FOREWORD

This is the 32d volume in a series of commodity-oriented environmental bibliographies resulting from a memorandum of understanding between the U.S. Department of Agriculture, National Agricultural Library (USDA-NAL), and the U.S. Environmental Protection Agency, Office of Pesticide Programs (EPA-OPP).

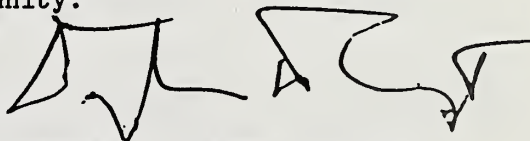

This close working relationship between the two agencies will produce a series of bibliographies which will be useful to EPA in the regulation of pesticides, as well as to any researcher in the field of plant or commodity protection. The broad scope of information contained in this series will benefit USDA, EPA, and the agricultural community as a whole.

The sources referenced in these bibliographies include the majority of the latest available information from U.S. publications involving commodity protection throughout the growing and processing stages for each agricultural commodity.

We welcome the opportunity to join this cooperative effort between USDA and EPA in support of the national agricultural community.

National Agricultural Library

DOUGLAS D. CAMPT, Director
Office of Pesticide Programs

INTRODUCTION

The citations in this bibliography, Vertebrate Pest Control, are selected from the AGRICOLA database and limited to those produced by North American authors. They cover articles or monographic publications added to the database from 1979 to April 1989.

This is the 32d bibliography in a series of commodity-oriented listings of citations from AGRICOLA jointly sponsored by the National Agricultural Library, U.S. Department of Agriculture (USDA-NAL), and the Office of Pesticide Programs, U.S. Environmental Protection Agency (EPA-OPP). Additional volumes issued recently are Plant Growth Regulators for Higher Plants, The Protection of Sugarcane and Sugar Beets, The Protection of Turf Grasses, The Protection of Hays, The Protection of Citrus, The Protection of Leaf Vegetables, The Protection of Root Vegetables, and The Protection of Corn. The 1989 volumes will include The Protection of Cotton, The Protection of Soybeans, The Protection of Wheat, The Protection of Small Fruits and Berries, The Protection of Grapes and Cherries, The Protection of Ornamental Plants, The Protection of Farm Animals, The Protection of Wildlife, and Vertebrate Pest Control.

Entries in the bibliography are subdivided into a series of section headings used in the contents of the Bibliography of Agriculture. Each item appears under every section heading assigned to the cited document. A personal author index is also included in the publication.

The U.S. Environmental Protection Agency contact for this project is Richard B. Peacock, Office of Pesticides and Toxic Substances.

Weed seed destruction by arthropods and rodents in low-input soybean agroecosystems.

Brust, G.E. House, G.J. Greenbelt, Md. : Institute for Alternative Agriculture. Weed seed consumption experiments involving comparison of rates of seed loss by seed feeders were conducted over a five-week period

in low-input (no insecticide, low herbicide usage) conventional- and no-tillage soybean agroecosystems. Seeds of four broadleaf weed species (ragweed *Ambrosia artemisiifolia* L., pigweed *Amaranthus retroflexus* L., sicklepod *Cassia obtusifolia* L., and jimsonweed *Datura stramonium* L.) and one grain crop species (wheat *Triticum aestivum* L.) were provided in a free choice design at densities of 10, 25, and 50 seeds/24 cm³. Approximately 2.3 times more seeds overall, and 1.4 times more large seeds as a group were consumed in no-tillage systems than in conventional-tillage systems. In our experimental low-input, no-tillage treatments, large ground beetles (Carabidae: Coleoptera) (15-25 mm) and mice preferentially fed on the larger seed species, while small carabids (less than 15 mm), ants and crickets, fed almost exclusively on the smaller seed species. Carabid beetles were responsible for more than half of all seeds consumed. Laboratory and field studies indicated that ground beetles selectively consumed specific seed species. In conventional-tillage, ants were one of the dominant consumers of seeds, suggesting different patterns of resource partitioning in each tillage system. We suggest that selective feeding by arthropod seed feeders, in combination with their high number, could affect the species composition and possibly the abundance of weeds in low-input, no-tillage agroecosystems. LBASA. Garibaldi, B.A. Pecquet Goad, M.E.; Fox, J.G.; Sylvina, T.J.; Murray, R. Cordova, Tenn. : American Association for Laboratory Animal Science. Cortisol values were obtained from 39 ferrets, *Mustela putorius furo*, by using a commercial radioimmunoassay. Sera from 25 males (18 intact, 7 neutered) and 14 females (7 intact, 7 spayed) were assayed. Resting serum cortisol values ranged from 0.13 to 2.70 microgram/dl for males (mean = 0.93 +/- 0.63 microgram/dl), and 0.55 to 1.84 microgram/dl for females (mean = 0.86 +/- 0.29 microgram/dl). The resting cortisol values of both males and females were comparable to those of the cat (1.0 to 3.0 microgram/dl). A 7 year old male ferret with suspected hyperadrenocorticism and an adrenal mass had a cortisol level of 8.1 microgram/dl. Adrenal cortical carcinoma was the histologic diagnosis. One adult female ferret had a cortisol level 3.30 microgram/dl. This animal also had proliferative colitis upon necropsy. An ACTH stimulation test (1 U/kg IM) and a low-dose dexamethasone suppression test (0.1 mg/kg) were performed on 10 ferrets. Post-ACTH serum cortisol levels increased by an average of 89%. Post-dexamethasone serum cortisol values decreased by an average of 18% 6 hours post-injection. *Laboratory animal science*. Aug 1988. v. 38 (4). p. 452-454. Includes references. Serum cortisol radioimmunoassay values in the normal ferret and response to ACTH stimulation and dexamethasone suppression tests.

LBASA. Garibaldi, B.A. Pecquet Goad, M.E.; Fox, J.G.; Sylvina, T.J.; Murray, R. Cordova, Tenn. : American Association for Laboratory Animal Science. Cortisol values were obtained from 39 ferrets, *Mustela putorius furo*, by using a commercial radioimmunoassay. Sera from 25 males (18 intact, 7 neutered) and 14 females (7 intact, 7 spayed) were assayed. Resting serum cortisol values ranged from 0.13 to 2.70 microgram/dl for males (mean = 0.93 +/- 0.63 microgram/dl), and 0.55 to 1.84 microgram/dl for females (mean = 0.86 +/- 0.29 microgram/dl). The resting cortisol values of both males and females were comparable to those of the cat (1.0 to 3.0 microgram/dl). A 7 year old male ferret with suspected hyperadrenocorticism and an adrenal mass had a cortisol level of 8.1 microgram/dl. Adrenal cortical carcinoma was the histologic diagnosis. One adult female ferret had a cortisol level 3.30 microgram/dl. This animal also had proliferative colitis upon necropsy. An ACTH stimulation test (1 U/kg IM) and a low-dose dexamethasone suppression test (0.1 mg/kg) were performed on 10 ferrets. Post-ACTH serum cortisol levels increased by an average of 89%. Post-dexamethasone serum cortisol values decreased by an average of 18% 6 hours post-injection. Laboratory animal science. Aug 1988. v. 38 (4). p. 452-454. Includes references. Serum cortisol radioimmunoassay values in the normal ferret and response to ACTH stimulation and dexamethasone suppression tests.
LBASA. Garibaldi, B.A. Pecquet Goad, M.E.; Fox, J.G.; Sylvina, T.J.; Murray, R. Cordova, Tenn. : American Association for Laboratory Animal Science. Cortisol values were obtained from 39 ferrets, *Mustela putorius furo*, by using a commercial radioimmunoassay. Sera from 25 males (18 intact, 7 neutered) and 14 females (7 intact, 7 spayed) were assayed. Resting serum cortisol values ranged from 0.13 to 2.70 microgram/dl for males (mean = 0.93 +/- 0.63 microgram/dl), and 0.55 to 1.84 microgram/dl for females (mean = 0.86 +/- 0.29 microgram/dl). The resting cortisol values of both males and females were comparable to those of the cat (1.0 to 3.0 microgram/dl). A 7 year old male ferret with suspected

hyperadrenocorticism and an adrenal mass had a cortisol level of 8.1 microgram/dl. Adrenal cortical carcinoma was the histologic diagnosis. One adult female ferret had a cortisol level 3.30 microgram/dl. This animal also had proliferative colitis upon necropsy. An ACTH stimulation test (1 U/kg IM) and a low-dose dexamethasone suppression test (0.1 mg/kg) were performed on 10 ferrets. Post-ACTH serum cortisol levels increased by an average of 89%. Post-dexamethasone serum cortisol values decreased by an average of 18% 6 hours post-injection. Laboratory animal science. Aug 1988. v. 38 (4). p. 452-454. Includes references.
