF TECHNIQUES THAT INFORM MARKET DECISIONS INTO TECHNIQUES THAT COMPRISE REGULATORY MANDATES OFTEN YIELDS UNFORESEEN OR UNDESIRABLE CONSEQUENCES, NOT THE LEAST OF WHICH ARE EVER MORE APPLICATIONS OF TECHNICAL CONCEPTS. ONE EXAMPLE IS THE LIMITATION ON SURFACE OWNER COMPENSATION, WHICH IS TIED TO FAIR MARKET VALUE DETERMINATIONS. I WOULD PREFER TO SEE FEDERAL ANALYSIS BASED ON SIMPLER CONCEPTIONS OF PROTECTION FOR THE FEDERAL TAXPAYER, WHICH I BELIEVE WAS THE CONGRESSIONAL PURPOSE FOR THE FAIR MARKET VALUE REQUIREMENT.

(4) I AM CONCERNED THAT THE DEPARTMENT OF THE INTERIOR MAY HAVE TWO MAJOR SORTS OF INTERNAL DIFFICULTIES WITH THE PROGRAM:

THE FIRST IS INSUFFICIENT FUNDS AND PERSONNEL TO HAVE THE SYSTEM WORK. THE PREFERRED ALTERNATIVE CLEARLY DEMANDS A GREAT DEAL OF DATA AND A GREAT DEAL

-9-

-10-

OF MANPOWER, SO MUCH THAT IT IS VULNERABLE TO BREAKDOWN IF CONGRESS LOSES ITS ENTHUSIASM FOR RESOURCE MANAGEMENT IN THIS PROPOSITION 13 ERA. I AM ENCOURAGED BY THE FACT THAT THE PREFERRED ALTERNATIVE LENDS ITSELF WELL TO THE ESTABLISHMENT OF PRIORITIES FOR INTERIOR'S RESOURCES, AND BY RECENT INDICATIONS THAT INTERIOR WILL NOT ATTEMPT TO BRING THE ENTIRE PROGRAM TO FULL SPEED AT ONCE.

THE SECOND PROBLEM IS LINES OF COMMUNICATION BETWEEN WASHINGTON AND BLM IN THE FIELD. IN THE PAST THIS HAS RESULTED IN CONFUSION AND DELAY THAT HAS HURT WYOMING CITIZENS. IN THIS REGARD, I AM ENCOURAGED BY DECISIONS WHICH DECENTRALIZE PROGRAM RESPONSIBILITIES TO THE STATE LEVEL. ONE EXAMPLE IS A CHANGE IN THE BLM LAND USE PLANNING REGULATIONS WHICH ALLOWS THE STATE DIRECTOR TO SUBMIT ENVIRONMENTAL STATEMENTS DIRECTLY TO THE ENVIRONMENTAL PROTECTION AGENCY WITHOUT FURTHER CLEARANCE FROM WASHINGTON.

(5) I AM CONCERNED THAT MANY OF ECONOMIC" ORIENTED POLICY QUESTIONS, IN SUCH TOPICS AS RIDDING SYSTEMS, ALLOCATED BY STATUTE TO THE DEPARTMENT OF ENERGY, HAVE NOT BEEN RESOLVED. I REALIZE THAT THE DEPARTMENT OF THE INTERIOR HAS NO CONTROL OVER THE DEPARTMENT OF ENERGY, BUT THE COORDINATED WORKERS RELATIONSHIP OF THE TWO AGENCIES MUST BE STRONG IN

-11-

PRACTICE. THE VALUE MEMORANDUM OF UNDERSTANDING FOUND IN APPENDIX X OF THE ENVIRONMENTAL STATEMENT IS NO GUARANTEE OF PERFORMANCE. INTERIOR ESTABLISHED A RIGOROUS SCHEDULE FOR ITSELF AND HAS HELD TO IT. IT SEEEMS THAT ENERGY SHOULD DO THE SAME.

(6) I AM CONCERNED THAT THE POLICIES SURROUNDING THE QUESTION OF SURFACE OWNER CONSENT MAY PROVE UNWORKABLE. THE PRACTICAL EFFECT OF THESE PROVISIONS, DESIGNED TO PROTECT LANDOWNERS WHO HAVE HELD THEIR LANDS FOR OVER THREE YEARS, IS STILL A QUESTION MARK. WHERE THE EFFECT IS TO ALLOW A SINGLE SURFACE OWNER, HOLDING OUT SOLELY FOR THE PURPOSE OF PERSONAL GAIN, TO STALL DEVELOPMENT IN AN OTHERWISE DESIRABLE LOCATION, STRONG PRESSURES WILL BE GENERATED TO LIMIT PROTECTION FOR ALL LANDOWNERS. I HAVE NO ISLEGAL ALTERNATIVE TO THAT FOUND IN THE PREFERRED ALTERNATIVE. I ONLY WISH TO IDENTIFY THIS AS A PROBLEM WHICH IS LIKELY TO WARRANT CONTINUING ATTENTION.

AS I NOTED ABOVE, MUCH REMAINS TO BE DONE WITH THE PREFERRED ALTERNATIVE; AND MANY OF MY JUDGMENTS WILL BE RESERVED UNTIL I SEE HOW THESE POTENTIAL PROBLEMS ARE ADDRESSED.

THIRD: DOES THE PREFERRED ALTERNATIVE RESPECT THE INTEGRITY OF WYOMING'S INSTITUTIONS?

-12-

WYOMING HAS CREATED MANY ORGANS OF STATE AND LOCAL GOVERNMENT WHICH DEAL WITH VARIOUS ASPECTS OF COAL DEVELOPMENT. WHERE WYOMING HAS ADDRESSED THESE QUESTIONS, I NATURALLY OPPPOSE FEDERAL ACTIONS WHICH WOULD PRE-EMPT OR TEND TO AGGRAVATE FUNCTIONING STATE AND LOCAL AUTHORITIES. BY AND LARGE, THE PREFERRED ALTERNATIVE HAS SUCCESSFULLY AVOIDED THESE SORTS OF CONFLICTS. A NUMBER OF EXAMPLES ILLUSTRATE THE PROBLEM AND THE POINT:

(1) THE LAND QUALITY DIVISION OF THE DEPARTMENT OF ENVIRONMENTAL QUALITY HAS PRIMARY AUTHORITY FOR MINED LAND RECLAMATION IN WYOMING. IT IS POSSIBLE FOR STIPULATIONS IN BLM LEASES TO IMPOSE UPON THE DETERMINATION THAT ARE PROBABLY LEFT TO OUR STATE REGULATORY AUTHORITY. THE PREFERRED ALTERNATIVE HAS CONSCIOUSLY AVOIDED THIS CONFLICT.

(2) OUR INDUSTRIAL SITING COUNCIL PROTECTS THE HEALTH AND WELFARE OF WYOMING BY OPERATING PERMIT PROCEDURES WHICH THOROUGHLY EXAMINE NEW ENERGY FACILITIES IN WYOMING. INTERIOR HAS PROPOSED AN INVESTIGATION OF ITS AUTHORITY TO REGULATE THE END USES OF COAL, WHICH MIGHT AFFECT THE POWERS OF OUR STATE AUTHORITY. THE PROPOSAL IS CURRENTLY TABLED FOR FURTHER STUDY, AND I HOPE THAT IT WILL REMAIN TABLED INDEFINITELY.

-13-

(3) OUR DEPARTMENT OF GAME AND FISH IS THE APPROPRIATE MANAGER OF ALL OF WYOMING'S WILDLIFE RESOURCES. THIS PRIMACY IS RECOGNIZED BY SPECIFIC OPPORTUNITIES FOR PARTICIPATION THROUGHOUT THE SYSTEM, INCLUDING THE FIFTEENTH CRITERIA FOR EXCLUDING LANDS FROM FURTHER CONSIDERATION FOR LEASING.

(4) WYOMING HAS A LAND USE PLANNING STATUTE AND RELATED PROCEDURES. I WOULD OPPOSE ANY ATTEMPTS TO POSE SPECIFIC AND ADDITIONAL FEDERAL REQUIREMENTS ON THIS STRUCTURE, SUCH AS SPECIFIC PLAN CONTENTS OR SPECIFIC MEASURES FOR PLAN IMPLEMENTATION. WHERE STATE AND LOCAL LAND USE PLANS ARE REFERENCED, IN THE PREFERRED ALTERNATIVE, I HAVE NOT SEEN THESE SORTS OF REQUIREMENTS.

IN SHORT THE PREFERRED ALTERNATIVE GENERALLY EVIDENCES A PROPER REGARD FOR WYOMING'S STRUCTURES OF GOVERNMENT.

FOURTH: HOW WILL INTERIOR ADDRESS THE SOCIAL AND ECONOMIC IMPACTS OF COAL DEVELOPMENT?

MY VIEW IS, AND HAS BEEN, THAT INTERIOR CANNOT MANAGE ENERGY DEVELOPMENT IMPACTS. THIS OBLIGATION FALLS, IF NOT ENTIRELY, ON LOCAL GOVERNMENT AND STATE GOVERNMENT, IN THAT ORDER. THE ONLY CONTROL THAT INTERIOR CAN EXERCISE IS OVER THE TIMING AND SPATIAL

-14-

DISTRIBUTION OF NEW COAL DEVELOPMENTS, ALTHOUGH I
STADILY SEE THAT THESE AUTHORITIES ARE SUBSTANTIALLY
STRONGER UNDER THE PREFERRED ALTERNATIVE THAN UNDER
PAST PROPOSALS. HOWEVER, IN THE PAST INTERIOR HAS NOT
EFFECTIVELY EXERCISED ITS LIMITED AUTHORITIES; I AM
ENCLINED TO BELIEVE THAT THIS IS BECAUSE INTERIOR HAS
NEVER BEEN ACCOUNTABLE FOR DEVELOPMENT IMPACTS.

I SEE TWO POSITIVE DEVELOPMENTS ON THIS QUESTION:
THE FIRST IS THAT INTERIOR HAS ESSSENTIALLY ADOPTED MY
VIEW OF THE PROBLEM, AS EXPLAINED IN CHAPTER SIX OF THE
ENVIRONMENTAL STATEMENT.

THE RECORD IS THAT WE MAY JOINTLY ESTABLISH
PROCEDURES WHICH EFFECTIVELY INJECT IMPACT
CONSIDERATIONS INTO LEASING DECISIONS, DURING THE TRACT
RANKING AND SELECTION STAGE OF THE SYSTEM. TRACT
RANKING AND SELECTION WILL BE DONE ON THE BASIS OF
PRODUCTION REGIONES. ONE ALTERNATIVE FOR MAKING
DECISIONS ON RANKINGS AND SELECTION IS TO CONVISE A
COMMITTEE WHICH DIRECTLY INCLUDES STATE PARTICIPANTS**
IN THE PLATTE RIVER BASIN. POTENTIALY, TO CONVISE A
COMMITTEE OF FIVE: GOVERNOR'S REPRESENTATIVES FROM
WYOMING AND MONTANA, BLM STATE DIRECTORS FROM UTEPS
AND BOISE, AND A BLM OFFICIAL RESPONSIBLE FOR
PREPARING THE ENVIRONMENTAL STATEMENT ON THE REGION.
TRACT DECISIONS WOULD ACCORDINGLY BE MADE WITH DIRECT

-15-

STATE PARTICIPATION, BASED ON CRITERIA WHICH WOULD
INCLUDE THE IMPACTS OF INDIVIDUAL TRACTS AND THE
CUMULATIVE IMPACTS OF A PATTERN OF TRACTS. THIS
MECHANISM WOULD INCREASE MY CONFIDENCE IN THE WISDOM OF
THE TRACT JUDGMENTS AND INTRODUCE A NEW ELEMENT OF
ACCOUNTABILITY INTO FEDERAL LEASING. I STRONGLY SUPPORT
IT.

FIFTH: DO THE GOVERNMENTS AND CITIZENS OF WYOMING
HAVE AN OPPORTUNITY FOR EFFECTIVE PARTICIPATION IN
LEASING DECISIONS?

ON PAPER, THE PREFERRED ALTERNATIVE IS RIDDLED
WITH OPPORTUNITIES FOR PUBLIC PARTICIPATION. LOOKING
TO THE STATE ALONE, THERE IS APPARENT OPPORTUNITY AT
EVERY STAGE OF THE PREFERRED ALTERNATIVE. THERE ARE
INVITATIONS TO ENTER INTO FORMAL AGREEMENTS WITH THE
BLM STATE DIRECTOR FOR BLM'S LAND USE PLANNING. THE
UNUSABILITY CRITERIA INCLUDE OPPORTUNITIES TO PROTECT
STATE RESIDENT FISH AND WILDLIFE. DEPARTMENT OF ENERGY
PROJECTIONS ARE MODIFIED WITH STATE CONSULTATION. AND
TRACT RANKING AND SELECTION MAY ULTIMATELY BE
IMPLEMENTED WITH FULL STATE PARTICIPATION.

DESPITE THE ATTRACTIVENESS OF THE PROGRAM DESIGN,
THIS QUESTION CAN ONLY BE ANSWERED IN PRACTICE. I
WOULD BE LESS THAN CANDID IF I WERE TO PRAYSE OUR PAST
WORKING RELATIONS WITH BLM IN THE FIELD. MOST STATE

-16-

OFFICIALS FEEL THAT WORKING PARTICIPATION WITH BLM
MEANS HAVING MORE THAN THE SURFACE HOUR OF CHOKING
ENDLESS PAPERWORK, WELL INSULATED FROM ANY SUSTAINING
EFFECT ON FEDERAL RESOURCE DECISIONS. THIS
DISSATISFACTOR HAS BEEN AMPLIFIED BY BLM'S OWN
DIFFICULTIES WITH ESTABLISHING A REASONABLE STRUCTURE
BETWEEN WASHINGTON AND THE FIELD. THE ONLY STRUCTURAL
CHANGE IN THE PREFERRED ALTERNATIVE WHICH CLEARLY
COUNTERS THESE PROBLEMS IS THE SCHEME FOR TRACT RANKING
AND SELECTION, WHICH FEATURES DIRECT STATE
PARTICIPATION.

I DO NOT REGARD THE SITUATION AS HOPELESS.
HOWEVER, FOR THE SHORT TERM, I WILL LOOK TO THE GROWTH
FOR INFORMAL, RATHER THAN FORMAL, WORKING RELATIONS
WITH BLM TO SEE WHAT THE FUTURE HOLDS. IT IS MY GOAL
TO DISCUSS MATTERS OF MUTUAL INTEREST ON A TIMELY
BASIS, WITH REASONABLE MAPPOWER DEMANDS ON BOTH SIDES.
I WILL RESERVE JUDGMENT ON THE MORE AMBITIOUS ASPECTS
OF THE PREFERRED ALTERNATIVE UNTIL I HAVE A CHANCE TO SEE
IF PROGRESS IS POSSIBLE ON THESE SIMPLER INTERACTIONS.

SIXTH: DOES THE PREFERRED ALTERNATIVE PROGRAM
FORCE UNDESIRABLE ADMINISTRATIVE BURDENS ON WYOMING
TAXPAYERS? DOES IT IMPLICITLY REQUIRE MODIFICATIONS IN
EXISTING LEGISLATION AND BUDGETS?

WYOMING HAS BROWN HEAVY OF FEDERAL PROGRAMS WHICH

-17-

REQUIRE STATE TAXPAYERS TO FOOT THE BILL. IN THE
EXTREME CASE, INTERIOR'S OFFICE OF SURFACE MINING. I
EVEN SEE A NEW FEDERAL BUREAUCRACY WHOSE SOLE PURPOSE
IS APPARENTLY TO HARASS AN ESTABLISHED AND EFFECTIVE
STATE AGENCY. IN THE SAME CAST, WYOMING HAS BEEN
SUBJECTED TO ENDLESS AND DRASTICIAN DEMANDS FOR
ADJUSTMENTS TO STATE LEGISLATION WHICH IS ALREADY
PROTECTING THE ENVIRONMENT.

I DO NOT BELIEVE THAT THE PREFERRED ALTERNATIVE
CREATES THESE SORTS OF PROBLEMS. THE PROGRAM IS
STRUCTURED AROUND STATE OPTIONS, NOT STATE
REQUIREMENTS. THERE ARE NONE OF THE BURDENOME
STATUTORY DEADLINES WHICH ELIMINATE WYOMING'S ABILITY
TO EXPERIMENT WITH EFFECTIVE GOVERNMENT. NO NEW
LEGISLATIVE AUTHORITY WILL BE REQUIRED TO PARTICIPATE
AT ANY STAGE. AND A DETERMINATION ON NEW MAPPOWER
REQUIREMENTS CAN WAIT UNTIL I HAVE HAD A CHANCE TO SEE
IF THE PREFERRED ALTERNATIVE IS IMPLEMENTED AND IF IT
WORKS.

NOR DOES THE PREFERRED ALTERNATIVE REQUIRE
MODIFICATION OF WYOMING'S OWN COAL LEASING SYSTEM.
OURS IS ALSO A GREAT DEAL LESS EXPENSIVE TO ADMINISTER,
AND ITS PRODUCTION IS LIKELY TO BE CONTROLLED BY
FEDERAL COAL MANAGEMENT DECISIONS. WE CAN WELL AFFORD
TO WAIT AND SEE WHETHER ADJUSTMENTS ARE NECESSARY.

-18-

I BEGAN THESE SIX QUESTIONS WITH A WORD OF CAUTION AND I BELIEVE THAT I CAN CONCLUDE WITH CAUTIOUS OPTIMISM. GIVEN THE FUNDAMENTAL CONGRESSIONAL CONSTRAINTS, THERE IS A GREAT DEAL TO LIKE IN THE DESIGN OF THIS PROGRAM. THIS MUST BE BALANCED AGAINST SUBSTANTIAL UNCERTAINTIES CONCERNING ITS OPERATORS AND ITS IMPLICATIONS FOR THE FUTURE OF FEDERAL/STATE RELATIONS IN WYOMING. THIS UNCERTAIN BALANCE RAISES A FINAL QUESTION OF ITS OWN: WHAT DOES THE STATE INTEND TO DO NOW?

FIRST, I INTEND TO CONTINUE PARTICIPATION IN THE PROGRAM DESIGN EFFORT WHICH BEGAN LAST APRIL. AS I HAVE INDICATED REPEATEDLY, THE PROGRAMMATIC ENVIRONMENTAL STATEMENT IS LARGELY COMPLETE, BUT MUCH REMAINS TO BE DONE ON THE PROGRAM. I PREFER TO BE A PART OF THOSE DECISIONS, IN CONJUNCTION WITH THE GOVERNORS OF OUR SISTER STATES IN THE COAL-PRODUCING WEST.

SECOND, FOR THE NEAR TERM I WILL EXPLORE THE VARIOUS ASPECTS OF STATE PARTICIPATION IN THE OPERATION OF THE PROGRAM. AS I SAID EARLIER, THE FIRST LEASE SALE WILL NOT BE A FULL-FAVORABLE EFFORT. IT APPEARS THAT I CAN PROCEED WITHOUT NEW COSTS TO THE PROGRAM TAXPAYERS.

THIRD, FOR THE LONG TERM, I WILL WAIT AND SEE WHAT

+19-

HAPPENS.

I WISH TO THANK YOU FOR THE OPPORTUNITY TO APPEAR TODAY, AND I HOPE THAT THESE VISITS HAVE BEEN HELPFUL.

NATIONAL PARK SERVICE
WASHINGTON, D.C. 20580

02/03

MEMORANDUM FOR:

154134135

To: Director, Bureau of Land Management

From: Director, National Park Service

Subject: Comments on Draft Environmental Statement, Federal Coal Management Program Final Environmental Impact Statement

General:

The preferred alternative seems the most sound of the seven presented. However, throughout the report and particularly in Chapter 7, it is hypothesized that new coal leasing will be needed to support the program. Existing non-producing leases will be canceled in 1984. The leases which are to be canceled are those which are "leaving the scene of the crime" and should be eliminated. New ones at the same time should be established. Once the new leases are established, the Bureau should be able to extend non-producing leases as outlined in section 3.1.1.3. It might develop that enough acceptable leases exist to satisfy the needs of the program for a new leasing program. Although some names might be found to put the "good" leases back into production, the possibility is never discussed in the DEIS.

Considering the general scope of this programmatic EIS, the document appears to be somewhat incomplete and lacks certain physical and biological descriptions of environmental impacts and losses are as accurate as can be expected within the broad parameters of the EIS. The physical and biological aspects of the EIS gives appreciable estimates to habitat as well as historic, cultural, and economic impacts. The social and legal aspects covering the physical-biological, socio-economic, and legal aspects resulting from or related to renewed coal leasing.

Washington, D.C. 20240

Dear Mr. Gregg:

This is in reference to your draft environmental impact statement entitled, "Federal Coal Management Program." The enclosed comments from the National Council and your administration are forwarded for your consideration.

Thank you for giving us an opportunity to provide them. We would appreciate receiving eight (8) copies of the final environmental impact statement.

Sincerely,

Audrey R. Jolley

for Environmental Affairs

Enclosure

Memo from:

Mr. Douglas M. LeComte
Environmental Data and
Information Service
GA/Dx1

P- 2412
The trend of increasing production of oil and gas from the 2-31 "overburden belt" is not discussed. Supplies becoming available from this new source should markedly affect growth of the energy needs in the West. It is recommended that the majority of Federal leasing would take place.

Pages 2-59 thru 5-32 show tables of estimates of emissions of SO₂, particulates, and other pollutants for 1970 and 1980 under the current program. These figures are not discussed. It is recommended that the western areas, in particular those in the Northwest, receive more attention. It is recommended that the provisions of the Air Act Amendments of 1977 are fulfilled and that the program is implemented in a timely manner and that the air quality related values that are slightly significant to the environment of units of the National Park System in this region.

MEMORANDUM

To: Office of Coal Management (140)
National Council
Washington, D.C.

FROM: Acting Area Manager
U.S. Fish and Wildlife Service
Salt Lake City, Utah

SUBJECT: Draft Environmental Statement - Federal Coal Leasing Program - December 1978

The Fish and Wildlife Service's Salt Lake City Area Office's geographic area of responsibility includes Utah, Colorado and, in some matters, the area from Idaho to Wyoming. We have reviewed portions of the draft statement that apply to our area.

In general, the draft statement is well prepared, and does a good job of addressing impacts on fish and wildlife resources to the extent possible. However, the draft statement has several shortcomings. The approach fails to adequately cover some significant fish and wildlife problems.

Section 2.6: Overview of the need for a Federal Coal Management Program. We wish to emphasize the importance of considering Federal coal leasing as a component of a total energy resource mix. The objectives should be a Federal-State-private combination that produces a pattern of development with the least total adverse impacts.

Section 3.1.1: The Preferred Program

The seventh element of the preferred program, "a strategy to integrate environmental protection and energy development," is extremely important. It is important for national and regional leasing programs to adequately address environmental impacts and to implement appropriate measures. There must be a mechanism for identifying and solving site-specific problems on a site-specific basis.

2.

Table 3-1 on page 3-10: State Resident Fish and Wildlife

The three examples of criteria for lands suitable for development are inadequate. Critical areas are not defined. Buffer zones are not defined. Critical areas do not include areas of high biological diversity, such as sage grouse, elk calving areas, and antelope feeding areas will be considered. Migration corridors for all big game animals should be included. Critical habitat for all species in a range should be included rather than only the most critical ranges.

Table 3-1 on page 3-12:

Under criterion and exception the last sentence for Falcon Cliff nesting sites are incomplete:

"Consideration of availability of habitat for raptor species shall be," Add, "Included in determination of buffer zones."

"Buffer zones may be increased or decreased if the land management agency determines that the active falcon nests will or will not be affected."

Section 3.2.1.4: Threshold Development Levels

We endorse the concept of threshold development levels for a given area based on land use planning rather than going solely by industry's interpretation of what constitutes a threshold level. We believe that it is preferable than actual numbers of animals or percent of population. Some wildlife populations fluctuate drastically from year-to-year while a given area of

4-26, and 2nd Column, 1st full paragraph, 2nd sentence:

"Foothills" should be Foothills.

4-26, 2nd column, 1st full paragraph, 2nd sentence:

Should be "should" was "will" throughout. In some sentences, the white-tailed prairie dog occurs in the Uinta-Southeastern Fish Region. It to doubtful if it occurs in the Green River - Hans Fork Region.

4-26, 1st Column:

After 4th full paragraph, insert "The sagebrush biome is a winter concentration area for golden and bald eagles."

4-6-4.6-2: The Environment and Man

1st paragraph, Danger Cave is in Tooele County, Utah (not Wyoming). It is also outside the Green River, Nine Fork Coal region.

4-29, 1st Column, 2nd full paragraph:

"Beachdoden" should be "Beachdoden".

6-23, 1st Column, 5th paragraph:

The Uinta-Southeastern Utah region has areas equally as adverse to Reclamation efforts as those mentioned.

5-4-1: Green River - Nine Fork Coal Region

The endangered fish mentioned are not described by "the cold, clear waters of the upper Green River" but are essential Colorado River fishes. These require the turbid, relatively warm waters of the lower elevations. The construction of dams and diversion of water from the river, cold waters by construction of reservoirs and trap sediment and toxins in the Colorado River structures is one of the main reasons for the decline of these species.

5-4-2: Uinta - Southeastern Utah Coal Region

Hunting areas for golden eagles and winter roosting concentration areas for bald eagles would be potentially affected.

Table 8-1: Estimated Regional Carrying Capacities and Primary Productivities

The acres per season (Figure 8-1) come from EPA's original. The acre per season number is 100,000 acres in the Uinta-Southeastern Utah region. The average capacity for 15 hard units is 1000 acre miles per unit based on the 100,000 acre per season figure.

We have attached our most recent copy of the Utah State Division of Wildlife Resources' comments on the draft environmental statement for the Department's Coal Management Plan. We concur with their comments that the proposed coal management plan must adequately accommodate the State Division of Wildlife Resources' and the Fish and Wildlife Service's concerns.

This opportunity to comment is appreciated.

Mitchell C. Shultz

Attachment

site-specific criteria. The complexities of reclamation potential, site-specific conditions, and other factors can define a specific site-specific criteria at the planning level, without good scientific data.

EPA is recommending that initial determinations for these criteria be made at the activity planning/extract reclamation stage, still prior to lease issuance. This will allow for the collection of basic information, gathering of data on soils, geology, air quality etc. In the long term, we believe that the data collected during the planning and early mining stages (and subsequent mining plan review stage) could eventually be factored back into lease/renewal plan assessments. This approach does not mean that the data collected at the planning stage would be used in the MFTs when empirical data is sound enough. This data development will take a number of years, however, and it is important that the criteria be developed for air quality and soil-quality before they could be used at the test area.

We understand that Interior had requested EPA participation some time ago in the development of sensitivity criteria. We apologize for our lack of participation but we hope the recommendation can be incorporated into the final EIS.

3. Water quality and water quantity impacts will be of National and international significance, and are carefully evaluated in the EIS. The EIS will include a detailed description of the water quality issues presented in the EIS relative to other available information. It was agreed that we would get the preparedness of the agency to address the effects of water quality on the environment. We reiterate that a better assessment of coal-related water quality impacts is needed, particularly assessing the effects of acid mine drainage and leaching.

4. Management Framework Plans (MFP's) — the backbone of the Department's plain-lease plan for the coal leasing program — former leases. We discussed the problems with the former leases and the difficulties in characterizing the program for which we apologize. EPA's experience with MFT's reviewed in the course of EIS reviews has been that there are three major problems with the former leases: 1) the lack of protection of resource conflicts highly skewed toward coal development, and lack of public participation in the review and revision process.

We are particularly concerned with the lack of data on MFT's that affected the coal leasing process. Following our meeting last week, we now understand that much of the critical data used in the EIS needed for sensitivity determinations came from the tract analysis stage of the EIS, as discussed under point 1. There are other data gaps such as mineral and water quality data, which are being addressed by the new data mining Interior Task Force set up for this reason. We do think that Interior should formally evaluate and revise the existing MFT's data needs (using the list of data gaps) as soon as possible to facilitate commercial as soon as possible in program implementation.

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
WASHINGTON, D.C. 20460

2011-1979

30261

Office of Air
Administrator

Honorable Gary R. Martin
Assistant Secretary for Land
and Water Resources
U.S. Department of the Interior
Washington, D.C. 20240

Dear Mr. Martin:

We are pleased to provide you detailed comments on the Final Coal Management Program Draft Environmental Impact Statement. These comments are a response to your letter to us dated January 10, 1979.

We are indicating our position in the interest of fairness to the Department of Interior. We are pleased with the proposal and the outstanding job done by the EPA Region VIII staff and the Interior staff. I am grateful to my staff, EPA Region VIII staff and I were able to meet on March 13 with Dr. John T. Hargan, Director of the Bureau of Land Management. This meeting allowed us to explore the merits of our recommended position and to better understand the position of the Interior. We thank you for your cooperation. We agreed that EPA would follow up this meeting with a re-statement of its position to reflect this dialogue.

Since the meeting agenda was concerned with the five points in our initial letter, we offer the following additional information on these points:

1. The unsatisfactory criteria need further refinement and consideration of other environmental factors that can affect success.

It is our recommendation that two other potential unsatisfactory determinations affecting coal leasing decisions be added to the list of significant determinants (MFT) from viability impacts for Class I air quality assessors. The first is the potential impact of acid mine drainage. We also concerned that the proposed reclamation unsatisfactory criterion was not well integrated into the proposed MFTs.

We continue to believe that these three criteria can and should be part of the unsatisfactory criteria. We do not believe, however, that the land-use planning (LUP) level should necessarily be the focus for these three

Our second consideration regarding MFT resource conflict resolution may have been received in the development of unsatisfactory criteria. With the exception of conflicts between mining and grazing or timbering, other conflicts such as water rights, energy, and mineral conflicts are not included in the MFTs. EPA has no concern about management transfers of timber, timber and mining, as long as postleasing multiple uses can be treated (treating like resources).

Our final concern is the lack of published MFT documents and difficulty of having public and agency access. As we now understand it, Interior will publish the MFTs in the Federal Register and make them available to the public. This document will define the unsatisfactory/allowable areas within each MFT. EPA will review the document until we have had an opportunity to evaluate these documents we would appreciate as soon as we can if possible.

While we have seen some difficulties in using individual MFT's as a management tool, we believe that the individual MFT's can be used to the stated ends. What is needed is a commitment by Interior to identify the MFTs and make them available to the public and the agency for review. To what extent or whether this data acquisition would delay some portion of the program development we cannot determine at this time.

4. The nature of existing Federal mineral land production and Preference Rights (PR) will be considered in the overall assessment of environmental stewardship. EPA's recommendation to comprehensively evaluate existing leases and to try to negotiate a reasonable lease price for existing leases makes good sense. We also think that a good faith effort to "clean up" existing leases "as best as possible" would also be positively received by the agency public.

We are sympathetic with the Department's position as it was presented in our meeting. EPA's position has been that it will handle existing issues and problems as they arise and will not be involved in the PR issue. We understand that you have been advised by your Solicitor that the Department will evaluate existing leases and EPA's for unsatisfactory et al earlier stage.

EPA's recommendation at this point is for DOI to publicly explain (to the extent permissible) the rationale for this position. As we understood it, the Department's position is that it will not be involved in the PR issue. We understand that you have been advised by your Solicitor that the Department will evaluate existing leases and EPA's for unsatisfactory et al earlier stage.

5. The last Management Program EIS has not explained how the agency's regulations of regional EIS's will be implemented under the proposed Federal Coal Management Plan EIS, and how the new regional EIS's will be integrated into the program. EPA's lack of explanation of how its own regulations will be applied is an incorrect impression that more work had already gotten underway relative to the new regional EIS's. We urge the Department to take part in the ongoing effort for these regional EIS's.

I hope this letter signifies EPA's desire to work closely with the Department in developing an environmentally compatible coal leasing program. We believe that the Department's coal leasing program, particularly the use of lease-use plans and unsuitability criteria, EPA would be ready sooner than the Department where it can be developing a sound coal management program.

Sincerely yours,

William H. Neidman, Jr.
Director
Office of Federal Activities (OFA)

DETAILED COMMENTS OF THE ENVIRONMENTAL PROTECTION AGENCY ON THE U.S. DEPARTMENT OF ENERGY'S DRAFT FEDERAL COAL MANAGEMENT PLAN EIS

A. SUMMARY OF CONCLUSIONS AND RECOMMENDATIONS

EPA believes that the programmatic draft EIS provides a sound basis for evaluating the overall coal management program, and evaluation of most of the impacts and effects of the proposed program. However, there are environmental reservations in five specific areas that need further evaluation and resolution in the final EIS:

1. The unsuitability criteria -- are incomplete and need further refinement. Specifically, the criteria do not provide for prevention of significant deterioration (PSD), particularly visibility, for Class I air quality areas, and do not provide for protection of water source aquifer protection. The provisions for PSD and water source protection may be too vague to be effectively implemented. Furthermore, the proposed impact evaluation criterion -- "reasonably foreseeable" -- is not clearly defined and not well integrated into the overall coal management program.

2. Water Quantity and water quality impacts will be national and inter-regional. Specifically, the new study evaluated water needs for coal mining operations in water-short regions, such as the Great Plains, by the Water Resources Council or other agency programs. The water quantity and quality need particular attention. The EIS did not evaluate the potentially significant problem of future water availability and demand.

3. Leasing Management Framework Plans (LMFP's) -- a key element in the Department's 1981 Coal Management Program -- have not been accounts for their intended purpose. Specifically, the LMFP's are based on lack of data, which will be important to the success of this program. Few have had much input from the public, were largely discretionary and had only advisory status and they were not developed in a timely manner. Resolution of resource management conflicts in past MPP's indicated a strong policy bias in favor of coal development.

4. The status of existing Federal leases and programmatic EIS's is sketchy. More detailed information is needed in the EIS on the issues of existing leases and EIS's. EPA prefers that the Department should handle these issues through a separate planning process of the Secretary's preferred program. The first order of business should be to try to eliminate those leases that pose the greatest environmental concern.

5. The Coal Management Program EIS has not explained how the proposed regional EIS's will be improved over existing regional EIS's and how the new regional EIS's will be integrated into the program. The new regional EIS's have the potential for evaluating the cumulative impacts of coal mining and for defining the threshold environmental criteria which can be used as a basis for decisions. However, their role in the overall coal management program should be defined now, as decisions are made regarding the structure of the program.

RECOMMENDATIONS

1. As a consequence of our position that there are still substantive deficiencies in the proposed programmatic EIS, we recommend the EIS recognizes that some of the existing leases and EIS's are not acceptable and we are asking the Department to arrest the Federal leasing program until these leases and PLAs are corrected. We urge the Department to concentrate on making the necessary changes and end the leasing phase to identify unsuitable areas for coal mining. In the near term, the program should be oriented toward replacing those existing leases that are unsuitable for mining. We are aware that budgetary constraints may prevent this alternative from being implemented.

2. The unsuitability criteria should be expanded to include the environmental regulations for the prevention of significant deterioration (PSD) for air quality, involved riverine waters, and areas of significant and wilderness areas falling under Class I. This would be a minimum set of criteria which should also be included in the critique. Finally, an environmental impact statement should be made at the tract selection phase before any leasing is done. This information would allow for a more informed decision on regulation, hydrology, geology and soil conditions. It would also allow for a more accurate evaluation phase at the best point to evaluate unsuitability and to propose changes.

3. EPA referred program needs to strengthen the unsuitability criteria generally and improve the existing land-use planning process. EPA's proposed EIS should include a better definition data needs for program development and implementation of threshold criteria into the land-use planning activity process. Better public and agency communication should be made available before the leasing process is started.

4. Water quantity and water quality evaluations should be conducted. Specific uses should be better identified. In particular, the Department should consider the need to focus closely on salinity problems, using data from recognized sources such as the Colorado River Basin Commission's study of alternative water quality impacts. The Department will need to identify the specific problem areas and the problem of trace metal contamination developing rapidly in some areas in a number of coal producing regions.

5. The Department should move toward more of a problem-solving approach in the next round of rulemaking. This would mean addressing regional environmental-social problems, rather than individual environmental problems. This approach should be developed and established in the EIS process. We request that EPA be named as a formal participant in the "leap-frog" process for these EIS's.

-3-

5. Current efforts of the Department to develop a Federal coal management program in this EIS, in proposed regulations, and at the Field Level, represent a continuation of the same approach to implementation of a long-term program and a "problem-solving" approach. EPA thinks it critical to an evaluation of the consequences of any proposed program and is addressing again further on our comments.

We believe that Interior's approach so far articulated in the EIS discussion in the BLM proposed regulations (pp. 30-31, draft EIS) and in the sample December 1979, pp. 30-31, draft EIS) does not go beyond the basic concept of the EIS and does not address the contentious issues of methodology and issues surrounding transition. Resolution of issues surrounding the EIS and its methodology and correcting past BLM planning deficiencies are part of the EIS. However, the lack of resolution of these issues of controversy for years to come, however possible in our comments, should be taken into account in the EIS through a shorter term interim discussion or series of decisions. Ultimately we think that the EIS should be evaluated on the basis of how well the transitional issues are handled.

3. EPA thinks that a number of important areas of the EIS need to be addressed in the coal management with the currently preferred DOI program. We are particularly pleased with the development of unsuitability criteria by the BLM in the land-use planning process and the coal program. We recommend that the BLM should identify those sensitive areas from coal development before the long-term lease begins. We believe that the way to an effective environmental planner, if the threshold criteria (discussed in p. 4) can not be improved, is the environmental and social identified in the regional EIS's many of the objectionable features of the proposed program and the PMLA's. Obviously, the more stringent review and approval requirements of the proposed EIS and the Coal Leasing Act will also improve the long-term consequences of mining.

4. We do have a number of serious concerns about some of the elements of the preferred program and long-term environmental impacts particularly

our analysis of the proposed Coal Management Program. Indications that we have received from the BLM staff is that the environmental acceptability of the program, and that more information should be developed on the environmental impacts of the program. Our procedures require that environmental impact statements and EIS's be made available to the public, and that our overall assessment is "EA-2" (Environmental Reservation/Sufficient Information).

There are also a number of other issues we have identified which the BLM staff and the Department should consider in the preparation of the final EIS.

B. GENERAL COMMENTS ON THE EIS AND PROGRAM DEVELOPMENT

1. We commend the Interior staff for the conscientious work shown in the draft EIS. The EIS is a dramatically improved document. We notice an overall improvement in the EIS, and considerable discussion of environmental impacts of the various program alternatives and the scope of the EIS. Our comments are directed at the EIS itself, and the BLM's efforts. Many of EPA's past objections to the programmatic coal leasing EIS have been resolved. However, the scope of the EIS, the program itself and the environmental impacts of the various approaches and impacts. Finally, we note a much more systematic evaluation of impacts through the EIS and the PMLA's, and occasionally outside consultants as necessary.

We hope that the Department will continue to follow-up on our comments to write a preproposal EIS in its subsequent EIS efforts. Past DOI efforts have been characterized as being structured as very short on cutting out issues of significance. We think this neglects the spirit of the Council of Environmental Quality's new regulations. These regulations require a more comprehensive treatment of environmental issues and their impacts in EIS's. We do think that larger print would be advised, and that the EIS should include extensive information contained throughout the document. The EIS could also use a comprehensive Table of contents.

-4-

affecting air quality, water quality and solid waste. The draft EIS is vague in discussing the methodology for determining the amount of coal to be leased. We have several concerns and describing program implementation. These concerns are detailed in the following sections.

C. THE NEED FOR NEW LEASING

This question is at the heart of the controversy surrounding the EIS. The BLM has not yet issued recent legislation. The Department has developed an environmental charter which attempts to demonstrate a rational for leasing in a series of factors. These factors are cited as reasons for resumption of leases.

*greater assurance of meeting national energy objectives;

*means of preventing more undesirable patterns of coal developments;

*significant administrative and legal advantages to the Department and;

*improving competition in the western coal industry.

It is not EPA's intention to fully evaluate all of these merits and demerits except where environmental impacts of the leasing are involved. However, based on our experience with western Federal Coal Leasing, we believe that the Department should add some considerations we feel are important to a resolution of the question of new leasing.

As a first step, the Department needs to present a critical discussion of the status of the present Federal leases and PMLA's. We are particularly interested in the EIS's contention that the Department has made some evaluation of the environmental impacts of the leases and PMLA's. Yet this most critical discussion has not even been presented. We believe that this presentation should be made in the EIS. A necessary first step is to present a critical discussion of the situation via regional maps of these leases (with and without mining plans) and PMLA's in the final EIS.

-5-

EPA is also aware that the Department has begun an evaluation of high-priority Management Framework leases and is using the proposed usability criteria. We have no specific reservations regarding the criteria as presently listed. However, we believe that there is a need that an essential first step in implementing the framework approach to management of leases would be through usability evaluation of existing Federal leases and PPLA's. Only when it is determined where current lease terms and amounts of existing leases that are non-usable can effective leasing decisions be made. This would be an intelligent appraisal of needed new leasing needs.

2. Since the preferred leasing system will supersede production levels from above (EOD national projections), it would seem important to have a mechanism to convert the outstanding leases granted/actual production levels into coal tonnage potentially available annually (based on a 30-year mining life) to estimate future leasing needs. This would be the order of 1551. Recognizing the numerous uses of coal, the appropriate amount of assessment given thought to what kind of ratio would be appropriate for setting what lease areas should be developed.

3. Although the assessment of likely coal production on pages 2-20 through 2-38 assumes current lease terms, it does not reflect actual levels of production over a 30-year period; recent experience has shown that lease terms are considerably less than expected. Increasing their production if no demand is there, we can find no basis for doing so. The Department's proposed legislation that would limit yearly increases in production by 10% is a good idea. The costs of this approach are attractive, requiring minimal additional capital investment.

Inputs of production beyond mining plan levels do not appear to be necessary due to uncertainty to those planners who will try to estimate future leasing needs. Let us hope the Department tries to make an assessment of what

the upper limit of annual coal production is likely to be over time in terms of a minimum number of years of production from leases. If there are other steps practical, cost-effective, and feasible, this tendency to maximize production from leases should be limited.

4. Although we are sympathetic with the U.S. Government's desire to promote greater competition in the eastern coal industry, we wonder whether additional leasing would be any practical benefit in this regard. It would appear that the best way to increase leasing levels could do so simply by buying them (through acquisition or leasehold) without an additional leasing charge. This situation is in any discernable way?

Other reviewers have indicated that there seems to be little incentive to convert existing leases that have been sold. Recent sales of leases have been at prices below market value. Whether a situation of greater competition among lease holders might result from new leases rather than existing ones is not clear. EPA recognizes that diligent development requirements may be a factor in this regard. It would be appropriate to consider whether a provision to eliminate re-sale of leases might further encourage leasehold sales. Although there may be benefit in having a resale of present leases, we can see no good reason why such a provision should be included unless it is advantageous to government or commerce. A lease could be resold if the lessee so desires, if necessary. Would a statutory change be necessary to implement such a provision, and if so, how? The Department should be advised of how will the Department police assignments that are made.

5. EPA strongly endorses DOI's concept of using the Federal Coal Management Program to correct past deficiencies, particularly in the areas of lease transfers, PPLA's, and environmental usability. Given a workable and timely assessment of existing leases, evaluation and updating of land-use plans, and given changes in the National Energy Plan and PPLA's via these criteria, EPA believes that a successful transition period leasing program could begin relatively soon.

-7-

-8-

We recommend that Interior approach new leasing in the short term as a corrective interim measure to the problems of the coal leasing and management programs. The first order of business should be the retirement of the most undesirable leases.

EPA proposal that Interior consider new leasing on a case-for-one basis with leases lasting up to 30 years is a good idea. It should further strengthen this approach through a detailed assessment of impacts through its role existing on coal management and BLM land-use planning. The department could formalize the process for transitioning leases to private hands in return for relinquishing undesirable leases and PPLA's.

From the standpoint of coal resources already under lease, EPA files little justification for more leasing in the near term, even some of the leases have been held for years. The decision to retransmit in 1985 (if not under development) were based on the assumption that the 1985 crunch of due dates for leases could be delayed, allowing more time for rational planning.

D. ENVIRONMENTAL IMPACT ANALYSIS

In a general programmatic treatise such as this EIS, there are definite limitations on what kind of detail it can provide. In the past, EPA has, in the past, faulted the Department for its lack of relevance in evaluating and discussing environmental impacts. This EIS is a good example of a great deal of information that has little in the way of relevance for the EIS. The concepts of "significance" or "importance" are essential in sorting out the mass of EIS data into a meaningful evaluation.

To a great extent, the past approach has been modified on this EIS, more in line with the recent EIS direction toward concise and relevant EIS. EPA feels the identification of issues in this EIS

and their often candid discussions. EPA will occasionally have disagreements on how the issues are resolved, but we generally approve of the format that this EIS has demonstrated.

A second general improvement is a more systematic definition and evaluation of impacts. We think that the EIS has done well in demonstrating to a reasonable degree that the environmental impacts of alternative ways of leasing (or not leasing) coal are small compared to the basic decision to trend toward a reduction in coal's major role in the nation's energy production. If anything, the quantity of impact is small enough that the impacts expected from the National Energy Plan...

EPA still has some concerns, explained below, about various impact parameters, particularly those associated with water quality. There is a valid question though whether much of the nationwide data used in this EIS is relevant for further decision-making. At this point, we don't think that the data is quite adequate for certain parameters in certain regions, there appear to be some constraints developing to the process of gathering data. One potential concern is the possible benefit of this EIS data is that areas of significant water limitation need of further research can be occasionally defined.

Our comments in this section reflect where we think that there may be a valid programmatic rationale for concern about certain parameters we accept Interior's position that such issues must be addressed in site-specific reports for site-specific cases. Our concerns about impact estimation found in Chapter 5 of this EIS are found below.

1. Water Quality/Water Supply

EPA considered this impact to be one of genuine national/regional concern. Water limitations could directly impact on the coal industry's future progress. Unfortunately, the water resources/water quality portions of the Draft EIS on the Federal Coal Management Program are very brief. At this point, it is difficult to make any meaningful sense out of the information. It is not at all clear what specific

-9-

-10-

water uses are included in the various alternatives. EPA specifically states that it is unable to directly compare figures in the draft with estimated water uses from other sources. "The water requirements, w/ hydrologic and water quality estimates presented by Salinity Forum, Appendix A. These projections are somewhat conservative, but they provide the best case possible to make a direct comparison between the forward projections and the figures in the draft EIS."

A similar section exists in the trying to compare information in the Draft EIS with the 1981 study "Water Use Energy Assessment: Upper Colorado Basin." This section is very similar to the one in the Draft EIS came from the WDC draft National Water Plan. It is not clear whether this is the case.

We question some of the basic assumptions the DOI has made in estimating water requirements for the Federal coal production program. We believe that the staff should have attempted to integrate the water requirements of the WDC and the Water Resources Council (WRC) with the water requirement estimates from the draft EIS to determine the best alternatives. Double counting the water requirements for coal development (using the same methods and assumptions for the entire water supply analysis) that much more inaccurate. Further, we do not believe that the water requirements calculations of water requirements (in 1985) for development of the coal production program are accurate. The estimates of consumptive water requirements of the no 1000 and 1100 water-short areas like the White/Southwestern Utah and Green River basins, and the 1000 water-short areas like the Green River and upper main stem Colorado River basins are not accurate. The water requirements in these two watersheds, with no more than 40,000 acre-feet/year and 30,000 acre-feet/year, respectively. These estimates are higher than the actual water consumption in the Green River watershed and Green River/lower Colorado River basin areas. Coal mining and mining [31,000 acre-feet/year and 36,000 acre-feet/year, respectively] would increase the water requirements for coal development in the year 2000 by 10,000 acre-feet/year. We believe that past water consumption figures in order to project accurate future water requirements for other coal options.

-11-

EPA believes that treatment of potential water quality impacts in this EIS is inadequate. Impacts on water quality could be severe. The EIS states that the water quality of the Colorado River there is a "modest impact" on the Colorado River. This is a major issue (national and international concern). The EIS does not state if this is correct, etc.) and that coal development could have a significant impact on the Colorado River. One of the draft's deficiencies is its failure to adequately address potential impacts on rare and endangered species in the Colorado River.

The EIS especially needs to assess the cumulative impact of strip mining on levels of soil salinity and groundwater salinity. In addition, there is a great deal of variability in the soils in the coal regions. Strip mining can affect a portion of each decade of the soil profile through new strip mining could expose leachable salts to the groundwater-surface water system. Further, ash disposal sites could pose a long-term leaching potential to the Colorado River. The EIS does not state what kind of the likely effect on the Colorado salinity problem should be made with the various 1985-1990 proposed coal development programs.

A second potential water quality issue of interregional concern involves the presence of tritium in the Colorado River and the Colorado River basin waters near existing mining operations. A study has been prepared by the U.S. Geological Survey for the Colorado River Program to assess the magnitude and details of the problem. The study has not been completed. It is anticipated to indicate whether this is a regional or more localized problem. No specific data has been reported which clearly identify this problem and indicate whether any studies will be funded to evaluate the full dimensions of this potential water quality problem. EPA would be willing to work closely with DOI in evaluating this problem.

-12-

2. Air Quality

EIS places a great deal of attention on cumulative air quality impacts. EPA thinks this is appropriate, but we believe that it is incomplete. Many of the potential air quality impacts described in the EIS are the result of the modeling and analysis procedure which attempts to determine the best way to produce coal. As the DES states:

"While many impacts, both beneficial and deleterious, are associated with the coal production that would result from different coal production options, a wide range of impacts would result from emissions associated with combustion, conversion, and use of coal."

We submit that the principal air quality impacts are in the latter category. To be sure, increased emissions from coal production and use of coal production would result from dust control, stack height, and other factors. Particulate emissions from the loading/unloading operations, for perspective, is small. Emissions from the burning of wastes from sources associated with coal production are just a few percent of current emissions.

While we do not disagree that a worthy goal is to minimize emissions attributed to coal production, we believe that the emphasis in the EIS program alternatives is in the order of tons when compared to hundreds of thousands or millions of tons. The difference is significant. For example, in 1985 vs. the present. While coal production seems to be a growth industry, the difference in the projected use between program options appear even smaller. Thus, the difference in the projected emissions in the most trivial when aggregated. As pointed out in the document, the significant impact should be on a regional scale. Although this is important, the environmental statement cannot address except through general statements. The EIS needs to include evaluations that can consider site-specific issues.

The programmatic EIS should recognize that the focus of air-quality impact issues for Federal coal production programs is the difference between coal mining/processing operations and given environmental sensitive air quality areas. Specifically, the fugitive dust problem of coal mining in proximity to Class I air quality areas deserves special attention under the Clean Air Act Regulations. Under these regulations, most of the criteria pollutants associated with coal mining activities can be adequately controlled with the notable exception of fugitive dust. In a West Texas oil producing area, visibility problems over Class I areas are a genuine concern with new leases. In the coal field, visibility problems at the Atom, Utica coal field. In our discussions on visibility problems, we have found that identifying these kinds of air quality impacts arise in leasing.

Specific comments are enumerated below and are keyed to page numbers.

Page S-53. This section which discusses emission control standards quotes EPA-proposed standards for power plants. The EIS fails to make the connection between power plant regulations and standards for stationary sources and stationary facilities using fossil-fuel steam generators."

Page S-56. The reason for the inclusion of Table S-29 is unclear. The text [page S-53] mentions only the "proposed" standards for power plants. Furthermore, comparison of state emission regulations is misleading. For example, New Mexico's TSP regulation, Arizona's SO₂ regulation, and CO regulation are much stronger than the proposed power plant NSPS and the Pennsylvania SO₂ regulation does not apply to power plants. The data in Table S-53 through S-62 appear to have been omitted or are misplaced.

Page S-57. The purpose of Table S-30 is obscure. While this material is factually correct, it is not used to develop any point.

Page S-58. See comment for page S-57.

-13-

Page 5-61. Reference?

Page 5-62 through 5-71, we believe that material of this type would be best if summarized (perhaps as tabular data) in the document. The data presented in the document appears to be appropriate, but it would be helpful to have totals on Tables 5-30 through 5-43.

We are not sure how the Tables 5-30 through 5-43 were generated, but they appear to be coal-to-coal comparisons for the different alternative coal leasing programs. In particular, the different tables show the changes in variations in SO_x emissions (powerplant-related) as shown. This is important information, but the nationwide new source performance standards for SO_x emissions were not available at the time this was written. It is also not clear what the statement says that "the impact analysis in the previous chapter does not include those areas where there are no federal regulations." The EIS should make clear the extent to which the EIS has or has not been placed on impact parameter estimates.

Since projections of end-use (basically postplant combustion from the NCA) provide the level of detail required for environmental impact frames and scenarios, the EIS should also make clear the number of units involved in each scenario. The size of the postplant facility size should also be identified, particularly where industry projections are available.

3. Solid Waste

Given the prognosis of some 1 to 1.1 billion tons of coal that will be consumed in this country by 1985 and higher amounts in 1990, some estimate of the fly-ash residuals should be made. We believe that between 100-300 million tons, we are talking about disposing of some 100-200 million tons per year. This is a significant amount of residuals, but on a national level, such a magnitude of often calcareous material could be a significant groundwater problem. In the Eastern coal regions, greater leaching rates and acidic conditions will result in significant groundwater problems. We have already alluded to the problem this could pose to the Colorado River system. Some discussion of initial mitigation measures to lessen this impact needs to be considered.

-15-

4. Archaeological Analysis

Under the discussion of geologic impacts from coal extraction, the EIS categorizes impacts on archaeological resources as site-specific. While this is true, we believe that the proposed EIS assessment mechanism could not at this point identify specific sites that may be at a high probability of certain strata containing archaeological fossils remains. These strata need to be identified early in the process. Eventually limited areas of the country may be exempted from further unsuitability criteria, if the potential resource is valuable enough.

5. Noise Impacts

Little or no analysis of noise impacts has been made. We believe that at this level of national analysis, noise impacts cannot be meaningfully evaluated. However, we do believe that we do expect that the Regional EISs will evaluate noise problems on specific communities and in certain situations. The Bureau of Land Management, for example, has been working with the Region VIII EPA to evaluate noise levels in the Western Coal Fields as well as assessing new various coal mining and processing facilities to meet specific urban noise level criteria. This information will be used in the West-Central Colorado Regional Plan.

6. Reclamation Potential Analysis (pp. 5-17 and pp. 22-23)

The analysis of reclamation potential on these pages is surprisingly cursory given the importance of this issue to the coal industry. The only descriptive assessment of reclamation potential is to state that the Bureau of Land Management and the Environmental Protection Agency are evaluating reclamation feasibility as part of unanticipated conclusions with little recognition of the regional problem.

In a national programmatic EIS of this kind, it is appropriate to ask whether there are certain geographical portions of the country where for one or

-16-

another reason, reclamation cannot be assured and perhaps no surface mining should occur. Specifically we are referring to the arid West (parts of Colorado, (portions of Utah, New Mexico, Arizona, etc.) where rainfall is minimal and water is scarce. In addition, it may be that no form of reclamation can be assured at this point in time. If this is the case, perhaps industry and government may have to reassess these areas until adequate research has established whether reclamation is feasible and at what cost.

EPA questions the use in this section (p. 5-17) of a maximum 15-year reclamation period to define reclamation potential. This value appears to have been derived from a study of the Colorado River - Ft. Union Area. We feel extremely skeptical of this value. It is reasonable to assume that more arid San Juan, Green River and Gila areas.

The upper limit of 15 years assumed for reclamation even in the most arid may even be in question. We believe the structure of the impact analysis. Does this value include artificial mitigation measures such as surface mining reclamation and topsoil addition, or "natural revegetation"? In section 5 of course, the EIS indicated that Chapter 5 analyses did not include required mitigation measures.

EPA suggests that a table be developed indicating the relative cost of reclamation activities versus intensive, required reclamation efforts to meet the requirements of the EIS. This table should indicate the types of reclamation activities that will be required and the estimated cost.

7. Socioeconomic Impact Analysis

Socioeconomic impacts cover the broadest range of impacts, and to the greatest extent these kinds of impacts least well defined in protective legislation in the EIS. We believe that the Department has a creditable job in defining many of these basic types of impacts. We believe that the Department should think that the most serious consideration as a next step is to identify what the Department can and will do to try to alleviate these impacts.

-17-

We recognize that in a broad statement of this kind, many more subtle local or regional socioeconomic conflicts will be overlooked. Witness, for example, the problem of the effect of unit trains (which are being considered for the Powder River and Mtn. Home, Idaho area) on the town of Gillette and Hotchkiss, Colorado for hours in a day. Another example is the conflict between the Bureau of Land Management and the State of Wyoming over the North Fork of the Snake River Valley where even though coal extraction takes place on Federal lands which are leased to private companies (mines, powerplants, (mine, railroad, etc.) occur on private lands in the valley where land-use conflicts can become extreme.

EPA believes that the focus for such problems is properly at the regional analysis level. The regional analysis will be described below. How this analysis will be handled. We shall discuss this issue in further detail in the discussion on Regional EISs.

B. End-Use Impacts

The DOI analysis on pp. 5-120 through 5-133 makes a fairly cogent case for why stipulations should be made to encourage the use of coal that cannot be placed on coal leasing. EPA can agree to this basic principle. It has been our past experience that the DOI through its mining regulations, particularly the U.S. Bureau of Reclamation and the U.S. Army Corps of Engineers, can influence the end-use of coal through its policies and regulations, particularly in water supply classification studies and project development.

The Department of the Interior in its Water for Energy Program has developed agreements with at least three states (Wyoming, Colorado and Montana) to allow the use of some 700,000 acre-feet of Missouri River water for coal mining. The Interior-Industry studies like the North Central Power Project report seem to say that coal will be required powerplants in the west. The USBR is still developing various water projects in western regions for basically M&I (Municipal and Industrial) use.

Since the functions of the USBR have been partially split between DOI - DOB, the exact role that USBR will play in developing gastrification

-18-

prospects around the country is still unclear. But given DOI's stated responsibility in managing the Federal coal program, it is a fair question to ask whether the agency should have a role in the overall assessing and/or other aspects of coal use.

EPA thinks that DOI should recognize this national responsibility and strive to formulate what its policies toward industrial energy-related water development should be at the earliest point. It is likely that such decisions will influence where the best uses of coal will take place in the years ahead.

E. EVALUATION OF ELEMENTS OF THE PREFERRED COAL PROGRAM

EPA vigorously supports the idea of "various" land-use planning before leasing. As we have stated, we wholeheartedly concur with the application of unsuitability criteria at the earliest stage to minimize later leasing conflicts. The idea of the proposed EIS is to identify areas where coal use is environmentally attractive but does contain some significant problems that must be addressed. EPA believes that this activity is the first step of tract delineation, evaluation and ranking is essential to the process.

1. LAND USE PLANNING

EPA believes that development and use of effective Land-use Plans (Management Framework Plans) is one key to the success of the Federal Coal Management Program. An approach suggested in this pragmatic CIS holds both considerable promise and difficulties.

a. Past Deficiencies

Although the Department is attempting to build the Existing Management Framework Plans (MPFs) at least initially to provide a sound basis for leasing, EPA has experienced many problems with these MPFs in past reviews. In the first place, the tasks of developing MPFs have varied considerably. Some have been extensive, public and agency input and review, others little or none. Even in cases like the

Williams Fork (Colorado) MPF which is supposed to be one of the higher quality MPFs, a subsequent review by EPA has even concluded that the MPF considerably understated wildlfife resources.

We are also concerned that the management of the coal leasing conflict has been slighted in the past highly favored coal development. Last May, Washington State filed a suit against DOI, which had officially defined this as policy. If the coal leasing conflict were better managed, resources were to be made, considerable changes in existing MPFs might be recommended.

As we indicate under our discussions on Unsuitability Criteria, existing MPFs' failure to consider unsuitability criteria for mining in certain areas, we believe this would be an unfortunate start to a coal leasing conflict that could have many additional benefits if done right.

We think that this programmatic EIS should include a detailed description of what would be used in coal leasing regions. How many areas are identified and what are they? What is required and adequate is their data, and how many will need to be assessed, altered and/or not yet be completed?

b. Unsuitability Criteria

(all General Comments. The DEIS outlines on pages 3-8 through 3-13 the proposed approach to unsuitability determinations in conjunction with BLM land-use planning. EPA believes that this is an important and long-awaited step to developing a sound coal management program. We believe that comparable difficulties (in §50 and 404 permits) exist in the coal industry to develop early planning restrictions on environmental issues that also require detailed legally mandated reviews.

-19-

-20-

At a general practice, EPA strongly believes that when determining the environmental unsuitability/inacceptability of lands for coal leasing, the agency should expand to define these unacceptable situations as broadly as possible and as quickly as possible. In the case of this program, we think that such determinations should be made of those lands before the lease sale begins. We think that such an approach would have the added benefit of allowing the Department in clearing the way for faster project development and reduced costs of suitable leases. Industries would also not be faced with a long period of time in obtaining necessary permits to start regulatory permits. If we can reduce the time in the permitting process for the leasing process, it is to the Nation's benefit.

EPA is faced with multiple legal determinations related to coal mining leases. These may result in an unacceptable finding. The principal responsibilities we are faced with include the following:

Air Quality

*New Source Performance Standards (NSPS) for Coal Preparation Plants

*Prevention of Significant Deterioration

 a. Coal extraction/processing emissions on Class I and II areas

 b. Visibility impacts with special emphasis on Class I areas

Water Quality/Drinking Water

*NODES discharge permits in certain states (Utah, South Dakota)

*Section 404 Dredge and Fill Permits

*Sole-source aquifer determinations

-21-

Some of these permitting requirements such as visibility and sole-source aquifer, are independent of location. Other permitting requirements, however, are isolated instances (e.g., compliance requirements for coal ash disposal units near Superfund sites) and have not been listed there. It is thus recurring determination that the environmental related to land-use (and hence are related to leasing) should take place the MPF would likely integrate into leasing decisions.

We think that two of EPA's mandated reviews should be integrated into the unsuitability determinants. These are the §50 and 404 water-quality assessments and sole-source aquifer determinations. Not every potential lease area will have both of these programs. The comments below will discuss how we think they could be integrated into the leasing decisions.

EPA also has a number of concerns with the currently proposed unsuitability criteria in the draft EIS. We do think that the approach taken is a good one, but excellent beginning and need further refinement.

As presently contemplated, these unsuitability criteria would be applied at the land-use planning MPF stage. Very broad and general approaches such as eliminating existing Federal park lands and scenic areas from leasing could be applied in a relatively straightforward manner in a land-use plan.

As we understand the Secretary's proposal, unsuitability determinations would also be made at the mining plan review stage under SMCRA. We think that this approach ignores a very critical stage where additional unsuitability determinations could be made -- namely the activity selection, evaluation and ranking step. It is at this

-22-

point that the locale is specific enough to evaluate reclamation, all existing and other potential coal leases should be included in broad-based land use plans covering those areas. This would mean that the evaluation and selection stages has the added advantage of still occurring before a lease is granted.

We will discuss this approach under the various criteria we feel should be added to the environmental test.

(3B) Air quality considerations need to be added to unsuitability criteria. Specifically, the Criteria of Significant Deterioration (PSD) consider air quality impacts and the criteria dealing with Federal Land System and Wilderness Study Criteria also consider air quality. It would be ill-advised to leave out air quality in the environmental impacts of mining would likely violate the PSD and wilderness standards. We already have such a case where an EIS dealing with the proposed coal leasing at the Utah coalfield indicated probable violations of nearby Class II PSD areas.

EPA suggests that the evaluation of protection for mandatory federal lands be expanded to include PSD criteria. We believe that such protection should be afforded to Class I areas, particularly those recommended for wilderness. In addition, we are supporting by the Forest Service in their RAKE II that more protection is needed for BLM lands now undergoing wilderness study.

-23-

EPA believes that under the present PSD regulations most coal mining operations will have to meet PSD requirements for Class II areas. The present PSD regulations require that, internally, the present proportion of production must be met so that areas meet PSD as a source that would be subject only to best available control technologies.

Potitive test could pose significant visibility problems to Class I areas; however, EPA currently proposes to propose regulations to define and limit regulations to define and limit visibility impacts to Class I areas. These will be proposed as soon as they are available.

The Clean Air Act Amendments of 1977 (P.L. 95-95) give the Environmental Protection Agency and the Department of the Interior authority to regulate air quality to protect air quality related values, including visibility in areas of national parks and wilderness areas.

The Federal Land Manager and the Secretary of the Interior have direct responsibility for management of such (Class I) areas. The Federal Land Manager's responsibility to protect air quality includes (including visibility).¹ Further, under the Clean Air Act, the Secretary of the Interior is to review and designate Class I areas where visibility is impaired.

EPA is still in the process of developing regulations to implement the provisions of the act. We think that the coal leasing program should provide compatibility with this area of environmental protection.

-24-

We suggest the following approach to the visibility problem. First, we should locate and identify areas and potential areas affected by coal mining in given MFP areas. A second step would be to determine emission levels from a mining operation and then we would need to define a suitable distance where there is a substantial likelihood that a potential mining enterprise would adversely affect visibility. Finally, these areas could then be excluded from leasing.

A second set of emissions level/distance values could be generated to indicate some minimum range of visibility would be unlikely to affect visibility. Areas beyond this range would be considered suitable for mining activities. (For some appropriate level of emissions, maximum-minimum values would need to be assessed at the activity plan level for these areas are otherwise desirable for leasing).

At the activity level, some appropriate level of emissions would have to be selected to protect air quality values. Potential lessors could then determine what kind of mitigation measures needed would be required to prevent adverse to mine coal. As we discuss under the environmental test, some sort of hypothetical distance analysis appears necessary at this stage. A similar to modeling analysis would have to be performed where this criterion needs to be evaluated.

-25-

What we have suggested above will work in the long-term. First, we would screen out, and then a more detailed air quality analysis would be done there is a reasonable chance that visibility impacts will occur.

EPA recognizes that this is an extremely difficult task and one, unfortunately, that may not be feasible. For the first round of the leasing program, it would probably be necessary to do a "rule of thumb" screening initially at the tract level. This would allow this information could be used in the review of individual areas where likely visibility impacts will occur.

We suggest that DOI conduct an initial screening of visibility impacts in the first round of the leasing program. A number of potential lease areas should be selected with reference to the location of the areas. By varying the distances and (in some cases, concentrated areas) some idea of effective distances and areas of visibility (or lack thereof) that affect visibility can be gained.

EPA would be willing to work with DOI to help them to define these minimum and maximum distances for some Class I areas in the coal leasing program as well as to help them to evaluate areas that might be used at the tract level. We hope that at this stage of analysis being made we can eventually eliminate the issue of whether PSD considerations would

-26-

restrict the essential mining activities before actual mining takes place. We also recognize that the estimates of visibility impacts are conservative at this time and may need some fine-tuning as perfect.

(b3) Sole-source aquifers and reportant aquifer recharge areas should also be considered as potential areas of concern. This is also another situation which is similar to the situation with coal mining and reclamation that does not admit of categorical answers or conclusions. One principal reason is that information on groundwater, aquifer recharge, and recharge areas is scanty. EPA's mandated reanalysis of the impact of coal mining damage to sole-source aquifer prior to water supplies from activities which were federally financially assisted, as presented in the report on federally designated sole-source aquifers in the Powder River Basin, contains no conclusions that we are aware of. That is not to say, however, that there are no such sole-source aquifers that could use legal protection.

At this point, we recommend that the agency add these two important recharge areas for aquifers to add to the list of potential areas of concern for mining, recognizing that more of the same information will be acquired in the future.

We think that the first step must be to gain as much as possible about what is known about groundwater resources. USGS and other scientific agencies can be contacted to define where known aquifers lie in proximity to potential

-27-

It is disturbing not to see any reference to soils, slope, precipitation, geologic stability, subsidence areas, etc. All of these factors are critical in determining the suitability of certain areas for reclamation of strip-mined areas.

It is our understanding that DOI has already applied these criteria to determine priorities of "high priority" coal areas. However, this approach predicts the extent to which these criteria can be satisfied. As indicated in the course of this EIS review, we are continuing to seek additional information available to make these determinations.

It is our understanding that many of the planning units that "were selected for this review did not have sufficient data to make evaluations regarding parameters such as soil infiltration, wetlands, floodplain areas, etc. The lack of such information should not preclude EPA from proceeding without it. We think that the best way to proceed is for DOI to do in order to determine what kind of preferred coal lease program can be initiated with these water data gaps in tandem.

We think that inclusion of these basic physical parameters reflecting the potential for flooding due to a successful coal management program would be the best way to resolve this situation would be to have the data collected by EPA to evaluate parameters such as reclaimability at the start of the planning phase.

-28-

coal leasing areas. Information would also have to be acquired to define where these waters obtain their drinking water. Some estimates would then have to be made as to how much of these equifers are used for the total municipal drinking water supply.

The results for this initial Management Framework Plans would be to allow public and agency input to the designation of recharge areas. Should a community decide to designate a water protected area, the MFP should recognize such a protection in defining suitable/reclaimable areas.

A second area of concern is the protection of important aquifer recharge areas. There needs to be a more definitive statement to delineate the locations of major aquifer recharge areas that could be impacted by coal mining. The MRP should consider the likely recharging areas at the activity tract parameter level. The activity tract extension would be offered by EPA if what assistance it can in defining areas protecting sensitive aquifer areas.

(d) We are also concerned about the inclusion of certain parameters in the listing under "unusually sensitive areas." For example, the statement regarding reclaimability, there is little information available of defining basic physical characteristics of soil texture and reclaimability. Most of the other criteria though important are too general in nature and simply reflect existing legislative requirements.

-29-

We recognize the extreme difficulty of quantifying the variables involved in assessing the potential for strip-mining. At the same time, we are referring to the statements in the "Description of the Environment Section, Chapter 4" concerning the potential for disturbance. The statement on page 1-12 of the EIS states that in the San Juan Coal Region -- "All areas will be reclamation areas unless they are removed by disturbance, provided that reasonable care and adequate measure is available." We believe it is little to imagine a circumstance where one could claim that reclamation is never impossible. It may be some of the San Juan areas precisely because of the presence of large amounts of moisture. We can find no literature regarding reclaimability for the Powder River area.

The assessment for the Nine Park-Diamond Creek area on page 4-26 states that "the potential for reclaiming land is dependent on variables considerably within the region." By using the best available data for the area of reclamation, many of the listed areas of potential for precipitation can probably be overcome.

EPA thinks that it is this "variation" in reclaimability that is the key issue in the question of unsuitability. Reclamation is not always feasible even at the planning stage in geological areas of high precipitation or areas of meager precipitation where reclamation is difficult or impossible.

-30-

We think that an attempt to define and evaluate the effects of reclaimability within and between regions would be useful. For example, EPA, in cooperation with the U.S. Forest Service, has recently contracted for a study to develop procedures for estimating vegetation potentials of surface coal mining areas. The results will be collected from major coal surface mines in the West and Midwest. Data such as vegetation characteristics at each mine site and surrounding undisturbed areas with native vegetation, terrain, soil type, and site age of vegetated areas, climatic factors, and factors such as growing season precipitation and length of growing season, physical features of areas (slope, elevation, soil characteristics in disturbed and undisturbed areas), and other ecological factors. Such information could be used to analyze the potential for recovery of mining areas as well as for identifying the unsuitability of some areas for reclamation. In addition, past reclamation techniques can be applied to future efforts leading to a higher level of reclamation. We strongly urge the DOI to engage in a similar study or analysis that will receive the special attention and/or mitigation measures that it deserves early in the decision-making process.

As an example, greater care in prioritizing areas such as the Hems Basin coalfield in southeastern Wyoming and the Powder River Coal Region will not only reduce the cost of reclamation of needed areas, but also careful selection of plant species.

-31-

We can sympathize with the extreme difficulty a Federal Land Management Agency faces at the landuse planning level, in trying to determine what areas of reclamation. Numerous parameters are concerned with the degree of reclamation desired, such as categorical year-to-year situations.

At the same time, we believe that waiting until the DSM mining permit application is filed to evaluate unsuitability is something that should be avoided. It appears to be an initial evaluation of reclamation potential that should be made at the tract selection and evaluation stage. Potential testing areas are determined by the agency and a site-specific evaluation. We can see no way to avoid some form of evaluation during this stage to do a reasonable job under Activity Tract Selection and Draftsman's approach. With this approach, EPA does think that some form of evaluation can and should be done.

(b) EPA also has some concerns about the exception provisions in the proposed criteria. We do understand the need to remain flexible at the planning

-32-

level particularly because of the unique nature of each situation. However, there are a number of provisions for defining and applying the criteria that appear to need better definition:

- a. p. 3-3 on Federal Land Systems: can the "Land Management Agency" make an adequate determination as to an appropriate buffer zone?
- b. p. 3-4 how can the "Land Management Agency" unilaterally determine what areas of reclamation will be adversely affected?
- c. p. 3-5 What happens if a non-state resident Fish and Wildlife where responsible for giving an opinion on effects existing land uses and Federal game managers?
- d. p. 3-10 Under Wetlands, can the land management agency make a determination as to habitat protection?
- e. p. 3-12 Under Eagle and nesting protection, can the "Land Management Agency" make a unilateral determination as to new activities are or are not permissible or already inventoried activities impacting animal wilderness potential?

This list of concerns is by no means exhaustive. The general problem appears to be a lack of criteria to define when the

-33-

exceptions can be made. A corollary problem is whether the Department of Interior can make an adequate determination of the wilderness potential of areas specific to other agencies who have expertise at the local level.

(b) EPA is also very much interested in the wilderness inventory and evaluation due and is currently, through the Department is taking an important role in the assessment of the wilderness potential of the 450 million acres of land held under its jurisdiction. We are somewhat concerned that the proposed EIS and its testing may compromise the wilderness study area.

We think that the final EIS should better articulate the schedules for wilderness study and the cost of the study. EPA thinks that the Department should be required to determine if new activities are or are not permissible or already inventoried activities impacting animal wilderness potential.

Finally, at such time as BLM lands and their wilderness potential are formally listed, we suggest that the proposed EIS be applied around these areas at least for the duration of the BLM's study period and until Congress acts on Interior wilderness legislation.

(c) Involvement by the public should come into play when there exists some questions as to the wilderness potential, the unsuitability criteria, or when decisions are made regarding

-34-

tracts which will be given priority for further analysis. A formal mechanism for actively involving other agencies, industry, and the public must be sought. A clearer commitment to coordinate inter-agency judgments outside-the-agency judgments should be indicated.

c. Threshold Criteria

We feel that it is an extremely promising concept that should eventually be worked into the MPPs. We recognize the difficulties involved in specifying threshold values at the present time. On page 10 of the EIS, EPA states: "It is not necessary to specify threshold levels in the land use plan" and that "it is important to leave some degree of flexibility...". We agree with this statement. However, we also believe that a careful delineation of how the proposed mining activities will interact with these other phases of the leasing process is essential. Ultimately the MPP must be specific enough to identify many of the successional thresholds, impacts, and interactions required in broader evaluations. At the same time, any such thresholds or impacts may be best defined at the tract evaluation phase. This would support more timely visibility discussions held at this early place. Such an effort could also help diffuse the potential for conflicts from nearby or successive leasing.

EPA thinks that the identification and delineation of successional thresholds should be one of the priorities of the future regional EISs. This is discussed further in a later section.

We recommend that a formal process be set up in activity planning to utilize the three levels of environmental impact. The notion that "decisions may be oriented more toward impacts dependent on levels or

rates of development" applies directly in this context. We believe that this is yet another discussion of threshold development levels was not included, and the approach of specifying successional thresholds was not specified. The threshold evaluation and its results were included as an activity planning procedure.

d. Existing Leases and PRILAs

In addition to the revision of existing MPP's to meet unsuitability criteria, the locations of existing leases and PRILAs should be identified and recommendations for or against development of these leases should be made at the MPP level. These recommendations should be integrated in the regional EISs or developed separately from the EISs.

We think it is important that a systematic evaluation of existing leases be made rather than a lease-by-lease action.

2. ACTIVITY TRACT SELECTION AND RANKING

As we have discussed, unsuitability Criteria for air quality (visibility), sole availability, and water quality (water impact criteria), the tract evaluation phase is a critical step in the environmental review. This is the principal step where specific lease areas can be screened out for unsuitability and recommendations for or against development are made. EPA thinks that a major review effort should be conducted at the regional level during the development of the tract selection and ranking process. This review will have to be performed on each specific tract. Such an analytical guide to specific tract evaluation procedures should include at least the most probable hypothetical mining plan for each tract. This guide should include the probable location of annual coal production, haul roads, railroads, coal storage, preparation and transportation facilities, and the like. The Department should be able to call on the services of USM experts or some other resource to develop these plans. Who will define environmental problems to the

-35-

-36-

air, water quality or any other environmental areas? Will USM people be involved to make these determinations? Who will do the first cut? This part of the program does seem to presuppose political influence over the agency. Fairly sophisticated multi-disciplinary teams should be the review and ranking steps.

During activity planning, tracts will be ranked according to utility, coal quality, environmental, social and economic effects and other factors. A ranking system will be given. However, as to how this ranking would be approached, the Office of Energy Activities at the Environmental Protection Agency (EPA) VII has recently (November, 1978) completed a study entitled "A Regional Activity Plan Model", which sets forth a methodology for representing and ranking tracts based on the quality expected from mining coal from particular tracts of land. This methodology is currently being proceeded with in the ranking process.

In ranking tracts, coal content should be a major consideration. Due to environmental factors, however, the quality of the coal available is low in ash, sulfur, and trace toxic elements. As a result, the quality of the major toxic element level of coal varies significantly within a region; the best quality coal should be selected for mining.

EPA agrees with the idea of a regional ranking of tracts, but we wonder whether a practical ranking system can be developed with so many disparate factors such as economics, coal quality, environmental desirability and all of the other concerns involved. It may appear that above a certain minimum qualification in terms of environmental desirability, a tract is unsuitable. Also, if one area is slightly closer to market than another, is it better to mine it for reclamation, can these disparate units be commercially compared?

3. COAL PRODUCTION GOALS - SUPPLY AND DEMAND ANALYSIS

a. To determine coal production estimates, an input will be the demand for coal which is derived from DOE's national coal model (NCM). Several assumptions in the model appear questionable:

*Transportation costs are understated. According to the NCM, the cost of shipping the coal from the mid-west to the low cost region would be 1977 cost rates with 4 % and 8 % increases for fuel and labor and current rates, respectively. Moreover, ICC rates are used for fuel and labor, but assume inflation at a rate much greater than the assumed 9.5 % per year.

*Synthetic fuel production levels are present assumptions in the model, and should be re-evaluated and documented more completely.

*Some of the wage rates (labor costs per ton of coal) used in the model may be too low. Coal has been defined as a low productivity job because workers, e.g. factor which should be taken into account in setting wages.

*In specifying utility environmental regulations, it should be clarified that the long-term goal is to reduce emissions by a monthly average. Further, the mid-range assumption should be changed as follows: DOE should assume a 10% reduction in high-sulfur coals and 10% FGD (flue gas desulfurization) for eastern and western areas, either as a result of New Source Performance Standards or as a result of significant deterioration regulations.

b. In projecting coal production levels--a key component in determining the magnitude of the environmental impact--the term "judgmental decisions" has been indicated (page 10 of the EIS). Yet, the NCM has not discussed. For example, how has the NCM been judged against coal industry and other energy sources? If the NCM is to be utilized (mid, high or low) will be utilized by DOE in developing the EISs? In the environmental regard, we assert that the high-level estimation of production is unnecessary and should not be utilized; the probability that all the

judgmental decisions" have been indicated (page 10 of the EIS). Yet, the NCM has not discussed. For example, how has the NCM been judged against coal industry and other energy sources? In the environmental regard, we assert that the high-level estimation of production is unnecessary and should not be utilized; the probability that all the

-37-

-38-

assumptions made in the EIS's high-level coal mining scenario is extremely small. In any case, the development and use of the preferred program will have been completed.

Chapter Appendix H and to a certain extent Chapter 5 of the EIS discusses the projections of coal supply and demand on page 5-1, and the coal supply analysis guidelines are set out for the coal impact estimation program that will turn based on coal supply and demand projections.

One of the key assumptions made in this analysis is that "labor, equipment and capital requirements will be met by the market at projected levels or timing of the Federal coal mining program." This assumption is stated in a very candid and striking analysis is made of the huge capital and equipment needs that face the coal transportation sector. For projected 1975-1980 production and distribution rates, the analysis on page 9-131 that "the railroad industry's current financial position is such that it is estimated that \$1 billion dollars per year of externally generated funds would have to be invested immediately after 1975."

We think that the analysis is excellent one and should be extended to other sectors of the coal production and distribution picture projected for 1985 and 1990. For one, can adequate coal extraction equipment be purchased and maintained in the market in the 1985 time frame? What magnitude of investment will be required in new coal extraction facilities in order to be able to utilize the projected coal output over the period of the second decade in the relatively short term 1980-1985? What degree of conversion to coal from oil and gas will be needed? What coal facilities will be needed? We think such an analysis would be useful in conjunction with a supply and demand side to determine whether such projections can be met and to assess the relative level of nation-wide input.

-39-

4. EXPLORATION LICENSES

This area of activity is not specifically discussed in the body of the EIS, but the regulations do provide some guidance for it. It is not clear at what point in the overall program should industry exploration be most appropriate.

We find the provision cited in Section 3461.3 to allow exploration in "areas defined as 'suitable' for leasing" to be particularly problematic. Exploration in such areas would seem to just be creating future extractive liability for the BLM and its land managers. Certain unsuitable areas (such as proximity to national parks, etc.) are clearly inappropriate and particularly inappropriate for exploration. As in many cases, the regulations should allow in the regulations the option of prohibiting exploration on unsuitable areas. Allowing such exploration would not be effective without consultation and agreement with other experts or responsible land managers involved in the unsuitability criteria discussion.

5. EMERGENCY LEASING

Although the Department seems to suggest in the EIS discussion (p. 3-3) that the emergency leasing system would not be used as an alternative to the normal leasing, EPA is unsure of the procedure that would work. As indicated in our discussions on the need for New Laws, we believe that there are strong temptations by an industry to increase its mining output beyond the amounts contemplated in the original mining plan. There should be provisions that the emergency leasing system not allow a greater amount of coal to be leased on a given mining operation than in the original mining plan. We would like to provide more specific examples of when the emergency leasing provision would apply for the criteria identified in Section 3461.5.

-40-

6. DATA NEEDS AND STUDIES

EPA thinks that the data evaluation study outlined on page 20-12 of the EIS is a very critical exercise. The preferred coal program cannot be realistically developed unless the level of data available is increased. We hope that the conclusions to this study will be made available to the public. We also think that public and agency dissemination of this information is important.

In view of our comments on the data definition and use, and the data use planning revisions using unsuitability criteria, we encourage the Department to include this study in its data needs analysis before proceeding further on implementing this program.

7. PROCEDURES FOR EXISTING LEASES AND PARK

We suggest that the Department include in its proposed regulations a section defining how the Department will handle existing leases and BLM's at review time. If the Department should decide to terminate existing leases regarding the early start of the leasing program to the coal industry, we think that there would need to be specific regulations outlining this process.

F. ALTERNATIVES

The areas of coal leasing occur so that there have not really been choices under the basic alternatives. We simply submit these for your consideration:

1. Using the CMRS "activity" approach involving industry contractors under the basic industry participation criteria of the preferred program has been applied. This approach would be based on indications of need rather than the OCS projections.

2. Private leasing in uncharartered areas where private land leases are held.

The latter may require some exploration. Since the Federal land management agency does not have jurisdiction

over some coal mineral rights (particularly involving state lands), the agency would have to be the preferred program treat those adjacent Federal leaseable lands as if they were state lands and be applied to these lands as well. Will the agency initially evaluate the leasing of these lands at a whole from a regional perspective or will the fragmented land ownership be a constraint to production?

G. FUTURE REGIONAL EISs

The Department has already committed itself to the use of sets of regional EISs to implement the preferred program in the coal producing regions. As a major reviewing agency of Department of the Interior EISs, EPA is very concerned that the EISs be developed in a manner that is consistent with the preferred program. The concept of "region" EISs be avoided. EPA does not want to see this type of EISs developed because they do not produce the required results. EPA reviewed all of the test set of regional EISs and has formally expressed its concerns to the Office of Coal and Oil on July 6, 1978, and we think that CEO's recent directive for the development of regional EISs is realistic decision-making.

EPA strongly believes that "scoping" the context and the range of these future regional EISs is absolutely essential to the success of the preferred program. The last generation of regional EISs was developed in a manner that the EISs were supposed to accomplish. The EISs as they now stand contain a cumulative summary impacts approach which is not appropriate. The EISs must be developed in a manner that provides timely information, while coupled in massive amounts, has not been developed. We think that this has future usefulness to good decision-making.

EPA would be definitely interested in helping to define the scope on these regional EISs. We believe it is obvious from earlier comments that we can make a much better job of this in this BOL coal management program, and that our comments on the preferred program will help you to see what can be done to improve the program.

Our first question in developing these "super-regional" EISs is how does the Department plan to utilize the individual and unique effort that went into the original 8 regional EISs on mining claims. The EIS is not even clear on which regions the EISs coincide with which superregional areas. We think that

-41-

-41-

The West-Central Colorado area is included in the
West-Southeastern area, but its status as a separate
area is Chapter 4 of this EIS. A list of superregions
and their respective areas should be identified in the
proposed FEIS.

We think that the greatest "value added" to the past
regional EIS efforts lies in the extent to which special
regional issues have been identified and discussed. Hopefully, this information
can be used in the preparation of a regional
development paper that could be expanded upon and made
available for public and agency review during the scopeing
process.

We can see the need for extensive public and agency
involvement at the early stages of planning for these
superregions. We believe that the most important
type of overriding issue of a socioeconomic kind
that the public and agency would be willing to incur
the cost of regional EIS to identify is those areas where
regional concerns in each region from the perspective of
its own unique resources and environment. These types of
issues from both the public and responsible agencies, the
EIS process should be able to identify, evaluate, and
evaluate and possible resolution of many of these
real-world problems.

We do think that these EIS evaluations need to be
concrete. For instance, it is not enough to talk about
railroad crossing problems in the Powder River EIS in
general terms. It is important to know exactly what is done in Gillette, Wyoming (or other known problems areas)
that can be evaluated.

As far as regional regulation, we think that the
superregional EIS need to discuss socio-environmental
concerns that cannot adequately be handled at the
interstate level. One example is the proposed diversion of
the North Fork of the Gunnison. If a local Federal MPF
MPF recommendation is made to mitigate off-site coal impacts, the
regional EIS should do so.

EPA also thinks that the superregional EIS is a good
place to identify and develop the idea of threshold
criteria for environmental impact analysis. This would be
utilized in regional evaluations and updating MPFs, that the precise
information needed for these criteria to be developed.
The EIS emphasis should be toward a
better understanding of how these criteria can be

developed and how they would be applied. We can see both
the likelihood and the need for state environmental
agencies to take an active role in this process. These
bodies would be helping to define their own environmental
and economic futures.

EPA has already stated its preference that any new
legislative structure geared on an interim basis towards
correcting past coal management deficiencies. By this we
specifically mean the need to correct environmental,
environmental, economic, and social malfeas of existing
coal mining operations. We sincerely hope that this will be the focus of the renewed
Federal coal leasing program and the first
"superregional" EIS. We understand of course that
the Department has no option but to proceed with the
present legislation.

We also see a need to include the important MPFs
in this regional EIS evaluation. EPA is uncertain
whether to recommend MPFs on individual existing MPFs in
coal areas or undergo a regionalization with
unacceptability criteria. We think that the
superregional EIS should make MPF recommendations
(at the management and conflict resolution level) to
especially identification of unsatisfactory areas, that this
information can be used to better evaluate, that this
information can be used initially in the
individual EISs and MPFs to be used initially in the
coal leasing program start-up.

Given the concurrent wilderness study areas by BLM
we think that the areas identified as wilderness and
any priority areas for wilderness recommendation also be
identified in the regional EIS.

A final issue of concern to EPA in the superregionals
is end-use considerations of coal mining. We admit to
not having a definite recommendation at this time because
of the lack of information available. However, we do think
make such sense to evaluate the end-use of coal in a
captive market area (e.g., the Powder River Basin) as well as
going to (or up or down) if the coal will be burned out of
the region. We think that this is a real
sense to concurrently handle in one EIS a coal mine and
nearly mine-mouth powerplant. An added area of
uncertainty is the effect of the proposed
regional EIS on the status and extent of DOE regional projections and other
DOI activities regarding industrial water development.
If either or both of these activities identify likely

-42-

Future end-use locations of coal, these should be
factored into the EIS. The responsible agency should be
willing to accept a position of negotiation of this issue
at the site the superregional EIS are undergoing the
scopeing process.

H. COMPLIANCE RECOMMENDATION

The responsible agency should consider the use of
stipulations similar to those found in air and water
quality legislation that might prohibit the issuance of
mining permits if the company was in violation of
SMCRA regulations or the appropriate management
regulations. In addition, if the responsible agency is EIS,
Department should evaluate the legal ramifications of
such an approach.

United States Department of Agriculture
Secretary:肩章
700, Box 2415
Washington, DC 20003

30282

1950

Mr. Frank Gregg
Office of Coal Management (140)
Denver Regional Management
15th and C Streets, NW
Washington, DC 20540

Dear Mr. Gregg:

We have reviewed the Draft Environmental Statement for the Federal
Coal Management Program. We realize these comments are late and
unnecessary, but hope they can still be considered in preparation
of the Final Environmental Statement.

Our Minerals and Geology Staff has participated in various aspects of
developing the Federal Coal Management Program. Ideally, we would
have liked to have been involved in the planning process, but personnel
callings and funding did not permit that level of participation.

Our main efforts have been aimed at getting recognition of STMW, the
Forest Service land management planning process and Forest Service
Management Activity Planning, and the role of the Minerals and Geology
Staff in the planning process, as provided in the provisions of the
provisional lease provided in the Federal Coal Leasing Amendments Act of 1976.

While these concerns have been fairly well incorporated into the
subject EIS, there are some areas which will warrant further attention.

1. Section 3.1.1.1 is a statement of the fact that
the Forest Service has the statutory authority and responsibility
to plan for the disposal of coal. We believe any such contention
should be supported by the Forest Service's Management Activity
Statement, and that such authority and responsibility be
transferred to the Forest Service.

The problem seems to surface in Section 3.1.1.1 Planning System
with the statement that the Department of the Interior would raid
on the Forest Service's agency planning system to develop the land
use and activity planning stages to provide the substantive and
the forums for decisionmaking regarding the federal coal program.

In the discussion under Section 3.2.2 Activity Planning it states
that the responsible agency would be responsible for the land
use and activity planning stages to provide the substantive and
the forums for decisionmaking regarding the federal coal program.
In delineating the tracts, the land management agencies would consider
such items as:

NRG/AM

Form 1279-3
