1046	7) Street Legal Vehicles ONLY: BLM must consider limiting the use of “limited use” areas such as the Juniper Sub Region to street legal vehicles only. While the type of vehicle does not necessarily have a different impact on the route, the way in which it is driven does have a significantly different impact on the area. Since street legal vehicles require a licensed driver, a citation could have more significance for that driver. The drivers have to be older than kids on green sticker vehicles. Street legal vehicles require insurance. Street legal vehicles have a more visible identification plate. All in all, there is more responsible behavior with a street legal vehicle, rather than a vehicle that is considered as a toy. If the BLM allows green sticker vehicles in the “limited Use” areas, then how the people access those areas must be taken into consideration and realize the provision for “staging areas”. Staging areas for off road vehicles and horses become large areas denuded of vegetation, cause dust and noise problems and must be carefully located. Staging areas usually become enlarged over time and therefore must be “contained” with boundary fences and barriers. Even with such considerations, we find that staging areas are not appropriate in the Juniper Sub Region where vehicle touring (not OHV play) is currently acceptable.
1046	Motorized access points should be carefully evaluated so as not to disturb neighbors, impact soils that cause erosion and flooding. Non-motorized access must be identified and clearly marked on the ground, and balanced with motorized access.
1055	I have observed a steady deterioration in residential quality of life and peaceful enjoyment both for myself and numerous neighbors. This can directly be attributed to the reckless disregard displayed by the BLM's implementation of off - road recreation routes throughout our community coupled with a demonstrated inability to manage the adverse affects of the off road recreation being promoted and abetted by these routes.
1055	all routes be eliminated in areas of private/public lands interface/checkerboard land use pattern;
1097	There is also the issue of trespass and individual trespass and the law enforcement issue that go along with opening an off road vehicle route through an already established community.
1097	The loss of residential property values that may come from the degradation to our neighborhoods by off road vehicles.
1098	Motorized vehicle use interferes with hiking and non-motorized vehicle use. It is noisy, dusty and not compatible with walkers, hunters, wildlife and bicyclists, whereas the other four groups ARE compatible with each other. Can there be greater seperation of routes between OHV users and all the other people and animals who use the land? I have seen agitation arise between a hunter whose dog was almost run over by OHV users, resulting in threats, whereas hunters have no argument with hikers bicyclists or horseriders.
1101	Illegal DRV activity on BLM lands, especially in areas of private/public land interface has caused extensive conflict between residents and businesses and riders. Large groupings of DRYs on holiday weekends have widespread lawlessness, accidents, deaths and extensive damage to the environment.
1108	Existing dirt road and trails are oriented for four wheel drive vehicles, two wheeled vehicles need single-track trails. These trails exist, however most have been fenced off allowing two-wheeled access. This has created a dangerous condition in mixing four-wheeled and two-wheeled vehicles.

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1163	The issue of private property is also a big key
1250	When designating routes of travel for motorized recreation there must be consideration of other users. Private property owners are greatly impacted by trespass, noise, air quality and even harassment when routes are too close to their property or when routes come up to the property boundaries. There are also dangerous encounters when dirt roads are used by local residents, people touring and OHV and OHV play activities.
1250	Quiet and solitude sought by many visitors also needs to be considered when designating routes, along with the protections of cultural sites. Some routes have gone through habitation sites. Routes must guide OHV's away from these areas.
1284	In fact, the BLM has prioritized off-road recreation above all other uses and values in the WEMO. These policies have also had significant impacts on private property by encouraging trespass off of established routes and by failing to provide adequate law enforcement. Studies have shown that the majority of the time off-road vehicles breach designated routes.
1284	Illegal ORV activity on BLM lands, especially in areas of private/public land interface has caused extensive conflict between residents and businesses and riders. Large groupings of ORVs on holiday weekends have led to widespread lawlessness, accidents, deaths and extensive damage to the environment. To date, the BLM has failed in its mandate to recover costs for large gatherings and events on public lands thereby shifting the financial burden from event organizers to the taxpayer. Rural communities adjacent to these large-scale events have suffered from the fallout of these events including lawlessness, trespass and damage to private property.
1284	The designation of open ORV routes must be accompanied by a route terminus sign since those routes without such a sign encourages trespass onto private property, public lands and roads off-limits to green sticker vehicles. This is a very serious problem since without the indication of a terminus, riders continue on designated routes past their ends. This leads to trespass on private and public lands and many of these routes cross rural roads leading to the potential for collision with local traffic. The failure of the BLM to place route terminus signs on designated routes places the agency in a position of liability for potential accidents and trespass.
43 CFR 8342.1(d) – Route Designation Criterion D	
1002	Special areas and the resources they are intended to protect need to be specifically addressed in all route designation endeavors. All tools available to inform route designation decisions should be employed, including the use of site-specific evaluations (e.g., field analysis, PFC assessment, aerial photo analysis, etc.). On-the-ground action implementation in special areas should also be a priority, particularly where non-compliant vehicle use is known to occur.
1006	Established conservation areas for rare resources, including Areas of Critical Environmental Concern (ACECs), Desert Wildlife Management Areas (DWMAs), Mohave Ground Squirrel (MGS) Conservation Area etc. should be foci for substantial route reductions based on the plethora of science that identifies detrimental environmental effects of roads, routes and trails.
1015	The BLM proposes to include as part of the road designation and amendment of the CDCA Plan additional changes which are not specifically a part of the road designation process. Should the BLM proceed on this course the Vehicle Access Element of the plan needs to be amended to specifically reflect the wording contained in the California Desert Protection Act with respect to exempt vehicle access in Wilderness Areas.
1016	43 C.F.R. 8342.1 (d) does not apply to the Congressionally Designated Wilderness within the California Desert Conservation Area and BLM may not use this CFR in its route designation process around wilderness. The California Desert Protection Act clearly states that there shall be no buffer zones around CDCA Wilderness. All of the lands up to the boundary of the congressionally designated Wilderness areas may be utilized.
1016	The Society for the Protection and Care of Wildlife believes the process should include

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	the designation as open, all routes which are congressionally designated open"cherry stems and wilderness boundary roads" as part of the Wilderness process.
1017	The BLM proposes to include as part of the road designation process and amendment of the CDCA Plan, additional changes which are not specifically a part of the road designation process. Should the BLM proceed on this course the Vehicle Access Element of the plan needs to be amended to specifically reflect the wording contained in the California Desert Protection Act with respect to exempt vehicle access in Wilderness areas. The Closed section in Chapter 3 should read, "No vehicle travel is allowed." Except that Vehicle Access is authorized for the purposes of maintaining and repairing and in times of drought carrying water to guzzlers, and tanks and maintaining wells, and maintaining seeps, springs, and tinajas. Roads leading to the guzzlers, wells, seeps, springs tinajas and tanks will not be closed or eliminated but may be gated with locks.
1017	Routes should be allowed to terminate at the edge of wilderness areas,
1025	Established conservation areas for rare resources, including Areas of Critical Environmental Concern (ACECs), Desert Wildlife Management Areas (DWMAs), Mohave Ground Squirrel (MGS) Conservation Area etc. should be foci for substantial route reductions based on the plethora of science that identifies detrimental environmental effects of roads, routes and trails.
1025	Certainly legislatively designated wilderness areas and wilderness study areas, should not have routes in them. Routes adjacent to these areas should be analyzed for possible closure based on the potential for or actual documented illegal intrusions.
1026	Provide a quantitative estimate of the amount of each route in special status areas such as designated critical habitats, USFWS identified priority habitat linkages between desert tortoise conservation areas, Area of Critical Environmental Concern, Wilderness, Wilderness Study Areas and Habitat Management Areas. Document all sensitive resources including sensitive species habitats and unusual plant assemblages along each route. Provide a quantitative estimate of the amount of these sensitive resources impacted by each route.
1055	all routes eliminated adjacent to Areas of Critical Environmental Concern (ACEC) and state and federal designated wilderness areas;
1072	I really disapprove of opening up Wilderness areas to motor vehicles.
1095	*No ORVs next to ACECs, Wilderness areas and lands with endangered, threatened or sensitive species.
1100	Routes should be allowed to terminate at the edge of wilderness areas. This facilitates the public non-motorized access to the wilderness interior and complies with the "no wilderness buffer zones". Nor should there be explicit buffer zones adjacent to military land.
1101	We recommend that: all routes be eliminated in areas of private/public lands interface/checkerboard land use pattern; all routes eliminated in washes and other ephemeral waterways; all routes eliminated adjacent to Areas of Critical Environmental Concern (ACEC) and state and federal designated wilderness areas;
1284	In summary, we recommend that: all routes be eliminated in areas of private/public lands interface/checkerboard land use pattern; all routes eliminated in washes and other ephemeral waterways; all routes eliminated adjacent to Areas of Critical Environmental Concern (ACEC) and state and federal designated wilderness areas; all routes eliminated in the proximity of critical habitat and habitat for species of special concern; no routes in wildlife corridors; all routes eliminated in areas out-of-compliance with state and federal air quality standards; and, all routes eliminated that may threaten cultural resources, sacred sites and tribal lands.
Network Purpose and Need	
1001	If any routes have been closed in the past, we ask that they be reopened or be replaced by new routes serving those collecting locations. Similarly, we ask that any routes proposed to be closed under the new plan be replaced so that no further access is lost entirely.
1001	many rockhounds are elderly or handicapped and unable to travel much of any distance or carry weight very far in any

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	event. This is further reason why we ask that you do not close or place restrictions on any routes that provide access to rock, gem or mineral collecting locations, or that you replace any that have been or are proposed to be closed.
1001	The proposed WEMO route plan should not be allowed to authorize further "take" of public access for purposes such as rockhounding, OHV access and other forms of recreation. Recreation and public access should not be limited or curtailed to accommodate the possible loss of species resulting from other activities as that would result in additional "taking" of public access for recreational purposes.
1001	The following is a list of collecting locations of great importance to rock, gem and mineral locations for which we request that access be maintained or restored: Calico Mountains (2 maps attached) Mule Canyon (1 map attached) Stoddard Well Area (2 maps attached) Boron (2 maps attached) Castle Butte Area (3 maps attached) Bristol Mountains (1 map attached) Cady Mountains – South and East (3 maps attached) – (Note: no map of "Sandy Wash" is included herewith, but the site was found on BLM's maps while working in coordination with Peg Margosian, and is mentioned in CN1183202.) "Manix" (1 map attached) Clay Mine Road (1 map attached) Cuddeback Mountains (1 map attached) Darwin Hills (1 map attached) Lavic Siding (3 maps attached) Kramer Area (2 maps attached) Last Chance Canyon (1 map attached) Newberry (1 map attached) Black Canyon (1 map attached) "Pleistocene Lake", north of I-15 near Dunn (1 map attached) Cadiz (1 map attached) Chambless (1 map attached) Hector Hills (1 map attached) Hector Road North (1 map attached) Ord Mountain (1 map attached) Hidden Hills (1 map attached) Afton Canyon (1 map attached) – Note: Rockhounds request that vehicular and motorized access to Baxter Wash Loop and to Pyramid Canyon be restored. Much of Afton Canyon and the central Cady Mountains are inaccessible to all but the extremely fit due to route closures. Alvord Hills (1 map attached) El Paso Mountains (1 map attached) Sheep Springs (1 map attached) Bristol Mountains – Strawberry Onyx (1 map attached) – Note: Many rockhounds cannot walk the 2.2 miles from the road to the collecting location since the road was closed and therefore request that the road be reopened to allow vehicular and motorized access. Note: Additional supplementary location maps and other data may be added at a later date as it is received from fellow rockhounds.
1005	Many of the OHV roads and trails lead to private property, and access to those properties should not be compromised.
1007	Trails that are currently open should remain open, since other BLM activities will further reduce the OHV open area footprint for the future solar projects and 29 Palms Marine Base expansion, and thereby criminalize the OHV by eliminating the open areas making it illegal to recreate anywhere else.
1012	Major road systems leading to historically used/visited destinations must remain open.
1012	All roads to ranch/range improvements – waters – etc. remain open or gated.
1013	Single-track and quad-width trails provide a very different experience for the public compared to using full size roads. The BLM should strive to provide for the ever-growing single-track and quad recreation population since local area fulfillment of their needs is under-achieving.
1013	We have all witnessed the very real dangers of forcing everyone from children to grandparents onto the same road as

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	four-wheeled off-road vehicles capable of high speeds. To address this safety issue, we propose the BLM add single-track trails and quad-width trails in order to help separate these uses from full-size road vehicles and improve safe travel for all.
1016	All routes leading to a seep, spring, tinaja, guzzler, tank, or well, used to provide water for wildlife, should be designated open or as administratively limited.
1017	No more roads to gem and or mineral collecting areas should be closed.
1023	The Proposed Action should continue to authorize, maintain, and enhance the recreational use of the land included in the West Mojave (WEMO) region covered, including motorized recreation, hiking, camping, mountain biking, sightseeing, and horseback riding, as long as such recreational use is consistent with applicable law and existing land use planning documents.
1024	3. Any element affecting travel should include and recognize the right to Rockhound and collect fossils as allowed by Federal law
1024	Any travel plan should recognize the need for those that qualify as disabled and senior citizens who need to have easy access to enjoy and use our public lands. We can't walk for long distances, carrying equipment or even a few rocks picked up.
1024	Such plans need to recognize the need for camping in remote areas and they need to be more than one car length from a dirty dusty road for health and safety reasons.
1027	Many of the OHV roads and trails lead to private property, and access to those properties should not be compromised.
1028	Multiple-use visitors also include physically challenged visitors who must use wheeled vehicles to visit public lands. All of these multiple-use visitors use roads and motorized trails for their recreational purposes and the decision must take into account motorized designations serve many recreation activities, not just recreational trail riding.
1028	The Purpose and Need does not adequately address and recognize the current highly popular level of motorized access and recreation and the need for increased motorized opportunities.
1028	There is a significant need for Youth Loops. Youth Loops would include a small area of several acres, either contained by fencing or clearly marked boundary, with short, tight trail system that is designed to entertain kids under adult supervision. The youth loop offers an alternative to unauthorized routes near camp areas and riding in campgrounds. A good example to refer to is the Lewis and Clark National Forest Travel Plan for the Little Belts. We request that this important need be adequately addressed in the preferred alternative.
1028	Single-track challenge trails are needed for expert riders and trials type motorcycles.
1028	The West Mojave Area project area has far less than the desired number of motorized trails. This creates two problems. First, the public will tend to "explore" closed routes in an attempt to salvage a decent outing. Secondly, it produces an unsatisfactory OHV experience.
1028	The evaluation must adequately consider the growing popularity of motorized recreation, the aging population and their needs for motorized access, and the increased recreation time that the aging population has and looked forward to enjoying public lands in their motor vehicles.
1028	We are concerned about the loss of access and impact on the handicapped, elderly, and physically impaired produced by each motorized closure to historic sites and traditional use areas.
1035	It is important to us to have access to the area's remaining collecting sites to gather mineral specimens.
1037	Due consideration must be afforded continued motorized access to the West Mojave (WEMO) of the proposed project area. The region is a popular destination spot for multiple forms of recreation, including but not limited to: four-wheel drive touring/driving for pleasure, rockhounding, photography, and wildlife viewing. These are activities that cannot be enjoyed, or replicated, in that diversity in other regions.
1037	The loss of access to the West Mojave (WEMO) region for recreation opportunity is a direct loss. There are also indirect impacts that would result should this Proposed Action be approved and implemented causing displacement of recreational activities. Those costs include, but are not limited to: (1) the increased enforcement required at other sites when displaced recreational users seek out other areas that may be poorly identified as wildlife preserves or other resource rich areas; (2) the loss of biological resources or habitat at other sites that displaced recreational users may utilize; (3) the loss of nature education; (4) the loss of outdoor recreation opportunities; (5) the loss of outdoor access and experiences for children in the community; (6) the loss of familial traditions, custom, and

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	culture of recreational and nature-oriented activities in the region; and (7) the loss of the region's history and traditions, specifically with respect to mining and recreational activities.
1038	I don't believe any road present before 1980 should be closed. I also thinks all mining access should be allowed. EP 15 is my access to my and other miners claims.
1042	the BLM must consider the many activities that abound in the area and not just OHV touring.
1042	the BLM must contact the property owner to determine whether that route should be designated open, limited to authorized access, or closed. If no contact is made with the property owner, the route should be closed.
1048	I am requestion gthat the BLM not close or restrict our public land any further
1052	I don't feel we should close all routes but one into an area , as this channels people into one over used route also increasing likelihood for accidents. With closure of OHV areas there will be a huge amount of increased traffic for those few areas allowed access.
1053	please retain as much trails as possible. The longer trails are safer as they reduce the hazard of two-way traffic. Keeping trails connected is safer as well. Please implement single track trails for motorcycles.
1056	I think sheltering places to protect wildlife is rule. but, as a rock hound, being able to approach areas for stone is also a necessity. I comment that ways to balance the two be approached
1069	We need to maintain roads into historic, reparation, cultural, geologic, and scenic sites so that All citizens have access to them, inculding the aged and handicapped. Sites that are sensitive such as springs and Indian ruins should be secured and roads should probably end 100' away, as a safeguard.
1070	Please consider keeping our public lands accessible by motorized vehicles and continue to allow rock collecting on public lands.
1071	But I and others, still think that a couple of parking lots for ORV'S would be a good thing,
1082	The closure of existing roads that provide access to federal mining claims creates a particular hardship forsmall scale miners who own or lease federal mining claims and pay annual maintenance fees to the BLM. Thisis so because the nature of mining, even small scale mining, requires the use of tools -- typically picks andshovels and small scale dry washers [hand or battery operated consistent with current BLM regulations] andmetal detectors. If a road is posted as closed, there is no practical alternative to the use of a motorized vehiclefor accessing these claim locations with the aforesaid types of equipment. The amount of travel is minimal,typically consisting of a drive directly to the claim site where the motorized vehicle remains until the time todepart, i.e., one trip in and one trip out. This stands in sharp contrast to recreational bikers or ATVers who havethe option to choose other roads that are not closed, who pay no annual maintenance fee and who do not own orlease federal mining claims.
1083	subject = BLM Road Closures FeedbackType = Comment request_comment = I am distressed to hear of the possibility of road closures in the Mojave Desert. I ride my horse in many of the areas you propose to close to traffic. I certainly support any organization that opposes these closures.
1087	Gem and Mineral Collectors have lost access to 98 percent of their collecting areas. No roads to collecting areas and mines should be closed.
1088	I am writing to respectfully ask that no more restrictions be put in place for motorized vehicles in the WEMO area.
1089	There would be better compliance if there was more trail opportunity, This is bottom line fact
1091	The WEMO Plan for closing a number ofroads on our public property will not only affect the use by prospecting organizations, gem and mineral groups, other outdoor clubs and also a large segment ofthe local community as well. Many area people use these roads for recreation and family outings.
1100	More single track routes need to be designated. One of the short falls of the interim designation process is that BLM has designated wide basic roads and not enough single track trails for motorcycles and bicycles. One unfortunate result of compliance and restoration efforts has been the loss of popular networks of historic but undesignated single-track motorcycle trails. The BLM should include these in the route designation pool.
1100	Gem and Mineral collectors have lost access to 98 percent of collecting areas in the California Desert Conservation Area which was 87 percent of California collecting. No more roads to gem and or mineral collecting areas should be closed.
1100	Roads leading to extreme riding or driving places, which are few and far between and require specialized terrain, should not be closed.
1103	Vertebrate fossils from the Mojave Desert are important to the North American continent for interpretation of climate, faults, floods, and continental biostratigraphy. Such assistance to the BLM

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	cannot be accomplished without legal access to select sedimentary formations. The established routes that need to remain open have been in use by paleontologists and campers for 60 to 100 years. Preliminary data justifying the significance of, and continued field research is available (Savage and Downs, 1954; Kurten and Anderson, 1980, Lundelius et al., 1987; Jefferson, 2008a).
1110	I am the Vice President of the Orange County 49er's. We have eight claims in the area with over 250 members that use our claims and prospect the desert at the the road closures are going to effect us and will end up in court if that is necessary, as you can not restrict access to a mining claim.
1132	Under the rules pertaining to the Paleontological Resources Protection Act, professional and trained vertebrate paleontologists are the only qualified persons who can legally help the BLM manage these non-renewable resources. I have been involved in these studies for over 50 years, and it is absolutely essential that we maintain access to areas with such resources to facilitate ongoing research and periodic prospection for fossils as ongoing weathering exposes new specimens.
1138	I am going to speak only for myself and those with common interest, which is rockhounding and enjoyment of the desert, which I have been doing for the past approximately 60 years. Please take into account that we are not those who leave the roads, dirt or paved, and who will not destroy any part of the desert. So many of us, like myself, are well up in years and cannot hike into our favorite areas, and those who might could easily get themselves into a world of trouble. All we ask is vehicle access on existing roads
1139	<p>These areas need to remain accessible to rockhounds to enjoy their hobby.</p> <p>One is the Paul Bunyan Agate site off Copper City Road. By the signs found it appears to be open now.</p> <p>Another is the Butler Onyx site on the north side of the Calico Mountains.</p> <p>Another is the Sagenite Agate site in the Calico Mountains. The road is open towards the site but it needs to transverse part of the road to a spring, and that is closed, but the Sagenite site continues off and</p> <p>WEMO_1139</p> <p>past the spring. At the moment it appears that the Sagenite site is unavailable due to the segment of road closure to the spring. The Sagenite site should be open for access.</p> <p>Another is the petrified palm in the Mule Canyon, Calico Mountains.</p> <p>Another is the Lavic Jasper/chalcedony sites in the Pisgah crater, Lavic Siding, Cady Mountain bajada area.</p> <p>All of the Cady Mountains should remain accessible on existing desert roads. This is an area that has been visited by rockhounds for years and continues unspoiled with rockhound exploration. There are many areas that dirt roads enter the Cady Mountains -- they should remain open.</p> <p>The road to the Strawberry onyx on the east side of Broadwell Lake is now signed closed. This classic onyx site should be open to rockhounds. Why is this area designated closed? Please change the category.</p> <p>Further on the west of Barstow is the Kramer Hills area that has agate & jasper. This should be open for rockhounds.</p> <p>And on over to the Boron, California City area are more sites famous for their agate & jasper. These areas should also be open.</p>
1146	If you close all the remote areas and/or make them unavailable, to most of the recreating public, those of us that don't want to be part of the herd, have no place to go. Being officially mobility disabled, I can still find serenity in those remote places I can drive to. I use my Jeep as a 4 wheel drive wheelchair. There are lots of us older folks with similar problems, desire access to those areas that are less traveled.
1146	Allow access to critical areas of the desert by volunteers servicing critical habitat, like those servicing wildlife guzzlers, fire suppression personnel removing brush around cabin sites, and those removing invasive species in isolated areas. Having to walk into these areas many times negates the effectiveness of the volunteers.
1146	Make allowances for those less able to move around normally. Time stressed local citizens may want to spend a short amount of time in an area Senior citizens, the mobility handicapped, and those otherwise inhibited cannot walk 10 miles a day, or climb Telescope Peak, or ride a horse through the backcountry. They still deserve to participate in the glory and serenity of the desert!
1155	I recommend that routes indicated on the attached maps and table be left open for vehicular access by collectors.
1158	I desire to visit sites used historically to collect minerals and semi-precious gemstones, est. by the Indian Wells Gem and Mineral Society over 50 years ago. These sites need vehicle access to transport hand tools and rocks
1159	Open routes, allow camping hiking, climbing, and rock hounding
1159	Understanding that open routes are necessary to camp, hike, and climb, will allow for a more balanced planning that does not lock people and families out of the desert.
1184	Love to see more single tracks open, like technical trails.

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1198	Need more open space for riding
1200	to many people to little trails
1201	Open up more trails
1202	Please open up more trails
1203	more trails makes it safe
1204	Open the trails
1205	Open up more trails
1206	Open up more trails
1207	Keep all trails open
1208	Please stop closing all the fun trails
1211	Keep the trails open
1212	Safety
1213	Open more trails so it is safer
1214	Open new trails
1215	Open new ones
1220	If there were more opportunities to explore this great land I believe it would attract more new comers and retain reoccurring folks. It would make me more confortable to ride and I imagine, reduce accidents due to overpopulation
1221	Would like to see more singletrack
1222	More single track routes need to be installed for not only safety concerns
1225	I would like a trail to the store that I can ride that doesn't have dunebuggies on it
1227	We would like to see more open trails
1238	Would like to see more open trails to enjoy
1242	Safe trail systems for all ages and skill levels
1256	In 1992 this area was taken from the open area. This area had been raced for 20 years. If Johnson Vally is lost to recreation the best place to replace it is this area. [Map depicting area southeast of Ridgecrest, CA]
1263	Many of our club, myself included, are senior citizens who have enjoyed the beauty of the desert for many years. We still enjoy the outdoors and the uniqueness of the Mojave Desert but we are not able to hike or walk for long distances. We need roads to get to some of our favorite areas.
1266	Many of our club, myself included, are senior citizens who have enjoyed the desert for many years. We still enjoy the outdoors and the beauty of the Mojave Desert but we are not able to hike or walk for long distances. We need roads to get to some of our favorite areas
1269	Enclosed is copies of various claims used by the High Desert Gold Diggers, Valley Prospectors, Orange Co 49 'Ers that I have in my possession. The areas include: Coolgardie Area; Lane Mountain Area; El Paso Mountain (Randsburg) Area; Ord Mining District; Dale Mining District. Also included is the copies of the GPAA (Gold Prospectors Of America) claims in the Coolgardie Area.
1287	A large number of rockhounds (and other recreational users) are elderly or disabled persons who have limited physical abilities and therefore require motorized vehicular access to public collecting areas and other recreational sites. These persons do not have the ability to hike any significant distance to access collecting locations and other recreational destinations. Therefore, closing public motorized vehicular routes that serve collecting sites and other recreational destinations constitutes unfair discrimination against them in particular. We strongly recommend that the BLM consider this in analyzing the routes that it will designate as "open". Public lands belong to all of us, not just those who are healthy enough to hike to their chosen recreational destination.
Range of Alternatives	
1006	As part of this process, the BLM should include in the EIS alternatives that are more protective of the environment, including at least one low density alternative that includes a mileage/density cap (miles of road per hectare) for designated routes based on special designations (ACEC, DWMA, WHMA, etc.), MUC classes and the conservation status and goals. Because of the many unauthorized vehicle routes created after 1980, the density of routes today in the West Mojave is far higher than is needed for travel, reasonable recreation, or access to identified destinations.
1017	The BLM has indicated it proposes to develop only one process utilizing one criteria for the route designation process. The SPCW believes upon reading the "remand" document that the BLM has an obligation to develop more than one route designation process and more than one road designation scheme and that there be differing route designation

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	designs in those alternatives. We believe the court is asking for alternatives from which she may pick.
1025	The definition of a “viable” route network needs to be explicit and alternative definitions explored. This could include analysis of the minimum route system needed to travel across a region, the minimum needed for reasonable access to recreational destinations, etc. The EIS should also consider at least one alternative with user limits at open areas.
1025	The BLM should clearly state what the proposed plan amendment is in the EIS and should include a number of alternative route designations scenarios.
1028	Reasonable alternatives to motorized closures must be pursued. The continual loss of motorized recreational opportunities is our primary concern. Because of the significant cumulative effect of motorized closures at this point in time, we feel strongly that there can be “no net loss” of motorized recreational opportunities with the Environmental Assessments for 8 Travel Management Areas within the West Mojave Area.
1028	We ask that management for sharing of these lands for multiple-use be selected as the preferred alternative. Sharing would include a 50/50 sharing and equal opportunity of non-motorized to motorized trails.
1028	The Environmental Assessments for 8 Travel Management Areas within the West Mojave Area must include the evaluation of a pro-recreation alternative so that motorized recreationists do not end up losing before the process begins. A true pro-recreation alternative should be based on the actual usage of the area which is 99% motorized multiple-use in the case of the West Mojave Area. A reasonable alternative should include: a. Sharing non-motorized trails with mountain bikes and motorcycles, b. Creating new mountain bike and motorcycle trails, c. Creating ATV trails from roadbeds that both currently open and closed, d. Creating new ATV trails e. Creating new ATV trails that connect with converted roadbeds to create loops, and, f. Establishment of 4x4 challenge routes using roadbeds that are both currently open and closed including historic mining routes.
1028	An adequate and reasonable preferred alternative would include an adequate quantity and quality of beginning, intermediate, and advanced routes and trails for a wide cross-section of motorized visitors including motorcycles, ATVs, and four-wheel drive vehicles. Additionally, the quantity and quality of motorized routes would be at least equal to the quantity and quality of non-motorized routes. This is the yard stick that the team should measure travel plan alternatives by.
1028	Therefore, it is incumbent upon the project team to formulate at least one alternative that maximizes motorized recreation, or at least does not reduce motorized recreational opportunities in the planning area.
1028	All roads to be closed to full-size vehicles should be converted to atv routes. This is a reasonable alternative for all existing roads.
1028	The preferred alternative must provide for an adequate number of routes as required to provide access to the many historic mines and cabins and an adequate number of dispersed campsites and trailheads.
1028	The existing level of access and motorized recreation is a reasonable starting position and alternative. An even fairer position given that this should be a travel plan seeking to address the needs of the public for motorized access and recreation would be an alternative based on an enhanced level of opportunity.
1042	We expect the BLM to fully consider a full range of alternatives that may even result in a reduction of overall mileage and/or elimination of “motorcycle only” routes in sensitive areas of the Juniper Sub Region.
1042	If the BLM does include an alternative which includes “motorcycle only” or “single track” routes or (other special use routes) we expect the BLM to fully disclose the definition of such a route, how wide it is, whether the 300’ stopping/parking rule applies, if the route is open for 3 or 4 wheel vehicles, etc. and how the BLM intends to ensure that such routes will be managed and maintained so as not to become full width routes.
1087	The BLM has indicated it proposes to develop only one process utilizing one criteria for the route designation process. We believe, upon reading the “remand” document, that the BLM has an obligation to develop more than one route designation process and more than one road designation scheme and that there be differing route designation designs in those alternatives. We believe the court is asking for alternatives from which they may pick.
1100	The BLM has indicated it proposes to develop only one process utilizing one criteria for the route designation process. The RACC believes upon reading the “remand” document that the BLM has an obligation to develop more than one route designation process and more than one road designation scheme and that there be differing route designation designs in those alternatives. We believe the court is asking for alternatives from which she may pick.
1163	In the Big picture of WEMO, let me say that because of the lawsuit and the expectations to have alternatives, I feel that

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	the need for more single track, 50 inches or less, is a desirable goal for those who want that type of experience.
1289	Our primary goal in providing these comments is to request that you consider an alternative for amending the motorized vehicle access element in a manner that maximizes the potential for the recovery of listed species and degraded habitat.
Data and Route Inventory	
1001	We recommend that the BLM include a process by which geographic information reflecting the interests of rockhounding, other forms of recreation, and public access be gathered and inventoried and clearly identified on an official map set for the decision making process. We know that rockhounds want to contribute to this effort, but do not have the resources to map the information themselves, nor should they be assigned the burden to do so.
1001	In addition, they have information regarding rocks, gems, minerals and fossils found in their areas which they offer to the public on their websites. Books have been published by authors such as Mary Francis Strong that identify rocks, gems, minerals and fossils found in the Southern California deserts and the locations in which they are found. Historic publications such as Desert Magazine which document rock, gem and mineral collecting locations in the Southern California Desert District and beyond have been digitized and are available online free of charge. All of these sources should be utilized by the BLM in identifying collecting locations and the routes needed to access them so that potential impacts to the public's access to them can be considered and avoided or mitigated.
1001	We incorporate by reference the collecting locations listed in all editions of the well respected and well-read books such as Rockhounding California by Gail A. Butler and Gem Trails of Southern California by James R. Mitchell, as well as the collecting locations listed in Desert Magazine and in all books authored by Mary Francis Strong on the topic, and request that access to each of the collecting locations listed therein be maintained or reopened.
1001	We also incorporate by reference collecting locations listed and reflected in the California Desert District Hobby Collection Map and accompanying index produced by R. Waiwood for the BLM California Desert District in January, 2003, and any additions thereto, and request that access to each of the collecting locations listed therein be maintained or reopened.
1001	We further incorporate by reference the GIS information prepared by Peg Margosian, GIS Specialist of BLM's district office in Moreno Valley, California, regarding collecting locations derived in coordination with myself upon joint review of rockhound location maps at meetings in her office, and request that access to each of the collecting locations identified therein be maintained or reopened. A copy of a list provided at the end of our last session is attached hereto and incorporated hereby for your reference
1006	Moreover, all current routes should be inventoried and evaluated for conflicts with biological and other rare resources as well as ecological, hydrological, eolian and other physical processes. That the BLM is able to undertake such an approach. was shown in the Ord Mountain Route Designation Environmental Assessment process (BLM 2000) which was a comprehensive process that was abandoned by BLM. BLM should consider replicating that process throughout the West Mojave area as it was originally proposed to do.
1006	In an attempt to understand more about the route proposal, the Center has requested the route inventory as GIS information so that we can accurately assess the impacts to other resources, but to date have not received the requested data. On February 1, 2012, I contacted the district wildlife biologist, Larry LaPre inquiring whom I should contact regarding the route data in GIS. On February 2, 2012, Dr. LaPre directed me to Peg Margosian, whom our GIS person contacted. Ms. Margosian forwarded on our request to you, Ms. Seehafer, but we never received a response. In order to effectively participate in the public process, we again request the current proposed route information in GIS format.
1006	the California Department of Fish and Game is currently implementing rigorous vegetation mapping in the West Mojave area, in support of the DRECP2. These data need to be incorporated into the environmental analysis and used as a basis for route evaluation.
1006	Regarding connectivity for wildlife', several new data sets are now available and should be included in the analysis. SC Wildlands has produced the "Linkage Network for the California Deserts 4. In addition, the USFWS has produced a map of essential linkages for desert tortoise (Attachment 1), which should also be incorporated and analyzed in the EIS. These areas are critical to keep the west Mojave desert's wildlife connected, and therefore should be analyzed as highly protected areas.
1009	There has never been a complete, and 100% accurate, route survey in the WEMO Plan area. For this reason,

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<p>so that the public at large can properly establish a more accurate amount of routes which have been lost in and around the WEMO route system, the BLM should release in electronic form, on the Internet, all data and information relative to any governmental mapping effort for this region.</p> <p>For the purpose of this request, "region" is to include not only the WEMO Plan area, but also all those lands in public or military ownership, for a range of one-hundred (100) miles from the exterior boundary of the WEMO Plan area. This information should also include historical USGS Topographic maps at the highest resolution and detail available for the same area.</p>
1009	<p>On all future draft and final maps relative to this action, an indicator should be included to show routes which extend beyond the WEMO Plan area.</p>
1015	<p>The inventory of springs and seeps should also include tinajas, guzzlers and tanks.</p>
1015	<p>BLM should leave the words "existing roads and trails" in the CDCA Plan however it should be clarified as to reflect that this does not just mean 1980. It could also mean whatever roads are in existence on the ground when ever access issues are determined.</p>
1016	<p>The Society believes the BLM should identify all those roads in existence in 1980. First cut should be all the roads within the CDCA and on pre 1980 U.S.G.S. Quads. Then those roads on AAA maps from that time. (These roads were ground truthed at the time and so we know they existed at that time.) This would be a great start on a base map to be used for the process. Should BLM choose not to do this, the public should be given the amendment the BLM proposes to use to change the California Desert Conservation Area Plan so that the public can submit scoping comments on the proposed plan amendment. The Society for the Protection and Care of Wildlife believes that the BLM proposed WEMO amendment to the California Desert Conservation Area Plan must amend the entire plan and not just the WEMO portion.</p>
1016	<p>The WEMO route designation amendment of the California Desert Conservation Area Plan being worked on now, needs to inventory every route, the paved roads, the graded dirt roads, the ungraded dirt routes, the single track routes, the rights of way, all routes in approved plans of operation, ALL ROUTES OF TRAVEL open or closed.</p>
1017	<p>Routes and route segments that are identified for analysis and designation should include: all routes originally within the 2004 designation pool; all routes identified in subsequent BLM surveys; routes identified by the public; and routes considered by previous designation efforts, i.e. Jawbone-Butterbrecht ACEC, Rand Mountains Management Area, Ord Mountains.</p>
1017	<p>The court mandated inventory of seeps and springs and their condition should also include tinijas, guzzlers, tanks and wells.</p>
1017	<p>The SPCW is concerned that the original WEMO maps have not been ground truthed to any degree. For example: the WEMO maps for the Slate Range. This map shows three open routes near Manly pass, none of which are actually on the ground even close to where shown. The BLM has posted closed signs on one of the three existing routes yet an open route shown on the map is a virgin canyon with no tracks.</p>
1022	<p>BLM must take into account all previous data and analysis from planning efforts spanning almost three decades in this Proposed Action.</p>
1025	<p>However, all current routes should be inventoried and evaluated for conflicts with biological and other rare resources as well as ecological, hydrological, eolian and other physical processes. The Ord Mountain Route Designation Environmental Assessment process (BLM 2000) was a comprehensive process which should be replicated throughout the West Mojave area as it was originally proposed to do.</p>
1025	<p>BLM need to use the best information to identify the existing route/roads/trails network from 1982, and then compare those data to the current routes/roads/trails data. All routes/roads/trails need to be evaluated for conflicts with resource concerns. If adequate and comparable aerial photos are available, they could be used to document the routes/roads/trails.</p>
1026	<p>Unfortunately, the BLM has not provided GIS layers showing the current authorized route inventory for the eight TMAs or the boundaries of the TMAs. Without this basic information, it is difficult for the public to provide meaningful proposals to help the BLM at this time. Please ensure that when any proposed actions are forthcoming that the relevant GIS data is made available so that the public can assist the BLM as is the clear intent of the National</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	Environmental Policy Act ("NEPA").
1026	For each identified route, provide the length and width. Determine the total area occupied by each route. Quantify the area of each route by soil type and by vegetation type. Document and quantify the number of wash and canyon crossings and adjacent riparian areas for each route.
1026	For each designated route provide an estimate of the number of other unauthorized routes that lead off that route to provide information required to ensure that the proposed system does indeed minimize conflicts between off-road vehicle use and other existing uses.
1027	Many guzzlers and other wildlife maintenance apparatus are located in the study area. Not only should these all be mapped and identified, access to all of these areas is critical and must be included in any new plan.
1027	All roads and trails on maps must be ground – verified. The current mapping contains many errors, in order that these errors do not become part of the finished product, site specific analysis is needed.
1028	It seems that both the BLM and Forest Service are using forest planning and travel management planning as an opportunity to close as many motorized recreational opportunities as fast as possible. We are asking that this project establish a baseline evaluation and address this significant impact.
1028	NOTE: PLEASE PROVIDE DATA AND ANALYSIS SIMILAR TO THE FOLLOWING FOR THE ENVIRONMENTAL ASSESSMENTS FOR 8 TRAVEL MANAGEMENT AREAS WITHIN THE WEST MOJAVE AREA ANALYSIS. THIS INFORMATION WILL SUPPORT ADDITIONAL OHV OPPORTUNITIES. [Insert containing data and analysis regarding travel management in certain U.S. National Forests]
1028	Furthermore, we request that the data in the next two tables be updated to reflect the significant reduction in miles of roads and motorized trails that decisions have produced since this data was assembled. This revised data should be used to guide the decision-making to forest plan and travel plan alternatives that adequately meet the needs of the public by increasing motorized recreational opportunities in the national forest system.
1033	Corrections should be made to the Middle Knob map: <ul style="list-style-type: none"> o Change State Route "29" label to "14" (south of Mojave). o Show the current SR 58 freeway alignment north and east of Mojave.
1037	The GIS/GPS data collected for the WEMO process must be made available to the public to enhance their ability to understand the review and analysis process.
1042	Previously disturbed places for stopping and parking should be located and mapped so people know where they can park without disturbing more vegetation.
1042	Language in the WEMO plan regarding route designation and use must be improved. Previous language used phrases such as routes that were to be "encouraged" leaves one wondering if cross country vehicle travel is okay. Language must be much clearer, stronger and more meaningful.
1042	The BLM has a responsibility to come up with a set of maps that depict a reasonable baseline from which to work.
1046	Please look at the maps that are available to the public yourself: Here are some items that are of concern: <ol style="list-style-type: none"> a) There is an annoying disclaimer that bounces around the map as you move the mouse. It states that the maps are representational only. When will the BLM come out with some real, accurate maps? How can the public be expected to make sensible comments if the maps are not considered complete or accurate by the BLM? b) Not all the open routes signed on the ground are on the map. How do we comment on the ones that are omitted? c) Many of the open routes don't have a number on the map. What is the status of those roads? d) Some of the numbers do not appear to be on the open route. e) It is not clear on the map what some of the unnumbered lines are: open or closed route, footpath, powerline or if it is a stream. How do we comment on those items? f) Some roads are marked 4wd which are limited/private use with a locked gate. Unless you are on the ground and find the gate you don't know it, and even then, you may wonder why there is a locked gate! If we were not so familiar with the area, we would not know about the purpose of such routes or gates. These routes, which give a right of way to a rancher/miner/guzzler must be on the map and accurately annotated as a "route for permittee only". g) There are very few place names and many of the important features are not included, which makes the maps almost

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<p>useless. Even well known roads such as Bowen Ranch Road are not named. 3N14 and 4N16 are not named as such, but those are the numbers on most county and area maps as well as GPS.</p> <p>h) There are no grid lines or coordinates for reference, making it very difficult to navigate.</p> <p>i) Open routes in the USFS boundary to the south are not included on the BLM map. The BLM has said that they work with the USFS to ensure connectivity, but the public has no way of visualizing that connectivity.</p> <p>j) The topography is not shown. This makes it difficult to determine accurate comments.</p>
1047	<p>Adequate Adequate maps are those that contain a standard set of features which would include the following (these can be provided in GIS layers):</p> <ul style="list-style-type: none"> topography and names of features such as mountains, streams etc some way to identify the area such as coordinates or Township etc. blue line streams, springs riparian vegetation and other vegetation types sensitive species Wilderness areas and WSAs ACECs Other areas of special scientific interest soils Currently active mining claims and rights of way disturbed lands including closed mine shafts, quarries, areas used for camping/shooting etc transmission lines and rights of way Railways and rights of way Communication towers and rights of way Other rights of way wind energy testing sites and location of towers or proposed towers Grazing allotments and improvements such as cattle guards, fences gates etc Boundaries with other agencies (such as parks and US forest lands) should also show the open routes in those lands and the non-motorized zones as well as boundary fences etc. other fences Routes should be differentiated between full sized roads, currently street legal only, OHV trails, and single track with the width provided Hiking and Equestrian trails Visitor centers, kiosks etc Ranches and homes as well as private property Places of historic interest
1047	<p>I am sending you a copy of my request that the BLM provide adequate maps so that the public can make informed comments regarding the WEMO route designation process. The BLM has updated maps for many areas regarding the items that would be helpful to me and others in making comments, but the only maps available to us are rudimentary and lack any sort of detail. In fact, with most maps, it would be very difficult to follow the routes on the ground, even with the open route signs posted at intervals. This is because, on the ground, there are a multitude of routes that are designated as closed (but not marked), and there are also miles and miles of new routes created by the public without the BLM designation process (volunteer or illegal routes).</p>
1055	<p>The BLM must publish accurate maps of the entire region and make them available to residents both on-line and in a hard copy for no cost. These maps should be available to the public at public meetings, at the BLM offices and via mail. One factor that contributed to the inaccuracy of the WEMO maps and route designations was the lack of ground-truthing in these areas. The BLM needs to apply Global Information System (GIS) technology to overlay critical habitat, private lands, ACECs, Desert Wildlife Management Areas (DWMA)s, and the Morongo Basin Wildlife Linkage Design[4] (see attached) to compare with proposed routes.</p>
1055	<p>Baseline Information</p> <p>In order to develop a travel management policy with a solid foundation, the BLM must include the latest scientific information and studies on the following:</p> <ul style="list-style-type: none"> • impact of ORVs on critical habitat, ACECs and habitat for threatened, endangered, rare and BLM sensitive species

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<ul style="list-style-type: none"> • the number of accidents involving ORVs and an accounting of citations issued by all relevant law enforcement agencies on a yearly basis since 1980 • the extent of ORV damage to soils, wildlife habitat and plant communities within the WEMO • the capacity of the BLM to provide law enforcement for the WEMO area • the impacts of ORVs on washes, unusual plant assemblages, and riparian resources • the impacts of ORVs on air quality within the WEMO area, especially in areas that are out of compliance with state and federal air quality standards for both PM 10 and PM 2.5 air pollutants, and the health impacts of this fugitive dust • the cost to local governments from ORV law enforcement and related emergency response, and ORV damage to roads, berms and flood control infrastructure • the impacts of ORVs on cultural resources and tribal lands • the potential for the spread of non-native invasive plant species
1057	In the proposed plan amendment, the OHV "Limited Use Areas" should include, at a minimum, those "routes of travel" identified as appropriate for such use in the new route designation process. In other words, the new route designation process will redefine the baseline for determining which routes are part of the WEMO Plan and which ones are not.
1057	BLM must ensure that the routes identified for inclusion in the plan amendment are "ground-truthed" as to location, width, length, and potential impacts on resources and other uses. Further, to the extent BLM can analyze however imperfectly - the effects of the proposed network as compared to those of the network that existed in 1980, this should be done.
1087	The inventory of springs and seeps should also include tinajas, guzzlers and tanks.
1087	In 1980, the year mentioned by the judge, there were 30,000 miles of roads in the California Desert. The original maps that were drawn up, should be made available to the public as their input had been requested and was considered part of the basis for the decisions. Without these original maps the road designation process will be considered flawed by NEPA standards.
1095	BLM should inventory all "previously disturbed" sites.
1098	I have looked at your maps and I am unable to understand them. The BLM must do better. If I cant understand where OHV users can go, how can they?
1100	The court mandated inventory of seeps and springs and their condition should also include tinijas, guzzlers, tanks and wells.
1100	The RACC is concerned that the original WEMO maps have not been ground truthed to any degree. For example: the WEMO maps for the Slate Range. This map shows three open routes near Manly pass, none of which are actually on the ground even close to where shown. The BLM has posted closed signs on one of the three existing routes yet an open route shown on the map is a virgin canyon with no tracks.
1100	Routes that are not listed as part of the designated route system, yet exist on the ground need to have a site GPS completed and be assigned a number and be made part of the designation system.
1101	<p>In order to develop a travel management policy with a solid foundation, the BLM must include the latest scientific literature on the following:</p> <ul style="list-style-type: none"> • impact of DRVs on critical habitat. ACECs and habitat for threatened species and species of concern. • the number of accidents involving DRVs and an accounting of citations issued by all relevant law enforcement agencies on a yearly basis since 1980 • the extent of damage by DRVs to soils, wildlife habitat and plant communities within the WEMD • the capacity of the BLM to provide law enforcement for the WEMD area • the impacts of DRVs on washes and other ephemeral waterways • the impacts of DRVs on air quality within the WEMD area, especially in areas that are out of compliance with state and federal air quality standards for both PM 10 and PM 2.5 air pollutants, and the health impacts of this fugitive dust • the cost to local governments from DRV law enforcement and related emergency response, and DRV damage to roads, berms and flood control infrastructure • the impacts of DRVs on cultural resources and tribal lands
1101	We are including a map of the Subregion with the above BLM areas circled in red. We are also including photos of the

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	degraded BLM Parcels. Poor management by BLM personnel has destroyed some of the most lovely land in Kern County.
1106	The BLM should develop a means to provide maps to the public that illustrate all the roads that currently exist on the ground as well as those in existence on the 1980 Desert Plan maps.
1114	Map Name and Number - Afton Map 1 Route# - Grid Location - Point of Interest - Comment Type - No details on the map. Where are the road names? Where is the campground? Add details to make the map more user friendly
1115	Maps totally inadequate for Afton County. Does not show rail road, major roads, campground etc. Give maps so we can verify validity.
1116	No features on detail map, should be USGS topo map.
1116	On the eastern side of Subregion needles south the map does not exist. Please send me a copy as soon as possible.
1120	Map Name and Number - Sierra Map 2 Route# - SE 993 Grid Location - T22S R37E Sec. 15, 16 Point of Interest - Comment Type - Site Specific Map error trails, SE993 not SE977
1120	Map Name and Number - Sierra Map 1 Route# - SE 9 Grid Location - T22S R39E Sec. 31 Point of Interest - Comment Type - Site Specific Intersection of SE7 and SE9. Map shows SE9 continuing toward the SE. On the ground the road heading NE is marked SE9.
1120	Map Name and Number - Sierra Maps 2 and 3 Route# - Grid Location - T24R38E Sec. 16 Point of Interest - Comment Type - Site Specific The historic Bonanza trail is shown as an undesignated route. See back page for additional info.
1120	Map 2 - Lower right-hand corner. Hwy 178 - Walker Press Rd. is nowhere near this map, correct it.
1146	I think we should revisit all the trails in the plan. If some trails were left open due to insufficient guidelines; conversely some were closed for the same reason. The present routes are said to be from the 85/87 route survey, which many contend was never ground proofed or completed. I think we should revert back to the original desert plan and consider all routes equally. I personally know of many routes in Searles Valley, Panamint Valley and the Darwin area that have been there for over a hundred years, yet are not on the present WEMO designated route plan.
1146	Assess all roads originally considered in the Desert Plan as amended in the 1980/82 time period. All network roads assessed after were never officially ground proofed or went through the full NEPA process and therefore should not be now closed.
1156	Need better maps.
1163	Highway 395 has the El Paso on the West and Ridgecrest on the East. There are single track routes that come down a hill, cross 395 and go over railroad tracks. This can clearly be seen from Hwy 395 before you get to the Ridgecrest billboard. When you look at the BLM maps, these single tracks do not show up, but we know they are there. Perhaps the Survey done by the BLM Catasdral group should be brought up to the Sub group meeting so that it can be identified on the maps, as well as other routes that cannot have GPS done without violating the "Closed Unless Signed Open" designation which is currently in place.
1249	Value of accurate, available and up-to-date route maps. Local planning efforts

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	can benefit greatly when accurate route maps are established and made readily available to planning groups. Setting conservation priorities for land acquisition and/or protection can be done in a more predictable manner when all of the stakeholders involved know which BLM routes are valid and established, and their exact locations. Hard copy and digital files of final route maps should be made available to the interested public.
1249	Base route designations in valid conservation science, including the use of existing wildlife linkage design studies to inform route designation. For example, SC Wildlands has performed two linkage design studies (www.scwildlands.org/reports) that map least cost corridors for a set of focal species defined by wildlife experts for the Morongo Basin. These are "A Linkage Design for the San Bernardino-Little San Bernardino Connection" and "A Linkage Design for the Joshua Tree-Twenty-nine Palms Connection." Other scientifically based studies by the USGS, USFWS, CA DFG or other agencies that can inform route designation should be included in the development of the route maps.
1256	I am enclosing 2 attachments pertaining to signage and mitigation. The supplemental maps issued in Aug. omit many open routes and notably the routes the Lost Coyotes M/C has used on 7 sanctioned dual sport events since 2001. This shows me how inaccurate the maps are. The subregions that have omitted our sanctioned dual sport routes are - Ridgecrest, El Paso's, - Red Mtn., - Fremont, - Black Mtn., - Kramer. I can supply sanction numbers and the routes will be on file in Ridgecrest and Barstow F.O. s.
1256	New maps should show single track trails in a different color than 2 track.
1256	Map is poor quality, Cooper City Route numbers change.
1284	The BLM needs to apply Global Information System (GIS) technology to overlay critical habitat, private lands, ACECs, Desert Wildlife Management Areas (DWMA)s, and the Morongo Basin Wildlife Linkage Design4 (see attached) to compare with proposed routes.
1284	In order to develop a travel management policy with a solid foundation, the BLM must include the latest scientific information and studies on the following: <ul style="list-style-type: none"> • impact of ORVs on critical habitat, ACECs and habitat for threatened, endangered, rare and BLM sensitive species • the number of accidents involving ORVs and an accounting of citations issued by all relevant law enforcement agencies on a yearly basis since 1980 • the extent of ORV damage to soils, wildlife habitat and plant communities within the WEMO • the capacity of the BLM to provide law enforcement for the WEMO area • the impacts of ORVs on washes, unusual plant assemblages, and riparian resources • the impacts of ORVs on air quality within the WEMO area, especially in areas that are out of compliance with state and federal air quality standards for both PM 10 and PM 2.5 air pollutants, and the health impacts of this fugitive dust • the cost to local governments from ORV law enforcement and related emergency response, and ORV damage to roads, berms and flood control infrastructure • the impacts of ORVs on cultural resources and tribal lands • the potential for the spread of non-native invasive plant species
1288	Need to add three riparian areas to the database that may have OHV impacts: Coxe Creek Riparian Zone (S. of Castro's private land), Lion Canyon Riparian Zone (near Luna Mtn), and Warm Springs.
1290	I'm working with a set of 11 x 17 maps that were handouts at the Jan 26, 2011 scoping meeting discussing Searles and Darwin WEMO routes. They are labeled North Searles, South Searles, Sierra Detail Maps 1, 2 and 3, and, Darwin. These maps are essentially unusable, and The BLM cannot expect the quality of comments it needs from them. Please distribute accurate, user-friendly maps in time for the public to use them to make the comments the BLM has requested. Problems with these maps: Grid: The maps have no Lat/Long or UTM grid lines, making precise field or desk

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<p>inspection impossible. Border tick marks are also missing, so I can't draw my own grid lines on the maps. Meaningful and accurate comments are near impossible unless a commenter is intimately familiar with the ground. The maps do have PLSS township, range and sections, and theoretically a moderately accurate position could be determined by comparing the maps with those USGS maps that also have PLSS. But that is asking more from your prospective commenters than you could expect in order to get good comments.</p> <p>Place Names: Very few place names are included, making it even more difficult to judge route locations.</p> <p>Contour Lines: Omission of contour lines also makes field inspection, or even desk inspection, difficult.</p> <p>Routes in Wilderness: Both open and closed routes are shown in designated wilderness. This is confusing. Is BLM suggesting open and closed routes in Wilderness could be designated for motorized use?</p> <p>Illegible Font: The tiny font for all except the legend requires either good close up vision or a magnifying glass.</p> <p>The maps are undated: There is no way, now or in the future, to tell how fresh they are. Please put publication dates on any new versions.</p> <p>Computer Printed: The handout maps can be downloaded. But when printed they are even less legible than the meeting handouts. This makes it very difficult to use home computers to make comments. It will severely restrict the quantity and quality of comments.</p> <p>Downloaded Pop-up: Briefly resting the cursor on a downloaded map shows a text pop-up with very confusing language, something about not being 508 compliant with no explanation of '508', and essentially saying the maps are no good, can't be relied on, and that the BLM takes no responsibility for them.</p> <p>These maps that are intended to elicit well considered comments, are an obstacle. Personally, I am familiar with routes on the North Searles map. Only with a lot of work researching and comparing the map lines with previous BLM maps and with topo maps would I be able to provide meaningful comment.</p> <p>The following suggestions would make the maps even more useful to commenters.</p> <p>Colors: BLM land is a light yellow, private is white. Complex boundaries are very hard to see.</p> <p>Adjacent Land: Include wilderness, open routes, and other land management status in adjacent FS and NPS managed lands. This is necessary to determine connectivity with the adjacent management areas. The borders are often not obvious on the ground, and routes crossing the borders should be consistent. This is very difficult to determine without knowing the land and route states of the adjacent areas.</p> <p>The BLM, exercising good faith, must consider the route maps as a tool for use by the public that has been asked to participate in the process. As it stands, the maps are a very poor tool. The BLM cannot expect the quality comments it wants and needs in return.</p>
	<p>Analysis and Impacts</p>
<p>1001</p>	<p>In addition, it is important that the cumulative effects of past government actions, and proposed or anticipated government action, including but not limited to proposed or anticipated alternative energy projects and military base expansions, whatever they may be, have deprived or will deprive rockhounds of former collecting locations.</p>
<p>1001</p>	<p>Replacement of access lost for recreational and all of the varied public use purposes, including Mechanized and Motorized Dependant Recreational Activities, must be considered on a overall view basis of the entire Plan Area with regard to the effects resulting from the past, present and potential future renewable energy facilities and base closures as well as any and all types of conservation efforts applied to the Plan Area that have or will affect the public's use.</p>
<p>1001</p>	<p>To consider only such losses on a project-specific basis denies all parties involved the opportunity to evaluate the cumulative losses for the Plan Area as is required by NEPA and our expectations. The application of NEPA with respect to analyzing cumulative effects is clear, it can and should apply to entire regions such as the WEMO Plan Area.</p>
<p>1001</p>	<p>The BLM must additionally consider other upcoming changes that will potentially affect access and recreational opportunities such as the proposed Marine Corps 29 Palms Air Ground Combat Center expansion which also has the potential to remove a large amount of land from public use.</p>
<p>1001</p>	<p>The BLM must fully examine recreation, including rockhounding, access, and the relationship between them. A dispersed motorized off-highway route network exists throughout the planning area and is utilized to pursue and support various activities including rockhounding. For this reason, data and specific information about the extensive</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	recreational uses within the West Mojave planning area is essential to developing the route plan. The potential impact of the plan on recreation broadly, and rockhounding specifically, must be a consideration when developing the West Mojave route plan.
1002	Equally significant, BLM's cumulative effects analysis in the 2003-05 route designations did not adequately address impacts associated with previous route proliferation; the effects of not fully implementing vehicle use management actions in the past; or the likelihood that planned BLM vehicle management action might not occur in a timely fashion. Nor did this analysis ensure that environmental factors were weighted equally when compared to other factors in BLM's decision-making process.
1002	An estimate of the acreage of land that will be subjected to low, moderate and high vehicle use disturbance in relation to differing erosion rates should be analyzed in any route network alternative analyzed in associated NEPA documents. Similarly, the acreage of lands that will be subjected to visual resource impact due to their location on certain topography, and/or the likelihood of erosion impacts over time, should be evaluated.
1002	It is critical that special status plant and animal species are proactively addressed in the route designation process using a biological screening process (BLM 2000). This analysis should be conducted by qualified biological personnel having knowledge of the respective species, the potential for vehicle impacts to individuals of the respective species/suitable habitat, and applying site-specific analysis where warranted.
1002	Per the Fort Irwin Military Land Withdrawal Act (U.S. Congress 2001), route designation throughout the WEMO planning area is also to be considered in light of all resource impacts connected with the approved expansion of the U.S. Army's National Training Center at Fort Irwin. Therefore, all planned WEMO route designation measures within tortoise critical habitat should be prioritized accordingly and undertaken in a timely manner.
1005	Our opinion runs counter to that assumption, and we encourage the BLM to use on site analysis using the best available science to determine probable impacts.
1005	As OHV use is also an important economic contributor to small, local communities, any change in direction from current use must be analyzed for economic impacts to those communities.
1005	Because Johnson Valley lies within the WEMO Planning Area, the proposed plan amendment must account for the impacts associated with the proposed USMC base expansion. As a result, the plan amendment must operate on two parallel but different assumptions. First, it should assume that the proposed base expansion into Johnson Valley will not be approved or implemented. Routes in existence today should be considered for inclusion in the final route network, regardless of whether these routes are located within the proposed USMC base expansion area. Second, the plan amendment should assume that the base expansion into Johnson Valley will take place. Therefore, the proposed route network must be designed to maximize access to those places within Johnson Valley left untouched by the base expansion. This would involve, among other things, possible development of new routes to function as access corridors between open areas and those venues within Johnson Valley which, while not part of the expanded Marine Base, will nevertheless be difficult to reach via the existing network of trails and staging zones.
1006	As to air quality, it is completely irrational for BLM to attempt to segregate the analysis of the impact of a route designation from the cumulative air quality analysis for all activities in the WEMO Plan, including open areas.
1006	The USGS has also produced a desert tortoise habitat model, and that modeling effort should be included in the analysis in support of desperately needed recovery opportunities for the declining desert tortoise.
1006	In addition, BLM must take into account new information regarding climate change and other impacts to resources in the West Mojave planning area in its new NEPA review.
1006	The solar PEIS is slated to be finalized shortly. Because of the potentially significant impacts to ecological processes and biological resources from the proposed preferred alternative in the supplemental PEIS, additional route restrictions in the west Mojave may be needed in order to assure persistence of these ecological processes and biological resources. The BLM's NEPA analysis in the EIS must clearly identify how it will address the increase in industrial scale development on lands in the West Mojave that would be authorized under the final PEIS designations.
1006	Additionally the project area is also located within the boundaries of the DRECP, which is also slated to be final by March 2013. In order to accommodate renewable energy development in the west Mojave desert and elsewhere in the CDCA, additional conservation

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<p>areas will need to be incorporated on public lands in order to meet the requirements of section 10 of the ESA (the Habitat Conservation Plan) as well as California's Natural Communities Conservation Plan standards. The BLM's NEP A analysis for the West Mojave plan amendment in an EIS will need to clarify how this process will incorporate the conservation goals of the DRECP effort into this planning process as well.</p>
1007	<p>However, with solar project development and a proposal to expand 29 Palms Marine Base, areas currently legal for OHV would be again ousted and removed from legal areas. Cumulatively the impact on the recreational population that is currently using the legal areas may be adversely impacted if the West Mojave Plan is further expanded to conserve habitat. A sensible balance needs to be achieved that allows regulated recreation that also protects sensitive environmental areas.</p>
1009	<p>The BLM should conduct a scientific study to determine current and foreseeable trends in public land use and how those trends affect the public at large who rely on motorized and mechanical means of transportation to visit their public lands. This study should include an analysis of all uses of Southern California desert lands and include the effects of renewable energy plans.</p> <p>This study should also include analysis of the following subjects:</p> <ul style="list-style-type: none"> a) Will the preferred alternative achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities? b) Will "individual choice" be sacrificed to that which dominant environmental groups in our nation are establishing as the norm for choices in contact with, and recreation on, our public lands?
1015	<p>When evaluating a road certain things must be considered. Some of these are:</p> <ul style="list-style-type: none"> Is it a through road? Is it a road which can be connected to another to relieve pressure on sensitive species? Is it a road which dead ends at a space which has room for parking and is a trail head for hiking or gem and mineral collecting or some other type of activity? How long has the road been in existence? Does the road have a history? Is the road in a sensitive area? Has there been significant impact to the sensitive whatever? Is the road a dead end which is or could be used to access an area for family camping, picnicking, painting, photography or quiet contemplation? Is the road needed to evacuate people in case of fire or flood? Is the road a dead end at a special geologic or some other feature? Is the road necessary to provide access to guzzlers, tanks, springs, seeps or tinajas? Is the road a cherry stem? And so on.
1017	<p>When evaluating a road certain things must be considered. Some of these are:</p> <ul style="list-style-type: none"> Is it a through road? Is it a road which can be connected to another to relieve pressure on sensitive species? Is it a loop trail such as: Hidden Valley to Mesquite Spring and Wilhelm Wash to Baxter Wash in Afton Canyon ACEC. Is it a road which dead ends at a space which has room for parking and is a trail head for hiking or gem and mineral collecting or some other type of activity? How long has the road been in existence? Does the road have a history? Is the road in a sensitive area? Has there been significant impact to the sensitive whatever or so little impact as to be insignificant? Is the road a dead end which is or could be used to access an area for family camping, picnicking, painting, photography or quiet contemplation? Is the road needed to evacuate people in case of fire or flood? Is the road a dead end at a special geologic or some other feature? Is the road necessary to provide access to guzzlers, tanks wells, springs, seeps or tinajas? Is the road a cherry stem? And so on.
1017	<p>The BLM EIS must also consider other forthcoming changes which will or have the potential to affect access. For example, the planned expansion of the Marine Corps Air Ground Combat Center Twenty Nine Palms, California will certainly remove a large amount of land from public use with all sorts of "take" of various species.</p>
1017	<p>There must be adequate discussion/consideration in the BLM EIS, of lost recreation opportunities and how they might be mitigated. As whatever vehicle one uses, becomes an OHV when it hits that dirt road, (usually historic and usually user maintained.) replacement of access lost for OHV use, should be considered as part of the analysis of project specific</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	impacts.
1022	The Proposed Action must adequately evaluate and mitigate the cumulative losses of land for recreational opportunities, including but not limited to cumulative closures or limitations on desert lands managed by BLM and on forest lands managed by the U.S. Forest Service. Actions that must be evaluated include, but are not limited to, proposed military base expansion, proposed renewable energy development sites, existing and proposed wilderness areas, existing and proposed critical habitat designations, and other existing and proposed land use designations that encompass restrictions to access, including but not limited to National Landscape Conservation System, National Conservation Areas, National Park, and Areas of Critical Environmental Concern.
1022	In reviewing the Proposed Action, CA4WDC finds it deficient in its acknowledgement of the importance of recreation to the West Mojave (WEMO) region. Specifically, the proposed Proposed Action fails to acknowledge that various recreational activities exist in the proposed project region.
1022	CA4WDC believes that the loss of access to the West Mojave (WEMO) region for recreation opportunity is a direct loss. There are also indirect impacts that would result should this Proposed Action be approved and implemented causing displacement of recreational activities. Those cost include, but are not limited to: (1) the increased enforcement required at other sites when displaced recreational users seek out other areas that may be poorly identified as wildlife preserves or other resource-rich areas; (2) the loss of biological resources or habitat at other sites that displaced recreational users may utilize ; (3) the loss of nature education, (4) the loss of outdoor recreation opportunities, (5) the loss of outdoor access and experiences for children in the community; (6) the loss of familial traditions, custom, and culture of recreational and nature-oriented activities in the region; and (7) the loss of the region's history and traditions, specifically with respect to mining and recreational activities.
1022	The aspects of social, economic, and public health and safety are very important and must be given adequate discussion and analysis. The Proposed Action must contain complete disclosure and analysis of the cumulative loss of recreational access, impacts to public health and safety, and economic impacts of the project on the local and regional communities.
1022	CA4WDC believes that cumulative effects of other planning efforts within and adjacent to the proposed planning area be determined and analyzed as part of determining motorized vehicle use issues and concerns within each sub-regional area of the WEMO plan area. The cumulative effects include but are not limited to planning efforts such as the proposed expansion of Twentynine Palms Marine Corps Base and the Desert Renewable Energy Conservation Plan.
1023	In reviewing the proposed environmental assessment (EA), it is deficient in its acknowledgement of the importance of recreation to the West Mojave (WEMO) region. Specifically, the proposed Action fails to acknowledge that various recreational activities exist in the proposed project region.
1025	In addition, BLM must consider other ongoing planning efforts that will amend the existing WEMO plan amendment to the CDCA such as the Solar PEIS, and the DRECP. For example, soil structure and air quality are both impacted by open areas, routes, grazing, and industrial scale renewable energy development
1025	Impacts to soils and air quality resources from route designation and other activities must be considered together in order to adequately evaluate the overarching impacts to soils and air quality and ensure that the resulting planning adequately protects these resources and others.
1025	Additionally, all routes (both legal and illegal user created routes) should be included in the analysis. Every route segment should be evaluated for environmental impacts to the surrounding ecosystem and if these impacts are determined to negatively affect species and habitats, soils, water resources, water and air quality, they should be closed. If existing routes cause a significant environmental impact, they should be considered for redesign or closure to minimize the environmental impacts.
1025	The route designation process should be a fully transparent public process, driven by science. Issues to be evaluated in route designation process for each route segment and disclosed in the EIS should include but are not limited to: <ul style="list-style-type: none"> · Analysis of impacts to BLM sensitive, rare, threatened and endangered species and their habitats including but not limited to desert tortoise, Mohave ground squirrel, Lane

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<p>Mountain milk-vetch, Mojave fringe-toed lizards;</p> <ul style="list-style-type: none"> · Analysis of impacts to plant communities and Unusual Plant Assemblages (UPAs); · Analysis of impacts to riparian, wetland, springs, seeps and other water dependent resources; · Analysis of impacts to essential ecological processes (for example dunes systems and sand transport corridors); · Analysis of impacts to essential wildlife connectivity corridors; · Analysis of the impact of the release of vehicular pollutants, including oil and gas, ozone precursors, nitrogen oxides, particulate matter, carbon dioxide, carbon monoxide, and heavy metals (such as lead, zinc and cadmium), which may have serious additive and cumulative effects on the surround environment; · Analysis of noise pollution from vehicles that impact wildlife populations; · Analysis of routes as dispersal corridors for invasive plant species; · Analysis of ORV as dispersal mechanisms for invasive plant species; Analysis of direct impacts from roads on wildlife including habitat loss, mortality due to collision, habitat fragmentation and edge-to-area ratio of habitat; · Analysis of impacts to the integrity of adjacent soil crusts and desert pavements; · Analysis of impacts from routes in destabilized soils that result in additional PM10 emissions. · Analysis based on the types of route (ORV trails [motorcycle, quad, jeep etc.], unimproved local road [1-lane dirt], improved local road [1 or 2 lane dirt or gravel] and collector road [2 lane dirt or gravel]); · Analysis of the ecological effects of vehicular routes at three spatial scales: (1) direct effects within route corridors (2) indirect effects distributed along gradients radiating outward from route corridors; and (3) dispersed landscape effects resulting from the cumulative effects of multiple routes across landscapes; · Analysis of the ecological effects on soils, including changes in hydrological processes that promote soil erosion such as rilling and gullyng, and increased impermeability of soils due to compaction; · Analysis of increased NOx emission and nitrogen deposition effects on plants (native and non-native). · Analysis of fire risk from the routes based on the incompatibility of desert landscapes and fire; · Analysis of cumulative impacts from grazing and routes on species, soils, water resources, air quality and others should be undertaken both at the WEMO regional scale and for sub-regions.
1025	<p>The California Desert Conservation Area lands are easily damaged and slow to heal. Therefore it is prudent that the BLM carefully evaluate the designation of routes on these fragile lands and put in place a system that minimizes damage to them.</p>
1026	<p>The BLM must consider the cumulative effects of the alternative route proposals it develops with other activities that it authorizes. Since 2006, when the WMP ROD was originally signed, the two most extensive area-wide activities that the BLM has authorized are livestock grazing and the use of public lands it manages for power plant projects including solar and wind energy power plant projects.</p>
1026	<p>Quantify the amounts of route proposed within the boundaries of the proposed National Monument and analyze the impacts.</p>
1026	<p>Because unauthorized vehicle activity is frequently found on both sides of fences, quantify the number of fences crossed by each route. For each designated route provide an estimate of the number of other unauthorized routes that lead off that route to provide information required to ensure that the proposed system does indeed minimize conflicts between off-road vehicle use and other existing uses.</p>
1026	<p>In the cumulative effects analysis, consider the cumulative impacts of each proposed action with all planned, proposed and reasonably foreseeable Solar and Wind energy projects and energy transmission projects on all listed and sensitive species, soil types and Unusual Plant Assemblages.</p>
1026	<p>Because of the extent of the current route network, and the overwhelming direct, indirect, and cumulative effects of motorized vehicle activity and motorized vehicle access on sensitive resources, the action will have significant cumulative effects with other land use activities authorized by the BLM including livestock grazing, mining, and energy development.¹</p>
1026	<p>It is unclear what the BLM intends by requesting "Identification of those portions of the</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	WEMO plan that should be revised to reflect current management policy regarding motorized vehicle access". Because of the overwhelming direct, indirect, and cumulative effects of motorized vehicle activity and motorized vehicle access, the BLM must revise all portions of the WEMO plan relating to authorized uses and land use designations that have significant cumulative effects including livestock grazing, mining, and energy development if it is to comply with NEPA.
1026	In order to assure that proposed route networks are compatible with recovery, the BLM should consult with the USFWS and utilize the Desert Tortoise Recovery Office's (DTRO) Spatial Decision Support System to model each alternatives proposed route's net impacts to desert tortoise.
1028	Adequate recreational opportunity for all visitors is the supreme issue that must be addressed by this action.
1028	We request that the BLM provide an adequate and fair evaluation of: <ol style="list-style-type: none"> 1. The needs of motorized recreationists and the cumulative impacts of motorized closures, 2. All existing routes including those meeting National OHV Rule guidelines and currently closed routes, 3. The current imbalance of non-motorized to motorized trails, and 4. At least one pro-recreation alternative in the analysis. 5. Under the existing condition, too much of the West Mojave area is set-aside for segregated exclusive non-motorized use for 1% of the visitors to the area. We do not agree with all of the effort that the agency is going through to segregate users. Multiple-use lands are public places. Segregation in public places has not been acceptable since the Civil Rights Act of 1964 (http://www.ourdocuments.gov/doc.php?flash=true&doc=97&page=transcript). In order to reasonably meet the requirements of integration a reasonable management goal for 99% of the forest would be for shared multiple-use that would produce a forest-wide 50/50 sharing and equal opportunity of non-motorized/motorized trail opportunities.
1028	The Environmental Assessments for 8 Travel Management Areas within the West Mojave Area must include adequate evaluation of cumulative effects so that motorized recreation will not be removed from our public lands. An adequate evaluation of cumulative effects would include all past, current, and reasonably foreseeable actions that have or will produce motorized closures in the State. The environmental analysis must adequately address the human environmental including issues, needs, alternatives, and impacts on the public associated with the reduction or lack of adequate motorized recreation. An adequate analysis would include evaluation of significant social, cultural, historical use, current use, future needs, economic impact, and quality of the human environment issues from the perspective of motorized recreationists.
1028	An adequate site-specific analysis should include monitoring and quantification of existing motorized use versus non-motorized use, types of motorized use and visitors, and effects of motorized closures on the quality of the human environment.
1028	The current emphasis on climate change is being given far too much weight. This focus is not balanced with objective science and the needs of the public. The existence of climate change and any positive or negative impacts are simply not known at this time.
1028	The BLN must give a hard look at the impact of motorized closures on the human environment. Per CEQ guidance, NEPA documents are to be driven by significant issues. Motorized closures and the lack of adequate motorized opportunities have a significant impact on motorized recreationists.
1028	the evaluation must include a meaningful evaluation of the cumulative effects of all current and reasonably foreseeable motorized closures on motorized recreationists including decisions and proposals in all surrounding areas and reasonably foreseeable actions as listed in the National OHV Policy.
1028	The site specific analysis of each road or trail to be closed must address or identify where the public would go to replace the motorized resource proposed for closure. In other words, the analysis must adequately evaluate the site specific value of a road or trail proposed for closure to motorized recreationists. It must also quantify the significant negative cumulative impact experienced when motorized recreationists could not find a trail or road with a similar experience in the area. The quality of our experience has been significantly reduced. It must also quantify the significant cumulative impact that the closure of a system of road and trails would have collectively when enough routes are closed to eliminate a good motorized day outing. An incomplete analysis is not acceptable under NEPA requirements.

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1028	Site-specific analysis should be provided for every road and trail so that the benefits of keeping each motorized travelway is adequately addressed and accounted for in the decision. Site-specific questions will need to be discussed during the process. We request that the mapping be sufficient to allow site-specific analysis.
1034	Second, route designation decisions must reflect the potential cumulative impacts to desert tortoises from grazing, the siting of renewable energy projects, and impacts from motorized vehicles.
1037	The cumulative effects of other planning efforts within and adjacent to the proposed planning area be determined and analyzed as part of determining motorized vehicle use issues and concerns.
1041	Speaking as an equestrian, there are more than esthetic, ie noise/dust issues concerning shared trails with motorized or even mountain cyclists~~horses are prone to "spook" when wheeled vehicles suddenly loom in front of them, with or without noisy motors.
1042	the BLM must take into consideration all of the factors that affect the Juniper Sub Region. These factors may be similar to those that affect other regions, but they may represent a very different set of "combined" or "cumulative" issues.
1046	<ol style="list-style-type: none"> 1. Routes should be placed so as not to harass wildlife and avoid disturbing their habitat. Therefore, all the springs and seeps and blue line streams must be included on the maps and in the legend. 2. Mines, especially active claims must be included on the maps. Mine shafts should be included. 3. Wind energy projects must be included on the maps. It is our understanding that about 8 wind testing towers have been approved for the region. Where will they be located? 4. The Round Mountain Cattle Allotment boundaries must be included on the map 5. The Juniper Flats ACEC must be on the map. It has a separate management plan with identified routes. 6. There is an aviary in the area. Where is it? 7. What other rights of way are approved? Powerline for SCE? 8. Where are the kiosks located? 9. Where are the guzzlers? People use the area to hunt upland game birds. 10. Where are the residences and ranches that are surrounded by BLM lands and routes or adjacent to those features?
1046	According to the original 1980 Desert Plan, SOIL, WATER, and AIR are the three most essential resource components of the California Desert Conservation Area. Impacts from motorized travel on roads and trails on the SOILS, WATER and AIR in the desert were to be monitored and evaluated. The results of those studies must be carefully evaluated in this Travel Management Plan/NEPA process including discussions on the particular impacts on soils of the proposed Plan. The scope and extent of those impacts must be revealed to the public.
1046	BLM has the responsibility of evaluating the cumulative impacts of the proposed plan.
1057	Proposed Route Network Should Anticipate Possible Expansion of USMC Base Into Johnson Valley
1057	the plan amendment must operate on two parallel but different assumptions. First, it should assume that the proposed base expansion into Johnson Valley will not be approved or implemented. Routes in existence today should be considered for inclusion in the final route network, regardless of whether these routes are located within the proposed USMC base expansion area. Second, the plan amendment should assume that the base expansion into Johnson Valley will take place. Therefore, the proposed route network must be designed to maximize access to those places within Johnson Valley left untouched by the base expansion.
1060	Recreation - the potential impacts to recreation should be evaluated. Motorized access is essential to most recreational activities within the proposed area. In our County, these impacts should be considered in light of past and continuing efforts to reduce motorized access and the associated recreational opportunities available to recreationalists. Recreationalists derive social value from recreational uses on public lands. Generations of people have enjoyed the recreation activities within the proposed area, any further limiting of those opportunities should be deeply considered. Recreational access is fundamentally important to the interaction of people with their environment. Consideration should be given to the social value impact the proposed plan will have on the recreational users.
1060	Socioeconomics - the potential economic impacts in Inyo County should be considered. Economic development is limited in Inyo County due to the public land ownership pattern. While the County is continuously striving to widen the economic base and decrease our dependence on tourism, we are still dependent on the tourism industry for economic success. Recreational tourism brings non-local spending to our community, in the form of recreational spending at OUF local firms that cater to the recreationalists. Recreational spending induces additional economic activity in our area. Recreational visitor spending and the additional economic activity should be considered, especially in our economy that is so dependent on the tourism industry.
1060	Resources - the potential impacts to resource access should be considered. Protection of both current and future of

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	mineral resources extraction is important to the County's economy_ Further limiting access to mineral resources should be avoided. Maintenance of wildlife enhancement features, such as guzzlers, is vital to the survival of several species in the arid climate. Access to such wildlife enhancements should remain open to motorized travel for future maintenance. Consideration should be give to accessing wildlife enhancement features for maintenance.
1060	Land Use and Planning - the Environmental Document and Proposed Plan Amendment should address land use and planning issues between the BLM and the County's planning policies and land use procedures.' Significant consideration should be given to the County's planning policies and land use procedures.
1076	The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, that is, sources that generate or attract vehicular trips should be included in the analysis.
1076	In addition to analyzing regional air quality impacts the SCAQMD recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LST's can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document.
1076	In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the lead agency perform a mobile source health risk assessment.
1086	At some point, you are going to have to realize the Billions of dollars of economic impact that you have on our economy by instituting all these restrictions. People spend Billions (that's Billions, with a "B") on motorhomes, trailers, helmets, gloves, boots. motorcycles, quads, gas cans, water cans, goggles, chest protectors, and so much more EVERY YEAR. If you continually remove our riding areas and leave us no place to ride, you will also lose the tax income from all of these purchases.
1087	When evaluating a road certain things must be considered. Some of these are: Is it a through road? Is it a road, which can be connected to another to relieve pressure on sensitive species? Is it a road which dead ends at a space, which has room for parking and is it a trailhead for some other type of activity? How long has the road been in existence? Does the road have a history? Is the road in a sensitive area and has it had any impact to the sensitive issue? Is the road a dead end, which is or could be used to access an area for family camping, picnicking, painting, photography or quiet contemplation? Is the road needed to evacuate people in case of fire or flood? Is the road a dead end at a special geologic or some other feature? Is the road necessary to provide access to guzzlers, tanks, springs, seeps or tinajas? Is the road a legal cherry stem? And so on.
1089	there should be a competition cooridor studied between Johnson Valley and Stoddard open OHV areas These will be necessary if we lose Johnson Valley to the military takeover
1100	The footprint created by future projects in the CDCA will further fragment the existing road and trail system by severing existing routes of travel thus excluding the public from the areas within project boundaries and the lands near by. The EIS must look at and the final document must amend the Vehicle Access Element to provide that each future project shall provide environmental analysis for however many work-arounds as are necessary to reconnect the severed access.
1100	When evaluating a road certain things must be considered. Some of these are: Is it a through road? Is it a road which can be connected to another to relieve pressure on sensitive species? Is it a loop trail such as: Hidden Valley to Mesquite Spring and Wilhelm Wash to Baxter Wash in Afton Canyon ACEC. Is it a road which dead ends at a space which has room for parking and is a trail head for hiking or gem and mineral collecting or some other type of activity? How long has the road been in existence? Does the road have a history? Is the road in a sensitive area? Has there been significant impact to the sensitive whatever or so little impact as to be

Table C-2. Scoping Comments by Comment Category

	insignificant? Is the road a dead end which is or could be used to access an area for family camping, picnicking, painting, photography or quiet contemplation? Is the road needed to evacuate people in case of fire or flood? Is the road a dead end at a special geologic or some other feature? Is the road necessary to provide access to guzzlers, tanks wells, springs, seeps or tinajas? Is the road a cherry stem? And so on.
1100	The RACC expects to see the Raven at least mentioned as a predator taking significant young and eggs of everything in the desert and when they can larger critters. We expect to see a control program as part of the process. It is wrong to ask stakeholders to cut back their access and activities so the Raven can continue to prey uncontrolled upon desert critters.
1100	The BLM EIS must also consider other forthcoming changes which will or have the potential to affect access. For example, the planned expansion of the Marine Corps Air Ground Combat Center Twenty Nine Palms, California will certainly remove a large amount of land from public use with all sorts of "take" of various species.
1134	There is no clear understanding that adding more Real Estate will bring back the tortoise. There has not been a scientific study to say what constitutes recovery? Where, when and how? Again, expand more closed areas is the only solution to all I can see in the documents presented
1190	Trail closures have had a negative financial impact that can no longer be ignored
1249	Consider adjacent land uses when designating routes, and anticipate possible land use conflicts. Current or projected land uses of adjacent parcels, including zoning, should be considered when establishing routes, to avoid creating conflicts due to incompatible uses or impacts on resources of concern. Access to route areas should also be considered in such a manner to avoid potential conflicts with local land uses or natural resources in adjacent private or public lands, including BLM lands.
1287	When evaluating a route certain things must be considered. Some of these include, but are not limited to, the following: o Is it a through route? o Is it a route which can be connected to another to prevent loss of access to rockhounding destinations? o Is it a route which dead ends at a space which has room for parking and is a trail head for activities such as rockhounding (i.e. a "cherry stem" or a "spur road")? o How long has the route been in existence? Does the route have a history? o Is the route in a sensitive area? Has there been significant impact to the sensitive species or habitat, or so little impact as to be insignificant? o Is the route a dead end which is or could be used to access an area for rockhounding, camping or other activities? o Is the route needed to evacuate people in case of fire or flood? o Is the route a dead end at a special geologic or some other feature? o Is the route a cherry stem? o Is the route a dry wash that has been historically used as a "cherry stem" or a "spur road" providing access to a collecting site or other important recreational destination?
1287	We expect to see ravens, as a predator, taking significant young and eggs of endangered and threatened native species, and attacking vulnerable adult members of protected species such as desert tortoises, mentioned at least once in the environmental impact statement/report. We expect to see a control program as part of the process. It is wrong to ask rockhounds and other stakeholders to cut back their access and activities so the Raven can continue to prey uncontrolled upon desert species.
1287	The BLM EIR/EIS must also consider all past, current and proposed or anticipated changes which will or have great cumulative impacts to rockhounding and other recreational access. For example, the many alternative energy projects, wilderness and conservation areas, and base expansions, all have had and will continue to result in a taking of public land and access thereto for rockhounding and other recreational activities
Mitigation and Minimization	
1001	No practical mitigation is available for loss of access to such areas, therefore we request that such locations be excluded

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	from closure or restriction and that motorized access, including spur roads and “cherry stems” serving those locations, be maintained.
1002	The purpose of route designation is not the formal recognition of illegally-created routes or the expansion of motorized use opportunity. The tenets of FLPMA must be recognized and undue or unnecessary degradation of public lands, avoided. Route designation is not intended to simply facilitate vehicle use “connectivity;” nor is it merely a paperwork exercise. Networks of varying extent should be evaluated in the associated NEPA analysis, but the governing land use plan guidance and minimization criteria specified in 43 CFR §8342 must be followed in all considered alternatives. Routes designated as open must not unduly impair our natural or cultural resources, air/water quality, scenic values, non-motorized uses of public lands or adjacent/interspersed private lands.
1002	The cumulative number of routes in high relief topography should also be minimized.
1002	A minimal vehicle use network, as opposed to an extensive network, would lend itself to a greater degree of management and control, particularly on public lands in and adjacent to special areas.
1005	If it is determined that there is a loss of recreational opportunities, those loss of those particular recreational opportunities should be mitigated within other designated areas. If one subregion loses mileage of single-track route, than another subregion should designated additional mileage as mitigation.
1006	In addition, where redundant routes exist, as in many parts of the West Mojave planning area, the BLM should identify and evaluate the minimum route system that would designate only the least damaging routes and close all others as part of a second low density/minimum route alternative.
1017	No practical mitigation is available for loss of access to such areas and the SPCW requests that such locations be excluded from closure or restriction and that motorized access be maintained.
1017	All roads must be up for consideration in the road designation process so as to be able to demonstrate true “minimization” which has already occurred in the California Desert Conservation Area.
1027	If it is determined that there is a loss of recreational opportunities, those loss of those particular recreational opportunities should be mitigated within other designated areas. If one subregion loses mileage of single-track route, than another subregion should designated additional mileage as mitigation.
1028	If the loss of motorized routes cannot be mitigated within the project area, then a Motorized Access and Recreation Mitigation Bank must be established. This mitigation bank would keep an overall accounting of the miles and acres of motorized access and recreational opportunities closed and the new motorized access and recreational opportunities created to offset that loss.
1057	any action which leads to a reduction of OHV routes or OHV use areas be treated as a significant impact that must be mitigated.
1089	There should be opportunity replaced and/or mitigated due to losses from renewable energy projects, Military, and clear Creek closures
1100	Numerous unique natural features exist on public lands within the WEMO planning area including springs, seeps and tinajas, that cannot be recreated or relocated. While access roads can be re-routed; natural area features cannot. There are also certain corridors utilized by wildlife that are only found in specific locations within the plan area. No practical mitigation is available for loss of access to such areas and the RACC requests that such locations be excluded from closure or restriction and that motorized access be maintained.
1100	All roads must be up for consideration in the road designation process so as to be able to demonstrate true “minimization” which has already occurred in the California Desert Conservation Area. Routes and route segments that are identified for analysis and designation should include: all routes originally within the 2004 designation pool; all routes identified in subsequent BLM surveys; routes identified by the public; routes considered by previous designation efforts, i.e. Jawbone-Butterbredt ACEC, Rand Mountains Management Area, Ord Mountains.
1100	Mitigation should not become the responsibility of other multi-use stakeholders or occur at the expense of other uses. Public access should not be curtailed or limited to accommodate the possible loss of species resulting from other activities.
1287	We ask the BLM to keep in mind the fact that natural features exist on public lands within the

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	WEMO planning areas are irreplaceable. While roads and campsites can be relocated, mineralogical and fossil deposits occur where nature has very uniquely placed them and cannot be recreated or relocated. Most rock, gem, mineral and fossils found at these locations have characteristics that are unique to that location and are not found elsewhere. No practical mitigation is available for loss of access to such areas, therefore we request that access to such locations be excluded from closure or restriction and that motorized and mechanized access, including spur roads serving those locations, be maintained. Rock, gem, mineral and fossil collection typically requires the use of hand tools and equipment that cannot be packed in or carried long distances, especially by the many elderly or handicapped rockhounds, and are therefore motorized and mechanized dependent.
1287	All roads, even those previously closed, must be up for consideration in the road designation process so as to be able to demonstrate true "minimization" which has already occurred in the California Desert Conservation Area.
1287	Mitigation for loss of habitat or species should not become the responsibility of other multi-use stakeholders such as rockhounds or occur at the expense of other uses such as rockhounding. Public access should not be curtailed or limited to accommodate the possible loss of species resulting from other activities.
1287	There must be adequate identification of rockhounding locations and a meaningful consideration of lost rockhounding locations, or access to such areas, and how such loss might be avoided or mitigated.
Implementation and Administrative Actions	
1002	Routes designated as open for vehicle travel per the BLM's WEMO Plan were found infrequently signed on the ground. Inadequate signing was found to be a significant problem where designated open routes intersected closed routes; with no means on the ground to direct vehicle users to the designated open route. The extent of signing and other implementation actions in certain areas (i.e., Rand Mountains, Juniper Flats and Ord Mountain vicinities) was found to far exceed implementation efforts in the remainder of the planning area.
1002	In general, closed routes were found neither signed nor rehabilitated in any manner that would identify these routes as formally closed to vehicle use. In the few instances where previous closed route rehabilitation has been completed, considerable vandalism and continued vehicle use was observed. Recent tire tracks were observed on almost all routes designated as closed, including within special areas. Many designated open routes were also found to direct vehicle users onto private lands where vehicle-related surface disturbance was noted.
1002	Kiosks and bulletin boards displaying BLM maps of designated open routes were seldom found at trailheads. Published BLM route network maps were found not to have been updated. Information relating to the consequences of non-compliance with vehicle use rules on public land was generally not posted. State requirements for vehicle use and county ordinances relevant to vehicle travel on interspersed private land were similarly absent.
1002	<p>Recommendations offered for improving route designation and vehicle network management include:</p> <ul style="list-style-type: none"> · Evaluation of potential open routes on the ground by a team of interdisciplinary specialists based on CFR application and aerial photo analysis, coupled with an evaluation of staff capability to manage, maintain and enforce the resulting network; · Improved route signing, primary trailhead kiosk installation with large-scale route maps and use rules, closed route rehabilitation and mandatory use education requirements; · Establishment of an effective, systematic vehicle use monitoring plan conducted on a regular basis by BLM staff, with the details/results made readily available to the public; · Development of a threshold which clearly identifies a level of unacceptable impact to public land resources, at which point affected areas or trails will be immediately closed to the type of vehicle causing such effects, until these effects are eliminated and measures have been implemented to prevent future occurrence; and · The adoption of strategies for effective enforcement of vehicle use on public lands and improved collaboration with city/county law enforcement personnel.
1002	Informing the public of ORV and/or off-highway vehicle (OHV) use allowances is critical in the implementation of route designation. Without appropriate information on the ground, the recreating public has no way of knowing what is allowed and what is not. Public outreach in furtherance of vehicle use management is required by the BLM Manual as well as the CDCA Plan, and was identified as a focal mitigation measure in the 2005 WEMO Plan FEIS. The distribution of current and understandable maps, posting of signs and dissemination of various printed information were to be used in

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	identifying designated open routes and to communicate the rules for vehicle use per the 2003-05 WEMO route designation efforts.
1002	BLM and the State of California should also together consider addressing more effective management of “red-sticker” and “green-sticker” licensed vehicle use on checkerboard ownership lands within the WEMO planning area.
1002	Where route proliferation and free play vehicular activities are known to adversely affect tortoise or other listed species’ habitat, and/or pose a risk for listed species mortality within critical habitat, active route network management steps need to be taken in route designation processes. Such steps are recommended to include: <ul style="list-style-type: none"> · Designating a minimal number of thoroughfare access routes as open within designated critical habitat, as well as and DWMAAs or ACECs designated for the species; · Installation of kiosks or bulletin boards at major trailheads, depicting the designated open vehicle route network and rules for legal vehicle use, outlining the importance of the affected habitat for tortoise recovery; · Prominently signing both open and closed routes, with removal of closed route signs following “vertical mulching” or other techniques designed to remove the visual appearance of regular vehicle use on the subject closed route; · Scheduling “vertical mulching” and removal of vehicle use indicators on closed routes intersecting open routes on an expedited timeframe; and Monitoring compliance with the designated vehicle use network on an annual basis, using systematic techniques, appropriate data collection, established thresholds for documented non-compliance, and real consequences (i.e., temporary area closure) for non-compliance as identified by the monitoring program.
1002	Interpretive signing and regular, careful monitoring of vehicle use in special areas is also recommended. Visitors should be informed that any actions which result in surface disturbance or destruction within special areas and elsewhere on public lands are illegal, per 43 CFR 8365.1-5. Timely closed route rehabilitation in special areas should be a BLM priority.
1002	Public land visitors should also be alerted about adjacent or intermingled private lands, as well as relevant state/county laws and ordinances. Information on county/state requirements should be provided at strategically located trailheads, particularly in public land areas bordering the urban interface. Close coordination with local communities is also recommended to ensure direct access to proximal open play areas and known patterns of use are considered, along with private land concerns, during initial route designation planning efforts. State peace officer delegation for BLM Rangers should also be secured to improve law enforcement efficiency.
1002	The implementation phase of route designation includes the posting of signs and maps, provision of information and education, route maintenance and closed route reclamation, law enforcement and monitoring (BLM 2009). Specific actions include: <ul style="list-style-type: none"> · Publishing and disseminating motor vehicle use maps; · Signing; Educating visitors on travel management regulations and designations; · Enforcing travel management restrictions; · Maintaining designated roads and trails; · Decommissioning/rehabilitating unauthorized roads and trails; · Establishing cooperative and volunteer agreements, fee programs, or efforts to ensure sustainable funding for vehicle use management; and · Monitoring impacts.
1002	Sign vandalism was observed to be common, with little difference in the rate of vandalism between closed and open route signs. While Limited Use (i.e., “vehicle travel limited to routes signed as open”) signs were found occasionally posted at trailheads, there was often a lack of information at a distance from these trailheads that clearly informed the visiting public that routes were closed unless signed open, in addition to no open route signs.
1002	The few routes designated as limited to specific vehicle access (rather than open or closed) evaluated in this review (e.g. F2088, F2032) were found unsigned. No information was found posted relating to use limitations. No gates or barriers had been installed. No difference between these routes and open/closed routes in the surrounding area could be ascertained.
1002	Failure to adequately sign a trailhead and associated routes creates very difficult enforcement situations. Vehicle use signs should be customized for site-specific application. Route use restrictions at trailheads should be clearly identified, along with the reasons for the restriction (i.e., to protect resources, to reduce user conflict, to protect wildlife habitat, etc.). Symbols should be used where possible rather than letters, to provide clear, concise direction. The carsonite signs used on individual routes in the WEMO planning area could very easily be modified to provide directional arrows, the terminus of a route where circumstances dictate or even a notation that vehicle use is limited to routes signed as open. Routes designated as limited to a specific use could also be signed according to their limitation, e.g., limited to private landowner, mining operator, etc. unless monitoring indicates additional treatment, such as gating, is necessary to affect

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	vehicle use compliance.
1002	Route signs could also be modified to reflect an admonition that vehicle use non-compliance is a punishable offense. Signs used in nearby national forests employ a symbol design that clearly reflects the allowed use (i.e., full-sized vehicle, motorcycle only, hiking only, etc.), as well as information pertaining to non-compliant vehicle use penalties. As open route signs are the most commonly encountered information conveyance device on public lands, they present the best opportunity to educate vehicle operators about allowed and prohibited uses; as well as penalties for non-compliant vehicle use.
1002	The BLM's policy of not posting closed route signs in the WEMO planning area needs to be revisited. Vehicle use is occurring on unsigned, non-rehabilitated routes. Active, timely management of these closed routes on the ground is necessary to prevent regular use. Closed route signs are a valuable tool which can be used to ensure BLM does not fall into a "black hole" of inaction, which has led to an ineffective vehicle use management system. Where vehicle use is or will cause adverse effects to resources, BLM is required to implement measures to prevent a recurrence of impact. While the physical rehabilitation of closed routes (together with monitoring and enforcement) remains the only long-term solution to halting continued vehicle use, closed route signing should be considered until rehabilitation work can be completed.
1002	The 2010 field assessment suggests rehabilitation of designated closed routes is integral to a successful vehicle use management program. However, field assessment findings also suggest that rehabilitation of closed routes is only one of several necessary management components to a successful program. Other components include: <ul style="list-style-type: none"> · Signing of open routes with a mixture of line-of-sight open signs and interspersed Limited Use signs explaining that vehicle use is restricted to routes signed as open; · Trailhead kiosks with a map of open routes and posted rules; · Rehabilitation of designated closed routes to the visual horizon through "vertical mulching" and boulder placement; · Timely and persistent repairs of rehabilitation vandalism, utilizing post-cable fencing where necessary in areas of repeated vandalism; and · Ensuring at least minimal presence of BLM or volunteer group personnel on a regular basis.
1002	Vertical mulching, boulder placement and fencing are all valuable tools that can and should be employed to successfully rehabilitate surface disturbance resulting from vehicle use. A careful review of all closed route rehabilitation actions undertaken to date in the western Mojave Desert is needed. Additional actions are likely needed to safeguard investments made with BLM funding and by the COHVC with taxpayer-generated funds. Additional management actions could include mandatory vehicle use education for California "Green-sticker" Program vehicle use in rehabilitation areas, increased resource monitoring, law enforcement patrol, specific area closure concurrent with rehabilitation work, or all of the above.
1002	Interpretive closed route signing explaining how and why rehabilitation work has been initiated may reduce levels of non-compliance and vandalism.
1002	A rigorous monitoring program should minimally be instituted when closed route rehabilitation projects are completed. A monitoring program can identify the most efficient means of achieving rehabilitation objectives, minimizing vandalism and protecting on-the-ground work investments. Where monitoring identifies vehicle use non-compliance or project vandalism, an area closure should be considered, per Executive Order 11989.
1002	Levels of vehicle use non-compliance, resource management need/damage severity may need to be ranked in order to facilitate adaptive management. Limited staff and rehabilitation funding should be directed where they are needed most. However, lower priority rehabilitation needs should also be tracked to ensure they do not fall completely off the radar of network management tasks. Rehabilitation prioritization should also be adjusted where funding opportunities are identified.
1002	In Fiscal Year (FY) 2010, the BLM (2009c) received an increase of \$5 million to support programs and partnerships that engage youth in natural resource management. In FY 2011, the BLM continued to fund these programs, as well as direct \$1.0 million in base funding to support a new public-private partnership program with the National Fish and Wildlife Foundation. In addition to COHVC grants, this "Youth in Natural Resources" funding should be considered for implementing closed route rehabilitation within the WEMO planning area.
1002	BLM is required to mark designated areas and trails in a manner that use limitations are easily understood. All official BLM maps should be updated to reflect the current authorized route network. The required educational features of the RMMA Education and Permit Program and its associated map information should be duplicated throughout the WEMO planning area. Whenever route designations are modified, DAGs and other official maps should be revised in a timely manner. Interpretive language included on these maps or otherwise imparted by BLM officials should be clear, concise,

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	consistent and unambiguous as to what is required by visitors engaged in vehicle use activities. Additional interpretive information could also be included on these maps to improve their usefulness and functionality, as well as contribute to the BLM's overall vehicle network management program (refer to Appendix C).
1002	A high resolution map of the BLM's official designated open route network should be prominently displayed at primary trailhead kiosks or bulletin boards. Such mapping should clearly direct vehicle operators to the authorized route network. Additional map boxes with available handout maps may also prove useful in directing vehicle operators to approved routes of travel. Information pertaining to local and county riding ordinances, particularly those applicable to SBC (i.e., Ordinance 3973: Off-highway Motor Vehicle Use), as well as state and federal laws addressing off-road vehicle use, should also be posted at trailhead kiosks and/or bulletin boards. This information should indicate that penalties are to be applied for vehicle use violations and that applicable rules are strictly enforced.
1002	Limited use signs, identifying that vehicle travel is allowed only on routes signed as open, should also be posted at primary trailheads, particularly where no kiosk or bulletin board is constructed. Numbered "open route" signs should be posted at regular intervals along designated open routes; particularly where open routes intersect closed routes.
1002	Additional decals informing visitors that vehicle use is allowed only on routes signed as open should be affixed to open route signs, as these signs are intended to be the most commonly encountered information conveyance device used in the WEMO planning area vehicle management program. Open route signs should also indicate that there are penalties for vehicle use violations, as is commonly done with route markers on national forest land.
1002	Agency presence in the field and public education is sorely needed. This presence could be in the form of Law Enforcement/Park Rangers or other BLM personnel. Local media should be used to improve public education about BLM's route network and rules for use.
1002	BLM should also utilize volunteer groups where available to assist in education/route rehabilitation/signing efforts. Where volunteer group hours are used as a basis for BLM grants, the associated grant funds should be directed to the area where these volunteer work hours are being generated. BLM Field Office-requested base funding should be used where appropriate.
1002	In summary, BLM is required to monitor vehicle use. While some vehicle use monitoring has been conducted in the BLM's Rand Management Area, the WEMO Plan FEIS does not indicate that BLM has developed a specific monitoring plan for the remainder of its designated route network. The public has not been informed of how BLM intends to monitor vehicle use.
1002	Effective monitoring could be guided by past direction identified in the BLM's (1980b) CDCA Plan (Appendix D: Attachment 1 [Off-road Vehicle Monitoring Guidelines]). Consistent with the Open Government Directive (OMB 2009), the BLM's reporting of monitoring results should make use of existing agency websites to the maximum extent practicable to promote transparency and accountability. Guidance recently proposed and clarified by the CEQ (2010, 2011) succinctly identifies this specific direction for improving agency mitigation and monitoring: <ol style="list-style-type: none"> 1. Proposed mitigation should be considered throughout the NEPA process. Decisions to employ mitigation measures should be clearly stated and those mitigation measures that are adopted should be identified as binding commitments to the extent consistent with agency authority, and be reflected in both NEPA documentation and decision documents. 2. A monitoring program should be created or strengthened to ensure mitigation measures are implemented and effective. 3. Public participation and accountability should be supported through proactive disclosure of, and access to, agency mitigation monitoring data.
1002	Monitoring reports, access to documents, and responses to public inquiries should be readily available to the public through online or print media, as opposed to being limited to Freedom of Information Act (FOIA) requests made directly to the BLM.
1002	Unfortunately BLM has not focused law enforcement in non-compliance areas, nor has the WEMO Plan been amended to reflect recommendations for increased on-the-ground agency personnel. Nor is there any indication that enforcement or other BLM personnel presence has increased since the WEMO route designation was formally adopted. A number of similar law enforcement actions and vehicle use management strategies have been prescribed by BLM nationally. While this direction was not found to be incorporated into the 2003-05 WEMO route designations, these types of measures should be considered in the future: <ul style="list-style-type: none"> · Strengthen existing or develop new law enforcement agreements with state and local law enforcement agencies wherever feasible; · Explore establishing... a system of 1-800 numbers to give citizens a convenient and timely method for reporting motorized OHV concerns;

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<ul style="list-style-type: none"> · Patrolling techniques should reflect the types of activities taking place on the public lands, such as the use of all-terrain vehicles (ATVs), motorcycles, etc.; · Adopt patrol techniques, including community policing that will enhance visitor contact and user compliance; · The BLM will work with adjacent land managers, landowners, and local law enforcement agencies to develop more consistent and coordinated enforcement techniques on all lands; · Prepare an annual law enforcement report that contains summary data and illustrative examples of BLM enforcement actions related to motorized OHV management; and · As part of BLM’s comprehensive motorized OHV education program, prepare information that describes legal consequences for violating motorized OHV regulation (BLM 2001).
1002	<p>Unfortunately, most of these areas have subsequently been relegated a low priority for management action implementation. The Kramer Subregion, supporting several special areas and a DWMA within an urban interface area with extensive illegal vehicle use, has been assigned a priority of 18 out of 21 implementation work areas (BLM 2011a-d). The Fremont Subregion, a subregion possibly containing the highest density of illegal vehicle routes in the WEMO planning area, has been assigned a priority of 14. The El Mirage Subregion, located adjacent to the El Mirage Open Area, a priority of 16. The Mitchell Mountain Range northwest of Barstow, where uncontrolled vehicle use issues have been identified (BLM 2003a, 2005a), a priority of 20. The Red Mountain and El Paso subregions that support extensive desert tortoise and other at-risk resources have been assigned a priority of 20. The East Sierra Subregion with its many riparian habitat resources, a priority of 21. Per previous CDCA Plan and/or WEMO Plan amendment criteria, the above areas merit a much high priority for active management.</p>
1005	<p>For off-highway users wanting to do the right thing and stay on designated roads and trails, the lack of signage makes that compliance nearly impossible. For roads and areas that are not designated for travel, signs must be erected indicated this very clearly.</p>
1012	<p>Lateral/parallel roads (OHV tracks, etc.) to major roads might be closed – but BLM’s expensive attempts to camouflage them in the Ord Mt. region have largely failed – and “closed” signs don’t survive long. The Plan needs to reflect on-the-ground reality with minimal ranger patrols.</p>
1013	<p>Thoughtful planning for the future should recognize the variety of users of this resource and how to accommodate them while protecting the flora and fauna. We believe that the best way to do this is by recognizing trails that have already existed for many years and add improvements like rating by difficulty (novice, intermediate, expert), descriptive trail markers, and historical points of interest. As evidenced by over 40 years of use by motorized Off-Highway Vehicles, this area’s trails are maintained by natural environmental events (wind and rain) without the need of man’s intervention or financial resources.</p>
1013	<p>Required maintenance for this system could be done by volunteers, thereby saving on maintenance costs. The Jawbone Canyon Store Trail System Team is ready, willing and able to supply volunteers to implement and maintain the proposed trail system project in partnership with the BLM.</p>
1013	<p>By opening single-track and quad trails and providing the opportunity the public is seeking, the BLM will undoubtedly have a large reduction in law enforcement expenses. Compliance will greatly increase if the BLM will provide a diverse trail system including significant single-track and quad trail systems.</p>
1013	<p>The BLM has been using barriers, posts and fences extensively in the Jawbone area to block trail access and cross country travel. In order to keep the proposed trails at their designed single-track or quad width, we suggest using similar barriers and fencing at key intersections, which only allow vehicles of certain widths to pass through. Our volunteers would like to help install them.</p>
1015	<p>All roads MUST be signed CLOSED.</p>
1015	<p>I am concerned that there is no signing of open or closed roads in an open as all roads in an open area are open even when unsigned. I think the BLM must insist to the judge that roads be signed closed and the open roads unsigned or signed remain as they are.</p>
1016	<p>In those areas that have pictographs, petroglyphs, scientifically significant locations (middens and caves and such), BLM should not post signs or construct kiosks and where they are currently existent they should be removed. Where possible the road should lead past and not call attention to the “arc site”. Where these sites are currently signed the signs should be removed.</p>
1016	<p>All roads designated closed through this process or any other process, must immediately be signed CLOSED.</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1017	Routes, regardless of jurisdiction, should be signed so that the public knows what is available and can stay on designated routes.
1020	BLM must include plans to educate OHVs sufficiently to get their compliance
1020	BLM must provide useable route descriptions
1020	BLM must implement density management in such areas.
1021	The original ROD WEMO plan calls for an education program for the Rand mountain management area with a small fee implemented. The education program should stay in tact, the fee should be dropped. The fee was never addressed in the last go around of stakeholder input, it was snuck in during draft of the ROD.
1025	The EIS should also address education and enforcement activities to increase compliance with the designated routes. Designated routes need to be signed open. The EIS needs to identify mechanisms for closing and rehabilitating undesigned routes, as well as mechanisms for preventing future route proliferation.
1026	Because many of the existing routes are in sensitive areas, language should be added to WEMO Plan 2.3.6 Monitoring, Adaptive Management and Implementation section to identify the specific monitoring program that will ensure that the agency does not authorize routes in sensitive areas that it cannot monitor.
1027	For roads and areas that are not designated for travel, signs must be erected indicated this very clearly.
1028	Site specific monitoring of motorized versus non-motorized use must be provided for each route.
1028	line of action and all education measures should be exhausted before pursuing other actions. There are situations where education is far more effective than law enforcement.
1033	In addition, in some areas, off-road vehicle use is occurring within Caltrans ROW, adjacent to the traveled way (e.g. State Route 14 in the Jawbone area, near Red Rock State Park). Besides being a safety and liability concern, such use also can destroy native plants and soil, and can create additional highway maintenance and safety problems due to erosion. Please address methods to inhibit such use (e.g. enforcement, education, etc.) and to repair damage.
1033	If any routes currently accessing a State highway are to be closed, the BLM should consult with the nearest Caltrans District office to ensure closure is done with a treatment appropriate to the situation so as to prevent continued use (e.g. re-vegetation, mounding of earth, etc.).
1042	Kiosks must be placed at all entry routes to the sub region and include something about the specialness of the region as well as the rules, dangers and how to reach law enforcement and emergency services.
1046	8) Monitoring: The need for annual monitoring has been identified since the very first 1980 Desert Plan.
1046	We do not agree that closed routes should be marked with a sign.
1046	Damaged signs must be repaired/replaced immediately. If parking/staging is to be allowed, there needs to be a barrier to limit the size appropriate for the area.
1046	Descriptions and the significance of riparian areas for wildlife should be described on signs appropriately placed at the hiking trailhead to such an area as well as on kiosks for motorized visitors.
1055	Law Enforcement It has been demonstrated from the existing network of illegal routes, widespread examples of soil erosion, violations and accidents, complaints from residents, observations in the field and law enforcement activity that the BLM currently does not have the capacity to enforce the law regarding ORVs on the lands under their jurisdiction. During large ORV events, law enforcement personnel are concentrated and rural communities are left defenseless against the influx of riders from surrounding areas. The designation of ORV routes must be based on a calculation including the capacity of the BLM to adequately monitor and protect areas with designated routes. This calculation alone will greatly reduce the extent of the designated route network. No management plan will be effective without a sufficient force to protect the lands within the management area.
1055	Route Designation Terminus The designation of open ORV routes must be accompanied by a route terminus sign since those routes without such a sign encourages trespass onto private property, public lands and roads off-limits to green sticker vehicles. This is a very serious problem since without the indication of a terminus, riders continue on designated routes past their ends. This leads to trespass on private and public lands and many of these routes cross rural roads leading to the potential for collision with local traffic. The failure of the BLM to place route terminus signs on designated routes places the agency in a position of liability for potential accidents and trespass.

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1055	<p>Large Format Signage and Informational Kiosks in TM 3</p> <p>The BLM has been mandated by the court to erect large format signage and kiosks at all areas where there has been shown to be significant ORV use. The kiosks must include:</p> <ul style="list-style-type: none"> • a statement of the relevant laws, penalties for violation and contact information for local law enforcement • a large scale map of the area that includes open routes and areas off-limits to ORVs including private property and rural communities, ACECs, wilderness areas, wildlife corridors and lands off-limits to ORVs • a short description of the impacts of ORVs on soils, vegetation, wildlife habitat and cultural resources • the components of the TREAD Lightly campaign • safety information including age limits, use of helmets and other safety gear <p>The BLM must install 12 kiosks in the Morongo Basin including the following locations:</p> <ul style="list-style-type: none"> • between Interstate 10 and Morongo Valley on Highway 62 at Indian Canyon Road • on Highway 62 in Yucca Valley at the top of the Morongo grade • at the corner of Highways 62 and 247 • at four locations between Highway 62 and Interstate 40 on Highway 247 • at two locations on Highway 62 between Yucca Valley and 29 Palms • at two locations on Amboy Road between Adobe Road and Iron Age Road • at Highway 62 and Godwin Road <p>In addition, the BLM must install kiosks at the Fort Mojave, Chemehuevi and Colorado River Indian Tribes tribal lands in collaboration with representatives from those tribes. ORVs have been responsible for the destruction of tribal lands and invaluable sacred sites on all three of these reservations.</p>
1060	<p>Enforcement - the crux of the problem lies in enforcement. Unlawful motorized travel created many of the roads that are excessive today, and are the reason the BLM is attempting to create an appropriate route designation plan. Consideration should be given to enforcement in the plan. An educated public may reduce the need for future enforcement. Education of local sensitive plants and animals may help reduce the impact to those species. Information on road status should be available in several technology appropriate fomats. Consideration should be given to an education program in the plan.</p>
1071	<p>I see that unlicensed kids on ORV's are not a problem on the combined use highways/roads, as long as they have had training and are supervised by a proper adult. (This also should be specified in the WEMO plan, and in local signage) So this mitigates my idea of having 2 parking lots (one at each end of Randsburg) for families to walk their kids into town (as I mentioned on the phone to you this morning). But I and others, still think that a couple of parking lots for ORV'S would be a good thing</p>
1071	<p>And the "Sign" part on the road. It would make it easier for them to identify trails, and thus, augment BLM enforcement officers "duties". My idea of the value of this as a subtle enforcement tool, especially applies to the "90 degree" crossing of ORV's across paved roads/highways. should also be a part of your (BLM) sign criteria. I see it nowhere I have been in the desert. It is for safety, and lets the on-highway traffic know to keep their eyes open for others (probably slow moving), crossing the highways and roads. It could also be used for enforcement in very subtle ways, to keep people on trails, and more importantly, inform CHP and other "unknowing-of-local-trails" officers, of who is on and off "designated" trails, as they drive by in their normal duties</p>
1071	<p>Allow someone/s to sign BLM,s Rand area maps/permits from the local area, for unknowing visitors. Staff the BLM info table with at least one local person, who has a local view, this is not a paid job. Seek out local balance.</p>
1071	<p>These signs are so ineffective, that they can be construed as graffiti. An example: When you go 45 mph on a paved road/street, the sign is about 2 feet square. When you go 45 mph off road, and concentrating on other things, signs are about 4 inches square on carsonite stakes. What is wrong with this picture: 4 square feet vs. four inches square? The Kiosks are full of info made to read at a desk and from a piece of paper 8 1/2 X 11", and at arms length. I maintain, that an adolescent ORV'er should be able to ride up to a kiosk and see a stylized map and know where to go,--- without stopping his engine, taking off his helmet, and dismounting and walking up to the kiosk for info. (We don't do this in normal driving.) Few do this in the Desert. And then, the info is "inaccurate, incomplete and confusing".</p>
1072	<p>At least put Dead-End signs up to keep people from cutting entirely new trails once they come to the end of these newly signed open routes!</p>
1081	<p>Many locations may have cultural resources. In those areas that have pictographs, Petroglyphs scientifically significant locations (middens and caves and such), BLM should not post signs or construct kiosks. Where possible the road should lead past and not call attention to the site.</p>
1082	<p>A reasonable administrative remedy exists in such a situation where an existing mining claim is made inaccessible by a</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	road closure. The remedy consists of the issuance of an administrative permit that would permit access to and from an existing federal mining claim by means of a motorized vehicle. The result of the issuance of such a permit would have negligible impact on the existing environment because only very limited access solely for the purpose of accessing a specific mining claim site would result. The BLM would continue to receive an annual maintenance fee from the miner and the miner would not de facto be deprived of the investment of his time, ingenuity, productivity and property interests.
1087	All roads MUST be signed CLOSED. There is no signing of open or closed roads in an open area, as all roads in an open area are open even when unsigned. I think the BLM must insist to the judge that roads be signed.
1087	Roads leading to extreme riding or driving places, which are few and far between, should be posted.
1089	Matter of fact, the entire concept of "Closed unless marked Open" is not a practical one, there are too many checkerboard properties this cannot function
1089	The Rand education program the fee should be dropped. The fee was never addressed in the last go around of stakeholder input it was snuck in during draft of the ROD
1095	BLM must erect informational kiosks in access areas with accurate maps, relevant laws and how to contact law enforcement.
1095	In Limited Use areas the maximum speed allowable should be 15 mph.
1095	BLM should maintain the policy of "Closed unless signed OPEN"
1095	More enforcement, heavier fines for ORV law violations
1098	Can we have a clear system, using footprints on signs for hikers, hoof prints for horses, single/double tire marks for motorcycl/ATV?Jeep use etc?
1100	Routes, regardless of jurisdiction, should be signed so that the public knows what is available and can stay on designated routes.
1100	All closed roads MUST be signed CLOSED. This is the most important concept in this entire planning activity and the BLM having failed to do so, is the reason the public is looking at the route designation process again. In the rest of the world and even in the open areas within the planning boundaries a route must be signed closed or gated to let the public know where they may go.
1101	It has been demonstrated from the existing network of illegal routes, widespread examples of soil erosion, violations and accidents, complaints from residents, observations in the field and law enforcement activity that the BLM currently does not have the capacity to enforce the law regarding DRVs on the lands under their jurisdiction. During large DRV events, law enforcement personnel are concentrated and rural communities are left defenseless against the influx of riders from surrounding areas. The designation of DRV routes must be based on a calculation including the capacity of the BLM to adequately monitor and protect areas with designated routes. This calculation alone will greatly reduce the extent of the designated route network. No management plan will be effective without a sufficient force to protect the lands within the management area.
1101	The designation of open ORV routes must be accompanied by a route terminus sign since those routes without such a sign encourages trespass onto private property, public lands and roads off-limits to green sticker vehicles.
1101	The BLM has been mandated by the court to erect large format signage and kiosks at all areas where there has been shown to be significant ORV use. The kiosks must include: <ul style="list-style-type: none"> • Statement of the relevant laws, penalties for violation and contact information for local law enforcement • A large scale map of the area that includes open routes, areas off-limits to ORVs including private property and rural communities. ACEes. wilderness areas, wildlife corridors and lands off-limits to ORVs • A short description of the impacts of ORVs on soils, vegetation, wildlife habitat and cultural resources • The components of the TREAD Lightly campaign • Safety information including age limits, use of helmets and other safety gear
1101	Historically, there are no designated OHV trails in this area. and the public is asking for these parcels to be closed once and for all. and having signage posted to that effect. There needs to be BLM LEO presence to enforce the law so that our public lands and surrounding private property can be protected from OHV trespass.

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1120	We should preserve and mark this historic trail
1127	Map: Red Mountain Signage and route access to Cuddeback Dry Lake and the surrounding area
1146	Since this is a motorized designation process, care should be utilized in making sure there is continuity in numerical signing of routes. The present WEMO signing is ambiguous in the numbering of trails. Many times it is unclear where a contiguous route actually goes. There is a confusing array of numbers not seen before and not on any readable maps available to the general public.
1163	Education program: This program should be eliminated in the Rands, but in its place be implemented in all of the WEMO areas, as a simple education program. This program was put on the Rands, without any input from anyone but BLM, and to say it only belongs to Rands is wrong. The Sierra club and CBD used this education element of Rands to shut down a perfectly legal trail, (a trail that is fenced in on both sides). Thus, that alone tells you how wrong this entire program is. It is missing the mark, we want to educate the Public and Desert Managers Group are spending millions on that, so why should Rands be held hostage on something that is desert wide?
1251	To successfully meet the challenge of effectively managing vehicle use on public lands situated adjacent to private acreage, we believe a concerted public education and route signing effort, BLM field presence and closed route rehabilitation and signage effort is necessary.
1251	Improved route signing, primary trailhead kiosk installation with large-scale route maps and use rules, closed route rehabilitation and mandatory use education requirements;
1251	Establishment of an effective, systematic vehicle use monitoring plan conducted on a regular basis by BLM staff, with the details/results made readily available to the public; • Development of a threshold which clearly identifies a level of unacceptable impact to public land resources, at which point a specific course of action will be undertaken by BLM to prevent future occurrence of these impacts; regular basis by BLM staff, with the details/results made readily available to the public;
1251	The adoption of strategies for effective enforcement of vehicle use on public lands and improved collaboration with city/county law enforcement personnel.
1256	Closed unless signed open will not work in the checker boarded West Mojave.
1256	3--Calif. DMV rules of the road say closed ways are signed. 4-- Calif. Parks and Recreation use closed signs. 5--Municipalities in and around the desert use closed signs. So the problem exists that trail riders coming on BLM limited use lands from Cal City for example or the open areas would tend to ride on unsigned trails.
1256	6-- You can not sign private land and many trails cross private land and in many incidents the trails split on private land and therefore the rider would not know which fork to take. In closing I would like to say, the idea that it doesn't have a sign must mean its on private property will be what people will think. You must put closed signs up for it to work.
1256	Route signage should be changed to coincide with surrounding area laws "open unless signed closed"
1265	RC3329 - Should take this sign down and put one up that says closed. This road dead ends into my salting area for cattle and the wilderness. People think it is an open area.
1284	The designation of ORV routes must be based on a calculation including the capacity of the BLM to adequately monitor and protect areas with designated routes. This calculation alone will greatly reduce the extent of the designated route network. No management plan will be effective without a sufficient force to protect the lands within the management area.
1284	The BLM has been mandated by the court to erect large format signage and kiosks at all areas where there has been shown to be significant ORV use. The kiosks must include: • a statement of the relevant laws, penalties for violation and contact information for local law enforcement • a large scale map of the area that includes open routes and areas off-limits to ORVs including private property and rural communities, ACECs, wilderness areas,

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	wildlife corridors and lands off-limits to ORVs <ul style="list-style-type: none"> • a short description of the impacts of ORVs on soils, vegetation, wildlife habitat and cultural resources
1284	The BLM must install 12 kiosks in the Morongo Basin including the following locations: <ul style="list-style-type: none"> • between Interstate 10 and Morongo Valley on Highway 62 at Indian Canyon Road • on Highway 62 in Yucca Valley at the top of the Morongo grade • at the corner of Highways 62 and 24 7 • at four locations between Highway 62 and Interstate 40 on Highway 247 • at two locations on Highway 62 between Yucca Valley and 29 Palms • at two locations on Amboy Road between Adobe Road and Iron Age Road • at Highway 62 and Godwin Road
1287	All routes, regardless of jurisdiction, should be signed so that the public is provided reasonable notice regarding which routes are available for use and which are closed so that members of the public can make educated decisions on which routes to use.
1287	All closed roads MUST be signed CLOSED. In the open areas within the planning boundaries a route must be signed closed or gated to let the public know where they may and may not go. We are concerned that there is no signing of open or closed roads in an open area, as all roads in an open area are open even when unsigned. The BLM must insist that closed roads be signed closed and the open roads unsigned or signed remain as they are. Anything else is too confusing to the public to provide adequate notice.
1288	Consider BLM-County MOU using USFS MOU as a template and more active participation in the quarterly meetings of the interagency taskforce (USFS, County Code Enforcement, BLM, including LE) to enhance implementation monitoring and compliance. USFS LE contact is Curtis Davis, their Chief Ranger. Their MOU provides easy access to State (OHV probably) Grant \$\$ that are approved through the taskforce to do reclamation and other route maintenance activities. A three-way partnership could improve \$\$ return for BLM. Also, code enforcement is consistently turning \$\$ back to the state at the end of the year that it cannot spend.
1288	Rehab strategies and activities: USFS would like to have a coordinated effort on implementation (closures, restoration, signing, kiosks) along the boundary with a focus on Deep Springs/Warm Springs area where significant work was completed during the Willow Fire closure in 1999. USFS is interested in contributing needed resources to make this more effective (manpower and equipment)—may wish to pursue through an MOU (avoid more NEPA), similar to our AML MOU with the State. This would demonstrate implementation actions to the court and provide a mechanism to evaluate the feasibility of the motorcycle network concept based on response of the OHV community. If can get compliance, can support motorcycle network concept. If not, may need to take more aggressive actions in the area and oppose further expansion.
1296	Route Designation: Signs. It has come to my attention that certain BLM staff and/or at least one Sierra Club Member are removing and or relocating and GPSing signs when they disapprove of roads which under the court ordered BLM process have been designated open access. I don;t know if the new GPS information has been entered into the data base. An example occurred in the Darwin area where there is a watch committee. BLM put up the open access signs. A few days later certain signs were removed and after I mentioned this to Jack and Eddie the signs went back up. It is my understanding that the removal and or repositioning of open access signs occurred throughout the WEMO area. I have been told the number of signs removed/gone is in excess of 100. I have not heard how many were moved.
Travel Management Area 1	
1001	Some areas such as the entire Cady Mountains are very rich mineralogically and have special importance to rockhounds. Every effort should be made to maintain or restore motorized and vehicular access to as much of the Cady Mountains and other similar areas as possible.

1001	<p>Klondike Chalcedony Rose Field C 109237, 112739,334542 - routes not designated. Searchers request these remain open for access to rockhounding.</p>
1001	<p>South of Klondike Rt. 66 CN 112768 (NS7967) - Designated open. Searchers request that this route remain designated open to the ghost camp for access to rockhounding area.</p>
1019	<p>Formal visits to Darwin Mine, Cerro Gordo Mine, Snow Cap Mine in Owens Valley region and many others have been excellent opportunities for my students to learn about historical and reactivated mines from geologists in the local regions of California. Having access to these mines and other mineral deposit locations helps our next generation learn from experienced mining personnel and BLM geologists in the process.</p>
1019	<p>Educational geology areas reached on the attached maps include all roads and trails prefixed by "SE" (Sierra and Darwin Subregions) and all roads and trails prefixed by P (North Searles Subregion) and all roads and trails prefixed by "RM" (South Searles Subregion)...Please maintain these areas as open to to allow continued earth science education, family camping and hobby collecting.</p>
1044	<p>We also request that BLM designate a staging area or areas for off-highway travelers, to minimize traffic, dust, and noise impact on Darwin residents. The abandoned mill site in Lucky Jim Wash could be one possible staging area.</p>
1044	<p>It is essential to maintain alternative routes for entering and exiting Darwin in case of road closures on Highway 190 and the Darwin Road. Some of the currently designated routes serve this purpose in case of emergency. These include: SE19/SE9/SE75; SE19/SE47; and SE66.</p>
1044	<p>The currently designated open routes in the Darwin Subregion are essential for access for purposes of recreation, hiking, bicycling, mining, education (geology classes), hunting, etc.</p>
1044	<p>The main roads to Darwin, namely, Highway 190 and the Darwin Road, are sometimes impassable owing to flooding, snow, or rock falls. It is essential that safe alternative routes be available for entering and exiting the town in case of emergency. The following routes are needed for this purpose: SE19/SE9/SE75; SE19/SE47; and SE66/unmarked road 11.</p>
1044	<p>Darwin's water line road (west of and parallel to SE40, and not currently marked as open), provides access to Darwin's pipeline, and must remain open. This road should not be designated as open for offhighway travel, owing to the sensitivity of the pipeline, which runs alongside this road.</p>
1044	<p>The route currently marked as SE24 should remain open all the way to its end, because this provides access to the ridge that Darwin residents plan to use to relay a microwave signal from Lone Pine or Keeler for broadband service to Darwin.</p>
1044	<p>The area around Darwin is very dry. There is no groundwater in Darwin, and sensitive areas such as Long's Well and Black Spring are accessible only by hiking. The roads that lead to the trailheads are essential for access to these interesting areas. By distributing traffic over a network of roads, as on Lower Centennial Flat, the current route system minimizes the damage that more focused heavy impact might create. The existing route system providing access to the historical mining areas around Ophir Mountain and the southern Darwin Hills allows for exploration of the mines, provides access for hiking into more remote areas, and distributes the impact of modern traffic in historically heavily disturbed areas.</p>
1044	<p>SE9 Alternate exit/entrance to Darwin. Access to Centennial Flat. Main artery – connects SE75 to SE19. Great</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	views throughout this route, and access to hiking, botanizing, and mining areas. Auto travel. [NOTE: Not properly identified on map at highway intersection.]
	SE18 Access to Black Spring. Access to hiking area.
	SE19 Alternate exit/entrance to Darwin. Access to Black Spring. Great views. Access to hiking, wildflowers, historic mining areas. Connects and completes loop to Darwin. Auto. Popular.
	SE20 Interesting road leading into Coso foothills.
	SE21 Interesting road leading into Coso foothills.
	SE22 Interesting road leading into Coso foothills.
	SE23 Loop to Centennial Flat. Alternate route from Darwin to Centennial Flat if pass into Centennial Flat is blocked. Very interesting views and terrain. Access to SE24 (see below).
	SE24 Access to proposed site for relay of broadband signal to Darwin.
	SE25 Access to Long's Well trailhead. Important area for hiking and viewing wildflowers. Camping at trailhead. Auto/bicycle. Popular.
	SE26 Access to historic mining area. [Note that there are two SE26's on large map.]
	SE28 Access to historic mining area and inholdings. Excellent for rockhounds.
	SE30 Access to mining area. Important for geology, hiking. Auto/4X4. Popular.
	SE31 Connects Darwin Canyon Road (#11) to mining area east of Ophir Mountain. Becomes 4X4 where route is currently unmarked.
	WEMO-1044. SE32 Access to hiking route to top of Ophir Mountain. Interesting canyon.
	SE33 Access to mines. Beautiful drive in interesting historical area.
	SE34 Access to historic mining area. Interesting area for rock collectors.
	SE35 Access to historic mines. Calcite hole. Rock collecting. Access to lava fields.
	SE36 Provides access to small spur roads where there are mining inholdings.
	SE40 Access to SE41 and NAWS gate. Continues into scenic area.
	SE41 To NAWS gate. ESSENTIAL FOR ACCESS TO WATER LINE ON NAVY BASE.
	SE42 Connects SE40 and SE43.
	SE45 Access to large camping area. Spur roads to many old mines, of great historical and geologic interest. Excellent starting point for hiking in the Darwin Hills. Auto/bicycle. Very popular.
	SE46 Short spur route provides access to extensive hiking area. Great views. Wildflowers.
	SE47 Alternate exit/entrance to Darwin. Makes loop from Darwin Road to SE19 and Darwin. This was once the historic road into Darwin. Interesting and varied terrain.
	SE48 Short spur road providing access to historic mines. Access to large hiking area.
	SE49 Connects SE19 and SE47.
	SE60 (Route marker on the ground; not on map.) Access to Jackass Mine. Spectacular overlook of Panamint Valley and Darwin Wash. Popular.
	SE61 Access to Zinc Hill (geology, history).
	SE62 Access to scenic and historic mining area. Important route.
	SE63 Access to Zinc Hill (geology, history).
	SE64 Access to Zinc Hill (geology, history).
	SE65 Access to large historic mining area. Camping area.
	SE66 Alternate exit/entrance to Darwin. Sometimes referred to as Zinc Hill Road. Access to Darwin Canyon, Darwin Wash, China Garden, Zinc Hill. Extremely interesting geology all along this route. Very important road.
	SE67 Access to extensive historic mining area. Excellent hiking from end of road. Spectacular overviews of Darwin Hills.
	SE68 Access to historic mines and extensive hiking area. Steep 4X4 route leads to a spectacular viewpoint.
	SE69 Access to mines and extensive hiking area. SE70 Access to Centennial Canyon
	SE71 Access to Centennial Canyon Trailhead. Spectacular views. Hiking up historically important canyon.
	SE72 Access to clay pits.
	SE73 Access to Timbisha Shoshone tribal lands. Access to clay pits.
	SE75 Main artery – access to SE71, SE9, SE72, and complex of roads on Centennial Flat.
	UNMARKED ROUTES:
	1 Small connecting road loops S19 and S25. Auto/bicycle. Popular

Table C-2. Scoping Comments by Comment Category

Popular in summer, occasional use in winter.</p> <p>11 Main route from Darwin to Darwin Canyon. Access to mining roads. Essential exit/entrance route from Darwin to Panamint Springs. Auto/4X4. Popular.</p> <p>12 Darwin Water Line Road (west of and parallel to SE40). Provides access to Darwin's pipeline. Should not be used for recreational traffic, which should travel on SE40).</p> <p>13 Loop to SE31. Connects Darwin Canyon Road (Zinc Hill Road, #11) to SE30/SE29. Access to many mines. 4X4.</p> <p>14 Access to Long's Well for maintenance of water source. 4X4. Hike to spring.</p> <p>15 Access to historic mining district. Complex of several roads leading to important mines. Spectacular views and excellent hiking.</p>
1044	<p>we request that BLM acknowledge that Darwin's water line road (parallel to and west of SE40) must remain open to provide access to the transmission line carrying Darwin's water supply. This is not, and should not be, a designated route for recreational off-highway travel due to the sensitivity of the pipeline.</p>
1044	<p>The currently designated SE24 provides access to a ridge that Darwin residents plan to use for microwave equipment, to transmit a signal from the Owens Valley to Darwin, once the Digital 395 fiberoptic cable has been installed.</p>
1044	<p>Many off-highway routes converge on the inhabited area of Darwin as a hub. To reduce noise, dust, and traffic impact on Darwin residents, we request that BLM designate a staging area or areas outside of town so that off-road travelers can unload and mobilize their equipment without disturbing town residents. One possible area for staging would be the abandoned mill site (N 36 16.131 W 117 35.917). The air strip should not be used for staging, because it is currently in use and needs to be available at all times for landings and takeoffs. Also, excessive high-speed vehicular traffic on the air strip degrades the surface, making it unsafe for use by aircraft.</p>
1044	<p>SITE A Suggested location for staging area for OHV travel, in general area of abandoned mill site west of Lucky Jim Wash (N 36 16.131 W 117 35.917).</p>
1044	<p>SITE B Proposed location for microwave relay for broadband to Darwin. (See SE24.)</p>
1045	<p>the advent of the Digital 395 project in the Eastern Sierra will open up an important broadband corridor. In order to benefit from this new fiberoptic backbone, Darwin will need to install communication facilities to send the signal from Lone Pine to Darwin, via an intermediate relay point. If the road providing access to this relay point were to be closed, that would kill Darwin's chances of utilizing this signal.</p>
1075	<p>1)darwin subregion and 2) the sierra subregion...further restricting roads now in use will further constrain humanity from accessing nature. with so few roads in this region the closure of any road precludes access. those with a passionate need to "be in nature" will eventually be restricted to the nearest paved hiway or at best a major dirt road with no opportunity to leave that road. those who would camp are told to camp alongside the open dirt thoroughfare. this is often not possible without obstructing other travelers and besides, it's dangerous. leaving small dead end spur roads open would allow campers to disperse and enjoy their experience. how would you like to experience nature as a view from the narrow shoulder of a dangerous hiway with no hope of offroad access?</p>
1075	<p>1)darwin subregion and 2) the sierra subregion...the closure of well used roads up long alluvial fans in the california</p>

Document Number	Comment Text
	desert is a statement to urban dwellers that they will no longer be able to enjoy weekend access to the desert mountains. a 5-8 mile hike to a former trail head subtracts a whole day from mountain exploration.
1075	rather than comment on specific roads by number my recommendation/comment is to leave all the roads in the darwin and sierra subregions open. we need them.
1117	<p>Map Name and Number - N. Searles Route# - P11 N. Grid Location - Sect 13 T26S R44E Point of Interest - Comment Type - Keep open as single track north of pavement ending and extend s. from section 36 to pass on P67 as single track. Serve horse, motorcycle, and bike access to Manly Pass</p>
1119	<p>I would like to see Route SE28 connected to Route SE26. This is an existing two track road of crushed road and sand, and has been in existence for many decades. There are no riparian areas on this section, and completing the route will lessen impact on the road itself. There are some historical mining areas that can be hiked to rather easily and has good views of lucky Jim Wash. SE26 continues for a bit, and dead ends at the Darwin Falls Wilderness.</p> <p>2. Route SE28A is a nice, historical, loop route. This is a 4 wheel drive loop with passage on a early 1900 style road and accesses an interesting mining area. At the cross-over at the top, there are several hiking routes to historical sites higher up. The route is in good shape; mostly small rock, sand and gravel, but steep and a bit rough, and technically interesting. There appears to be no riparian areas. There is one mine shaft that might eventually need a bat gate.</p> <p>3. This little side road off SE30 leads up to a couple of interesting head frames and some hiking trails up to more interesting historical sites. There are excellent views from the top of the hill to the west.</p> <p>4. This little side trail off SE30 leads to what appears to be a machine shop/building and a mine headframe. It is one of the few standing buildings in the area and the height of the mining pad allows a nice view of the surrounding area. Historically interesting and a great photographic area. This is a long preexisting road made of mostly crushed rock, sand and gravel, it meanders through several different eras of mining activity and connects the upper western Lucky Jim Wash with the eastern side of Ophir Mountain. It is historically interesting and has great views of the Panamint Mountains and the Zinc Hill areas. It eventually connects to the eastern entrance road to Darwin. The short side roads lead to small historic mining areas. Connecting this route to SE 60 allows a complete loop without backtracking through Darwin and lessens impact on the area. This is an extremely scenic, historic, and interesting route. Very historically photogenic and many opportunities for hiking.</p> <p>6. This cluster of short roads all lead to historic mining areas. All appear to connect to the main eastern road into Darwin.</p> <p>7. This is the main road into Darwin from the east and connect Darwin with SE66, the Darwin Wash Road.</p> <p>8. This cluster of interesting routes connect the main eastern Darwin entrance road with many early mining areas. Lots of history, hiking opportunities, and of course picture taking. All of these roads are also somewhat technically interesting to 4x4 enthusiasts. They also connect SE45 and SE 60 with many interesting sites</p> <p>9. These roads connect one huge, historical mining site with several eras of workings. All are good roads and lead to different areas. Lots of hiking trails. These trails connect with routes on non posted private property and allow a continuous route to some interesting mining areas and outstanding views of the countryside from many angle.</p> <p>10. This loop would allow access to the airstrip and cemetery without going through the town of Darwin proper. This would also be a possible site for a staging area for events that require trailers and such to park and unload cargo, both animal and motorized. This</p>

	<p>would stop some of the trespass inside the town site of Darwin.</p> <p>11. This is the main western entrance between Hwy 190 and the town site of Darwin. This should be an Inyo Co. road.</p> <p>12. This partially paved road was once part of the historic Keeler to Darwin Road. I'm told it was bypassed when the present entrance (see comment 11), road was built. The two open routes. SE68 and SE69 lead to scenic overlooks, and allow a very scenic view of the Darwin Wash for many miles. To me it's very spiritual and quiet. and allows to really see some of Mother Nature's beautiful work.</p> <p>14. This isn't actually a road. It is mostly the bottom of the Darwin Wash and is mostly loose sand. It is a loop off of SE66. I've mostly seen just motorcycles and sand rails on it. [attached map]</p>
1121	<p>Map Name and Number - N. Searles Route# - P102 extends south to P140 Grid Location - Sec. 27 and 34 Point of Interest - Comment Type - Extend to connect to P140 bypasses airport, avoids conflict w/ indian wells residents and golf course.</p>
1121	<p>Map Name and Number - S. Searles Route# - Grid Location - Sec. 26 T27SR42E, extend east to across RM 3163 Point of Interest - Comment Type - Move GR? Line S. to match on ground and extend to connect on existing route for 2008-2010 dual sport to P140 on edge of map</p>
1122	<p>Map Name and Number - S. and N. Searles Route# - RM6140 to P158, P125 Grid Location - Point of Interest - Our personal property Comment Type - Maintain right to access our private property would consider right to pass to trailhead at end of P125</p>
1142	<p>We also request that BLM designate a staging area or areas for off-highway travelers, to minimize traffic, dust, and noise impact on Darwin residents. The abandoned mill site (N 36 16.131, W 117 35.917) could be one possible staging area.</p>
1142	<p>Subregion: North Searles Route #: P68 Acces to Manly Pass that gives access to Paramount Valley</p>
1142	<p>We, the undersigned, request that all currently designated off-highway travel routes in the Darwin Subregion remain open. In addition, we request that BLM acknowledge that Darwin's water line road (parallel to and west of SE40) must remain open to provide access to the transmission line carrying Darwin's water supply. This is not, and should not be, a designated route for recreational off-highway travel due to the sensitivity of the pipeline.</p> <p>It is essential to maintain alternative routes for entering and exiting Darwin in case of road closures on Highway 190 and the Darwin Road. Some of the currently designated routes serve this purpose in case of emergency. These include: SE19/SE9/SE75; SE19/SE47; and SE66/Darwin Canyon Road.</p>
1142	<p>Map: Darwin Route #: SE 24 Access to microwave relay site</p>
1143	<p>The Darwin Mine was developed in 1873 with water rights located in the Darwin Wash and a pipe line and utility easement CA8872 (also not shown on your map). The pipe line is underground in places and on the surface in others. There are dozer track that have been used to access the ridge lines, vents, and power poles and lines. Without access to our site, ventilation, and secondary escape routes, we would face serious safety issues.</p>
1146	<p>Darwin, North Searles Valley, South Searles Valley Subregions are huge amounts of archeological, geological, scenic and historical sites in these areas. Lack of use should not be a criteria for eliminating these routes.</p>

	<p>What is the Issue/Concern/Opportunity? See attached map for locations. 1) This is a single track connecting two BLM roads. It was built by the DWP in the early 1900s to survey the fal/line for the Aqueduct tunnel through the mountain to the west. Because of the total lack of single tracks, this should be designated open]</p>
1157	<p>What is the Issue/Concern/Opportunity? See attached map for locations. 1) This is a 2-track that is next to C1 sandwash that is more desirable than old race course that is soft sand. It should be designated Open. 2) This is a single track that has been used by many Endurance horse races and Dual Sport rides. It provides an exceptional view of the Pinnacles. Considering the total lack of single track, it should be designated Open. 3) This is a 2-track that provides a more recreational exit from Pinnacles area, it should be designated Open. 4) These are all either pipeline or power line roads that should be designated Open to the public not just utility companies</p>
1254	<p>This letter presents established routes to significant localities shown on the Sierra Subregion map of the Sierra Polygon. Numbered access routes that need to remain open are listed below. Unnumbered access routes that need to remain open are shown in red on the attached map. Routes prefixed with "SE" 2, 3, 9, 10, 18, 19, 20, 21, 70, 71, 72, 76, 430, 432,433, 748,752,756,776,777,778,858,859,860,867, 869,870,984,986, 987 Please maintain these routes in an "OPEN" status to allow continued access for management and protection of significant, nonrenewable paleontological resources.</p>
1256	<p>Map or Name - N. Searles Route # - Grid Location - T24SR45E Sec. 14, T24SR41E Sec. 28 Point of Interest - Single Track Trail Comment Type - Site Specific This is a crecent-shaped trail that allows riders to ride from pioneer point up and around indian wells and back w/o disturbing residents at indian wells</p>
1256	<p>Map or Name - S. Searles Route # - RM3150 Grid Location - T25SR41E Sec. 14, 6 Point of Interest - Comment Type - Site Specific Taking 3150 is the main way for dual sport events to connect off-road between ridgecrest and trona. 3150 should go through sec 12 and meet 3147 in sec 6.</p>
1272	<p>If you must close roads, here are a few hat I would not see a problem with closing: 1) SE 46 & SE 38; 2) SE 42;</p>
1277	<p>3)Unmarked route #1 (see map); 4) Unmarked route #7 (see map)</p>
	<p>Closing roads will restrict access to important hiking areas.</p>
1279	<p>[Identified Important Routes] SE71 - Auto, SE75 - Auto, SE9 - Auto, SE19 - Auto, SE25 - Auto/Bike, 1 - Auto/Bike, 2 - Auto/Bike, 3 - Plane/Auto/Bike, 4 - Auto/Bike, 5 - Auto/Bike, 6 - Auto/Bike, 7 - Auto/Bike, SE47 - Auto, SE24 - Auto, 13 - 4x4, 9 - Bike, 10 - Campsite</p>
1281	<p>Without access to our site, ventilation, and secondary escape routes, we would face serious safety issues. MSHA representative John O'Brien is trying to schedule a visit to the Darwin Mine sometime in May, 2012, and I am sure he will concur.</p>
1281	<p>We have tried to depict the areas of concern. However, with one hundred forty years of workings, we feel a buffer zone, allowing us access to the complete property holdings would be appropriate. As we have safety concerns for our employees as well as the public.</p>
<p>Travel Management Area 3</p>	
1002	<p>The threatened Parish's daisy (Erigeron parishii) is one of many special status plant species restricted to the western Mojave Desert (BLM 1999b, 1999c) that can be adversely affected by vehicle travel. It is found along washes, canyon bottoms or loose alluvial deposits on adjacent benches (Sanders 1998). Off-road vehicle travel is common in portions of</p>

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	the Carbonate Endemic Plants Conservation Area and Bighorn Subregion; both of which have a high potential to support this species. Vehicle travel can result in soil disturbance, crushed/destroyed vegetation and potentially introduce non-native plants. As vehicle camping and parking can also occur within 300 feet (91.4 m) of designated open routes per the CDCA Plan (BLM 1980b, 1999a), it is critical that route designation in Parish's daisy habitat take into account the risk of vehicle use/parking/camping impacts to this species. There is no indication in the WEMO Plan that occupied or suitable Parish's daisy habitat was screened as a significant consideration in BLM's 2003-05 route designation effort.
1002	The endangered least Bell's vireo, southwestern willow flycatcher and yellow-billed cuckoo have been reported from riparian areas along the Mojave River (Patten 1998; Unitt 1998; Laymon 1998). These species are suspected to utilize this habitat type where it occurs at springs and along creeks in the Juniper and Bighorn subregions during migration. The yellow-billed cuckoo has been reported from Arrastre Canyon (C. Stubblefield, pers. comm. 2012) during the migration season. The threatened Inyo California towhee is known to nest in riparian habitat within the Argus Mountains (USFWS 1987); specifically within the Great Falls ACEC. ORV use has resulted in the direct loss of desert scrub and riparian habitat in this area
1042	<p>1. Areas and trails shall be located to minimize damage to:</p> <p>Soil: Arrastre Canyon, Lovelace Canyon, Grapevine Canyon, Deep Creek Canyon and many of the other sites in the area have thin, granitic soils and hilly terrain which are especially susceptible to erosion. The many limestone outcrops may support rare plants.</p> <p>Watershed: Almost all streams and drainage goes into Arrastre Creek near the Arrastre Waterfall beside JF3330. Cottonwood Creek with its tributaries drains into Arrastre Creek near Bowen Ranch Road.</p> <p>Additionally, creeks in Upper Arrastre Canyon drain into Arrastre Creek near the VP mine and routes JF3221M, JF3259M, JF 3219M. Other watersheds in the area are drainages into the Deep Creek and the Mojave River, Lovelace Canyon and Grapevine Canyon. The watersheds in the region are predominately hilly terrain with numerous rocky outcrops and thin granitic soils.</p> <p>Vegetation: Most trails in the area originate from old mining roads. Historically, hunting and grazing activities have continued use of the old roads. Unfortunately, many of these roads have led to riparian areas and with continued and increasing use this leads to excessive degradation of riparian vegetation. BLM must be aware of and take into account that just because intermittent use in the past resulted in acceptable levels of degradation, continuation of that use and opening up the roads to pure recreation will have a devastating impact on riparian vegetation. Almost all the riparian areas are still in need of clean up from mining/grazing. Motorcycle trails have emerged along cattle paths many of which lead from one riparian area to another and along streams. While cattle paths often disappear in a season, once they are used by motorcycles they remain and become eroded and the spread of non native plants is increased.</p> <p>Air: Although most of the soils are granitic gravel, with continued use, the gravel becomes pulverized resulting in a power-fine particle that is easily airborne. There are also numerous limestone outcrops.</p> <p>Other resources of the public lands: The Juniper Sub Region contains important prehistoric and historic sites both within and outside the Juniper Flats ACEC. Native Americans certainly used the natural resources in the area for hunting, food gathering, and habitation etc., including water sources, vegetation and rocks.</p>
1042	2. Areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats. Motor vehicle trails should not be located within a mile of streams, seeps and springs. Motor vehicle access to such areas as Arrastre Waterfall has resulted in the stream side being used as a camping area and the stream as a toilet, target shooting etc. The area around the stream is becoming denuded of vegetation and gravel from the erosion due to OHV hill climbing and use of an equestrian trail closed to motor vehicles is heading towards the stream.
1042	<p>3. Areas and trails shall be located to minimize conflicts between off-road vehicle use and other existing or proposed recreational uses of the same or neighboring public lands, and to ensure the compatibility of such uses with existing conditions in populated areas, taking into account noise and other factors. Some of the activities that may not be compatible and need special consideration are:</p> <ol style="list-style-type: none"> 1) Motorcycle riding vs. hiking/horseback riding/running/mountain bike riding 2) Target shooting vs. picnicking/rock climbing/hiking/horseback riding/mountain biking/running 3) Motorcycle riding vs. grazing 4) Hunting vs. nature appreciation

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	<p>Many residents in the Milpas Highlands area have complained of noise generated by OHV use on the nearby BLM lands in Arrastre Canyon. They are also acutely aware of the danger of the narrow, twisting Powerline Road when used by OHV drivers engaging in berm play and cutting shortcuts along the road. Many people use the Powerline Road (JF3330) for hiking and horseback riding. It has a long history of abuse by OHV traffic and its twists and turns all have numerous OHV shortcuts, some so wide that it makes it difficult to determine which is the "real" road.</p> <p>To date, there are no designated hiking paths; however, it seems all paths become abused by OHV riders. This includes the short 100 foot path to Arrastre Waterfall, and many cow paths and equestrian trails that crisscross the region. The historic Native American foot path to Deep Creek has also been severely degraded by OHV traffic.</p> <p>Cows make new paths each winter during their grazing season and in the spring and summer these are used by motorcycle riders.</p> <p>Many people visit the Juniper Flats area for quiet, for hunting and for watching wildlife. Noise from motor vehicles travels many miles through the area, especially when vehicles are speeding up steep hills.</p> <p>Target shooting and hunting are becoming dangerous issues for other visitors, especially because many people are heard and seen discharging weapons that are not shotguns. The Juniper Sub Region is a shot gun only area, but that is not being enforced, and safety is a concern.</p>
1042	<p>4. Areas and trails shall not be located in officially designated wilderness areas or primitive areas. Areas and trails shall be located in natural areas only if the authorized officer determines that vehicle use in such locations will not adversely affect their natural, esthetic, scenic, or other values for which such areas are established. "ACECs are an administrative designation made by the BLM through a land use plan". The management plan for the Juniper Flats ACEC (1988) included several routes through the area. Since then, miles of motorcycle trails have been created by rogue riders. Some of these trails are natural extensions of routes that abruptly terminate or join another route at 90 degrees. Others parallel designated roads. Will the BLM need to amend the ACEC management plan if new routes or uses are to be approved within the ACEC?</p>
1055	<p>the WEMO routes crossing through the Shadow Mountain Road neighborhood of Wonder Valley constitute an attractive nuisance.</p>
1055	<p>Unless BLM, either acting independently or in concert with local law enforcement, can demonstrate better control of the illegal and nuisance ORV activity generated by the TMA 3 routes located in the Wonder Valley community, they must either close the routes or limit use of same to street legal travel only.</p>
1055	<p>All BLM routes in the Morongo Basin adjacent to private property, wilderness areas and fragile habitat should be permanently closed. In addition, the BLM should erect physical barriers and disguise these routes with vertical mulching to discourage trespass. Routes that have been closed in the area near the Poste Homestead Natural and Historic Area are regularly breached by ORV riders who have demonstrated no respect for the closures. This area is in need of physical barriers on the west side of the adobe ruins and Chadwick Road should be closed to all ORVs.</p>
1055	<p>ORV routes should be eliminated on Gammel Road, along the Cleghorn Lakes and Sheephole Mountains Wilderness Areas and routes near the boundary of Joshua Tree National Park. Since the greatest biodiversity in the Mojave desert resides in washes and ephemeral waterways, and ORV activity has been shown to destroy vegetation and wildlife habitat and disturb desert soils, all routes in washes should be eliminated. In addition, all currently designated routes through the Morongo Basin that lead directly to into private property and therefore encourage trespass must be eliminated. These routes should never have been designated in the first place and are the result of a faulty computer-designed decision tree and the failure of the BLM to conduct ground-truthing investigations in these areas. The BLM should endeavor to avoid making the same mistakes that led to the current court order.</p>
1084	<p>RC 3329: This road should be closed it dead ends right at the salting area for my cows.</p>
1084	<p>RC 3343; There should be speed limit signs on this OHV Corridor 15MPH. For the safety of the cattle, horses and the rancher and his family. They should also post that this is a 4 mile road, 10 feet wide and the wilderness is closed to all vehicles. (They should really remove the signs they put up because people think they are open routes)</p>
1097	<p>I am writing to you to express my concern and dismay particularly with the establishment of Route WV 1948, that runs through my neighborhood an my community of Wonder Valley, California.</p> <p>This route runs directly across some major thoroughfares in my neighborhood Gammel and even more traveled daily by local residents, Godwin Rds. These are county maintained dirt roads.</p>
1097	<p>This is a recipe for disaster. There are many older residents in Wonder Valley that travel these roads to do their grocery</p>

Document Number	Comment Text
	shopping etc. It will be a matter of time only in my opinion until somebody gets broadsided by a speeding dirt truck or off road vehicle racing down this newly established rout.
1103	Juniper Flats Subregion: The Crowder Formation (Reynolds et al, 1998), Phelan Peak Formation and the Old Woman Sandstone (Sadler, 1982; May and Repenning, 1982) in this area contain vertebrate fossils that describe the age of the sediments involved with timing of the tectonic uplift of the San Bernardino Mountains that reach 11,000 feet elevation. The existing BLM routes with the prefix of "JF" must be kept open for resource management purposes.
1103	Rattlesnake Canyon Subregion: The Pioneertown sandstones and basalt dikes and flows as old as 10 million years, (Neville, 1983; Neville et al, 1985; Reynolds and Kooser, 1986) assist with describing the timing of the tectonic uplift of the San Bernardino Mountains. BLM routes prefixed with "RC" must be kept open for resource management purposes.
1123	Map Name and Number - Rattlesnake Canyon Route# - Grid Location - Point of Interest - Comment Type - Open to vehicles? In brn-rd. terminates at my property - you want to maintain your access
1124	Subregion: Rattlesnake Canyon Route #: RC1430 Burns Canyon Roads Proj. Fund - Maintained by property owners but used by others causing increased maintenance costs
1153	Map Name and Number - Johnson Valley/Rattlesnake Route# - RC3418, RC3435 Grid Location - South of Hwy 247 Point of Interest - Comment Type - Site specific Numbered routes feed into dirt roads in the community of Johnson Valley. Signage is needed - entering community roads "no outlet"
1154	Map Name and Number - Coolgardle To make sure there are roads to access mining claims looking at map cannot locate through roads.
1250	More specifically, the Mojave Group is very concerned about the Juniper Flats Sub Region and the great destruction which is taking place in that area. Since this is a transition area between the large population of the Victor Valley and the San Bernardino Mountains, there are a large variety of recreational uses taking place and not in a compatible manner. As other recreational areas are disappearing due to growth, more pressure is being placed on the Juniper Sub Region where illegal motorcycle use is rampant and illegal trails are appearing everywhere. Residents in the area and in adjacent Milpas Highlands are subjected to noise, dust, trespass and harassment.
1265	Route # - RC3343, RC3329 Site Specific Comment There should be a 15mph sign posted on this OHV corridor road for the safety of me and my family, my cattle and horses.

Document Number	Comment Text
	I need to use Gold Crown Rd. off Route 62, 29 Palms to access my claim Blackjack Claim for placer mining purpose.
1271	TMA 3 WEMO travel management plan. I have resided in the community of Wonder Valley for over 30 year! and have a long standing Interest in the welfare of the community as a resident, home owner, and business owner in that community. Since the Inception of the NEMO olanning process, I have observed a steady deterioration in residential quality of life and peaceful enjoyment both for myself and numerous neighbors. This can directly be attributed to the reckless disregard displayed by the BLM's Implementation of off - road recreation routes throughout our community coupled with a demonstrated inability to manage the adverse affects of the off road recreation being promoted and abetted by these routes.
1271	Three of the WEMO routes in my community cross Shadow Mountain Road. As a resident of the Shadow Mountain Road area I observe the previously described violations by non - street legal ORVs on a daily basis, and even more frequently during off road holiday riding periods. Given current management and enforcement practices, the WEMO routes crossing through the Shadow Mountain Road neighborhood of Wonder Valley constitute an attractive nuisance.
1282	Off-Road Vehicle routes have no place in this environment. They add noise and dust to a dust control area already out of compliance. They encourage trespass onto state and private parcels. Users of these routes often ride at excessive speed and nearly all of these routes cross or are crossed by multiple public roads with no signage. Current routes actually cross private parcels with no compensation to the landowners. Some routes border on wilderness areas encouraging ingress to these areas.
1282	The multiple and poorly marked routes in the adjacent Dale Mining district, combined with no BLM enforcement in this area, have resulted in large areas of the district looking far more like an off-road vehicle use area than it does a historic mining district. This heavy use in the mining district results in ORV activity overflow spilling into the lower basin generally reducing the quality of life for residents here.
1283	We do not want ORVs riding through our residential area making a lot of noise, stirring up dust and destroying our beautiful desert flora. Not only are they riding on private properties and roads illegally, but they tear up our roads that we pay to have maintained through our tax dollars.
1284	Since significant biodiversity in the Mojave desert resides in washes and ephemeral waterways, and ORY activity has been shown to destroy vegetation and wildlife habitat and disturb desert soils, all routes in washes should be eliminated.
1284	All BLM routes in the Morongo Basin adjacent to private property, wilderness areas and fragile habitat should be permanently closed. In addition, the BLM should erect physical barriers and disguise these routes with vertical mulching to discourage trespass. Routes that have been closed in the area near the Poste Homestead Natural and Historic Area are regularly breached by ORY riders who have demonstrated no respect for the closures. This area is in need of physical barriers to protect fragile dune resources on the west side of the adobe ruins. Chadwick Road may remain open to licensed vehicles but should be closed to all ORYs.
1284	ORY routes should be eliminated on Gammel Road, along the Cleghorn Lakes and Sheephole Mountains Wilderness Areas and routes near the boundary of Joshua Tree National Park.
1284	In addition, all currently designated routes through the Morongo Basin that lead directly to into private property and therefore encourage trespass must be eliminated. Specific routes include: Pipeline Road (AKA UK on WEMO Map #80, Chadwick Road, and Old Stage Route (AKA MP235 on WEMO Map #80). These routes should never have been designated in the first place and are the result of a faulty computer-designed decision tree, a violation of the BLM's own guidelines and FLPMA, as well as the failure ofthe BLM to conduct ground-truthing investigations in these areas. The BLM should endeavor to avoid making the same mistakes that led to the current court order.
1284	In addition, the BLM must install kiosks at the Fort Mojave, Chemehuevi and Colorado River Indian Tribes tribal lands in collaboration with representatives from those tribes. ORVs have been responsible for the destruction of tribal lands and

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	invaluable sacred sites on all three of these reservations.
1285	I live in the Wonder Valley and don't believe that off-road vehicles belong in our residential areas.
1288	Motorcycle trail plan being initiated in the Oak Springs, Grapevine area on USFS lands i. This may affect route network on BLM between Coxe truck trail and Grapevine Canyon roads in T3N, R2W, Sections 9-10 and 11. Issues with Balanced Rock mining claimant (active claim).
1288	Considerations for BLM TMA3 route network: Poor planning and coordination could lead to additional trespass issues on BLM. Also an opportunity because a well maintained network could help alleviate some of the pressure in the Deep Creek and JF ACEC and redirect motorcycle use further south and east on USFS lands.
1288	Specific route issues: i. 3384 and 3382, South of Castro's place and Deep Creek provide connection to an unauthorized network; ii. 3355M: via unauthorized connector to 3N59A in T3N, R2W, Sec 9; iii. 3359M, just w. of 4N16 (Grapevine Canyon Rd) in T3N, R2W, Secs 11-12; iv. 3215M, a bit further east in T3N, R2W, Sec 12; v. Warm Springs Road, T3N, R3W, Secs 13-14; vi. RC3203: Close or limit access route depending on status of mining claim (active or inactive) in T3N, R2E, Sec 21. Check with Scott Aliason; vii. RC2217, T1N, R3E, Sec 22 to unauth. Shortcut route directly south in Sec 27 (official access is Sec 22 to 23 to 26 to 27).
1291	Because of the many existing roads, questionable boundaries and general porosity of the area [Viscera Springs], the fences and rock barricades have created a dangerous situation. Two weeks ago I was driving on an open road and ended up trapped behind the fences and barricades. If I had not known the area well, it could have been possible that I would not have been able to find my way back out. [attached map]
1291	I am questioning the legitimacy of the closures occurring on the National Forest land. I am not questioning the legitimacy of the Bighorn Mountain Wilderness Area located on BIM land. During passage and implementation of the California Desert Protection Act in 1994, I paid close attention to the process, and to the best of my knowledge only the portion of this Wilderness Area located on BIM land was discussed or included on the maps. I have been in contact with both BIM and Forestry regarding this issue. Both agencies have stated that the Bighorn Mountain Wilderness Area was designated as part of the California Desert Protection Act of 1994. I have received maps from both agencies and some are in conflict. Map 23 (Attachment 1) from the California Desert Protection Act of 1994 does not show the Viscera Springs area currently being closed is included in the Bighorn Mountain Wilderness Area. I have requested a legal map from the Forestry Service showing that the area around Viscera Springs was included in the Bighorn Mountain Wilderness as part of the Desert Protection Act of 1994. So far they have not been able to produce it. All the Forestry Service has been able to provide is a topographical map (Attachment 2) with no land marks or other identifiable locators on it. One thing that this map does show is that the area is flat, open and has many established roads that make it literally impossible to successfully close and enforce without putting a fence around the whole area.
1293	My husband and I drove through Joshua Tree National Park and out to Highway 62 on Old Dale Road over the weekend. A few miles from the north end of the road, we were surprised to see a huge encampment of off-roaders. We had been out there three weeks earlier, and never saw another vehicle. Do you know if this was some sort of permitted event? They had erected markers with the letters "FCM" along Gold Crown Road from Highway 62 to the encampment area. For miles, all the washes, trails and roads -- and a few places that were not washes or trails -- were hashed up with tire tracks. Little roads that a few weeks ago were 20 feet wide are now 40 feet wide and deeply churned. I was shocked at the extent of the change in the area. Based on our visit a few weeks ago, this is not a territory that had been heavily used by off-roaders. If this was a BLM-sanctioned event, I think the bureau should take a look at the damage that was done before allowing the group to hold another event on BLM land. If it was not a sanctioned event, then I would guess it should be a law-enforcement matter. Or perhaps that area is designated for ORV recreation? The area I'm talking about is about 12 miles east of Twenynine Palms, then south off Gold Crown Road, which connects with Old Dale Road. The encampment was in the Pinto Mountains about 6 or 7 miles south of Highway 62 and several miles northwest of the

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	national park boundary.
1294	Was wondering specifically which roads will be the topics at the Barstow meeting any are being considered for closure? I am an equestrian, and mainly ride on trails, but also on occasion need to ride roads to get to where I'm going, so there's some concern about possible closures. We're south of the Bighorn range, and east of Big Bear in the high desert.
Travel Management Area 4	
1004	I support the Jawbone store Plan to have trails for ATV and motorcycles maintained and expanded. Please give consideration to these off road vehicles and needed trail system.
1008	We also support the Jawbone Canyon Store Trail System
1018	Jawbone Canyon Store Trail System will help with a quality riding experience for above average riders
1032	I urge you to re-open these green sticker off-road routes to the mountains to once again restore the lost luster and relieve the punishment to our much needed everyday street vehicles, and to allow the traditional, adventurous, and challenging passageways we have long enjoyed on our way into the mountains from Jawbone Canyon.
1040	we Foxes wish to express our support for the Jawbone Canyon Store and their very rider friendly Trail System.
1049	Opening existing, but currently closed, trails in the Jawbone/Butterbredt/Dove Springs areas area and designating them as "Motorcycle Only" would provide a place for those who ride motorcycles without the concern of encountering large 4-wheel vehicles.
1050	Reopen the St. John's Ridge trail. Currently the only legal off-road route into the Piutes from Kelso Valley is by using the Bright Star Wilderness corridor trail. Reopening the St. John's Ridge trail would provide a method creating a loop. Additional trails would need to be available to access the St. John's Ridge trailhead off of Kelso Valley Road from SC123.
1058	BLM should consider permanent closures around sensitive raptor habitat in the Jawbone-Butterbredt ACEC, especially around Robber's Roost. The current, temporary closures do not appear to deter people from visiting the area during the nesting season. Permanent closure of routes in the vicinity may prove more effective at protecting this habitat. BLM should also reevaluate routes in the Jawbone-Butterbredt ACEC for proximity to tortoise burrows. Several have been spotted, especially in the northern portion of the ACEC.
1061	Scott Spencer asked me to email the attached FINAL draft of the Jawbone Canyon Store Trail System Proposal Introduction pages dated April 6, 2012 to replace the previous introduction pages you received. This final version has been updated to emphasize crucial points of interest and applicable substantive comments about the proposal as well as the request to include this final draft of the document in the public record. Please note the addition of organizations signed-on in support of this proposal including Stewards of the Sequoia (Chris Horgan – Executive Director) and the Bakersfield Trailblazers (Richard Gauthier - President). The second attachment in this email contains the downloadable GPS tracks (Garmin Data Base) displayed in the proposal and specifically requested by Mr. Beck in a separate email. This email will be followed by the mailing of an additional complete paper copy of the proposal FINAL draft and two electronic copies (DVDs) that also contain the downloadable GPS tracks.
1065	This comment is with regard to the ongoing illegal ingress by motorcycles into the Burring Moscow Spring drainage. At present, OHVs converge into this sensitive area from Kelso Valley Road via at least three places and a fourth from Puite Mtn road near tunnel Spring. Restrictive signs and barriers are regularly destroyed and overrun to gain ingress. In my view legitimizing these trails into the Puite Mtns. is not the solution since usage would increase 10-fold and certainly bring a new illegal incursions. The Puite Mountains are a delicate and fragile ecosystem which over the past 10 years have suffered at least four major fires...It would be a serious error in judgement if this illegal trail is sanctioned by the Bureau of Land Management for addition to the Western Mojave OHV Trail System.
1077	Yes I support recreation in Jawbone Cyn.! Do not close it. By doing so, you are removing freedom from our country.
1078	I support the Jawbone Canyon Store Trail System as the existing system does not work well with all residents
1099	I am writing you to express my wholehearted support for the addition of single-track and/or small vehicle trails as outlined in the "Jawbone Canyon Store Trail System"
1101	With regard specifically to the Middle Knob Subregion. all the checkerboard BLM parcels in the Tehachapi Mountains must be officially dosed. Native American artifacts and sites have been destroyed by illegal off-road vehicle riders in the general area known as "Bean Canyon". The Southern Tehachapi Mountains have suffered unnecessary and undue degradation as a result of relentless, unchecked dirt bike activity.

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
1101	<p>I enlisted the help of a colleague to help with the map information, and her response is pasted below. Also I attached a detailed map which includes BLM Middle Knob sections; this map should make it simple for you to understand the locations of the illegal OHV trespass, and how these neglected, unpatrolled parcels serve as a gateway to illegal dirt bike joyriding on the Pacific Crest Trail.</p> <p>The BLM parcels are peach colored and CalPortland Cement, which is a large private company, is colored in blue. You can compare this detailed map with BLM's Middle Knob map to view the sections with more clarity. There is not one BLM parcel that has not sustained breathtaking damage by off-road vehicles.</p> <p>An attached photo shows dirt bike damage (whoop-dee-doos) on the PCT in Section 2. Multiply this photo by 100 and you get a mental image of miles of Pacific Crest trail in the Middle Knob region and beyond.</p> <p>When you access the Google Earth map of Bean Canyon, you will be able to zoom into areas to view the Middle Knob area and the also the Pacific Crest Trail.</p>
1101	<p>The dirt bike damage to BLM in the photos you sent are on BLM from where dirt bikers ride up to the PCT just north from that photo....This area of destruction in particular is all in Township 10N, Range 14W, SBBM, and leads up into Township 11N, Range 14W, SBBM. This .kmz doesn't show Section numbers for Bean Canyon, but they are in the following Sections: (they can compare what they were sent and find the same area I've marked on the .kmz file that opens in Google Earth, that area seems to be changing a lot, but the hill-climbs are the same, they are quite obvious:</p> <p>Section 2= BLM with dirt bike destruction to Pacific Crest Trail.</p> <p>Section 4= Most is BLM, CP Cement & a few private property owners.</p> <p>Section 5= Calportland</p> <p>Section 8= BLM with dirt bike damage to resources.</p> <p>Sections 10=BLM with significant dirt bike damage to resources and PCT.</p> <p>Section 29= CalPortland</p> <p>Section 30= majority is BLM, with PCT damage by dirt bikes</p> <p>Section 31= CalPortland</p> <p>Section 32= majority is BLM, with OHV destruction throughout.</p> <p>Section 33= CalPortland</p>
1102	i support the jawbone canyon store trail system.
1104	<p>Map or Subregion Name and Number: Jawbone/Dove Springs/Butterbredt</p> <p>Comment: Existing dirt road/trail systems fail to provide a quality riding experience for small 4-wheel & 2-wheel riders that only single track and narrow track trails can bring. Groomed dirt roads attract large vehicles capable of high speed creating unsafe conditions.</p>
1105	<p>Map or Subregion Name and Number: Butterbredt Area</p> <p>Route #: Trail 28</p> <p>What is the issue/concern/opportunity: The Opening of butterbredt Peak and surrounding/connecting trail system. Trail 28 has an extremely high valued trail traversing the best ridgeline terrain and viewpoints of the entire trail system.</p>
1108	Opening public access to more public lands in the area of Jawbone Canyon. Please allow safer travel of smaller two-wheeled vehicles by opening and reopening access to single track trails in and around the area.
1136	<p>Ever since Jawbone and the Friends of Jawbone started putting up fences, which were paid for out of the green sticker funds, I have stopped going there due to the danger factor of putting all users onto the same "roads".</p> <p>In order to promote a safe and enjoyable outdoor experience for everyone, adding existing narrow trails into the legal system seems like a no brainer. Less traffic, safer and varied experiences will add up to a logically better alternative that what is currently in place.....</p>
1163	On Kelso Valley Road, Piute Mtn. Road, and St. John Ridge, there is a triangle of unauthorized routes.
1166	I support the Jawbone Canyon Store trail plan.
1166	<p>Closure of trails and kid tracks by campsites. Reopening of single trails and use of kid tracks in camp.</p> <p>It would be great to have an all open area like Jawbone & Dove Springs, for the light green area on the Friends of Jawbone OHV map.</p>
1171	We all support the Jawbone Canyon Stone Trail System
1175	<p>Map or Number - Jawbone Canyon</p> <p>I support a trail system that links Jawbone Canyon with Red Rock Dove Springs area so to avoid the Dangerous wide fenced in dirt roads that the area is restricted to now.</p>
1176	Map or Number - Jawbone/Dove Springs

	into the proposed wilderness.
1073	Map or Subregion Name and Number: Cronese Lake Subregion Route#: C4039 What is the Issue/Concern/Opportunity: Parking for the walk to the Soda Mountain's Peak. Enclosed are photos from the peak for dramatic effect!! The WEMO plan shows C4039 closed near the Wilderness Study Area boundary at a point very near and in full view of the freeway. Allowing travel on the closed portion (Approx. 1300ft) would dramatically enhance the walk to the peak because the last portion tucks behind a small hill. Being out of view will create a better and much safer experience for hikers. Also, the entire mouth of the wash is already disturbed from roads and there are many mining trenches.
1148	Map: Black Mtn Detail Route #: BM 7154 Keep open - Unique 4 wheel drive loop
1255	This correspondence is to request retaining OPEN status in paleontological areas of areas managed by the Bureau of Land Management in the Western Mojave Planning Area (WMOA). Coolgardie Subregion: This includes the Mud Hills which have been a prime paleontological and geological resource for over 100 years, and continue to be important relative to the ongoing chronological data available (paleontological fossils, volcanic ashes, and paleomagnetic measurements).
1256	Wash should continue to route BM6370. Route BM 6362 should continue to route BM6383. No names on Routes like Bird Springs Wash or Hamburger Mill. These routes provide a loop that connects, other open routes. [Attached map; Black Mountain]
1264	Map or Subregion Name and Number: Cronese Lake Subregion Route#'s: CR 8304, CR8315, CR8323, CR 8331, CR 8335, CR 8337, CR 8339, CR 8334, .PR 8345, CR 835L,CR 88()~CR-8819;eR 883tr,CR1383r,--eR-8847tCR 884a What is the Issue/Concern/Opportunity? The Palos Verdes Gem & Mineral Society is a non-profit california corporation who~ primary objective is the promotion of the study of gems, minerals, and fossils. We are a member of the california and American Federations of Gem and Mineral Societies. We enjoy exploring, photographing, and sometimes camping in the Mojave De~rt. Many of our members are Senior Citizens who enjoy the outdoors, but are not able to walk great dls~nces. Therefore, for many of us to experience the natural beauty of the Mojave De~rt, it is necessary to have 4WD access to certain areas. The Routes shown above are of Immediate concern to us. We have enjoyed 4WD trips to the~ areas in the past, and we hope that they can remain open.
1267	We are still waiting for more information about the status of route BM6362, but would like to the take the opportunity to officially submit a request that this route be closed during the route designation process if it is currently open. If the route is open, it wi ll lead riders to trespass through a large parcel of private property specifically acquired and managed to provide habitat for multiple sensitive species. If the route is closed, we request that any signs along the route clearly indicate that it is closed.
1268	Map Name and Number - Thomas Guide GPS Map 349 Route# - Coolgarde Rd. Grid Location - Point of Interest - Comment Type - Site specific I use Copper City Rd. to Coolgarde Rd. to get my claim Red Dog.
1289	Specifically, we are aware of areas on Coolgardie Mesa and north of the Minneola Road Exit from Interstate 15 where unauthorized off-road vehicle use is degrading habitat.
1292	Here in the Tehachapi Mountains of Kern County, there has been a tremendous amount of effo rt expended to protect private property, businesses, and our nat ional heritage, the Pacific Crest Trail, from ongoing destruction by illegal off-road vehicles.Ground truthing expeditions of this area in question, along with perusal of maps, show that the checkerboard BLM parcels which are currently being savaged by rogue riders are within WEMO boundaries. There has been no protection of these parcels by BLM law enforcement personnel for a number of reasons, one of which

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	is largely due to the paucity of enforcement officers available. This is unfortunate, because these lands are a draw for illegal riders who joy ride on the Pacific Crest T rail and trespass onto private posted properties.
Travel Management Area 6	
1002	In 2010, numerous presumably unauthorized routes were noted on public lands encompassing Point of Rocks, specifically adjacent to the historic Mojave Trail. Significant erosion, vegetation and scenic value impacts were noted. In the adjacent Mojave Fishhook Cactus ACEC, not a single interpretive or open route sign, or fencing were detected. Extensive, recent unauthorized vehicle travel was noted throughout the ACEC.
1002	The BLM sensitive Barstow woolly sunflower (<i>Eriophyllum mohavense</i>) is also potentially at risk from vehicle use/parking and vehicle-based camping in the Fremont Subregion.
1002	A similar situation of uncontrolled vehicle use also occurs on MUC U public lands along the Bryman Bluffs south of Helendale, overlooking the Mojave River and abutting the southern edge of the Kramer Subregion. Both the threatened desert tortoise and Mohave ground squirrel are known to occur on these lands, which are highly visible from National Trails Highway. In 2010, numerous routes and vehicle play activities were noted on these public lands, along with extensive erosion, vegetation and scenic resource impacts.
1096	My main interest is in the Edwards Bowl region. My feeling is that if riders could not legally stage their vehicles at the Edwards Bowl, it would contribute to the preservation of the desert's natural values including habitat for the Desert Tortoise and Mojave Ground Squirrel, in addition to protecting the rights of neighboring residents to live free of the nuisance of offroad recreation behaviors.
1096	At one point I had a conversation with Barstow Field Office Chief Roxy Trost in which she suggested that the Edwards Bowl area might be "closed to camping". If the routes mentioned above are indeed left OPEN to OHV use, another way of dealing with the problem of scofflaw riders might be to invoke the "closed to camping" restriction so that riders could not stage there.
1144	My feeling is that if riders could not legally stage their vehicles at the Edwards Bowl, it would contribute to the preservation of the desert's natural values including habitat for the Desert Tortoise and Mojave Ground Squirrel, in addition to protecting the rights of neighboring residents to live free of the nuisance of off-road recreation behaviors... The routes which I refer to above are EM 2050 and EM2090. These are the only access routes into the Edwards Bowl from Buckthorn Canyon Road which is the principal thoroughfare crossing the area. On the WEMO maps made available to me these are shown as closed routes, but they are signed OPEN and riders habitually use these routes to enter and exit the Edwards Bowl area.
1163	El Mirage OHV area was created by joint efforts of two counts, BIM and the OHMVR Division. When the fencing was done, it was with understanding that we would have some gates for connectivity of existing routes outside the fenced areas. This has not been accomplished. Maps of the region need to be looked at and decided upon which designated route can accommodate a gate for the public to have a long distance experience, rather than have to get on El Mirage Road or go on to undesignated routes.
1251	THC manages its properties according to a specific charter and certain conservation easements held by California Department of Fish and Game (CA DFG), we are concerned about routes which may direct vehicle travel and associated activities to our private properties. CA DFG has a vested interest in protecting these properties in perpetuity as they funded the acquisition of the properties we own in the DWMA, as well as restoration and management of these properties we are undertaking now. While we recognize some routes on public lands occurring proximal to our properties may be necessary for our own access, as well as general public land access, we believe that vehicle use on many public land routes which do not end at our property boundaries may be detrimental to our properties.
1256	Fremont Peak and Gravel Hills are a major recreational area and should be set aside for that purpose...
1256	A-Unnumbered route - bypasses Barstow Woolly Sunflower area from Kramer Junction to Harper Peak, B-Connect FP5324 to FP5261, C-Jeep Road, Cleaner route north to FP5261, D-Completes route from Harper Peak to Haburger Hill, E-Good reason why you need red closed signs. [Attached map; West Mojave]

1256	Map or name - Iron Mountain Route#: IM6436, 64378, 6445 These routes used on dual sports events should be motorcycles only. To keep routes open for motorcycle dual sport events route has previously been used for sanctioned dual sport events. [Iron Mtn. map attached]
1256	Map or name - Kramer Hills Map 1 Show these routes as "open" when they are actually motorcycle only. [attached map]
1256	Map or name - Kramer Hills Map 2 Show these routes as "open" when they are actually motorcycle only. [attached map]
Travel Management Area 7	
1001	South of Inyokern El Paso Mountains CN946377-79 - EP26 - Searchers request these remain open for access to rockhounding
1001	Castle Butte No C number - routes going through the section directly south of Castle Bune T32S R38E MDM, Section 34, and directly east, sec 26 are not designated but would be necessary to be open in order to access the Bune, which is in a private section in a checkerboard area.
1001	Last Chance Canyon CN9465 15,946519,947546,947547,947548,947551-3, 947555-7, 947618, 947620, 948436, 948437, 955732, 947622-4,954932,955733-4 - part of which is EP 15 - Searchers request routes remain open for access to rockhounding areas
1003	My concern is that the northwest section of EP499 is not only in an ACEC, but it is on top of a mesa with very high aesthetic values, very valuable resources and virtually no way of monitoring off route travel. I hike this area regularly and am disturbed by the proliferation of tire tracks off route. Additionally, at the eastern end of the mesa, where the route descends to the south towards EP30, the route is virtually non-existent, as there are no readily identifiable marks on the ground. I made this comment because I wish the WEMO subgroup and the BLM to consider closing the section of EP499 above EP101, as well as closing the eastern-most section of EP468 that goes up to the mesa
1005	The Spangler area should be expanded to include 'C' routes. There have been many losses to OHV opportunities around the state, including Christmas Canyon, Clear Creek, and the possibility of a diminishing of opportunities in Johnson Valley. To relieve the pressure and meet the need of the recreating public, the expansion of the Spangler OHV Area is sorely needed.
1005	Certain regions of the CDCA, but specifically the El Paso region should be designated as a "Special Management OHV Area" and all trails managed as open to travel.
1005	There are two routes in the Rand mountains, R5 and R50 that had been closed due to compliance issues. Since those issues have now been fixed by extensive fencing, those routes should be reopened, and an educational process through signing, mapping and the release of information to the public needs to be adopted.
1016	Roads R5 and R50 which have been fenced to prevent inadvertent trespass in the Rands (the tortoise area) need to be designated open to vehicle travel. There is no longer any reason for them to remain closed.
1021	C routes area should be included to expand the Spangler area due to loss of Christmas canyon, and losses of Clear creek, JV and other possible losses due to wilderness re-designation
1021	R5 and R50 in the Rands should be re opened, they were closed due to compliance issues, those were fixed via fencing, there is no reason they should be closed, they are major connecting routes between Cal City, Randsburg, Spanglers and El Pasos, Those closures are putting too much traffic and pressure on routes such as R43
1027	The Spangler area should be expanded to include "C" routes. There have been many losses to OHV opportunities around the state, including Christmas Canyon, Clear Creek, and the possibility of a diminishing of opportunities in Johnson Valley. To relieve the pressure and meet the need of the recreating public, the expansion of the Spangler OHV Area is sorely needed.
1027	There are two routes in the Rand mountains, R5 and R50 that had been closed due to compliance issues. Since those issues have now been fixed by extensive fencing, those routes should be reopened, and an educational process through signing, mapping and the release of information to the public needs to be adopted.
1027	Certain regions of the CDCA, but specifically the El Paso region should be designated as a "Special

	Management OHV Area" and all trails managed as open to travel.
1038	Upper Bonanza Gulch is where Hatfield the Rainmaker set up his camp. Many other historical sites are in Bonanza Gulch, (CB Jones' dug out shelter and CB Jones' shaft) along the road following the small tributary stream on the El Nino mining claim. This the same road which traverses the mesa from Mesa Springs to Bonanza Gulch and is used by equestrian endurance racers. This road is also necessary for me to access the far North east end of my claim.
1043	i am particularly interested in the roads which leda from EP0222 west ttword the mountain. These roads dead end at the foot of the mountain and are used for target practice with high power rifles. People used to set out chairs and tablesto shoot from. It was not practle to carry all this stuff in from from EP0222 to the shooting area. Now people will shoot from EP0222 which is not as safe.
1051	I hope these routes will remain open for the following reasons: The Joshua trees in the Coso range along the Cactus Flat Rd and routes SE 858, SE 756, etc. and down towards Haiwee Reservoir are abundant and wonderful to drive and hike through. The vista of the lake and alkaline hillsides we think are unique. Also the Cactus Flat area is usually quiet and expansive with few visitors making it a special area to experience by vehicle.
1051	EP101. This route today runs all the way up the hillside and back down on the eastern side to connect with EP 30. The WEMO map does not continue the route on the eastern side and we think it should as this is the easier way to take this route, from the east. The EP101 route passes near the spring, close enough for us to maintain the small cistern and plumbing with overflow for native animals which Walt put in years ago. The archeological site nearby consists of mutates and grinding areas off the current roadway by several hundred feet. EP 499 passes through Bonanza Gulch alongside several public cabins which are good shelters from the elements for overnight campers. The route today goes alongside the eastern side of Bonanza Gulch and up over the mesa, dropping down into EP30. This is a nice loop road which we've taken many times, with the views southwestward extending to Tehachapi. EP 15, EP 30, EP 100, EP 26, and the hill-climb routes such as EP 136, 195 and EP 194 are great for vistas. Goler narrows EP 146, Benson Gulch and Iron Canyon are great areas to 4wd. Hopefully most of the routes shown in blue for the El Pasos can be kept open
1058	BLM should keep the former West Rands ACEC closed to motorized used. This area is recovering from years of OHV abuse and should be allowed to continue to recover since it is critical tortoise habitat. Outside of the West Rands ACEC, the route network should stay the same or have fewer routes through areas that are suitable tortoise habitat. Especially in the West Rands ACEC, some of the routes have active tortoise burrows within 20 feet of them. Routes such as these should be reevaluated by qualified biologists as to their suitability for motorized recreation.
1067	My wife, Romelle, and I have been horseback riding in the El Paso sub region for the past 30 years. Many of these rides are group rides that have up to 12 other equestrians. Access is needed for vehicles to transport the horses, feed and water as well as places to camp.
1079	I am part owner along with about three other people on a gold claim in Bonanza Gulch. Our main access road is EP 15. I do not think this road or any other main access roads should be closed.
1080	please do not close EP 15, our main access road, not only do we prospect for gold but we also go to have fun and enjoy each others company. I have many fond memories of the times we have had there and would be terrible not to be able to go back anymore.
1089	El Paso region should be designated as "Special management" all existing trails, including single track should be managed as Open weather signed open or not.
1089	C routes area should be included to expand the Spangler area due to loss of Christmas canyon, and losses of Clear creak, JV and other possible losses due to wilderness re-designation.
1089	The Spangler open area should be expanded East of HWY 395, Down to RM1444 and the boundary area of Golden valley wilderness
1089	R5 and R50 in the Rands should be re opened, they were closed due to compliance issues, those were fixed via fencing, there is no reason they should be closed, they are major connecting routes between Cal City, Randsburg, Spanglers and El Pasos, Those closures are putting too much traffic and pressure on routes such as R43
1125	Map: El Paso Detail Map zone 34 and 35 Route #: EP0222 Grid Location: 35/34 Point of Interest: Hillside, 4 roads to old SP RR road bed Lack of accomodation for elderly shooters and hunters under the Americans with Disabilities Act by closing or blocking the (4) roads to this 60+ year well established shooting area
1128	Maps: Rands Detail Map 1

Table C-2. Scoping Comments by Comment Category

	Allow a manageable single track trail system on the west side of the Rands that reduces illegal single track.
1128	Currently the trails that are numbered go up a canyon and get so steep that riders have to turn around. There is a need for mid slope trail that is above the 44 trail but below the 30 trail and runs mid slope parallel to the Rand Mountains
1129	Map: El Paso Detail Map zone 34 and 35 Route #: EP0222 Grid Location: 35/34 Point of Interest: Hillside, 4 roads to old SP RR road bed The Hillside supporting the SP Railroad track bed is an established target shooting and bird hunting area. Blocking the 4 roads leading to the hillside from EP0222 eliminating access to this area for shooters and hunters.
1129	Map: El Paso Detail Map zone 34 and 35 Route #: EP0222 Grid Location: 35/34 Point of Interest: Hillside, 4 roads to old SP RR road bed Many of the shooters are elderly, and carrying equipment to the sites against the hillside would be impossible and would be a hardship for seniors or anyone else. Closing the above mentioned existing access roads is a violation of the americans with disabilities act
1130	Map: Section 27, T 29S, R40E Mnt. Diablo Route #: R66 Grid Location: H-12 Closure of R-66 between R-110 and Goler Rd. R-66 goes through the middle of our current mining claims of which SBM has commercial placer mining operations. R-66 open is dangerous to OHVs, riders, offroaders, and SBM personnel. See attached maps. One quarter mile NE of R-66 is R-44. Riders/OHVs can traverse from R-110 to Goler Rd. via R-44. After closure of R-66 to the public, SBM will maintain and continue to use R-66 as we currently do.
1131	Map: El Paso Detail Map zone 34 and 35 Route #: EP0222 Grid Location: 35/34 Point of Interest: Hillside, 4 roads to old SP RR road bed The mountainside supporting the SP Railroad track bed is an established target shooting and bird hunting area. Block the 4 roads leading to the hillside from EP0222 eliminated access to this area for shooters and hunters...Road EP 0222 (and EP82) should lead to 4 existing roads that allow motorized vehicle access to the above mentioned hillside so that shooters can unload equipment such as benchrests, coolers, chairs and target sun shades, clay pigeon...Block access to motor vehicles means that shooters must walk a distance of as much as a half mile to participate in this activity. Many of the shooters are elderly, and carrying equipment to the sites against the hillside would be impossible and would be a hardship for seniors or anyone else.
1133	El Paso Subregion. All of us use these roads to access the desert for taking pictures of wildlife, plants, as well as views of the desret. We go looking for rocks and minerals and use these roads to visit historical places too. Like Bickle Camp and the depression minning area. The Burro Schmidt Tunnel and more! These roads: EP45,15, & 40; Last Chance Canyon Road EP41, 45, 15, & 40; and Bonanza Gulch Road EP41, 45, & 30 are just 3 roads use often by many of us. PLEASE keep these roads in working order.
1145	Subregion: El Paso Point of Interest: Star Party Site Need access to site that has hosted public star parties since 1979. See attached Map.
1152	Route #: EP429, EP05, EP144, EP4 Grid Location: 14, 15, 22 I would like to keep these areas open because of family memories of the last 50 years
1157	There is an existing motorcycle trail going over Red Mt. connecting RM 108 to L ' RM 189. This trail was used by several motorcycle Enduros in the 70's. Due to the total lack of single track trails, this existing route should be designated Open to motorcycles. 2) There is an existing motorcycle trail that connects RM 104 to RM 1555. Due to the total lack of single track trails, this existing route should be designated Open

Table C-2. Scoping Comments by Comment Category

1001	Lavic PC7618, 7621, 7615 - Searchers request these routes remain open to the 29 Palms Reserve fence.
1001	Hector CNIIII006 off the National Trail (Rt. 66) - Searchers request that this road become a designated open route for access to rockhounding areas. CNIIII121-2, 1111125-26, 1111134-36, 1111142-44, 1111146-Hector Hills-Searchers request these roads become designated open routes for access to the rockhounding along the pipelines. Some of this covers private lands, so signing would be needed to inform people of leaving BLM lands.
1001	Talc Mine West of Hector CN115013, 1164527, 1165334, 1173621, 1174568, 1174599, 1174602, 1174606, 1174621, 1174622, 1174689, 1174690-4,1174696-702,1174704-10,1174715-18, 1174721, 1174723-40, 1174742-47, 1174750, 1174763, 1174765-6, 1174769, 1174773-4, 1174776-79, 1174781-6, 1174788-9 - rockhounding area is threaded by these routes, some of which are designated open and some of which are not designated. The area is half owned by BLM (east) and half by private (west) with a line State land on the north. Searchers request that those routes that are not designated be so designated as open, and those already so designated to remain open. Signs will be needed to inform public when leaving BLM land.
1001	Granite Mountains Garnets CN 1127667 - comes up from Hwy 247 onto BLM land - requested to be designated open for access to rockhounding.
1012	While BLM is dealing with roads again – this is a good time to get Camprock Rd. designated under RS 2477.
1057	BLM should establish a route that connects the Stoddard Valley Open Area with the remaining open areas of Johnson Valley. This will allow "hare and hound" motorcycle races to continue in this part of the WEMO.
1134	Again, speed, removing B to V, and Stoddard to Johnson Valley Corridors route is again putting a complete bias against OHV, yet you will allow hunting, and dogs. How do they get in there?
1149	Subregion: Ord/Red Mtn/Newberry Ord Region starting to look like "open area" - washes trashed up - old camouflaged roads back in use - Need weekend ranger patrols - Paid for by mitigation/compensation from solar and wind projects etc. use Ord Rt. planning grant for monitoring and patrols. This is a DWMA/ACEC - not "open area"
1149	Obtain easements from private property owners through which a BLM "open" route traverses - Plus indemnification for routing OHVs onto private land.
1150	Point of Interest: Johnson Valley More and more of land owned by the people of the U.S. is being taken away...At Lone Wolf Colony we have the opportunity to see literally hundreds of families come through our facility getting water and then on the return trip come through to empty their waste tanks.
1259	We paid taxes, green sticker fees to ride up on the desert. Now, the Marines want to expand into Johnson Valley OHV

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	Area. Please keep the Marines from expanding into Johnson Valley... I go sometimes with the "RIMBENDERS" motor cycle club up Stoddard road. They are a family club and don't destroy the land up there. We the people need that land and treat it with respect. Keep that land open for us.
1268	Map Name and Number - Thomas Guide GPS Map 369 Route# - Hwy 247 to 8 Grid Location - Point of Interest - Comment Type - Site specific I use pipeline road SV183 off of 247 to 8 to access my claims that I do placer mining on.
Out of Scope	
1010	For these reasons, we respectfully request an additional scoping period of thirty (30) days beyond the 17th. of October 2011 be added to this process.
1012	BLM needs to recognize the liability of a BLM-designated road traversing private property - indemnifying said owners for any liability linked to such authorized public use.
1014	As i mentioned on the phone this morning, there is a new sign attached to the BLM Kiosk at the junction of Hiway 395 and RM30. The sign states that the area is open to cross country travel. Can you please bring this to the attention of the appropriate person.
1015	The BLM should extend the comment period to a total of 120 days.
1016	The single most important action the BLM could take today, to make this process better, is to fill the position of the Ridgecrest Field Office with a permanent manager and now that Roxie Trost is leaving, the Barstow Field Office manager position too. And finally, appoint someone who has knowledge of the CDPA and FLPMA to be in charge.
1016	BLM cannot possibly complete everything required by the court, by the date agreed to. BLM knows the process took over 15 years and it wasn't yet complete. The Society believes that BLM has boxed itself into a corner and will have to do another down and dirty designation of routes which will again be in court. The Society is concerned that some of those who brought the legal action which resulted in this exercise attended the "scoping/open houses in order to set up a future legal action. Each person and organization who/which brought the legal action which resulted in this exercise, participated in the 4 years of planning for the WEMO amendment. The Fish and Wildlife Service approved the WEMO and route designation was part of that amendment.
1016	We are concerned that shortly there will only be Mr. Stein and Dr. LePre who possess any historical knowledge of what has taken place in the CDCA and during the 4 years of the WEMO amendment plan. This failure on the part of BLM to retain the people who have this knowledge has resulted in more legal actions by people and organizations who/which rely on this absence to win their points. The Society believes the BLM documentation exists, but the people with historic knowledge are gone.
1017	The BLM should complete a new Federal Register notice and extend the scoping comment period to a total of 120 days.
1022	In addition to the economic impacts on the local and regional communities, the Proposed Action must analyze and disclose the cost of the proposed action, including the ongoing, perpetual costs of the proposed renewable energy projects.
1024	The comment period is too brief for the public to have an adequate response. The time needs to be extended.
1028	Additionally we request that an adequate number of agency staff be licensed and safety trained to operate OHVs, have an adequate number of OHVs for their use and spend an adequate amount of time riding OHVs along with OHV recreationists so that they can adequately understand the needs associated with motorized access and motorized recreationists.
1046	4) Target Shooting needs to be managed: The Juniper Sub Region is a "shotgun" only area, but there is an increase in target shooting with weapons other than shot-gun, in inappropriate areas and shooting at inappropriate targets. Target shooting desert-wide is becoming more of a threat to other users. Target shooting areas are often in places where people access the hilly terrain for hiking or horseback riding (a box canyon). Target shooting also occurs regularly in Riparian areas. Areas often used for target shooting become dumping

Document Number	Comment Text
	grounds for all types of trash including couches, refrigerators televisions etc.
1071	Unlicensed kids on ORV's are not a problem on the combined use highways/roads, as long as they have had training and are supervised by a proper adult. (This also should be specified in the WEMO plan, and in local signage)
1081	The WEMO Vehicle Management Plan affects public lands two BLM Field Offices: the Barstow Office and the Ridgecrest Office. BLM is actively seeking the public's participation in the route designation plan amendment process without a permanent Field Office Manager in either of the BLM administrative offices. The public, and elected officials are relying on BLM management and staff to provide guidance and direction regarding this important CDCA plan amendment.
1087	As such, a request of 120 days extension is asked for.
1100	BLM has confused the public as to the correct date on which the scoping comment period ends. The notice in the Federal Register states the end date as October 13, 2011. At the public meeting in Ridgecrest it was announced that the ending date was October 17, 2011. The BLM should complete a new Federal Register notice and extend the scoping comment period to a total of 120 days.
1100	BLM has to accept that the implementation of whatever plan emerges, has to be shared by and with public partners. BLM has neither the money nor the manpower to implement whatever is finally accepted by the court.
1124	Landowners paying for maintenance and green stickers using illegally, All routes should be street legal. Owner signing and ___ all green stickers in green sticker areas parking staging identified
1126	extend the April 15th date
1127	In addition to the previously stated, general land management concern, I would also like to specifically address the issue of unmarked abandoned mines. If possible, I would like the BLM to increase public awareness of abandoned mines and any potential hazards that they may present.
1134	No financial plans have been made to understand how this is all going to be paid for. Does the BLM plan on taxing all the Cities and Counties to implement this plan?
1142	I request a 2 month extension.
1151	Offering services of SNEL(biological Consulting Service) to do surveys / inventories of sensitive species in areas of Route designation
1159	We should not create defacto wilderness areas
1164	How do we get an extension of the 10/13 comment period. With all these reference you are giving how on earth can we possibly get to the bottom and give you good comments? I think we should extend the time what do I have to do, Make formal request to who?
1263	As a member of the Palo Verdes Gem and Mineral Society, I am concerned about the proposal made by senator Feinstein to deny access to 1,000,000 plus acres of the Mojave Desert (act of 2011).
1266	As a member of the Palos Verdes Gem and Mineral Society I am concerned ...about the proposal made by Senator Feinstein to deny access to 1,000,000 plus acres of the beautiful Mojave Desert.
1272	I don't see how closure enforcement could be convened under current and future budget cuts.
1287	BLM must recognize that the implementation of whatever plan emerges will require the involvement of public partners such as rockhounds and other recreational users. BLM has neither the money nor the manpower to successfully implement whatever is finally accepted by the court without such participation.
1291	I am also challenging the validity of inclusion of the Viscera Springs area in a Wilderness Area as defined by the Wilderness Act of 1964 (Attachment 3) and the Desert Protection Act of 1994 (Attachment 4). This area does not meet the requirements for designation as a "Wilderness Area". The Wilderness Act of 1964 states that the area shall be "Untrammeled By Man. It is also stated in the Desert Protection Act of 1994 that the areas shall be "Essentially Unaltered By Mans Activities". The area around Viscera Springs does not come close to meeting those definitions, and the area has many established roads, cabins, mines, manmade water sources and so on.
1296	Wildlife: Several years ago CDFG and volunteers reintroduced 110 Bighorn Sheep into the Whipple Mountains. BLM has failed to keep its commitment to control burro populations in this Mountain Range. If we are lucky we may have 10 Bighorn left. There needs to be a seriously major burro gather in the Whipple Mountains. The BLM should schedule regular gathers in areas where conflicts exist between burros and Bighorn.
1296	Wildlife: The Society for the Protection and Care of Wildlife's Water for Wildlife Committee does projects on its own and partners with other groups which also do water projects. In the Ridgecrest Field Office there is a MAJOR problem. Quail Unlimited holds the CDFG authorization to maintain all the guzzlers and tanks in the area. They have the letter which makes them the CDFG agent for maintaining, repair and when necessary carrying water to all guzzlers and tanks. The

Table C-2. Scoping Comments by Comment Category

Document Number	Comment Text
	California Desert Protection Act (CDPA) authorizes vehicle access in wilderness to do any or all of those activities and authorizes and appoints the CDFG as the sole arbiter of these activities. (This was one of the coalition's amendments which I helped author and which became part of the CDPA.) The Ridgecrest Wilderness person who seems to hate supplemental water sources is attempting to get around the California Desert Protection Act language by now saying that she has to approve a CDFG proposal which CDFG must prepare and submit to her and which justifies not only the work to be done but the very existence of the guzzler or tank.
1297	Many of the route designations in the wilderness that were protected by the 1994 Desert Act and the Wilderness Act for preserving guzzlers are being actively and willfully closed without legal discussion from the public in the Ridgecrest area. Quail Unlimited holds the CDFG authorization to maintain all the guzzlers and tanks in the area. They have the letter, which makes them the CDFG agent for maintaining the guzzlers.

APPENDIX C ACRONYMS AND GLOSSARY

C.1 List of Acronyms

Acronyms used throughout this document have been compiled and are provided in alphabetical order below in Table C-1.

Table C-1. List of Acronyms

Acronym	Definition
4WD	four-wheel-drive
ACHP	Advisory Council on Historic Preservation
AFB	Air Force Base
ATV	all-terrain vehicle
AUM	animal unit months
AVAQMD	Antelope Valley Portion of LA County Air Quality Management District
ACEC	Area of Critical Environmental Concern
APE	Area of Potential Effects
BMP	Best Management Practices
BA	Biological Assessment
BO	Biological Opinion
BLM	Bureau of Land Management
CBDT	California Backcountry Discovery Trail
CDAWG	California Desert Air Working Group
CDCA	California Desert Conservation Area
CDNCL	California Desert National Conservation Land
CDPA	California Desert Protection Act
CDFW	California Department of Fish and Wildlife
CHP	California Highway Patrol
CHU	Designated Critical Habitat Unit
CNDDB	California Natural Diversity Database
CRHR	California Register of Historical Resources
CO ₂	carbon dioxide
CO	carbon monoxide
CDC	Centers for Disease Control and Prevention
cm	centimeter
CFC	chlorofluorocarbon
CWA	Clean Water Act
CFR	Code of Federal Regulations
CERCLA	Comprehensive Environmental Response, Compensation, and Liability Act
CTTM	Comprehensive Travel and Transportation Management
CAPA	Coordinated/ Collaborative Access Planning Area
CEQ	Council on Environmental Quality

Table C-1. List of Acronyms

Acronym	Definition
the Court	United States District Court for the Northern District of California
CH ₄	methane
DFA	Development Focus Area
DoD	Department of Defense
DOE	Department of Energy
DRECP	California Desert Renewable Energy Conservation Plan
DTNA	Desert Tortoise Natural Area
DT ACEC	Desert Tortoise Area of Critical Environmental Concern
DWMA	Desert Wildlife Management Area
DEIS	Draft Environmental Impact Statement
EKAPCD	East Kern Air Pollution Control District
ESA	Endangered Species Act
EA	Environmental Assessment
EIS	Environmental Impact Statement
EPA	Environmental Protection Agency
ERMA	Extensive Recreation Management Area
FAMS	Facility Asset Management System
FESA	Federal Endangered Species Act
FHWA	Federal Highway Administration
FLPMA	Federal Land Policy and Management Act
GIS	Geographic Information Systems
GPS	global positioning system
GBUAPCD	Great Basin Unified Air Pollution Control District
GBVAB	Great Basin Valley Air Basin
GHG	Greenhouse Gas
GTLF	Ground Transportation Linear Features
HCFC	hydrochlorofluorocarbon
HFC	hydrofluorocarbon
HSG	Hydrologic Soils Group
IM	Instruction Memorandums
I-15	Interstate-15
I-40	Interstate-40
JD	jurisdictional delineation
kV	kilovolt
L _{dn}	day-night average noise
L _{eq}	equivalent continuous sound level
LUP	Land Use Planning
MCAGCC	Marine Corps Air Ground Combat Center
MW	megawatt
MOU	Memorandum of Understanding
MPH	miles per hour
MDAB	Mojave Desert Air Basin

Table C-1. List of Acronyms

Acronym	Definition
MDAQMD	Mojave Desert Air Quality Management District
MFTL	Mojave Fringed-toed lizard
MGS	Mohave ground squirrel
MVA	Motorized vehicle access
MUC	Multiple Use Class
NAIP	National Agriculture Imagery Program
NAAQS	National Ambient Air Quality Standards
NEPA	National Environmental Policy Act
NHPA	National Historic Preservation Act
NHD	National Hydrography Dataset
NLCS	National Landscape Conservation System
NPS	National Park Service
NRHP	National Register of Historic Places
NAWS CL	Naval Air Weapons Station China Lake
NO ₂	nitrogen dioxide
NO _x	nitrogen oxide
N ₂ O	nitrous oxide
NGO	non-governmental organizations
NA	Not Applicable
NECO	Northern and Eastern Colorado
NEMO	Northern and Eastern Mojave
NOI	Notice of Intent
OHV	off-highway vehicle
O ₃	Ozone
PDSI	Palmer Drought Severity Index
PA	Plan Amendment
PM	particulate matter
PM _{2.5}	fine particulate matter
PM ₁₀	respirable particulate matter
PFC	perfluorocarbons
PSD	prevention of significant deterioration
PEIS	Programmatic Environmental Impact Statement
PFC	proper functioning condition
P.L.	Public Law
RHT	Rademacher Hills Trail
ROD	Record of Decision
ROV	recreational off-highway vehicle
RWQCB	Regional Water Quality Control Board
RCRA	Resource Conservation and Recovery Act
RMP	Resource Management Plan
ROW	right-of-way grant
SBNF	San Bernardino National Forest

Acronym	Definition
SCAQMD	South Coast Air Quality Management District
SCAG	Southern California Association of Governments
SDWA	Safe Drinking Water Act
SEIS	Supplemental Environmental Impact Statement
SRMA	Special Recreation Management Area
SHPO	State Historic Preservation Office
SIP	State Implementation Plan
SO2	sulfur dioxide
SO4	sulfate
SRP	Special Recreation Permit
SUV	sport utility vehicle
SWRCB	State Water Resources Control Board
TMA	Travel Management Area
TTM	Travel and Transportation Management
USACE	United States Army Corps of Engineers
USDA	United States Department of Agriculture
USEPA	United States Environmental Protection Agency
USFWS	United States Fish and Wildlife Service
USFS	United States Forest Service
UPA	Unusual Plant Assemblages
VRI	Visual Resource Inventory
VRM	Visual Resource Management
VOC	volatile organic compounds
WEG	Wind Erodibility Group
WEMO	West Mojave
WEMO Plan	2006 West Mojave Plan Amendment
WMRNP	West Mojave Route Network Project
WSA	Wilderness Study Area

C.2 Glossary

This section provides the definitions of terms used or referred to in this document that cannot be found in a standard dictionary. These terms augment or expand the scope of terms in the 2006 WEMO Plan to address the analysis in this Supplemental EIS.

Adaptive Management: Adaptive management is an integrated method for addressing uncertainty in natural resource management. It also refers to a structured process for learning by doing. Therefore, we are defining adaptive management broadly as a method for examining alternative strategies for meeting measurable goals and objectives, and then, if necessary, adjusting future management actions according to what is learned. An adaptive management strategy may (1) identify the uncertainty and the questions that need to be addressed to resolve the uncertainty; (2) develop alternative strategies and determine which experimental strategies to

implement; (3) integrate a monitoring program that is able to detect the necessary information for strategy evaluation; and (4) incorporate feedback loops that link implementation and monitoring to a decision-making process (which may be similar to a dispute-resolution process) that result in appropriate changes in management. (Adapted from the Final Addendum to the [USFWS] Handbook for Habitat Conservation Planning and Incidental Take Permitting Process.)

Area of Critical Environmental Concern: A BLM land use designation. Areas within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards. The identification of a potential ACEC shall not, of itself, change or prevent change of the management or use of public lands. ACECs can be located within any BLM multiple use class, and include areas that are popular recreational destinations or that are used for scientific investigations.

Assets – Term utilized to describe roads, primitive roads, and trails that comprise the transportation system. Also the general term utilized to describe all BLM constructed “Assets” contained within the Facility Asset Management System (FAMS).

Asset Classification – Identification of the appropriate design and maintenance standards, which are no higher than necessary to accommodate the intended function(s) of routes. Asset classification may also be utilized to identify a desired future outcome to upgrade or downgrade a route, to reflect the route designation, to incorporate additional field information and changing maintenance needs, or to focus or reflect travel use patterns.

Administrative Use: Official use related to management of the public lands and resources by Federal, State, or local government personnel in the performance of their official duties.

Animal Unit Month (AUM): The amount of forage needed to sustain one cow, five sheep, or five goats for a month. A full AUMs fee is charged for each month of grazing by adult animals if the grazing animal (1) is weaned, (2) is 6 months old or older when entering public land, or (3) will become 12 months old during the period of use. For fee purposes, an AUM is the amount of forage used by five weaned or adult sheep or goats or one cow, bull, steer, heifer, horse, or mule. The term AUM is commonly used in three ways: (1) stocking rate as in X acres per AUM, (b) forage allocation as in X AUMs in allotment A, and (3) utilization as in X AUMs consumed from Unit B.

Authorized Use: BLM issues leases, permits, rights-of-ways, and maintenance agreements to authorize certain kinds of development, uses, and/or occupancy of the public lands. Leases and permits are issued for such activities as temporary or permanent commercial facilities (except on mining claims), harvesting native or introduced species, residential occupancy, recreation (e.g., camping, ski resorts), agriculture (crops, apiaries), construction equipment storage, livestock holding or feeding areas not related to a grazing permit, water pipelines and well pumps (for irrigation or other purposes), and advertising displays. Rights-of-way are issued for such things as roads, pipe lines, aqueducts, and power transmission lines.

Biological Opinion: The Federal Endangered Species Act (FESA) requires federal agencies to consult with the FWS to ensure that the actions they authorize, fund, or carry out will not jeopardize listed species (see below, Section 7 definition). Where the USFWS determines the proposed action will jeopardize the species, it must issue a biological opinion offering reasonable

and prudent alternatives identifying measures that, if adopted, could avoid jeopardy to the listed species.

California Desert Conservation Area (CDCA): A region encompassing BLM- administered public lands within the Mojave and Colorado deserts of southern California. Congress designated the California Desert as a Conservation Area in 1976. In making that designation (in the Federal Land Policy and Management Act), Congress made the following findings:

- (1) The California desert contains historical, scenic, archaeological, environmental, biological, cultural, scientific, educational, recreational, and economic resources that are uniquely located adjacent to an area of large population;
- (2) The California desert environment is a total ecosystem that is extremely fragile, easily scarred, and slowly healed;
- (3) The California desert environment and its resources, including certain rare and endangered species of wildlife, plants and fishes, and numerous archaeological and historic sites, are seriously threatened by air pollution, inadequate Federal management authority, and pressures of increased use, particularly recreational use, which are certain to intensify because of the rapidly growing population of southern California [43 USC 1781(a)].

The purpose of the designation was “to provide for the immediate and future protection and administration of the public lands in the California desert within the framework of a program of multiple use and sustained yield, and the maintenance of environmental quality.” (43 USC 1781(b).)

California Desert Conservation Area Plan (CDCA Plan): In 1976, Congress found that:

- (1) The use of all California desert resources can and should be provided for in a multiple use and sustained yield management plan to conserve these resources for future generations, and to provide present and future use and enjoyment, particularly outdoor recreation uses, including the use, where appropriate, of off-road recreational vehicles [43 USC 1781(a)].

Congress directed the Secretary of the Interior to “prepare and implement a comprehensive, long-range plan for management, use, development, and protection of the public lands within the California Desert Conservation Area” (43 USC 1781(d)). The CDCA Plan was completed by the BLM and signed by the Secretary of the Interior in 1980. The CDCA Plan, as amended since its original adoption, serves as the BLM’s general land use plan for public lands in this region, including all public lands located within the western Mojave Desert.

Closed Area – As identified in 43 CFR 8342.1, an area closed to off-highway vehicle use. Public OHV use in these areas is prohibited. Use of off-highway vehicles in closed areas may be allowed for certain reasons; however, such use shall be made only with the approval of the authorized officer.

Closed Route – As identified in the CDCA Plan, a closed route is a route on which access is prohibited by motorized vehicles except: (1) fire, military, emergency or law enforcement vehicles when used for emergency purposes; (2) combat or combat support vehicles when used for national defense purposes; (3) vehicles whose use is expressly authorized by an agency head under a permit, lease, or contract; and (4) vehicles used for official purposes by employees,

agents, or designated representatives of the Federal Government or one of its contractors. Use must be consistent with the multiple use guidelines for that area. This term is being supplanted by “Translinear Disturbance,” a term from the 2005 TTM guidance.

Comprehensive Transportation and Travel Management (CTTM) - The proactive interdisciplinary planning, on-the-ground management, and administration of travel networks (both motorized and non-motorized) to ensure public access, natural resources, and regulatory needs are considered. It consists of inventory, planning, designation, implementation, education, enforcement, monitoring, easement acquisition, mapping and signing, and other measures necessary to provide access to public lands for a wide variety of uses (including uses for recreational, traditional, casual, agricultural, commercial, educational, and other purposes).

Conserve: To allow natural habitat or species populations to remain in place.

Critical Habitat: FESA defines this as the specific areas within the geographical area occupied by a listed species on which are found those physical or biological features (I) essential to the conservation of the species and (II) which may require special management considerations or protection; and specific areas outside the geographical area occupied by a listed species upon a determination by FWS that such areas are essential for the conservation of the species.

Desert Tortoise Area of Critical Environmental Concern (DT ACEC): Administrative area within the recovery unit established under the 2006 WEMO Plan as DWMAAs, and which are managed such that reserve-level protection is afforded to desert tortoise populations while maintaining and protecting other sensitive species and ecosystem functions; DT ACECs are essential to the long-term recovery, viability, and genetic diversity of the species and are implemented to provide for the long-term viability of tortoise populations and the ecosystems upon which they depend. (see Desert Wildlife Management Area).

Designated Roads and Trails: Specific roads and trails identified by the BLM (or other agencies) where some type of motorized vehicle use is appropriate and allowed either seasonally or year-long. (BLM Manual H-1601-1 Land Use Planning Handbook).

Desert Wildlife Management Area (DWMA): Former name of administrative areas now managed as DT ACECs. (see Desert Tortoise Area of Critical Environmental Concern).

Endangered Species: A species that is in danger of extinction throughout all, or a significant portion, of its range.

Goals and Objectives: Goals are the broad guiding principles for the transportation and travel management and grazing program strategies, as well as the biological conservation program of the 2006 WEMO Plan. They are the rationale behind the minimization and mitigation strategies that are developed for these programs. If the operating program is relatively complex, the goals are further divided into manageable, and, where appropriate, measurable objectives. Transportation and travel management objectives may apply planning area wide, by TMA, or to specific aspects of travel management. Grazing program objectives likewise may be program wide, by specific allotment, or to specific aspects of allotment management. Biological objectives are the different components needed to achieve the biological goal such as preserving sufficient habitat, managing the habitat to meet certain criteria, or ensuring the persistence of a specific minimum number of individuals. The biological goals and objectives may be either habitat or species based. (Adapted from the Final Addendum to the USFWS Handbook for Habitat Conservation Planning and Incidental Take Permitting Process.)

Ground Disturbance Cap: Generally, a limitation on ground-disturbing activities in California Desert National Conservation Lands and ACECs. Expressed as a percentage of total BLM-managed California Desert National Conservation Lands and/or ACEC acreage, and cumulatively considers past, present, and future (proposed activity) ground disturbance. Baseline/existing (past plus present) ground disturbance would be determined using the most current imagery and knowledge at the time of an individual activity proposal. Specifically, the ground disturbance caps will be implemented as either a limitation or an objective triggering disturbance mitigation. The ground disturbance cap functions as an objective, triggering a specific disturbance mitigation requirement if the ground disturbance condition of the California Desert National Conservation Lands and/or ACEC is at or above its designated cap. The disturbance mitigation requirement remains in effect until the unit drops below its specified cap, at which time the disturbance cap becomes a limitation. Under the 2006 WEMO Plan, the threshold for tortoise DWMA was 1% of the total surface area of those DWMA, that is, about 15,000 acres. Under DRECP, unit-specific thresholds have been established in all ACECs, DT ACECs, and CDNCLs.

Ground Disturbance Mitigation: A discrete form of compensatory mitigation, unique to the ground disturbance cap implementation, and separate and distinct from other required mitigation in the DRECP LUPA. The disturbance mitigation requirement is triggered when the ground disturbance condition of the California Desert National Conservation Lands and/or ACEC is at or above its designated cap. The disturbance mitigation requirement remains in effect until the California Desert National Conservation Lands and/or ACEC drops below its designated cap.

Ground Transportation Linear Feature (GTLF): A geospatial database of transportation (from motorized to foot) linear features as they exist on the ground. Features include all linear features; not just what is in the BLM Transportation System.

Habitat: The location where a particular taxon of plant or animal lives and its surroundings, both living and non-living; the term includes the presence of a group of particular environmental conditions surrounding an organism including air, water, soil, mineral elements, moisture, temperature, and topography.

Land Disturbance: Clearing, excavating, grading or other manipulation of the terrain.

Land Disturbing Activity: Any activity that results in the clearing, excavating or other manipulation of the terrain.

Land Tenure Adjustment (LTA) Program: Numerous land exchanges have been taking place within the Western Mojave Land Tenure Adjustment Area, pursuant to a joint BLM and Air Force project initiated in the late 1980s. These exchanges, facilitated by Air Force funding, are intended to preclude land uses not compatible with the training/testing mission of Edwards AFB, to encourage private land development in appropriate locations, and to provide for more efficient management of public lands. The acquisition of land through LTA project exchanges does not, in and of itself, create a commitment for long-term management or prevent future development.

Lands with Wilderness Characteristics: Lands that have been inventoried and determined by the BLM to contain wilderness characteristics as defined in Section 2(c) of the Wilderness Act.

Limited Area – As identified in 43 CFR 8342.1, an area where vehicular access is limited to designated trails, and may be otherwise restricted at certain times, in certain areas, and/or to certain vehicular use.

Limited Route – Routes that are available for use, and the specific conditions or specific classes of users to which the route is available. These conditions may be of any type but can generally be accommodated within five categories: (1) to all users on designated trails, (2) to a specific subcategory of motorized users or specified numbers of vehicles, types of vehicles, time or season of vehicle use, (3) to permitted or licensed use or to administrative use only; (4) restricted to non-mechanized use, or (5) restricted to non-motorized use. All users are, at a minimum, restricted to the designated trail, except as identified for stopping, parking, and camping.

Linkage: Region connecting two or more conservation areas. Linkages may act as dispersal corridors for wide-ranging species, provide habitat for pollinators, or serve to maintain genetic continuity between major populations of a species. Some linkages, particularly large drainages, serve to connect several different habitats over an elevational gradient.

Maintain: On-the ground activities that support the use of the network, and to protect natural or cultural resources found near the route.

Maintenance Intensities – Transportation System Assets - BLM Route Maintenance Intensities provide guidance for appropriate “standards of care” to recognized routes within the BLM. Recognized routes by definition include Roads, Primitive Roads, and Trails carried as assets within the Bureau of Land Management Facility Asset Management System (FAMS).

Management Prescription: Discrete component of the West Mojave Plan’s habitat conservation strategy. A prescription could include take-avoidance measures intended to minimize and mitigate the impacts of a new development, as well as a proactive management program to be undertaken by land management agency (for example, to control raven populations).

Mechanized Travel: Moving by means of mechanical devices that are not powered by a motor or engine, such as a bicycle or landsailer.

Minimize Take: Measures that will be implemented on-site to minimize impacts to the desert tortoise and other special-status species (e.g., fencing, biological monitors, reduced speed limit, education programs, etc.).

Mitigate Take: Measures that will be implemented off-site to compensate for impacts to a special-status species (e.g. compensatory land purchase).

Mohave Ground Squirrel Habitat Conservation Area: An area identified to apply special measures to protect habitat and conserve the MGS and other special-status species occurring in that area.

Monitoring: Monitoring provides information necessary to assess plan compliance and project impacts, and to verify progress toward meeting plan goals and objectives. Monitoring also provides data to evaluate the success of the 2006 WEMO Plan operating program and to make appropriate adjustments to the program. Monitoring is divided into two types. Compliance monitoring is verifying that the terms of the Plan are being carried out. Effects and effectiveness monitoring evaluates the effects of the action and determines whether the effectiveness of the Plan strategies are consistent with the assumptions and predictions made when the plan is developed and approved; in other words, whether the 2006 WEMO Plan is achieving the goals and objectives as outlined in that plan and supplemented herein for travel management and grazing. (Adapted from the Final Addendum to the [USFWS] Handbook for Habitat Conservation Planning and Incidental Take Permitting Process).

Motor-Dependent Activities: Activities that require a motor vehicle to either accomplish the activity or reach the activity location.

Motorized Travel: Moving by means of vehicles that are propelled by motors or engines such as cars, trucks, OHVs, motorcycles, and motorhomes. Routes designated as motorized are available for all forms of motorized travel unless otherwise limited as indicated by a sub-designation. If a sub-designation is placed upon the route then that route is limited to that form of motorized travel only, such as a motorcycle only route. Routes designated as motorized are also available for non-motorized and non-mechanized travel.

Motorized Vehicle Access Network: A general term referring, collectively, to routes of travel (roads, ways, trails and washes) on BLM-administered public lands designated by that agency as either open for motor vehicle use, or open in a limited matter (e.g. subject to restrictions based upon vehicle numbers or type, time or season of use, permitted or licensed use, or subject to speed limits).

Multiple Use Class: A BLM land use planning designation. On the basis of uses and resource sensitivity, the BLM's CDCA Plan geographically designated nearly all public lands within the CDCA into four multiple-use classes (MUC). These MUCs were eliminated in the 2016 DRECP.

Non-mechanized Travel: Moving by foot, horseback, other animal-powered travel, and cross-country skiing; travel not aided by mechanical means. Routes designated as non-mechanized are available for all forms of non-mechanized travel unless otherwise limited as indicated by a sub-designation. If a sub-designation is placed upon the route then that route is limited to that form of travel only, such as a hiking only route.

Non-motorized Travel: Moving by foot, stock, or pack animal, or mechanized vehicle such as a bicycle or landsailer. Routes designated as non-motorized are available for all forms of non-motorized travel unless otherwise limited as indicated by a sub-designation. If a sub-designation is placed upon the route then that route is limited to that form of non-motorized travel only, such as a bicycle only route. Routes designated as non-motorized are also available for non-mechanized travel.

Off-Highway Vehicle (off-road vehicle) - Any motorized vehicle capable of, or designated for travel on or immediately over land, water or other natural terrain, excluding: (1) any non-amphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle while being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) vehicles in official use; and (5) any combat or combat support vehicle when used for national defense.

Open Area: An area where all types of OHV vehicle use is permitted at all times, anywhere in the area subject to the operating regulations and vehicle standards set forth in 43 CFR 8341 and 8342, and subject to permission of private land owners, if applicable. The CDCA Plan has designated OHV Open Areas for (1) those lands specifically designated as open for vehicle travel, and (2) certain sand dunes and dry lakebeds. (from CDCA Plan as amended, 1999 reprint, page 76.)

Open Route: As identified in the CDCA Plan, an open route is a route on which access by motorized vehicles is allowed. Special uses with potential for resource damage or significant conflict with other use may require specific authorization. Open routes are no longer being

designated. All routes are Limited to the designated trail and are therefore considered Limited Routes, consistent with the 2005 TTM guidance.

Primitive Road: A linear route managed for use by four-wheel drive or high clearance vehicles. These routes do not normally meet any BLM road design standards.

Primitive Trail - Roadlike feature on public land in wilderness study areas used by vehicles having four or more wheels, which receives no maintenance to guarantee regular and continuous use.

Protect: To take positive action to avoid harm to a covered species or to conserve its habitat in a natural and undisturbed condition.

Reclamation: Taking such reasonable measures as will prevent unnecessary or undue degradation of the Federal lands, including reshaping land disturbed by operations or activities to an appropriate contour and, where necessary, revegetating disturbed areas so as to provide a diverse vegetative cover and/or disguise previous activities/uses.

Recovery Plan: Plans developed by FWS that recommend a program to provide for the conservation and survival of listed species. These plans include site-specific management actions and recommendations to achieve the conservation and survival of the species; objective and measurable criteria for delisting; and time and cost estimates.

Recovery Unit: Distinct population segments of a listed species. The desert tortoise, for example, is listed as threatened by the Service within those portions of its range north and west of the Colorado River. This area is divided into six recovery units. The western Mojave Desert is one of those recovery units. Recovery is judged in the context of each of these units independently.

Rehabilitation: The site will be returned to a stable form, not necessarily to a condition that existed prior to surface disturbing operations. Land use alternatives may be considered in post operation or activity development plans. A second use may include a use not consistent with uses existing prior to disturbances, that do not substantially enhance the area of disturbance.

Restoration: Return the disturbed area as best able to a condition that existed prior to surface disturbing activities. Elements include revegetation or the ability to revegetate with species native to the area, and may include placement of vegetation in the same locations that existed prior to conduct of operations.

Road: A linear route declared a road by the owner, managed for use by low clearance vehicles having four or more wheels, and maintained for regular and continuous use.

Route Designation: The route designation determines the allowable mode of transportation (motorized, non-motorized, non-mechanized) of the route.

Route Segment: A portion of a route used for planning and analytical purposes. A route segment could be anywhere from a small segment of a route (<0.1 miles of a route) to an entire route.

Section 7 (FESA): The subdivision of FESA that describes the responsibilities of Federal agencies in conserving threatened and endangered species. It requires that any action authorized, funded, or carried out by the agency should not be likely to jeopardize the continued existence of any threatened or endangered species or result in the destruction or adverse modification of the species habitat. It includes a requirement that agencies consult with FWS if an action will likely

affect a listed species that may be present in the area affected by the project. It requires FWS to issue a biological opinion stating how the action will affect the species or its critical habitat and, if jeopardy or adverse habitat modification is found, it suggests reasonable and prudent alternatives.

Special Areas: A land use designation applied by BLM to a variety of areas with unique features, plant communities, or other resources. Special Areas are a tool to highlight areas known to be important for special consideration in the environmental assessment process for any kind of project. Where appropriate, activity plans will establish site-specific management directives.

Special Status Species: These include species:

- Listed as threatened or endangered (state and federal)
- Proposed for listing;
- Candidates for listing by the state and/or federal government;
- California species of concern;
- Designated as sensitive by the BLM; and,
- Plants identified by the California Native Plant Society as rare, threatened, endangered, or of limited distribution in California.

Standards and Guidelines: A Standard is an expression of the level of physical and biological condition or degree of function required for healthy, sustainable rangelands. Guidelines for grazing management are the types of grazing management activities and practices determined to be appropriate to ensure that the standards can be met or significant progress can be made toward meeting standards.

Subdesignation: The subdesignation(s), if assigned, further defines the types of vehicles and/or users that may use each route. Subdesignations include ATV/UTV, administrative, authorized/permitted, biking, competitive, designated only, equestrian, hiking, motorcycle, seasonal, and street legal only.

Subregion (Vehicle Access): Thirty-six geographic subdivisions covering various portions of public lands within the West Mojave planning area and that provide complete coverage of the planning area. These subdivisions were established for purposes of organizing the development of a network of motorized vehicle access routes on public lands, and to facilitate implementation of the route network. They generally coincide with law enforcement patrol sectors.

Threatened Species: A species is likely to become endangered within the foreseeable future. All species of plants and animals, except pest insects, are eligible for listing as endangered or threatened.

Trail: A linear route managed for human-powered, stock, or off-highway vehicle forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high-clearance vehicles.

Transportation Linear Disturbances – Man-made linear features that are not part of the BLM's Transportation System. Linear disturbances may include engineered (planned) as well as

unplanned single- and two-track linear features. Even if previously authorized, these features are considered unauthorized, and suitable for removal and rehabilitation.

Transportation Linear Features – The broadest category of physical disturbance (planned and unplanned) on BLM land. Transportation-related linear features include engineered roads and trails, as well as user-defined, non-engineered roads and trails created as a result of the public use of BLM land. May include roads and trails identified for closure or removal as well as those that make up the BLM's defined transportation system.

Transportation System – The roads, primitive roads, and trails designated as facility assets and maintained by the BLM.

Travel Management Areas - Polygons or delineated areas where a rational approach has been taken to classify areas open, closed or limited, and have identified and/or designated a network of roads, trails, ways, and other routes that provide for public access and travel across the planning area. All designated travel routes within travel management areas should have a clearly identified need and purpose as well as clearly defined activity types, modes of travel, and seasons or timeframes for allowable access or other limitations. (BLM Manual H-1601-1 Land Use Planning Handbook).

Utility Corridor: The CDCA Plan designated a regional network of nineteen utility planning corridors. Corridors are from two to five miles wide, and are several to hundreds of miles in length. They apply to electrical transmission towers and cables of 161-kV and above; pipelines with diameters greater than 12 inches, coaxial cables for interstate communications, and major aqueducts or canals for inter-basin transfers of water. Their purpose is to guide detailed planning and siting of utility projects requiring a right of way from the BLM. Location of a project within a corridor does not, without more, confer a right of way or fulfill environmental review requirements; however, projects subject to the corridor requirement are allowed outside of corridors only through an amendment to the CDCA Plan. BLM issues a permit that allows the construction of a new utility in these corridors only after FESA Section 7 consultation with FWS and Section 106 consultation with SHPO. Local distribution facilities may be located outside of designated corridors without a further land-use plan amendment. The CDCA Plan also identified several contingent corridors (routes having some potential for use in the future), which could be brought forward into the plan after successfully completing the Plan Amendment process. (CDCA Plan, pages 93-94.). At least one contingent corridor has already been activated in the WEMO Planning Area.

Voluntary Relinquishment: “the donation” of any valid existing grazing permit or lease within the CDCA. The term donation is interpreted by the BLM to mean “voluntary relinquishment” of the permit or lease to graze on a public land grazing allotment and the preferential position that the permittee or lessee enjoyed, in relation to other applicants, to receive that permit or lease.

WEMO ID: The unique planning number given by BLM to each specific route or route segment. WEMO IDs have been used internally to distinguish route segment features for planning and analytical purposes.

West Mojave Amendment Web Page:

http://www.blm.gov/ca/st/en/fo/cdd/west_mojave__wemo.html

West Mojave 2006 Plan Web Page: <http://www.blm.gov/ca/st/en/fo/cdd/wemo.html>

Wilderness Area: A unit of the National Wilderness Preservation System. Wilderness areas are designated by Congressional action. It is a natural preserve with outstanding opportunities for solitude and unconfined primitive experience. Wilderness is a place to enjoy where ecological, geological and other features of scientific, scenic, educational and historical value are protected and their character retained. BLM manages wilderness in accordance with the provisions of the Wilderness Act of 1964 and approved wilderness management plans. These plans generally contain actions that:

- (1) Maintain an enduring system of high-quality wilderness;
- (2) Perpetuate the wilderness resource;
- (3) Provide, to the extent consistent with items 1 and 2, opportunities for public use, enjoyment, and understanding of wilderness, and the unique experiences dependent upon a wilderness setting;
- (4) Maintain plants and animals indigenous to the area;
- (5) Maintain stable watersheds within constraints of the Wilderness Act;
- (6) Consider protection needs for populations of threatened or endangered species and their habitats in management of wilderness;
- (7) Consider accessibility to all segments of the population (including the handicapped, elderly, and underprivileged) in the management of wilderness;
- (8) Consider valid nonconforming resource uses and activities in the management of wilderness so as to have the least possible adverse effect and/or wherever possible a positive effect; and
- (9) Provide access to inholdings of private lands and vehicle access required by many areas because of the lack of water and the harsh environment of the Desert. [CDCA Plan as amended, page 50.]

Wilderness Study Area (WSA): Wilderness Study Areas are public lands that Congress has directed remain unimpaired for Wilderness designation until such time as Congress decides whether or not they will become units of the National Wilderness Preservation System. BLM manages its WSAs pursuant to an interim management policy described in the CDCA Plan. Although Congress made a final designation decision with respect to most of the western Mojave Desert's WSAs in 1994, five WSAs remain, all on BLM lands: Avawatz Mountains, Cady Mountains, Great Falls Basin, Soda Mountains and South Avawatz Mountains.

APPENDIX D
ANALYSIS OF MANAGEMENT SITUATION

This page intentionally left blank.

Appendix D

Analysis of Management Situation

This section describes how transportation and grazing are currently managed in the WEMO Planning area, with an emphasis on the historical evolution of the route network and grazing and the transportation management and grazing policies in response to legislation, resource considerations, land uses, and social and economic conditions. This section summarizes how resources and land uses have influenced the development of the transportation network and livestock grazing practices in the Planning Area, and how they have resulted in the current transportation network and management policies for that network and livestock grazing in the West Mojave Planning Area. The specific resources, land use needs, and social and economic conditions that may be affected by the transportation network alternatives, including livestock grazing are presented throughout the resource-specific subsections of Chapter 3.

D.1 Legislation and Policies

Federal Land Policy and Management Act (FLPMA)

The BLM's planning process is governed by FLPMA (43 USC 1712) and 43 Code of Federal Regulations (CFR) 1600. FLPMA requires Land Use Plans (LUPs) to be developed, maintained and when appropriate, to be revised to provide for the use of the public lands. In development and revision of land use plans BLM is required to use multiple use and sustained yield principles, achieve integrated consideration of physical, biological, economic, and other sciences, rely on present inventories of the public lands and their resources and values, consider the present and potential use of the public lands, comply with applicable pollution control laws, and consider the policies of state, local and tribal land use plans. As required by FLPMA, public lands must be managed in a manner that protects the quality of public land resources, and that provides for outdoor recreation and human occupancy and use (43 USC 1701(a)(8)).

FLPMA specifically addresses transportation and OHV use, as well as livestock grazing. In addition to the Congressional Declaration of Policy, 43 USC 1701, noted above, Part 6 and Part 7 of Title V, authorizes the issuance of rights-of-way for use of the public lands. Title VI of FLPMA, which established the CDCA, specifies that the use of all California desert resources can and should be provided for in a multiple use and sustained yield management plan, to conserve resources for future generations, to provide for the present and future use and enjoyment, particularly outdoor recreation uses, including the use, where appropriate, of off-road recreational vehicles (ORV/OHVs) (43 USC 1781).

Executive Orders No. 11644, 11989, and 13195

In 1972, Presidential Executive Order No. 11644 established the first uniform policies regarding OHV use on public lands. Each land management agency was directed by this Order to issue directions as to which trails and areas were open for OHV use and which were not. The Order required that OHV use be monitored to assess and minimize associated impacts. The requirements of the Order were implemented by BLM in 43 CFR 8342.1. Executive Order 11989 (42 FR 26959, May. 24, 1977) amended Executive Order 11644 (37 FR 2877, Feb. 8, 1972) by requiring that off-road vehicle areas or trails be closed immediately if an agency

determines that the use of off-road vehicles will cause or is causing considerable adverse effects on the soil, vegetation, wildlife, wildlife habitat, or cultural or historic resources. Executive Order 13195, January 23, 2001 (66 FR 7391) Trails for America in the 21st Century provides, in part, that Federal agencies will work cooperatively with Tribes, States, local governments, and interested citizen groups to protect, connect, and promote trails of all types throughout the United States.

Federal Regulation 43 CFR 8342.1

The CDCA Plan's motorized-vehicle access element was amended (1982 Plan Amendment Three, approved May 17, 1983) to conform with 43 CFR 8342.1, which states (See Appendix G.1-19):

“The authorized officer shall designate all public lands as either open, limited, or closed to off-road vehicles. All designations shall be based on the protection of the resources of the public lands, the promotion of the safety of all the users of the public lands, and the minimization of conflicts among various uses of the public lands; and in accordance with the following criteria:

- Areas and trails shall be located to minimize damage to soil, watershed, vegetation, air, or other resources of the public lands, and to prevent impairment of wilderness sustainability.
- Areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- Areas and trails shall be located to minimize conflicts between off-road vehicle use and other existing or proposed recreational uses of the same or neighboring public lands, and to ensure the compatibility of such uses with existing conditions in populated areas, taking into account noise and other factors.
- Areas and trails shall not be located in officially designated wilderness areas or primitive areas. Areas and trails shall be located in natural areas only if the authorized officer determines that off-road vehicle use in such locations will not adversely affect their natural, esthetic, scenic, or other values for which such areas are established.”

Wilderness Act of 1964 and Omnibus Bill of 2009

The Wilderness Act of 1964 established the National Wilderness Preservation System. Wilderness as defined by the Act is “an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions” for the benefit of present and future generations (Wilderness Act, 1964).

The 2009 Omnibus Public Land Management Act of 2009 added more than two million acres of wilderness, more than 1,000 miles of Wild and Scenic Rivers, and established new National Parks, conservation areas, national heritage areas, national trails, and national monuments. The bill created new water conservation, habitat restoration, and land management programs, and gave formal recognition to the 26 million acre National Landscape Conservation System (NLCS)

encompassing BLM's National Monuments, Conservation Areas, Wilderness and Wilderness Study Areas, Wild and Scenic Rivers, and Scenic and Historic Trails.

The WEMO Planning area includes areas designated as wilderness, as well as legislatively designated Wilderness Study Areas (WSA). In addition, the Mojave River in the planning area includes segments that have been determined to be eligible Wild and Scenic Rivers. Other lands in the planning area have not been designated as wilderness or WSA, but retain wilderness characteristics. These various lands are discussed in Section 3.11.

John D. Dingell, Jr. Conservation, Management and Recreation Act

The John D. Dingell Jr. Conservation, Management and Recreation Act, was signed by President Donald J. Trump on March 12, 2019. The Act (Public Law 116-9) makes multiple changes to public lands in the WEMO Plan Area, including:

- Designate three new Wilderness Areas
 - Great Falls Basin
 - Grass Valley
 - Soda Mountains
- Expand one existing Wilderness Area
 - Golden Valley
- Release all or the remaining portions of three Wilderness Study Areas
 - Cady Mountains
 - Soda Mountains
 - Great Falls
- Designate five off highway vehicle recreation areas
 - El Mirage
 - Rasor
 - Spangler Hills
 - Stoddard Valley
 - Johnson Valley
- Transfer lands between BLM and NPS federal agencies
 - Land transfer from BLM to Joshua Tree National Park

The Record of Decision will include an Errata with updated maps reflecting the new designations and necessary changes to the travel and transportation system to ensure the designated route system is consistent with the law.

BLM Travel and Transportation Management Guidance

In recent years, BLM has developed substantial guidance to facilitate the integration of comprehensive travel and transportation management planning into land use planning. Travel and Transportation Manual 1626 (MS-1626, revised September 27, 2016), forms the backbone of this guidance. Many of these developments were in the form of Instruction Memorandums (IMs), which only have temporary applicability until their provisions are formally incorporated into a BLM Manual or Handbook. A summary of the recent IMs and Handbooks is as follows:

- BLM regulations in 43 CFR 8342.1, which requires designation of public lands as open, limited, or closed based on protection of resources of the public lands, safety of all users, and minimization of conflicts among the various uses of the public lands, and in accordance with the minimization criteria provided in the regulation;
- Technical Note 422. Roads and Trails Terminology. November 2006. Implemented in IM 2006-173, dated June 20, 2006.
- IM 2007-030. Clarification of Cultural Resource Considerations for OHV Designation and Travel Management. December 22, 2006.
- IM 2008-014. Clarification of Guidance and Integration of Comprehensive Travel and Transportation Management Planning in the Land Use Planning. October 25, 2007.
- IM-2012-067. Clarification of Cultural Resource Considerations for Off-Highway Vehicle Designations and Travel Management. February, 10, 2012.
- H-8342-1, Travel and Transportation Management Handbook which describes how BLM is to comprehensively manage travel and transportation on public land. March 16, 2012.
- BLM Handbook 1610-1, Appendix C, Comprehensive Trails and Travel Management, which requires delineation of travel management areas and designation of Off-Highway Vehicle Management Areas as open, limited, or closed (March 11, 2005); and
- BLM Handbook 8342, Travel and Transportation Management Handbook,
- BLM Manual 1626, Travel and Transportation Management Manual, which provides detailed policy, direction and guidance for the comprehensive management of travel and transportation on Bureau of Land Management-administered lands.

Livestock Grazing

Within the West Mojave Planning Area, domestic livestock grazing is managed under the authorities contained in the Taylor Grazing Act of 1934, FLPMA, NEPA, Endangered Species Act of 1973 (ESA), the Public Rangelands Improvement Act of 1978 and the CDCA Plan of 1980, as amended. Within the grazing regulations, 43 CFR Part 4100 are specific guidance for the administration of livestock grazing on the public lands.

The Continuing Resolutions authorized by Congress over the past few years have contained language specific to livestock grazing concerning grazing permit and lease renewals, the trailing of livestock across public lands, the administrative review process, grazing transfers and changes in the mandatory terms and conditions.

The Consolidated Appropriations Act of 2012, specifically addresses livestock grazing in the California Desert Conservation Area. This Act allowed for the donation of grazing permits and leases back to BLM and make the land available for mitigation by allocating the forage to wildlife use consistent with any applicable Habitat Conservation Plan, Section 10(a)(1)(B) permit, or Section 7 consultation under the ESA.

Section 3023 of Public Law (PL) 113-291, National Defense Authorization Act (NDAA) 2015, amended Section 402 of FLPMA of 1976 and includes seven provisions related to livestock grazing. Amended Section 402(c)(2), allows BLM to renew expiring grazing permits/leases when BLM is unable to complete the requirements of NEPA and other applicable laws prior to the expiration of a grazing permit or lease under the same terms and conditions of the expiring permit or lease for a period up to ten years. These nondiscretionary grazing permits or leases issued in accordance with Section 402(c)(2) of FLPMA as amended by PL 113-291 are not protestable or appealable under the processes described in 43 CFR 4160 and 43 CFR 4.470 et seq. [1].

Other Agencies

No other federal, state, or local agencies have specific jurisdiction over OHV use and livestock grazing on public lands. The National Highway Traffic Safety Administration (NHTSA) has established Federal Motor Vehicle Safety Standards (FMVSS) for motor vehicles, and these, along with California state regulations established by the Department of Motor Vehicles (DMV), California Air Resources Board (CARB), and California Highway Patrol (CHP), govern the types of vehicles that may be used on highways. In addition, the route network established for the WEMO Planning area must be consistent with the networks established in the adjacent areas by considering "edge-fitting," in which open routes in the WEMO Planning area would link with open routes in adjacent areas, and the same would occur for closed routes. Within the West Mojave Planning Area, the U.S. Fish and Wildlife Service (USFWS) has issued biological opinions that contain terms and conditions which direct BLM's livestock grazing program on matters concerning the conservation and recovery of special status species and their habitats.

D.2 CDCA Plan, WEMO Plan, and DRECP LUPA Background

CDCA Plan

By map referenced in statute, the California Desert Conservation Area (CDCA) encompasses 25 million acres of land in southern California. The applicable land use plan, the CDCA Plan of 1980, addressed public-land resources and resource uses on 12 million acres of public land within the 25 million acres of CDCA land in southern California. The CDCA Plan includes 12 plan elements, including a Motorized-Vehicle Access (MVA) Element that establishes the travel management framework for the CDCA, and also includes some activity-level decisions for popular locations, and a Livestock Grazing Element that established geographic boundaries of livestock allotments, the types of forage use, and the upper limits on the stocking levels in each of the allotments. The other elements in the CDCA Plan include a Recreation Element, a Wild Horse and Burro Element, Cultural Resources and Native American Elements, Wildlife and Vegetation Elements, a Wilderness Element, a Land Tenure Adjustment Element, an Energy Production and Corridors Element, and a Geology, Energy and Mineral Resources Element. Since 1980, numerous amendments have been adopted which have changed the CDCA Plan.

Unless otherwise noted, references in this document to specific text within the CDCA Plan are referencing the 1999 reprint version. Multiple amendments to the CDCA Plan have been approved since 1999, including the 2006 WEMO Plan and the 2016 DRECP LUPA.

The MVA Element of the CDCA Plan addresses travel management on public lands in southern California with a focus on recreational vehicular use of and identifies the travel management framework for those various public lands. The MVA Element also outlines the route designation process, specifically restricts motorized vehicle routes to those that existed in 1980 (CDCA Plan, 1999, p. 77), and includes goals that, either in practice or through amendment, have been updated since 1980 to implement current policy. The CDCA Plan considers non-motorized travel in the context of the motorized access necessary in order to reach non-motorized areas and activities within the planning area. The Recreation Element of the CDCA Plan also addresses an aspect of access outside of OHV Open Areas—the routes that can be used for, and adoption of specific courses for, competitive vehicle events.

The goal of the Motorized-Vehicle Access Element of the CDCA Plan is to provide a system and set of rules governing access to the CDCA by motor vehicles. Specific objectives included are:

- Provide for constrained motorized vehicle access in a manner that balances the needs of all desert users, private landowners, and other public agencies.
- When designating or amending areas or routes for motorized vehicle access, to the degree possible, avoid adverse impacts to desert resources.
- Use maps, signs, and published information to communicate the motorized vehicle access situation to desert users. Be sure all information materials are understandable and easy to follow.

In addition to the goals stated in the Motorized Vehicle Access Element, other elements of the CDCA Plan address access needs for various desert uses, as follows:

- The Recreation Element cited access to recreational opportunities using motorized vehicles as being among the most important recreation issues in the desert, and ensuring that access routes necessary for recreation are provided is a primary consideration of the recreation program.
- The Geology, Energy, and Mineral Element requires that BLM continue to provide access and opportunities for exploration and development on public lands which are accessed or have potential for:
 - i) Critical mineral resources (national defense; 50+% importer; net importer)
 - ii) Potential energy resources (geothermal, oil, gas, uranium, and thorium)
 - iii) Minerals of local and State importance (sand & gravel, limestone, gypsum, iron, specialty clays, zeolites)
- The Energy Production and Utility Corridors Element specifies that the Plan will provide space not only for communications sites, but for associated infrastructure such as access roads. In addition, this element allows for the development of renewable and other energy production and transmission facilities, each of which requires access.

The Livestock Grazing Element states that currently and historically, livestock grazing has been and continues to be a significant use of renewable resources on public lands in the California Desert. The goals of the element are:

- Use range management to maintain or improve vegetation to meet livestock needs and to meet other management objectives set forth in this plan.
- Continue to use the California Desert for livestock production to contribute to satisfying the need for food and fiber from public land.
- Maintain good and excellent range condition and improve poor and fair range condition by on condition class, through the development and implementation of feasible grazing systems or Allotment Management Plans (AMPs). Adjust livestock grazing use where monitoring data indicate changes are necessary to meet resources objectives.

Area Designations

BLM's planning regulations (43 CFR 8341) require that all public lands be designated as "open," "limited," or "closed" to OHV use. Within designated "open" areas, all types of vehicle use are permitted anywhere in the area, subject to operating regulations and vehicle standards provided in 43 CFR 8341 and 8342. Within "closed" areas, all OHV use is prohibited. Within "limited" areas, individual roads, primitive roads, and trails can be designated as "open," "closed," or "limited," and BLM must establish permitted types or modes of travel, time or season of use, allowable vehicle types, authorization or permit requirements, and other types of user limitations. OHV area designations are LUP decisions, as opposed to implementation decisions. Specific route designations within area designations are implementation level decisions.

The CDCA Plan adopted landscape-level Vehicle Access designations, presented in Map 10 of the Plan. The Vehicle Access designations were made commensurate with the multiple-use class (MUC) designation for each area. The three Vehicle Access Designations are "open areas," "closed areas," and "limited areas." Vehicle use in open areas was approved subject to restrictions by the operating regulations and vehicle standards described in 43 CFR 8341 and 8342. Closed areas included all public lands within designated wilderness areas, and other specified areas closed by the CDCA Plan or specific activity-level management plans. Page 76 of the CDCA Plan (1999 reprint) in Table 8 and for four listed areas immediately before the table, includes areas designated as closed prior to the CDCA Plan which remain closed under the CDCA Plan, and will remain closed under the Plan unless modified by subsequent implementing action. Table 9 includes significant sand dune areas or dry lake beds which have either been opened or closed under the CDCA Plan (CDCA Plan, p.78, 1999 reprint).

Within the limited areas, the CDCA Plan stated that "Limited" vehicle access means that motorized-vehicle access is allowed only on "routes of travel." According to the language of the CDCA Plan, at the minimum, use will be restricted to existing routes of travel. BLM would work with the public to determine which routes needed to be closed or limited in some other way, in consideration of the criteria listed in 43 CFR 8342.1.

Route Designations

The designation of individual roads, primitive roads, and trails are addressed as an implementation level plan tiered from the LUP. These decisions can be developed as stand-alone TMPs, or can be incorporated into activity management plans,

The CDCA Plan provided the following definitions for open, closed, and limited routes.

- **Open Route.** Access on the route by motorized vehicles is allowed. Specific uses with potential for resource damage or significant conflict with other use may require specific authorization.
- **Closed Route.** Access on route by motorized vehicles is prohibited except for: (1) fire, military, emergency or law enforcement vehicles when used for emergency purposes; (2) combat or combat support vehicles when used for national defense purposes; (3) vehicles used for official purposes by employees, agents, or designated representatives of the federal government or one of its contractors. Use must be consistent with the multiple use guidelines for that area.
- **Limited Route.** Access on route is limited to use by motor vehicles with respect to number of vehicles, type of vehicles allowed, time or season of vehicle use, permit or license requirements, and speed limits.

The definition of limited routes is further defined in the 2012 TTM Handbook (H-8342-1) to include consideration of types or modes of travel; identification of roads, primitive roads, and trails; time or season of use; types of vehicles (OHV, motorcycle, ATV, high clearance, etc.); authorizations or permits for vehicles or users; and BLM administrative use only or other types of limitations.

Implementation Strategies in CDCA Plan

The CDCA Plan specified on-the-ground implementation of the OHV Area designations made in the Plan, as follows:

- Open areas were signed and identified on maps for public distribution. In open areas that abut private lands, BLM encourages users to avoid unauthorized use through the use of signs, brochures, on-site personnel, and placement of permanent kiosks. Signs and maps also indicate locations of military land boundaries.
- Closed areas were signed to prevent unauthorized use, and identified on publicly available maps.
- For Limited areas, BLM developed considerations to be used in designating individual routes.

2006 WEMO Plan

In 2006, the BLM approved a comprehensive amendment covering the WEMO area of the CDCA, called the 2006 WEMO Plan, which was analyzed as BLM's component of the 2005 WEMO EIS. The 2006 WEMO Plan is a federal land use plan amendment to the CDCA Plan that presents (1) a comprehensive strategy to conserve and protect the desert tortoise, the Mohave ground squirrel (MGS) and over 100 other sensitive plants and animals and the natural

communities of which they are a part, and (2) a streamlined program for complying with the requirements of the federal and California Endangered Species Acts (FESA and CESA, respectively) (WEMO, 2006 p. ES-1).

The 2006 WEMO Plan includes modification of the vehicle management program and livestock grazing program to promote the adopted conservation strategy for public lands. The modifications to the vehicle management program are discussed in subsection C.3 below.

Livestock Grazing Decisions in 2006 WEMO Plan

The 2006 WEMO Plan modifications of the livestock grazing program include, among others:

- Elimination of the majority of ephemeral sheep grazing within sheep grazing allotments located in DWMA's;
- Elimination of ephemeral grazing within cattle and horse grazing allotments when forage is inadequate;
- Elimination of ephemeral grazing and temporary non-renewable grazing authorization within cattle grazing allotments located in DWMA's;
- Measures to remove grazing through temporary closures in cattle grazing allotments in DWMA's when forage is inadequate; and
- Measures to allow voluntarily relinquishment of allotments located in DWMA's and other special status species habitat.

The 2006 WEMO Plan Public Land Livestock Grazing Program contained a total of 29 management prescriptions (LG). Key additions to the CDCA Plan Livestock Grazing Objectives made in the 2006 WEMO Plan that are not proposed for change are listed below. The adoption of regional standards and guidelines are dependent upon approval by the Secretary of the Interior.

1. Adopt and Implement Regional Standards of Rangeland Health and Guidelines for Grazing Management in the West Mojave Planning area, consistent with 43 CFR 4180 et seq., and Conform Grazing Activities to the Standards.
2. Discontinue livestock grazing in DWMA allotments that are voluntarily relinquished and reallocate all of the AUMs from livestock forage to wildlife use and ecosystem functions, upon compliance with the terms identified in the land use plan. Voluntarily relinquished allotments would be unavailable for grazing.
3. Further limit livestock grazing in DWMA's and other sensitive areas within the WEMO Planning area. Specific elements of this objective include elimination of ephemeral cattle grazing, substantial limitation of sheep grazing within DWMA's and other sensitive areas (see pages 2-131-133 of the 2005 WEMO FEIS), elimination of ephemeral and temporary non-renewable (TNR) permit authorizations for cattle allotments within DWMA's, and increasing ephemeral forage production requirements before livestock turnout in other desert tortoise habitat. Livestock grazing would continue on the Valley Well Allotment.

The WEMO 2006 ROD incorporates the terms and conditions of the Biological Opinion (BO) issued on January 9, 2006 by the U.S. Fish and Wildlife Service (USFWS) and amended by the USFWS on November 30, 2007 to minimize impacts from the livestock grazing program.

Post WEMO Changes to Vehicle Access Management

In August 2006, a lawsuit was filed challenging the route designation process used in the 2006 WEMO Plan and the route designations resulting from the analysis of impacts in the 2006 WEMO Plan. The court issued a Summary Judgment order on September 28, 2009, and a Remedy Order on January 28, 2011. The Remedy Order remanded the 2006 WEMO ROD to the BLM and directed the BLM to amend the CDCA Plan and reconsider route designation throughout the WEMO Planning area, among other things.

The specific issues related to route designation that were remanded for re-evaluation are as follows:

- **Sufficiency of the No Action Alternative:** According to the Court's Summary Judgment order, the 2005 EIS did not sufficiently explain that the routes contained in the No Action Alternative (inclusive of post-1980 routes), was larger than both the 1980 and 1985-1987/ACEC networks, and was smaller than the 2001-2002 inventoried network. In addition, the discussions of the No Action network throughout the EIS were not consistent. Some specific examples were raised, including Table 3-58 and Table 4-45. Instead of alternatives being compared only to the No Action Alternative, they were also compared to the 1985-1987 network, the 2001-2002 inventory, and the 2003 EA network. The Court stated that a single No Action network needs to be defined, described, and then used as the basis for comparison for all impacts.
- **Inclusion of post-1980 routes in alternatives:** In its discussion of "limited" areas, the CDCA Plan states that ". . . use will be restricted to existing routes of travel." The Court noted that this statement is problematic in that BLM did not have an inventory of the routes that existed in 1980. The Court interpreted this language to prohibit the designation of any routes as "open" or "limited" that did not exist before 1980. The Summary Judgment order does state that BLM can designate additional routes that did not exist in 1980 (Summary Judgment Order, Pg. 36, lines 13-16). However, to do so, BLM must amend the language that restricts the network to pre-1980 routes. That amendment would need to be done in accordance with NEPA and FLPMA, and would have to explain why inclusion of post-1980 routes is justified.
- **Criteria Used for Route Designations:** The Court ruled that the BLM's rationale for making their route designations was not complete, and did not address the requirements of 43 CFR 8342.1. The Court also cited specific resources (soils, cultural resources, Unusual Plant Assemblages and riparian areas, Mojave fringe-toed lizard, and air quality) for which analyses were not complete, and needed to be re-visited.
- **Reasonable Range of Alternatives:** The Court ruled that the 2005 WEMO FEIS's inclusion of the same route network in each of the evaluated HCP alternatives violated NEPA.

These decisions of the Court provide an additional framework in which the current effort to establish a route network must be developed. Also, the Court left the following specific issues related to travel management, the route network and livestock grazing in place during remand:

- Provisions allowing for grazing allotments to be voluntarily relinquished, certain areas to be designated as not available for grazing, and any subsequent decisions to relinquish or retire grazing allotments;

- The restrictions on motorized vehicle stopping, parking, and vehicular camping;
- The deletion of the portion of the Barstow to Vegas Race Course within the WEMO Planning area;
- All routes that were closed in the ROD remain closed;
- The policy that all routes should be considered closed unless signed “open;”
- Allowable use of OHVs on the route network that are not “street legal;” and
- Route designations made in the Juniper Flats, Wonder Valley, and Edwards Bowl areas.

Specific route network-related issues that were vacated by the Court include:

- Adoption of the route network in the Rand Mountain-Fremont Valley Management Plan;
- Adoption of the route network in the Afton Canyon Natural Area; and
- Establishment of a connector route in the Stoddard Valley to Johnson Valley Corridor.

As specific mitigation measures ordered to be implemented during remand, BLM was required to do the following:

- Provide the Court with a detailed Implementation Plan;
- Update all BLM-produced and available maps to include accurate and up-to-date route information, including a statement regarding restriction of motorized use to “open” routes only;
- Provide the Court with a monitoring plan to determine compliance with route closures and whether new illegal routes were being created;
- Perform additional monitoring regarding air quality, Mojave fringe-toed lizard and its habitat, and riparian areas and Unique Plant Assemblages;
- Provide a plan for maintenance of the open route network;
- Provide a plan for additional enforcement capability; and
- Provide quarterly progress reports.

Other Recent Policy and Planning-Related Post 2006 WEMO Developments

Since the 2006 WEMO ROD, the public lands included within the planning area have been subject to additional BLM planning efforts and CDCA Plan amendments. These amendments to the CDCA Plan are now status quo, or the baseline for consideration of plan requirements. In addition, post-WEMO implementation activities have been undertaken. Major efforts are summarized as follows:

- BLM has completed renewal evaluations, including Environmental Assessments (EAs) and rangeland health assessments, for 28 grazing allotments within the planning area since 2006. Also, several allotments have been voluntarily relinquished since the 2006 WEMO Plan was completed. The EAs all evaluated route designation and OHV use within each allotment as part of their cumulative analysis. Also, several of the EAs specified that the allotments had been modified and, in some cases, voluntarily

relinquished, as part of the 2006 WEMO Plan. The specific information related to the allotments is presented in Section 3.7 of this Draft SEIS.

- In 2012, Congress passed and the President signed the 2012 Appropriations Act (Public Law 112-74, 125 Stat. 1048, Dec 23, 2011). This Act provided that the Secretary of the Interior “shall accept the donation of any valid existing permits or leases authorizing grazing on public lands within the California Desert Conservation Area. With respect to each permit or lease donated under this paragraph, the Secretary shall terminate the grazing permit or lease, ensure a permanent end (except as provided in paragraph (2)), to grazing on the land covered by the permit or lease, and make the land available for mitigation by allocation the forage to wildlife use consistent with any applicable Habitat Conservation Plan, section 10(a)(1)(B) permit or section 7 consultation under the Endangered Species Act of 1973”. Under this authority, two allotments have been donated within the WEMO Planning area—Lava Mountain and Walker Pass Common Allotments. Consistent with the 2012 Appropriations Act, the permanent relinquishment of these two allotments has been accepted, grazing allotment boundaries were updated, and AUMs were reallocated from livestock forage to wildlife use and ecosystem functions.
- Activity-specific route designations: BLM land throughout the WEMO Planning area continues to be available for, and subject to, permit and ROW applications for a variety of activities, as are allowable under BLM regulations and the CDCA Plan. These applications include solar, wind, and energy transmission projects; installation and operation of communications towers and pipelines; access to mining operations and exploratory activities, and permitted recreation events. Most projects require access for project construction and operation, and this access often needs to be provided in whole or in part, through construction and authorization of new routes.
- In July 2012, BLM and the Department of Energy (DOE) published the Final Programmatic Environmental Impact Statement (PEIS) for Solar Energy Development in Six Southwestern States, which included consideration of the WEMO Planning area in California. The PEIS ROD designated lands within the WEMO Planning Area as either exclusions areas or variance areas. Exclusion areas are unavailable for utility-scale solar energy development. The BLM considers any application for utility-scale solar energy development within variance areas after following a process outlined in the PEIS ROD. The PEIS considered the potential impact of solar development on the National Historic Trail System, and on routes of travel. The PEIS noted that solar development may require closure of designated OHV routes. In response to these impacts, the PEIS proposed design features to mitigate impacts, including rerouting roads around solar developments, and considering replacement of acreage for lost recreational opportunities.
- With respect to the BLM, and the Department of the Interior as a whole, Secretarial Order 3347 (signed March 2, 2017) requires each bureau and office of the DOI to work with the Wildlife and Hunting Heritage Conservation Council (WHHCC) and Sport Fishing and Boating Partnership Council (SFBPC) to:
 - (1) Identify specific actions to expand access significantly for recreational hunting and fishing on public lands as may be appropriate.

- (2) Identify specific actions to improve recreational hunting and fishing cooperation, consultation, and communication with state wildlife managers.
- (3) Identify specific actions to improve habitat for fish and wildlife.
- (4) Identify specific actions to manage predators effectively and efficiently.
- (5) Encourage, promote, and facilitate greater public access to all Department lands consistent with applicable laws.

2016 DRECP LUPA

The 2016 DRECP LUPA was developed as an interagency plan by the BLM, the U.S. Fish and Wildlife Service (USFWS), the California Energy Commission (CEC), and the California Department of Fish and Wildlife (CDFW, collectively known as the Renewable Energy Action Team (REAT or REAT Agencies) to (1) advance federal and state natural resource conservation goals and other federal land management goals; (2) meet the requirements of the federal Endangered Species Act, California Endangered Species Act, Natural Community Conservation Planning Act, and Federal Land Policy and Management Act (FLPMA); and (3) facilitate the timely and streamlined permitting of renewable energy projects, all in the Mojave and Colorado/Sonoran desert regions of Southern California. BLM's component of the Interagency DRECP is a federal land use plan amendment to the CDCA Plan. The DRECP LUPA addressed a larger land area than the WEMO Planning Area, but the WEMO Planning Area is entirely encompassed within the DRECP LUPA area. If applicable to WEMO, the land use planning decisions made in the DRECP LUPA apply to the entire WEMO Planning Area.

In the CDCA Plan and 2006 WEMO, many allowable land uses and conservation measures related to both travel and transportation management and grazing were based on land use designations. As a result, many of the planning level decisions considered in the 2015 WMRNP Draft SEIS were based on the land use designations which were in effect at that time, and which have since been modified as a result of the adoption of DRECP LUPA. These changes have resulted in the need to modify some of the proposed plan amendments which were considered in the Draft SEIS. A summary of these changes is as follows:

- The previous designations of multiple use classes have been eliminated, and were replaced with an overlapping set of designations established for resource conservation, recreation, and development.
- The boundaries of previously existing ACECs have been modified. The designation of Desert Wildlife Management Areas (DWMAs), which had previously distinguished between ACECs established for protection of the desert tortoise and ACECs established for protection of other resources, has been eliminated. ACECs established for protection of the desert tortoise are now referred to as desert tortoise ACECs (DT ACECs)
- Areas have been designated as California Desert National Conservation Lands (CDNCLs). Public Law 111-11, the Omnibus Public Lands Management Act of 2009, formally established the National Landscape Conservation System (NLCS), which is made up of BLM-managed nationally significant landscapes with outstanding ecological, cultural and scientific values, and is managed to conserve, protect and restore these values. Within the DRECP LUPA, components identified for inclusion in the NLCS as

lands within the CDCA administered for conservation purposes are referred to as CDNCLs.

- Lands Managed for Wilderness Characteristics have been established. Wilderness values were previously evaluated in the Draft SEIS with respect to Wilderness Areas, Wilderness Study Areas (WSAs), and Lands Inventoried for Wilderness Characteristics. The Lands Inventoried for Wilderness Characteristics have now been eliminated and replaced, where applicable, by Lands Managed for Wilderness Characteristics.
- Visual Resource Management (VRM) classifications have been adopted across the entire CDCA.
- Special Recreation Management Areas (SRMAs) are managed for their recreation opportunities, unique value, and importance. Extensive Recreation Management Areas (ERMAs) have been established to address recreation use and demand.
- Development Focus Areas (DFAs) have been established as areas where renewable energy development is allowed and incentivized. Variance Process Lands (VPLs) are available for renewable energy development, but are not incentivized.

Other specific decisions made in the 2016 DRECP LUPA which are relevant to the WMRNP are as follows:

- Conservation and Management Actions (CMAs) were developed to establish allowable uses, management actions, stipulations, best management practices, and mitigation measures to reduce or avoid impacts on public lands.
- The boundaries of OHV Open Areas were modified, and are now different from those that were analyzed in the Draft SEIS in 2015. The revised Open Areas are described in Table 3.6-2.
- Additional modifications to the livestock grazing program were made in the 2016 DRECP LUPA. The DRECP LUPA did not make changes to the CDCA Plan Livestock Grazing Element goals, but did add additional goals to maintain and enhance various resource values that are relevant to the Livestock Grazing Element (listed beginning on pp. II.3-137 of the 2015 DRECP FEIS). The DRECP LUPA also analyzed and made changes to the Livestock Grazing Element objectives that affect allotments within the WEMO Planning Area, as outlined on page II.3-200 of the 2015 DRECP FEIS. These specific changes include:
 1. Make Pilot Knob, Valley View, Cady Mountain, Cronese Lake, and Harper Lake allotments, allocations unavailable for livestock grazing and change to management for wildlife conservation and ecosystem function. Reallocate the forage previously allocated to grazing use in these allotments to wildlife use and ecosystem functions.
 2. The following vacant grazing allotments within the CDCA will have all vegetation previously allocated to grazing use reallocated to wildlife use and ecosystem functions and will be closed and unavailable to future livestock grazing: Buckhorn Canyon, Crescent Peak, Double Mountain, Jean Lake, Johnson Valley, Kessler Springs, Oak Creek, Chemehuevi Valley, and Piute Valley.

3. Allocate the forage that was allocated to livestock use in the Lava Mountain and Walker Pass Desert allotments (which have already been relinquished under the 2012 Appropriations Act) to wildlife use and ecosystem function and eliminate livestock grazing on the allotments.

D.3 History of Route Designation

Pre-CDCA Plan

Management of OHV use on the public lands is based on Executive Orders, the Federal Land Policy and Management Act of 1976, as amended (FLPMA), and 43 CFR Part 8340. On February 8, 1972, President Richard Nixon issued Executive Order 11644— Use of off-road vehicles on the public lands. This Order established the first uniform policies regarding OHV use on public lands. The Secretaries of Interior, Agriculture, and Defense were directed to develop and issue regulations that would designate areas and trails on public lands on which the use of OHVs might be permitted and those which may not be permitted for OHV use. The Order also required the development of operating conditions, public information, appropriate penalties for violations of regulations adopted pursuant to the order, and the monitoring of the effect of the use of OHV's on lands under their jurisdiction.

FLPMA is considered the “organic act” for the BLM and establishes the agency's multiple use mandate to serve present and future generations of Americans. FLPMA specifically addresses transportation and OHV access and use in several sections. Title V authorizes the issuance of rights-of-way for use of the public lands for such features as roads, trails, highways, livestock driveways, or other necessary means of transportation which are in the public interest and which require a right-of-way to cross the public lands. Title VI established the CDCA and specifies that the use of all California desert resources can and should be provided for in a multiple use and sustained yield management plan, to conserve resources for future generations, to provide for the present and future use and enjoyment, particularly outdoor recreation uses, including the use, where appropriate, of off-road recreational vehicles (OHVs) (43 USC 1781).

On May 24, 1977, President Jimmy Carter issued Executive Order 11989 –Off-Road Vehicles on Public Lands to amend Executive Order 11644 by adding Section 9. Section 9(a) directs that if a determination is made that OHV use will cause or is causing considerable adverse effects on the soil, vegetation, wildlife, wildlife habitat, or cultural or historic resources of an area or trail on public lands, that the agency immediately close the area or trail to the type of vehicle causing the damage, until such time as it is determined that such effects have been eliminated and that measures have been implemented to prevent future recurrence. Additionally Section 9(b) authorizes the adoption of policy that parts of the public lands shall be closed to use by OHV except those areas and trails which are suitable and specifically designated as open to such use pursuant to Section 3 of the Order.

FLPMA and these two executive orders formed the basis of the guidance found in Part 8340 of Title 43 of the Code of Federal Regulations, which were developed by the Secretary of the Interior for the Bureau of Land Management. Subparts within Part 8340 establish a definition for OHV, conditions of use, vehicle operations standards, and penalties. Specifically Subpart 8342 outlines the designation criteria, procedures, and changes related to designation of areas and trails available for use by OHVs. All public lands are to be designated as open, limited, or closed to OHVs. These designations are to be based on the protection of the resources of the public

lands, promotion of the safety of all the users of the public lands, and the minimization of conflicts among various uses of the public lands.

1980 CDCA Plan

With the passage of FLPMA the Congress found that “the California desert contains historical, scenic, archeological, environmental, biological, cultural, scientific, educational, recreational, and economic resources that are uniquely located adjacent to an area of large population.” It also found that its resources, “including certain rare and endangered species of wildlife, plants and fishes, and numerous archeological and historic sites” are “seriously threatened by air pollution, inadequate Federal management authority, and pressures of increased use, particularly recreational use.” Congress stated that “the use of all California desert resources can and should be provided for in a multiple use and sustained yield management plan to conserve these resources for future generations, and to provide present and future use and enjoyment, particularly outdoor recreation uses, including the use, where appropriate, of off-road recreational vehicles.” To accomplish this, BLM was directed to prepare a plan for the “management, use, development, and protection of public lands within the California Desert Conservation Area” (of which the western Mojave Desert comprises the northwestern third). The plan would “take into account the principles of multiple use and sustained yield in providing for resource use and development, including, but not limited to, maintenance of environmental quality, rights of way, and mineral development.”

The plan that was developed is the California Desert Conservation Area (CDCA) Plan which was completed in 1980. The stated goal of the CDCA Plan is to “provide for the use of the public lands and resources...including economic, educational, scientific, and recreational uses”. To achieve the goal of the Plan management actions are first based on a geographic basis using guidelines establishing four Multiple Use classes. The Multiple Use classes are Class C (Controlled Use), L (Limited Use), M (Moderate Use) and I (Intensive Use). Small areas were left “Unclassified”, due to their scattered or isolated location.

These guidelines are further clarified, refined, and expressed in goals for each Plan Element. There are twelve Plan Elements covering the major resources or issues of public concern that were identified during the CDCA planning process. Those Elements of the CDCA Plan that have access management goals or objectives, or discuss the need for access to desert resources are the Motorized-Vehicle Access; Recreation; Wilderness; Geology, Energy, and Mineral; and the Energy Production and Utility Corridors Elements.

As part of the CDCA Plan, and in accordance with Executive Orders 11644 and 11989, all public lands in the CDCA were designated as open, closed, or limited to vehicle use. The designations were made on the basis of multiple-use classes with certain exceptions set forth in the Motorized Vehicle Access (MVA) Element. These designations are displayed on CDCA Plan Map Number 10 – Motorized-Vehicle Access.

Amendments to the CDCA Plan

The CDCA Plan was written based on the concept that it would provide the framework for management of the CDCA for the next 20 years and in some situations and actions much further into the future. It was recognized at the time of writing that it could not be cast in concrete and

therefore provided for the ability to be amended as needed to adjust to needed changes and to acknowledge better ways of doing things in the future.

Between 1981 and 1990, amendments to the Plan were made on an annual or biennial basis. The CDCA Plan reprint of 1999 includes a full review of the amendments made to the plan between 1980 and 1999. The following is a description of the more significant changes that effected travel management within the WEMO planning area.

Amendments to the Plan that had the largest effect on travel management occurred in 1982 and 1985. The 1982 Amendment revised the Motorized Vehicle Element while the Goals for all Plan Elements were restated in 1985.

The 1982 Amendment incorporated 43 CFR 8340 into the Motorized Vehicle Access Element and made changes and clarified the Open, Closed, and Limited Area designations. While public vehicle travel is permitted anywhere in Open Areas and no public vehicle travel is allowed in a Closed Area, Limited areas are more complicated. Limited vehicle access means that motorized-vehicle access is allowed only on certain "routes of travel." This was described in the CDCA Plan: "At the minimum, use will be restricted to existing routes of travel." The 1982 amendment defined that an existing route as "a route established before approval of the Desert Plan in 1980, with a minimum width of two feet, showing significant surface evidence of prior vehicle use or for washes, history of prior use." Depending on the particular Multiple Use class and the degree of control needed in a particular area, Limited Areas were managed differently:

Class I: "Unless it is determined that further limitations are necessary, those areas not "open" will be limited to use of existing routes."

Class M: "access will be on existing routes, unless it is determined that use on specific routes must be limited further."

Class L: "Due to higher levels of resource sensitivity in Class L, vehicle access will be directed toward use of approved routes of travel. Approved routes will include primary access routes intended for regular use and for linking desert attractions for the general public as well as secondary access routes intended to meet specific user needs. Routes not approved for vehicle access will be reviewed and, after opportunity for public comment, those routes deemed to conflict with management objectives or to cause unacceptable resource damage will be given priority for closure... "All remaining routes of travel will be monitored for either inclusion as approved routes or for closure to resolve specific problems."

Class C and ACECs: "In Class C areas prior to wilderness designation by Congress, and in ACECs where vehicle use is allowed, vehicle access will be managed under the guidelines for Class L."

Unclassified areas: "In areas not assigned to a Multiple-Use Class, the route approval process will be applied as needed to resolve specific problems and to establish a cohesive program."

Additionally, the 1982 Amendment identified the concept of individual Route Designation in addition to Area Designations. Routes could be designated as "open," "closed," or "limited" for motor vehicle use which was generally tied to area designation. "OHV Open" routes allowed for access by motorized vehicles. "OHV Closed" routes prohibited motorized vehicles access with

the exception of use for emergency purposes, national defense purposes, use expressly authorized under permit, lease, or contract, and for official purposes. "OHV Limited" routes allowed motorized vehicles to travel on the route but that use could be restricted. Some of the restrictions could be types of vehicles, season of use, or permitted or licensed vehicles only. Route designations could be made in each of the four multiple use classes, in ACECs, and in unclassified lands. Route designations could not be made in Congressionally designated wilderness areas.

Following the concept of designation the MVA Element developed an Implementation approach to the management of vehicle designations. Within this section it was recognized that the implementation of "Limited" areas would "require detailed analysis to insure that each area's limitations are appropriate to the issues and resources involved. Until such limitations are put into effect, these areas will be managed on an interim basis as explained under "Interim Management of Vehicle Access" guidelines. These guidelines specified that "Existing routes of travel may be used in all Class L and M areas, and in those Class I areas not designated open and in unclassified lands, unless other limitations are in effect. In Class C areas, vehicle use will occur as if the areas were Class L until such time as the area formally becomes wilderness, except in those cases where vehicle use could impair wilderness suitability."

1985-1987 Route Designation Effort

Shortly after the completion of the CDCA Plan the route designation process began. In June 1981, the BLM published a set of 21 maps titled Motorized Vehicle Interim Access Guides (IAG), which covered all of the BLM administered public lands within the CDCA. These maps were distributed to the public for their use, input, and review in order to gather information on the existing route network within the CDCA. Also in the fall of 1981 each Resource Area Office developed an Ad Hoc Advisory Committee. These groups were to include a good cross section of desert users. These ad hoc groups held meetings and took field trips with the intent of working towards the goal of helping to develop a designated route system for the public lands.

In addition to the Ad Hoc Advisory Committees efforts, during the early 1980s, BLM staff began gathering existing route data using a collection of 15 & 7 1/2 minute United States Geological Survey (USGS) topographic maps, aerial photography, and field checks. No extensive field inventory was conducted at the time. Based on this gathered information and input of the Ad Hoc Committee BLM staff developed a designated route network of motorized vehicle routes throughout the planning area. The staff documented their recommendations for routes on forms titled "Vehicle Route Designation Recommendation/Decision". These forms included space for describing the resource values of special concern for the area, whether the route traveled across or provided access to private lands, the complete text of 43 CFR 8342.1 Designation Criteria, and selection of a recommendation-proposed designation (Open, Closed, Limited). If a Closed or Limited recommendation was chosen the criteria from 43 CFR 8342.1 that the designation was based upon was to be indicated, along with space provide decision rational and explanation of the route's Limited or Closed status. This designation criterion was followed up with space for signatures by the Staff specialist making the recommendation, approval by the Area Manager, and concurrence by the District Manager.

BLM conducted a field and map inventory of OHV routes on public lands throughout the planning area in the mid-1980s and, based upon that inventory, identified a network of open

motorized vehicle access routes. BLM personnel inventoried and evaluated existing routes of travel. Information from existing maps and aerial photos was supplemented by field checks. This information was then utilized to create a known route inventory that primarily consisted of known "two-track" routes (i.e. "single-track" motorcycle routes were generally not part of the inventory). Public meetings were conducted and members of the public also reviewed these route inventories. Criteria for determining which routes were to remain open was based upon public access needs, recreational values and resource considerations. Following public meetings, decisions to designate the route network were announced.

On August 21, 1985, BLM published a Notice in the Federal Register titled Off-Road Vehicle Designation Decisions; Ridgecrest Resource Area, CA (Federal Register, Vol. 50, No. 182). Two years later, on June 19, 1987, BLM published Federal Register notice titled Off-Road Vehicle Route Designation Decisions for the California Desert District (CDD), Barstow Resource Area (Federal Register, Vol. 52, No. 118, p. 23364); and, on September 22, 1987, BLM published a Federal Register notice titled Off-Road Vehicle Route Designation Decisions for the California Desert District, Barstow Resource Area (Federal Register, Vol. 52, No. 183, p. 35589). These notices designated 2,949 miles of OHV routes on public lands as open routes.

These recommendations resulted in the development of Draft Routes of Travel Decision Maps. These maps were sent out to the public, the Ad Hoc Advisory Committee, and were distributed at public meetings being held to solicit input on the proposed route network. At the completion of the public comment period, input was reviewed and changes made to the system as deemed appropriate thus creating the final route designations. These efforts culminated and became effective with the publication of notices in the Federal Register for the Ridgecrest Field Office (50 FR 33856; August 21, 1985) and for the Barstow Field Office (50 FR 23364; June 19, 1987, and 52 FR 35589; September 22, 1987).

Area-Specific Designations

Other route designation efforts occurred before and after the far reaching 1985-87 route designation efforts mainly related to ACECs. Specific area route designations efforts were frequently included as part of the ACEC Plan development efforts to further ACEC management goals and objectives. These efforts generally occurred between 1982 and 1995, and identified motorized vehicle access networks through public lands, collectively identifying 317 miles of open routes. Table D.1 lists these plans, together with the date the route network in each was developed. Some of these lands, which were acquired after the 1985-1987 inventories, were evaluated in subsequent ACEC Plans or the 2006 WEMO Plan. However, other lands acquired after 1987 were not included in the 2006 WEMO Plan baseline. Those lands were included in the 2012 inventories, and are part of the reason for the increase in the inventory of routes from approximately 7,000 miles in 2006 to approximately 16,000 miles for the current SEIS.

Table D.1. Pre-WEMO ACEC Route Networks and Principal Recreation Activities

ACEC Name	Size (Acres)	Year	Route Status	Principal Recreation Activities
Afton Canyon	8,830	1989	26-mile designated route system	Camping, vehicular touring, equestrian, rock hounding, recreational mining on outside edges of area.
Amboy Crater National Natural Landmark	639	NA	One access route to parking area.	Geologic exploration, rock hounding
Barstow Woolly Sunflower	19,079	1982	Mapped routes excluded; vehicles excluded From NW ¼ of Section 11; T11N; R6W	Non-vehicular dependent: Hiking, botanizing
Bedrock Springs	786	1987	Mapped designated route system	Access to prehistoric values and Northern portion of the Golden Valley Wilderness Area
Big Morongo Canyon	24,934	1982 and 1996	Mapped designated route system; Routes designated in 2002 Coachella Valley Plan Amendment	Hiking, wildlife viewing, picnicking
Black Mountain	51,261	1988	26-mile designated route system	OHV recreation and touring, equestrian riding, hiking, camping, prehistoric and historic interpretation, recreational mining on northeastern fringe of area, wilderness recreation, in the southcentral Black Mountain subregion.
Calico Early Man Site	834	1984	Mapped designated route system	OHV touring, hiking, camping, prehistoric and historic interpretation, located in the southern portion of the Calico Mountains subregion.
Christmas Canyon	3,445	NA	No route designation because most of ACEC is within Open area	OHV recreation and touring, historic interpretation. Located in Spangler Hills OHV area and China Lake Naval Weapons Center.
Cronese Basin	8,469	1984	Mapped designated route system	OHV touring, bird-watching, wildlife viewing, in the center of the Cronese Lake subregion.

Table D.1. Pre-WEMO ACEC Route Networks and Principal Recreation Activities

ACEC Name	Size (Acres)	Year	Route Status	Principal Recreation Activities
Desert Tortoise Research Natural Area	22,230	1988	Designated closed to vehicular use; protected by perimeter fence	Hiking and wildlife viewing, located in the southwestern portion of the Rands subregion.
Fossil Falls	1,630	1986	Designated route system	OHV touring, camping, hiking, rock climbing, prehistoric appreciation. Located at north end of Sierra subregion.
Great Falls Basin	9,539	1987	Mapped designated route system	OHV touring, picnicking, bird-watching, wildlife viewing. Located just north of Trona.
Harper Dry Lake	485	1982	Mapped designated route system; all routes within 100 yards of marsh vegetation closed.	OHV touring, bird-watching, equestrian riding. Located southwest of Black Mountain Wilderness Area in the Harper Lake subregion.
Jawbone/Butterbredt	147,832	1982	133-mile designated route system	OHV touring, bird-watching, wildlife watching, rock-climbing, hunting. Located in the Jawbone subregion.
Juniper Flats	2,387	1988	Mapped designated route system	Equestrian riding, OHV recreation and touring, access to Deep Creek hot springs. Located north of San Bernardino Mountains, in the western portion of the Juniper Flats subregion.
Last Chance Canyon	5,135	1982	Designated route system	OHV recreation and touring, historic appreciation, wildlife viewing. Located south of El Paso Mountains Wilderness Area.
Manix	2,907	NA	None	Paleontological and historic interpretation, OHV touring. Located at the western boundary of the Afton subregion.
Mojave Fishhook	637	1990	Designated route system	OHV touring, botanizing

Table D.1. Pre-WEMO ACEC Route Networks and Principal Recreation Activities

ACEC Name	Size (Acres)	Year	Route Status	Principal Recreation Activities
Rainbow Basin	4,103	1991	30-mile designated route system	Camping, OHV touring, equestrian riding, hiking, geologic, paleontological and prehistoric interpretation. Located in the southwestern portion of the Coolgardie subregion.
Red Mountain Spring (formerly Squaw Spring)	718	1987	Mapped designated route system; area closed to vehicular travel	Prehistoric and historic interpretation. Located in northern portion of Red Mountain subregion.
Rodman Mountains Cultural Area	6,208	NA	Routes outside Rodman Mtns. Wilderness were designated as part of Ord-Rodman Plan	OHV touring and recreation, cultural interpretation, hiking, wilderness recreation. Located in the southern portion of the Rodman Wilderness in the Newberry-Rodman subregion
Rose Springs	838	1985	Routes designated closed	Hiking, wildlife viewing, prehistoric interpretation, hunting. Located in north end of Sierra subregion.
Sand Canyon	2,583	1989	Specific route closures	Hiking, wildlife viewing, bird-watching, hunting, cultural interpretation. Located in southern end of the Sierra subregion.
Short Canyon	754	1990	Most of the ACEC routes are closed because they are within wilderness	Hiking, botanizing, wildlife viewing, bird-watching, hunting. Located in Sierra subregion, borders Owens Peak Wilderness.
Soggy Dry Lake Creosote Rings	184	1982	All vehicular routes closed to protect unique vegetation	Botanizing, hiking. Located just south of Johnson Valley OHV area in the Johnson Valley subregion.
Steam Well	41	1982	Designated route system; All routes closed with inclusion of ACEC in the Golden Valley Wilderness Area	Prehistoric and historic interpretation. Located in southwest edge of Golden Valley Wilderness area.
Trona Pinnacles	4,058	1989	Designated route system	Sightseeing, commercial filming, OHV touring, geologic interpretation. Located in South Searles subregion.

Table D.1. Pre-WEMO ACEC Route Networks and Principal Recreation Activities

ACEC Name	Size (Acres)	Year	Route Status	Principal Recreation Activities
Western Rand Mountains	31,102	1994	128-mile designated route system	OHV touring and recreation. Applied to ACEC and surrounding lands. Located in the Rand subregion
Whitewater Canyon	13,973	1982	Designated route system	OHV touring, wildlife viewing, hiking.

Desert Access Guides

Between the late 1980s and the mid-1990s, BLM published 21 Desert Access Guide (DAG) maps of the CDCA Plan area. Within the Ridgecrest and Barstow field office boundaries, these maps displayed the route networks designated in 1985 and 1987, and the networks designated for the ACECs. These DAGs were distributed for public use.

Listing of the Desert Tortoise

In April 1990 the Mojave population of the Desert Tortoise was listed by the United States Fish and Wildlife Service as threatened.

Ord Mountain Pilot Off-Road Vehicle Designations

In 1995, the BLM issued an emergency closure of routes in the Ord Mountain area in response to the 1994 designation of critical desert tortoise habitat in the area. The emergency closure utilized available on the ground knowledge, topographic maps, and early West Mojave Plan data that had already been collected in this sensitive area, to identify a total of 549 miles of routes in the area and designate 100 miles of routes on public lands as open. In response to public feedback on the emergency network, BLM undertook a pilot project within the Ord Mountain area to test methods to acquire a more complete inventory of routes of travel and revisit the emergency closure designations.

As part of the review, the Natural Applied Research Science Center (NARSC) was contracted to conduct a pilot project using low-level aerial photography to digitally record routes. The data was then captured using early GIS digitizing technology and computer evaluation to verify the inventory in the area. An additional 113 miles of routes was identified based on the aerial data review and field reviews by the public and BLM for a total of 662 miles over an area covering just under 125,000 acres. On public lands, 547 miles were identified on 102,135 acres, which did not include routes and lands received as a result of the recent 11,835-acre Catellus acquisitions in January, 2000. This proposed network was developed from public input and evaluated in the Ord-Mountain Route Designation EA, published and approved in 2000.

The Ord pilot project had some limitations but was considered successful in improving and augmenting on-the-ground inventory information. However, due to its expense, the Ord Pilot project could not be applied on a larger scale. Following the development of the Ord Pilot Project inventory, a large scale satellite-photography based draft route system was developed in

about 1997. This route system was developed using mid-1990's satellite photography and a custom-designed computer program that analyzed the satellite photos and identified linear features possessing shades of gray that matched the gray associated with a route. A computer modeling program was used due to the lack of staffing available to do heads up digitizing at the time. Once the computer based route system was finished it was field checked for accuracy. The field check identified what appeared to be "routes" in the satellite photos were sometimes fence lines and other non-route ground features. Because of these problems this draft system and inventory was abandoned and a GPS field inventory was undertaken beginning in the fall of 2001.

Redesign Effort

In the mid-1990s, BLM began a process to redesign a portion of the existing 1985 and 1987 route networks (WEMO redesign area). The primary focus of the WEMO redesign area became Desert Tortoise critical habitat. Certain other sensitive areas were also included in the redesign of the network. This redesign effort was known as the Western Mojave Desert Off Road Vehicle Designation Project, and it was approved by a Decision Record signed on June 30, 2003 (2003 WEMO Route Designation Project).

2003 Western Mojave Desert Off Road Vehicle Designation Project

The 2003 WEMO Route Designation Project built upon these earlier planning efforts. Its purpose was to update the previous route designation efforts, taking into account new or significant planning issues like the listing of the desert tortoise as a threatened species in 1990. The planning area for the 2003 WEMO Route Designation Project is synonymous with the region that was also addressed by the 2006 West Mojave Plan, an interagency habitat conservation plan that developed conservation strategies for over 100 sensitive plant and animal species.

The 2006 WEMO Plan was prepared through the collaborative effort of city, county, state, and federal agencies which had jurisdiction over lands within the region. To support the development of the 2006 WEMO Plan, these agencies and local jurisdictions cooperated with more than 100 non-governmental organizations (NGOs) including businesses, environmental groups, and user groups. Representatives of the agencies, jurisdictions, and the NGOs comprised the West Mojave Supergroup. In November 1999, the West Mojave Supergroup established four task groups to develop components of the WEMO Plan. Of these, Task Group 2 was developed to address the Motorized Vehicle Access Network.

To assist Task Group 2 and the route designation process, two subcommittees were formed: a field survey advisory group and a route designation technical committee. As the task group process evolved, certain issues would emerge that would result in considerable public interest or controversy, including the design of the motorized vehicle access network. When this occurred, public information meetings were held throughout the desert on an irregular basis. About a dozen of these meetings, attended by a total of approximately 250 persons, were held during the task group process. Many persons who first became involved through these meetings later joined one or another of the task groups.

Due to the size of the area covered by the WEMO Plan, 3.1 million acres of public lands in a larger 9.4 million area of contiguous lands, it was determine that the most effective way to

approach route designation was to subdivide the WEMO Plan area into manageable and recognizable designation planning units. This effort resulted in the creation of 21 "subregions".

These 21 subregions included: Amboy, Bighorn, Coyote, East Sierra, El Mirage, El Paso, Fremont, Granite, Juniper, Kramer, Middle Knob, Morongo, Newberry-Rodman, North Searles, Ord, Pinto, Ridgecrest, Red Mountain, Sleeping Beauty, South Searles and Superior. These 21 subregions cover approximately 1.3 million acres of public lands which is 42 percent of the overall planning area. In addition to the new subregions the planning effort would also incorporate the route designations efforts for the ACECs where route designation had been completed, the Ord Mountain Pilot Project and the remaining areas covered by the 1985-87 designation efforts. Some of this additional data was within one or more of the twenty-one subregions.

Based on the level of resource sensitivity 11 of the 21 subregions were selected for detailed updating in the Designation Project. A description of the field-surveyed subregions is provided in Table D.2.

Table D.2. Off-Road Vehicle Designation Subregions

Subregion	Principal Recreation Activities	Route Mileage Designated Open 1985-87	Route Mileage 2001 Route Inventory	Comments
Coyote	Rock hounding, off-highway touring/sightseeing, mining.	178	411	Calico Early Man Archaeological Site, Cronese Lakes ACEC, and Soda Mountains Wilderness Study Area. OHV recreation relatively light. Most OHV activity occurs in southwestern sectors.
El Mirage	OHV, recreational mining	49	267	El Mirage OHV recreation area borders subregion to the south. Area of more historic use than current use. Once more popular for races which have since shifted to the Open Areas. Edwards bowl in the western sector popular as a motorcycle area creates some conflicts with adjoining private property owners. Shadow Mountain once very popular with motorcyclists. Use now restricted due to conflicts with hamlet of Shadow Mountain to the south. Bajadas north of Shadow Mountain have been found to have higher than average desert tortoise sign.
El Paso	OHV use, rock hounding, shooting/hunting.	324	465	Last Chance Canyon ACEC and El Paso Mountains Wilderness abut the subregion. Very mountainous area universally popular for a variety of visitor types including jeepers, motorcyclists, miners, campers, rock hounders, equestrians, historical explorers and upland game hunters

Table D.2. Off-Road Vehicle Designation Subregions

Subregion	Principal Recreation Activities	Route Mileage Designated Open 1985-87	Route Mileage 2001 Route Inventory	Comments
Fremont	OHV use, shooting/hunting, rock hounding, equestrian riding, hiking, recreational mining.	214	582	Contains Barstow Woolly Sunflower ACEC, Harper Dry Lake ACEC, and the Black Mountain Wilderness. Northern hilly sectors very popular longstanding MC area; Gravel Hills and Hamburger Mill northwest of Fremont Peak known for long-term historical use. Bajada areas in the southern sectors not nearly as popular as the above-described areas to the north. Bajadas areas in the south and central sector known for historically high populations of desert tortoise.
Kramer	OHV use/dual sport, rock hounding, shooting/ hunting	254	642	Mining and homestead site established in the late 19th and early 20th century exists in the area, some of which may have historical significance.
Middle Knob	OHV touring/sightseeing, camping, hiking, hunting	N/A	91	Cultural resources are significant in the subregion. Contains biological values of special concern, including habitat for nesting birds of prey.
Newberry-Rodman	Equestrian, OHV touring, sightseeing, dual sport, rock hounding, mining	142	210	Subregion contains the Newberry Mountains Wilderness, the Rodman Mountains Wilderness and the adjoining Rodman Mountains ACEC. Rock art and cultural sites are within the subregion.
Ord	Recreational mining, OHV touring/ sightseeing	38	549	The historic Ord Mountain Road and the Daggett Wash Road are accessible by four-wheel drive vehicles and motorcycles (OHV/dual sport). The Stoddard Valley OHV Recreation Area to the west and the Johnson Valley OHV area to the southeast of the subregion provide for OHV/dual sport activities.
Red Mountain	OHV touring/sightseeing, shooting hunting, OHV/ dual sport, hiking, equestrian riding, mining.	234	733	The Grass Valley Wilderness is partly contained in the subregion and the Golden Valley Wilderness borders the subregion to the north. These bajada areas in the central west sector west of Cuddeback Lake, are known for historically high populations of desert tortoise and extremely high historical mining activity.
Ridgecrest	Hiking, equestrian OHV/dual sport	106	328	The Rademacher Hills trails open to the hiking, jogging, horseback riding and mountain biking.

Table D.2. Off-Road Vehicle Designation Subregions

Subregion	Principal Recreation Activities	Route Mileage Designated Open 1985-87	Route Mileage 2001 Route Inventory	Comments
Superior	OHV/dual sport, rock hounding, camping, mining.	396	668	Contains the Rainbow Basin National Natural Landmark ACEC. The Black Mountain Wilderness lies to the west of the subregion and the Calico Mountains lie to the south east of the subregion.

Seven of these subregions were within Desert Tortoise critical habitat: Coyote, El Mirage, Fremont, Kramer, Newberry-Rodman, Red Mountain and Superior. Middle Knob included sensitive plant habitat. Two others, El Paso and Ridgecrest were located close to the City of Ridgecrest, and both were popular areas with increasing OHV use. Finally, the Juniper subregion was included for a new field inventory in response to comments made during the public review of the Draft WEMO EIS.

Nine subregions were not selected for new field inventories. They included: Amboy, Bighorn, East Sierra, Granite, Morongo, North Searles, Pinto, Sleeping Beauty, and South Searles. These nine were not significantly affected by the issues associated with the other subregions. In these nine subregions, the existing 1985 and 1987 route networks were retained. The 2003 WEMO Route Designation Project made only a few minor corrections to the existing network in these subregions. These corrections included the realignment of some routes at boundaries between the ACEC networks and the 1985 and 1987 networks, to ensure that the routes connected seamlessly.

Between September 2001 and March 2002, thirteen field crews inventoried nearly 8,000 miles of OHV access routes within 10 of the 11 subregions that were selected for detailed updating. These 10 subregions encompass about 774,000 acres of public lands, which is 33 percent of the Limited access portions of the overall WEMO Planning area. The Juniper subregion ended up not getting a detailed field inventory due to time constraints and the availability of route data that was considered adequate at the time to meet the needs of a more detailed update. Both four-wheel drive and motorcycle crews participated in the survey. Routes were recorded using global positioning system (GPS) technology. The nature of the route (graded gravel, good dirt, motorcycle trail) was recorded, and nearly two dozen types of pertinent desert features mapped (including campsites, mines, trailheads, and water sources). This information was transferred into the planning team's digital GIS library. In addition, data collected by BLM field survey crews in 1985 and 1987, and during the preparation of BLM management plans for ACECs between 1980 and the late 1990s, was digitized and stored in the GIS database. This data was supplemented by data digitally collected from aerial photography taken in 1995 and 1996, and covering most public lands within the planning area.

The updates to eight of these subregions along with minor revisions to the 1985-87, and ACEC Off-Road Vehicle designations served as the basis for the evaluation in BLM's 2003 Environmental Assessment and Decision Record for the Western Mojave Desert Off-Road

Vehicle Designation Project. The minor revisions occurred in the North Searles and El Mirage subregions, Black Mountain ACEC along with edge matching efforts at 25 locations to align the ACEC, 1985-87, and 2002 designation boundaries. For the El Paso Mountains and Ridgecrest subregions the existing 1985-87 network was adopted until completion of a collaborative planning effort that with local jurisdictions and the general public.

The purpose of the 2003 Western Mojave Desert Off-Road Vehicle Designation Project was to update the existing West Mojave route designations, and to adopt the revised route network as a component of the CDCA Plan, while the 2006 WEMO Plan was under development. The 2003 Designation Project evaluated four route network alternatives developed to meet enhanced ecosystem protection and enhanced recreation objectives. The resulting Record of Decision selected Alternative A, which was based on the existing route designations, modified to incorporate a revised network within desert tortoise critical habitat and other sensitive resource areas. That network, totaling 5,098 mile of routes, served as the basis for the route network alternatives evaluated in the 2006 WEMO Plan.

2006 West Mojave Plan

The route designations adopted in the 2003 WEMO Route Designation Project effort was considered the baseline for the No Action Alternative in the development of the 2006 WEMO Plan. The baseline was subjected to minor modifications and a field survey was conducted in one additional subregion—Juniper Flats. The EIS for the 2006 WEMO Plan evaluated seven alternatives which addressed various use restrictions, using the findings in the 2003 WEMO Route Designation Project as a point of departure. With respect to travel management, the use restrictions on the routes varied among the 2006 WEMO FEIS alternatives, but the overall mileage of the network did not vary. The proposed network evaluated in the 2005 WEMO FEIS consisted of the 2003 network with modifications in specific areas. The Record of Decision (ROD) adopted the FEIS proposed action with minor modifications, resulting in the 5,098 mile network of the 2006 WEMO Plan.

Vehicle Access Decisions in 2006 WEMO ROD

In 2006, the BLM approved a comprehensive amendment covering the WEMO Planning area of the CDCA. Key elements of the CDCA Plan that were updated for the WEMO Planning Area include the Wildlife Element, the Vegetation Element, the Grazing Element, the Recreation Element, and the Motor Vehicle Access Element.

The vehicle route network approved in the 2006 WEMO Plan was based on the 2003 vehicle route network, with the following modifications:

- The mileage of non-motorcycle routes in higher density tortoise population areas was decreased from 439 miles to 384 miles;
- The mileage of vehicle routes within ACECs was reduced from 427 miles to 406 miles; and
- Within the Juniper subregion, a redesigned vehicle access network was adopted that consisted of 73 miles of open routes and 25 miles of routes that would be limited to use by single-track vehicles (motorcycles), which replaced the 152 miles of open routes that had been adopted in 2003.

Overall, the 2006 WEMO Plan included modification of the vehicle management decisions, including OHV route designations, on more than 2.35 million acres of Limited access public land within the CDCA. The ROD for the 2006 WEMO Plan approved the designation of 5,098 miles of motorized vehicle (OHV) routes.

The 2006 WEMO Plan Amendment approved a total of 12 separate decisions, each affecting multiple geographical areas within the planning area. Most of the decisions focused on establishment or adjustment of ACECs for biological resources and changes to multiple use classes to reflect an increased resource protection balance. The specific decision components related to Motorized Vehicle Use and route designations made in the 2006 WEMO ROD, are as follows:

- Decision 5: Recommendations made in the 1994 Rand Mountains-Fremont Valley Management Plan were adopted, including adoption of the proposed motorized vehicle access network to be managed with an educational permit system.
- Decision 6: The motorized vehicle access network in the Afton Canyon Natural Area was adopted.
- Decision 9: The motorized vehicle access network in the remainder of the planning area was adopted, and included minor modifications of the 2003 route network, a redesign of the Juniper subregion, and route closures in the Lane mountain milkvetch ACEC, Barstow woolly sunflower ACEC, the Mojave monkeyflower ACEC, and the Red Mountain subregion. The approved network also included the opening of a 9-mile undesignated route east of Haiwee Reservoir, and establishment of competitive "C" routes northeast of the Spangler Hills Open Area.
- Decision 10: The Stopping, Parking, and Camping Section of the CDCA Plan Motorized Vehicle Access Element was modified to incorporate restrictions within DWMA's, including limiting camping to previously existing disturbed camping areas adjacent to open routes and limiting stopping and parking to within 50 feet of the centerline of open routes.
- Decision 11: The portion of the Barstow to Vegas Race Course within the WEMO Planning area was deleted.
- Decision 12: The use of the Stoddard Valley to Johnson Valley Connector was modified to establish a connector route, and to delete its availability for competitive speed events.

In addition to decisions that were proposed in the 2005 EIS, the 2006 ROD made modifications as a result of resolution of protests. These modifications included specific changes to route designations in the Red Mountain, Ord, Newberry Rodman, Fremont, and Juniper subregions, and in Stoddard Valley. The specific routes designations are listed in the 2006 ROD.

The 2006 WEMO ROD also continued the administrative closure affecting 26 miles of selected dirt roads in a 17,000-acre area of the Rand Mountains, in order to allow time to complete work necessary to implement an educational program and permit system for recreational users.

The following management prescriptions for motorized vehicles (designated as "MVs" in the FEIS) were proposed as take avoidance measures:

- Open Routes (MV-1): Routes designated open would be available for a variety of uses including commercial, recreational, casual access, and non-competitive permitted uses. No motorized vehicles would be allowed to travel off of designated routes, except in emergency situations, or with the explicit permission of the BLM, or as specifically noted below.
- Speed Limits (MV-2): With respect to speed limits on unimproved roads, current law would apply. Basic Speed Law (38305) of the 2001 Vehicle Code, Traffic Laws states: “no person would drive an off-highway motor vehicle at a speed limit greater than is reasonable or prudent and in no event at a speed which endangers the safety of other persons and property.”
- Speed Regulators (MV-3): Within DWMAs, there is no proposal to install speed regulators; however, if monitoring or studies show that certain unimproved roads are causing increased tortoise mortality, the BLM will consider ways, including speed regulators, to reduce or avoid that mortality.
- Washes (MV-4): On public lands, motorized vehicle travel in washes would be allowed only in those washes that are designated as “open routes” and signed as appropriate.

West Mojave Route Network Plan Supplemental EIS

The West Mojave Route Network Plan (WMRNP) Supplemental EIS is being developed as a result of legal action that was brought against the 2006 WEMO Plan. The Record of Decision for the West Mojave Plan /Amendment to the CDCA Plan was signed in March 2006. In August of 2006, eleven environmental organizations sued the Bureau of Land Management (BLM) and the U.S. Fish and Wildlife Service (FWS) claiming the BLM’s designation of an off-highway vehicle route network throughout the WEMO planning area violated FLPMA. The plaintiffs also claimed that the Environmental Impact Statement and Environmental Impact Report for the West Mojave Plan violated the National Environmental Policy Act of 1969. The court order of September 2009 left in place most of the WEMO Plan and found no Endangered Species Act violations. However, the court ruling did fault the methods used to identify and designate the nearly 5,100 miles of off-road routes throughout the WEMO Plan area. Subsequently, a court Remedy Order of January 2011, remanded the 2006 WEMO Plan to the BLM and directed the BLM to prepare a revised OHV route network that complies with the designation criteria in 43 CFR 8342.1.

In response to the court’s ruling BLM started looking at the previous route designation efforts and identified the following issues and concerns:

1. Age of decisions

The route designations of 1985 – 1987 today are nearly 30 years old.

ACEC Plans which included route designations that were written between 1982 and 1995 are approximately 20 to 30 years old.

2. Increase in population and amount of vehicles registered

In the 34 years since the original adoption of the CDCA Plan the population of CA has grown by 57.4 percent (2010 U.S. Census compared to 1980 U.S. Census).

During the same time period the number of OHV registrations grew by 337.3 percent, from 235,003 to 1,027,612.

These changes result in a greater demand for the limited space and resources found on the public lands.

3. Quality of inventories establishing route system

The 1985 – 1987 designations did not result in a detailed inventory of all routes on the public lands. These designations were developed from a combination of sources including 15 & 7.5 minute USGS maps, aerial photography, and limited field visits.

Hundreds of thousands of acres of land has been acquired (and disposed of) throughout the Planning area since the mid-1980's through acquisitions, donations, disposals, and exchanges, including through the West Mojave Land Tenure Project and other major landowner agreements.

Authorizations approved under right-of-way, permit, and easement were documented in individual hard-copy project casefiles, and were not added to the inventory and designated network if not already included in the 1985 – 1987 designations.

The 21 subregions identified in the 2003 WEMO Route Designation Project cover only about 1.3 million acres (55%) of the overall 2.35 million acres of Limited access public lands within the planning area. They were only developed for what was believed to be the more environmentally sensitive areas at the time.

Intensive field inventories were only completed for 10 of the 21 subregions identified in the planning area for the 2003 WEMO Route Designation Project. These efforts encompassed roughly 774,000 acres or 33% of the West Mojave Planning area and recorded about 4400 miles of routes.

In the end only 8 of the 10 inventoried subregions received a route system revision in 2003. Between 2003 and 2006 the Juniper subregion was inventoried, and its designations addressed in the 2006 WEMO Plan.

Therefore, at the end of the 2006 EIS planning effort, 698,000 acres representing just under 30% of the WEMO Planning area had received a detailed inventory and updated route system.

4. Reproducible documentation supporting consideration of 43 CFR 8342.1 in the development of older route designation efforts

Due to the age of the original 1985-1987 route designation process, copies of all designation forms for all routes affected by that decision are not available.

Documentation is lacking or incomplete to show consideration of the Designation Criteria as outline in 43 CFR 8342.1 for the 2003 WEMO Route Designation Project per the court's ruling.

Areas outside of the 8 inventoried subregions of the 2003 WEMO Route Designation Project and the Juniper subregion did not have route-specific designation documentation. It is unknown what level of documentation exists to support the statement made in the 2003 Designation Project that the parts of the then existing network not included in the

2003 designation effort were reviewed to ensure compatibility with the WEMO conservation strategy and were in compliance with federal regulation

5. Compliance with new Travel Management policy and guidance

Route Designation for OHV use of the BLM administered lands has changed to keep pace with the current concept of Travel Management for the Public Lands. All forms of travel are now being considered in the designation process including subdesignations of Motorized, Mechanized as well as Non-motorized; not just OHV Open use as it was in 2006 and before. Additionally, this concept change means that travel for all forms of public land users are now considered in the process including rights of way holders, mining claimants, grazing permittees, as well as casual recreational users.

Because of these concerns and the change in Travel Management policy, BLM decided that 100 percent of the inventory in the planning area would be reviewed, and that the entire area would be considered for new route designations during the 2015 WEMO SEIS process. One of the first steps to be undertaken to reach the final goal of a designated travel network was to develop a base inventory of what at the current time (2013) exist out on the public lands.

The initial inventory was developed from multiple existing sources, and its accuracy and completeness varied depending upon the source. BLM then updated the inventory of linear features by reviewing existing features and tracing additional features from US Department of Agriculture's (USDA) one meter-resolution National Agriculture Imagery Program (NAIP) aerial photography into the Ground Transportation Linear Features (GTLF) geospatial database.

While the GIS staff were digitizing the route system into the GTLF geo-database system it was discovered that the 2001-2002 field survey was not as complete as thought to have been. This issue was confirmed to be true when staff compared NAIP aerial photography from 2005 against 2012 for the same location within the Coolgardie subregion. This comparison showed that routes were well-established on the ground in 2005 and that they were not recorded during the GPS inventory process conducted at that time. Refer to Figures D.1 and D.2 for a sample of what was found within the Coolgardie subregion. Additionally Figures D.3 through Figure D.12 show a sampling of similar missing route situations found within the El Paso, Juniper Flats, Middle Knob, Rand, and Stoddard Valley subregions respectively. Refer to Table D.4 for a comparison of the number of miles inventoried for the 2003 WEMO Route Designation Project compared to what was inventoried for the development of the GTLF geo-database.

Because of the change in policy to now consider and incorporate all transportation features no matter their purpose (authorized, permitted, or casual use) or mode of travel on them (motorized, non-motorized, non-mechanized) into the travel management strategy for an area, the route networks overall mileage will increase from that considered and approved as part of the 2006 WEMO EIS. Routes authorized by permit, right-of-way or easement undergo site-specific review, and, if approved within the last 30 years, would have considered the minimization criteria. Since the ROD for the 2006 WEMO Plan, about 250 miles of authorized and permitted routes have been added so far into the system, the majority of which existed prior to 2005. These routes continue to be added, and a complete review of case files will not be completed until the FEIS.

Finally, because the WEMO SEIS is going to review and update 100% of the planning area versus 30% that was completed in 2006, it is expected that the overall mileage of the route

system will increase. When the BLM conducted its inventory in 2001-2002, there were 4,400 miles of routes in the ten inventoried subregions that encompassed 33% of the 2.35 million acres in the Limited access portion of the planning area. With the development of the new inventory for the planning area approximately 15,000 miles of transportation linear features across the 2.35 million acres of Limited access public lands were identified. These 15,000 miles represent all forms of transportation features on the public lands for both casual use along with permitted uses such as rights-of-ways. Within the 10 subregions inventoried in 2001-2002, the GTLF effort found that the inventory increased by nearly 41 percent from about 4,400 miles in 2001-2002 to 6,200 miles in 2013 within those subregions. The amount of increase in the 10 previously inventoried subregions was surprising. However, some oversights were anticipated, and had been pointed out by the public and staff, particularly in identifying additional permitted routes and during the BLM 2012 route signing and monitoring efforts. It was unclear to what extent these were widespread or isolated issues with the inventory, or the result of non-compliance. BLM conducted sample surveys and based on these surveys, it is believed that most of the additional routes identified in the 2013 inventory existed in 2001-2002, but were not identified in the survey.

2017 Temporary Street-Legal Route Designations

In January 2017, BLM initiated an effort to designate 148 miles of routes located on BLM lands, but maintained by the County of San Bernardino County Public Works Department. This action was taken in response to a January 19, 2017 stipulation from the Court for an additional interim remedy. Use of the routes is limited to street-legal vehicles only, as defined by the California Department of Motor Vehicles. The street-legal designation by BLM is temporary, pending finalization of designations under the WMRNP. In support of this effort, BLM held public open house meetings in Yucca Valley on April 19, 2017, in Barstow on April 20, 2017, and in Barstow on May 3, 2017. The public review period closed on May 12, 2017. An Environmental Assessment (EA) has been released regarding the temporary restriction of street-legal only routes.

D.4 Process for Development of Route Network Alternatives

The WMRNP is being undertaken, in part, to complete the required Transportation and Travel Management (TTM) planning process for the WEMO Planning area.

As discussed in BLM's TTM Handbook (H-1342-1), every acre of BLM-managed public land must be designated as "Open", "Closed", or "Limited" Areas for OHV use. These area designations were made for the entire WEMO Planning Area in the CDCA Plan, and have not changed since 1980. As part of the planning area's TTM planning efforts, each individual transportation linear feature within "Limited" areas must also be designated as either:

- A Road, Primitive Road, or Trail that is part of the designated travel network;
- Transportation Linear Disturbance (not part of the travel network, i.e., closed routes); or
- A Temporary Route (not part of the travel network, e.g., routes available exclusively to one or more right-of-way or easement holders over a specified timeframe).

Within the OHV Limited areas, individual linear features are also further designated as either "OHV Open", "OHV Limited", or "OHV Closed". Both OHV Open and OHV Limited routes

are used by motorized vehicles. OHV Open routes are open to public use without limitations, while OHV Limited routes are subdesignated to indicate their type of limitation. These include subdesignation of routes for Administrative, ATV/UTV, Authorized/Permitted, Competitive event, motorcycle, seasonal, and street legal-only use. OHV Closed routes include "Non-Motorized" and "Non-Mechanized" routes, as well as "Transportation Linear Disturbances". The travel network alternatives developed for evaluation in the WMRNP consist of different combinations of these designations, as needed to meet different access, use, and resource protection objectives.

The required process in the TTM Handbook includes mandatory planning-level decisions, optional delineation of TMAs, and then implementation-level decisions, which can be made concurrent with the planning-level decisions, but must be completed within five years following the completion of the applicable LUP amendment. The general outline of the process is as follows:

- OHV Area Designations (mandatory planning-level decision);
- Identification of Travel Management Areas (optional planning-level decision);
- Designation of the travel management network consisting of roads, primitive roads, and trails (mandatory implementation-level decisions), temporary routes, and identification of other linear features as transportation linear disturbances.

In 43 CFR 8342.1, the preamble and the four components require designation of public lands and routes as open, limited, or closed based on protection of resources of the public lands, safety of all users, and minimization of conflicts among the various uses of the public lands, and in accordance with the following minimization criteria:

- a) Areas and trails shall be located to minimize damage to soil, watershed, vegetation, air, or other resources of the public lands, and to prevent impairment of wilderness suitability.
- b) Areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitats.
- c) Areas and trails shall be located to minimize conflicts between off-road vehicle use and other existing or proposed recreational uses of the same or neighboring public lands, and to ensure the compatibility of such uses with existing conditions in populated areas, taking into account noise and other factors.
- d) Areas and trails shall not be located in officially designated wilderness areas or primitive areas. Areas and trails shall be located in natural areas only if the authorized officer determines that off-road vehicle use in such locations will not adversely affect natural, esthetic, scenic, or other values for which areas are established. (Note: "Natural areas" and "primitive areas" are not terms used by BLM and thus these factors do not apply).

The above criteria served as the basis for identifying resources to be considered and establishing thresholds to trigger measures to minimize impacts for each linear feature identified in the current inventory under each alternative. These thresholds are referred to throughout this Draft SEIS as "minimization triggers". A detailed description of each step of the route designation process, including the current status and future plans, is provided in the subsections below.

OHV Area Designations

The designation of all acreage as Open, Limited, or Closed to OHV use is required as part of the Land Use Planning (LUP) process for each planning area. The CDCA Plan, which includes the WEMO Planning area, includes OHV area designations. No changes to these designations were proposed in the 2006 WEMO Plan or the recently adopted DRECP LUPA, and none are being considered in this current plan amendment effort.

Identification of Travel Management Areas

Identification of TMAs is an optional tool that BLM Field Offices can use to facilitate their overall TTM process. The identification of TMAs is a land use planning-level decision that must be addressed in the applicable LUP or amendment, which in this case would be an amendment to the CDCA Plan, as amended by the 2006 WEMO Plan and 2016 DRECP LUPA.

In the WEMO Planning Area, the feasibility of establishing TMAs and using them to facilitate TTM planning was evaluated as a result of the scoping process. Following the initial scoping meeting in September 2011, BLM held eight travel designation workshops within the identified TMAs, with the intention of conducting additional scoping that focused on the particular uses, resource issues, and areas of controversy that are specific to each TMA.

One purpose of the current planning effort is to establish TMAs as part of the Motorized Vehicle Access Element of the CDCA Plan. The BLM has identified three Alternatives related to establishment of TMAs, including:

- Alternative 1: No Action, which would include no TMAs being established;
- Alternatives 2 and 3: Establishment of eight TMAs, as developed during the scoping process; and
- Alternative 4 (Proposed Action): Establishment of nine TMAs, based on additional analysis following the scoping period.

Identification of Subregions

Similar to the identification of TMAs, the BLM's evaluation of public comments received during the scoping process led to the definition of subregions that were later used to facilitate the analysis of impacts and identification of route network alternatives. As the public comments were analyzed to identify issues, common issues were found to be grouped geographically based on proximity to population centers, topographical and geologic setting, presence of sensitive resources, historical land uses, and other characteristics. These areas were found to be similar to the geographic boundaries used by BLM's rangers to facilitate law enforcement efforts, and comprise 35 subregions throughout the WEMO Planning area. Based on the issues and similarity to BLM's law enforcement boundaries, BLM staff chose to evaluate the existing route network and develop route network alternatives on a subregion basis. The 35 subregions are defined in Table D.3, and shown on Figure 2.1-1. Detailed descriptions of the subregions are provided in subsection D.5.

There are some distinct differences in the establishment of TMAs and subregions. TMAs are planning decisions used to establish common objectives and coordinate management actions throughout an area. The subregions were used as a tool to facilitate resource-specific analysis,

but were not intended to act as administrative units for establishing land use planning objectives and coordinating management actions.

The number, configuration, and names of the subregions in this Draft SEIS have been modified from those evaluated in the previous Draft SEIS. This is due to the designation of two new National Monuments, the Mojave Trails National Monument and the Sand to Snow National Monument, within the WEMO Planning area. Each of these new monuments overlaps the boundaries of multiple subregions that had been used for analysis in the Draft SEIS, so the boundaries have been adjusted to allow each monument to serve as a stand-alone subregion. This has allowed the BLM to specifically consider the objectives expressed in each national monument's Presidential Proclamation in route network analysis and decisions within these subregions.

Table D.3. Summary of WEMO Planning Area Subregions Used to Support the Route Network Analysis and Development of Draft Implementation Strategies

Subregion	Indicator on Maps	General Location
Broadwell	BL	South third of TMA 1, bounded by Interstate 40 on south, Power line road on the east, Newberry Springs to west, Hidden Valley Rd to NW, and Cady Mountains to the NE.
Afton	AC	North third of TMA 1, bounded by Interstate 15 on NW and NE, Hidden Valley Rd on south west, Mojave National Preserve on the east, Union Pacific Railroad to the south east, Cady Mountains on the south central boundary, and Newberry Springs on the west boundary.
Barstow	BA	West third of TMA 1; directly east of Barstow, north boundary Hwy 15, south boundary Hwy 40. Majority land private, mixed development, military base, railroad, agriculture.
Darwin	DA	Northern end of TMA 2, bounded by Hwy 190 on the north, Death Valley NP on the east, China Lake NWS on the south, and Coso Range Wilderness on the west.
Sierra	SI	Western half of TMA 2, bounded by CDCA boundary and Hwy 190 on the north, China Lake and Darwin subregion on the east, Hwy 178 on the south, and the Inyo NF and CDCA boundary on the west.
North Searles	NS	Northeastern end of TMA 2, bounded by the Slate Range Crossing on the north, the ridge top of the Slate Range separating Searles Valley from Panamint Valley on the east, Township line 26S on the South, and China Lake NWS on the west.
South Searles	SS	Southeastern end of TMA 2, bounded along Township line 26S on the north, China Lake NWS on the east, Randsburg Wash Road on the south, and China Lake NWS on the west.
Joshua Tree	JT	In TMA 3, bounded by Highway 62 to the north, Joshua Tree National Park to the south and east, and Sand to Snow National Monument on the west.
Wonder Valley	WV	In TMA 3, bounded by Highway 62 to the south, Twentynine Palms Marine Corps Air Ground Combat Center 29 on the north, Amboy Road on the east, and Highway 247 on the west.

Table D.3. Summary of WEMO Planning Area Subregions Used to Support the Route Network Analysis and Development of Draft Implementation Strategies

Subregion	Indicator on Maps	General Location
Rattlesnake Canyon	RC	In TMA 3, bounded by Highway 247 on the north and east, Sand to Snow National Monument on the south, and U.S. Forest Service land to the west.
Juniper Flats	JF	Southwest corner BFO; borders Hwy18 on east, SBNF to south, Mojave River on west & Hwy 247 to north.
Sand to Snow National Monument	SA	The Monument has two separate areas. There are two sections in Rattlesnake Canyon T1NR5E SBM to include section 4, T2NR5E SBM and to include section 19-21& 28-33. The second area is in Morongo Valley bounded by the National Forest on the west, on the east is Joshua Tree National Park.
Mojave Trails National Monument	MT	Bounded by the WEMO planning boundary on the east, and the Union Pacific Railroad and Interstate 15 on the north, Afton Canyon, Broadwell, Twentynine Palms, and the Cleghorn Lakes Wilderness are on the west, and to the south is Joshua Tree National Park.
Jawbone	JB	Northern end of TMA 4, bounded by Hwy 178 on the north, Hwy 14 on the east, Township line 31S on the south, and the CDCA boundary on the west.
Middle Knob	MK	Central section of TMA 4, bounded by Township line 31S on the north, Hwy 14 on the east, Kern and Los Angeles county lines on the south, and the CDCA boundary on the west.
Lancaster	LA	Southern area of TMA 4, bounded by Highway 58 on the north, San Bernardino county line on the east, Angeles NF on the south, and the CDCA boundary on the west.
Fremont Peak	FP	Northwest corner of BFO; N boundary Ridgecrest OF, W boundary Hwy 395, S boundary Hwy 58 & BNSF, E boundary Harper dry lake.
Black Mountain	BM	Northwest portion, east of and similar to Fremont Peak. N boundary Ridgecrest, China Lake, W boundary Fremont Peak, S boundary Hwy 58 & BNSF, E boundary Coolgardie.
Harper Lake	HL	South central portion of TMA 5. North of Highway 58, including Harper Dry Lake.
Coolgardie	CG	North central portion TMA 5. Softer & rounded landscape, between Ft Irwin to north & City of Barstow to south; Calico to east & Black Mountain to west.
Mitchel Mountains	MM	Center of BFO, south center portion of TMA 5. Small pocket of low rugged mountains border north side of Barstow City.
Calico Mountains	CM	Central portion of TMA 5. Borders I15 on south, Ft. Irwin Rd to west & north, Alvord Mountains to east.
Cronese Lake	CL	North eastern portion of TMA 5. Borders I15 on south, Ft. Irwin to north; west from Coyote Dry Lake east to almost Baker.
El Mirage	EM	Pocket area north of El Mirage, west of Hwy395, east of LA county & south of Edwards.
Kramer Hills	KH	West center portion of BFO and northern portion of TMA 6. West boundary is Hwy 395 & east is Helendale Rd; north boundary is Hwy 59 & south boundary is Silver Lakes.

Table D.3. Summary of WEMO Planning Area Subregions Used to Support the Route Network Analysis and Development of Draft Implementation Strategies

Subregion	Indicator on Maps	General Location
Victorville	VV	Southern portion of TMA 6 west of the Mojave River, and east of the Los Angeles County/San Bernardino County boundary.
Iron Mountain	IM	Area south of Hwy 58, east of Helendale, and north of Route 66.
Ridgecrest	RI	Northeastern portion of TMA 7, including the community of Ridgecrest, bounded by China Lake NWS on the north and east, Golden Valley Wilderness on the south, and Hwy 395 on the west.
El Paso	EP	Northwestern portion of TMA 7, bounded by Hwy 178 on the north, Hwy 395 on the east, Garlock and Redrock-Randsburg Road on the south and Hwy 14 on the west.
Rand	RA	Southwestern portion of TMA 7, bounded by Garlock and Redrock-Randsburg Road on the north, Hwy 395 and the Kern/San Bernardino county line on the east, Hwy 58 on the south, and Hwy 14 on the west.
Red Mountain	RM	Southeastern portion of TMA 7, bounded by Golden Valley Wilderness and Township line 29S on the north, China Lake NWS on the east, Cuddeback Lake Road, Hwy's 395 and 58 on the south, and the Kern/San Bernardino county line on the west.
Stoddard Valley	SV	Area between Victorville & Barstow, south of Hwy 15; east boundary Hwy 247, west boundary Mojave River.
Ord Mountains	OM	Nearly geographical center of field office, center north of TMA. West boundary Hwy 247, east boundary Camp Rock Rd, north boundary I40 & Bartow, south is Lucerne Valley
Newberry Rodman	NR	Located within TMA 8. Bounded by Interstate 40 to the north, Powerline Road and Twentynine Palms Marine Corps Air Ground Combat Center 29 to the east, Camp Rock Road to the west, and the Johnson Valley Off Highway Recreation Area to the southwest.
Johnson Valley	JV	In TMA 8, includes Johnson Valley OHV Area and public lands as far south and west as Hwy 247.

Development of Travel Network Alternatives in the Draft SEIS

Implementation-level decisions include the designation of individual roads, primitive roads, trails, and temporary route as part of the designated travel network. Roads, primitive roads, trails, and temporary routes to be included in the network would include OHV Open and OHV Limited, non-motorized, and non-mechanized routes. Also, non-mechanized routes in wilderness or other OHV Closed Areas may be included in the network, consistent with current wilderness policies, plans, and minimum tool standards. Travel management plan decisions will ultimately identify selection of management prescriptions for individual routes in the network, including signage; speed limits; stopping and parking restrictions; or restrictions based on season, time of day, or weather.

Route designations that were evaluated and adopted in the 2003 Environmental Assessment for the Western Mojave Desert Off Road Vehicle Designation Project were the starting point for the

analysis in 2006 WEMO Plan, and the adopted 2003 network, with some modifications as a result of public comment on the 2003 WEMO Plan DEIS, was proposed and analyzed in the 2005 WEMO Plan FEIS. The 2006 WEMO Plan ROD approved the FEIS route designations, with some minor modifications. The 2006 WEMO ROD was vacated by the Court's Summary Judgment order, which required BLM to reconsider the route designations, consistent with the 43 CFR 8342.1 regulations.

In response, BLM has re-developed the WEMO route designation process in accordance with the TTM Handbook. To develop travel network alternatives that provide for a coherent network and include route designation criteria for consideration in the March, 2015, Draft SEIS, BLM implemented the following steps:

A. Conduct Inventory and Establish the Baseline

- The initial basis of the route network inventory was the 2006 WEMO Plan inventory, as corrected per the errata maps ordered by the Court, and provided by BLM.
- This initial inventory was taken from multiple sources, and its accuracy and completeness varied depending upon the source. BLM then updated the inventory of linear features by reviewing existing features and tracing additional features from USDA's one meter-resolution National Agriculture Imagery Program (NAIP) aerial photography into the Ground Transportation Linear Features (GTLF) geospatial database. The inventory consisted of the 2006 WEMO Plan network (as corrected and adjusted by the BLM pursuant to the Court's order), which serves as the No Action Alternative, and other linear features that currently exist on the ground, to ensure that all existing features were included in the analysis. Note that this inventory reflects the on-the-ground features existing as of 2013, and thus includes features that were developed after 1980. It also reflects substantial improvement in technical accuracy—many of the previously unrecognized features are simply the result of better photography since 1980 and were not detected at that time, and many others are the result of subsequent land acquisitions and permitting activities.
- The route inventory developed from the NAIP aerial photography has been continually ground-truthed during field surveys in 2012 through 2018 that were conducted by the BLM in order to sign and monitor the open route network.
- The 2012-2013 inventory is intended to include all routes that still have some evidence of recent past or current use. Some routes may be included where recent use no longer is evident as a result of active or passive reclamation, and the inventory will be updated as new on-the-ground information confirms use levels. This is a continuing process that is reported in quarterly reports to the Court and copied to the plaintiffs. A sample review of earlier (2005) and later (2013) aerial photographs indicates that the inventory represents a combination of previously known and undocumented routes that have been on-the-ground for at least the last 8 years, and that the inventory is relatively stable.
- The BLM identified and collected existing resource data, in Geographic Information Systems (GIS) format, to be considered based on the requirements of

43 CFR 8342.1, the Court's Summary Judgment and Remedy orders, and scoping comments.

B. Document Analytical Process

- BLM developed an Access database that was used to document the potential route segment baseline, the resources associated with each route segment, the preliminary route network recommendations resulting from application of the minimization trigger analysis using GIS, the public input and other non-GIS information captured for each route segment, and the rationale for the final staff recommendations for each preliminary alternative (e.g., documenting instances where professional judgement or other route-specific or resource-specific information may have overridden the GIS based analysis).
- Once alternative development was complete, the Access database was used to generate an analysis of impacts from the route network under each alternative to 43 CFR 8342.1 criteria.
- The Access database facilitates review of the coincidence between a route segment and one or more potential resource issues to clarify or quantify that coincidence, allows entering additional known route use or resource information that may affect the route network recommendation, and provides for the assignment of specific minimization and mitigation for each route segment within each alternative, and modification of the preliminary GIS-developed recommendation, where appropriate.
- This database was used to document adjustments to specific routes in the network based on identification and analysis of new issues and needs.

C. Identify Mechanisms to Use for Alternative Development

- The BLM identified the No Action Alternative, which, based on the Remedy Order, is the route network currently in use until a revised network is approved.
- The BLM identified specific resource values (e.g. riparian areas) that could adequately identify potential resource impacts based on the 43 CFR 8342.1 minimization criteria associated with the network and with individual routes and linear features.
- The Network-wide minimization measures, described in more detail in item D below, were identified for each alternative. The specific parameters for the following were elements of the potential minimization measures:
 - Stopping, parking and camping parameters were modified, specific to each alternative.
 - The approach to routes that had been designated as “Closed” in the 2006 WEMO Plan decision was determined for each alternative, subject to route-specific review.
 - The approach to routes which were undesignated in the 2006 WEMO Plan decision (i.e., features that were added in 2013 as a result of the GTLF

inventory update and the on-the-ground signing and monitoring process) was determined for each alternative, subject to route-specific review.

- The approach to competitive-event routes outside of OHV Open area.
- The approach to designated parking, staging and camping areas in sensitive locations.
- Staff identified resource minimization triggers that would identify the potential need for minimization and mitigation of resource impacts on the network and on each specific route segment (referred to herein as minimization measures), for criteria in 43 CFR 8342.1. Some of the minimization triggers were based on a distance between the route and the resource (e.g. route within 50 feet of a riparian area), while others were based on co-location of any portion of the route with a resource (e.g., route within a desert wash). In most cases, the comparison of the route to the resource was based on a GIS analysis. In cases where the resource data were not available in GIS, such as tribal areas, the comparison was done based on the resource specialists' working knowledge of the local area, supplemented with additional field visits and tribal consultations, as needed.
- The BLM developed objectives to be considered as part of the framework for the route network alternatives, considering overall goals in the CDCA Plan, 2006 WEMO Plan, and 2016 DRECP LUPA, as well as public scoping comments.
- BLM adjusted the minimization triggers by alternative, reflective of the objectives for each alternative.

D. Issues and Assumptions Used to Develop Alternatives

- All action alternatives utilize the 43 CFR 8342.1 minimization criteria, as well as factoring in the issues of network connectivity, pertinent resource issues not identified in the 43 CFR criteria, and information on the use of the network and of specific routes, including information provided by the public.
- The specific initial minimization measures and mitigation responses in each alternative vary, and the minimization trigger for closure as the initial minimization measure, is lower for Alternative 2 (closure is more readily triggered) than in Alternative 3 (closure is less readily triggered with mitigation more readily triggered). In Alternative 4, the selection of either initial minimization through closure or other mitigation measures, as a response to conflicts was more sensitive to existing uses and needs.
- Minimization and mitigation measures fall into three categories: (1) network-wide; (2) site- or use-specific; and (3) designation changes to a route segment or entire route.
- Network minimization measures minimize impacts of the network on a network-wide basis. Identifying some of these at the outset of the process helped focus other potential minimization and mitigation.

- The site- and use-specific mitigation responses were developed to specifically respond to the sensitivity and location of the conflict. These are outlined in Section 2.3.
- Designation changes to minimize impacts included route closure or further limitation of OHV and other uses of a route by vehicle type (such as closure to OHV use), by authorized user, or by season of use. These terms are defined in the glossary. For the purposes of this analysis, the following assumptions were made with respect to vehicle use:
 - Narrower routes (single-track motorcycle routes), and then quad routes, are considered less impacting than 4-wheel drive routes;
 - Two-wheel drive improved routes are considered less impacting than 4-wheel drive routes, other factors being equal;
 - Non-motorized routes and primitive trails (in Wilderness Study Areas) are considered less impacting than OHV routes;
 - Non-mechanized routes are considered less impacting than non-motorized routes;
 - Hiking routes are considered less impacting than non-motorized routes and primitive trails; and
 - Seasonal-use routes are less impacting than OHV routes, other factors being equal, and may be less impacting than other routes and trails.
- Other minimization measures address impacts through the development of post-designation implementation strategies, as outlined in the TMPs. These can include, but are not limited to, strategies for:
 - Monitoring patrols;
 - Route improvement, upgrade, or reroute;
 - Law enforcement patrols;
 - Fencing, gates, vehicle exclusion barriers, or other vehicle control mechanisms;
 - Water erosion control structures; and
 - Measures to abate fugitive dust.
- Also, the following assumptions were made with respect to users:
 - General public user routes (not available for competitive events) are less impacting than public user routes that are also available to competitive event users;
 - Authorized use and temporary routes are generally less impacting than routes open to the public; and
 - Administrative routes are less impacting than either authorized or public-use routes.

E. Summary of the Alternative Development

The minimization triggers and measures that were developed by alternative are included in the alternative-specific discussions.

1. The most current resources data was overlain on the 2013 inventoried routes to create a computer-generated Geographic Information Systems (GIS) layer and BLM ran a comparative GIS analysis of the inventoried route segments to identify specific locations of potential resource impacts, based on network wide and resource-specific minimization triggers.
2. Three sets of network-wide measures were identified to focus and minimize impacts, depending upon the alternative: a) No Action; b) Alternative 2; and c) Alternatives 3 and 4.
3. BLM staff reviewed the results of the GIS analysis and other resource comparisons to assure that the minimization triggers would adequately identify impacts to sensitive resources. Where impacts were not adequately identified, the minimization triggers were adjusted accordingly, and the analysis re-run.
4. Based on the types of impacts to sensitive resources, route-specific conflicts with the 43 CFR 8342.1 criteria, the objectives of the each alternative, and the overall resource goals of the WEMO Planning area, the BLM refined the minimization triggers to establish the framework for identification of the initial route network alternatives that would incorporate standard minimization measures (e.g., closures and route limitations) and also identify routes that may need additional mitigation measures or other minimization.
5. For Alternatives 2 and 3, a preliminary alternative was then generated through the GIS exercise that included initial assignment of a preliminary designation and sub-designation of each route segment based on resource impacts. Maps of each of the subregion networks in a particular TMA for each of the alternatives were generated. These maps were integrated with additional resource, recreational, and other information to provide context for the route-specific review and development of the alternative.
 - a. Each feature was then reviewed and additional site-specific information applied. In addition, the level of conflicts and issues was assessed.
 - b. Initial connectivity needs were identified where the minimization triggers result in routes with some route segments recommended for closure and other segments recommended to stay open.
 - c. Conflicts in use were identified where the resulting preliminary alternative results in routes where one or more of the alternative objectives would recommend consideration of different approaches to minimization and mitigation.
 - d. Conflicts in analysis were identified where the resulting preliminary alternative results in a route segments that include different approaches to minimization and mitigation.

- e. Connectivity issues and conflicts were addressed based on the relative sensitivity of affected resources, known uses and needs of the route segment, the objectives of the alternative, additional resource and recreation goals for the area, where identified, and other information from staff, other agencies, and the public, to determine if a feature is included within the alternative travel network as OHV Open, OHV Limited or OHV Closed, and any appropriate additional mitigation measures are identified.
 - f. Specific minimization measures were identified by resource, as needed.
6. BLM staff then began the development of the alternative from the preliminary GIS alternative. The maps with the initial designations were reviewed by BLM staff, and adjusted based on the identified conflicts and issues, public or other agency input, site-specific knowledge, and to ensure that the network would be complete and link to adjacent subregions seamlessly to create a travel management area network.
7. For No Action and Alternative 4, Steps 6 and 5 were reversed in order. BLM began with the No Action alternative. The No Action alternative was adjusted only to correct errors and add known rights-of-ways that had been overlooked. Alternative 4 was then developed from the No Action alternative, as corrected. Alternative 4 factored in additional site-specific knowledge, conflicts and issues, public input from scoping and from the subsequent WMRNP Desert Advisory Council (DAC) Subgroup recommendations to the BLM District Manager (the reports are posted on the DAC website at <http://www.blm.gov/ca/st/en/info/rac/dac/wmrnp.html>), and input from other agencies and from staff, to develop the preliminary Alternative 4 network. Then, as with alternatives 2 and 3, a GIS exercise generated maps in each subregion within a TMA that showed remaining areas of conflict. The GIS exercise was used for the No Action alternative as well, to identify remaining conflicts and issues as well, as a basis of comparison with the other alternatives. No changes were made. Alternative 4 maps indicated which of the preliminary routes and route-segments in the initial Alternative 4 would need site-specific review for additional minimization measures (closure or use limitation) and mitigation measures, and other route options to address unmet needs and continuity of the network where conflicts had been identified.
8. The preliminary identification of a route under all alternatives was modified to (1) complete the network, (2) ensure inclusion of authorized rights-of-way that were known, (3) incorporate other staff or public input, and (4) address level of sensitivities. Where conflicts were identified during these changes, additional minimization measures could be identified for the route. Where sensitivities were known not to exist (false positives) or to be less problematic than the GIS indicated, routes may have been opened.
9. Input on specific types of uses other than OHV use was taken into consideration in development of the alternatives, including non-motorized and non-mechanized trails, and motorcycle routes. One or more alternatives may have been adjusted,

based on the overall goals of each alternative, to provide a reasonable range of alternatives for routes that are particularly sensitive, in consideration of network continuity, in consideration of different resource values, or for routes that received a wide range of feedback from the public during scoping.

10. For routes ending at a jurisdictional boundary or private property, the following preliminary designations would generally be made, subject to agency consultation, the need for a reasonable range of alternatives, and potential mitigation measures:
 - a. For the Department of Defense, the route would be identified as a transportation linear disturbance (closed) from the last intersection, unless the route leads to an official gated access.
 - b. For the National Park Service, US Forest Service, California Parks, or California Fish and Wildlife, route access would be matched to the corresponding designation by the other jurisdiction, unless impacts were further minimized based on the minimization criteria, or site-specific input was provided by the agency. For example if the route on US Forest Service land was OHV, BLM would allow for connection by identifying the route as OHV Open, or, if the route was subject to an authorization, it would be designated as OHV Limited. Otherwise, the route would be identified as a transportation linear disturbance (closed) from the last intersection.
 - c. For a route entering private property or land of the California State Lands Commission, the route would be designated as OHV Open to allow for access to the private parcel, to the extent feasible with the current network, and consistent with a review of the minimization criteria. If the property boundary was known to be fenced, or BLM was contacted by owner and asked to not provide access, the route was designated as a transportation linear disturbance (closed) from the last intersection, consistent with network connectivity in at least one alternative, consistent with the minimization criteria.
 - d. For a route that runs adjacent to other jurisdictions or private property, no specific approach was taken. These routes were addressed based on site-specific factors and the objectives of each alternative.
 - e. For a route which intersects a nationally designated trail, if the route provides access to a trailhead, it was identified as OHV Open, unless there is no parking or staging area or the route is located some distance from the designated trail, consistent with the minimization criteria. If the route conflicts with trail use, such as traveling parallel to the trail, then it was generally identified as a transportation linear disturbance (closed). These designations may be adjusted in the Final SEIS, to achieve consistency with the draft DRECP Plan setbacks from designated trails (see <http://www.blm.gov/ca/st/en/prog/energy/DRECP/policy.html>).

11. After the route-specific review, these administrative draft alternative designations went through a preliminary impact analysis process and additional adjustments may have been made based on the results of the initial analysis of impacts and the overall goals of the alternative.
12. The results of the analysis are documented in an Access Table by route or route segment, referred to as a WEMO ID. These WEMO IDs were used to break apart routes in order to allow more detailed, site-specific analysis of the impacts of its various parts. Each WEMO ID is cross-referenced back to the route name, and includes data for the route, who input data, how the route is being used, adverse impacts, recreational assets, public comments, the alternative designation (transportation and travel uses) under the alternative, and whether mitigation measures are identified.

The alternative networks were displayed on maps and reviewed to verify that the resulting route network within each alternative was viable, met the objectives of the alternative, and was consistent with the 43 CFR 8342.1 minimization criteria, the goals and objectives of the CDCA Plan, as modified herein, and the additional goals and objectives of the 2006 WEMO Plan. Adjustments were made in highly sensitive areas based on issues that were not identified through the GIS analysis and preliminary review. Management reviewed staff recommendations, made adjustments to alternatives, and developed the Draft SEIS Proposed Action.

Modification/Development of Travel Network Alternatives in the SEIS

The process described in steps A through E above was used to develop the alternative route networks for Alternatives 1 through 4, which were evaluated in the WMRNP Draft SEIS published in March, 2015. BLM received and evaluated public comments on the route networks associated with Alternatives 1 through 4 in the Draft SEIS during two rounds of public review in 2015, ending in January, 2016. However, by January 2016, BLM was proposing to make other changes in land use designations and associated conservation goals in the DRECP LUPA, and made the decision to delay consideration of route networks in the WMRNP until the changes associated with the DRECP LUPA became final. The DRECP LUPA was adopted in September, 2016, and its land use designations, modified conservation goals, and Conservation and Management Actions (CMAs) now serve as the framework for consideration of the route network alternatives in this Draft SEIS. As a result, the original route networks associated with Alternatives 2, 3, and 4 have been revised, including re-development of Alternative 4 into the Proposed Action, to incorporate BLM's adoption of the DRECP LUPA, as well as other land tenure adjustments and route network corrections identified based on public comments on the 2015 Draft SEIS.

The changes and updates used to modify Alternatives 2 and 3 and to re-develop Alternative 4 as the Proposed Action, included:

- The route inventory was updated following publication of the Draft SEIS, to include authorized routes which were not previously included in the inventory evaluated in the Draft SEIS, to incorporate the results of field observations and monitoring by BLM staff, and to incorporate public comments on the presence or absence of specific routes. Changes made in response to field observations included elimination of washes that were later determined to not be actually used as routes. BLM continued to update the

inventory on an ongoing basis, as staff working in the field identified changes in conditions. The revised inventory was incorporated into modifications of the route networks for Alternatives 1 through 4, and in the development of the Proposed Action.

- BLM conducted detailed review of all alternatives to ensure continuity of the route network. This included identification, review, and, if necessary, correction of designations for small route segments which had been designated as transportation linear disturbances within a longer open route, and vice-versa. It also included review of route designations along single linear features that crossed off and then back onto public lands, to ensure that designations on either side of the adjacent land parcel were consistent.
- The universe of available route designations was expanded to allow designation of some routes as “Competitive”, or “C-routes”, to be used during authorized competitive events. The Alternative 2 through 4 route networks were reviewed and the C-route designation applied, where applicable. The C-route designation was also applied, where applicable, to routes in the Proposed Action.
- Global changes in designation were made in specific geographic areas, or for specific types of routes. These changes vary by alternative, depending on the objectives of that alternative:
 - Routes within lands acquired by the Department of Defense (DoD) for management as a conservation easement as compensation for the expansion of the Fort Irwin National Training Center. These routes are designated globally as transportation linear disturbances under Alternative 2. Under Alternative 3, the backbone network has been designated as open routes. Under Alternative 4, the designation in these areas is the same as under WEMO 2006 (the No Action Alternative), except for specific routes on which public comments were considered.
 - Routes within the China Lake expansion area. Under Alternative 2, all routes in this area were designated as transportation linear disturbances. Under all other alternatives, the routes are designated as they were under WEMO 2006 (the No Action Alternative).
 - Routes within Special Districts (CSA 70 and road districts in San Bernardino County). Under Alternative 2, these routes were designated globally as street-legal use only. Under Alternative 3, the route designations under WEMO 2006 were applied. Under Alternative 4 (the Proposed Action), the street legal designation was applied to San Bernardino County Public Works roads only, and all other roads were designated as they were under WEMO 2006.
 - Routes within the Mojave Trails and Sand to Snow National Monuments. Under Alternatives 2 and 3, all routes remained designated as they were in the Draft SEIS. Under Alternative 4, the routes are designated the same as the Alternative 3 routes in the Draft SEIS, but the network will be refined in future work efforts.
 - Routes within Lands Managed for Wilderness Characteristics. Under Alternative 2, routes remained designated as they were in the Draft SEIS, and the network will be refined in future work efforts. The same designations apply to the

Proposed Action. Under Alternatives 3 and 4, the routes are designated as they were under WEMO 2006.

- Routes with authorized rights-of-way. Under Alternative 2, these routes are globally designated as “authorized only”. Under Alternatives 3 and 4 (the Proposed Action), these routes are designated as “OHV Open”, with no sub-designation. Due to the digitization of many rights-of-way into GIS over the last few years, Alternative 1 was updated to reflect necessary access to these rights-of-ways (i.e., routes were changed from “transportation linear disturbances” to “OHV Limited”), which increased the overall mileage of open routes under this alternative from the previous baseline.
- Routes within Small Tracts Act parcels. Under Alternative 2, these routes are globally designated as “street-legal only”. Under Alternative 3, these routes are designated as OHV Open, with no subdesignation. Under Alternative 4 (the Proposed Action), these routes are designated as OHV Open, with no subdesignation, unless the route overlaps with a San Bernardino County Public Works road. If the route overlaps with a San Bernardino County Public Works road, then it was designated as OHV Limited “street-legal only”.
- BLM reviewed and made appropriate changes to route designations under all alternatives based on updated resource and route use information. Based on public comments and efforts associated with the DRECP LUPA, BLM staff identified additional geographic-based resource data associated with soil erosion and biological resources, and incorporated these additional GIS layers into the analysis. Route designations were also modified in response to the identification of actual resource impacts, use conflicts, and/or use requirements through field monitoring, and as reported by the public in route-specific public comments. Responses to the generic (non-route specific) public comments are attached as Appendix I.
- In the Draft SEIS, the alternative route networks were developed to meet the management objectives associated with the applicable Multiple Use Class and/or special designations such as ACEC, DWMA, and other designation categories. Following the changes in land management classifications implemented through the DRECP LUPA, the designation of the Mojave Trails and Sand to Snow National Monuments, and other mechanisms, the route networks for Alternatives 2, 3, and 4 have been revised, and the route network for the Proposed Action has been developed, to meet the new management objectives.
- The DRECP LUPA implemented CMAs on a Land Use Plan Area-wide basis, as well as specifically for each of the different land management classifications. Newly authorized activities, such as authorization for new OHV routes, would be required to comply with those CMAs. Under WEMO 2006, a disturbance cap limit of 1 percent was applied in DWMA. Under the DRECP LUPA CMAs, disturbance cap limits have been developed for all ACECs, not just those established for protection of the desert tortoise. In addition, the disturbance cap limits on the areas which were previously designated as DWMA have been revised, and now range from 0.1 to 1.0 percent. Areas where existing development, including the route network, exceed the disturbance thresholds require mitigation, consistent with DRECP LUPA, unless the routes are currently authorized for use.

The process used to revise the route networks associated with Alternatives 2 and 3 and to develop the network associated with the Proposed Action, was as follows:

- A preliminary analysis of disturbance from the existing GTLF inventory was conducted to identify areas where disturbance cap limits had already been reached.
- For Alternatives 1 through 3, each alternative network was reviewed against disturbance caps in areas where the DRECP LUPA adopted new or modified existing caps, and the analyses re-performed with updated information compiled after the release of the Draft SEIS. Routes not currently authorized for use by the public were identified in areas with exceedances, to identify and apply area-wide mitigation measures, as needed. Authorized routes not yet included in the Draft SEIS were added to the system, for authorized users only.
- A preliminary Proposed Action was then generated through the GIS exercise, which included initial assignment of a preliminary designation and sub-designation of each route segment based on resource impacts, uses, and the disturbance parameters in a particular area. Maps of each of the subregion networks in a particular TMA for each of the alternatives were generated. These maps were integrated with additional on-the-ground, resource, recreational, and other information to provide context for the route-specific review, consideration of public input, and development of the Proposed Action.
- BLM continued to use the database to document potential resource impacts and user conflicts associated with the various alternative route networks. However, modifications were made to incorporate newly available resource inventory data, changes in land management designation, and changes to the available route sub-designations. These modifications were used to revise the previous analyses of the route networks for Alternatives 1 through 3 with respect to resources and user conflicts, as well as to serve as the basis for the analysis of the route network for Alternative 4.
- An additional assumption was made to support the analysis of impacts. In the analysis of Alternative 4 (the Proposed Action), it was assumed that street-legal use only routes are less impacting than routes also available for OHV users.

The Draft SEIS includes the Alternative 1 through 4 implementation strategies from the previous Draft SEIS, as updated. Route network and implementation strategy changes to Alternatives 1 through 4 are limited to those generated based on new information and analyses completed after the release of the Draft SEIS, unless otherwise indicated. Within Alternative 4, a Proposed Action has been generated in each proposed TMA in response to public input on the Draft SEIS alternatives, new analyses, and additional information. A draft of each of nine proposed TMPs was developed to implement the Proposed Action, including proposed implementation strategies and a map of the proposed routes for each TMA. Each TMP was reviewed to verify that the resulting proposed route network is viable, that the implementation strategy meets the objectives of the Proposed Action, that route designations and minimization measures are consistent with the 43 CFR 8342.1 criteria, with the goals and objectives of the CDCA Plan, as modified herein, and with the additional goals and objectives of the 2006 WEMO Plan and the 2016 DRECP LUPA. TMP adjustments were made based on area- and route-specific issues and public input that were not already identified and addressed through the GIS analysis and preliminary review. Management reviewed staff recommendations, made adjustments, and selected a Proposed TMP

for each area. Proposed TMPs are included with the Draft SEIS, and are being made available for a 45-day public review, prior to adoption of Final TMPs.

Comparison of 2003 WEMO Designation Project to 2015 SEIS GTLF Geo-Database

Table D.4 shows the WEMO 2003/2006 subregions with the mileages as reported in Table 2-7, Page 28 of the 2003 WEMO Designation Project compared to what is found in the 2015 SEIS GTLF geo-database. Because the boundaries of the 2003/2006 subregions do not correspond with current subregion boundaries, these numbers do not translate into the number of miles within the WMRNP subregions analyzed in this EIS.

Table D.4. Comparison of 2001 Inventory to 2015 GTLF Inventory

2003 Subregions	Acres of BLM Lands	2001 Total Miles Inventoried On BLM Lands	2015 Total Miles GTLF Inventory On BLM Lands

Appendix D Figures

This attachment to Appendix D displays some comparative NAIP photographs of the routes in the inventory in 2005 and 2012. The photographs were used to compare the on the ground changes since 2005, and also the digitizing accuracy for the 2006 WEMO Plan and the current WMRNP inventory completed in 2013. The aerial photography displays what was actually on the ground at the time of each flight, and the routes captured. New routes added to the inventory are indicated on the 2012 figures with dashed lines.

For example, Figure D.1 and Figure D.2 are photographs of the same area in the Coolgardie subregion flown in 2005 then again in 2012. Note that the dashed white lines on the 2012 figure show all the routes on public lands that were added to the inventory in 2013 for the current planning effort. Some red routes identified as closed in the 2006 WEMO Plan are not included in the 2013 inventory as closed routes because they were not found in either year's aerial photos, or else are substantially misaligned and have been captured as new routes.

The remaining NAIP Imagery Photographs are:

D.5 Description of Travel Management Areas and Subregions

One of the first steps in the off-road vehicle designation process in the Draft Supplemental Environmental Impact Statement (SEIS) was the identification of travel management areas (TMA) for travel network. Nine travel management areas provide the geographical framework for implementation of the travel network through specific transportation and travel management (TTM) plans. The factors used in the development of boundaries for TMA are primarily natural transportation boundaries (e.g. highways, jurisdictional, geographic boundaries). Because of the size of the West Mojave (WEMO) planning area, the nine TMAs were further subdivided into 35 subregions. The boundaries of the 35 subregions that compose the TMA consider the natural transportation boundaries, law enforcement patrol areas, designated management areas, and issue-driven factors.

By comparison, the 2006 WEMO Plan had identified 20 different subregions, which included much but not all of the West Mojave Planning Area, from which they examined 11 subregions to build the WEMO network. The 2006 WEMO subregions are based on similarities in certain biological characteristics, but do not readily lend themselves to on-the-ground implementation of

the transportation network. The 2006 WEMO subregion boundaries roughly correlate to the new subregion boundaries as feasible.

The number, configuration, and names of the subregions and TMAs were then modified following the designation of two new National Monuments, the Mojave Trails National Monument and the Sand to Snow National Monument, within the WEMO Planning area. Each of the monuments overlapped the boundaries of multiple subregions. To facilitate both analysis in this Revised Draft SEIS, and ultimate management of the travel networks in the monuments, BLM chose to modify the subregion boundaries so that each monument served as a stand-alone subregion. This required adjustment of the boundaries of the subregions and TMAs, as they had been evaluated in the Draft SEIS. The changes associated with the monuments are as follows:

- The Mojave Trails National Monument incorporated portions of Afton Canyon, Broadwell Lake, Pisgah Crater, and Wonder Valley subregions, and all of the Needles South subregion. The remaining western portion of the Pisgah Crater subregion was then absorbed into Mojave Trails National Monument. The result is that the Pisgah Crater and Needles South subregions have ceased to exist, and the boundaries of Afton Canyon, Broadwell Lake, Wonder Valley, and Newberry Rodman subregions have been modified.
- The Sand to Snow National Monument incorporated all of the Morongo Valley subregion, as well as portions of the Joshua Tree and Rattlesnake Canyon subregions. The result is that the Morongo Valley subregion has ceased to exist, and the boundaries of the Joshua Tree and Rattlesnake Canyon subregions have been modified.

The following discussion provides a general overview of each of the Travel Management Areas and the subregions within it, as they were analyzed in the Revised Draft SEIS.

Travel Management Area (TMA) 1

Afton Canyon Subregion

The Afton Canyon subregion comprises the northeastern-most and the northern middle-third portions of TMA 1, extending south from Interstate 15 to include the Manix and Mojave Fringe-toed Lizard ACECs and the northern two-thirds of the Cady Mountains Wilderness Study Area. It is accessed by the Afton or Basin exits off of Interstate 15 or from Crucero Road on the south. It is bisected by the Mojave River, and bounded on the east by the Rasor OHV Open Area and the Mojave National Preserve and, to the south of the Preserve, the old Tonapah and Tidewater (T&T) Railroad and the adjacent Crucero Road that continue south along the boundary of the Broadwell Lake subregion to Ludlow, CA. The Afton Canyon subregion also extends to the west boundary of the Manix Paleontological ACEC. The southern boundary of the subregion is a major wash which begins at Crucero Road on the east, becomes Hidden Valley Road, and extends to private residences surrounded by agricultural lands on the west, south of the Manix ACEC.

Within the Afton Canyon subregion, the CNDDDB documents the occurrence of five special status species (desert tortoise, golden eagle, pallid bat, fringed myotis, and Nelson's bighorn sheep) and/or suitable habitats. Although present, only a small amount (approximately 2 acres) of desert tortoise Critical Habitat is found within this subregion.

In Afton Canyon, the Mojave River flows aboveground for portions of the year and supports riparian woodlands with an unusual riparian plant community. The Mojave River also flows

along the northernmost portion of the Mojave Trails National Monument subregion. It hosts many rare bird species, provides much needed riparian sustenance for all desert wildlife, and the canyon cliffs are home to nesting raptors. The Mojave River meanders through the canyon along a broad, flat sandy floor a few hundred feet wide, framed by its scenic vertical walls with multiple colors and interesting features. The river flows all year long on the west side of the canyon. A thick ribbon of plants comprised of native and invasive species lines the riparian zone and supports a wide diversity of wildlife including bighorn sheep, mountain lion, badger, coyote, raptors, and numerous small mammals, reptiles, rodents and birds. There is frequent vehicle and train traffic in and through the canyon.

The Mojave River also forms a primary prehistoric, historic, and modern transportation corridor from the eastern Mojave basin and ranges province into the West Mojave desert, and evidence of this use is present on the landscape. Humans in the Afton Canyon area left a record in the form of stone tools and pottery, some of it estimated to be over 8,000 years old. Spanish missionaries were the first documented Europeans through the area in 1776.

Primary activities in Afton Canyon include camping in the developed fee campground and group camp site, river play, hiking, historic Mojave Road touring, equestrian riding, bird watching, bighorn sheep and wildlife viewing, photography, nature study, rock collecting, scenic touring, 4x4 exploration, geo-caching, and hunting. Visitor facilities include public lands for camping and interpretative signs and kiosks.

The Mojave Road route takes visitors through Afton Canyon and a portion of the Mojave National Trails Monument subregion. It is regularly traveled by recreational tourists seeking to understand the experiences of earlier historic travelers and retrace the ancient and historic trail. Remnants can be followed from the Colorado River to the site of the old Camp Cady further upstream along the Mojave River, located in the adjacent Barstow subregion.

The designated river crossings are sometimes impassible because of high water. Use of the route at these times creates sedimentation in the river, which dissipates over time as the flows continue. Because of plantings by the railroad and downstream depositions of seeds, invasive tamarisk plants have been a recurring problem in the river channel. An ongoing restoration program has been underway since 1990 to restore and maintain the river channel riparian vegetation. Much of the channel has been fenced to prevent OHV intrusions where restoration activities have taken place.

The Baxter Mine, a large iron mine, operates at the northern end of the subregion and large trucks regularly access the mine via Basin Road. Other mineral exploration occurs in the area as well. Grazing historically has occurred in this area, but the only obvious evidence remaining is in areas of range improvements. The Afton Canyon subregion is known for its distinctive recreational opportunities, such as the OHV route along the historic Mojave Road, the camping opportunity at the improved campground, hiking, equestrian, and rock hounding opportunities.

The iron mine is accessed from Interstate-15 and Basin Road at the eastern boundary of this subregion. Basin Road is a maintained County Road that is used by both mining trucks and casual users on their way to Afton Canyon or the Razor OHV Open Area. Once the County Road splits from the OHV route, the County Road continues up to the mine entrance. Several OHV routes are located off of this last stretch of County Road on the way up to the mine. These routes are both on public lands as well as the adjacent patented mine land, and are a potential safety issue for OHVs and the large mine trucks that travel up and down the County Road.

Broadwell Lake Subregion

The Broadwell Lake subregion forms the middle southern third of TMA 1. Its southeastern corner is bounded by Power Lane (road) and the Cady Mountains WSA. County Road 20795 establishes the eastern vertical border until the subregion connects with Afton Canyon subregion. The northern border is defined by a wash, which follows the public lands boundary back south to Interstate-40, and forms the southern boundary of the subregion. Troy Lake is north of Interstate 40 in the subregion near its western boundary, and the subregion is bisected by an east-west utility road that forms the southern boundary of the Cady Mountains WSA.

The larger sandy washes draining the southern Cady Mountains support disjunct occurrences of white-margined beardtongue and crucifixion thorn, both sensitive plant species. The subregion includes the occurrence of the following special status wildlife species and/or suitable habitat: Bendire's thrasher, burrowing owl, golden eagle, Mojave fringe-toed lizard, and Nelson's bighorn sheep. In addition, the southern Cady Mountains is also home to the bighorn sheep herd and lambing area that crosses between this subregion and the Mojave National Trails Monument subregion. The Broadwell Lake subregion also includes some of the bighorn corridors, from the lambing areas and points southeastward.

Commercial activities in the subregion include the development and maintenance of major linear utilities, which include the transmission line and pipeline along the southern boundary of the Cady Mountains WSA. A solar facility had been permitted in the southern portion of the subregion, but did not get developed due to a lack of available electrical transmission capacity. Historic mineral prospecting has occurred, particularly in the southeastern portion of the subregion, and portions of the subregion were part of the cattle grazing allotment that extends northward into the Afton Canyon area.

Due to the remoteness of the Broadwell Lake subregion and the relative inaccessibility of the Cady Mountains WSA, this subregion receives light recreational use. Recreation activities include recreational prospecting, rockhounding, wildlife viewing, and vehicle touring.

One major issue is the lack of a legal crossing of the railroad tracks north of Interstate 40 off Hector Road. While the lack of legal railroad crossings is an issue everywhere in the West Mojave, the lack of alternative north-south access for miles makes it more problematic at this location.

There has been some route proliferation in the southwestern portion of the subregion near Troy Lake and the adjacent interface with adjacent private lands. However, overall the subregion has few access conflicts due to the relatively light use it receives.

Barstow Subregion

The Barstow subregion is bounded by Interstate 40 to the North. Public lands along the Mojave River that retain their riparian integrity provide additional habitat and potential intermittent water source for wildlife. One of the other two locations where the Mojave River can flow aboveground is Camp Cady Wildlife Area, located within and adjacent to a portion of the Mojave River approximately 23 miles east of Barstow, California, about 2.5 miles southeast of the Harvard Road exit on Interstate 15. The Wildlife Area is state land, administered by the California Department of Fish and Wildlife, and is managed for sensitive riparian plants and animals, including a fish known as the Mojave tui chub. The Mojave Fringe-toed lizard also

makes its home in the sandbars adjacent to the Mojave River in this subregion and further northeast along the river in the Afton subregion.

Special status plant species occurring in the subregion include the Mojave monkeyflower and Parish's phacelia. Approximately 650 acres of a designated ACEC to protect the Mojave monkeyflower overlaps with the subregion. The subregion includes the occurrence of the following special status wildlife species and/or suitable habitat: burrowing owl, desert tortoise, golden eagle, and Le Conte's thrasher. Approximately 3,337 acres within this subregion has been designated as an ACEC to protect the Mojave fringe-toed lizard.

Camp Cady is also historic military camp dating from the 1860s. Although the Old Spanish Trail and the Mojave Trail continue adjacent to the river, it is difficult to follow the trails due to the intermittent land ownership patterns. Evidence of prehistoric and historic use of these trails and the riverine area has generally been lost over time due to repeated intermittent Mojave River flood flows.

Most public lands in this area have been disposed of, and those that remain in the subregion are primarily located along the Mojave River corridor, with a few other scattered locations that are surrounded by private land. Most of the public lands that remain along the river have been designated as one of the units of the Mojave Fringe-Toed Lizard ACEC.

The majority of lands in this area are private, including some of the best agricultural lands in the West Mojave as well as small towns and rural developments that are concentrated near the two Interstate highways. The MCLB military depot and a small, rural commuter airport can also be found in the subregion. A power-plant is located in the subregion, which is crossed by a major north-south transmission corridor, including both electrical and pipeline transmission facilities. There is little topography in the eastern two-thirds of the subregion. Closer to Barstow, Elephant Mountain dominates the skyline, along with the many communication sites on its back.

Mojave Trails National Monument

The Mojave Trails National Monument subregion is bounded on the north by the Union Pacific Railroad, on the south and southwest by the 29 Palms MCACC and 29 Palms Hwy., on the west by County Road 20795, and Crucero Road, and to the east, a long boundary is formed by the National Trails Highway and Amboy Road. The Mojave Trails subregion has an additional section not touching the larger area of the subregion, which is bounded by Ironage Road and Amboy Road to the east, and bisects the Sheephole Valley Wilderness in its southeastern-most corner. This subregion was created for the West Mojave Route Network Project to better manage the national monument for the resources, objects and values that is was designated for by President Barack Obama in February 2016. The Mojave Road or Mojave Trail is a historic route across the Mojave Desert, linking watering holes between the Colorado River and San Bernardino; the Mojave Road was used by Native Americans and later served Spanish missionaries, explorers, foreign colonizers, and settlers from the 18th to 19th centuries. The Old Spanish Trail was a historic trade route which also follows the Mojave Road through the Afton subregion, and which connected the settlements near Santa Fe, New Mexico with those of Los Angeles and southern California. The segment of the Old Spanish Trail across the Mojave Desert was considered one of the most arduous and difficult for pioneers to navigate, making the Afton Canyon a special oasis on the arduous journey.

This area is characterized by its geologic features, deep canyons carved out of the badlands in the desert landscape, formed when Lake Manix, located at the eastern edge of the subregion, drained 19,000 years ago. The centerpiece of the area is the Afton Canyon Natural Area ACEC, which was designated in the CDCA Plan in recognition of its unique stratigraphy and its unrivaled combination of riparian, geologic, cultural, transportation, and recreational features in the West Mojave. The most predominant feature of the Afton Canyon ACEC is the Mojave River, which forms a 600-foot deep canyon as it flows aboveground here, one of only three places where the Mojave River does so. To the west of the Afton Canyon ACEC, most of the public lands that remain along the river have been designated as units of the Mojave Fringe-Toed Lizard ACEC. The Cady Mountains Wilderness Study Area (WSA) overlaps the southern third of the ACEC and extends further south towards the east boundary Broadwell Lake subregion. The WSA is characterized by a series of detached ridges and deep valleys with the highest peak being Cady Mountain. OHV travel to and from the ACEC campgrounds north of the WSA have resulted in route proliferation in various areas away from the river. The lack of a loop route to the campground has resulted in campers creating loop routes on their own through the Afton Canyon ACEC located in this subregion. The routes south to the Cady Mountains WSA are very scenic. The primitive trails within the WSA are very sandy or very steep and rocky in places, and can be difficult to follow. Some route proliferation has resulted from motorcyclists crossing the river from the Afton Campground area and creating trails up steep canyons to the top of the peaks in the Cady Mountains in the WSA.

The stratigraphy provides gorgeous scenic vistas as the traveler enters the canyons of the Mojave River and as one travels in the more remote canyons in the WSA to the south in the Cady Mountains. The Cady Mountains is home to a bighorn sheep herd and lambing area. Bighorn travel from the remote lambing areas in the WSA to the Mojave River regularly to drink, and sunup or sundown can offer spectacular views of sheep offset by the canyon landscape. Activities in the middle third of this subregion, particularly in the Cady Mountains WSA, are wildlife viewing and rockhounding. The WSA is widely known as a premier rockhounding location in the West Mojave. The Mojave Trails subregion also provides bighorn corridors between the lambing area and points northward and southeastward.

The middle portion of the subregion includes Sleeping Beauty Mountain, a part of the southern Cady Mountains. South of Sleeping Beauty Mountain is a broad, scenic valley named Hidden Valley which extends for six miles. A portion of the middle section of the subregion is a large, sweeping bajada sloping southward to Interstate 40. The lava rock interspersed with sandy soils provides habitat for unusual plants such as crucifixion thorn and suitable habitat for the Mojave fringe-toed lizard. Access to this part of the subregion is generally from Interstate 40, via Lavic off-ramp.

Access conflicts can occur in this area of the Mojave Trails subregion between the mining operation and casual users which occasionally trespass onto private lands. Because of the intermittent nature of the mining operation, this issue is not as problematic here as at some other active mines. Casual spelunkers can also cause damage to the fragile biological resources in the lava tubes.

The southern portion of this subregion was previously Needles South subregion. It consists of a narrow swath of land about 12 miles long and 2-3 miles wide running in a NW-SE arc from Interstate 40 just east of Bagdad on the north, around the northeastern and east side of the 29 Palms MCACC, terminating south of Interstate 62 adjacent to Joshua Tree National Park. The

eastern boundary of the subregion is Amboy Road in the north, and the Sheephole Valley Wilderness Area and Joshua Tree National Park in the south. It includes the northwest and southwest corners of public lands managed by the Needles Field Office in San Bernardino County, California.

This area comprises a relatively lower and drier desert basin area, and a portion of the historic Route 66 transportation corridor (National Trail Highway) providing access from Barstow to Needles and points east. The most prominent feature is Amboy Crater National Landmark. The Sheephole Valley Wilderness Area substantially limits access options in the southern half of the subregion.

The drive down Amboy Road is one of the most scenic in the Mojave Desert during spring due to the spectacular displays of wildflowers along Amboy Road. Amboy Crater National Natural Landmark marks a majestic black lava crater rim that towers over the adjacent bajada landscape, surrounded by a field of black rock. A few locations of the BLM-sensitive White-margined beardtongue are found north of 29 Palms MCACC in this subregion. This subregion also includes approximately 1,197 acres of Critical Habitat for the desert tortoise.

The area includes pipelines, powerlines, and a railroad, and its boundaries are marked by major transportation corridors. One active mine, Amboy Mine, and scattered ruins of large mining operations can be found off of Amboy Road and Route 66. There is little opportunity for OHV Touring in this subregion. Most recreationists are in the Needles subregion either to visit the Amboy Crater National Natural Area, to view wildflowers, or to park at a trailhead of one of the wilderness areas.

There are few access conflicts in this area due to its relatively small size and the relative light use it receives.

Within the Mojave Trails National Monument subregion, the CNDDDB documents the occurrence of ten special status species (desert tortoise, golden eagle, pallid bat, fringed myotis, Mojave monkeyflower, burrowing owl, Gray vireo Mojave fringe-toed lizard, southwestern pond turtle and Nelson's bighorn sheep) and/or suitable habitats. Although present, only a small amount (approximately 2 acres) of desert tortoise Critical Habitat is found within this subregion. The CNDDDB reports approximately 27,000 acres of historic occurrence data within this subregion and the adjacent Afton Canyon subregion for Nelson's bighorn sheep. In addition, approximately 12,000 acres within this subregion have been designated as an ACEC to protect the Mojave fringe-toed lizard.

Historically, the travel route through Afton Canyon has utilized the sandy riverbed through large portions of the canyon. The route has been moved out of the riparian area, and uses either side of the river, but vehicles still must cross the river to traverse the entire canyon area and to avoid a major railroad crossing at the east end of the canyon. The railroad through the canyon runs adjacent to the travel route through much of the canyon; the private railroad crossing at the east end of the canyon between the Natural Area and the Razor OHV Area is a popular shortcut used instead of the official route across a sandy portion of the river, in order to continue south to the Cady Mountains and Interstate 40. The private crossing area is more dangerous than most crossings because multiple tracks come together at this location so that to get from one side to the other, at least 3 sets of tracks must be crossed.

Primary activities in Mojave National Trails Monument include camping in the developed fee campground and group camp site, river play, hiking, historic Mojave Road touring, equestrian riding, bird watching, bighorn sheep and wildlife viewing, photography, nature study, rock collecting, scenic touring, 4x4 exploration, geo-caching, and hunting.

Visitor facilities include two ACEC campgrounds in the norther portion of the subregion, an equestrian campground, and interpretative signs and kiosks. The Mojave National Trails Monument campgrounds are popular and regularly used by regional residents and travelers on long distance multi day camping trips due to easy access off of Interstate 15. From the campground, an easy loop through the canyon and up Basin Road brings the traveler back to the Interstate. The campground is also used to stage OHV over to the adjacent Razor OHV Open Area in Afton Canyon subregion. The Mojave Road is one of the primary means of travel for visitors to experience this subregion.

OHV travel from the ACEC campgrounds has resulted in route proliferation in various areas away from the river. The lack of a loop route to the campground has resulted in campers creating loop routes on their own through the ACEC. The routes south to the Cady Mountains WSA are very scenic. The primitive trails within the WSA are very sandy or very steep and rocky in places, and can be difficult to follow. Some route proliferation has resulted from motorcyclists crossing the river from the Afton Campground area and creating trails up steep canyons to the top of the peaks in the Cady Mountains in the WSA.

Travel Management Area 2

Darwin Subregion

The CNDDDB documents the occurrence of four special status species (Le Conte's thrasher, pallid bat, Death Valley sandpaper-plant, and Nelson's bighorn sheep) and/or suitable habitat within the Darwin subregion. There are approximately 277 acres of BLM designated habitat for the Le Conte's thrasher located near the western boundary of this subregion. Additionally, the Darwin subregion contains the only known occurrence data for the Death Valley sandpaper-plant within the WEMO planning area.

Due to the area being bounded on the south by the China Lake Naval Weapons Center accidental vehicle trespass is an occasional issue in the area along with private property trespass within the community of Darwin itself.

The subregion is comprised of open desert expanse that is sporadically interrupted topographically by the upper extent of the Coso Range, the Darwin Hills, and other unnamed hills. The Darwin Falls Wilderness is on the north east flank of the area which provides opportunities for primitive and unconfined non-mechanized forms of recreation. The area is popular for its backcountry vehicle touring and exploration of historic mining sites, primitive camping, packing, hiking, camping, rock collecting, wild horse viewing, and photography. Popular recreational destinations include China Gardens spring, Lower Centennial cabin site, and the historic mining community of Darwin.

North Searles Subregion

The North Searles subregion, is located approximately 28 miles northeast of Ridgecrest, immediately north of Pioneer Point and the community of Trona. It is bounded by Slate Range

Crossing on the north, the crest of the Slate Range on the east, the Inyo-San Bernardino County line on the south, and the China Lake Naval Air Weapons Station (NAWS) boundary on the west.

The Great Falls Basin ACEC, Argus Mountains wilderness, and the Great Falls Basin Wilderness Study Area are surrounded by this subregion on three sides. The general region consists of the upper part of Searles Valley, part of the ancient lakebed above Searles Lake. It is encircled by two prominent mountain ranges on the west, and east and north - the Argus and Slate ranges, respectively. The area is made up almost entirely of gravel, sand, and silt lakebed sediments. Elevations start as low as 1,600 feet on the southern Inyo-San Bernardino County boundary, climbing to more than 5,300 feet above sea level to the west in the Argus Range and to 4,950 feet above sea level in the east along the crest of the Slate Range.

Common plant communities predominate in this area, including Mojave saltbush and creosote bush scrub in the lowlands, with rabbitbrush dominating communities in the washes. However, Joshua trees are found in sparse stands at a few locations at upper elevations in the Argus and Slate ranges. The subregion also contains the Indian Joe Canyon Ecological Reserve, a Department of Fish and Wildlife property protecting significant riparian habitat. Smaller riparian communities exist at isolated seeps and springs throughout the Argus Range. These communities, made up mostly of willow and baccharis, comprise the sole critical habitat for a threatened species, the Inyo California towhee. This is a subspecies of towhee endemic only to the southern Argus Range.

Due to its location along the highway to Death Valley National Park (Highway 178) and close proximity to the community of Trona, visitation is generally high throughout the year, especially in the cooler months. The many small seeps and springs attract upland game hunters, as well as more casual visitors from the surrounding local area.

Casual OHV recreational use involving dune buggies, quads, and motorcycles is popular within the subregion. The majority of these users are local residents from Trona and nearby communities or from Homewood Canyon. Several commercial 4-wheel drive, dual sport motorcycle and equestrian tours, and equestrian competitive endurance rides occur in this area.

Numerous dispersed camping opportunities exist along the route network. While some staging areas off of Highway 178 exist, most off road vehicle enthusiasts stage from their own homes in nearby communities. There are many unmaintained dirt roads that directly connect these communities to the route system in the area. Virtually all trails in this subregion accommodate full-size 4x4 vehicles, as opposed to single-track motorcycle routes. Many of these trails offer challenges requiring strong 4x4 driving skills, particularly in rocky and mountainous stretches of the Slate and Argus Ranges.

Gem and mineral collecting also occurs throughout the Argus and Slate Ranges. Trona is home to an interpretative museum and hosts an annual gem and mineral show. Other uses occurring within the subregion are birdwatching, climbing, equestrian rides, hiking, target shooting, hunting, and rockhounding. Regular bird censuses are taken in Indian Joe Canyon ecological preserve by volunteers, and the Great Falls Basin is particularly popular with backpackers.

Due to its location near several small, rural communities, trash and graffiti, including in sensitive areas, are ongoing issues, requiring regular response. Route proliferation, such as vehicle trespass to Austin Springs at the base of the falls and to various unauthorized hill climbs in the

immediate vicinity are ongoing issues in the Great Falls Basin ACEC. Fences have been built at several springs in the area to protect towhee critical habitat from damage by wild burros, horses, or vehicles.

South Searles Subregion

The South Searles subregion, is located approximately 8 miles northeast of Ridgecrest, immediately north of Randsburg Wash Road and the Spangler Hills Open Area. Randsburg Wash Road defines the subregion on the south, the China Lake Naval Air Weapons Station (NAWS) boundaries on both its east and west sides, and by the Inyo-Kern County line on the north. Numerous landowners own the private lands. The Trona Pinnacles National Natural Landmark and ACEC are surrounded by the subregion on all four sides.

The general region consists of the lower part of Searles Valley surrounding Searles Lake. It is encircled by two prominent mountain ranges, the Argus and Slates, on the west and east, and by the Spangler Hills on the south. The area abuts the upper half of Searles Valley above Searles Lake to the north - an area covered by the North Searles subregion. The area is made up almost entirely of gravel to sandy to silty lakebed sediments. Elevations within this subregion are generally quite low, keeping to within 1,600 to 2,500 feet on the valley floor, to more than 2800 feet at selected high points in the Argus Range. Visitation is generally high, particularly in cooler, winter months, due to the presence of the Trona Pinnacles, and the subregion's general location along a highway to Death Valley National Park (Highway 178) and close proximity to the communities of Trona and Ridgecrest. Mojave saltbush and creosote bush scrub are the predominant plant communities on the valley floor, with rabbitbrush dominating plant communities in upper elevation washes.

The South Searles subregion is located within the Ridgecrest Mohave ground squirrel key population center. Access to this subregion is primarily from Highway 178 and its Trona-Wildrose extension. The subregion can also be accessed from the Randsburg-Wash road, north of the Spangler Hills Open Area.

In general, the area absorbs a lot of casual OHV recreational use involving dune buggies, quads, and motorcycles. Most of these users are local residents. They come from Trona and the associated communities of West End, Argus, and Pioneer Point, or from Homewood Canyon. Some gem and mineral collecting also occurs, primarily in the foothills of the Argus Range on the western edge of the subregion. In October, the Searles Valley Gem and Mineral Society put on a Gem and Mineral Show. The subregion is also used for interpretative museum and commercial 4-wheel drive, dual sport motorcycle and equestrian tours.

Vehicles are permitted to pull off within 300 feet of a route to make camp in the subregion, except in the vicinity of the Pinnacles where visitors are asked to camp only in already impacted sites. Laws and regulations prohibit camping or staying within 200 yards of waters, which includes the natural seeps and springs in the Argus Range. Currently, all access routes on public land in this subregion comply with applicable law.

Most trails in the subregion are full-size 4x4 as opposed to quad or single-track routes, which exist only in the extreme southwestern corner of the subregion. While some staging areas off of Highway 178 exist, most off-road vehicle enthusiasts probably stage from campsites within the Trona Pinnacles or from various campsites within the Spangler Open Area just outside the subregion. Local people most likely enter this area directly from their homes in West End, South

Trona, and Argus. For access to good riding areas, they must cross highway 178, traveling approximately 7 miles south of town to reach the Pinnacles or more than 12 miles to reach the Spangler Open Area.

The area offers very few opportunities for backcountry touring and sightseeing outside of the Trona Pinnacles National Natural Landmark. Climbers have not been observed in great numbers within the subregion. Equestrian use is tied to spring sources or in the case of organized, commercial and/or competitive events to regular vehicle routes for staging the necessary water and periodic veterinarian checks. Most people who hike in the area are locals who are simply exploring their own backyards.

Access to hunting areas is limited within the subregion. Hunting thus requires a good deal of hiking in the subregion. Hunters are known to pursue chukar over steep rocky terrain for long distances. Chukar and California quail are the primary targets although jackrabbits and mourning dove are hunted as well.

Non-motorized trails for mountain bikers do not exist in the area. However, mountain biking is popular along Highway 178 and with campers at the Pinnacles.

Rockhounding occurs throughout the area, in specific localities, mostly in the foothills of the Argus and Slate Ranges. During October's Gem and Mineral Show, the Searles Valley Gem and Mineral Society offers information and several tours to various collecting and other sites of local interest in the valley.

Target shooting occurs throughout the area and is generally permitted wherever the terrain offers a safe backstop. However, the ACEC Plan for The Trona Pinnacles specifically prohibits target shooting anywhere within the vicinity of the National Landmark.

Sierra Subregion

The Sierra subregion, located approximately 10 miles west of Ridgecrest, is defined by Highway 14 on the east, Highway 178 on the south, the Bakersfield BLM Field Office and Sequoia National Forest boundaries on the west, and the Class L and Class M boundary in the Coso Junction and Rose Valley area on the north. The Owens Peak and Sacatar Trail wilderness areas (49,009 and 33,132 acres, respectively) are located within this subregion.

All or parts of three ACECs are found within the Sierra subregion: Fossil Falls, Sand Canyon and Last Chance Canyon. Route designation for Fossil Falls and Sand Canyon was designated by their management plans and is not changed by the West Mojave Plan. For the Last Chance Canyon ACEC, Alternative A would adopt the 1985-87 route designations, except for the east access to Mesa Springs, which was recommended for closure by the 1982 ACEC management plan. This network would be effective on an interim basis, until the completion of a collaborative and community-based program to develop a revised motorized vehicle access network for the El Paso Mountains, including all of the Last Chance Canyon ACEC outside wilderness. Participants in this effort would include the City of Ridgecrest, Kern County, BLM and interested stakeholders. When completed, the revised network for the El Paso Mountains would be incorporated into the CDCA and West Mojave Plans through an amendment.

The region consists primarily of the eastern face of the southern Sierra Nevada. Elevations range from 2,400 feet along Highway 14 to 8,453 feet above sea level on top of Owens Peak. The mountainous terrain has deep, winding, open and expansive canyons, many of which contain

springs with extensive riparian vegetation. This area is a transition zone between the Great Basin, Mojave Desert and Sierra Nevada ecoregions. Vegetation varies considerably with a creosote bush scrub and Joshua tree woodland community on the bajadas, and cottonwood and willow riparian vegetation in the canyons at lower elevations. Above 5,000 feet, the canyons and ridges are dominated by pinyon-juniper woodland with sagebrush and grey pine.

The Sierra subregion includes the occurrence of the following special status species and/or suitable habitat:

- Plants
 - Charlotte's phacelia
 - Dedecker's clover
 - Hall's daisy
 - Mojave tarplant
 - Nine Mile Canyon phacelia
 - Owen's Peak lomatium
 - Sanicle cymopterus
 - Spanish needle onion
- Wildlife
 - Burrowing owl
 - Golden eagle
 - Le Conte's thrasher
 - Least Bell's vireo
 - Mohave ground squirrel
 - Northern sagebrush lizard
 - Swainson's hawk

Approximately 63,934 acres of the Coso Range-Olancha Mohave ground squirrel core area is located within the northern portion of the subregion.

Primary recreation activities and resource uses occurring in the area are: domestic sheep and cattle grazing, mineral exploration, utility and aqueduct corridor maintenance, communication site maintenance, recreational vehicle touring/sightseeing, dispersed hiking and camping, rock climbing, upland gamebird and deer hunting, bird watching, wildflower viewing, rock hounding, mountain biking and equestrian use. Much of this subregion is designated as wilderness.

The proposed route designations provide for vehicle access to the following features: Owens Peak Wilderness, Sacatar Trail Wilderness, Short Canyon, Sand Canyon, Ninemile Canyon, the LADWP Aqueduct, No Name Canyon, and Indian Wells Canyon. They also provide for vehicle access to dispersed camping throughout the Eastern Sierra. The designations provide access to hiking trailhead opportunities along the boundary of the Owens Peak and Sacatar Trail

Wildernesses, Short Canyon, Sand Canyon and No Name Canyon. The designations provide access to staging areas for mountain bike and equestrian recreation throughout the subregion.

The proposed designations provide for vehicle access to and through the subregion's prime chukar, Gambel's quail, and deer hunting areas. Vehicle access to popular rock hounding sites and historic Depression-Era mining sites in Indian Wells Canyon are provided. Also, vehicle access for livestock operations is provided.

The proposed designations provide for vehicle access to every known active mineral exploration area, and provide access along each authorized utility and aqueduct corridor within the area. Vehicle access to all authorized communication sites are also provided for.

Travel Management Area 3

Juniper Flats Subregion

The Juniper Flats subregion is located east of the City of Hesperia, south of the Town of Apple Valley, and south of State Route 18 up to the southern boundary of the WEMO Planning Area in the foothills of the San Bernardino Mountains. The San Bernardino National Forest comprises the southern boundary of the subregion. The Mojave River runs adjacent to the western boundary, and California State Highway 18 forms the northern and eastern boundaries. The entire subregion is located in San Bernardino County, California.

The Juniper Flats subregion is defined by a large block of BLM-managed public lands that abut the San Bernardino National Forest and nearby Deep Creek on the south, and private lands on the east, west, and the north. Juniper Flats is a diverse landscape of mountains, canyons, impressive boulder fields, and washes. Elevations range from 3,000 feet to 6,000 feet. The northern boundary at the highway bisects Fifteen Mile Valley and Rabbit Dry Lake.

In the subregion is located the Juniper Flats ACEC, on a large plateau overlooking Victor Valley that has been a Native American habitation and special use site due to its ample resources and its strategic view of the valley. The ACEC includes one of several watercourses that seasonally flow into the dry lakebeds in the valley floor, with springs and an extensive stretch of riparian habitat in a dense stand of junipers.

Other watercourses running from the mountains to the valley fairly regularly are located in a series of canyons east of the ACEC, including Grapevine Canyon and Arrastre Canyon. A small waterfall is located at the northern end of Arrastre Canyon before it leaves public lands.

The Juniper Flats Cultural ACEC is on the west side of the subregion, and includes a significant Native American habitation and special use site, on a large plateau strategically overlooking Victor Valley. Middens and sub-surface deposits characterize much of the ACEC. These deposits indicate that that Native Americans used large riparian areas as sites for tool manufacture, cooking, food processing, shelter, and hunting. Archaeologists believe that the diversity of multiple abundant game species, such as black-tailed jackrabbits and rabbits, game birds, mule deer, and plant foods from Yucca fruits, pinyon seeds, Eriogonum seeds, and native grass seeds, in combination with available fresh water made Juniper Flat an important pre-historic site. The ACEC includes one of several main watercourses that seasonally flow into the dry lakebeds in the valley floor below, with multiple springs and an extensive stretch of riparian habitat in a dense stand of junipers.

A BLM bird survey was conducted in 2001 in the central portion of the subregion and detected 61 avian species in Grapevine Canyon and 73 species in Arrastre Canyon. In addition to the California quail and other breeding gamebirds, the canyons are used extensively by neotropical migrants. Federally listed, Southwestern Willow Flycatcher's were found on these surveys of Arrastre Canyon. The flycatchers were seen during the breeding season and were exhibiting territorial behavior, but breeding was not confirmed.

The subregion is a productive ecosystem that provides ample riparian and upland habitat for large and small mammals and predators, and many other species, including habitat for the San Diego horned lizard and the gray vireo, two unlisted species proposed for protection in the West Mojave Plan. Soils are extremely erosive in most areas due to the topography in the area. Major historic fires in the area in the 1990's which scoured the landscape of its vegetation, including much of its remaining Juniper Woodlands, has increased the erosive potential of much of the eastern half of the subregion.

The CNDDDB documents the occurrence and/or suitable habitat of four special status plants (cushenbury buckwheat, cushenbury milk-vetch, Mojave tarplant, and Parish's daisy) within the subregion. Additionally, critical habitat is found for three of the four species (cushenbury buckwheat, cushenbury milk-vetch, and Parish's daisy).

The subregion is dissected by a major power line which runs from Hesperia to points east of Juniper Flats. Four large patented or unpatented limestone operation pits are located where BLM-managed public lands and forest service lands meet at the Juniper Flats subregion's south central and southwestern boundaries. Road access to these large active mining pits from nearby processing facilities and the transportation network in the valley beyond occurs on improved roads with a heavy volume of large truck traffic. Small exploratory mining activities occur in the central and eastern portions of the subregion, and a large disturbed, abandoned mine is located on the west end of the subregion that is occasionally used for camping. Seasonal cattle grazing also on the Round Mountain Allotment in the area, and occasional land use permits are approved for transient, seasonal apiary farms. Small to moderately-sized communication sites in the subregion serve the communities in the valleys below.

Recreation activities include hiking, dispersed camping, bird watching and hunting, horseback riding, four-wheel drive vehicle touring, motorcycle touring, mountain biking, and wildlife and wildflower viewing. An equestrian campground is located on nearby forest service land and a network of equestrian trails runs up a ridge above Arrastre Canyon in the Juniper Flats subregion and around Grapevine Canyon and Round Mountain. The area lacks a staging/parking area for horse trailers which limits use to local equestrians. Visitors can camp at Bowen Ranch, a private facility, and also at developed facilities on Forest Service lands. A small, undeveloped camping area is located above Cottonwood Springs in this subregion.

The riparian areas and numerous springs in Juniper Flats, and the hot springs located along Deep Creek on adjacent forest service lands are popular hiking destinations. A parking area is located above the Deep Creek trail, and continuing on the other side of Deep Creek is hiking access to the Pacific Crest Trail.

The 1995 and 1999 fires burned over the entire northeastern third of the subregion, leading to a temporary closure of the area in and around the Juniper Flats ACEC until vegetative recovery had begun. Long-term changes in vegetative cover were triggered or accelerated by these fires, resulting in increased erosion potential and spread of invasive species. These issues can be

exacerbated by OHV use, particularly use off of routes. Some routes may need additional flood control devices to control erosion that may occur during heavy rains.

Safety issues can occur where OHV's and mountain bikes use or cross limited-access trucking routes on the east side of the subregion. Topography is such that visibility of the road ahead is impaired in locations, and trucks traveling downhill have a limited ability to stop quickly in response to unforeseen traffic. Authorized traffic is controlled on these roads, but OHV's and mountain bikes may still occur on undesignated route crossings. Juniper flats is an area of significant unauthorized route use, and is currently a management "hot spot" subject to intensive management focus.

In addition, motorcycles and equestrians or hikers use the same trails in many places, resulting in startling of horses or motorcyclists, and aesthetic conflicts. Some anecdotal evidence exists that either supports or does not support startling of animals by motorcyclists and vice versa. Some horses have become accustomed to approaching motorcycles while others may not be. Hikers have complained that the aesthetic experiences in this subregion do not approach a backcountry experience due to the noise and visual effects of OHV vehicles. Another OHV conflict occurs where motorcycle routes have received 4x4 vehicle use, making them difficult to maintain as motorcycle-only OHV routes.

Trespass issues occur in this subregion because of the relative popularity of the area both as a destination and as an access point to reach forest service lands. These occur near the boundary of public lands and private lands, and near the boundary between forest service and public lands, where multiple access points occur. Most of the trespass issues occur as the result of local users. The east-west powerline road, which crosses non-public lands for most of its length through the area, has been a primary access point for local users.

Rattlesnake Canyon Subregion

The Rattlesnake Canyon subregion is located east of the Juniper Flats subregion, southeast of Lucerne Valley. The Bighorn subregion consists of public and private lands found to the south of State Highway 247 from Lucerne Valley eastward, and State Route 18 roughly between its intersection with Camp Rock Road and the community of Yucca Valley, California. The San Bernardino National Forest comprises the western boundary of both the subregion and the WEMO Planning Area in this location. The southern border of this subregion is bounded by the Sand to Snow National Monument and San Gorgonio Wilderness. Rattlesnake Canyon Road, a wilderness corridor, provides the major access to the San Bernardino Mountains from the north and Pioneertown Road provides the major access from the east.

The Bighorn Mountains Wilderness is located in the center of the subregion, and extends west into the San Bernardino National Forest. The wilderness consists of the steep canyons and sharp peaks of the rugged Bighorn Mountains, which form the eastern foothills of the San Bernardino Mountains. These features limit OHV access to the subregion from the north and northwest, and the adjacent wilderness in the San Bernardino National forest limit access to the subregion from the northeast.

The Carbonate Endemic Plants Research Natural Area ACEC was designated in the WEMO Plan on approximately 4,400 acres of public lands in the Rattlesnake Canyon subregion that abut the San Bernardino National Forest. Four listed and one unlisted sensitive plant species occur in this

area that are associated with the remaining high-grade carbonate (limestone) soils that have not been disturbed by mining in this region.

The Rattlesnake Canyon subregion is a productive ecosystem that provides ample riparian and upland habitat for many species, including habitat for special status species including the San Diego horned lizard, gray vireo, Bendire's thrasher, golden eagle, Le Conte's thrasher, and species that are found in the Carbonate Endemics Plants ACEC. The transition area from the mountains down to the valleys includes a narrow band of very high grade limestone that is used in pharmaceuticals and special clays, and provides habitat for rare plant species. The CNDDDB documents the occurrence and/or suitable habitat of seven special status plants (cushenbury buckwheat, cushenbury milk-vetch, cushenbury oxytheca, Little San Bernardino Mountains Linanthus, Mojave monkeyflower, Parish's daisy, and Robison's monardella) within the subregion. Additionally, critical habitat is found for four of the seven species (cushenbury buckwheat, cushenbury milk-vetch, cushenbury oxytheca and Parish's daisy).

The area is an ecological transition zone between desert and mountain vegetation that in many places is relatively undisturbed because of the steep topography, its limited development and access potential, and few nearby population centers. Numerous ephemeral creeks flow through the wilderness and adjacent canyons down to the valley floors into Johnson Valley. Elevations within the Bighorn subregion range from 3,100 to 6,600 feet. The Bighorn Mountains and surrounding area is known for a wide variety of wildlife species, including large mammals, raptors, and game and non-game birds.

Primary resource uses are large-scale mining and associated rights-of-ways along the southern side of the subregion, powerline and pipeline rights-of-way along the northern edge of the subregion parallel with the highway and on the east side to scattered residences, and cattle grazing in the Rattlesnake allotment that partially overlaps the wilderness.

Recreational activities include OHV touring, technical touring up the Rattlesnake Canyon corridor, hunting, wildlife viewing, hiking, camping, and mountain biking. The area is a popular destination for San Bernardino National Forest-related recreation coming from State Route 18 east of the subregion via the one major east-west access point south of the wilderness.

Trespass issues are a problem in the isolated communities on the east side of the subregion as new roads and development has occurred and the forest service access route has become more popular. Topography and landownership limit the ability of a complete touring loop on public lands, which has also increased trespass problems.

Sand to Snow National Monument

The Sand to Snow National Monument subregion is located at the southernmost tip of the WEMO Planning Area on either side of State Route 62 just north of the town of Morongo Valley at the southeastern base of San Bernardino Mountains. The subregion is bounded on the west and north by the San Gorgonio Wilderness Area, on the east by the Big Morongo Canyon ACEC and Joshua Tree National Park, and on the south at the San Bernardino County line at the planning area boundary. Elevations on public lands in the area range from 1700 feet on the canyon floor to 3800 feet on the ridges heading up towards the peaks of the San Gorgonio Wilderness. These lands overlap the South Coast Resource Management Planning Area, and public lands within the subregion are primarily managed out of the Palm Springs South Coast Field Office. This subregion was created for the West Mojave Route Network Project to better

manage the national monument for the resources, objects and values that is was designated for by President Barack Obama in February 2016.

Public lands in the area are primarily located within wilderness and the wilderness corridors to inholdings. Three public land focal areas are located outside of wilderness, two on the west side and one on the east side of State Route 62. This area includes the transitional zone between the eastern base of the San Bernardino Mountains and dry upland desert ranges of the City of Twentynine Palms and Joshua Tree National Park, and contains a series of parallel canyons, rocky ridges and boulder outcrops. The subregion is also transitional between the high and low deserts of Southern California. The ephemeral drainages flow down from ridge tops on either side of the highway steeply down into Morongo Valley.

The Sand to Snow subregion provides an important wildlife corridor used by deer, bighorn sheep, and mountain lions between the San Bernardino National Forest, the San Gorgonio Wilderness Area and Joshua Tree National Park. The springs in this area and in the nearby Big Morongo Canyon Preserve serve as essential sources of water during drought periods.

Big Morongo Canyon Preserve ACEC, located within the subregion, is a 28,198 acre wildlife refuge and National Watchable Wildlife Site. Preserve programs and displays seek to provide educational opportunities for children, youth, and adults to further their understanding of desert and marsh ecosystems, and the function and importance of a preserve on local, regional, and global levels. Numerous non-motorized trails, including boardwalk trails through the marsh and stream habitats, meander through the Preserve, which is managed by the BLM. Access to the Preserve is via State Route 62.

This area is transected by numerous roads, rights of way, utility corridors, ranches, farms, cabins, and tract homes in the valley below. The public lands further away from the valley floor receive relatively light recreational use due to the many private inholdings and commercial activities. Some OHV activity, hunting, hiking, wildlife viewing, photography, and nature appreciation occurs in this area.

There are few access conflicts in this area due to the relative light use it receives.

Joshua Tree Subregion

The Joshua Tree subregion includes the southeastern portion of the Planning Area adjacent to Joshua Tree National Park and south of State Highway 62. The cities of Twentynine Palms and Joshua Tree are at its northern edge along the highway, and provide the primary access points into the area. The subregion forms a narrow band of public land between the park and the towns below.

Most of the subregion is dominated by steep but generally routed hills, vegetated with the creosote bush scrub community, dry desert lands rise to the south from Highway 62 towards Joshua Tree National Park. The smaller, north-south-trending Twentynine Palms Mountains are located in the western portion of the region and the larger, east-west-trending Pinto Mountains cover its southern half. Elevations range from 1,300 to 4,500 feet.

The central portion of the subregion includes many scenic rock outcroppings that are not far off of the highway. Many washes are located in this area that contains sensitive riparian vegetation communities, including smoke tree, catclaw and desert willow. Stands of Mojave yucca exist

within many of the interior valleys. The Old Dale Mining District covers most of the eastern half of the subregion and is well known for its many historic mining features.

The Pinto Mountains Wilderness was established in 2009 and is located at the southern end of the subregion adjacent to the Joshua Tree National Park. Approximately 102,680 acres of desert tortoise Critical Habitat is located within the subregion, as well as approximately 1,418 acres of a designated Mojave fringe-toed lizard ACEC.

Primary resource uses occurring in the subregion are mining and mining exploration, and powerline and pipeline rights-of-way. Recreation activities in the area include rockclimbing and rock crawling, rockhounding, recreational mining, hunting, shooting and off-highway touring. Most of the area south of the town of Twentynine Palms is managed as backcountry with a few main improved routes that run through it and provide access to roadside attractions. The Old Dale Mining District is a popular destination for historic mine buffs. Features include extensive historic mines and related roads, ruins and camps.

Two specific locations have been identified with boundary issues, where OHVs continue into Joshua Tree National Park on routes that dead-end at the park boundary. Two areas have evidence of substantial route proliferation, the result of historic mining exploration, which may impose safety risks from old mining workings and shafts.

Wonder Valley Subregion

The Wonder Valley subregion comprises the area north of State Highway 62 and south of 29 Palms MCACC, between Amboy Road on the east and State Route 247 just north of Bodick Road on the west. The western and southern expansions of the 29 Palms MCACC are adjacent to this subregion on the north and northwest. Most of the area is generally referred to as Wonder Valley.

This subregion is an extension of the east-west Desert Valley basin, with lands gradually rising to a ridgeline on the 29 Palms MCACC to the north. The northeastern corner of the subregion is comprised of the designated Cleghorn Lakes Wilderness Area, and therefore is closed to vehicles except for trailheads immediately off of Amboy Road or from public lands south of the wilderness area. The foothills of the Bullion Mountains rise as you travel north towards the ridgetops in the Cleghorn Lakes Wilderness, and continue into the 29 Palms MCACC. Sand dunes are located in the north-central portion of the subregion adjacent to springs and nearby Mesquite Dry Lake bed, which continues onto the marine base. The Joshua Tree National Park gateway community of 29 Palms is located on the southern boundary of the subregion, and the City of Joshua Tree is located on its southeastern boundary at the intersection of State Routes 62 and 247. A half-dozen rock outcroppings are located at the northwestern edge of the otherwise flat portion of the subregion, including Giant Rock, a large outcropping adjacent to a dry lake bed.

Some historic dwellings exist in the subregion but this area contains extensive dispersed urban interface from small tract homes, and few undisturbed areas. The sand dunes and springs adjacent to Mesquite Lake bed include sensitive vegetation, most of which is located on private lands. Sensitive plant species occurrence on BLM lands includes the Little San Bernardino Mountains Linanthus and Robinson's monardella. The Wonder Valley subregion includes approximately 6,592 acres of designated desert linkage networks, crucial to the conservation of special status wildlife species. The CNDDDB and BLM field offices document the occurrence of

the four special status wildlife species and/or suitable habitat: Bendire's thrasher, Le Conte's thrasher, Mojave fringe-toed lizard, and Nelson's bighorn sheep. Approximately 1,220 acres within this subregion has been designated as an ACEC to protect the Mojave fringe-toed lizard.

An active salt mine is located on Dale Lake Bed in the southeastern corner of the Wonder Valley subregion. Historic and active mining claims are prevalent in the Copper Mountain and other highlands public land areas, interspersed with broad valleys that are primarily private rural residential lands. The area includes features typical of the southeastern Mojave Desert, with some rock outcroppings that offer opportunities for exploration. Just off the northwestern edge of this subregion is a well know destination known as Giant Rock, and south of that is the Integratron "rejuvenation machine," built in 1959, which has become an international tourist attraction. In the north-central portion of the subregion is Copper Mountain Community College, a small community college that primarily serves residents of the surrounding small towns and rural areas. The college students use the area surrounding the college for recreational pursuits outside of the classroom, and the area immediately north of the college shows significant signs of on- and off-route use of OHVs.

Some of the major issues in this area are trespass, air quality and noise due to the many residences along unmaintained roads that are interspersed with empty lots and public lands. Route designation is more constrained in this area because many private lands were obtained through the Small Tracts Act of 1938, a desert settlement act originally for World War I servicemen that targeted specific areas, including the Wonder Valley area. In many cases no access was set aside in classification orders for individual tracts, and in such cases reserves were made around the entire perimeter of the tracts. These reserves resulted in unnecessary access routes adjacent to many tracts, and restricted the use of the entire tracts by the purchasers. As a result there is a system of routes in this rural area that is more akin to a square road system within an urban suburb containing small tract homes.

Travel Management Area 4

Jawbone Subregion

The Jawbone Canyon subregion includes the Jawbone Canyon and Dove Spring Open Areas, and Bright Star and Kiavah Wilderness Areas.

The Jawbone subregion includes approximately 84,226 acres (approximately 32% of the subregion) of designated desert linkage networks, crucial to the conservation of special status wildlife species. The CNDDDB and BLM field offices document the occurrence of the following special status species and/or suitable habitat, which includes four plant species: Charlotte's phacelia, Kelso Creek monkeyflower, Mojave tarplant, Spanish needle onion; and six animal species: Bendire's thrasher, burrowing owl, golden eagle, Le Conte's thrasher, Mojave ground squirrel, and pallid bat.

Approximately 54,448 acres of the Little Dixie Wash Mohave ground squirrel core area is located within the eastern portion of the subregion. In addition, the Jawbone subregion contains numerous ACECs including, those set-up for the conservation of the Bendire's Thrasher and Kelso Creek monkeyflower. Over half of the northern portion of the subregion includes the Jawbone-Butterbredt ACEC and a small portion of the Middle Knob ACEC overlaps with the southern boundary of the subregion.

The extensive amount of private property checker boarded with public lands in the southern and western portions of this subregion result in access conflicts. The Pacific Crest National Scenic Trail also traverses through the management area. This trail sometimes sees user conflicts between non-mechanized and OHV user when some vehicles trespass onto this trail.

Middle Knob Subregion

The Middle Knob subregion, located approximately 40 miles southwest of Ridgecrest, is defined by Highway 14 on the east; Highway 58 on the south; the CDCA boundary on the west; and the Jawbone Butterbredt ACEC on the north. Numerous landowners own the private lands.

Primary recreation activities and resource uses occurring in the subregion are recreational vehicle touring/sightseeing (such as in the proposed Middle Knob ACEC), camping and hiking (such as within the proposed Middle Knob ACEC and the Pacific Crest National Scenic Trail), hunting, domestic sheep and cattle grazing, utility corridor maintenance, communication site maintenance, wind energy, and mineral exploration.

This subregion has a variety of special habitats (pavement plains, vernal pool, springs and grey pine woodland) and artificial waters (small game guzzlers). Biological values of special concern include habitat for desert tortoises, Mohave ground squirrels, raptors (nesting and foraging areas), and special status plants. The CNDDDB and BLM field offices document the occurrence of the following special status species and/or suitable habitat, which includes three plant species: Charlotte's phacelia, Kern buckwheat, Bakersfield cactus; and three animal species: burrowing owl, golden eagle, and Le Conte's thrasher.

Further, cultural resources are significant in the subregion.

Lancaster Subregion

The subregion consists of an assortment of scattered tracts of public land; predominantly within Los Angeles County. Open routes primarily connect private roads and provide casual OHV recreation. There are extensive private land developments with roads, power and water systems. Other developments include commercial power plant, military bases, airports, hotels, restaurants and gas stations.

The Fremont-Kramer DT ACEC overlaps with the northeastern corner of the subregion, as well as 1,369 acres of designated desert tortoise Critical Habitat. In addition to desert tortoise populations, approximately 126 acres of the Edwards Air Force Base ground squirrel core area is located within the northeast corner of the subregion.

Due to the scattered nature and small amount of public lands within this area the largest access concern in this area is ensuring that our network connects with those already in place being managed by the local municipalities and other government agencies.

Travel Management Area 5

Fremont Peak Subregion

The Fremont subregion is located approximately 30 miles northwest of Barstow, California. U.S. Highway 395 provides access to the Fremont subregion from the west, Cuddeback Road from the north, Hoffman (Lockhart) Road and smaller roads that skirt around the east side of Harper

Lake from the east, and State Highway 58 from the south. It is bounded by the Harper Lake subregion on the southeast, by the Black Mountain subregion on the northeast, by Cuddeback subregion on the north, by the Rands subregion on the west, and by the Kramer Hills subregion on the south.

The northwest portion of the subregion includes primarily flat terrain, undulating slightly with some prominent rocky buttes. Vegetation is creosote bush scrub, typical of that found throughout the Western Mojave, transitioning towards the south to a combination of creosote bush scrub and salt bush scrub. The lands in the subregion slowly rise from the west and south towards Fremont Peak located in the northeastern corner of the subregion. The creosote bush scrub community in this area is limited to the bajadas and foothills, extending only about one-third of the way to the top of Fremont Peak. The higher elevations of Fremont Peak are rocky hillsides with widely scattered plants of the Mojave mixed woody scrub community. Smaller outcrops are found in the center of the subregion and along Hoffman Road, the major north-south access road.

The entire subregion is within the Fremont Kramer DT ACEC to conserve desert tortoise and enhance its habitat. The designated DT ACEC continues north beyond Cuddeback Road into the Red Mountain subregion in TMA 7, and south to the other side of State Highway 58, into the Kramer Hills subregion, within TMA 6. In addition, the Barstow Woolly Sunflower ACEC is located in this subregion, which has the highest concentration of the species in the planning area.

The Barstow Woolly Sunflower is a rare West Mojave endemic plant which is found on shallow soils throughout the subregion. Approximately 19,000 acres has been designated as an ACEC for the protection of the species within the central portion of this subregion. The Fremont subregion also provides suitable habitat for the desert tortoise. Over half of the subregion is designated desert tortoise Critical Habitat by the USFWS. Desert tortoise fencing runs along the north side of State Highway 58 to prevent desert tortoise fatalities from traffic on the highway. In addition to the desert tortoise and the Barstow Woolly Sunflower populations, other sensitive resource values overlap the western and southeastern portion of the subregion, including two of the Mojave Ground Squirrel population areas.

A north-south utility corridor parallels US Highway 395 on the west side of the subregion and another utility corridor runs east-west from Kramer Junction at that intersection of US Highway 395 and State Route 58. These utility corridors include high-voltage transmission lines and underground pipelines and the access roads associated with their construction and maintenance. Small mining exploration and activity, both historic and recent, occurs primarily in the vicinity of Fremont Peak. Leasable economic mineral resources (oil and gas) occur in the southern part of the subregion. Low-level military overflights occur regularly in this area, and sonic booms are not uncommon.

Most recreation in the Fremont subregion is either associated with destination-oriented camping or touring. Cuddeback Lake Bed, located adjacent to and north of this subregion, is the most popular recreational and camping destination for travelers in the area. Cuddeback Lake Bed is accessed from Cuddeback Road which runs east off of US Highway 395. Cuddeback Road also provides access to points further east and south. Recreationists also use Cuddeback Dry Lake and some nearby disturbed areas off Cuddeback Road to stage their secondary vehicles. Motorcycles are particularly popular in this area. Hoffman Road provides access to Cuddeback Lakebed from the south and intersects Cuddeback Road. Hoffman Road runs past two smaller

lakebeds known as Twin Lakes on the way to Cuddeback Road. Adjacent to Twin Lakes are two well-used staging and camping areas, one of which is particularly popular owing to the unique acoustics created by its location in a natural recess adjacent to a high vertical rock wall. Occasional dual-sport tours occur in and through this area, including, in some years, the multi-day Thanksgiving touring event.

A substantial amount of the non-public land in this subregion is being managed under conservation easement to private landowners. The primary issue in this area is unauthorized use of closed routes and route proliferation near camping and staging areas in sensitive habitat, both on public lands and private lands. Unauthorized use occurs primarily in the northern and western part of the subregion, off of the major east-west and north-south routes, or near highway access.

Black Mountain Subregion

The Black Mountain subregion is located approximately 25 miles northwest of Barstow and east of the Fremont Peak Subregion. It is tucked between the Fort Irwin Army NTC and three other subregions in the TMA. It is bordered on the west by Hoffman (Lockhart) Road, on the east by Hinkley Road and BM6285 which angles northeasterly towards Superior Dry Lakes, the pipeline road on the south boundary of the Black Mountain Wilderness Area, and Fort Irwin and Grass Valley Wilderness Area on the north.

Black Mountain dominates, located in the south central portion of the subregion, along with Opal Mountain to the north of Black Mountain. A parallel ridge line lies northeast of Black Mountain on the other side of a narrow valley. The foothills surrounding Black Mountain provide varying topography and areas of sharp relief, and taper into several valleys to the north and Black Canyon to the east. The westernmost Superior Dry Lake is located in the northwestern corner of the subregion in Superior Valley, and Gravel Hills is located in the northeastern portion of the subregion adjacent to the southern edge of Grass Valley. The Black Mountain Wilderness Area includes Black Mountain and the area immediately around it, and comprises about 20% of the subregion. The Black Mountain Cultural ACEC, designated for its prehistoric and Native American values, overlays about a third of the subregion and includes all of the wilderness area and lands surrounding the wilderness extending further northward and eastward, into the adjacent subregion. The ACEC was modified in the 2006 WEMO Plan to include conservation of desert tortoise and sensitive plant species. The entire subregion is within the Superior-Cronese DT ACEC, designated to conserve desert tortoise and enhance its habitat.

The Black Mountain Petroglyph Sites are an extensive assemblage of prehistoric rock carvings in the basalt rock outcroppings through the south-central portion of the subregion. The most well-known site is Inscription Canyon, which is nationally known and receives substantial visitation in this area. A number of sites in this area are listed within a National Register District. The prehistoric resources represent habitation, extractive activities, and lakeside adaptations. Many of the sensitive resources in this area also represent historic activities, mostly mining and travel.

Approximately 70 percent of the subregion is designated desert tortoise Critical Habitat. Additionally, the entire subregion is within the Superior-Cronese Desert Wildlife Management Area, an Area of Critical Environmental Concern to conserve desert tortoise and enhance its habitat. The DT ACEC continues north into Grass Valley Wilderness Area, south into the Harper Lake subregion, and east into the Coolgardie subregion. A population of desert cymopterus is located in the southeastern portion of the subregion within the Black Mountain

ACEC and Wilderness Area. In addition to the desert tortoise, other sensitive resource values include a portion of the Coolgardie Mesa-Superior Valley Mojave Ground Squirrel Core Population Areas along the eastern boundary of the subregion. Murphy's Well provides essential water for wildlife and is located immediately adjacent to the eastern boundary road, BM6285.

This area is a popular destination and touring subregion. Black Canyon and Inscription Canyon are particularly popular destinations for touring and petroglyph viewing. Opal and Black Mountains are popular rockhounding destinations in the subregion. Superior Dry Lake and its two sister lakes, now located within the Fort Irwin NTC boundary, used to draw many land-sailing enthusiasts and the remaining western lakebed still receives some visitation. Hunting is also popular in this area. Occasional dual-sport tours occur through this area, including, in some years, the multi-day Thanksgiving touring event. The large basaltic mountains and interspersed canyons are also popular for raptor viewing. Low-level military overflights occur regularly in this area, and sonic booms are not uncommon.

Most of the lands in this subregion are federal or State lands. The primary issue in this subregion is vandalism and theft of the sensitive cultural artifacts, particularly in areas which receive higher visitation or are more widely known. Unauthorized use of closed routes occurs in and around the Black Mountain Cultural ACEC and in the northeastern corner of the subregion towards Cuddeback Dry Lake.

Coolgardie Subregion

The Coolgardie subregion, located north of Barstow, is bounded by Fort Irwin NTC on the north, and Hinkley Road which becomes BM6285 and the Black Mountain Wilderness boundary on the west; Fossil Bed Road and a pipeline road, HL7159 mark the boundary with Harper Lake subregion to the southwest, Irwin Road on the boundary with Mitchel Mountains subregion to the south and Calico Mountains subregion to the southeast. The major private landowner is the Catellus Development Corporation. Much of the private land has been acquired by the Department of Defense as mitigation for the expansion of the Fort Irwin Army NTC. Primary access to this area is off of a paved highway, Fort Irwin Road in the southeastern portion of the planning, which connects to another well maintained road, Copper City Road that runs southeast to northwest. Another well used north-south access road off of Fort Irwin Road is the Randsburg-Barstow Road.

The subregion includes the following major geographic features and designations:

- Unique and colorful exposed geologic features
- Lane Mountain provides the high point of the subregion, tapering towards mesas and valleys surrounding it and back up to the volcanic, rocky slopes of the Paradise Range in the north.
- Rainbow Basin/Owl Canyon ACEC: protects paleo geologic, scenic values, sensitive spp.; provides for recreational enjoyment, accessible off Fossil Bed Road, and includes the Mud Hills, Fossil Canyon, Owl Canyon campground, and the colorful Rainbow Basin.
- Approx. 4,000 acres within the Rainbow Basin/Owl Canyon ACEC is a National Natural Landmark and is withdrawn from the mining laws for protection of natural features and

recreational values, and the area in and around the Owl Canyon Campground is closed to shooting

- Coolgardie Mesa ACEC and the Paradise Valley ACEC within the central and north central portions of the subregion are proposed for withdrawal from the mining laws for the protection of two of four remaining known populations of the endangered Lane Mountain Milkvetch plant.
- Superior-Cronese DT ACEC
- A small portion of the Black Mountain Cultural ACEC, designated for its prehistoric and Native American values, extends into the westernmost portion of this subregion, east of Hinkley Road/BM6285. Most of the Black Mountain Cultural ACEC is within the adjacent Black Mountain subregion to the west.

The Coolgardie subregion includes approximately 54,064 acres (approximately 45% of the subregion) of designated desert linkage networks, crucial to the conservation of special status wildlife species. The CNDDDB and BLM field offices document the occurrence of three special status wildlife species (Le Conte's thrasher, Mohave ground squirrel, and desert tortoise) and/or suitable habitat. Approximately 31,712 acres of the Coolgardie Mesa-Superior Valley ground squirrel core area is located within the northern portion of the subregion. In addition, the Coolgardie subregion contains 81,478 acres (approximately 67%) of the designated desert tortoise Superior-Cronese DT ACEC and designated Critical Habitat. Additionally, the occurrence of four special status plant species (alkali mariposa lily, Barstow woolly sunflower, Clokey's cryptantha, and Lane Mountain milk-vetch) have been documented within this subregion. Approximately 9,888 acres of Critical Habitat has been designated within the Coolgardie subregion for the Lane Mountain mild-vetch.

This area is readily accessible to recreational users, RVers, and groups. The central portion of the subregion is very popular for recreational "dry washing" (gold panning) near Copper City Road, including by drywashing clubs. The subregion includes the following activities:

- Recreational touring throughout the planning area.
- Camping both in the Owl Canyon Campground and dispersed throughout the subregion.
- Other recreational activities include touring the OHV Rainbow Basin loop trail, rockhounding, hunting, and motorcycling, including on technical trails in the Mud Hills
- Utility corridor in the southeastern portion of the subregion, major transmission lines, and a pipeline within the corridor.
- Major mining activities in the southeastern portion of the subregion, zeolites and decorative rock used in landscaping,
- Major prospecting, primarily in the Mud Hills in the west central portion of the planning area east off of Coolgardie Road to Copper City Road.

The area has high recreational use levels in sensitive areas. Drywashing has disturbed critical habitat. Historic disturbances have exceeded the 50-foot Stopping and Parking limits.

Harper Lake Subregion

The Harper subregion, located northwest of Barstow, is bounded on the north by a pipeline road (HL7159) which also marks the boundaries with the Coolgardie subregion on the northeast and the Black Mountain Wilderness and subregion boundary on the northwest. A major divided highway, Irwin Road, forms the eastern boundary with the Mitchel Mountains subregion, State Highway 58 is the southern boundary of the subregion and TMA 5, and the Fremont Peak subregion forms the western boundary of the subregion. The small semi-rural community of Hinkley is located in the south-central portion of the subregion, with its town center at the junction of Hinkley Road and old State Highway 58. A major east-west railroad also runs just north and parallel to State Highway 58.

Waterman Hills is in the eastern portion of the subregion, and Harper Lake is in Harper Valley in the western portion. The southern portion of the subregion encompasses Mud-Water Valley, Waterman Hills, and outlying areas of Barstow. Access to the subregion from the south is obtained from Interstate 15, State Route 58, and Irwin Road.

The subregion contains 27,275 acres of designated desert tortoise Critical Habitat. In addition, the Superior-Cronese and Fremont-Kramer DT ACEC overlap with the majority of the subregion. This subregion also includes the occurrence of four special status plant species (Barstow woolly sunflower, desert cymopterus, Mojave monkeyflower, and Parish's phacelia) that have been documented within this subregion.

Excellent opportunities for both hiking and backpacking exist in the Black Mountains, Opal Mountains, and Calico Mountains. Major activities include camping, rockhounding, hunting, and motorcycle free play. Routes vary from long, flat graded utility corridor routes or the flats of Superior Valley; technical jeep routes in the Calico Mountains; technical single-track motorcycle routes in the Mud Hills; lengthy remote touring routes around the Black Mountain wilderness or through the Grass Valley wilderness corridor; short quickly accessible routes into the Mitchell Range or Waterman Hills; and those that provide a loop opportunity to those that are "dead-ends".

Several public roads are located within the subregion including Harper Lake Road, Santa Fe Avenue, and Lockhart Road. The Grass Valley Wilderness and the Red Mountain subregion (within BLM's Ridgecrest Resource Area) bound the subregion to the north, State Highway 58 to the south, the Black Mountain Wilderness and Superior subregion to the east, and U.S. Highway 395 to the west. The Fremont subregion encompasses a total of approximately 222,750 acres, which includes 52% (116,274 acres) Federal land managed by the BLM, and 47% (105,494 acres) private and State land.

The southern portion of the Fremont subregion includes Water Valley, a relatively large, open and flat area with scattered low rolling hills. This area also includes about half of Harper Dry Lake, which is the lowest point of the subregion at 2,018 feet. A portion of Harper Lake is within a BLM Area of Critical Environmental Concern (ACEC), in support of the birds and wildlife in that area. Vegetation in the Water Valley consists mainly of creosote bush scrub and saltbush scrub, and some scattered Joshua trees. A large number of unimproved roads cross the valley along with public infrastructure facilities that include high voltage transmission lines, wood pole power lines, and telephone lines. In addition, the valley includes intermixed grazing and ranching lands with associated fences and structures.

Mitchell Mountains Subregion

This subregion has few roads and trails, scattered historic mines, key communication sites on peaks, and no springs; there is significant vista from top of Mitchell Mountain. Intensive use from urban interface includes recreation shooting, OHVs, 4x4s, mountain biking, running, hiking, dog walking, equestrian use, and geo-caching. People commonly wander and explore into fringes along city edge.

The subregion contains 13,925 acres of designated desert tortoise Critical Habitat and the majority of the subregion is located within the Superior-Cronese DT ACEC. This subregion also includes the occurrence of two special status plant species (Barstow woolly sunflower and Mojave monkeyflower) that have been documented within this subregion.

Calico Mountains Subregion

The Calico Mountains subregion includes the rocky, rugged, colorful Calico Hills and historic mining town; and Coyote dry lake in the north portion (closed). The area is very popular for target shooting, riding OHVs and general exploration. Numerous roads, trails, mines, adits, and diggings are popular for groups, jeep clubs, SRPs, exploration, hiking, equestrian, 4x4 touring and OHV play. The town includes stores, historic cemetery, restaurants, and campground, and is popular with regional, national and international tourists; there is a KOA campground at the freeway. More activities include climbing, photography, painting and commercial photography.

The subregion contains 29,132 acres of designated desert tortoise Critical Habitat and the majority of the subregion is located within the Superior-Cronese DT ACEC. This subregion also includes the occurrence of two special status plant species (Mojave monkeyflower and Parish's phacelia) that have been documented within this subregion.

Cronese Lake Subregion

The Cronese Lake subregion, located approximately 20 miles northeast of Barstow, California, is defined by the Fort Irwin Military Reservation (National Training Center) on the north, Interstate-15 on the south, the Calico Mountains on the southwest, and the Soda Mountains Wilderness Study Area (WSA) on the east. The extensions of this subregion consist primarily of public lands on either side of the Soda Mountains WSA. This area is remote and rugged with numerous jagged mountains and ranges, scattered small playas, and dry upland desert lands. There are few roads, the vast Soda Wilderness Study Area, occasional communication sites, power, pipe and communication lines; mountaintop communication sites and few other developments. Similar to the Afton subregion, this is an ancient, historic and modern day east-west travel corridor and includes portions of Old Spanish National Historic Trail, Mormon Rd, Route 61 and Hwy15. This is the primary path travel and trade corridor between the west coast and all points east. Cronese Lake was the western border of the Anasazi Empire. The area includes a tank trail.

Coyote Dry Lake, Alvord Mountain, and a portion of the Calico Mountains are found within the subregion. Elevations range from 1,700 to 3,600 feet.

The Calico Early Man Site is found at the south end of the subregion. This National Register Property was designated as an ACEC by the 1980 CDCA Plan. A management plan was

prepared in 1984. The plan designated a network of vehicle access routes, a network designed to protect the evidence of ancient human occupation.

This subregion is located within the Superior-Cronese DT ACEC. Additionally, it contains 81,754 acres of designated desert tortoise Critical Habitat.

Primary recreation activities and resource uses occurring in the area are powerline and pipeline rights-of-way, wildlife habitat, cattle grazing, recreational mining, rockhounding, hiking, upland gamebird hunting, and off-highway vehicle use restricted to open routes of travel. The recommended route network provides vehicle access for all of these, as well as for access to each block of non-federal land within the area.

Travel Management Area 6

Kramer Hills Subregion

The Kramer subregion is located south of State Highway 58, between the cities of Hinkley and Kramer Junction. State Highway 58 and Edwards Air Force Base bound the subregion on the north, State Highway 395 on the west, and private lands to the east and south. The Kramer subregion encompasses a total of approximately 133,129 acres, which consists of 84,020 acres (63 percent) of federal land managed by the BLM, and 49,109 acres (37 percent) of private and State land.

The Kramer subregion is largely an area of alluvial soils and low rolling hills incised by braided, seasonal washes draining toward the Mojave River. Elevations range from 2,273 feet to 3,021 feet. The Kramer Hills, Iron Mountain, and Buckthorn Wash are found within the subregion. The Kramer Hills provide the most topographically varied portion of the subregion, and consist of low-lying, rolling hills composed of a complex of sedimentary and volcanic rocks. Iron Mountain, located in the northeastern portion of the subregion, also provides prominent areas of topographic relief. Most of the subregion is covered with creosote bush scrub and saltbush scrub plant communities. Joshua trees are scattered throughout the Kramer Hills and upper washes, in association with creosote and cholla.

Approximately 65,662 acres of the subregion is designated desert tortoise Critical Habitat. Additionally, the majority of the subregion is within the Fremont-Kramer DT ACEC, an Area of Critical Environmental Concern to conserve desert tortoise and enhance its habitat. In addition to the desert tortoise, other sensitive resource values include a portion of the Harper Lake Mojave Ground Squirrel Leitner Population along the northeastern boundary of the subregion.

State Highway 58 on the north and U.S. Highway 395 on the west provide access to the subregion. Several public roads are located within the subregion including Shadow Mountain Road, Harper Lake Road, and Helendale Road.

Current land uses include routes for several power lines and gas pipelines, as well as scattered homesteads. Recreational uses within the subregion include primarily OHV activity, and rockhounding in the Kramer Hills. Primary recreation activities and other resource uses occurring in the subregion are power line and pipeline rights-of-way, wildlife habitat, mining, hunting, and off-highway vehicle use restricted to open routes of travel.

The Kramer subregion includes portions of two grazing allotments. The majority of the subregion falls within the Stoddard Mountain grazing allotment. The southernmost portion of the subregion includes a small portion of the Buckhorn Canyon Allotment.

Mineral resources within the subregion are located primarily within Iron Mountain and the Kramer Hills. Gold has been produced at the Kramer Hills, which also includes occurrences of uranium, magnesite and feldspar. Considerable exploration of uranium occurred in the Kramer Hills during the 1970s. At Iron Mountain, limestone, marl, quartzite, and asbestos have been produced. In addition, there are occurrences of clay, copper, and mica in this area. The U.S. Geological Survey has classified the subregion as prospectively valuable for sodium, potassium, oil, and gas. Mining and homestead sites established in the late 19th and early 20th century exist in the area, some of which may have historical significance.

The suggested route network provides the following: 1) vehicle access to the Kramer Hills, Iron Mountain, and other areas located throughout the Kramer subregion; 2) access to sites appropriate to recreational target shooting; 3) opportunities for general dispersed camping and back country touring; 4) access through each of the primary upland gamebird hunting areas; 5) access to popular rockhounding locations; 6) access to known areas important for recreational mining; 7) OHV access facilitating mountain bike recreation throughout the subregion; and 8) a variety of opportunities for the recreational OHV enthusiasts from which to choose. The suggested route network also maintains vehicle access for a variety of terrain, a variety of trip lengths, access to remote areas for the equestrian community, and a substantial portion of the dual-sport network (for on-street/off-street motorcycles) which runs throughout the subregion.

Iron Mountain Subregion

The major landscape feature in the Iron Mountain subregion is the Mojave River along the TMA southern boundary. Trails and roads in this area are popular for equestrian riding, hiking, scenic touring, 4x4 exploration and OHV play; hunting, photography and bird watching. Features include the Old Spanish National Historic Trail, Mormon Rd., BNSF tracks, historic mines and old stage routes north to Harper and Death Valley.

Approximately 8,500 acres of the subregion is designated desert tortoise Critical Habitat. Additionally, the northwestern portion of the subregion is within the Fremont-Kramer DT ACEC to conserve desert tortoise and enhance its habitat. In addition to the desert tortoise, other sensitive resource values include a portion of the Harper Lake Mojave Ground Squirrel Leitner Population along the northwestern boundary of the subregion.

El Mirage Subregion

The El Mirage subregion, located northwest of the community of Adelanto and due north of BLM's El Mirage Off-Highway Vehicle Area is defined by Edwards Air Force Base to the north and west, State Highway 395 to the east, and the El Mirage Off-Highway Vehicle Area immediately to the south. The western boundary is not well defined, consisting of private and Federal lands. The subregion is located in both Los Angeles and San Bernardino Counties.

The Shadow Mountains, in the southwestern corner, trend northwest-to-southeasterly, and have a maximum elevation of 3,996 feet. The greater area is characterized by bajadas, dry lakebeds, washes, rugged hills, and desert mountains. Vegetation consists of three basic types, creosote

bush scrub, saltbush scrub and alkali sink scrub, all of which are typical of the western Mojave Desert. Creosote bush scrub is by far the dominant vegetative type.

Approximately 26,934 acres of the subregion is designated desert tortoise Critical Habitat. Additionally, the entire subregion is within the Fremont-Kramer DT ACEC to conserve desert tortoise and enhance its habitat.

Primary recreation activities and resource uses occurring in the area are powerline and pipeline rights-of-way, rockhounding, cattle grazing, recreational mining, upland gamebird hunting, hiking and camping, wildlife habitat, and off-highway vehicle use restricted to open routes of travel. Particular designated routes provide access to various blocks of non-federal land within the area.

Victor Valley Subregion

Approximately 500 acres of the subregion is designated desert tortoise Critical Habitat. Additionally, a small portion of the subregion at the northern border overlaps within the Fremont-Kramer DT ACEC to conserve desert tortoise and enhance its habitat.

Travel Management Area 7

Red Mountain Subregion

The Red Mountain subregion, located approximately 20 miles southeast of Ridgecrest, is defined by U.S. Highway 395 and the Kern County line on the west; the Spangler Hills Off-Highway Vehicle Management Area on the north; the China Lake Naval Air Weapons Station B Range on the east; and the Barstow Field Office management boundary on the south. 120,199 acres in size, the area is 82% (98,043 acres) Federal land managed by the BLM and 18% (22,156 acres) private and State land. Numerous landowners own the private lands. The subregion borders the Golden Valley and Grass Valley wilderness areas.

Elevations in the subregion range from 2,568 feet on the Cuddeback Playa to 5,260 feet on Red Mountain. Creosote bush and Mojave saltbush are the predominant plant communities in the lowlands, with cheesebush-dominated plant communities found in the washes, remnant stands of native perennial bunch grasses on the mountaintops and scattered Joshua tree woodland.

Nearly half of the subregion is made up of designated desert linkage networks, crucial to the conservation of special status wildlife species. The subregion contains approximately 111,357 acres of desert tortoise Critical Habitat. In addition to known desert tortoise populations, the subregion is also located within the boundaries of key Mohave ground squirrel population centers described as the Fremont Valley/Teagle and Pilot Knob populations.

The subregion is used for commercial 4-wheel drive and dual sport motorcycle tours and competitive equestrian endurance rides. Further, additional activities in the subregion include commercial filming, mineral exploration, utility corridor maintenance, recreational vehicle touring/sightseeing, dispersed hiking and camping, and upland game bird hunting.

Superior Valley, Monolith Cantil, Lava Mountains, and Pilot Knob are grazing allotments located within the subregion. The first three are ephemeral sheep allotments, and the Pilot Knob Allotment is an ephemeral cattle allotment, which is currently leased to the Desert Tortoise

Preserve Committee. Sheep grazing is not currently allowed in the majority of tortoise critical habitat.

The BLM's mineral resource potential classification shows a moderate potential for the occurrence of placer gold deposits in the Randsburg and Atolia mining districts. A high potential for lode and placer gold occurs immediately outside the south boundary of the subregion. There are no active mining operations in the Red Mountain subregion based on reports from the California Division of Mines and Geology filed under the California Surface Mining and Reclamation Act of 1975 (SMARA). BLM records show, as of March 2001, there are eight lode-mining claims north and west of Randsburg, and two lode claims located on some older workings on a small hill west of the Black Hills.

There are approximately 246 placer mining claims in the subregion. The placer claims are clustered in the center of the subregion, with dense clusters in the Atolia mining district and at the Summit Diggings area south of the Summit Range. Small clusters of placer claims are also located in the center of the subregion near Blackhawk Well. Most of the placer mining claims are association placers, each aggregating about 160 acres. As of March 2001, there were five plans of operation and eleven notice level operations authorized by BLM in the subregion pursuant to 43 CFR 3809. Most were approved for small placer operations in the Summit diggings area or assessment work in the remaining area of the subregion.

A utility corridor crosses the western portion of the subregion, running parallel to Highway 395. The corridor contains existing facilities.

Various opportunities for outdoor recreation are present in the subregion. Some of the best upland game bird hunting in the eastern Kern and San Bernardino Counties is available in the Lava Mountains, Red Mountain and Blackwater Well areas. During years when winter rainfall is suitable, seasonal wildflower displays are exceptional in the Golden Valley and Grass Valley areas. Red Mountain Spring (formerly called Squaw Spring) and Steam Well are two cultural heritage sites in the subregion. Both of these sites contain rock art. A route proposed for the California Statewide Discovery Trail crosses from south to north.

Other recreational opportunities and experiences available in the Red Mountain subregion include dispersed camping; four wheel drive and motorcycle touring; target shooting; rock hounding; hiking in the Golden Valley wilderness and climbing Red Mountain; mountain biking and equestrian recreation; and land sailing on Cuddeback Dry Lake. Several outfitters also use the area for recreational activities operated under recreation use permits including equestrian endurance rides, dual sport events and jeep tours.

Commercial filming in the subregion occurs primarily on Cuddeback Dry Lake where an average of 15 permits a year is issued for advertising and motion picture projects.

Rands Subregion

The bajadas, alluvial fans, and undulating hills that lie between the towns of Randsburg and California City along with scattered sections of land south of California City within eastern Kern make up the Rands subregion. Recreational activities within the region include OHV trail riding and touring, upland game bird hunting, rock hounding, gold prospecting, hiking, nature study, and photography. Popular destination locations include the Desert Tortoise Research Natural Area, Government Peak, and the living ghost town of Randsburg.

The subregion contains approximately 52,676 acres of desert tortoise Critical Habitat. In addition to known desert tortoise populations, the subregion is also located within the boundaries of the key Mohave ground squirrel populations centers described by Leitner as the Fremont Valley/Teagle and Boron Extension populations. Other known Mohave ground squirrel populations within the subregion include the Boron/Kramer Junction and Desert Tortoise Natural Area populations.

Occasionally vehicle trespass into the Desert Tortoise Research Natural Area is of concern. This issue has lessened over time with fencing being completed around the area and volunteer and staff patrolling the perimeter to maintain the fence.

Due to the scattered nature and small amount of public lands within the southern portion of this subregion an access concern for this area is ensuring that our network connects with those already in place that are being managed by the local municipalities and other government agencies.

Travel Management Area 8

Newberry-Rodman Subregion

The Newberry/Rodman subregion, located just south of Newberry Springs, California, is defined by Interstate-40 on the north, the Twentynine Palms Marine Corps Base and the Johnson Valley Off-Highway Vehicle Area on the south, and Camp Rock Road on the west. The subregion is 81,585 acres in size, with 73.6% Federal land (60,012 acres) managed by the BLM and 26.3% private and State land (21,481 acres). Catellus Development Corporation is the primary private landowner.

The general region consists of two small rugged mountain ranges and the surrounding foothills, valleys, sloping alluvial fans, washes, lava flows, and canyons. The entire area shows evidence of volcanic geologic activity, which provides for dramatic views. Elevations range from 1,800 feet to 5,100 feet in the Newberry Mountains. Creosote bush scrub is the predominant plant community in the lower elevations, with a desert willow-dominated plant community found in the dry desert washes, and remnant stands of perennial bunchgrasses in the higher elevations. Joshua tree woodland and small, riparian plant communities may also be found here in select locations. Many raptor nesting sites are found in the region. Kane Wash, which runs in a southwesterly to northeasterly direction, bisects the subregion, separating the Newberry Mountains wilderness and the Rodman Mountains wilderness. Access to this subregion is from Interstate-40, a power line road to the southeast, and Camp Rock Road on the west side.

The Pisgah cinder cone and lava field, south of the Cady Mountains, provides a unique mars-like, scenic black landscape. Lava tubes adjacent to the Pisgah crater cone provide habitat for sensitive bat species. Sensitive species that occur in population nodes in the sandy, lavic soils include white-margined beardtongue, crucifixion thorn, and Mojave fringe-toed lizard. Occurrence of this species has been documented within this portion of the Mojave Trails subregion. The lava fields also have extensive networks of "lava tubes" which may support sensitive endemic cave invertebrates.

The prominent cinder cone feature that dominates the landscape makes the area popular for scenic touring and photography. Casual use spelunkers as well as biologists and other scientists explore the lava tubes surrounding the cinder cone. The cinder cone itself is the location of an

active mining operation for its unusual decorative rock. Away from the cinder cone and adjacent lava field, it is a relatively remote area with few visitors, yet human sounds are near constant because of intensive ambient sounds associated with transportation activities and low flying aircraft.

A wide diversity of cultural site types are found here, some of which are associated with a National Register District. The Serrano tribe lived in the region, resulting in rock art and other cultural sites. Parts of the Rodman Mountains are designated as an ACEC to protect cultural resources. Additionally, approximately 2,000 acres within the subregion are designated as an ACEC to protect the Mojave monkeyflower. Most of this area is within the Rodman Mountains Wilderness. The subregion contains approximately 101,326 acres of designated Critical Habitat for the desert tortoise. In addition to the desert tortoise, the prairie falcon and the golden eagle are found in the subregion, and the area is a potential reintroduction area for bighorn sheep. The Ord Mountain grazing allotment is located in the subregion. Much of the area is highly scenic in character, and both hiking/backpacking and upland gamebird hunting opportunities are plentiful.

Primary recreation activities and other resource uses occurring in the subregion are cattle grazing, mineral exploration/production, utility corridor maintenance (2 major utility corridors), communication site maintenance, recreational vehicle touring/sightseeing, dispersed hiking and camping, equestrian recreation, upland gamebird hunting, and rockhounding.

The Ord grazing allotment is located within this subregion. This allotment consists of 154,848 acres, of which 14,820 are private.

In regards to mineral values in the subregion, construction materials (crushed rock, sand and gravel) are being produced from the northwest area of the Newberry Mountains (Cal West Quarry). There has been production of placer gold at the Camp Rock mine. Cinders have been and are being produced from Pipkin cinder cone (Malpais Crater) in the south-central part of the subregion. Borates (Fort Cady Minerals) and specialty clays (Rheox) are being produced in the eastern part of the subregion. BLM classified the western portion of the subregion as having a moderate to high potential for the occurrence of copper, silver, lead, tungsten and gold based on past exploration and production. The eastern portion of the subregion has a high potential for borate minerals and clay deposits.

A utility corridor runs along the northern boundary of the subregion, while another utility corridor crosses from north to south.

Excellent hiking/backpacking and upland game hunting opportunities exist in the Newberry and Rodman Mountains. There are three highly rated interpretive sites within the subregion, the Newberry Mountain Caves, Pipkin Cinder Cone, and the Rodman Mountain petroglyphs. Other federal plans relating to this subregion include the Johnson Valley Off-Highway Vehicle Area Management Plan.

The suggested route network provides for vehicle access for these resource uses and recreational activities. Further, they provide access to each block of non-federal land within the subregion.

Ord Mountains Subregion

The Ord subregion, located southeast of Barstow, California, is defined by State Highway 247 on the west, the U.S. Marine Corps Firing Range on the north, Camp Rock Road on the east, and greater Lucerne Valley on the south. The Newberry Mountains Wilderness lies immediately to

the northeast, the Johnson Valley and Stoddard Valley Off-Highway Vehicle Areas to the southeast and northwest respectively, and private land of Lucerne Valley to the south.

Apart from the portion north of Power Line Road and a small portion to the south, the subregion consists of the BLM's Ord Mountain Route Designation Pilot Planning Unit. The Planning Unit consists of approximately 126,000 acres, located between the Stoddard Valley and Johnson Valley Off-Highway Vehicle Areas. As such, it is a popular connector between the two. In early 1995, the Ord Mountain Pilot Project was initiated as an opportunity to conduct OHV route planning and vehicle access planning for the West Mojave Plan.

The subregion includes three important desert peaks in close proximity to one another, Ord Mountain, East Ord Mountain, and West Ord Mountain; as well as Daggett Ridge and portions of East Stoddard Valley and North Lucerne Valley. Elevations in the area range from 2,500 feet to 6,309 feet above sea level.

The Ord Mountain area consists of valleys, rolling and jagged hills, sloping bajadas, braided washes, and barren playas. The creosote brush scrub plant community is the dominant vegetative assemblage found within the subregion. Plant species within this community include creosotebush, burrobrush, Mormon tea, allscale saltbush, golden cholla, and beavertail cactus. A BLM sensitive species, the Mojave monkeyflower, is found here and approximately 23,000 acres within the subregion are designated as an ACEC to protect this species.

The subregion contains approximately 106,574 acres of designated Critical Habitat for the desert tortoise. Other reptile fauna found in the area include desert banded gecko, desert horned lizard, rosy boa, and Mojave rattlesnake. Notable avian species include golden eagle, prairie falcon, roadrunner, burrowing owl, and loggerhead shrike. Mammalian fauna include desert woodrat, antelope ground squirrel, black-tailed jackrabbit, kit fox, and coyote.

Primary recreation activities and resource uses occurring in the area are cattle grazing, powerline and pipeline rights-of-way, rockhounding, rock climbing, communication sites, camping, hiking, wildlife habitat, mining and recreational mining, hunting, and off-highway vehicle use restricted to open routes of travel.

The Ord Planning Unit consists of a precise vehicle network, restricting access to only essential routes of travel; all other historical routes are either closed or are limited to access by certain individuals for specific reasons, such as maintenance crews and ranch operators.

The recommended route network provides for vehicle access to the following features. Stoddard Valley Off-Highway Vehicle Area, to the west, and Johnson Valley Off-Highway Vehicle Area, to the southeast. In addition to these, the historic Ord Mountain Road and the Daggett Wash Road are accessible by four-wheel-drive vehicles and motorcycles. Mining operators used these two historic roads to haul their ore to the railhead in Daggett, California. Hercules Rock, on the south of the subregion, is a popular destination for rock climbers.

In addition, the network provides for access to the boundary of the Newberry Mountains wilderness, to the east; vehicular travel is not permitted within wilderness, but hiking, camping, and horseback riding are encouraged.

Many visitors to this area take advantage of the many hunting opportunities for small game birds found here. Hunting is enhanced in the region by a variety of water sources to be found here, including springs and guzzlers.

The recommended route network also provides access to various blocks of non-federal land within the area.

Johnson Valley Subregion

The major feature in the Johnson Valley subregion is the Johnson Valley OHV Area designated for 4x4 and OHV use, including exploration, touring, play and competition. The area is popular for large scale OHV events and competitions. It includes the Cougar Buttes area popular with trials bike SRP events and commercial filming. The area includes dry lakebeds, lava flows, rugged mountains, long valleys, springs, Creosote and Yucca Ring plant assemblies, and extensive and large scale mine operations. Sensitive areas are closed and fenced; signs, kiosks and visitor patrols help guide visitors and protect sensitive resources.

The subregion contains approximately 5,000 acres of designated Critical Habitat for the desert tortoise, as well as the occurrence of other sensitive species such as the golden eagle, Le Conte's thrasher, western mastiff bat, and Little San Bernardino Mountains Linanthus.

Stoddard Valley Subregion

The Granite subregion, is defined by State Highway 247 on the east, the Stoddard Valley Off-Highway Vehicle Area on the north, private lands on the west, and private lands on the south. The Granite Mountains, Sidewinder Mountain, North Lucerne Valley, and Stoddard Ridge are all found within this subregion. Elevations range from 3,000 feet to 4,900 feet.

The subregion contains the occurrences of sensitive wildlife species including the Bendire's thrasher, burrowing owl, golden eagle, Le Conte's thrasher, Mojave fringe-toed lizard, western mastiff bat, Barstow woolly sunflower, Mojave monkeyflower, and Parish's phacelia. ACECs within the subregion have been set-up to protect sensitive species including the Bendire's thrasher, Mojave fishhook cactus, and Mojave monkeyflower.

Primary recreation activities and resource uses occurring in the area are cattle and sheep grazing, powerline and pipeline rights-of way, rockhounding, communication sites, hiking, camping, wildlife habitat, mining and recreational mining, hunting, and off-highway vehicle use restricted to open routes of travel.

Some designated routes provide access to many blocks of non-federal land within the area.

Travel Management Area 9

El Paso Subregion

The El Paso subregion, located approximately 10 miles southwest of Ridgecrest, is defined by the El Paso Mountains wilderness area and "old" U. S. 395 to Inyokern on the north, U.S. Highway 395 on the east, the Garlock Road and Red Rock Canyon State Park on the south, and Highway 14 on the west. The subregion is 83,474 acres in size, with 92% federal land (76,998 acres) managed by the BLM and 8% private and state land (6,475 acres). Numerous landowners own the private lands. The El Paso Mountains wilderness is surrounded by this subregion on three sides.

The region consists of prominent volcanic peaks (El Paso Mountains), broad valleys, rolling foothills, badlands, sloping bajadas, braided washes, and narrow canyons. Elevations range from

2,000 feet on the southern boundary to 5,244 feet above sea level on top of Black Mountain. Creosote bush scrub and saltbush scrub are the predominant plant communities in the lowlands, with numerous desert washes, remnant stands of native perennial bunchgrasses on the mountain tops, scattered Joshua tree woodland, and small riparian plant communities at a few of the widely spaced springs.

The El Paso Mountains contain three West Mojave endemic plants: Red Rock poppy, Red Rock tarplant and Charlotte's phacelia. They are well known as a raptor nesting area and support abundant populations of upland game birds.

Approximately half of the subregion is made up of designated desert linkage networks, crucial to the conservation of special status wildlife species. A small portion of the subregion contains desert tortoise Critical Habitat (approximately 68 acres) at the southern border. The subregion is also located within the boundaries of key Mohave ground squirrel populations described as the Little Dixie Wash, Fremont Valley/Teagle, and Ridgecrest populations.

Primary resource uses occurring in this subregion are: domestic sheep grazing, mineral exploration, utility corridor maintenance, communication site maintenance, and various recreational activities. The BLM's CDCA Plan identified four sites within the subregion with excellent potential for interpretation and education: Burro Schmidt's Tunnel; the El Paso Mountains; the Garlock Fault; and the Goler Graben.

In particular, the El Paso Mountains are heavily used for a variety of recreational activities. The area contains excellent opportunities for upland game bird hunting (chukar and Gambel's quail) and rock and mineral collecting. Other activities include recreational vehicle touring/sightseeing, dispersed hiking and camping, mountain biking, and equestrian recreation.

The subregion is also used for commercial 4-wheel drive and dual sport motorcycle tours and competitive equestrian endurance rides.

Ridgecrest Subregion

The Ridgecrest subregion, located south and east of the city of Ridgecrest, is defined by U.S. Highway 395 and the boundary of the Spangler Hills Open Area on the south; the city of Ridgecrest and the China Lake Naval Air Weapons Station on the north and west; and BLM Route RM 138 on the east. 22,465 acres in size, the area is 94% (21,115 acres) Federal land managed by the BLM and 6% (1,350 acres) private land. Numerous landowners own the private lands.

The general region consists of the rolling Rademacher and Spangler Hills. Sloping bajadas, braided washes, and narrow canyons characterize the general topography. Elevations range from 1,900 feet at the northeastern point of the subregion, to over 3,400 feet above sea level in the hills directly south of the City of Ridgecrest in the western portion of the subregion. Creosote bush scrub is the predominant plant community in the subregion, with cheesebush-dominated plant communities found in the washes, remnant stands of native perennial bunch grasses on the mountain tops and scattered Joshua trees. The subregion also located within the boundaries of key Mohave ground squirrel populations described as the Fremont Valley/Teagle population to the south and Ridgecrest population to the north.

The subregion contains two livestock grazing allotments. The Spangler Hills Allotment is located in the eastern-most portion of the subregion. This allotment is identified by the 1980

Desert Plan as an ephemeral allotment requiring a minimum of 200 pounds of dry vegetation per acre before the livestock are turned out to graze. The Cantil Common Allotment, an ephemeral grazing allotment, covers the remainder of the subregion. Sheep grazing occurs in the area in the spring when the annual vegetation meets the minimum requirements. The northern portion of the subregion contains a portion of the Centennial Wild Horse and Burro Herd Management Area.

The BLM's Mineral Resource Potential Classification identifies most of the subregion as having a moderate potential for the occurrence of placer and lode gold deposits, with a high potential for placer, principally hydrothermal lode gold deposits, identified in the western area of the subregion (Rademacher Mining District). In addition, there is a high potential for construction aggregates (sand and gravel) in the western portion of the subregion, with aggregates mined at the Bowman and Inyokern pits outside the western boundary. There are no active mining operations in the subregion filed under the California Surface Mining and Reclamation Act of 1975 (SMARA), based on reports from the California Division of Mines and Geology. Some interest has been expressed in the far western portion of the subregion as evidenced through mining claim locations. BLM records show, as of March 2001, that there are six lode-mining claims and six placer mining claims in this portion of the subregion in the Rademacher Hills. There is one plan of operation and one pending (April 2001) notice level operation in the Rademacher Hills area of the subregion filed pursuant to the regulations at 43 CFR 3809. There are no aggregate resources being developed within the subregion, and the subregion is not valuable, prospectively or otherwise, for Leasing Act minerals.

A utility corridor crosses the northern portion of the subregion, in an east/west direction. This corridor contains existing facilities.

The Ridgecrest Subregion supports a wide variety of recreation opportunities and experiences including, but not limited to, four wheel drive and motorcycle touring, hunting and target shooting, paintball, stargazing, photography, exploring mining sites, social gatherings, rockhounding, hiking and running, limited dispersed camping, mountain biking and equestrian recreation.

The most prominent recreation feature in the subregion is the Rademacher Hills, located south of the City of Ridgecrest. The Rademacher Hills offer a 12.5-mile network of trails open to hiking, jogging, horseback riding and mountain biking. This area forms the backdrop for the City of Ridgecrest and provides an urban-public land interface that is fast becoming a popular recreation site for local residents. OHV trails through the Rademacher Hills provide access from the City of Ridgecrest to the 57,000 acre Spangler Hills OHV Area. A link to the Statewide Motorized Discovery Trail is proposed to connect the trail to the City of Ridgecrest through the Rademacher Hills.

The subregion is also used by a variety of recreation permit holders who use the public lands for mountain bike races, ultra-marathon running events, high school cross country running competitions, equestrian trail rides and endurance events, dual sport motorcycle tours, jeep tours, and other activities.

The area is used for commercial 4-wheel drive and dual sport motorcycle tours and competitive equestrian endurance and mountain bike events.

APPENDIX E
REGULATORY FRAMEWORK AND REGIONAL BACKGROUND INFORMATION

This page intentionally left blank.

Appendix E

Regulatory Framework and Regional Background Information

E.1 Introduction

This appendix summarizes the regulatory framework and regional background information relevant to each resource evaluated in the West Mojave Route Network Project (WMRNP) Supplemental Environmental Impact Statement (SEIS). Resource data that are more location-specific and are used directly in the impact analysis are presented in Chapter 3 of the SEIS.

For the comparison of route network alternatives to resources for the impact analysis in Chapter 4 of the SEIS, primary data were collected and compiled into GIS layers. GIS layers used in the analyses and impact evaluations, along with their sources, are listed below. Most of these data are readily available from the source listed.

In addition to route data, additional field data was collected on the condition of riparian waters and springs, on cultural resources sites, wilderness characteristics, recreational destinations, and MFTL.

E.2 Air Resources

E.2.1 Air Quality

E.2.1.1 Regulatory Framework

The following regulatory framework identifies the federal and state agencies in charge of monitoring and controlling mobile and stationary sources of air pollutants and describes measures

taken to achieve and maintain healthful air quality in the WEMO planning area. This section summarizes the applicable regulations related to the Proposed Project.

Rules and regulations promulgated by the federal, state or local agencies impose limits on emissions from sources of air pollutants. These agencies manage mobile sources of air pollutants and exhaust from off-road vehicles (OHVs) through emission performance standards and fuel formulations requirements.

Federal

The Environmental Protection Agency (EPA) implements and enforces the requirements of most federal environmental laws. EPA Region 9 administers federal air programs in California. The federal Clean Air Act (CAA) provides the EPA with the legal authority to regulate air pollution from stationary and mobile sources. The EPA has authority over conformity issues with the CAA in areas that do not meet national ambient air quality standards (NAAQS). The EPA has delegated the authority to review to the California Air Resources Board (ARB). The ARB has further delegated this authority to Air Quality Management Districts (AQMDs) and Air Pollution Control Districts (APCDs) established throughout the state. Federal land management agencies also are responsible for conformity issues related to federal activities and projects that federal land managers authorize in conjunction with the AQMDs and APCDs.

Federal Clean Air Act (CAA)

The CAA, enacted in 1970 and amended in 1977 and 1990 (42 United States Code [U.S.C.] 7401 et seq.), protects and enhances the quality of the nation's air resources to benefit public health, welfare, and productivity. The CAA regulates certain forms of air pollution under three main categories: criteria pollutants, air toxics, and global warming and ozone-depleting gases. Regulation also covers a more general category of emissions that reduce visibility: regional haze, prevention of significant deterioration (PSD), and visibility reducing particulates (VRP).

In 1971, the EPA developed National Ambient Air Quality Standards (NAAQS) to achieve the mandates of CAA Section 109 (42 U.S.C. 7409). NAAQS cover seven "criteria" pollutants of national concern for public health: ozone, respirable particulate matter (PM₁₀), fine particulate matter (PM_{2.5}), carbon monoxide, nitrogen dioxide, lead, and sulfur dioxide.

Each NAAQS has two parts. A primary standard intended to provide an adequate margin of safety required to protect health in consideration of long-term exposure for sensitive groups in the general population. Sensitive groups include children, senior citizens, and people with breathing difficulties. A secondary standard for each criteria pollutant is intended to "protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air" (42 U.S.C. 7409[b] [2]).

State

California Health and Safety Code § 41700

The Health and Safety Code prohibits the discharge of air pollutants that cause injury, detriment, nuisance or annoyance to the public. AQMDs and APCDs implement this requirement through rules.

California Clean Air Act, California Health and Safety Code § 42300 et seq.

The California CAA of 1988 provides for air quality planning and regulation beyond and independent of federal regulations. ARB is the state's lead air quality agency and adopts standards for the California Ambient Air Quality Standards (CAAQS), some of which are more stringent than the NAAQS. ARB is responsible for the attainment and maintenance of both NAAQS and CAAQS, oversees the operation of local AQMDs and APCDs, and is responsible for motor vehicle air pollution control. ARB also assists the individual air districts with air quality monitoring as well as planning activities such as inventorying air pollutant emissions and modeling air quality.

In addition the federal criteria pollutants established under the CAA, the State of California also sets air quality standards and manages for sulfates, hydrogen sulfide, visibility-reducing particles, and vinyl chloride.

ARB Special Programs for Reducing Emissions from Off-Highway Recreational Vehicles

The California Clean Air Act mandates that ARB achieves the maximum feasible emission reductions from all off-road mobile sources as part of attainment of the CAAQS. Off-road mobile sources regulations target construction equipment as a major source targeted for reductions to achieve hydrocarbons, nitrogen oxides (NO_x), carbon monoxide (CO), and PM_{2.5} exhaust standards. In addition, ARB implements control measures to reduce diesel particulate matter emissions (PM_{2.5}) as well as NO_x from existing off-road diesel vehicles and equipment, fleet emission targets for new vehicles, and specific limits on emissions from classes of vehicles, including red-sticker and green-sticker off-road vehicles.

The California Department of Motor Vehicles has designated off-highway vehicles from 2003 or newer model years that do not meet ARB emissions standards as non-complying "red-sticker" vehicles. ARB permits red-sticker vehicles to operate at certain BLM OHV facilities during specified times of year. Within the WEMO planning area, red-sticker vehicles and engines that do not meet ARB OHV emissions standards may operate only at BLM OHV Open Riding Areas at specified seasons as follows: Olancho Dunes, all-year; Dove Springs, Jawbone Canyon, Johnson Valley, Rasor, Spangler Hills, Stoddard Valley, September 1 to May 31; and El Mirage, October 1 to 30 April. Red-sticker vehicles may not operate on BLM-designated OHV routes.

All other off-highway vehicles that meet ARB standards are allowed on all BLM OHV open riding areas and all BLM-designated routes fall under the category for "green-sticker" vehicles. All pre-2003 model year and all compliant 2003 or newer model-year vehicles qualify as green-sticker vehicles. ARB began rulemaking to control emissions for off-highway recreational vehicles in 1994 with California Regulations for New 1995 or Later Off-Highway Recreational Vehicles and Engines under 25 horsepower. Off-highway recreational vehicles (OHRVs) constitute a single regulatory category in California that includes motorcycles (OMCs), all-terrain vehicles (ATVs), off-road sport vehicles, off-road utility vehicles, sand cars, and golf carts, as defined in Cal. Code

Regs., tit. 13, § 2411(a). ARB has developed a regulation to control evaporative emissions from gasoline-powered OHRVs in order to satisfy the 2007 State Implementation Plan (SIP) commitment to reduce reactive organic gas (ROG, also known as volatile organic compound - VOC) emissions from OHRVs.

ARB Organization for Managing Air Quality

Air Basins Intersecting the WEMO Planning Area

Air basins are the basic geographic management units for which the ARB sets limits on maximum amounts of air pollutants allowed for attainment of NAAQS and CAAQS. Air basins consist principally of adjacent areas with similar geographical and meteorological features, but political boundaries may also shape air basin boundaries in some cases. Usually air pollution can move freely within an air basin, but pollution can also sometimes move from one basin to another. The WEMO Planning area falls within portions of three of California's 15 air basins (see Figure E.2-1). The Great Basin Valleys Air Basin encompasses the Inyo County portion of the WEMO planning area. The Mojave Desert Air Basin includes the Mojave Desert portions of Kern, Los Angeles, east-central Riverside, and San Bernardino Counties in the WEMO planning area. The Salton Sea Air Basin includes the WEMO planning area in a small part of central Riverside County and contains no BLM public lands.

Air Quality Management Districts and Air Pollution Control Districts Intersecting the WEMO Planning Area

The State of California has further subdivided these air basins into administrative planning areas based variously on problems of emissions attainment, watershed boundaries, and county boundaries.

The WEMO planning area falls within five different regional air districts (see Figure E.2-2):

- Antelope Valley Air Quality Management District (AVAQMD) covers the Antelope Valley portion of Los Angeles County that comprises part of the Mojave Desert Air Basin.
- East Kern Air Pollution Control District (EKAPCD) encompasses the Mojave Desert portion of Kern County within the Mojave Desert Air Basin.
- Great Basin Unified Air Pollution Control District (GBUAPCD) partially includes the Inyo County portions of the Great Basin Valleys Air Basin.
- Mojave Desert Air Quality Management District (MDAQMD) consists of the Mojave Desert portions of San Bernardino County.

South Coast Air Quality Management District (SCAQMD) includes the WEMO part of Riverside County

Ambient Air Quality Standards

The CAA and the California Clean Air Act contain the primary provisions relating to air quality. The most important provisions relate to establishment of the NAAQS and CAAQS for criteria air pollutants, nonattainment areas, development of state implementation plans (SIPs), prevention of significant deterioration (PSD), air toxics, and federal general conformity. The EPA and the ARB have issued rules to implement the CAA and California Clean Air Acts respectively.

Under the CAA, ARB and the EPA determine whether they are in attainment or nonattainment or are unclassified for any of the NAAQS.

California has established CAAQS for the same federal criteria pollutants, plus an additional four pollutants (visibility reducing particulates, sulfates, hydrogen sulfide, and vinyl chloride).

Prevention of Significant Deterioration

The CAA Section 162(s) classifies areas where air quality already attains the NAAQS or where air quality for the NAAQS remains unclassified with regard to attainment. The three classes of air quality have specific goals. For example, the EPA has authority to review new projects that may affect Federal Class I areas as defined in 40 CFR 51.166. The management goal for Federal Class I areas is pristine air quality. Requirements for additional limits above NAAQS, specifically for emissions of particulate matter and SO₂, are most stringent in Class I areas.

Mandatory Class I federal lands include those lands that as of the date of enactment of the Clean Air Act Amendments of 1977 were:

- International parks.
- National wilderness areas larger than 5,000 acres.
- National memorial parks larger than 5,000 acres.
- National parks larger than 6,000 acres.

These lands may not be redesignated as Class II or Class III areas. The WEMO planning area includes a portion of Joshua Tree National Park, which is a Class I area.

The BLM wilderness areas and national monuments within the WEMO planning area did not exist in 1977. The CAA provides (Section 163(4)), however, that additional acreages added to Class I wilderness areas after enactment of the CAA Amendments of 1977, also receive Class I designation. A singular exception for Class I air quality status on BLM lands in the WEMO planning area comprises the BLM lands added in 1994 to the San Geronio Wilderness, which itself was established as a US Forest Service Wilderness in 1964 and was an original Class I area.

All other air quality jurisdictions not qualifying as Class I areas were originally designated as Class II areas in 1977. Most other areas already in attainment of NAAQS are Class II areas where the air quality goal is no significant deterioration of current air quality. BLM public lands usually fall under Class II status in California. Class II areas are also subject to maximum limits to air quality degradation called air quality increments (often referred to as PSD increments). These air quality increments are more stringent than NAAQS.

If desired by local constituents, a state air quality management agency or a federally recognized Native American tribe may redesignate a Class II area as a Class III area. In Class III attainment areas, air quality may be degraded but only to levels no less than the NAAQS.

For Federal lands with special designations that were established since 1977, CAA Section 164 delegates to the State of California the authority to designate Federal lands in NAAQS attainment or unclassified status as new Class I areas. Requirements for Federal land to be considered for redesignation to Class I areas are:

1. A national monument, a national primitive area, a national preserve, a national recreation area, a national wild and scenic river, a national wildlife refuge, a national lakeshore or seashore which exceeds 10,000 acres; or
2. A national park or national wilderness area which exceeds 10,000 acres.

To date, the State of California has not designated any Federal lands as new Class I areas.

E.2.1.2 Regional and Background Information

Air quality in the WEMO planning area is often good. At times, however, air quality planning areas do not meet ambient air quality standards (i.e., are in nonattainment status). Fugitive dust is the most pervasive air pollutant in the WEMO planning area, portions of which constitute the two criteria pollutants, PM₁₀ and PM_{2.5}.

Frequent high winds aggravate fugitive dust pollution in the desert. Emissions that affect air quality in the WEMO planning area may also originate from outside the planning area and migrate into the West Mojave Desert by way of the Owens Valley and low-lying passes from the Los Angeles Basin and the Central Valley. Bytnerowicz et al. (2016) describe the source, cause, and impacts to the WEMO planning area from the Owens Valley:

“Dust storms occurring in the Owens Valley east of the Sierra Nevada as a result of many decades of pumping water from that aquifer to Los Angeles lead to violations of the coarse particulate matter air quality standard. The Owens Valley is one of the most turbulent valleys in the U.S. and one of the largest coarse particulate matter sources in the Western hemisphere (Reid et al. 1994). Coarse particulate matter is generated during wind events by sandblasting of the efflorescent crust with saltation particles created from lakebed sediment and sand from the shoreline (Reid et al. 1994). Atmospheric coarse particulate concentrations in the Owens Valley area during windstorms can exceed 1,000 µg m⁻³ (compared to the federal health standard of 150 µg m⁻³), with plumes reaching above 2,000 meters in height (Reid et al. 1994).”

Many times winds blow from the Owens Valley into the immediately adjacent WEMO planning area. Prolonged dry conditions and fires in southern California mountains can also intensify fugitive dust pollution and substantially reduce visibility in the Mojave Desert.

Air quality degradation and ambient air quality standard exceedances in the planning area have been episodic in nature. High PM₁₀ concentrations that exceeded the PM₁₀ NAAQS peaked in the early 1990s. In recent years, monitoring data has led to reclassification requests to the EPA for most nonattainment areas of the region. Implementation of fugitive dust control rules and controls on a number of critical sources have led to reductions in PM₁₀ concentrations.

E.2.2 Climate Change

E.2.2.1 Regulatory Framework

Federal

Presidential Executive Order 13783 on Promoting Energy Independence and Economic Growth, dated March 28, 2017, has revoking the preceding Executive Order 13653 Preparing the United States for the Impacts of Climate Change, dated November 1, 2013. The 2017 Order also rescinded

the President's Climate Action Plan from June 2013 and the Climate Action Plan Strategy to Reduce Methane Emissions from March 2014. Further, the Order directs the Council on Environmental Quality to rescind its final guidance entitled "Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in National Environmental Policy Act Reviews," which is referred to in "Notice of Availability," 81 Fed. Reg. 51866 (August 5, 2016).

In addition, the Secretary of the Department of Interior and directors of its component agencies shall identify existing agency actions, reports, and guidance related to or arising from the specified rescissions of climate-related Presidential and Regulatory Action enumerated in the Order to be revoked or rescinded. As soon as practicable, each agency is to suspend, revise, or rescind, or publish for notice and comment proposed rules suspending, revising, or rescinding any such actions, consistent with existing law and the policies of Order 13783.

State

The State of California is pursuing wide-ranging policies to reduce greenhouse gas (GHG) pollutant emissions originating with vehicular and industrial sources as a means to cap total emissions and to mitigate adverse impacts to society and ecosystems from atmospheric warming and attendant climate change. GHGs are increasing in the atmosphere and effect a warming trend in the atmosphere because molecules of GHGs are effective at capturing and reradiating energy (heat) reflected from the earth's surface back to earth rather than continuing into outer space.

To that end, the State of California has developed a unique market-based "cap-and-trade" approach to emissions management intended to address current and potential future impacts of climate. Governor's executive orders, legislation incorporated into the California Code of Regulations, and policy documents direct integrated and collective efforts to offset production of GHGs in California. Climate-related documents bearing on this SEIS refer here mainly to efforts on the part of the California Air Resources Board (CARB) to curb vehicle emissions, particularly in exurban settings where motorized access and recreation occur, including on BLM public lands.

Following is a brief summary of State climate change measures in place or soon to be in place.

Governor's Executive Orders on Climate Change and Control of GHGs from Motor Vehicles

Executive Order S-3-05

In 2005, the Governor of California issued Executive Order S-3-05, establishing statewide GHG emission reduction targets scaled back to 2000 levels by 2010, 1990 levels by 2020, and 80 percent below 1990 levels by 2050.

Executive Order B-16-12

The Governor of California ordered CARB and other California state government agencies in 2012 to achieve the following benchmarks by 2025:

- Over 1.5 million zero-emission vehicles will be on California roads and their market share will be expanding; and
- California's clean, efficient vehicles will annually displace at least 1.5 billion gallons of petroleum fuels.

Executive Order B-30-15

In April 2015, the Governor established an accelerated target for reducing GHG emissions to 40 percent below 1990 GHG levels by 2030.

California State Legislation on Climate Change and Control of GHG Emissions from Motor Vehicles

2002: AB 1493, the “Pavley Bill” on Vehicular Emissions: Greenhouse Gases, established the California Climate Action Registry, and require CARB to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of greenhouse gases from motor vehicles. The Registry applies procedures and protocols for the reporting and certification of reductions in GHG emissions from mobile sources [e.g., motor vehicles] for use by CARB in granting the emission reduction credits. Regulations aim for maximum feasible reduction of GHGs emitted by passenger vehicles and light-duty trucks and any other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the state

2006: AB 32, the Global Warming Solutions Act, caps the California GHG emissions at 1990 levels by 2020 starting in 2012. This law enacted the first statewide program in the United States to mandate an economy-wide limit for GHG emissions from motor vehicles accompanied by enforceable penalties. The Act directed CARB to develop and implement regulations to reduce statewide emissions from stationary sources. It also specifies that CARB regulations adopted in response to AB 1493 also address GHG emissions from vehicles. Guidance was put in place to reduce emissions in an economically efficient manner while ensuring that reductions do not unfairly affect businesses and consumers.

2006: AB 1803 requires CARB to assume responsibility for preparing, adopting, and updating the State of California inventory of GHG emissions.

2016: SB 32 requires that CARB ensure that statewide GHG emissions are reduced to 40% below the 1990 level by 2030.

2016: AB 197 requires that CARB inventory all sources of air pollution within California air basins and determine the kinds and quantity of air pollutants, including but not limited to, the contribution of natural sources, mobile sources, and area sources of emissions, including separate identification of those sources. CARB also makes available, and updates at least annually on its Internet website the emissions of GHGs, criteria pollutants, and toxic air contaminants throughout California broken down to a local and sub-county level for stationary sources and to at least the county level for mobile sources. The law further stipulates that CARB consider the social costs of GHG emissions. Social costs are defined as “an estimate of the economic damages, including, but not limited to, changes in net agricultural productivity; impacts to public health; climate adaptation impacts, such as property damages from increased flood risk; and changes in energy system costs, per metric ton of GHG emissions per year.”

CARB Policy Documents Guiding Reductions of GHGs

Zero-Emissions Vehicles (ZEVs)

The Governor’s Interagency Working Group on Zero-Emission Vehicles (2016) establishes State of California policy to achieve targets set forth in Executive Order B-16-12. The Working Group

has charged CARB with consideration of regulations in 2018 that would create emissions-based credit programs for zero-emission motorcycles, off-highway recreational vehicles, and off-highway utility vehicles.

2017 Climate Change Scoping Plan Update

CARB approved its initial Climate Change Scoping Plan in 2008 to fulfill directives of AB 32. With periodic updates, the Scoping Plan is the State's roadmap to reach GHG reduction goals. The plan outlines a number of key strategies to reduce GHG emissions. The latest update from 2017 continues cap-and-trade regulation of GHG emissions, maintains the low-carbon fuel standard, and advances technology to reduce tailpipe emissions from all motor vehicles. For the first time, the Scoping Plan also addresses reducing GHG emissions from natural lands. By the end of 2018, CARB will develop the Natural and Working Lands Action Plan to reach a goal of making the entire land base of California a net carbon sink, i.e., sequestering more carbon than emitting carbon as GHGs into the atmosphere.

E.2.2.2 Regional and Background Information

Climate Conditions

Temperature

The WEMO planning area is characterized by hot summer temperatures (average daily highs above 37°C (100°F)). Temperature extremes are common in the planning area. Seven of thirteen weather stations in the WEMO planning area have average low temperatures below freezing in December and January. El Mirage at the San Bernardino / Los Angeles county line has the lowest average temperatures in the planning area, and Twentynine Palms at the east end of the planning region has the highest average temperatures. Average daily temperature change ranges 16°C (29°F) for all stations. Seasonal variations are high. Ridgecrest, for example, has recorded highs of 48°C (118°F) and lows of -18°C (0°F) since the mid-1980s.

Rainfall

The rain shadow effect of the mountains on the western and southern boundaries of the WEMO planning area produces less precipitation than on the coast-facing sides. Rainfall generally follows seasonal wind patterns. Most winter rainfall arrives from the southwest and spreads eastward in diminishing amounts across the desert. Cool-season precipitation is the most important and extensive source of rain in the region. Areas of rainfall are generally more widespread and of longer duration during the cool season than in the warm season. Snow occurs during the winter over a large portion of the planning area. The total average snowfall ranges from under one inch in Trona to over three inches at Haiwee Reservoir and Lancaster.

A major feature of western Mojave Desert rainfall is its variability. The cyclic weather phenomenon known as El Niño increases annual winter precipitation in the planning area. The difference in rainfall between wetter El Niño years and the drier intervening La Niña years creates high interannual variability in rainfall over the long run. For example, the town of Mojave in Kern County has mean annual precipitation of 6.06 inches but with a standard deviation from the mean of 4.04 inches expected, so that in about two-thirds of all year's annual precipitation ranges from a low of 2.02 inches to 10.10 inches. Weather records indicate that there have been 23 El Niño years since 1931, approximately one-third of all years. El Niño years, however, account for 65 percent of the precipitation since 1931 at the westernmost edge of the planning area. East-to-west variability

is apparent in the difference in the influence of El Niño years. In Twentynine Palms, by contrast, only 44 percent of the precipitation fell in El Niño years since 1931.

During the summer, southwest airflow results in typically very dry weather on the western edge of the Mojave Desert. The influence of summer southwest winds diminishes toward the eastern Mojave Desert, however. This pattern results in a greater continental influence, characterized by a monsoonal weather pattern in the east. The annual precipitation cycle across the entire Mojave Desert shows the two distinctive patterns that approximately divide the region in half. May and June are consistently dry in both patterns, accounting for less than 5% of annual rainfall. From October through April, precipitation is the dominant pattern and accounts for 82% of the annual total in the west part of the West Mojave Desert, whereas in the more easterly bi-seasonal monsoonal weather zone, just 66 percent of the annual precipitation comes in the winter. From July through September, 13 percent and 29 percent of the annual rainfall total falls in the western winter-dominant and the eastern bi-seasonal zones, respectively.

Randsburg, along the western edge of the planning area, and Twentynine Palms, at the eastern edge, illustrate the summer precipitation conditions. In Randsburg, only two percent of the Julys from all years and six percent of Augusts from all years have more than one inch of precipitation. By comparison, Twentynine Palms averages more precipitation in July and August combined than in January and February combined.

Warm-season precipitation results largely from convective precipitation in the form of thunderstorms. Although infrequent, the most dramatic precipitation source is tropical cyclones and hurricanes that drift across the region from offshore Baja California. These typically occur late in the warm season and with widespread and severe flash flooding. Summer thunderstorms can drop more precipitation on a site in one event than the mean annual precipitation for that location. On the other hand, the extent of thunderstorms not associated with tropical storms is often highly localized, and weather stations in areas having a low density of weather stations may miss recording occurrences of local cloudbursts (Redmond 2009).

Wind

Summer storms may bring high winds with peak wind velocities above 50 miles per hour, and even wind speeds of 100 mph occur locally nearly every year. High winds can occur at any season. Winds can increase aerosolization of soil particles and create unhealthy particulate levels in the air.

Climate Change in the Mojave Desert from 1900 to the Present

Climate change has been occurring across the Mojave Desert in the recent past, with a consistent increase in seasonal maximum temperatures regionally (Davey et al. 2007b). Evidence of climate change in the Mojave Desert is based on weather station data (air temperature and precipitation) since 1900 combined with the US Geological Survey's Basin Characterization Model (Flint et al. 2013, Rapacciuolo et al. 2014, Thorne et al. 2015). Because the intervals of time used in retrospective studies of recent climate change differ, model results differ in some aspects. Results appear in Tables E.2-1 and E.2-2. These studies show increases in temperatures recently, but results about precipitation generalized across the Mojave Desert are not easy to pinpoint. Table E.2-1 displays the historic changes.

Table E.2-1. Changes in nine climate variables for the Mojave Desert based on differences between historical (1951-1980) and modern (1981-2010) conditions

	Mean Annual Temp. (°C)	Minimum Annual Temp. (°C)	Maximum Annual Temp. (°C)	Total Annual Precip. (mm)	Potential Evapo-transpiration (mm)	Actual Evapo-transpiration (mm)	Mean Climatic Water Deficit (mm)	Runoff (mm)	Recharge (mm)
Average Change	+0.4	+0.7	+0.30	+13.6	+27	+13	+20.4	+0.5	+0.9

Source: Flint et al. 2013, Thorne et al. 2015

Table E.2-2. Changes in the Means, Minima, and Maxima of Six Climate Variables for Mojave Desert¹

Description of the Range of Climate Change	Mean Annual Temperature (°C)	Minimum Annual Temperature (°C)	Maximum Annual Temperature (°C)	Total Annual Precipitation (mm)	Mean Actual Evapo-transpiration (mm)	Mean Climatic Water Deficit (mm)
Average Change	+0.67	+0.81	+0.30	-1.04	-1.65	+24.63
Minimum Change	-0.17	-1.02	-0.70	-30.34	-34.25	-39.13
Maximum Change	+1.50	+2.84	+0.94	+46.96	+23.30	+71.53

¹ - Based on differences between historical (1900-1939) and modern (1970-2009) conditions

Source: Rapacciuolo et al. 2014, supporting information in Appendix S1 available online at: <http://onlinelibrary.wiley.com/doi/10.1111/gcb.12638/full>

The term climatic water deficit (CWD) (Stephenson 1998) is the amount of water by which potential evapotranspiration (PET) exceeds actual evapotranspiration (AET) of vegetation, i.e., the amount of additional water that would have evaporated or transpired under non-drought conditions if the water had been present in the soils under ambient conditions. CWD is a useful indicator of net change in climate conditions over time as it combines the concurrent effects on vegetation from solar radiation, evapotranspiration, air temperature, and soil moisture (as a function of water recharge from precipitation). Importantly for the vegetation of the Mojave Desert, each recent study indicates that CWD has been increasing in recent decades, whether or not rainfall is increasing or decreasing. Even under conditions where rainfall increases as climate warms, the CWD may still increase because rates of soil transpiration and vegetation evapotranspiration of water under hotter ambient air temperatures may exceed the rate of water delivery to the soil from increased rainfall. This calculation has ecological significance because it estimates drought stress on soils and plants and can point to physiological stress of plants and growing habitat unsuitability for some plant species.

The distribution of impacts of a changing climate are not uniform across a landscape. Rapacciuolo et al. (2014) demonstrate in their modeling of recent climate conditions that topographic diversity and other environmental factors create a range of different responses at a fine scale. Therefore, maximum and minimum ranges of values for climate change since 1900, inclusive of local variations across the Mojave Desert, appear alongside average regional changes in Table D.2-2. Even though regional trends in the Mojave Desert may overall be toward warming (and perhaps

drying), individual drainages may have diverged from the regional trend and individually undergone cooler and/or wetter conditions during the same period.

Gonzalez (2016) analyzed climate change between 1950 and 2010 in Death Valley National Park, at the northeast boundary of the WEMO planning area. Average annual temperature in the Park increased statistically significantly at a rate of $1.3 \pm 0.5^{\circ}\text{C}$ per century. Terrain has played an important role in how much climate has changed in recent time. The highest historical rates of temperature increase have occurred at higher elevations in the northwest section of the park adjacent to the WEMO area. A trend in rainfall amounts was not statistically apparent.

Scenario Models of Future Climate in the WEMO Planning Area

Models of future climate do not predict the future. Future scenario modeling provides insight to landscape and resource managers about a range of possible futures and an understanding of the risks that might confront managers in the future. Models also aid managers to set in motion a portfolio of robust management actions now so that in coming decades future managers will be better able to avoid, mitigate, adapt to, or offset eventual adverse impacts from climate.

Detailed climate scenario modeling for the Mojave Desert has been undertaken less often, as the complexity needed for depicting climate at a scale meaningful for managers is formidable in the highly varied topography of the Mojave Desert and because data from the Mojave Desert for use in scenario modeling are less extensive in contrast to other parts of California. The BLM did not conduct climate scenario modeling specifically for the WEMO SEIS. Recently, however, the BLM has commissioned two independent projects that modeled scenarios of future climate for the WEMO planning area: the BLM Mojave Basin and Range Rapid Ecoregional Assessment (REA) (2013) and products generated in support of the DRECP (2016). Other pertinent sources of scenario modeling for WEMO climate conditions come from Thorne et al. (2015) and Gonzalez (2012, 2016). These resources provide a starting point for adaptation planning for public lands in the West Mojave Desert.

In 2010, NatureServe produced future climate modeling for the BLM Mojave Basin and Range REA. Subsequently in 2013, the Conservation Biology Institute produced maps for the BLM DRECP (2016) based on the modeling work of Flint and Flint (2012) at the US Geological Survey. Two distinct climate change scenarios using different assumptions about the atmospheric forcing (the process of atmospheric warming) and future GHG emissions showed divergent modeled results for the climate and hydrologic features for the period 2070-2099 in the WEMO planning area. The Parallel Climate Model (PCM), developed by the U.S. Department of Energy showed in general less severe results than the Geophysical Fluid Dynamics Laboratory model, developed by the National Oceanographic and Atmospheric Administration (NOAA).

The increase in annual minimum-temperature projections suggests a reduction in the duration and intensity of freezing conditions. By mid-century, the frost-free growing season in the Mojave Desert is projected to lengthen by about 30 days and begin about 22 days earlier (Bell et al. 2004). The number of days below 0°C (32°F) is projected to decrease, with the Mojave Desert experiencing almost 40 fewer days of temperatures below freezing (Bell et al. 2004). Extremely cold days (days exceeding the long-term 95th percentile) are projected to decrease by 44 days per year in the Mojave Desert (Bell et al. 2004). Change to higher frequency of severe flooding from less frequent but heavier rainfall linked to climate change are forecast under some modeled

projections of climate change in the Southwest. Flood risks are likely to become greater if winter storms and/or monsoons increase in frequency and severity.

Climate Refugia

Climate refugia are parts of landscapes where topographic features and weather patterns combine to sustain current climate conditions or slow the pace (velocity) of changing climate. Such refugia are likeliest where elevation rise is steep, for example. Refugia for the Mojave Basin and Range REA based on conditions modeled through 2060.

According to the REA model, climate refugia will be most extensive in three areas: the mountainous northern half of the China Lake Naval Weapons Air Station in southern Inyo County, the eastern Sierra Nevada and its foothills, and the northeast and east edges of the San Bernardino Mountains.

In separate modeling for the DRECP, the Center for Biological Conservation (CBI) (2013) produced additional modeling of climate refugia also using PCM A2 and GFDL A2, for the entire DRECP area, covering the WEMO planning area. The PCM model displays a possible future with greater opportunities for conservation in refugia than the possible future shown resulting from the GFDL model. This range of possible futures gives managers a sense of the uncertainty about future conditions that they can consider in formulating robust decisions now that will impact the future.

E.3 Geology, Soils, and Water

E.3.1 Geology and Soils

E.3.1.1 Regulatory Framework

There are no federal, state, or local regulations associated with geology or soil resources that are applicable to the WMRNP.

Regional and Background Information

Geologic Setting

The WEMO Planning area is mainly in the Mojave Desert geomorphic province (Mojave Block) of California. The geomorphic provinces do not completely match the bioregional provinces that were used to identify the WEMO Planning area and adjacent planning area boundaries. The Planning area also encompasses a substantial portion of the Basin and Range province to the north and small portions of the Sierra Nevada province to the northwest and the Transverse Ranges to the southwest. The geomorphology of the province is dominated by broad basins filled with sediments eroded from adjacent highlands and mountains, burying the ancient topography. The region may once have been entirely within the Basin and Range province until the Garlock Fault became active in the early to mid-Tertiary Period to create a geographic and climatic boundary. Although Paleozoic- and early Mesozoic-age rocks are present, the desert itself is a Cenozoic-age feature, formed as early as the Oligocene, presumably from movements of the San Andreas and the Garlock faults. During the Pleistocene (Ice Ages), this region of California had a cooler average temperature and lower evaporation rate than at present. While never a wet climate, the Mojave Desert nonetheless once contained many small lakes, and the Mojave River had water flow throughout its length. The majority of the surface in the planning area is covered by Quaternary-age (Pleistocene and Holocene) unconsolidated surficial deposits. These deposits consist primarily of alluvial, fluvial, lacustrine and aeolian sediment.

The Mojave Desert province has distinct western and eastern portions. The "western Mojave" lies within the wedge where the San Andreas and Garlock faults meet, and is bounded on the east by the Mojave River and a line running northwest from Barstow, San Bernardino County, to Red Rock Canyon, Kern County. Uplifts along the two major fault systems include the El Paso Mountains along the northwest side of the Garlock fault, and the San Gabriel and San Bernardino Mountains to the southwest along the San Andreas fault. The western Mojave Desert consists of great expanses of gentle surface with isolated knobs, buttes, ridges, and locally hilly areas. The eastern Mojave consists of alluvial filled basins (downthrown blocks) between mountain ranges separated by normal faults, but includes thrust-fault emplacement hills and mountains. In the southern half, the mountain ranges have a general northwest trend, whereas in the northern half these features have no consistent orientation. For more detailed geology, the reader is referred to the Geologic Map of California, San Bernardino Sheet (Bortugno and Spittler 1986).

Basin and Range province is a geologic term referring to the structure of Mojave Desert valleys (basins) and mountains (ranges) that are aligned roughly north to south. The province extends from the Wasatch Mountains of Utah to the east side of the Sierra Nevada in California. In this region the earth's crust has been extended (stretched thinner) from east to west, and faults associated with this thinning and stretching generally border mountain ranges in this province. The planning area north of the El Paso Mountains and east of U.S. Highway 395 is part of the Basin and Range province. Basin and Range includes the Coso, Argus, and Slate mountains and their adjacent valleys. The Coso Mountains consist largely of igneous/volcanic rocks, including pumice, basalts, cinders and obsidian, and are tectonically active with frequent, very small earthquakes. The Argus and Slate Ranges are mostly igneous/granitic rocks, with some volcanic rocks and exposures of limestone formations. Searles Valley is well-known for its deposits of sodium minerals that are the remnant of a Pleistocene lake that once formed the terminus of the Owens River.

Mountain ranges and valleys of the Transverse Range region trend eastward in a pattern essentially transverse to generally northwest-trending features of southern California. The lowlands of the San Bernardino and Los Angeles plains in the southern part of this region rise abruptly northward to the San Bernardino and San Gabriel mountains, respectively, two of the most rugged and highest ranges in southern California. The rock units of the Transverse Range region may be divided into two main groups: (a) crystalline basement complex composed of metamorphic and plutonic rocks; and (b) sedimentary and volcanic rocks. The metamorphic rocks of this complex include, from oldest to youngest: Precambrian gneiss and marble; Precambrian Pelona Schist; Paleozoic meta-sedimentary rocks containing mineralized gold; and marble/limestone; and Pre-Cenozoic rock (Dibblee 1970).

Highly diverse marine and non-marine sedimentary rocks, volcanic and intrusive igneous rocks range from Precambrian to Recent times. Geologic events involve plate collision, metamorphism, and faulting. This diversity of rock types, long history of igneous activity, and the complex structural and geomorphic development of the region have resulted in the formation of a wide variety of mineral assemblages and their concentration to form ore deposits that are present in the planning area.

Available Soil Survey Information for the Planning Area

The USDA Natural Resource Conservation Service (NRCS) soil surveys have identified many kinds of soils across the planning area. The NRCS has created two separate types of soil mapping

data. The Digital General Soil Map of the United States (STATSGO2) is an inventory of soils and non-soil areas at a map scale of 1:250,000 for the continental United States. STATSGO2 is useful for broad planning and management uses covering state, regional, and multi-state areas. For much of the Mojave Desert, STATSGO2 is the only source of soils data. In the absence of ground-based soil survey data, STATSGO2 data relies on geology, topography, vegetation, and climate derived from Land Remote Sensing Satellite (LANDSAT) images for probable classification and extent of the soils. For project-specific planning such as OHV route designation, STATSGO2 is not sufficient.

A second NRCS data source for soils mapping is the SSURGO database. The SSURGO database contains soils information collected by the National Cooperative Soil Survey. The information come from direct on-the-ground observations coupled with interpretation of remotely sensed data, often followed up with laboratory analysis. Soil maps generated in SSURGO outline areas called map units. Map units describe soils and other components that have unique properties, interpretations, and productivity. Each map unit may contain one to three major soil components and some minor components. Map units typically have the name of the major soil components. Information available from the SSURGO database includes physical and chemical properties, frequency of flooding, and limitations affecting recreational uses. Soil scientists collect information at scales ranging from 1:20,000 to 1:63,360. Resulting maps are intended for natural resource planning and management.

The NRCS organizes the SSURGO data into soil survey areas. SSURGO map data can be viewed in the Web Soil Survey (<https://websoilsurvey.sc.egov.usda.gov/App/HomePage.htm>). Table E.3-1 lists the NRCS's Order 3 soil survey areas that encompass BLM public lands in the WEMO planning area. Other soil surveys are available for Department of Defense military installations, adjacent national forests, and Joshua Tree National Park. Although these survey areas do not overlap with BLM lands, they contain information useful for BLM managers about public lands adjacent to these other jurisdictions. Wherever possible, data from the SSURGO are used in description and analyses of soils in this SEIS. Each year the NRCS soil survey staff updates SSURGO databases to reflect new information.

Table E.3-1. NRCS Soil Survey Areas in the WEMO Planning Area

Survey Name	Survey Number	County	Status	Coverage
Benton-Owens Valley Area	CA802	Inyo	complete	Along highway 395 from the WEMO boundary south to the south end of Haiwee Reservoir and then east to the China Lake Naval Air Weapons Station.
Kern County, Southeast Part	CA670	Kern	complete	Tehachapi Range foothills parallel to Rosamond north to Cantil, east to Atolia, and south to Boron across the north side of Edwards Air Force Base.
Mojave Desert Area, Northwest Part	CA682	Kern, San Bernardino	partial	The BLM Ridgecrest Field Office boundary on the west from Cantil north to the Inyo County line and then east to Searles Lake and the boundary of the Fort Irwin National Training Center and south to just below Atolia, west back to Cantil.

Table E.3-1. NRCS Soil Survey Areas in the WEMO Planning Area

Survey Name	Survey Number	County	Status	Coverage
Antelope Valley Area	CA675	Kern, Los Angeles	complete	Mojave Desert portion of Los Angeles County and north into Kern County along the Tehachapi Range foothills outside the Los Padres National Forest north parallel to the town of Boron.
Mojave River Area	CA671	San Bernardino	complete	North from the boundaries of the Angeles and San Bernardino National Forests and east of Edwards Air Force Base to Harper Lake, east past Barstow along the south side of Fort Irwin to Yermo (I-15) and Newberry Springs (I-40), then west again to near Daggett and south to Lucerne and the San Bernardino National Forest
Mojave Desert Area, West Central Part	CA698	San Bernardino	partial	Near I-40 south and west of Newberry Springs and east of Lucerne Valley to the west boundary of the Twenty-nine Palms Marine Corps Ground Combat Center and south to the southeast boundary of the WEMO planning area and the boundary with Joshua Tree National Park.

Desert Soil Properties and Processes

Desert soils differ considerably from soils of mesic (moist climate) ecosystems, which scientists have studied in greater depth. For example, Mojave Desert vegetation often provides scant cover for wildlife from predators and extreme temperatures. Many vertebrate animal species, therefore, use desert soils burrows as their principal source of cover and habitat for reproduction and survival. Lizards, snakes, desert tortoises, burrowing owls, rodents, kit foxes, and badgers are some of the desert animals that dwell in sub-surface burrows during a large portion of their lives.

Size and texture of sediments, mineral composition, amount of pore spaces between sediments and between soil organic complexes, soil fertility, vegetation cover, presence of biological soil crusts, and water content become critical in water-limited or xeric desert ecosystems. Soils in arid and semi-arid region are important because they can promote microbial and invertebrate populations that facilitate plant growth and nutrient cycling despite water scarcity. The ability of soil to hold water for long periods is critical to photosynthesis in plants that converts atmospheric carbon through plant water use to add or maintain sufficient aboveground vegetation and belowground root biomass.

Important processes in the Mojave Desert are the accumulation of organic matter, the formation of and translocation of clay minerals, the accumulation of particulate matter deposited from the atmosphere, weathering of parent material, sequestration of inorganic carbon, and the formation of desert pavement. Degradation of these soil processes occurs when soils lose their capacity to hold moisture and soil nutrients in desert ecosystems.

Fertility also depends on the availability of soil mineral macronutrients and key micronutrients in desert soils. Low amounts of phosphorus in the soil often limit growth of plants in desert soils, for example. Inputs of nutrients to desert soils come from deposition of minerals, sediments, and

organic matter, either from the atmosphere or from water transport. Minerals are important because they bind especially to soil organic compounds for eventual uptake by plants when soil water is sufficient to dissolve the minerals attached to the compounds and transfer dissolved minerals to plant roots.

West Mojave Desert soils locally receive unnaturally high amounts of nutrients, creating environmental problems. One example is the high rate of deposition of nitrogen onto the surfaces of soils. This nitrogen load stems from high amounts of atmospheric nitrogen generated principally by vehicle traffic in the Los Angeles Basin and moving downwind into the West Mojave Desert. Added nitrogen increases the habitat suitability of desert soils for comparatively high-nitrogen consuming plants such as non-native invasive annual grasses. Native plants can't effectively use this excess nitrogen because they didn't evolve in a higher nitrogen environment. These non-native plants now comprise as much as 90 percent of the annual plant biomass in some areas and subsequently lead to the loss of species-diverse native plant communities and to an unprecedented increase of fire-prone fine fuels in the desert.

Scientists have often underestimated the amount of carbon sequestered in the desert because investigations of soil carbon limited their inquiry to the top one meter of soil and considered only organic carbon (Wang et al., 2010). Soil inorganic carbon, especially in the form of calcium carbonate (CaCO₃), results from mineral weathering under dry conditions. Mineral weathering is a major process transforming carbon from the atmosphere and from plants into inorganic carbon sequestered in mineral compounds such as carbonates. Desert soils are the third largest global pool of carbon (Emmerich 2003), most of it stored as inorganic carbon. Soil inorganic carbon tends to be more stable than soil organic carbon over time because inorganic carbon compounds are not readily available for microbial respiration.

E.3.2 Water Resources

E.3.2.1 Regulatory Framework

Federal

The Federal Clean Water Act

In 1972, amendments to the Federal Water Pollution Control Act, or "Clean Water Act" (CWA), created a broad national program to protect water quality and regulate waste and pollutant discharges in United States waters (Title 33 United States Code [U.S.C.] Section 1251 et seq.). The CWA authorizes the U.S. Environmental Protection Agency (EPA) to establish water quality standards and to oversee permitting for otherwise prohibited waste and pollutant discharges from "point sources," that is sources from industrial facilities, sewage treatment plants, and stormwater drains. Large amounts of sediment in streams from one or more upslope erosion areas ("non-point sources") may also qualify as pollutants under the CWA.

The CWA also grants to the EPA the authority to delegate to state governments the implementation of CWA provisions. In California, the State Water Resources Control Board (SWRCB) oversees administration of CWA regulations.

Key CWA provisions relevant to the scope of this SEIS include:

- Section 303(d) – Identification of waters where current pollution control technologies alone cannot meet the water quality standards set for that waterbody. Every two years, states are

required to submit for EPA approval a list of impaired waters plus any that may soon become impaired. Each state prioritizes impaired waters based on the severity of the pollution and the designated beneficial use of the waterbody (e.g., fish propagation or human recreation). States must establish the total maximum daily load(s) (TMDLs) of the pollutant(s) in the waterbody for impaired waters on their list or provide an alternate means to reverse the impairment. In some water body located in the Mojave Desert naturally occurring pollutants such as Arsenic may be present with no practical way of reversing the impairment.

- Section 401 – Water Quality Certification requirements for federally permitted activities involving construction that may result in discharges to surface waters and wetlands.
- Section 404 – Permit program for controlling discharges of dredge or fill materials into surface waters and wetlands. The EPA delegates to the US Army Corps of Engineers implementation of Section 404. Activities in waters of the United States regulated under this program include fill for development, water resource projects (e.g., dams) and infrastructure development (e.g., stream crossings, culverts, visitor centers). Section 404 also requires a permit before dredged or fill material may be discharged into waters of the United States unless the activity is exempt (e.g., certain farming and forestry activities). No discharge of dredged or fill material may be permitted if a practical, less damaging alternative exists, or if waters would be significantly degraded. For most discharges with only minimal adverse impacts, a *general permit* may suffice. Specific categories of activities receive general permits on a national, regional, or state basis. General permitting process eliminates individual review and allows some activities such as minor road activities, utility line backfill, and bedding to proceed with little or no delay once general or specific conditions for the general permit are met. Section 404 permits are also subject to CWA Section 401 water quality certification from the regional representative office for the SWRCB or Regional Water Resources Control Boards (RWQCB). There are two RWQCBs in the WEMO Planning Area, the Lahotan and Colorado River RWQCBs.

Executive Order 13778 Review of the ‘Waters of the United States’ Rule

The EPA and the US Army Corps of Engineers determine whether Sections 404 and 401 of the CWA protect a waterway, water body, or wetland under the definition of “waters of the United States. On February 28, 2017, Executive Order 13778 “Restoring the Rule of Law, Federalism, and Economic Growth by Reviewing the ‘Waters of the United States’ Rule” directed the EPA and the Army Corps of Engineers to (1) review and rewrite the final rule entitled “Clean Water Rule: Definition of ‘Waters of the United States,’” 80 Fed. Reg. 37054 (June 29, 2015), for consistency with the current policy and (2) publish for notice and comment a proposed rule rescinding or revising the rule, as appropriate and consistent with law. In connection with the proposed rule, the EPA and the Army Corps ... shall consider interpreting the term “navigable waters,” as defined in 33 U.S.C. 1362(7), in a manner consistent with the opinion of Justice Antonin Scalia in *Rapanos v. United States*, 547 U.S. 715 (2006).

On July 27, 2017, the EPA Administrator and the acting the Assistant Secretary of the Army for Civil Works proposed a rule to rescind the existing definition. Once the final rule is published, the current definition will be rescinded. A second step in rulemaking intends to return the legal definition of “waters of the United States” to the definition used before 2015.

The text of current rule under rulemaking to be rescinded is available at: <https://www.federalregister.gov/documents/2015/06/29/2015-13435/clean-water-rule-definition-of-waters-of-the-united-states>. The 2015 Rule recognizes three basic categories of jurisdiction for “waters of the United States”: waters that are jurisdictional in all instances, waters that are excluded from jurisdiction, and a narrow category of waters subject to case-specific analysis to determine whether they are jurisdictional.

Under the 2015 definition, waters of the United States comprise:

1. All waters that are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide.
2. All interstate waters including interstate wetlands.
3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:
 - (i) Which are or could be used by interstate or foreign travelers for recreational or other purposes
 - (ii) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce.
 - (iii) Which industries use or could use for interstate commerce.
4. All impoundments of waters otherwise defined as waters of the United States.
5. Tributaries of waters identified in paragraphs (s) (1) through (4) of this section.
6. The territorial sea.

Wetlands that are not waters of the United States include waste treatment systems and treatment ponds and lagoons. Waters of the United States also do not include converted cropland. A project proponent would conduct a Jurisdictional Determination (JD) to determine whether “waters of the United States” are within the project boundaries and whether the proposed action would impact these waters. The US Army Corps makes that final determination whether Section 404 Permits are required and whether Section 401 Certification is issued with additional mitigation required to have the project comply with the CWA. Within the WEMO planning area, the Mojave River is considered a “waters of the United States.”

Executive Order 11990 Protection of Wetlands

Executive Order 11990 requires that federal agencies prohibit construction or management practices that would adversely affect wetlands, unless an agency finds either that no practical alternative exists or that a proposed action has considered all practical measures to minimize harm to the wetlands. EO 11990 directs all federal agencies to minimize the destruction, loss, or degradation of wetlands. The order also directs agencies to preserve and enhance the natural beneficial values of wetlands in the conduct of agency responsibilities for: (1) acquiring, managing, and disposing of federal lands and facilities; (2) providing federally undertaken, financed, or assisted construction and improvements; and (3) conducting federal activities and

programs affecting land use, including but not limited to water and related land resource planning, regulating, and licensing.

Executive Order 11988: Floodplain Management

EO 11988 requires federal agencies to avoid, to the extent possible, both long- and short- term adverse impacts from the occupancy and modification of floodplains, and to avoid both direct and indirect support of floodplain development wherever there is a practical alternative. This order states that “each agency shall provide leadership and shall take action to reduce the risk of flood loss, to minimize the impact of floods on human safety, health, and welfare, and to restore and preserve the natural and beneficial values served by floodplains in carrying out its responsibilities” for:

- Acquiring, managing, and disposing of federal lands and facilities.
- Providing federally undertaken, financed, or assisted construction and improvements.
- Conducting federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulation, and licensing activities.

The guidelines follow an eight-step process that agencies are to carry out as part of their decision-making on projects that could potentially impact a floodplain. The eight steps are:

1. Determine whether a proposed action is in the base floodplain (an area that has a 1% or greater chance of flooding in any given year).
2. Conduct early public review, with appropriate advance public notice.
3. Identify and evaluate practicable alternatives to locating in the base floodplain, including alternative sites outside the floodplain.
4. Identify impacts of the proposed action.
5. Develop measures to minimize impacts and to restore and preserve the floodplain, as appropriate, where impacts cannot be avoided.
6. Re-evaluate alternatives.
7. Present the findings and a public explanation.
8. Implement necessary actions.

The Federal Interagency Task Force on Floodplain Management has clarified requirements for development in floodplains and emphasized that agencies should select alternative sites for projects outside floodplains and, where practical, develop measures to mitigate unavoidable impacts.

Department of Interior and BLM Water Resource Management Policies

Federal policy defines wetlands as areas inundated or saturated by surface water or groundwater at a frequency or duration sufficient to support a prevalence of vegetation typically adapted for life in saturated soil conditions. BLM Manual 1737, Riparian–Wetland Area Management, includes under this definition marshes, shallow swamps, lakeshores, bogs, muskegs, wet meadows, estuaries, and riparian areas (seeps and springs). The manual defines riparian areas as a form of

wetland transition between permanently saturated areas and upland areas. BLM's Riparian-Wetland Initiative for the 1990s established national goals and objectives for managing riparian and wetland resources on public lands. The overall objective was to restore riparian and wetland areas so that 75 percent or more were determined to be in Proper Functioning Condition (PFC). PFC is a qualitative method for assessing the condition of riparian-wetland areas. A PFC assessment considers in a consistent approach hydrology, vegetation, and processes and attributes of erosion and deposition of soils and sediments. BLM staff evaluate conditions of riparian areas using the Standards for Rangeland Health (see 43 CFR 4180.2) and PFC for riparian management as explained in BLM Technical Reference 1737-15 (Prichard 1998) and BLM Technical Reference 1737-16, revised edition (Prichard 2003).

State

California Constitution, Article X, Section 2

The California State Constitution, Article X, Section 2, states that water resources of the state be put to beneficial use to the fullest extent possible and prohibits water waste, unreasonable use, or unreasonable methods of use.

Porter-Cologne Water Quality Control Act, as Amended

The Porter-Cologne Water Quality Control Act protects the water quality and beneficial uses of "waters of the state" (California Water Code, Division 7, Section 13000 et seq.). Under the Act, waters of the state include "any surface or groundwater, including saline water, within boundaries of the state" (California Water Code, Division 7, Section 13050 [e]). All waters of the United States (federal waters) and all non-federal waters are also waters of the state.

The Porter Cologne Act authorizes the SWRCB and the state's nine RWQCBs to establish water quality standards and discharge prohibitions, issue waste discharge requirements, and implement provisions of the federal CWA.

The SWRCB and RWQCBs are the principal state agencies responsible for water quality. On behalf of the federal CWA, they jointly establish water quality standards, beneficial uses, water quality objectives for beneficial uses, best management practices (BMPs), an anti-degradation policy, and regulations for waste discharges to ensure compliance with water quality standards. Basin Plans prepared by the staffs of each RWQCB provide details of these elements.

Two RWQCBs, the Lahontan and Colorado River, have jurisdiction over parts of the WEMO planning area. The Lahontan RWQCB is further divided into north and south basins, of which the south basin covers the larger part of the planning area. BLM WEMO public lands are extensive in both regions. The Colorado River RWQCB has jurisdiction in the WEMO planning area over the BLM public lands approximately south of Barstow and east of Victorville. In 1985, the BLM California Desert District and the Colorado River RWQCB established a memorandum of understanding (Board Resolution 85-24) for collaborative work.

Water quality standards "consist of a designated use or uses for the Waters of the United States and water quality criteria for such waters based upon such uses. Water quality standards are to protect the public health or welfare, enhance the quality of water and serve the purposes of the CWA" (40 CFR 131.3[i]). Water quality standards developed for particular water segments are therefore location-specific as well. Designated uses in California fall under categories of "beneficial uses."

In 1987, the CWA was amended to include the National Pollutant Discharge Elimination System (NPDES). The RWQCBs have the authority to issue NPDES General Permits for construction project that have been authorized on public and private land within the WEMO planning area, currently and into the future. The NPDES permitting program manages waste discharges into Waters of the US and State.

California Water Code

The California Water Code stipulates that the primary interest of the people of the State of California is the conservation of all available water resources, and requires that the maximum re-use of reclaimed water offset potable resource use (Sections 451 and 13550 et seq.). The code divides California water rights into three categories: surface water, percolating groundwater, and subterranean streams that flow through known and definite channels (Section 1200). The code defines waters of the state (Section 13050) and requires RWQCBs to prepare Basin Plans that define water quality objectives for protecting beneficial uses of surface water and groundwater and provide comprehensive water quality planning (Sections 13240 through 13243). The code further includes many other provisions that (1) define reasonable and beneficial water uses; (2) set standards for well drilling; (3) require that water supplies for large new developments be demonstrated in advance; (4) require Storm Water Pollution Prevention plans; and (5) address other aspects of water resources, water rights, and water management.

Water Quality, Supply and Infrastructure Improvement Act

In 2014 the Water Quality, Supply and Infrastructure Improvement Act was signed into law. The Water Quality, Supply and Infrastructure Improvement Act institutes funding for integrated regional water management, water recycling, groundwater sustainability, and watershed protection and ecosystem restoration.

Groundwater Sustainability Act, CGC 65350.5

In September of 2014, Governor Brown signed three bills that together constitute the Sustainable Groundwater Management Act (SGMA). SGMA has defined sustainable groundwater management as the management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results. SGMA authorizes water management agencies and stakeholders collaborate in the formation of Groundwater Sustainability Agencies to prepare Groundwater Sustainability Plans, with public input, to achieve sustained groundwater yield. The Department of Water Resources publication *California's Groundwater, Bulletin 118, Interim Update 2016* has identified boundaries of groundwater basins, high- and medium-priority groundwater basins, and basins in critical conditions of overdraft. Sustainability Plans for groundwater basins that are both high- or medium-priority *and* in critical conditions of overdraft must be completed January 31, 2020. High- and medium-priority groundwater basins *not* in critical conditions of overdraft must have completed Sustainability Plans by January 31, 2022.

California Fish and Game Code, Sections 1600-1616, as Amended

The California Fish and Game Code states that all streams and lakes are subject to the Code (Section 1600 et seq.). The California Department of Fish and Wildlife (CDFW) is the agency

assigned to regulate activities that would divert or obstruct the natural flow or otherwise substantially change the bed, channel, or bank of any river, stream, or lake. The Code also covers deposit or disposal of debris, waste, or other material where it may pass into any river, stream, or lake that supports fish or wildlife (Fish and Game Code, Section 1602). CDFW also has jurisdiction over riparian habitats adjoining watercourses. Any proponent of a project either to substantially divert or to obstruct natural water flow; to substantially change the bed, channel, or bank of any river, stream, or lake; or to use materials from a streambed must formally notify CDFW before beginning the project (Section 1602). If CDFW determines that the project may adversely affect existing fish and wildlife resources, a Lake or Streambed Alteration Agreement is required.

California Fish and Game Code, Sections 5650-5656, as Amended

This part of the Code prohibits any substance from being deposited in, permitted to pass into, or placed where the substance that is deleterious to fish, plant life, mammals, or bird life (Section 5650) can pass into waters of the state. This section does not apply to a discharge or a release that is:

1. expressly authorized and in compliance with the terms and conditions of waste discharge requirements pursuant to Section 13263 of the Water Code;
2. a waiver issued pursuant to subdivision (a) of Section 13269 of the Water Code issued by the State Water Resources Control Board (SWRCB) or a RWQCB after a public hearing; or
3. is certified pursuant to and in compliance with, the terms and conditions of a federal permit that the SWRCB or a RWQCB has, after a public hearing, under Section 13160 of the Water Code.

The California Department of Fish and Wildlife (CDFW) makes a final determination of effects on waters of the state after a project proponent makes a preliminary jurisdictional evaluation. If the CDFW determines that an action would impact waters of the state and could substantially adversely affect an existing fish and wildlife resources, the agency then requires a Streambed Alteration Agreement to comply with Section 1602. A Streambed Alteration Agreement is required in the event that the CDFW determines the activity.

Executive Order W-59-93

Executive Order W-59-93, signed by Governor Wilson on August 23, 1993, established state policy guidelines, with two primary goals, for wetlands conservation: to ensure no overall net loss, and to achieve a long-term net gain in the quantity, quality, and permanence of wetland acreage in the state. Currently, in fulfillment of the executive order, the SWRCB is drafting the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (the "Procedures") (formerly called the *Wetland and Riparian Protection Policy*). However, the Lahontan Basin Plan has established a "no net loss" policy for its wetland acreage, function, and value, with concurrence of the SWRCB.

E.3.2.2 Regional and Background Information

Groundwater

The majority of groundwater resources in the planning area are associated with the floodplain aquifer along the Mojave River. Precipitation occurring at the headwaters of the Mojave River near Cajon Pass, as well as further south at San Gorgonio Pass, generates the surface water flow in the Mojave River. As it flows more than 150 kilometers (km) east to Afton Canyon, this surface water infiltrates, recharging groundwater in the hydraulically connected basins along the way (Izbicki and others 2007). The Mojave River Basin has been adjudicated and is managed by Mojave Water Agency (MWA). Ground water withdrawals from the basin greater than 10 acre-feet/year require a Base Production Water-Right issued by the MWA.

Throughout the rest of the planning area, groundwater is also found in unconsolidated alluvial fan deposits, although locally floodplain and lacustrine (lake) beach deposits may yield water to wells. The valleys and basins are generally internally drained, with water from precipitation within the basin recharging the alluvial fan deposits, and then ultimately discharging to the land surface and evaporating within the basin. Groundwater is generally under unconfined, or water table, conditions at the margins of the basins, but as the unconsolidated deposits become finer grained toward the centers of the basins, the water becomes confined.

Dating of the water in the Mojave River floodplain aquifer using tritium and carbon-14 methods indicates that the water is relatively recent. In contrast, groundwater in the regional aquifers in the surrounding mountain and canyons is more than 20,000 years old (Izbicki and Michel 2004), suggesting much lower recharge rates.

Although there are vast quantities of water within the groundwater basins, some of the water is of poor quality. The mineral quality of the groundwater within the WEMO Planning area varies greatly. The geologic setting of the basins directly affects the degree of groundwater mineralization. In general, basins near the source of recharge are less mineralized than those that are more distant.

Surface Water

Surface water is very scarce in the WEMO Planning area. Streams that originate high in the surrounding mountains to the west and south may have perennial flow in the higher altitudes; at the lower altitudes and throughout the planning area virtually no water exists in streambeds or riverbeds, except locally after infrequent, heavy cloudbursts. The playas may be covered by water from runoff for as long as two months a year. There are many locally important creeks, springs, and seeps, most of which are associated with the mountain areas.

Very short flow paths generally characterize small local flow systems, usually no more than a few miles in length. Springs connected to these systems are usually located in or near the mountains and have highly variable annual ranges in discharge that respond to the precipitation that year or a few years previous. Discharge waters have small concentrations of dissolved sodium plus potassium and chloride plus sulfate, large concentrations of tritium, and water temperatures that commonly approach average air temperatures. These characteristics imply that the groundwater that feeds the springs is relatively recent, being recharged within a span of less than 70 years.

In contrast, large local flow systems are characterized by inter-basin flow or flow confined to one basin with longer flow paths. Springs connected to these systems have moderate concentrations of

the major salts, no significant concentrations of tritium and water temperatures from 50 to 60 degrees Fahrenheit, suggesting a much longer residence time in the aquifer.

Surface water was and is the major transport agent of the rock material from the mountains to the alluvial fans to the valleys. The intense short duration storms result in rapid floodwaters that have enough energy to transport rock material both in the water column and along the beds of the arroyos. Longer duration storms with less intensity still have the energy to transport finer sediment materials. All ephemeral streams in the planning area have naturally high sediment concentrations. Flows from groundwater sources have low sediment concentrations unless runoff water is dominating the flow. Playa water usually has a high concentration of very fine sediment mixed into the column by wind action and varying salt concentrations that depend on the geology of the area.

Riparian Areas and Springs

In the Remedy Order associated with 2005 WEMO Final EIS, BLM was required to perform new PFC Assessments for all springs and seeps in the WEMO Planning area. As of April, 2016, BLM has completed a total of 162 PFC assessments in the planning area. Table E.3-2 describes those seeps, springs, wetlands and creeks that have been assessed for PFC between 2011 and 2016.

Surface Water Quality

Surface water quality impacts associated with the transportation management system can occur in two primary ways:

- Releases of petroleum fuels from OHVs; and
- Increased sedimentation and erosion due to soil disturbance.

Any use of OHVs on the transportation network can potentially lead to releases of fuels used to power the vehicles. These releases can potentially occur at any location on the network due to vehicle accidents. However, any such releases are expected to be small in volume. Also, given the scarcity of surface water within the planning area, the potential for these releases to enter surface water bodies or otherwise affect sensitive receptors is low. The only exception may be associated with auxiliary fuel tanks used at organized events or remote locations. Some OHV users may carry additional fuel volume in separate tanks in order to re-fuel their vehicles without having to return to developed areas. In such cases, the potential volume of fuel that could be released would be higher, up to 100 or more gallons. The potential for releases from auxiliary fuel tanks to impact sensitive resources would be directly related to the proximity of the release to those resources.

In the impact analysis in Chapter 4, routes identified as having potential for water quality impacts due to erosion and sedimentation are those which are parallel to, or located within, desert washes. The analysis in Chapter 4 identifies the mileage of routes associated with washes for each of the four alternatives.

E.4 Biological Resources

E.4.1 Vegetation

E.4.1.1 Regulatory Framework

Federal

Executive Order 13112 – Invasive Species

Executive Order 13112 was signed in February 1999 and established the National Invasive Species Council. This Order requires agencies to identify actions that may affect the status of invasive species. It also directs federal agencies not to authorize, fund, or carry out actions that they believe are likely to cause or promote the introduction or spread of invasive species in the United States or elsewhere unless, pursuant to guidelines that the agency has prescribed, it has determined and

made public its determination that the benefits of such actions clearly outweigh the potential harm caused by invasive species; and that all feasible and prudent measures to minimize risk of harm will be taken in conjunction with the actions.

Plant Protection Act of 2000

The Plant Protection Act of 2000 (7 USC Ch. 104) established a federal program to control the spread of noxious weeds. The Secretary of Agriculture is authorized to publish a list of plants designated as noxious weeds (7 USC §7712(f)). The movement of all such weeds in interstate or foreign commerce is prohibited except under permit.

Lacey Act, as amended

The Lacey Act (16 USC §§3371-3378) protects plants and wildlife by creating civil and criminal penalties for a wide variety of violations including illegal take, possession, transport or sale of protected species.

Federal Endangered Species Act

The FESA (16 USC §1531 et seq.) designates threatened and endangered species, both animal and plant species, and provides measures for their protection and recovery. "Take" of listed wildlife, and of listed plant species located on federal land, is prohibited without obtaining a federal permit. Take is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct." Harm includes any act that actually kills or injures fish or wildlife, including significant habitat modification or degradation that significantly impairs essential behavioral patterns of fish or wildlife. Activities that damage the habitat of (i.e., harm) listed wildlife species require approval from the USFWS for terrestrial species. The FESA also generally requires determination of critical habitat for listed species. If critical habitat has been designated, impacts to areas that contain the primary constituent elements identified for the species, whether or not it is currently present, is also prohibited. FESA §7 and §10 provide two pathways for obtaining authority to take listed species.

For projects proposed on federal lands, federal agencies, such as the BLM are required by the FESA to ensure that any action they authorize, implement, or fund, including energy developments, will not jeopardize the continued existence of any federally threatened or endangered species or destroy or adversely modify designated critical habitat. In a §7 consultation, the lead agency (e.g., BLM) prepares a BA that analyzes whether the project is likely to adversely affect listed wildlife or plant species or their critical habitat, and proposes suitable avoidance, minimization, or compensatory mitigation measures. If the action may adversely affect the species, the USFWS then has 135 days to respond to the BA by issuing its BO determining whether the project is likely to jeopardize the species or result in adverse modification of critical habitat.

If a "nonjeopardy" or "no adverse modification" opinion is provided by the USFWS, the action agency may proceed with the action as proposed. If a jeopardy or adverse modification opinion is provided, the USFWS may prepare a BO with reasonable and prudent measures to minimize take and associated, mandatory terms and conditions that describe the methods for accomplishing the reasonable and prudent measures. In a BO that results in a jeopardy or adverse modification

conclusion, the USFWS may develop mandatory reasonable and prudent alternatives to the proposed action.

BLM Sensitive Species

BLM Sensitive Species are species designated by the State Director that are not already federally listed, proposed, or candidate species, or state listed because of potential endangerment. BLM's policy is to "ensure that actions authorized, funded, or carried out do not contribute to the need to list any of these species as threatened or endangered." Various offices of the BLM maintain a list of special-status plant and wildlife species that are to be considered as part of the management activities carried out by the BLM on the lands that they administer.

California Desert Conservation Area Plan, 1980 as Amended

The CDCA Plan guides the management of all BLM-administered lands in the Mojave, Sonoran, and a small portion of the Great Basin Deserts. In total, the CDCA Plan includes an area of approximately 25 million acres, 12 million of which are public lands. The primary goal of the CDCA Plan is to provide guidance for the overall maintenance of the land while simultaneously planning for multiple uses and balancing the human needs with the need to protect the natural environment.

The CDCA Plan includes 12 elements: Cultural Resources; Native American; Wildlife; Vegetation; Wilderness; Wild Horse and Burro; Livestock Grazing; Recreation; Motorized Vehicle Access; Geology, Energy and Mineral Resources; Energy Production and Utility Corridors; and Land-Tenure Adjustment. Each of the elements contains goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. In addition, each element provides both a desert-wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities.

California Desert Renewable Energy Conservation Plan

BLM issued the DRECP in October, 2016. The DRECP amends the CDCA Plan, specifically with respect to natural resource conservation and renewable energy development. The DRECP establishes Ecological and Cultural Conservation and Recreation Designations, and Renewable Energy Activities, Policies, and Allocations.

Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act (16 USC §§661-666) applies to any federal project where the waters of any stream or other body of water are impounded, diverted, deepened, or otherwise modified. Project proponents are required to consult with the USFWS and the appropriate state wildlife agency. These agencies prepare reports and recommendations that document project effects on wildlife and identify measures that may be adopted to prevent loss or damage to wildlife resources. The term "wildlife" includes both animals and plants. Provisions of the Act are implemented through the NEPA process and §404 permit process.

Clean Water Act (33 U.S.C. § 1251 et seq.)

The Clean Water Act (CWA) is the principal federal statute protecting navigable waters and adjoining shorelines from pollution. The Clean Water Act is administered by the EPA and the United States Army Corps of Engineers (USACE). The USACE is responsible for regulating the discharge of fill material into waters of the United States. Waters of the United States include lakes, rivers, streams and their tributaries, as well as wetlands. Since its enactment, the CWA prohibits the discharge of pollutants into waters of the United States without a permit. Section 404 of the CWA provides that whenever any person discharges dredged or clean fill material into Waters of the United States including, without limitation, wetlands, streams, and bays (e.g., while undertaking road construction, bridge construction, or streambed alteration), a permit is required from the USACE. Through field reconnaissance surveys and analyses of National Wetlands Inventory (NWI) and watershed data, it is unlikely that there are any jurisdictional waters of the United States.

State

California Endangered Species Act

The CESA includes provisions for the protection and management of species listed by the State as endangered or threatened, or designated as candidates for such listings. CESA includes a requirement for consultation “to ensure that any action authorized by a state lead agency is not likely to jeopardize the continued existence of any endangered or threatened species... or result in the destruction or adverse modification of habitat essential to the continued existence of the species” (§ 2090). Plants of California declared to be endangered, threatened, or rare are listed at 14 California Code of Regulations (CCR) § 670.2. Animals of California declared to be endangered, threatened, or rare are listed at 14 CCR § 670.5. The administering agency for the above authority is the CDFW.

California Fish and Game Code Section 3503, 3511, 4700, 5050, and 5515

These California Fish and Game Code (FGC) sections list bird (primarily raptor), mammal, amphibian, and reptile species that are classified as fully protected in California. Fully protected species are prohibited from being taken or possessed except under specific permit requirements. These Codes also prohibit the take, possession, or needless destruction of the nests or eggs of any bird, including birds of prey or their nests or eggs, except as otherwise provided by the code or any regulation made pursuant thereto.

California Desert Native Plants Act

The California Desert Native Plants Act protects certain species of California desert native plants from unlawful harvesting on both public and privately owned lands. The law applies in the counties of Imperial, Inyo, Kern, Los Angeles, Mono, Riverside, San Bernardino, and San Diego. Within these counties, the CDNPA prohibits the cutting, removal, sale, or possession of specific native desert plants unless a person has a valid permit or wood receipt, and the required tags and seals. The appropriate permits, tags and seals must be obtained from the sheriff or commissioner of the county where collecting will occur, and the county will charge a fee.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act provides State coordination with the CWA, which is described above. It provides a mechanism by which the Regional Water Quality Control Boards certify that federal actions that result in a discharge to waters, including federally issued CWA permits to ensure the compatibility of federal and State water quality guidelines, are in compliance with Section 401 of the CWA, which requires such federal actions to comply with state water quality standards. The act provides for the development and periodic review of water quality control plans (basin plans) that designate beneficial uses of California's major rivers and groundwater basins and establish narrative and numerical water quality objectives for those waters. Basin plans are primarily implemented by using the National Pollution Discharge Elimination System permitting system to regulate waste discharges to ensure that water quality objectives are met. Waste discharges may include fill, any material resulting from human activity, or any other "discharge" that may directly or indirectly impact Waters of the State relative to the implementation of Section 401 of the CWA. Waters regulated under Porter-Cologne include isolated waters that are no longer regulated by USACE. Developments which impact jurisdictional waters must demonstrate compliance with the goals of the Act by developing SWPPPs, Standard Urban Storm Water Mitigation Plans, and other measures in order to obtain a CWA §401 certification.

E.4.1.2 Regional and Background Information

Alkali Mariposa Lily (*Calochortus striatus*)

Background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005). For a general discussion of this species, please refer to Section 3.3.8.1, pp. 3-184 to 3-185 of the 2005 WEMO Final EIS. The supplemental information presented below is based on the species accounts prepared for the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012) and recent BLM data.

Life History

Alkali mariposa lily grows in seasonally moist alkaline habitats with calcareous sandy soil within Mojavean desert scrub communities (Dudek and ICF International 2012). This species prefers claypans and sand dunes, especially along drainages, in halophytic (associated with saline soils) saltbush scrub (Dudek and ICF International 2012). It has been reported that periodic natural inundation is important to alkali mariposa lily, however, alkali mariposa lily has been reported as absent from areas with surface salts or areas with permanent standing surface water (Dudek and ICF International 2012). This species ranges in elevation from 224 to 5,240 feet (Dudek and ICF International 2012).

Some associated species include saltgrass (*Distichlis spicata*), rushes (*Juncus* spp.), sedges (*Carex* spp.), beardgrass (*Polypogon* sp.), dock (*Rumex* sp.), alkali sacaton (*Sporobolus airoides*), beardless wildrye (*Elymus triticoides*), dwarf checkerbloom (*Sidalcea malviflora*), rabbitbrush (*Chrysothamnus* sp.), Baltic rush (*Juncus balticus*), and yellow sweetclover (*Melilotus indicus*) (Dudek and ICF International 2012).

Regulatory Status

The regulatory status for the alkali mariposa lily has been updated from the 2005 WEMO Final EIS (BLM 2005) to eliminate the California Species of Special Concern status (as described in Section 3.3.8.1, pg. 3-185 of the 2005 WEMO Final EIS) and add a BLM sensitive designation.

Alkali mariposa lily is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “seriously threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The alkali mariposa lily has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The greatest threat to alkali mariposa lily is the lowering of water tables through hydrological alterations and water diversions, which alters the seasonally moist alkaline habitat that this species requires. Other threats include urbanization, grazing, trampling, road construction, dumping, and military operations (NatureServe 2011).

Big Bear Valley woollypod (*Astragalus leucolobus*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Big Bear Valley woollypod is a perennial herb which is endemic (limited) to California (CalFlora 2017). It occurs within Inyo, Kern, Los Angeles, Riverside, San Bernardino, San Benito, San Diego, and Ventura counties (CNPS 2017). This species generally blooms from May through July (CNPS 2017). This species often occurs in rocky areas associated with the following habitat types: lower montane coniferous forest, pebble (pavement) plain, pinyon and juniper woodland, and upper montane coniferous forest (CNPS 2017). This species ranges in elevation from 1100 to 2885 meters (CNPS 2017). Known from about 35 extant occurrences and about 3500 individuals (NatureServe 2017).

Regulatory Status

The Big Bear Valley woollypod is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The Big Bear Valley woollypod has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very

restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The Big Bear Valley woollypod is threatened by development, recreational activities, and vehicles (CNPS 2017).

Barstow Woolly Sunflower (*Eriophyllum mohavense*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.2, pp. 3-185) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Barstow woolly sunflower is in the aster family (Asteraceae) (Jepson Flora Project 2011). It is an annual herb standing approximately 1 to 2.5 centimeters (0.4 to 1 inch) in height that blooms from March to April or May, then goes to fruit in May (CNPS 2011; Jepson Flora Project 2011; NatureServe 2011). Plants tend to be clumped together. As an annual, germination and establishment of this species depends on the amount and timing of winter and spring rains. There is no information available regarding pollinators, seed dispersal, seed germination, or seedling establishment.

Barstow woolly sunflower prefers sandy or rocky areas within chenopod scrub, Mojavean desert scrub, creosote bush scrub, and also occurs on playas (NatureServe 2011; CNPS 2011; Jepson Flora Project 2011). This species prefers bare areas with little soil that frequently contain a shallow subsurface caliche layer (BLM 2005).

Regulatory Status

Barstow woolly sunflower is not federally or state listed, but is a BLM sensitive species. Barstow woolly sunflower has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “seriously threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The Barstow woolly sunflower has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Threats to Barstow woolly sunflower include energy and subdivision development, sheep grazing, off-road vehicle use, highway and road improvements and building, mining, dumping, and pipeline construction (NatureServe 2011; CNPS 2011). Of these threats, those of primary concern include energy development, sheep grazing, off-road vehicles, and highway improvements (NatureServe 2011). According to NatureServe (2010), several Barstow woolly sunflower sites may be

extirpated, but their status has not been reported to the CNDDDB. Currently, only one CNDDDB occurrence is recorded as possibly extirpated (CDFW 2012b).

California alkali grass (*Puccinellia simplex*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The California alkali grass is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Alameda, Butte, Contra Costa, Colusa, Fresno, Glenn, Kings, Kern, Lake, Los Angeles, Madera, Merced, Napa, San Bernardino, Santa Clara, Santa Cruz, San Luis Obispo, Solano, Stanislaus, Tulare, and Yolo counties (CNPS 2017). This species generally blooms March through May (CNPS 2017). This species occurs in alkaline, vernal mesic sinks, flats, and lake margins associated with the following habitat types: chenopod scrub, meadows and seeps, valley and foothill grassland, and vernal pools (CNPS 2017). This species ranges in elevation from 2 to 930 meters (CNPS 2017).

Regulatory Status

The California alkali grass is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The California alkali grass has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The California alkali grass is threatened by hydrological alterations, urbanization, agricultural conversion, development, and habitat fragmentation, disturbance, alteration, and loss; resulting in extirpation of some occurrences (CNPS 2017). This species is also possibly threatened by solar energy development, grazing and proximity to roads (CNPS 2017).

Chaparral sand-verbena (*Abronia villosa* var. *aurita*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The chaparral sand-verbena is an annual herb which is not endemic (limited) to California (CalFlora 2017). It occurs within Imperial, Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura counties in California as well as in Arizona and Baja California (CNPS 2017). This species generally blooms from March through September (CNPS 2017), with some blooming as early as January. This species occurs in sandy areas associated with the following habitat types: chaparral, coastal scrub, and desert dunes. (CNPS 2017). This species ranges in elevation from 75 to 1600 meters (CNPS 2017). Known from around 80 occurrences in California (NatureServe 2017).

Regulatory Status

The chaparral sand-verbena is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.1 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The chaparral sand-verbena has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The chaparral sand-verbena is threatened by non-native plants, alteration of fire regimes, road maintenance, flood control activities, vehicles, and development (CNPS 2017).

Charlotte's Phacelia (*Phacelia nashiana*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.4, pp. 3-186 and 3-187) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Charlotte's phacelia is an annual herb in the borage or waterleaf family (Boraginaceae) that is endemic to California. Charlotte's phacelia is typically 3 to 18 centimeters (1.2 to 7.1 inches) tall (Jepson Flora Project 2011). Flowering periods have been variously reported between March and June and Charlotte's phacelia can be found in flower by late March at lower elevations (White 2006a; CCH 2011). However, specimens collected by Chester, Kay, and Madore from Borrego Palm Canyon were also flowering in February (CCH 2011).

Some *Phacelia* species, such as Parry's phacelia, are fire-adapted, but it is unknown whether Charlotte's phacelia has any similar adaptation trigger. The habitats occupied by Charlotte's phacelia are frequently open and sparse, and the elevation ranges are higher than other *Phacelia* species, which could suggest that a similar, fire-adapted lineage is not likely (White 2006a). Pollination vectors and seed dispersal remain unknown for the species. Population data collected in

a few known locations over time appear to fluctuate widely (CDFW 2012b), and hydrology could be key in both distribution and population size.

Regulatory Status

Charlotte's phacelia is not federally or state listed, but is a BLM sensitive species. Charlotte's phacelia has a CRPR of 1B.2. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "seriously threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Barstow woolly sunflower has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

Impacts to Charlotte's phacelia from grazing and off-road vehicles are the most frequently noted threats in the CNDDDB records (CDFW 2012b). Trampling and collecting by hikers were also listed as threats to populations that occur along trails and within parks and recreational areas. Mining activities were noted as threats in a few locations, and activities and/or expansion of facilities at China Lake Naval Air Weapons Center could also pose a threat to populations near Volcano Peak outside of the planning area and Indian Wells within the planning area.

Chimney Creek nemacladus (*Nemacladus calcaratus*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Chimney Creek nemacladus is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Inyo, and Tulare counties (CNPS 2017). This species generally blooms May through June (CNPS 2017). This species occurs in granitic flats associated with the following habitat types: pinyon and juniper woodland (CNPS 2017). This species ranges in elevation from 1900 to 2100 meters (CNPS 2017). This species is thus far known only from three specimens found in the Chimney Creek area in Tulare County at the southern end of the Pacific Crest (NatureServe 2017).

Regulatory Status

The Chimney Creek nemacladus is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Chimney Creek nemacladus has a California Heritage Element Ranking of S1, indicating that it is "critically imperiled in the state because of extreme

rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

The Chimney Creek nemacladus is possibly threatened by foot traffic and grazing (CNPS 2017).

Clokey's Cryptantha (*Cryptantha clokeyi*)

Life History

Clokey's cryptantha is an annual herb in the borage or waterleaf family (Boraginaceae) that is endemic to California. Clokey's cryptantha is typically 8 to 15 centimeters (3.1 to 5.9 inches) tall (Jepson Flora Project 2013). Flowering period is from April to May (Jepson Flora Project 2013).

Clokey's cryptantha is found on slopes and ridge crests. Substrates may be sandy, rocky, or gravelly (CNPS 2013; Jepson Flora Project 2013). This species is found in desert woodland vegetation communities. The elevation range of Clokey's cryptantha is 3,445 to 5,413 feet amsl (Jepson Flora Project 2013).

Regulatory Status

Clokey's cryptantha is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Clokey's cryptantha has a CRPR of 1B.2 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “seriously threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Clokey's cryptantha has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Clokey's cryptantha is threatened by military activities and alteration of fire regimes (CNPS 2013).

Creamy blazing star (*Mentzelia tridentata*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The creamy blazing star is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Imperial, Inyo, Kern, Riverside, San Bernardino, and San Diego counties (CNPS 2017). This species generally blooms from March through May (CNPS 2017). This species occurs in rocky, gravelly, and sandy areas associated with the following habitat types:

Mojavean desert scrub (CNPS 2017). This species ranges in elevation from 700 to 1175 meters (CNPS 2017). Only 12 specimens are currently known and all other site locations are considered historic since they are from over 20 years ago (NatureServe 2017). Likely range-wide population is less than 1,000 individuals, though there are no current counts (NatureServe 2017).

Regulatory Status

The creamy blazing star is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.3 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). The creamy blazing star has a California Heritage Element Ranking of S3, indicating that it is “vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation” (CDFW 2012b).

Threats

The creamy blazing star is threatened by vehicles, mining, and grazing (CNPS 2017).

Curved-pod milk-vetch (*Astragalus mohavensis* var. *hemigyris*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The curved-pod milk-vetch is an annual herb which is not endemic (limited) to California (CalFlora 2017). It occurs within Inyo County in California as well as in Nevada (CNPS 2017). This species generally blooms from April through June (CNPS 2017). This species often occurs in carbonate areas associated with the following habitat types: Joshua tree woodland and Mojavean desert scrub (CNPS 2017). This species ranges in elevation from 1250 to 1620 meters (CNPS 2017). Known only from the Charleston Mountains of southern Nevada and one occurrence in California where it was rediscovered in 2001 (NatureServe 2017).

Regulatory Status

The curved-pod milk-vetch is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.1 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The curved-pod milk-vetch has a California Heritage Element Ranking of S1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

The curved-pod milk-vetch is potentially threatened by mining (CNPS 2017).

Cushenbury Buckwheat (*Eriogonum ovalifolium* var. *vineum*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.3, pp. 3-186) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Cushenbury buckwheat is in the buckwheat family (Polygonaceae) (Jepson Flora Project 2011). It is a mound-forming perennial herb approximately 1.5 to 2.5 decimeters (5.9 to 9.8 inches) in diameter (Sanders 2003).

A study of the Cushenbury buckwheat's reproduction patterns found it to be an outcrossed species with high levels of diversity, low levels of inbreeding among maternal individuals, and selection against homozygous offspring (Neel and others 2001). The main flowering period is May and June, and fruits ripen in about July and prepare for germination during any summer rains in August and September (Sanders 2003). There can also be later flowering in September. It is probably pollinated by small insects and possibly by generalist flower visitors rather than a specialist (Sanders 2003). A personal communication to Sanders (2003) by Morita indicated that nearly 100 insect species visited flowers, including potential pollinators and plant feeders. Insect taxa visiting flowers included many flies (particularly tachinids), bee-flies (Bombyliidae), and smaller species such as chloropids (Sanders 2003). A reintroduction study onto a disturbed site by Mistretta and White (2001) showed about 77% survival from 1991 to 1998 and successful reproduction within 6.6 feet of planting areas. Mistretta and White (2001) suggested that Cushenbury buckwheat does not depend on specialized pollinators or soil microorganisms due to the success of the species at the disturbed site, as well as in botanical gardens. Short dispersals likely are wind-aided, with the dried tepals (a division of the perianth where the petals and sepals are indistinguishable) acting as wings (Sanders 2003). Long-distance seed dispersal by this species has not been directly studied, but buckwheat seeds are thought to be dispersed by birds; however, there is no evidence of long-distance dispersal by Cushenbury buckwheat given its restricted distribution (Sanders 2003). As noted previously, Mistretta and White (2001) documented progeny within 6.6 feet of planting areas and no individuals were found more than 98 feet from planting areas.

The species *Eriogonum ovalifolium* is not well adapted to competing for light due to its low stature, but it competes well on sites with moisture and nutrient deficiencies, wind, and winter cold due to its compact "cushion" habit (Sanders 2003). The dense covering wool on its leaves, which reduces water loss, indicates that moisture and light are not controlling factors for this species. Tall, fast-growing species that may out compete *Eriogonum ovalifolium* for light do not grow well on limestone sites with nutrient deficiencies and high pH, which interferes with mineral uptake (Sanders 2003).

Cushenbury buckwheat does not appear to tolerate high or continuing levels of anthropogenic or natural disturbance (e.g., washes and canyon bottoms), but has been observed colonizing abandoned haul roads (Sanders 2003). Mistretta and White (2001) were able to successfully reintroduce it to a barren cut slope above a quarry haul road where no habitat enhancements were

made other than irrigation the first summer and fall after planting and use of the potting soil mix surrounding the roots of the plantings.

Cushenbury buckwheat is closely associated with carbonate substrates on stable slopes with bedrock outcrops and elevations between about 4,600 and 7,900 feet (Sanders 2003; USFWS 2009d; CDFW 2012b). It has never been found away from carbonate substrates and appears to be more closely associated with limestone than dolomite, but this preference needs confirmation (Sanders 2003). General vegetation communities associated with the species are pinyon-juniper woodland, Joshua tree woodland, and Mojavean desert scrub (CNPS 2011; CDFW 2012b). Sanders (2003) notes that it also has been observed in Jeffrey pine-western juniper woodland. It occurs in open areas on gentle to steep slopes with north or west aspects, little accumulation of organic material, open canopy cover (generally less than 15%), and powdery fine soils with rock cover exceeding 50% (USFWS 2009d). Although it may be locally common, individuals tend to occur in scattered distributions (Sanders 2003), and only about 25% of less than 20 occurrence locations known in 1984 supported more than 1,000 individuals (USFWS 2009d).

Regulatory Status

Cushenbury buckwheat is federally listed as endangered but is not state listed. A recovery plan addresses this species: *San Bernardino Mountains Carbonate Plants Draft Recovery Plan* (USFWS 1997b). Cushenbury buckwheat has a CRPR of 1B.1. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .1 are "seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat" (CNPS 2011). The Cushenbury buckwheat has a California Heritage Element Ranking of S1, indicating that it is "critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province" (CDFW 2012b).

Threats

The main threat to Cushenbury buckwheat when it was federally listed in 1994 was mining (USFWS 2009d). Other threats at the time included OHV use, a hydroelectric project, and a 115-kilovolt power line proposed for construction through Cushenbury Canyon (USFWS 2009d). About 75% of occupied habitat was under threat as a result of being under claim for mining, in private ownership and subject to mining, or as a result of other disturbances (USFWS 2009d). Mining continues to be the primary threat to the species, but other threats include energy development and OHV use, which can result in direct ground disturbance and dust generation (USFWS 2009d). Further, dispersed target shooting, dispersed camping areas, and fuelwood collection can result in trampling of Cushenbury buckwheat and impact its habitat through ground disturbance or dust creation (USFWS 2009d). Padgett and others (2007) conducted a study examining dust deposition from mining activities and potential effects to Cushenbury buckwheat and other carbonate plant species. This study documented lower photosynthetic activity and less growth for plants near mining activities due to dust. Fire suppression activities can result in ground disturbance through fire line construction, retardant and water drops, and establishment of fire camps (USFWS 2009d). Artificial lighting is also cited as a potential threat due to potential impacts on the behavior of pollinators or seed dispersers, or by altering photoperiod responses (USFWS 2009d).

The specific potential effects of climate change on Cushenbury buckwheat are unknown, but if climate change caused a shift to higher elevations due to warmer and drier conditions, as has occurred with other plant species on the Santa Rosa Mountains of Southern California (Kelley and Goulden 2008), this endemic species could be concentrated in a smaller area and more vulnerable to extinction (USFWS 2009d).

Cushenbury Milk-vetch (*Astragalus albens*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.3, pp. 3-186) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Cushenbury milk-vetch is a member of the legume family (Fabaceae). It is a prostrate annual or perennial plant with stems approximately 2 to 30 centimeters (0.8 to 12 inches) in length (MacKay 2003). Individual plants may be annual or perennial (MacKay 2003; Hickman 1996), but otherwise little is known of its natural history, including reproduction (MacKay 2003). Flowering occurs from late March to mid-June and pods ripen as early as May (MacKay 2003). It is probably pollinated by small bees given flower shape and color (MacKay 2003; USFWS 2009e). It is unknown whether plants flower and fruit in their first year, how long they live, or what conditions cause them to be annuals or perennials (MacKay 2003). They reproduce by seed and seeds have been shown to have high viability (MacKay 2003). Seeds require scarification (cutting of the outer seed coat) to germinate and may remain dormant in the soil during drought years (MacKay 2003). The length of time seeds can remain viable, the characteristics of seed banks (e.g., size, kinds of seeds), and the type and extent of seed predation and/or dispersal are unknown (MacKay 2003). However, populations increase in response to rainy seasons after droughts, indicating that seed banks persist and seeds remain viable for at least several years (MacKay 2003).

Other than their association with carbonate soils and some other habitat features such as canopy, litter, and slope described in Habitat Requirements, little is known of the life history and ecological relationships of Cushenbury milk-vetch. Pollinators are probably small bees and seeds appear to have high viability and resistance to drought (MacKay 2003). Dispersal mechanisms are unknown. Of particular interest is the factor(s) related to whether individuals are annual or perennial. A factor potentially related to conservation and management of the species is its apparent ability to colonize slightly disturbed sites such as little used roads and long abandoned quarries, but it does not appear to tolerate high or continuing levels of disturbance (MacKay 2003).

Cushenbury milk-vetch is closely associated with carbonate and carbonate-related soils (limestone and dolomite) and outcrops at elevations between 4,000 and 6,600 feet (MacKay 2003). General vegetation communities associated with the species are pinyon-juniper woodland, Joshua tree woodland, and Mojave desert scrub (CNPS 2011). Most occurrences are between 5,000 and 6,600 feet for soils deriving from decomposed limestone (USFWS 2009e). In some cases, the species has been found in carbonate alluvium that was deposited over granitic rocks or has fallen into other soils as a result of a debris slide (MacKay 2003).

Regulatory Status

Cushenbury milk-vetch is federally listed as endangered but is not state listed. Critical habitat was designated on December 24, 2002 (67 FR 78570–78610). A recovery plan addresses this species, *San Bernardino Mountains Carbonate Plants Draft Recovery Plan* (USFWS 1997b). Cushenbury milk-vetch has a CRPR of 1B.1. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The Cushenbury milk-vetch has a California Heritage Element Ranking of S1.1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

The main threat to Cushenbury milk-vetch when it was federally listed in 1994 was mining (USFWS 2009e). Other threats at the time included OHV use, a hydroelectric project, and a 115-kilovolt power line proposed for construction through Cushenbury Canyon (USFWS 2009e). About 97% of occupied habitat was under threat as a result of being under claim for mining, in private ownership and subject to mining, or as a result of other disturbances (USFWS 2009e). Mining continues to be the primary threat to the species, but other threats include energy development and OHV use, which can result in direct ground disturbance and dust generation (USFWS 2009e). Further, dispersed target shooting, dispersed camping areas, and fuel wood collection can result in trampling of Cushenbury milk-vetch and impact its habitat through ground disturbance or dust creation (USFWS 2009e). Dust can reduce plant viability by altering soil chemistry and light penetration into the seed banks (USFWS 2009e). Fire suppression activities can result in ground disturbance through fire line construction, retardant and water drops, and establishment of fire camps (USFWS 2009e). Artificial lighting is also cited as a potential threat due to potential impacts on the behavior of pollinators or seed dispersers, or by altering photoperiod responses (USFWS 2009e).

The specific potential effects of climate change on Cushenbury milk-vetch are unknown, but if climate change caused a shift to higher elevations due to warmer and drier conditions, as has occurred with other plant species on the Santa Rosa Mountains of Southern California (Kelley and Goulden 2008), this endemic species could be concentrated in a smaller area and more vulnerable to extinction (USFWS 2009e).

Cushenbury Oxytheca (*Acanthoscyphus parishii* var. *goodmaniana*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.3, pp. 3-186) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Cushenbury oxytheca is a small annual plant approximately 0.5 to 3 decimeters (2 to 12 inches) in size that germinates in late fall, producing a relatively long taproot and basal rosette of leaves that remain until the inflorescence develops and flowers bloom from May to October (Sanders 2007).

Observations suggest that it is pollinated by generalist insects, such as small flies and small beetles (S. Morita, cited in Sanders 2007). Little is known about seed bank, seedling establishment, or population structure (USFWS 2009f).

Other than Cushenbury oxytheca's association with carbonate soils, little is known of the life history and ecological relationships of this species. What is known of its life history is based on personal observations and museum records; little information has been published on the species (Sanders 2007). Gonella and Neel (1995) noted its presence/absence on plots in relation to Cushenbury buckwheat and Cushenbury milk-vetch; generally it does not co-occur with these two species.

Cushenbury oxytheca is an annual herb that generally grows on limestone or a mixture of limestone and dolomite soils. This species is most commonly found on talus slopes within pinyon and juniper woodland (Hickman 1996, p. 886; CNPS 2011; CDFW 2012b; USFWS 2009f). Slope where it occurs are usually steep and almost always on loose scree or talus (Sanders 2007). Habitat preferences include an open canopy structure with little or no accumulation of organic material at the soil surface.

Dominant species within pinyon and juniper woodland include single-leaf pinyon pine (*Pinus monophylla*), Utah juniper (*Juniperus osteosperma*), and more rarely California juniper and western juniper (*Juniperus occidentalis*). Understory species within pinyon and juniper woodland are more variable, but may include mountain-mahogany (*Cercocarpus ledifolius*), Mormon tea (*Ephedra viridis*), Mojave yucca (*Yucca schidigera*), Joshua tree, and brittlebush. Cushenbury oxytheca co-occurs with another carbonate endemic, Parish's daisy (*Erigeron parishii*). Its presence, however, appears to be negatively related to at least two other carbonate soils species that tend to occur on stable slopes. Gonella and Neel (1995) never found Cushenbury oxytheca on sample plots centered on Cushenbury milk-vetch (*Astragalus albens*), but it was fairly regularly found on plots without the milk-vetch. Cushenbury milk-vetch is a species typical of stable, often bedrock, slopes. Cushenbury oxytheca also appears to be negatively correlated with the presence of Cushenbury buckwheat (*Eriogonum ovalifolium* var. *vineum*). However, later surveys conducted by Rancho Santa Ana Botanic Garden for the USFS did find Cushenbury oxytheca growing with Cushenbury milk-vetch and Cushenbury buckwheat in some areas (V. Sosa, cited in Sanders 2007).

Regulatory Status

Cushenbury oxytheca is federally listed as endangered but is not state listed. Critical habitat was designated on December 24, 2002 (67 FR 78570–78610). A recovery plan addresses this species: *San Bernardino Mountains Carbonate Plants Draft Recovery Plan* (USFWS 1997b). Cushenbury oxytheca has a CRPR of 1B.1. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The Cushenbury oxytheca has a California Heritage Element Ranking of S1.1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

According to a variety of sources, the primary threat to Cushenbury oxytheca is limestone mining (CDFW 2012b; Sanders 2007; Hickman 1996). Besides direct impacts, dust and artificial lighting can affect the species through dust impacts on soil chemistry and potential lighting impacts on seedbanks and pollinators and seed dispersers (USFWS 2009f). The USFWS (2009f) reports that 79% of known occupied habitat is currently subject to mining claims. Additional threats are non-native plant encroachment, power line maintenance, a hydroelectric project, and OHVs (CNPS 2011; USFWS 2009f).

Death Valley Sandpaper-plant (*Petalonyx thurberi* ssp. *gilmanii*)

Life History

Death Valley sandpaper-plant is a perennial subshrub in the loasa family (Loasaceae) that is native and endemic to California. Death Valley sandpaper-plant is typically less than 100 centimeters (39.4 inches) tall (Jepson Flora Project 2013) and flowers from May to June and September to November (Calflora 2013; Jepson Flora Project 2013).

Death Valley sandpaper-plant is found on dunes and in sandy washes (Jepson 2013); and within sagebrush scrub, Joshua tree woodlands, and pinyon-juniper woodlands in the vicinity of Panamint and Death Valleys. Substrates are sandy (CNPS 2013). This species is found in desert dunes and Mojavean desert scrub vegetation communities (CNPS 2013). Elevation range reported as 0 to 3,937 (Jepson 2013) and 853 to 4,741 feet amsl (CNPS 2013).

Regulatory Status

Death Valley sandpaper-plant is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Death Valley sandpaper-plant has a CRPR of 1B.3 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California, with less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). The Death Valley sandpaper-plant has a California Heritage Element Ranking of S2.3, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Death Valley sandpaper-plant has no known threats (CNPS 2013).

Dedecker's Clover (*Trifolium dedeckerae* also *Trifolium kingii* ssp. *Dedeckerae*)

Life History

Dedecker's clover is a perennial herb in the legume family (Fabaceae) that is endemic to California. Flowering period is from May to July (Calflora 2013).

Dedecker's clover is found on alpine crests and in rock crevices (Jepson 2013). Substrates are granitic and rocky (CNPS 2013). This species is found in lower montane coniferous forest, pinyon and juniper woodland, subalpine coniferous forest, and upper montane coniferous forest vegetation communities (CNPS 2013). Elevation range reported as 6,890 to 11,483 feet amsl (CNPS 2013).

Regulatory Status

Dedecker's clover is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Dedecker's clover has a CRPR of 1B.3 (CNPS 2013). CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .3 are "not very threatened in California, with less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known" (CNPS 2011). Dedecker's clover has a California Heritage Element Ranking of S2.3, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

Dedecker's clover is possibly threatened by mining and grazing (CNPS 2013).

Desert Cymopterus (Cymopterus deserticola)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.6, pp. 3-187 and 3-188) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Desert cymopterus is in the carrot family (Apiaceae) (Jepson Flora Project 2011). Desert cymopterus is a tap-rooted perennial about 15 centimeters (5.9 inches) in height (Jepson Flora Project 2011). As a taprooted perennial, desert cymopterus does not appear to reproduce vegetatively, but rather reproduces via seeds. Seedling establishment has not been reported for this species. Establishment of new individuals in a population may be infrequent given that many reported desert cymopterus populations are highly dispersed and low density (NatureServe 2011).

Depending on the year, desert cymopterus flowers between early March and mid-May, and may not flower at all in unfavorable years. Poor seed production or seed survival may be a factor in infrequent establishment observed in field studies. Fruits of desert cymopterus are fairly large and do not seem well adapted for dispersal over long distances. Fruits generally seem to fall relatively close to the parent plant. However, the fruits have a marginal wing that may facilitate dispersal by wind. In addition, the fruits mature late in the season, typically after the end of the rainy season, so they remain dry and light. Therefore, given that wind is relatively common in the open sandy habitats where this species is found, it could easily push the fruits along the soil surface, although the fruits probably don't become airborne (NatureServe 2011).

Because of the annual variability in rainfall, the underground parts of herbaceous desert perennials, including desert cymopterus, must be able to maintain the populations over time with frequent

years of reproductive failure; in addition, they must be able to survive prolonged periods of low soil moisture and entire years without aboveground photosynthetic activity (NatureServe 2011). In dry years, desert cymopterus may not produce flowers or fruit and may even remain dormant underground during the usual growing season. In very wet years, however, they may produce flowers and fruits abundantly.

Population sizes appear to vary greatly from year to year, evidently in response to the amount and timing of winter and spring rainfall, making it difficult to determine population trends (NatureServe 2011).

Desert cymopterus grows in Joshua tree woodland, saltbush scrub, and Mojavean desert scrub communities on loose, sandy soils. The sandy soils required by this species occur on alluvial fans and basins, stabilized sand fields, and occasionally sandy slopes of desert dry lake basins (69 FR 64884–64889).

Regulatory Status

Desert cymopterus (*Cymopterus deserticola*) is not federally or state listed, but is a BLM sensitive species. Desert cymopterus has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Desert cymopterus has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Desert cymopterus is potentially threatened by habitat alteration and destruction resulting from military activities on Edwards Air Force Base, the expansion of Fort Irwin, oil and gas development, utility construction, renewable energy development, off-road vehicle use, sheep grazing, Land Tenure Adjustment, and urban development (69 FR 64884–64889; CNPS 2011). However, according to the proposed rule (69 FR 64884–64889), the magnitude and relative importance of most of these potential threats were unknown. Grazing by native and non-native herbivores—presumably including mammals, insects, and desert tortoise—is also a threat to this species. This may contribute to the low density, dispersed nature of the majority of reported desert cymopterus populations by limiting the plants’ reproductive potential and reducing their vigor (Bagley 2006).

Gilman’s goldenbush (*Ericameria gilmanii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Gilman's goldenbush is a perennial shrub which is endemic (limited) to California (CalFlora 2017). It occurs within Inyo, Kern, and Tulare counties (CNPS 2017). This species generally blooms from August through September (CNPS 2017). This species occurs in carbonate or granitic areas associated with the following habitat types: subalpine coniferous forest and upper montane coniferous forest. This species ranges in elevation from 2100 to 3400 meters (CNPS 2017). There are six known occurrences for this species and only one has been seen in the past 20 years (NatureServe 2017).

Regulatory Status

The Gilman's goldenbush is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.3 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .3 are "not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known" (CNPS 2011). The Gilman's goldenbush has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

There are six historic populations of Gilman's goldenbush known, but only 1 has been seen in the past 20 years. This single site is on USFWS lands and seems unthreatened at this time (NatureServe 2017). Only 11 plants occur at this site (NatureServe 2017), so low population size is a concern.

Grey-leaved violet (*Viola pinetorum* ssp. *grisea*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The grey-leaved violet is a perennial herb which is endemic (limited) to California (CalFlora 2017). It occurs within Fresno, Inyo, Kern, Los Angeles, Madera, San Bernardino, Tulare, and Ventura counties (CNPS 2017). This species generally blooms April through July (CNPS 2017). This species occurs in the following habitat types: meadows and seeps, subalpine coniferous forest, and upper montane coniferous forest (CNPS 2017). This species ranges in elevation from 1500 to 3400 meters (CNPS 2017). This species is known from just over 50 populations (NatureServe 2017).

Regulatory Status

The grey-leaved violet is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The grey-leaved violet has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The grey-leaved violet is threatened by grazing, trampling, and vehicles and possibly threatened by recreational activities (CalFlora 2017). Other threats mentioned include grazing and OHVs (NatureServe 2017).

Hall's Daisy (*Erigeron aequifolius*)

Life History

Hall's daisy is perennial herb in the sunflower family (Asteraceae) that is endemic to California. Hall's daisy is typically 10 to 20 centimeters (3.9 to 7.9 inches) tall (Jepson Flora Project 2013). Flowering period is from June to August (Calflora 2013).

Hall's daisy is found on rock ledges and in crevices (Jepson Flora Project 2013). Substrates are granitic and rocky (CNPS 2013). This species is found in broad-leaved upland forest, lower montane coniferous forest, pinyon and juniper woodland, and upper montane coniferous forest vegetation communities. The elevation range of Hall's daisy is 4,921 to 8,005 feet amsl (CNPS 2013).

Regulatory Status

Hall's daisy is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Hall's daisy has a CRPR of 1B.3 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California, with less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). Hall's daisy has a California Heritage Element Ranking of S2.3, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Hall's daisy has no known threats (CNPS 2013).

Harwood's eriastrum (*Eriastrum harwoodii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Harwood's eriastrum is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Riverside, San Bernardino, and San Diego counties (CNPS 2017). This species generally blooms from March through June (CNPS 2017). This species occurs in desert dunes associated with the following habitat types: desert playa, North American warm desert dunes and sand flats, lower bajada and fan Mojavean-Sonoran desert scrub, and Madrean warm semi-desert wash woodland/scrub (CNPS 2017). This species ranges in elevation from 125 to 915 meters (CNPS 2017).

Regulatory Status

The Harwood's eriastrum is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Harwood's eriastrum has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province"(CDFW 2012b).

Threats

The Harwood's eriastrum is potentially impacted by solar energy development by grazing and trampling (CNPS 2017). More likely threats include mining, non-native plant competition, and vehicles (CNPS 2017).

Horn's milk-vetch (*Astragalus hornii* var. *hornii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Horn's milk-vetch is an annual herb which is not endemic (limited) to California (CalFlora 2017). It occurs within Inyo, Kern, San Bernardino, and Tulare counties in California as well as Nevada (CNPS 2017). This species generally blooms from May through October (CNPS 2017). This species often occurs along lake margins or alkaline areas associated with the following habitat types: meadows and seeps, and playas (CNPS 2017). This species ranges in elevation from 60 to

850 meters (CNPS 2017). NatureServe currently does not have occurrence data for this species (NatureServe 2017).

Regulatory Status

The Horn's milk-vetch is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.1 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .1 are "seriously threatened in California with over 80% of occurrences threatened/high degree and immediacy of threat" (CNPS 2011). The Horn's milk-vetch has a California Heritage Element Ranking of S1, indicating that it is "critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province" (CDFW 2012b).

Threats

The Horn's milk-vetch was subject to eradication efforts in early 1900's because it was poisonous to sheep and is now threatened by habitat alteration (CNPS 2017).

Kelso Creek Monkeyflower (*Mimulus shevockii*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.7, pp. 3-188) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Kelso Creek monkeyflower is a tiny ephemeral winter annual herb in the lopseed family (*Phrymaceae*), which was recently segregated from the figwort family (*Scrophulariaceae*) (Jepson Flora Project 2011; Beardsley and Olmstead 2002). Kelso Creek monkeyflower stands approximately 2 to 12 centimeters (0.8 to 4.7 inches) in height (Jepson Flora Project 2011; Elvin 2006). Kelso Creek monkeyflower blooms from March to May (CNPS 2011). It is unknown whether Kelso Creek monkeyflower is self-sterile or self-fertile (Elvin 2006). Given the relative size of its corolla, the nectar guide patterning, and corolla colors, Kelso Creek monkeyflower is probably outcrossing, and is probably pollinated by small solitary native bees; soft-wing flower beetles (*Trichochrous* sp.) have been observed visiting flowers (Fraga 2007).

It fruits from April to June (Fraga 2007). The fruit is a 0.25-inch capsule that contains more than 100 seeds and is dehiscent at the end and along both sutures (Heckard and Bacigalupi 1986). Although not directly observed, water is a likely seed dispersal mechanism since Kelso Creek monkeyflower occurs in washes (Elvin 2006).

The role of the seedbank is probably very important for the long-term survival of populations. It is known from similar annual *Mimulus* species that even in high rainfall years, some fraction of seed stays dormant and remains in the seed bank (Fraga 2007). Kelso Creek monkeyflower does not germinate at all in drought years. The amount and timing of rainfall affect the number of seeds that germinate, the timing of germination, and the size and longevity of desert annuals (Fraga 2007).

Although Kelso Creek monkeyflower is highly restricted in distribution, it appears to be common where it occurs in years of ample rain (Fraga 2007). It does not appear to have very exacting habitat requirements (Fraga 2007), although there appears to be hundreds of acres of apparently suitable habitat that are unoccupied (Heckard and Bacigalupi 1986). In wet years, Kelso Creek monkeyflower can form carpets on the desert floor, but can be difficult to locate in drier years (CPC 2011).

Kelso Creek monkeyflower hybridizes with its closest relative Tehachapi monkeyflower (*Mimulus androsaceus*) (Audubon 2011; CDFW 2012b). This suggests that the Kelso Creek monkeyflower may have evolved from Cyrus Canyon and spread southward to other locations in the Kern and Kelso Valleys (Audubon 2011).

Kelso Creek monkeyflower occurs predominately in loamy, coarse sands on alluvial fans, dry streamlets, or washes and granitic deposits within Joshua tree or California juniper xeric woodlands (59 FR 50540–50550; Heckard and Bacigalupi 1986). Substrates where Kelso Creek monkeyflower are found are generally granitic or metamorphic, and sandy or gravelly (CNPS 2011). However, the population near Cyrus Flat grows on finer soils developed from metasedimentary rocks (CDFW 2012b; Heckard and Bacigalupi 1986). The California Native Plant Society (CNPS) (2011) reports an elevation range for this species from 800 to 1,340 meters (2,625 to 4,396 feet). However, the CNDDDB (CDFW 2012b) includes one occurrence at 4,500 feet. Species strongly associated with Kelso Creek monkeyflower include pygmy poppy (*Canbya candida*), silver cholla (*Cylindropuntia echinocarpa*), purple sage (*Salvia dorrii*), golden gilia (*Leptosiphon aureus*), Tehachapi monkeyflower, Fremont's monkeyflower (*Mimulus fremontii*), and white burrobrush (*Ambrosia salsola* var. *pentalepis*) (Heckard and Bacigalupi 1986).

Regulatory Status

Kelso Creek monkeyflower (*Mimulus shevockii*) is not federally or state listed, but is a BLM sensitive species. It was proposed for federal listing in 1994 (59 FR 50540–50550), but the proposal was withdrawn in 1998 when it was determined that the species was not threatened with extinction and therefore did not meet the definition of a threatened or endangered species (63 FR 49065–49075). Kelso Creek monkeyflower has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The Kelso Creek monkeyflower has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Threats to Kelso Creek monkeyflower have not changed since the 2005 WEMO Final EIS (BLM 2005). The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.7, pp. 3-188) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Kelso Creek monkeyflower is threatened by urbanization, OHV use, agricultural land conversion, road maintenance, cattle grazing, habitat loss from water inundation, fire suppression activities,

and competition from non-native species (59 FR 50540–50550; CNPS 2011; NatureServe 2011). The extremely limited distribution of this plant puts it at risk of stochastic extinction events (Elvin 2006).

This species is primarily threatened by the current or potential destruction, modification, or curtailment of its habitat or range. Mobile home and subdivision development and associated grading threaten or have impacted 6 of the 11 occurrences (CDFW 2012b). Cattle grazing, introduction of non-native plant species, and conversion of habitat to orchards have begun to modify the landscape and threaten Kelso Creek monkeyflower occurrences and limited natural habitat (Elvin 2006; CDFW 2012b).

Of the seven occurrences within the planning area, three are entirely on BLM Ridgecrest RA lands, two are partially on BLM Ridgecrest RA lands and partially on private lands, and two are partially on BLM land outside of Ridgecrest RA and partially on private lands (CDFW 2012b). Although occurrences on BLM lands are provided some protection, there are still documented threats to these populations (Elvin 2006). All of the populations on private land are at risk of mobile home or subdivision development. Populations located on BLM lands adjacent to private property are also affected by this threat (Elvin 2006).

The effect that highway and road maintenance has on populations on or adjacent to private property is twofold: improved access has increased development and the additional traffic has created pressure to add or widen roads. At least one population has been bisected by road development. OHV use directly impacts or threatens approximately half of the known occurrences throughout its range (Elvin 2006). At least one population site has been highly disturbed, probably from uncontrolled overgrazing during drought (CDFW 2012b). Water developments and impoundments also potentially threaten this species (Elvin 2006).

Kern Buckwheat (*Eriogonum kennedyi* var. *pinicola*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.8, pp. 3-189) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Kern buckwheat is a perennial herb in the buckwheat family (Polygonaceae) (CNPS 2011; Reveal 2003). Kern buckwheat stands approximately 0.5 to 1.3 decimeters (2.0 to 5.1 inches) in height (Jepson Flora Project 2011). The species blooms from May to June (CNPS 2011; Jepson Flora Project 2011). The fruit ripens and is dispersed around July. Sexual reproduction in Kern buckwheat is probably both selfing and outcrossing (NatureServe 2011) considering the federally listed variety *E. k.* var. *austromontanum* produces seeds by self-pollinating and insect-mediated outcrossing (71 FR 67712–67754).

Eriogonum species generally attract small generalist pollinators. Visitors, and potential pollinators, of the species *Eriogonum kennedyi* are small wasps, flies, bees, butterflies, and ants (O'Brien 1980). A small, silvery-white, iridescent butterfly has been observed pollinating this variety (Hare, pers. obs., cited in Sanders and Greene 2006). Kern buckwheat flowers change to red when pollinated suggesting that bees are important pollinators.

Though seed dispersal for this taxon has not been studied, birds may play a role in the dispersal of all *Eriogonum* seeds. Although there is little information available, wind, rain and streams may also act as dispersal agents (Sanders and Greene 2006).

Kern buckwheat appears to share many general ecological characteristics with other varieties of *E. kennedyi*. It occurs in open areas and prefers full sunlight, appearing to be intolerant of extensive shading. Although not well adapted to competing for light, it is very competitive on sites where tall and fast-growing species are excluded by moisture deficiencies, wind, and cold (Walter 1973, cited in Sanders and Greene 2006). Its compact cushion-like habit probably helps to reduce moisture loss (Walter 1973, cited in Sanders and Greene 2006). Therefore, this variety appears to favor sites where moisture stress is combined with high insulation (Sanders and Greene 2006).

Moisture rather than light is probably a controlling factor for Kern buckwheat. The foliage is densely covered with tomentum (wool) that substantially reduces the amount of light that strikes the leaf tissue. Although pubescence may affect photosynthesis, it also forms a layer of dead air at the leaf surface, which can reduce water loss from wind (Johnson 1975, cited in Sanders and Greene 2006).

Kern buckwheat is found in poorly draining depressions in white bentonite clay soils that are derived from volcanic ash (Sanders and Greene 2006). The depressions have pebbles, gravel, and rock cemented into the soil surface that form exposed open flats located on ridge tops and saddles between knolls (Sanders and Greene 2006).

This species occurs in chaparral and pinyon and juniper woodland (CDFW 2012b; CNPS 2011). Associated species include California sagebrush (*Artemisia californica*), Great Basin sagebrush (*Artemisia tridentata*), adobe yampah (*Perideridia pringlei*), fivetooth spineflower (*Chorizanthe watsonii*), and old fallen Jeffrey pines (CDFW 2012b; CCH 2011).

Regulatory Status

Kern buckwheat (*Eriogonum kennedyi* var. *pinicola*) is not federally or state listed, but is a BLM sensitive species. Kern buckwheat has a CRPR of 1B.1. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The Kern buckwheat has a California Heritage Element Ranking of S1.1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

Current threats to Kern buckwheat are wind energy development on private land and vehicles (CNPS 2011). OHVs have already destroyed plants and habitat in one of the occurrences on BLM land. The highly restricted distribution and small number of remaining plants make this species vulnerable to stochastic extinction (Sanders and Greene 2006).

Approximately half of the 1-acre population on private land on Sweet Ridge was destroyed by the construction of wind energy facilities. Suitable habitat and plants were destroyed with the construction of access roads to newly subdivided lots and the construction of a ramp to a proposed

campsite along the Pacific Crest Trail. Illegal grading has resulted in an erosion problem that threatens part of one population (Hare 1995 and Rutherford 1998, cited in Sanders and Greene 2006). Although cattle grazing is not known around the populations now, the area has been grazed in the past (Sanders and Greene 2006).

Based on observations, Kern buckwheat has been unable to recolonize disturbed areas (Hare 1995, cited in Sanders and Greene 2006).

Kern Plateau bird's-beak (*Cordylanthus eremicus ssp. Kernensis*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Kern Plateau bird's-beak is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs on the Kern Plateau within Inyo, Kern, and Tulare counties (CNPS 2017). This species generally blooms from July through September, which some blooming taking place as early as May (CNPS 2017). This species occurs in wetlands, and occasionally non-wetlands (CalFlora 2017) associated with the following habitat types: Great Basin scrub, Joshua tree woodland, pinion and juniper woodland, and upper montane coniferous forest (CNPS 2017). This species ranges in elevation from 1675 to 3000 meters (CNPS 2017). Known from 14 sites in California (NatureServe 2017).

Regulatory Status

The Kern Plateau bird's-beak is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.3 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .3 are "not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known" (CNPS 2011). The Kern Plateau bird's-beak has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

The Kern Plateau bird's-beak is potentially impacted by trail maintenance, foot traffic, and OHV use (CNPS 2017).

Kern River evening-primrose (*Camissonia integrifolia*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Kern River evening-primrose is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Kern County (CNPS 2017). This species generally blooms in May but may also bloom in April (CNPS 2017). This species occurs in chaparral (CNPS 2017). This species ranges in elevation from 700 to 1000 meters (CNPS 2017). Known from three occurrences in California (NatureServe 2017).

Regulatory Status

The Kern River evening-primrose is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.3 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). The Kern River evening-primrose has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The Kern River evening-primrose is potentially threatened by road maintenance (CNPS 2017).

Lane Mountain Milk-vetch (*Astragalus jaegerianus*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.9, pp. 3-189 and 3-190) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Lane Mountain milk-vetch is a member of the legume family (Fabaceae). It is a perennial herb approximately 3 to 7 decimeters (11.8 to 27.6 inches) in size (Charis 2002). It flowers in April and May and fruits ripen from the end of April to the end of May (Charis 2002). Work on pollinators indicates the species most likely to be effective pollinators include the megachilid bees *Anthidium dammersi*, *A. emarginatum*, and *Osmia laticulata* (Hopkins 2005; USFWS 2008c).

Greenhouse studies have shown higher rates of seed production in individuals that are self and cross-pollinated compared with unpollinated individuals, so pollination appears to be important for reproduction by this species (Rundel and others 2005, cited in USFWS 2008c). Genetic studies indicate that Lane Mountain milk-vetch is a facultative outcrosser (i.e., cross-pollinator) that relies more on outcrossing within dense populations than within low-density populations (Walker and Metcalf 2008). Dispersal mechanisms in Lane Mountain milk-vetch are unknown, although Charis (2002) suggests that dispersal may be by gravity, but notes that seeds and pods of other *Astragalus* species are fed upon by various birds, rabbits, and rodents.

Lane Mountain milk-vetch exhibits a relatively low recruitment rate; less than 2% of the 4,888 individuals detected by Charis (2002) were seedlings. Field and greenhouse studies by Rundel and others (2007) found that key factors for seedling growth and survival include the amount, frequency, and timing of precipitation. Generally, seed germination may be high under controlled greenhouse conditions, but much lower in the wild (Rundel and others 2007).

Community structure and the availability of suitable host plants for Lane Mountain milk-vetch appear to be important ecological factors. Charis (2002) found that Lane Mountain milk-vetch occurs in Mojave creosote scrub and Mojave mixed woody scrub with widely scattered Joshua trees. It does not occur in creosote scrub habitat dominated by creosote and white bursage. More than 99% of mature individuals were found on host plants, and the association with host plants appears to be non-random, with turpentinebroom accounting for about 20% of the host records, and white bursage, Mojave Desert California buckwheat, Cooper's goldenbush, Nevada jointfir, and "dead shrub" accounting for about 10% each (Charis 2002). Some common shrubs, such as creosote bush and white bursage, are used less frequently as host plants in relation to their abundance.

The growth patterns and distribution of Lane Mountain milk-vetch also appear to be related to the availability of moisture. Individuals annually go dormant during the hot, dry summer season and respond with vegetative growth to winter rains, or possibly also in response to temperature and photoperiod (Charis 2002). In very dry years, the species may have little vegetative growth, flowering, or fruiting (Bagley 1989, cited in Charis 2002). The greater presence of Lane Mountain milk-vetch on shallow ridges where soils are thinner and bedrock much closer to the surface, as opposed to deeper alluvial soils, suggests that occupied sites have a better moisture supply (Charis 2002).

Precipitation amounts, timing, and frequency are key factors in seedling growth and survival of Lane Mountain milk-vetch. In the wild, wet years are critical for seedling growth and survival, but invasive species may also proliferate in wet years, and may compete with and promote herbivory of milk-vetch (Rundel and others 2007). Even in a wet year (2004–2005), on a study plot, seedling survival to the following year was only 16% (8 of 49 individuals) (Rundel and others 2007). Rundel and others (2007) suggest that summer rains may be critical for seedling establishment and survival. More recent information indicates that drought over the last decade has had severe adverse effects on Lane Mountain milk-vetch populations, because of low seedling survival and depleted seed banks.

Lane Mountain milk-vetch occurs in Mojave creosote scrub and Mojave mixed woody scrub with widely scattered Joshua trees, and intergrades of the two communities that have relatively high shrub diversity (Charis 2002). The California Native Plant Society (CNPS 2011) also lists Joshua tree woodland as habitat occupied by the species, but the Charis (2002) study indicates that Joshua trees are widely scattered in occupied habitat. The species does not occur in areas dominated by creosote bush and white bursage (Charis 2002). Occupied habitat is characterized by gentle slopes and low ridges 6.5 to 8.8 feet high, with shallow and lighter granitoid soils (Charis 2002). The species' distribution suggests that it may be responding to water supply (Charis 2002). It occurs at elevations of 3,100 to 4,200 feet above MSL (Charis 2002).

Lane Mountain milk-vetch typically occurs in patchy (i.e., clustered) distributions, but also occurs less commonly in distributions of a few scattered individuals over a broader area. It almost always is associated with a host shrub, which the Lane Mountain milk-vetch uses as a trellis. Of 4,888

mature plants recorded by Charis (2002), less than 0.5% were found growing alone. The six most frequent host plants accounted for approximately 75% of the records, with turpentinebroom (*Thamnosma montana*) accounting for about 20% of the host records, and white bursage, Eastern Mojave buckwheat (*Eriogonum fasciculatum* ssp. *polifolium*), Cooper's goldenbush (*Ericameria cooperi*), Nevada jointfir (*Ephedra nevadensis*), and "dead shrub" accounting for about 10% each (Charis 2002). Host-specific selection was apparent because some relatively frequent shrubs had extremely low frequencies as hosts, including creosote bush, littleleaf rhatany (*Krameria erecta*), Johnson's indigo bush (*Psorothamnus arborescens* var. *minutifolius*), desert peppergrass (*Lepidium fremontii*), and peach thorn (*Lycium cooperi*).

Regulatory Status

Lane Mountain milk-vetch (*Astragalus jaegerianus*) is federally listed as endangered but is not state listed. The final rule for critical habitat for Lane Mountain milk-vetch was published May 19, 2011 (76 FR 29108–29129). Lane Mountain milk-vetch has a CRPR of 1B.1. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .1 are "seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat" (CNPS 2011). The Lane Mountain milk-vetch has a California Heritage Element Ranking of S1.1, indicating that it is "critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province" (CDFW 2012b).

Threats

The main anthropogenic threats to Lane Mountain milk-vetch are surface mining, OHV recreation, and military training activities (USFWS 2008c). The Coolgardie Mesa area has high mineral potential, with several small recreational mining operations that may have cumulative effects (USFWS 2008c). Unauthorized OHV use increased in one portion of the Coolgardie Mesa site in the 2000s, creating a barren area of approximately 20 acres where the species formerly occurred (USFWS 2008c). In the critical habitat rule, the USFWS also acknowledged the potential effects of climate change on Lane Mountain milk-vetch, but there is no information specific to this species indicating what areas may become important in the future in response to climate change (76 FR 29108–29129). The USFWS (2008c) also identifies two other threats to Lane Mountain milk-vetch: wildfires and nonnative species.

Latimer's woodland-gilia (*Saltugilia latimeri*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Latimer's woodland-gilia is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Inyo, Kern, Riverside, and San Bernardino (SBD) counties (CNPS 2017). This species generally blooms March through June (CNPS 2017). This species occurs in rocky or

sandy, often granitic, soils associated with the following habitat types: chaparral, Mojavean desert scrub, and pinyon and juniper woodland (CNPS 2017). This species ranges in elevation from 400 to 1900 meters (CNPS 2017). This species is known from San Bernardino and Riverside counties with outlier populations in Kern and Inyo counties. There is a disjunct population in Inyo County, some 120 miles from the other known occurrences (NatureServe 2017). As of 2005, there were 16 occurrences known for this species (NatureServe 2017).

Regulatory Status

The Latimer's woodland-gilia is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The Latimer's woodland-gilia has a California Heritage Element Ranking of S3, indicating that it is “vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation” (CDFW 2012b).

Threats

The Latimer's woodland-gilia is possibly threatened by recreation. (CNPS 2017).

Little San Bernardino Mountains Linanthus (*Linanthus maculatus*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.10, pp. 3-190) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Little San Bernardino Mountains linanthus is an annual herb in the phlox (*Polemoniaceae*) family. It is a diminutive, densely hairy, alternate-leaved annual species approximately 1 to 3 centimeters (0.4 to 1.2 inches) in height (Jepson Flora Project 2011; Patterson 1989). It reproduces via seed, but otherwise its ecology has not been well studied. As such, little is known about the plant's pollinator relationships, seed viability, or seed germination (Patterson 1989; Sanders 2006; CVAG 2006). The flower is white with a vermilion spot on each spreading lobe on most individuals, suggesting that the species is almost certainly insect-pollinated (Munz 1974; Sanders 2006). The flowering time for this species is March through May (CNPS 2011). A review of the collections shows that approximately one-third of the specimens were collected in March, two-thirds in April, and only a few in February and May (CCH 2011).

Little San Bernardino Mountains linanthus grows on loose, well-aerated, open sandy benches and flats on the margins of desert washes (Sanders 2006; Jepson Flora Project 2011). This plant is always found in open areas that receive no shade from nearby shrubs and is associated with other small annual species, such as sigmoid threadplant (*Nemacladus sigmoideus*), blushing threadplant (*N. rubescens*), evening primrose (*Camissonia pallida*), common loeflingia (*Loeflingia squarrosa*), Arizona nest straw (*Filago arizonica*), and Wallace's woolly sunflower (*Eriophyllum wallacei*) (Sanders 2006).

Regulatory Status

Little San Bernardino Mountains linanthus (*Linanthus maculatus*) is not federally or state listed and has no other federal designations (e.g., BLM or USFS sensitive). Little San Bernardino Mountains linanthus has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California, with 20% to 80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Little San Bernardino Mountains linanthus has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

Little San Bernardino Mountains linanthus is potentially threatened by habitat disturbance and destruction due to urban expansion, OHV use, flood control activities, illegal dumping, and an increase in invasive non-native species (CNPS 2011). The largest populations are adjacent to communities, such as Yucca Valley, Joshua Tree, and Desert Hot Springs, that have grown substantially in the last two decades. Additional development pressures associated with the expansion of these communities could impact core populations (Sanders 2006).

Flood control maintenance activities pose a specific threat to the species as these activities change the hydrological regime and sediment-carrying capacity of flows within wash systems. In particular, flood control activities pose a substantial threat to populations of Little San Bernardino Mountains linanthus in the Whitewater Canyon, Mission Creek, and Dry Morongo Canyon Wash areas (CVAG 2006).

OHV use is a threat to Little San Bernardino Mountains linanthus because the species grows only in desert wash areas, which are favored by OHV users because they are so sparsely vegetated (Sanders 2006).

Mojave Monkeyflower (*Mimulus mohavensis*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.11, pp. 3-190 and 3-191) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Most members of the lopseed family are insect pollinated (Beardsley and Olmstead 2002); and given the showy flowers, Mojave monkeyflower pollinators are probably Hymenoptera (bees, wasps, ants, and sawflies) or Lepidoptera (butterflies and moths). MacKay (2006) hypothesized that the white margin of the corolla reflects ultraviolet light, and the maroon veins extending into this margin act as nectar guides to facilitate pollination.

Small seeds and an annual habit suggest that dispersal of Mojave monkey flower is mostly abiotic (MacKay 2006; NatureServe 2011). For populations located on rocky slopes above washes, it is probable that gravity carries seeds down into the washes and intermittent water flow may carry

seeds further down washes. Although biotic vectors of seed transport are unknown, granivorous ants or rodents may transport seeds over short distances and birds may transport seeds longer distances (MacKay 2006).

Although suitable habitat for this species appears to be fairly abundant, it is quite restricted geographically. Population sizes fluctuate substantially from year to year, probably in response to the amount and timing of precipitation; as an annual, germination and establishment are dependent on the timing and amount of spring rains (MacKay 2006; NatureServe 2011). Unknown unusual germination and establishment requirements may account for the considerable variability in population sizes from year to year (MacKay 2006).

This species occurs in Joshua tree woodland and Mojavean desert scrub, specifically creosote bush scrub (MacKay 2006; CNPS 2011). Mojave monkeyflower is associated with the following species or genera, among others: creosote bush, desert senna (*Senna armata*), white burrobrush, ratany (*Krameria erecta* and *K. grayi*), chollas (*Cylindropuntia* spp.), white bursage, prairie-clovers (*Dalea* spp.), catclaw, Bigelow's monkeyflower (*Mimulus bigelovii*), desert bells (*Phacelia campanularia*), desert fivespot (*Eremalche rotundifolia*), spiny hopsage (*Grayia spinosa*), and desert trumpet (*Eriogonum inflatum* var. *inflatum*) (MacKay 2006; CDFW 2012b).

Mojave monkeyflower commonly occurs in areas that are not subject to regular water flow (MacKay 2006). These areas include the gravelly banks of desert washes with granitic soils and rocky slopes above washes, as well as the sandy openings of creosote bush scrub (MacKay 2006).

Regulatory Status

Mojave monkeyflower is not federally or state listed, but is a BLM sensitive species. Mojave monkeyflower has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly endangered in California, with 20%–80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Mojave monkeyflower has a California Heritage Element Ranking of S2, indicating that it is considered imperiled in California (CDFW 2012b).

Threats

Threats to Mojave monkeyflower include development, mining, non-native plants, solar and wind energy projects, grazing, vehicles, and road development (CNPS 2011; NatureServe 2011; MacKay 2006). Additional potential threats include pipeline installation and quarries and test pits adjacent to populations (MacKay 2006). Mojave monkeyflower is also under threat by the potential for the BLM to convert land occupied by this species to private lands, which could then be developed (MacKay 2006; CDFW 2012b). The area under consideration for disposal or land exchange is located between Barstow and Victorville (CDFW 2012b).

Because population sizes fluctuate considerably annually in response to environmental conditions, Mojave monkeyflower is susceptible to depletion of the seed bank after a series of drought years. In addition, small population sizes increase the risk of inbreeding, which may result in reduced seed set or reduced seed viability (MacKay 2006).

Mojave Tarplant (*Deinandra mohavensis*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.12, pp. 3-191) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Mojave tarplant is in the sunflower family (Asteraceae) (Jepson Flora Project 2011). The plant was thought to be extinct at one time but was rediscovered in 1994 by A. Sanders in the San Jacinto Mountains, in Riverside County (Sanders and others 1997). Mojave tarplant is an annual plant approximately 1 to 10 decimeters (3.9 to 39 inches) in height. Mojave tarplant and the closely related Red Rock tarplant (*Deinandra arida*) are the only two self-compatible species in the genus *Deinandra* (Tanowitz 1982; Baldwin pers. comm. 1997, cited in Sanders 2006b). This may be the result of genetic drift and/or the relative isolation of these two species, which occur on the edge of the desert as local populations (Sanders 2006b). Pollination studies have not been conducted for this Mojave tarplant; however, Faull (1987) has observed small beetles and honey bees visiting Red Rock tarplant flowers.

Mojave tarplant is known to reproduce easily in cultivation (B. Baldwin, pers. comm. 1998, cited in Sanders 2006a) and at a botanical garden has been known to escape into disturbed places (S. Boyd, pers. comm. 1998, cited in Sanders 2006a).

Mojave tarplant blooms from June through January (CNPS 2011). Flowering peaks between August and October. Once flowering has begun, it continues until the plants begin to senesce. Fruit maturity and dispersal are continuous as well. Seed dispersal vectors have not been reported for this species; however, the seeds are relatively heavy and may just fall to the ground around the source plant. The seeds are not armed with any obvious mechanisms, such as hooks or wings, for long-distance dispersal (Sanders 2006a). Baldwin (pers. comm., cited in Sanders 2006b) reports that *Hemizonia* (now *Deinandra*) ray achenes maintain some degree of dormancy while the disk achenes freely germinate.

Mojave tarplant is associated with seasonally saturated clay or silty soils on gentle slopes or low gradient streams, with few shrubs and trees. These saturated areas are typically dry at the surface but provide a substantial water source at depth through summer (Sanders and others 1997). This species has a discontinuous and possibly relictual distribution (Sanders 2006a), and little is known of its life history and ecological relationships.

The Mojave tarplant occurs in open moist sites in arid regions near the margins of the desert, within chaparral, coastal scrub, and riparian scrub (CNPS 2011; Sanders 2006a). Plants are typically observed at seeps and along grassy swales and intermittent creeks. The most suitable habitat occurs in mountainous areas within microhabitats of low gradient streams and on gentle slopes with few shrubs and trees. This species is associated with clay or silty soils that are saturated with water early in the year. Mojave tarplant prefers areas that are dry at the surface but which have a substantial water source at depth through summer. Dwarfed plants occasionally are found in drier sites near occupied moist areas (Sanders and others 1997). This cycle of early saturation with later desiccation may reduce competition from other plant species; dryness during drought years may further reduce competition (Sanders 2006a).

At the type locality, Mojave tarplant was known to occur along a sandy intermittent creek; however, this habitat is now believed to be atypical and not sufficient to maintain a permanent population. Sanders and others (1997) does note that there are some occurrences of Mojave tarplant associated with sand, where the sand is adjacent to more typical habitat.

Regulatory Status

Mojave tarplant (*Deinandra mohavensis*) is not federally listed, but is California endangered and a BLM sensitive species. Mojave tarplant has a CRPR of 1B.3. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California, with less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). Mojave tarplant has a California Heritage Element Ranking of S2, indicating that it is considered imperiled in California (CDFW 2012b).

Threats

Mojave tarplant is threatened by grazing, recreational activities, development, hydrological alterations, road maintenance, and vehicles (CNPS 2011). The type locality was modified by construction of the Mojave River Forks Dam. Within the planning area cattle grazing occurs at some of the Mojave tarplant occupied areas, and in some areas is locally intense and may pose a threat. However, plants of the genus *Deinandra* may not be palatable to cattle, so grazing may not be a major threat. Trampling by cattle may be a threat around limited watering sources in dry areas (Sanders 2006a).

Muir's tarplant (*Carlquistia muirii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Muir's tarplant is a perennial rhizomatous herb which is endemic (limited) to California (CalFlora 2017). It occurs within Fresno, Kern, Monterey, and Tulare counties (CNPS 2017). This species generally blooms July through August but may also bloom in October (CNPS 2017). This species occurs in granitic soils associated with the following habitat types: chaparral (montane), lower montane coniferous forest, and upper montane coniferous forest (CNPS 2017). This species ranges in elevation from 755 to 2500 meters (CNPS 2017). Known from fourteen occurrences in California which comprise of approximately 1,600 individuals (NatureServe 2017).

Regulatory Status

The Muir's tarplant is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.3 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat

or no current threats known” (CNPS 2011). The Muir's tarplant has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The Muir's tarplant is potentially threatened by recreational activities. (CNPS 2017). Some populations are threatened by road maintenance and timber harvesting (NatureServe 2017).

Nine Mile Canyon Phacelia (*Phacelia novemmillensis*)

Life History

Nine Mile Canyon phacelia is an annual herb in the borage or waterleaf family (Boraginaceae) that is endemic to California. Nine Mile Canyon phacelia is typically 5 to 10 centimeters (2.0 to 3.9 inches) tall (Jepson Flora Project 2013). Flowering period is from May to June (Calflora 2013) or February to June (CNPS 2013).

Nine Mile Canyon phacelia is found in open foothills. Substrates are sandy to gravelly (Jepson Flora Project 2013). This species is found in broad-leaved upland forest, Cismontane woodland, pinyon and juniper woodland, and upper montane coniferous forest vegetation communities (CNPS 2013). Elevation range reported as 5,397 to 8,661 feet amsl (CNPS 2013).

Regulatory Status

Nine Mile Canyon phacelia is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Nine Mile Canyon phacelia has a CRPR of 1B.2 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly endangered in California, with 20%–80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Nine Mile Canyon phacelia has a California Heritage Element Ranking of S2.2, indicating that it is considered imperiled in California (CDFW 2012b).

Threats

Nine Mile Canyon phacelia is threatened by grazing and recreation (CNPS 2013).

Owens Peak Lomatium (*Lomatium shevockii*)

Life History

Owens Peak lomatium is a perennial herb in the carrot family (Apiaceae) that is endemic to California. Owens Peak lomatium is typically 4 to 12 centimeters (1.6 to 4.7 inches) tall with an elongated taproot (Jepson Flora Project 2013). Flowering period is from April to May (Calflora 2013).

Owens Peak lomatium is found on rocky slopes and talus. Substrates are rocky (Jepson Flora Project 2013). This species is found in lower montane coniferous forest and upper montane

coniferous forest vegetation communities (CNPS 2013). Elevation range is 5,807 to 7,218 feet amsl (CNPS 2013) or 7,218 to 8,202 feet amsl (Jepson Flora Project 2013).

Regulatory Status

Owens Peak lomatium is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Owens Peak lomatium has a CRPR of 1B.3 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California, with less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). Owens Peak lomatium has a California Heritage Element Ranking of S2, indicating that it is considered imperiled in California (CDFW 2012b).

Threats

Threats to Owens Peak lomatium are not described (CNPS 2013).

Owens Valley checkerbloom (*Sidalcea covillei*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Owens Valley checkerbloom is a perennial herb which is endemic (limited) to California (CalFlora 2017). It occurs within Inyo County (CNPS 2017). This species generally blooms April through June (CNPS 2017). This species occurs in alkaline, mesic soils associated with the following habitat types: chenopod scrub, and meadows and seeps (CNPS 2017). This species ranges in elevation from 1095 to 1415 meters (CNPS 2017). Several large populations of over 100,000 individuals exist and over 2 million plants were reported in 2004 (NatureServe 2017).

Regulatory Status

The Owens Valley checkerbloom is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.1 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The Owens Valley checkerbloom has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The Owens Valley checkerbloom is possibly threatened by ground water pumping, ground and surface water diversions, and long-term drought (NatureServe 2017). Other possible threats identified include non-native plants, grazing, and meadow succession (CalFlora 2017).

Pale-yellow layia (*Layia heterotricha*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The pale-yellow layia is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Kern County (CNPS 2017). This species generally blooms from March through June (CNPS 2017). This species occurs in alkaline or clay areas associated with the following habitat types: cismontane woodland, coastal scrub, pinyon and juniper woodland, and valley and foothill grassland (CNPS 2017). This species ranges in elevation from 300 to 1705 meters (CNPS 2017). There are 30 recently verified populations of this species identified throughout its range with several thousand individuals in total (NatureServe 2017).

Regulatory Status

The pale-yellow layia is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.1 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The pale-yellow layia has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The pale-yellow layia is threatened by agricultural conversion and previous construction of San Antonio Reservoir, grazing, non-native plants, and vehicles. It is also potentially threatened by road maintenance and wind energy development (CNPS 2017).

Palmer's mariposa-lily (*Calochortus palmeri* var. *palmeri*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Palmer's mariposa-lily is a perennial bulbiferous herb which is endemic (limited) to California (CalFlora 2017). It occurs within Kern, Los Angeles, Riverside, Santa Barbara, San Bernardino, San Luis Obispo, and Ventura counties (CNPS 2017). This species generally blooms from April through July (CNPS 2017). This species often occurs in mesic areas associated with the following habitat types: chaparral, lower montane coniferous forest, and meadows and seeps

(CNPS 2017). This species ranges in elevation from 710 to 2390 meters (CNPS 2017). Known from seven counties and may be declining but field surveys are needed to confirm this determination (NatureServe 2017).

Regulatory Status

The Palmer's mariposa-lily is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Palmer's mariposa-lily has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

The Palmer's mariposa-lily occurs in wet meadows which are threatened by grazing, recreational activities, non-native species, and many other site specific threats (NatureServe 2017).

Parish's Daisy (*Erigeron parishii*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.3, pp. 3-186) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Parish's daisy is in the Asteraceae family (IPNI 2011). It is an herbaceous, long-lived perennial subshrub approximately 7 to 30 centimeters (3 to 12 inches) in height from its taproot (Mistretta and White 2001; Sanders 2006). It flowers from May through August (CNPS 2011), peaking mid-May to mid-June (Sanders 2006). Based on the conspicuous flowers, pollinators are probably insects and likely include bees, butterflies, and other known pollinators of similar and related species (Sanders 2006). Parish's daisy produces plumed achenes adapted for wind dispersal (Mistretta and White 2001) and does not appear to have a seed dormancy mechanism (Mistretta 1994). Based on observations of seedlings at several sites (Krantz 1979), reproduction is probably primarily by seed rather than vegetatively by rhizomes or stolons. A recent study by Neel and Ellstrand (2001) found no evidence of vegetative reproduction, concluding that the species probably primarily reproduces sexually through outcrossing.

Recent research on allozyme diversity showed that genetic diversity was high (compared to many narrowly endemic plant taxa) and populations were only moderately differentiated, suggesting that gene flow among populations is still high and any recent fragmentation has not yet affected genetic diversity (Neel and Ellstrand 2001).

Parish's daisy occurs in Mojavean desert scrub and pinyon and juniper woodlands (CNPS 2011) and is largely restricted to loose, carbonate alluvium, although it is occasionally found on other rock types (Sanders 2006). Populations of Parish's daisy are most commonly found along washes

on canyon bottoms or on loose alluvial deposits on adjacent benches, but they are also occasionally found on steep rocky slopes (Sanders 2006). Based on this species' occurrence on noncarbonate granitic soils, it is possible that the apparent carbonate preference is due to reduced competition from other plants, although reports of this species on noncarbonate soils are few (Sanders 2006). It has also been observed at sites where soils have been found to be strongly alkaline, implying that the noncarbonated granitic soils may have been influenced in their soil chemistry by adjacent carbonate slopes (Sanders 2006).

Specific plant species associated with Parish's daisy have not been described in the literature, but dominant species within pinyon and juniper woodland where Parish's daisy is typically found include single-leaf pinyon pine, Utah juniper, and more rarely California juniper and western juniper. Understory species within pinyon and juniper woodland are more variable, but may include mountain-mahogany (*Cercocarpus ledifolius*), Mormon tea (*Ephedra viridis*), Mojave yucca, Joshua tree, and brittlebush.

Parish's daisy co-occurs with another carbonate endemic, Cushenbury oxtheca (*Acanthoscyphus parishii* var. *goodmaniana*). Its presence, however, appears to be negatively related to at least two other carbonate soils species - Cushenbury milk-vetch (*Astragalus albens*), and Cushenbury buckwheat (*Eriogonum ovalifolium* var. *vineum*), which tend to occur on more stable slopes.

Regulatory Status

Parish's daisy is federally listed as threatened, but is not state listed. Critical habitat was designated on December 12, 2002 (67 FR 78570–78610). A recovery plan addresses this species, *San Bernardino Mountains Carbonate Plants Draft Recovery Plan* (USFWS 1997b). As of 2010, no status changes for Parish's daisy were indicated by USFWS (75 FR 28636–28642). Parish's daisy has a CRPR of 1B.1. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .1 are "seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat" (CNPS 2011). The Parish's daisy has a California Heritage Element Ranking of S2S3, indicating that it is somewhere between "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" and "vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation" (CDFW 2012b).

Threats

The main threat to Parish's daisy is limestone mining because this species is mostly restricted to carbonate deposits (USFWS 2009g). Besides direct impacts, dust and artificial lighting can affect the species through dust impacts on soil chemistry and lighting availability for seeds and the impacts of artificial lighting on growing conditions (USFWS 2009g). Sanders (2006) notes that that after moistening, the mining dust appears to harden into a cement-like coating. Additional threats listed by USFWS and CNPS include energy development projects, OHVs, grazing, fuel-wood collection, fire suppression activities, camping, target shooting, road construction, and residential developments, but these threats are relatively low compared to mining (USFWS 2009g; CNPS 2011).

The specific potential effects of climate change on Parish's daisy are unknown, but if climate change caused a shift to higher elevations due to warmer and drier conditions, as has occurred with other plant species on the Santa Rosa Mountains of Southern California (Kelley and Goulden 2008), this endemic species could be concentrated in a smaller area and more vulnerable to extinction (USFWS 2009g).

Parish's Phacelia (*Phacelia parishii*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.14, pp. 3-192) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Parish's phacelia is a low-growing, annual herb in the borage or waterleaf family (Boraginaceae) ranging in height from 5 to 15 centimeters (0.2 to 0.5 inch) (Jepson Flora Project 2011). The comparatively simple, toothed to shallowly lobed leaves, and the unequal sepal size in fruit distinguish Parish's phacelia from many other phacelias; other species within its range that also have unequal sepals and have much showier flowers. The flowering season for Parish's phacelia is reported as April to July (CNPS 2011; Jepson Flora Project 2011), but all of the California collections have been made between April and May (White 2006b). The Mojave Desert flowering period is earlier than that of the Great Basin, and Smith (1997) reported that the California populations were fruiting by late April; the later dates have generally been for collections made in White Pine County, Nevada, at much higher elevation and latitude than the California occurrences.

Not much is known about the reproductive biology of the species, but it likely depends on wind and rain for seed dispersal. Given its restriction in California to seasonally wet alkaline flats, and its many small seeds, its seed dispersal range is probably quite short, but seeds may occasionally be ingested by shorebirds or picked up with mud on their feet and carried long distances (White 2006b).

Although some precipitation data are known for the Nevada populations of Parish's phacelia (Smith 1997), there is little information on the ecology of the species in California. In Nevada at one of the Pahrump Valley sites, bees are thought to contribute to pollination, and at another Nevada site (Indian Springs Valley), moths are believed to be at least partially involved with pollination (Smith 1997).

Typical habitat for Parish's phacelia includes clay and alkaline soils, and dry lake margins at elevations of 1,772 to 3,937 feet. In California, the species has been documented in central San Bernardino County on playas and valley floors that are relatively unvegetated and have few associated species. Habitats are creosote bush scrub and alkali sinks. According to White (2006b), all the known occurrences of Parish's phacelia in California occur on sparsely vegetated alkaline flats, generally in dry, cracked mud flats of seasonal pools, and growth is apparently controlled by water level as plants may appear within different levels of the pools, depending on the hydrologic conditions and the timing of rainfall. Smith (1997) reports that the species tends to occupy flat, open expanses, but may also occur on gentle slopes.

Regulatory Status

Parish's phacelia (*Phacelia parishii*) is not federally or state listed. This species was previously classified as a Category 2 Candidate for Listing under the federal ESA as amended in 1988 (58 FR 51144–51190). Parish's phacelia has a CRPR of 1B.1. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). Parish's phacelia has a California Heritage Element Ranking of S1.1, indicating that it is "critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province" (CDFW 2012b).

Threats

The known California populations of Parish's phacelia are confined to a relatively small area, which makes the species vulnerable to extinction. With the exception of the Stewart Valley site, all occurrences of the species are within the vicinity of the Fort Irwin Military Base and could be extirpated if the populations are disturbed by military exercises, or by the expansion of the current military facilities in the area (White 2006b).

Populations that occur southeast of Coyote Lake in the Fort Irwin area are threatened by tank use and other off-road vehicles (CDFW 2012b). White (2006b) notes that other reports have indicated that access road construction and the establishment of power line corridors could disrupt the local hydrology, and that these potential activities threaten current populations. The BLM's special-status plant management program also lists overgrazing by cattle and horses as a threat to populations in the Barstow area (BLM 2005).

Red Rock Poppy (*Eschscholzia minutiflora* ssp. *twisselmannii*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.16, pp. 3-193) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Red Rock poppy is a small annual herb in the poppy family (*Papaveraceae*) that stands approximately 2 to 14 inches tall (BLM 2010b; Jepson Flora Project 2011). It blooms from March to May (CNPS 2011). Red Rock poppy has a relatively large colorful flower, so it is most likely probably insect pollinated. Potential pollinators of Red Rock poppy that have been recorded on Edwards Air Force Base include solitary bees (*Dufourea desertorum*, *D. malacothricis*, *D. vernalis*), a hersperapis bee (*Hesperapis parva*), and miner bees (*Perdita carinata*, *P. inflexa*, *P. mortuaria*, *P. mucronata*, *P. robustula*) (Buchman and others 2010).

Information on the natural history of Red Rock poppy, such as seed germination, and seed dispersal has not been reported. However, it is a desert annual that reproduces by seed. In addition, the soil seed bank is probably important for the long-term survival of populations, as it is for many other desert annuals.

Red Rock poppy is associated with bajadas and alluvial fans, flats, washes, and slopes in Mojavean desert scrub communities on volcanic tuff (CNPS 2011; CDFW 2012b). It has a very limited

geographic distribution, and little is known of its life history and ecological relationships. As an annual species the population numbers vary widely from year to year in response to annual rainfall. Plants may not appear at all in low rainfall years (CDFW 2012b).

Red Rock poppy occurs on volcanic tuff in Mojavean desert scrub on desert washes, flats, and slopes (CNPS 2011; CDFW 2012b). It has been recorded on bajadas and alluvial fans, flats, washes, and slopes (CDFW 2012b). The subspecies may be specific to rhyolite tuffs and granitic derived soils (Clark and Faull 1991), but these are common in the area where Red Rock poppy occurs (Sanders and Pitzer 2006). Red Rock poppy has also been reported on sedimentary mounds, limestone, metamorphic rocks, and rocky basalt (CDFW 2012b). Aspects are generally west, southwest, or south (CDFW 2012b). Associated species include a variety of common Mojave desert scrub shrubs and herbs (CDFW 2012b). The subspecies ranges in elevation from 680 to 1,230 meters (2,231 to 4,035 feet) according to CNPS (2011), but one occurrence is at 4,040 feet (CDFW 2012b).

Regulatory Status

Red Rock poppy is not federally or state listed, but is a BLM sensitive species. Red Rock poppy has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly endangered in California, with 20%–80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Red Rock poppy has a California Heritage Element Ranking of S2.2, indicating that it is considered imperiled in California (CDFW 2012b).

Threats

Red Rock poppy is primarily threatened by OHV activity (CNPS 2011; CDFW 2012b). In Red Rock Canyon State Park, habitat for Red Rock poppy occurs along the main routes of travel (Sampson 2007). OHVs disrupt the surface soil and compact the surface soil and subsoil, leading to soil loss. The most significant long term effect is the accelerated erosion and associated inability of areas subject to heavy OHV use to support natural revegetation. OHV use also directly damages and destroys plants. Plant rehabilitation efforts are often marginally successful or unsuccessful (as cited in Sampson 2007).

Red Rock Canyon monkeyflower (*Erythranthe rhodopetra*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Red Rock Canyon monkeyflower is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Kern County (CNPS 2017). This species generally blooms from March through April (CNPS 2017). This species occurs in sandy areas and canyon washes associated with the following habitat types: Mojavean desert scrub (CNPS 2017). This species ranges in elevation from 610 to 915 meters (CNPS 2017).

Regulatory Status

The Red Rock Canyon monkeyflower is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.1 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). The Red Rock Canyon monkeyflower has a California Heritage Element Ranking of S1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province”(CDFW 2012b).

Threats

The Red Rock Canyon monkeyflower is possibly threatened by mining, vehicles, recreational activities, foot traffic, and non-native plants (CNPS 2017).

Red Rock Tarplant (*Deinandra arida*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.17, pp. 3-193) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

Red Rock tarplant is an annual herb in the sunflower family (Asteraceae) that stands approximately 2 to 8 decimeters (7.9 to 32 inches) in height. Red Rock tarplant blooms from April through November (CNPS 2011). Pollination studies have not been conducted for this species; however, Faull (1987) has observed small beetles and honey bees visiting Red Rock tarplant flowers.

Red Rock tarplant does not appear to reproduce vegetatively, but rather by seeds.

However, seed germination and seedling establishment has not been reported for this species. Baldwin reports that *Hemizonia* (now *Deinandra*) ray achenes maintain some degree of dormancy while the disk achenes freely germinate (Sanders 2006). Red Rock tarplant consistently produces fertile ray achenes (but few to zero fertile disk achenes). Sanders (2006) suggests that the ray achenes could contribute to the persistence of a Red Rock tarplant seed bank through difficult climatic cycles vegetatively.

Red Rock tarplant and Mojave tarplant (*Deinandra mohavensis*) are the only two self-compatible species of *Hemizonia* (now *Deinandra*) (Tanowitz 1982; Sanders 2006). This may be the result of genetic drift and/or the relative isolation of these two species, which occur on the edge of the desert as local populations (Sanders 2006).

Red Rock tarplant grows in Mojavean desert scrub communities on clay soils and volcanic tuff (CNPS 2011). In general, this species is associated with seeps and seasonally moist substrates along ephemeral streams (sandy and gravelly washes), low ridges, and road shoulders (CDFW 2012b). Faull (1987) found that Red Rock tarplant habitat consists of the following:

1. Sandy to gravelly ephemeral alluvial washes, sometimes exhibiting surface platey structure;
2. Moist alkaline fringes of seeps and springs along alluvial flats and washes;
3. Relatively shallow, dry, sandy alluvial and colluvial slopes at the base of ridges and cliffs and associated erosional ravines; and
4. Ledges of dry colluvium suspended on steep cliff slopes up to 160 feet above the valley floor by ribs of resistant bedrock.

Preferred habitat appears to be adjacent to seeps and along washes (Sanders 2006). From a geologic substrate perspective, Red Rock tarplant appears to prefer erosional remnants of the Ricardo Group, but also occurs on Quaternary alluvium (Faull 1987). Associated species in moister locations include the seep-spring monkeyflower (*Mimulus guttatus*) and Palmer's monkeyflower (*Mimulus palmeri*) (Faull 1987).

Regulatory Status

Red Rock tarplant is not federally or state listed, but is a BLM sensitive species. Red Rock tarplant was previously a candidate for federal listing (58 FR 64828–64845), but was removed from candidacy on February 28, 1996, in a notice of review (61 FR 7597–7613). Red Rock tarplant has a CRPR of 1B.2. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly endangered in California, with 20%–80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Red Rock tarplant has a California Heritage Element Ranking of S1.2, indicating that it is considered critically imperiled in California (CDFW 2012b).

Threats

The primary threat appears to be OHV use and colonization by invasive non-natives such as shrub tamarisk (*Tamarisk ramosissima*) (Faull 1987). Red Rock tarplant are vulnerable to anthropogenic disturbances such as OHV use (Faull 1987). Camping and vehicle parking at Red Cliffs in Red Rock Canyon may also be threats. Measures to control these threats have been implemented by the DPR in the past (Faull 1987), but current management is uncertain. Faull (1987) observed that Red Rock tarplant experiences herbivory by rabbits (and possibly ground squirrels): the main stems and branches of up to 75% of plants at one location were observed to have been removed by herbivores.

Robbins' nemacladus (*Nemacladus secundiflorus* var. *robbinsii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Robbins' nemacladus is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Los Angeles, Santa Barbara, San Benito, San Luis Obispo, and Ventura

counties (CNPS 2017). This species generally blooms April through June (CNPS 2017). This species occurs in openings associated with the following habitat types: chaparral and valley and foothill grassland (CNPS 2017). This species ranges in elevation from 350 to 1700 meters (CNPS 2017). This species is found in the South Coast Ranges with one population found in the Green Mountains in Tulare County (Nature Serve 2017).

Regulatory Status

The Robbins' nemacladus is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Robbins' nemacladus has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

The Robbins' nemacladus is possibly threatened by road maintenance and widening (CNPS 2017).

Robison's Monardella (*Monardella robisonii*)

Life History

Robinson's monardella is a perennial subshrub or shrub in the mint family (*Lamiaceae*) that is endemic to California. Robinson's monardella is typically 15 to 50 centimeters (5.9 to 19.7 inches) tall and it has an erect, multi-branched habit (Jepson Flora Project 2013). Flowering period is from April to September (Calflora 2013) or February to October (CNPS 2013).

Robinson's monardella is found among granite boulders (Jepson Flora Project 2013). This species is found in desert scrub (Jepson 2013) and pinyon and juniper woodland vegetation communities (CNPS 2013). Elevation range is 2,001 to 4,921 feet amsl (CNPS 2013).

Regulatory Status

Robinson's monardella is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Robinson's monardella has a CRPR of 1B.3 (CNPS 2013). CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .3 are "not very threatened in California, with less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known" (CNPS 2011). Robinson's monardella has a California Heritage Element Ranking of S3, indicating that it is "vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation" (CDFW 2012b).

Threats

Robinson's monardella threats are not described (CNPS 2013).

Rose-flowered larkspur (*Delphinium purpusii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Rose-flowered larkspur is a perennial herb which is endemic (limited) to California (CalFlora 2017). It occurs within Kern and Tulare counties (CNPS 2017). This species generally blooms from April through May, which some blooming taking place as early as March (CNPS 2017). This species occurs in rocky, often carbonate soils, associated with the following habitat types: chaparral, cismontane woodland, and pinyon and juniper woodland (CNPS 2017). This species ranges in elevation from 300 to 1340 meters (CNPS 2017). The California Native Plant Society indicates that this species is found in a limited number of occurrences and that precise location and endangerment information is needed (NatureServe 2017).

Regulatory Status

The Rose-flowered larkspur is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Rose-flowered larkspur has a California Heritage Element Ranking of S3, indicating that it is "vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation" (CDFW 2012b).

Threats

Specific threats have not been identified for this species, but they are likely similar to other plant species listed here.

San Bernardino aster (*Symphyotrichum defoliatum*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The San Bernardino aster is a perennial rhizomatous herb which is endemic (limited) to California (CalFlora 2017). It occurs within Imperial, Kern, Los Angeles, Orange, Riverside, San

Bernardino, San Diego, and San Luis Obispo counties (CNPS 2017). This species generally blooms July through November (CNPS 2017). This species occurs near ditches, streams, springs associated with the following habitat types: cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and valley and foothill grassland (vernally mesic) (CNPS 2017). While this species usually occurs in meadows, springs, and streams, it also occurs in upland habitat (NatureServe 2017). This species ranges in elevation from 2 to 2040 meters (CNPS 2017). This species has been seldom reported in recent years (NatureServe 2017).

Regulatory Status

The San Bernardino aster is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The San Bernardino aster has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The San Bernardino aster is possibly threatened by non-native plants (CalFlora 2017) and development of private lands (NatureServe 2017).

San Bernardino milk-vetch (*Astragalus bernardinus*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The San Bernardino milk-vetch is a perennial herb which is endemic (limited) to California (CalFlora 2017). It occurs within Riverside and San Bernardino counties (CNPS 2017). This species generally blooms from April through June (CNPS 2017). This species often occurs in granitic or carbonate areas associated with the following habitat types: Joshua tree woodland and pinyon and juniper woodland (CNPS 2017). This species ranges in elevation from 900 to 2000 meters (CNPS 2017). Known from forty-two occurrences in California (NatureServe 2017).

Regulatory Status

The San Bernardino milk-vetch is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The San Bernardino milk-vetch has a California Heritage

Element Ranking of S3, indicating that it is “vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation” (CDFW 2012b).

Threats

The San Bernardino milk-vetch is threatened by mining, grazing, development, and recreation (CNPS 2017).

Sanicle *Cymopterus* (*Cymopterus ripleyi* var. *saniculoides*)

Life History

Sanicle cymopterus is a small perennial herb in the carrot family (Apiaceae) that is known from California and Nevada. Sanicle cymopterus is typically 10 to 15 centimeters (3.9 to 5.9 inches) tall, sprouting from a buried root crown (Jepson Flora Project 2013). Flowering period is from April to June (Calflora 2013).

Sanicle cymopterus is found on gravelly, sandy, or carbonate substrates (Jepson Flora Project 2013). This species is found in Joshua tree woodland and Mojavean desert scrub vegetation communities (CNPS 2013). Elevation range is 3,609 to 5,446 feet amsl (CNPS 2013).

Regulatory Status

Sanicle cymopterus is not a federal or state listed species (CNPS 2013), but is a BLM sensitive species. Sanicle cymopterus has a CRPR of 1B.2 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly endangered in California, with 20%–80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Sanicle cymopterus has a California Heritage Element Ranking of S1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

Sanicle cymopterus is threatened by cattle grazing on BLM land at Lee Flat, as well as by vehicles and mining (CNPS 2013).

Short-joint Beavertail (*Opuntia basilaris* var. *brachyclada*)

Background information for the short-joint beavertail would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005). For a general discussion of this species, please refer to Section 3.3.8.20, pgs. 3-194 and 3-195. The supplemental information presented below is based on the species account from the California Native Plant Society (CNPS 2014) and recent BLM data.

Life History

Short-joint beavertail cactus is mostly associated with Joshua tree, pinyon pine, and juniper woodlands, although it also occurs in chaparral and Mojave desert scrub communities. It has been reported from a wide variety of well-drained soils, from sandy to rocky, in open streambeds and on rocky slopes. Flowering period is from April to August (CNPS 2014). It occurs between elevations of 3000 – 6500 feet.

Regulatory Status

The short-joint beavertail is not federally or state listed, but is a BLM sensitive species and has a CRPR of 1B.2 (CNPS 2013). CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly endangered in California, with 20%–80% of occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). Short-joint beavertail has a California Heritage Element Ranking of S3, indicating that it is “vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation” (CDFW 2012b).

Threats

This species is threatened by urbanization, mining, horticultural collecting, grazing, and vehicles (CNPS 2014). Other possible threats include powerline construction and non-native plant encroachment (CNPS 2014).

Spanish Needle Onion (*Allium shevockii*)

The Spanish Needle onion was not included in the 2005 WEMO Final EIS (BLM 2005), but is considered to potentially occur within the planning area based on recent documentation (Dudek and ICF International 2012) and consultation with BLM biologists. The information presented below is based on the species accounts prepared for the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012).

Life History

Spanish Needle onion is a perennial bulbiferous herb that stands approximately 10 to 20 centimeters (3.9 to 7.9 inches) tall (Jepson Flora Project 2011). It grows each year from an underground bulb, with the leaves withering after flowering, which is given variously as May to June (CNPS 2011) and June to July (Jepson Flora Project 2011). This information probably comes from the original Spanish Needle Peak population, because the lower elevation Tehachapi populations flower as early as late April.

Like several other onion species in California, Spanish Needle onion appears to reproduce mostly vegetatively, by production of new bulbs that form on short rhizomes growing from the base of the parent bulb (McNeal 1987), at least as indicated by the Spanish Needle Peak population (Pitzer 2006). The flowers, however, are large and distinctive and are probably attractive to insect pollinators, and plants in the Horse Canyon area have been reported to produce seed (Hare pers.

comm. 1997, cited in Pitzer 2006). There has been no research on pollinators, seed production, establishment of bulbs, or other aspects of its reproduction (Pitzer 2006).

Spanish Needle onion grows in rocky soil and at the edge of rock outcrops and talus derived from volcanic and metamorphic rock (Pitzer 2006; CDFW 2012b; Jepson Flora Project 2011). The rocky sites inhabited by Spanish Needle onion are sparsely vegetated; the occurrences are surrounded by sparse pinyon-juniper woodland with pinyon pine, California juniper, chaparral yucca (*Hesperoyucca whipplei*), and narrowleaf goldenbush (*Ericameria linearifolia*) (CDFW 2012b). An elevation range of 2,000 to 2,500 meters (6,560 to 8,200 feet) is given in recent literature (Jepson Flora Project 2011), whereas CNPS (2011) provides a low elevation of 850 meters (2,790 feet). The Horse Canyon occurrences are at 4,800 to 5,225 feet, and recent records in the CNDDDB give much lower elevations for the Jawbone Canyon occurrences: 1,050 and 3,000 feet (CDFW 2012b). Therefore, based on records in the CNDDDB, its elevation range in the planning area appears to be 1,050 to 5,400 feet (CDFW 2012b).

Regulatory Status

Spanish Needle onion (*Allium shevockii*) is not federally or state listed, but is a BLM sensitive species. Spanish needle onion has a CRPR of 1B.3. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b).

Threats

Because of the relatively remote and rugged character of its habitat, threats to the species are considered minimal (Pitzer 2006; CDFW 2012b). However, because it occurs in relatively small numbers at each known occurrence, it may be vulnerable to local extirpation from random events. Potential threats mentioned by surveyors are wind energy development, grazing, OHV use, and road/trail construction (CDFW 2012b), but there is no evidence that these threats are causing actual damage to any populations. An additional potential threat comes from the showy flowers that could attract collectors, but so far, there is no evidence that bulb collection is occurring (Pitzer 2006).

Sweet-smelling monardella (*Monardella beneolens*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The sweet-smelling monardella is a perennial rhizomatous herb which is endemic (limited) to California (CalFlora 2017). It occurs within Inyo, Kern, and Tulare counties (CNPS 2017). This species generally blooms from June through September (CNPS 2017). This species occurs in granitic areas associated with the following habitat types: alpine boulder and rock field, subalpine coniferous forest, and upper montane coniferous forest (CNPS 2017). This species ranges in elevation from 2475 to 3500 meters (CNPS 2017). Known from only three occurrences on the eastern crest of the Sierra Nevada (NatureServe 2017).

Regulatory Status

The sweet-smelling monardella is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.3 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). The creamy blazing star has a California Heritage Element Ranking of S2, indicating that it is “Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The sweet-smelling monardella is known only from the eastern Sierran crest. Remoteness of occurrences limits disturbance. However this species hybridizes with *M. linoides* ssp. *Linoides* and *M. odoratissima* ssp. *pallida* (CNPS 2017).

Tehachapi monardella (*Monardella linoides* ssp. *oblonga*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The Tehachapi monardella is a perennial rhizomatous herb which is endemic (limited) to California (CalFlora 2017). It occurs within Kern, Los Angeles, Tulare, and Ventura counties (CNPS 2017). This species generally blooms June through August with some blooming starting as early as May (CNPS 2017). This species occurs in the following habitat types: lower montane coniferous forest, pinyon and juniper woodland, and upper montane coniferous forest (CNPS 2017). This species ranges in elevation from 900 to 2470 meters (CNPS 2017).

Regulatory Status

The Tehachapi monardella is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.3 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .3 are “not very threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). The Tehachapi monardella has a California Heritage Element Ranking of S2, indicating that it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province” (CDFW 2012b).

Threats

The Tehachapi monardella is threatened by road maintenance, ORVs, and wind energy (NatureServe 2017).

White-bracted spineflower (*Chorizanthe xanti* var. *leucotheca*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB data base.

Life History

The white-bracted spineflower is an annual herb which is endemic (limited) to California (CalFlora 2017). It occurs within Los Angeles, Riverside, San Bernardino, and San Diego counties (CNPS 2017). This species generally blooms April through June (CNPS 2017). This species occurs in sandy or gravelly soils associated with the following habitat types: coastal scrub (alluvial fans), Mojavean desert scrub, and pinyon and juniper woodland (CNPS 2017). This species ranges in elevation from 300 to 1200 meters (CNPS 2017). Known from fifty occurrences in California (NatureServe 2017).

Regulatory Status

The White-bracted spineflower is not federally or state listed, but is a BLM sensitive species.

This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The White-bracted spineflower has a California Heritage Element Ranking of S3, indicating that it is “vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation” (CDFW 2012b).

Threats

The White-bracted spineflower is threatened by development, flood control projects, mining, and vehicles (CNPS 2017). Other threats include grazing and weeds (NatureServe 2017).

White-margined Beardtongue (*Penstemon albomarginatus*)

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.8.22, pp. 3-195 and 3-196) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

Life History

White-margined beardtongue is a short-lived perennial member of the plantain family (*Plantaginaceae*) that is 15 to 35 centimeters (5.9 to 13.8 inches) tall (CNPS 2011; Jepson Flora

Project 2011). It appears to reproduce primarily through production and dispersal of seed (Etyemezian and others 2010) and blooms between March and May (Jepson Flora Project 2011). Peak flowering appears to occur in April of most years (Etyemezian and others 2010).

Like many Mojave Desert perennial plants, white-margined beardtongue reproductive events are rare and episodic and may require a combination of successive wet years that favor seed production, seed germination, and seedling growth (Etyemezian and others 2010). Andre (2010) notes that this species maintains a substantial soil seed bank and survives underground as a subterranean heterotrophy (root/caudex) during dry years (Andre 2010). Even during average years of precipitation, a large percentage of the seed bank will not germinate and many living plants remain dormant underground. Only a subset of plants will put on above ground growth, and an even fewer number flower and set seed. Seed banks can persist in the soil for many decades before germinating (Andre 2010).

Andre (2010) also has observed and documented frequent localized extinctions of cohorts with rapid establishment of plants in previously unoccupied areas. He concludes that plants at the California occurrence behave like biennials or short-lived perennials, relying upon the maintenance of a viable seed bank, and over time exhibit a shifting distribution within the aeolian sands where they occur (Andre 2010).

Etyemezian and others (2010) observed very limited seed production and dispersal of whitemargined beardtongue at study sites in Nevada during the drought years of 2008–2009. They attributed the lack of reproductive success to drought and insect herbivory at two sites, but did observe seed dispersal at one site in 2009. Seed dispersal distances ranged from 1 to 15 centimeters (0.4 to 6 inches) at this site.

MacKay (2006) noted that white-margined beardtongue is present in some washes but absent in other drainages nearby, and suggests that might be due to both limited seed dispersal distances and the lack of suitable stabilized deep sand in those other drainages (MacKay 2006). She suggests that the small seeds could be scattered short distances by ants or rodents, or may get transported by water in very wet years.

The tendency for plants to occur in scattered groups of up to 20 individuals, and the fact that young cuttings produce adventitious roots in experiments (Scogin 1989, as cited in MacKay 2006), suggest that vegetative reproduction may occur in this species in its natural habitat, even though attempts to propagate from cuttings at the garden failed (Scogin 1989, as cited in MacKay 2006).

The success of white-margined beardtongue is dependent upon a variety of interactions with pollinators and other nearby plant species, as well as a variety of ecological processes. The showy flowers are visited by several insects, including small carabid beetles, large flies, and vespid wasps with orange abdomens. Pollen was observed on upper-body surfaces of the vespids, making them the most likely pollinator of white-margined beardtongue (Scogin 1989, as cited in MacKay 2006).

White-margined beardtongue establishment is much more likely in canopy inter-spaces than under plant canopies, but Etyemezian and others (2010) could not determine whether competition with other perennial species or other micro-environmental factors were responsible for this phenomenon (Etyemezian and others 2010). For the few individuals they noticed growing in under canopy locations, the overstory species was equally likely to be white bursage or big galleta grass (only in Clark County), but never creosote bush.

The CNDDDB element occurrence information cites the habitat requirements of whitemargined beardtongue as Mojave Desert scrub and desert dunes, specifically in deep, stabilized desert sand, and in washes and along roadsides (CDFW 2012b). Within California, Andre (2010) notes that this species occurs on mostly “fine alluvial sands within a sparse creosote bush scrub community.”

White-margined beardtongue occurs from 635 to 1,065 meters (2,083 to 3,494 feet) (CDFW 2012b). There are additional records in the CCH database that, if verified, would extend this elevation range to as low as 426 meters (1,398 feet) (Jepson Flora Project 2011).

Regulatory Status

White-margined (*Penstemon albomarginatus*) beardtongue is not federally or state listed, but is a BLM sensitive species. White-margined beardtongue has a CRPR of 1B.1. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .1 are “seriously threatened in California, with over 80% of occurrences threatened/high degree and immediacy of threat” (CNPS 2011). White-margined beardtongue has a California Heritage Element Ranking of S1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

At the time of the 2006 WEMO Plan analysis, all of the white-margined beardtongue occurrences in California were located within or adjacent to BLM verified solar and wind project applications, the BLM Pisgah Solar Energy Zone, approved solar projects, or on military bases. The proposed solar projects have been withdrawn from consideration for a variety of reasons and the Pisgah SEZ was eliminated from further consideration in the Final Solar PEIS. These locations are also near possible military base expansion lands, including Fort Irwin Army Base and the Twenty-Nine Palms MCAGCC (29 Palms). According to the 29 Palms Land Acquisition/Airspace Establishment Study FEIS (29 Palms FEIS), white-margined beardtongue is located in the Lavic Lake Training Area, but it was not observed or discussed as potentially occurring in the expansion areas to the west, south, and east of the existing combat center (Department of the Navy 2011b). However, the 29 Palms FEIS also reports potential habitat (i.e., creosote bush scrub and/or desert dunes) for white-margined beardtongue in all three expansion areas, so there is likely some risk to this species that would result from these expansion plans.

This species is also potentially threatened by the presence of I-40 and numerous utility access roads that facilitate movement of people and OHVs to the occupied habitat areas. MacKay (2006) notes that repeated destruction of above-ground plants may use up nutrient stores within the long taproot of the plant and result in declines of this species. Large, organized off-road races also create massive dust clouds and are held in areas adjacent to white-margined beardtongue habitat areas in Nevada. The dust has been seen rising hundreds of feet into the air (Mangrich, pers. obs. 2009), and poses a potential threat to the Nevada population’s pollinators, as well as the plant’s photosynthetic capacity (Mangrich, pers. obs. 2009). Although there are no known organized off-road races held near occupied habitat within the planning area, OHV activity in the planning area could pose similar, albeit somewhat less severe, threats.

Other threats include the presence of power lines and pipelines that bring human disturbance into areas of occupied habitat (MacKay 2006). Military activities (e.g., camping) have also been observed in the vicinity of occupied habitat areas, which could increase trampling damage to the species (MacKay 2006).

Although white-margined beardtongue is a showy plant, it does not appear that there is a threat resulting from horticultural efforts because it doesn't propagate well from cuttings, and transplantation efforts have been unsuccessful (Scogin 1989, as cited in MacKay 2006).

Beaver dam Scurfpea/Beaver dam breadroot/ Beaver indian breadroot (*Pediomelum castoreum*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the November 2012 DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDDDB database.

Life History

The Beaver dam breadroot, a dicot, and a perennial herb that is native to California and is also found outside of California, but is confined to western North America (CalFlora 2017). It is native to the deserts around the intersection of California, Nevada, and Arizona, where it grows in local habitat including disturbed areas (CNPS 2017). Found in open areas and on roadcuts (Jepson 2013) and in washes. Substrate is sandy. Found in Joshua tree woodland and Mojavean desert scrub vegetation communities. Elevation range 2,001 to 5,003 feet amsl (CNPS 2013) or < 5,741 feet amsl (Jepson 2013). Flowering April to May (Calflora 2013).

Regulatory Status

The Beaver dam breadroot is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Beaver dam breadroot has a California Heritage Element Ranking of S2, indicating that it is "imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province" (CDFW 2012b).

Threats

The Beaver dam breadroot is potentially impacted by vehicles and road widening (CNPS 2011).

Boyd's monardella (*Monardella boydii*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the November 2012 DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDDDB database.

Life History

The Boyd's monardella is a dicot, and an annual herb that is native to California (CalFlora 2017). Endemic to California (San Bernardino County) (CNPS 2013) in the south-central Mojave Desert (Jepson 2013). Present in the Project Area (pers. comm. Chavez 2013). Known occurrences within the Project Area are clustered to the southeast of Barstow, near Ord Mountain, Camp Rock Mine, and Silver Bell Mine (CNPS 2013). Found on rocky slopes and in canyon bottoms or washes (Jepson 2013). Substrate is usually alluvial soils and bedrock cracks. Found in Mojavean desert scrub, pinyon and juniper woodland, and desert riparian scrub vegetation communities. Elevation range 4,593 to 5,413 feet amsl (CNPS 2013). Flowering August to October (Calflora 2013).

Regulatory Status

The Boyd's monardella is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .2 are "fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat" (CNPS 2011). The Boyd's monardella has a California Heritage Element Ranking of S1, indicating that it is "critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province" (CNPS 2017).

Threats

The Boyd's monardella is potentially impacted by mining, vehicles, wind and solar energy development, trampling, and climate change (CNPS 2017).

Mojave menodora (*Menodora spinescens* var. *mohavensis*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) nor was it discussed in the November 2012 DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDDDB database.

Life History

The Mojave menodora is a dicot, and a shrub that is native to California (CalFlora 2017). Endemic to California (Inyo and San Bernardino Counties) (CNPS 2013) on the north slope of the San Bernardino Mountains (Jepson 2013). Wide-spread distribution in Project Area (pers. comm. Chavez 2013). Known occurrences within the Project Area occur in the general vicinity of Barstow and on the north side of Joshua Tree NP into the Yucca Valley (CNPS 2013). Found on rocky desert hillsides and in canyons (Jepson 2013). Substrate is andesite gravel. Found in Mojavean desert scrub vegetation communities. Elevation range 2,264 to 6,562 feet amsl (CNPS 2013).

Regulatory Status

The Mojave menodora is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.3 species. CRPR 1B species are considered "rare, threatened, or endangered in California and elsewhere" (CDFW 2012b). CRPR species with a threat rank of .3 are "not very

threatened in California with <20% of occurrences threatened/low degree and immediacy of threat or no current threats known” (CNPS 2011). The Mojave menodora has a California Heritage Element Ranking of S2S3, indicating uncertainty whether it is “imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province,” and/or indicating that it is “vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation” (CDFW 2012b).

Threats

The Mojave menodora is potentially impacted by vehicles (CNPS 2011).

Piute Mountains jewelflower (*Streptanthus cordatus* var. *piutensis*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) but was discussed in the November 2012 DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDB database.

Life History

The Piute Mountains jewelflower is a dicot, and perennial herb that is native to California and is endemic (limited) to California (CalFlora 2017). Endemic to California (Kern County) in the southern Sierra Nevada. Known occurrences within the project area are concentrated near Sweet Ridge, south of Cache Peak near the City of Mojave (CNPS 2017). Found on metamorphic rocks and sandy slopes, though the limited distribution makes it difficult to generalize these observations. Found in broadleaf upland forests, closed-cone coniferous forest, and pinyon-juniper woodland vegetation communities and is associated with species including associated with Bodfish Piute cypress (*Cupressus nevadensis*) and California juniper (*Juniperus californica*). Elevation range 3,592 to 7,000 feet amsl. Flowering June to July (Jepsen 2017).

Regulatory Status

The Piute Mountains jewelflower is not federally or state listed, but is a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The Piute Mountains jewelflower has a California Heritage Element Ranking of S1, indicating that it is of S1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

The Piute Mountains jewelflower is potentially impacted by wind energy development (CNPS 2015).

Triple-ribbed milkvetch (*Astragalus tricarinatus*)

This species was not analyzed previously in the 2005 WEMO Final EIS (BLM 2005) but was discussed in the November 2012 DRECP baseline biology report (Dudek and ICF International 2012). This species is being added as a result of a review of the current CNDDDB database.

Life History

The Triple-ribbed milkvetch is a dicot, is a perennial herb that is native to California and is endemic (limited) to California. (CalFlora 2017). Known from California (Riverside and San Bernardino Counties), mainly in the eastern San Bernardino Mountains/Whitewater Canyon area, Morongo Canyon, and the western part of the Little San Bernardino Mountains, with disjunctive occurrences in the Orocopia and Santa Rosa mountain ranges (CNPS 2017). On edge of Project Area, no designated routes in habitat (pers. comm. Chavez 2013). Known occurrences within the Project Area are in Big Morongo Canyon and adjacent canyons. Found commonly on rocky slopes and ridges that are mostly barren. Substrate is coarse and granitic. Found in Joshua tree woodland and Sonoran desert scrub vegetation communities with associated species including associated plants including giant needlegrass (*Achnatherum coronatum*), California buckwheat (*Eriogonum fasciculatum*), ceanothus (*Ceanothus greggii*), bush poppy (*Dendromecon rigida*), bigberry manzanita (*Arctostaphylos glauca*), bitter snakewood (*Condalia globosa*), yerba santa (*Eriodictyon trichocalyx*), and Spanish bayonet (*Yucca schidigera*). Elevation range 2,300 to 4,000 feet amsl. Flowering February to May (Jepsen 2017).

Regulatory Status

The Triple-ribbed milkvetch is federal but not state listed species. It is also a BLM sensitive species. This species is also a CRPR 1B.2 species. CRPR 1B species are considered “rare, threatened, or endangered in California and elsewhere” (CDFW 2012b). CRPR species with a threat rank of .2 are “fairly threatened in California with 20-80% occurrences threatened/moderate degree and immediacy of threat” (CNPS 2011). The Triple-ribbed milkvetch has a California Heritage Element Ranking of S1, indicating that it is “critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province” (CDFW 2012b).

Threats

The Triple-ribbed milkvetch is potentially impacted by pipeline maintenance and vehicles (CNPS 2010).

E.4.2 Wildlife

E.4.2.1 Regulatory Framework

Federal Endangered Species Act

The ESA includes provisions for protection and management of species that are federally listed as threatened or endangered or proposed for such listing and of designated critical habitat for these species. The administering agency for the above authority for non-marine species is the USFWS.

BLM Sensitive Species

BLM Sensitive Species are species designated by the State Director that are not already federally listed, proposed, or candidate species, or state-listed because of potential endangerment. BLM's policy is to "ensure that actions authorized, funded, or carried out do not contribute to the need to list any of these species as threatened or endangered." Various offices of the BLM maintain a list of special-status plant and wildlife species that are to be considered as part of the management activities carried out by the BLM on the lands that they administer.

California Desert Conservation Area Plan, 1980 as Amended

The CDCA Plan guides the management of all BLM-administered lands in the Mojave, Sonoran, and a small portion of the Great Basin Deserts. In total, the CDCA Plan includes an area of approximately 25 million acres, 12 million of which are public lands. The primary goal of the CDCA Plan is to provide guidance for the overall maintenance of the land while simultaneously planning for multiple uses and balancing the human needs with the need to protect the natural environment.

The CDCA Plan includes 12 elements: Cultural Resources; Native American; Wildlife; Vegetation; Wilderness; Wild Horse and Burro; Livestock Grazing; Recreation; Motorized Vehicle Access; Geology, Energy and Mineral Resources; Energy Production and Utility Corridors; and Land-Tenure Adjustment. Each of the elements contains goals and specific actions for the management, use, development, and protection of the resources and public lands within the CDCA, and is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. In addition, each element provides both a desert-wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) includes provisions for protection of migratory birds, including basic prohibitions against any taking not authorized by federal regulation. The administering agency for the above authority is the USFWS. The law contains no requirement to prove intent to violate any of its provisions. Wording in the MBTA makes it clear that most actions that result in "taking" or possession (permanent or temporary) of a protected species can be a violation of the act. The word "take" is defined as "pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to pursue, hunt, shoot, wound, kill, trap, capture, or collect (including nests, eggs, and feathers)."

Lacey Act

The Lacey Act, as amended (16 USC 3371-3378) protects plants and wildlife by creating civil and criminal penalties for a wide variety of violations including illegal take, possession, transport, or sale of protected species.

The Bald and Golden Eagle Protection Act

Bald eagle protection began in 1940 with the passage of the Eagle Protection Act, which was later amended to include golden eagle and was renamed. The Bald and Golden Eagle Protection Act makes it unlawful to import, export, take, sell, purchase, or barter any bald eagle or golden eagle, their parts, products, nests, or eggs. Take includes pursuing, shooting, poisoning, wounding, killing, capturing, trapping, collecting, molesting, or disturbing. Exceptions may be granted by USFWS for scientific or exhibition use, or for traditional and cultural use by Native Americans. However, no permits may be issued for import, export, or commercial activities involving eagles.

Wild Horse and Burro Act of 1971, as amended

Herd Areas are those geographic areas where wild horses and/or burros were found at the time of the passage of the Wild Horse and Burro Act in 1971. Herd Management Areas are those areas within Herd Areas where the decision has been made, through Land Use Plans, to manage for populations of wild horses and/or burros. Herd Areas boundaries may only be changed when it is determined that areas once listed as Herd Areas are later found to be used only by privately owned horses or burros, or the Herd Area boundary does not correctly portray where wild horses and burros were found in 1971.

California Desert Renewable Energy Conservation Plan

BLM issued the DRECP in October, 2016. The DRECP amends the CDCA Plan, specifically with respect to natural resource conservation and renewable energy development. The DRECP establishes Ecological and Cultural Conservation and Recreation Designations, and Renewable Energy Activities, Policies, and Allocations.

State

California Endangered Species Act

The CESA includes provisions for the protection and management of species listed by the State as endangered or threatened, or designated as candidates for such listings. CESA includes a requirement for consultation “to ensure that any action authorized by a state lead agency is not likely to jeopardize the continued existence of any endangered or threatened species... or result in the destruction or adverse modification of habitat essential to the continued existence of the species” (§ 2090). Plants of California declared to be endangered, threatened, or rare are listed at 14 California Code of Regulations (CCR) § 670.2. Animals of California declared to be endangered, threatened, or rare are listed at 14 CCR § 670.5. The administering agency for the above authority is the CDFW.

Other Provisions of the California Fish and Game Code

These California Fish and Game Codes (CFGC) list bird (primarily raptor), mammal, amphibian, and reptile species that are classified as fully protected in California. Fully protected species are prohibited from being taken or possessed except under specific permit requirements. These Codes also prohibit the take, possession, or needless destruction of the nests or eggs of any bird, including birds of prey or their nests or eggs, except as otherwise provided by the code or any regulation made pursuant thereto.

E.4.2.2 Regional and Background Information

The 22 special status wildlife species identified as potentially affected by the proposed action or alternatives within the planning area are described in the following section.

The majority of the updated summaries of species are based on the Species Accounts prepared for the March 2012 draft DRECP Baseline Biology Report (Dudek and ICF International 2012) baseline biology report. The WEMO Planning area exists within the boundaries of the DRECP LUPA planning area.

Mammals

Mohave Ground Squirrel

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.3, pp. 3-144 to 3-169 of the 2005 WEMO Final EIS.

Life History

There is little direct information on the potential role of MGS in maintaining ecological relationships and processes. Their burrow systems likely provide refuge for other species that do not dig their own burrows such as snakes and lizards and potentially other small rodents. The range of the MGS is entirely overlapped by the diurnal white-tailed antelope squirrel, but there appears to be little direct competition between the two species (MGSWG 2011). They are probably prey for several natural predators, such as coyote, American badger, bobcat, red-tailed hawk, golden eagle, prairie falcon, common raven, and Mojave rattlesnake (Best 1995).

MGS maintain three types of burrows within their home ranges: (1) home burrows that are used overnight during the active season and usually located at the edge of a home range; (2) aestivation burrows; and (3) accessory burrows that are used during social interactions or for escape and thermoregulation during the midday (Best 1995). Burrows are typically constructed under large shrubs (MGSWG 2011).

Harris and Leitner (2004) conducted a 5-year radiotelemetry study of home range use by MGS in the Coso Range in Inyo County. At this study site, individual MGS home ranges (calculated using both minimum convex polygon and adaptive kernel methods) varied substantially by year,

individual, sex, and season (i.e., mating season vs. post-mating season). Generally, males have larger home ranges than females, with the most pronounced differences during the mating season.

Harris and Leitner (2005) used radiotelemetry to track dispersal movements by juvenile MGS in their first year to hibernation sites. Most juveniles dispersed relatively long distances from their natal burrow area, and exhibited dispersal that is farther than other squirrels and other mammals in proportion to home range sizes (Harris and Leitner 2005).

The MGS breeding season is from mid-February to mid-March (Best 1995; Laabs 2006). Males emerge from hibernation in February, up to two weeks before females, and during this time they may be territorial (Best 1995). Females generally only occupy male territories for one or two days then establish their own home ranges after copulation. Males stake out the overwintering sites of females to mate with them when they emerge (MGSWG 2011).

Pregnant females are present from February to May and gestation lasts from 29 to 30 days (Best 1995). Litter sizes range from four to nine (Best 1995), though mortality of juveniles is high during the first year, especially for juvenile males (MGSWG 2011). Parental care and lactation continues through mid-May and juveniles emerge above ground from 10 days to 2 weeks later. Litters generally appear above ground in early May (Harris and Leitner 2004). Females will breed at 1 year of age if environmental conditions are suitable, but males do not mate until 2 years of age (MGSWG 2011).

Threats

Threats to the Mohave ground squirrel would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. For a discussion of these threats, please refer to Section 3.3.3.5, pg. 3-157 to 167.

Bats

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.4, pp. 3-169 to 3-170 of the 2005 WEMO Final EIS.

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.4, pg. 3-169 to 3-170) is supplemented by the following updated information from the DRECP Baseline Biology Report (Dudek and ICF International 2012).

Life History

Five species occurring within the planning area could potentially be affected by the proposed action or alternatives: spotted bat, pallid bat, western mastiff bat, fringed myotis, and western small-footed myotis.

The fringed myotis and western small-footed myotis were not included in the 2005 WEMO Final EIS (BLM 2005). The fringed myotis and western small-footed myotis occur within a wide variety of habitats, but use caves, mines, buildings, and crevices as roost sites. Hibernation lasts

from October/November through March. Mating occurs in the fall and the young are born from May through July (Zeiner, D.C. et al 1988-1990).

The fringed myotis is widespread in California and the western small-footed myotis is a common resident of arid uplands in California occurring from on the west and east sides of the Sierra Nevada, and in Great Basin and desert habitats from Modoc to Kern and San Bernardino counties. The range for both species occurs along the western and northern boundaries of the planning area (Zeiner, D.C. et al 1988-1990).

All other life history information for the other three species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.4, pp. 3-169 to 3-170 of the 2005 WEMO Final EIS.

Regulatory Status

The regulatory status for the five bat species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.4, pp. 3-169 to 3-170 of the 2005 WEMO Final EIS.

Threats

The threats identified for the five bat species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.4, pp. 3-169 to 3-170 of the 2005 WEMO Final EIS.

Nelson's Bighorn Sheep

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.5, pp. 3-170 to 3-171 of the 2005 WEMO Final EIS.

Life History

The life history of the bighorn sheep would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. Please refer to Section 3.3.5.1, pg. 3-171.

Regulatory Status

The regulatory status of the bighorn sheep would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. Please refer to Section 3.3.5.1, pg. 3-171.

Threats

Threats to this species would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. For a discussion of these threats, please refer to Section 3.3.5.1, pg. 3-171.

Birds

Southwestern Willow Flycatcher

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.11, pp. 3-178 to 3-179 of the 2005 WEMO Final EIS.

Life History

In California, the southwestern willow flycatcher is restricted to riparian habitats occurring along streams or in meadows (Craig and Williams 1998; Sogge and others 2010). The structure of these habitats typically consists of a dense mid-story and understory and can also include a dense canopy (60 FR 10695–10715). However, suitable vegetation is not uniformly dense and typically includes interspersed patches of open habitat. Typical plant species associated with their habitat include willow (*Salix* spp.), mulefat (*Baccharis salicifolia*), box-elder (*Acer negundo*), stinging nettle (*Urtica* spp.), cottonwood (*Populus* spp.), tamarisk (*Tamarix* spp.), and Russian olive (*Elaeagnus angustifolia*). Within the habitat structure parameters discussed above, southwestern willow flycatcher does demonstrate adaptability in that it can occupy riparian habitats composed of native broadleaf species, a mix of native and exotic species, or monotypic stands of exotics (Sogge and others 2010). This subspecies is known to nest in monotypic stands of Russian olive and tamarisk (60 FR 10695–10715). Furthermore, along the San Luis Rey River in San Diego County, southwestern willow flycatcher has nested in riparian habitat dominated by coast live oak (*Quercus agrifolia*), and in Cliff-Gila Valley in New Mexico they are known to nest in tall box-elder. Plant species composition does not seem as important as a dense twig structure and an abundance of live, green foliage (Sogge and others 2010). Also, the location of the nest seems to depend more on suitable twig structure and live vegetative cover than height or plant species composition (Sogge and others 2010).

Southwestern willow flycatcher nesting sites are located near surface water or saturated soils. Due to the variability of hydrologic conditions in Southern California, water availability at a site may range from inundated to dry from year to year or within the breeding season. Nonetheless, moisture levels must remain high enough to support appropriate riparian vegetation (Sogge and others 2010). Dense willow thickets are the most important habitat component for breeding *E. t. adastus* and *E. t. brewsteri* in California (Stefani and others 2001).

Southwestern willow flycatchers are insectivorous and forage at the edges or internal openings of their territory, above the canopy or over open water. Their diet consists mainly of bees, wasps, flies, leaf hoppers, and beetles (Durst and others 2008b), which they catch in the air, glean from

vegetation, or occasionally pick, catch, or seize from the ground (Sedgwick 2000). Presumably, the diets of migrating *E. t. adastus* and *E. t. brewsteri* are similar.

Southwestern willow flycatcher is predominantly monogamous although reports of polygyny are not uncommon (Sedgwick 2000). Males arrive at the breeding sites between early May and early June (USFWS 2002). Females arrive 1 to 2 weeks after males and inhabit the territory of a male (Finch and Stoleson 2000). Nest building begins approximately 2 weeks after pair formation. The female incubates the eggs for an average of 12 to 13 days. The nestlings fledge between 12 and 15 days after hatching (Sogge and others 2010). Southwestern willow flycatcher will typically renest following an unsuccessful attempt and less frequently may renest following a successful attempt.

Regulatory Status

The regulatory status for the southwestern willow flycatcher has not changed from the 2005 WEMO Final EIS as described in Section 3.3.6.11, pg. 3-179 (BLM 2005).

Threats

The primary threat to the southwestern willow flycatcher is loss, modification, and fragmentation of suitable riparian habitat (Sogge et al. 2010). In general, increased human populations and development have resulted in a decline of riparian habitat, a habitat type that is naturally rare, patchy, and dynamic in the Southwest due to the varying hydrologic conditions of the region. The specific primary causes for loss and modification of riparian habitats have been dams and reservoirs, water diversion and groundwater pumping, channelization, flood control, agriculture, recreation, and urbanization (Sogge et al. 2010). Other threats include nest parasitism by cowbirds and grazing.

Western Yellow-billed Cuckoo

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.15, pg. 3-181 of the 2005 WEMO Final EIS.

Life History

In the western United States, nests are typically constructed in willows, Fremont cottonwood, mesquite, hackberry (*Celtis* spp.), soapberry (*Sapindus saponaria*), alder (*Alnus* spp.), or cultivated fruit trees on horizontal branches or vertical forks of the large tree or shrub (Hughes 1999). Nest sites in arid regions are restricted to relatively humid river bottoms, ponds, swampy areas, and damp thickets (Hughes 1999). Foraging occurs extensively in cottonwood riparian habitat (Hughes 1999).

The western yellow-billed cuckoo has a short breeding season, lasting only about 4 months from time of arrival on breeding grounds in the spring to fall migration. Western yellow-billed cuckoos typically lay a single clutch per season in mid-June to mid-July, and incubation occurs over 9 to 11 days (Hughes 1999; Johnson and others 2008). Development of the young is very rapid, with

fledgling occurring in 6 to 9 days; the entire breeding cycle may be only 17 days from egg laying to fledging of the young (Hughes 1999). Fledglings are dependent upon parents for up to 3 weeks following fledgling (Johnson and others 2008). Cuckoos are a monogamous species, and both sexes incubate and care for the young (Hughes 1999).

Regulatory Status

The regulatory status for the western yellow-billed cuckoo has been updated from the 2005 WEMO Final EIS (BLM 2005) to include a BLM Sensitive listing in addition to California endangered and proposed threatened under the ESA (as described in Section 3.3.6.15, pg. 3-181 of the 2005 WEMO Final EIS (BLM 2005). Additionally, a decision on the designation of Critical Habitat is pending.

Threats

The western yellow-billed cuckoo is sensitive to habitat fragmentation and degradation of riparian woodlands due to agricultural and residential development (Hughes 1999), and major declines among western populations reflect local extinctions and low colonization rates (Laymon and Halterman 1989). Groundwater pumping and the replacement of native riparian habitats by invasive non-native plants, especially tamarisk, have substantially reduced the area and quality of available breeding habitats for yellow-billed cuckoo (75 FR 69222–69294).

Bendire's Thrasher

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.1, pp. 3-173 to 3-174 of the 2005 WEMO Final EIS.

Life History

This species breeds in desert areas containing cactus, Mojave yuccas, and Joshua trees.

Regulatory Status

The regulatory status for the Bendire's thrasher has been updated from the 2005 WEMO Final EIS (BLM 2005) to include BLM Sensitive and a USFWS bird of conservation concern in addition to the California Species of Special Concern status (as described in Section 3.3.6.1, pg. 3-173 of the 2005 WEMO Final EIS).

Threats

Identified threats include habitat destruction through rural and urban development, off-road vehicle activity during the nesting season, and removal of yuccas and cholla cacti. Grazing has shown both positive and negative effects on this species. Fragmentation of the small remaining populations is a serious long-term threat.

Burrowing Owl

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.3, pg. 3-174 of the 2005 WEMO Final EIS.

Life History

Throughout their range, burrowing owls require habitats with three basic attributes: open, well-drained terrain; short, sparse vegetation generally lacking trees; and underground burrows or burrow-like structures (e.g., pipe openings) (Gervais and others 2008; Klute and others 2003).

Burrowing owls are opportunistic predators that will consume arthropods, small mammals, birds, amphibians, and reptiles (Haug and others 1993; Karalus and Eckert 1987; Gervais and others 2008). Owls typically forage in habitats characterized by low-growing, sparse vegetation (Haug and others 1993). In California, crickets and meadow voles were found to be the most common food items (Thomsen 1971).

Nesting in California generally runs from February through August, with peak activity from mid-April to mid-July (Zeiner and others 1990; Thomsen 1971; Gervais and others 2008). Burrowing owls are primarily monogamous and typically breed once per year.

California supports year-round resident burrowing owls and over-wintering migrants (Gervais and others 2008). Many owls remain resident throughout the year in their breeding locales (especially in central and Southern California) while some apparently migrate or disperse in the fall (Haug and others 1993; Coulombe 1971; Barclay 2007).

Burrowing owls exhibit high site-fidelity and reuse burrows year after year, although dispersal distances may be considerable and variable depending on location and the age of the owls. In California, western burrowing owls most commonly live in burrows created by ground squirrels (Gervais and others 2008). Therefore, the suitability and quality of burrowing owl habitat in the planning area is closely and positively related to the occurrence and population health of ground squirrels. In other regions where squirrel burrows do not occur, burrowing owls may depend on badgers for nest burrow excavation, although this species is a major predator of burrowing owls (Green and Anthony 1997). Where burrowing mammals have been eliminated, burrowing owls may prefer grazed areas where livestock have reduced vegetation height (Wedgwood 1976).

Regulatory Status

The regulatory status for the burrowing owl has been updated from the 2005 WEMO Final EIS (BLM 2005) to include BLM Sensitive and a USFWS bird of conservation concern in addition to the California Species of Special Concern status (as described in Section 3.3.6.3, pg. 3-174 of the 2005 WEMO Final EIS).

Threats

Threats to the burrowing owl would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. For a discussion of these threats, please refer to Section 3.3.6.3, pg. 3-174.

Golden Eagle

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.5, pg. 3-175 of the 2005 WEMO Final EIS.

Life History

Golden eagles use nearly all terrestrial habitats of the western states, occurring primarily in mountainous canyon land, rimrock terrain of open desert and grassland areas (Kochert and others 2002). In central California, they prefer open grasslands and oak savanna, with lesser numbers in oak woodland and open shrublands (Hunt and others 1998) but can also be found in desert grasslands and chaparral habitats (Millsap 1981). Secluded cliffs with overhanging ledges and large trees are used for nesting and cover. Preferred territory sites include those that have a favorable nest site, a dependable food supply, and broad expanses of open country for foraging. Golden eagles typically forage in open habitats including grasslands and shrublands.

Golden eagles in the planning area are mostly resident, but may move downslope for winter or upslope after the breeding season (Polite and Pratt 1990). Both residents and migratory individuals show fidelity to wintering areas (Kochert and others 2002).

Golden eagles use the same nest each year, alternate nests in successive years, or nest only every other year (Terres 1991). Pairs rarely re-nest when the first clutch is destroyed (Watson 1997) and there are no records of pairs producing more than one brood per year. Golden eagles prefer to locate their nests on cliffs or trees near forest edges or in small stands near open fields (Bruce and others 1982; Hunt and others 1998). Mating occurs from late January through August, with peak activity in March through July. Eggs are laid from early February to mid-May. Incubation lasts 43–45 days (Kochert and others 2002), and the fledging period is 72–84 days (Johnsgard 1990). The young usually remain dependent on their parents for as long as eleven weeks after fledging.

Golden eagles are a top avian predator in the scrubland, grassland, and woodland ecosystems that make up much of the planning area. They feed mainly on leporids (hares and rabbits) and sciurids (ground squirrels, prairie dogs, marmots), but they also take birds, fish, and reptiles, mostly on or near the ground, and they frequently feed on carrion (Kochert and others 2002). They may directly compete with ferruginous hawks and other smaller hawks for small mammals, and with California condors and common ravens for carrion. Territorial interactions with other golden eagles may result in some fatalities.

Regulatory Status

The regulatory status for the golden eagle has been updated from the 2005 WEMO Final EIS (BLM 2005) to include a BLM Sensitive listing in addition to the California: Fully Protected, Species of Special Concern (as described in Section 3.3.6.5, pg. 3-175 of the 2005 WEMO Final EIS (BLM 2005)).

Threats

Threats to the golden eagle would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. For a discussion of these threats, please refer to Section 3.3.6.5, pg. 3-175.

Gray Vireo

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information. All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.6, pp. 3-175 to 3-176 of the 2005 WEMO Final EIS.

Life History

This species is found on arid slopes dominated by short, densely branched, stiff-twigged shrubs. It is migratory, occurring in the western Mojave Desert from early April until mid-August.

Regulatory Status

The regulatory status for the gray vireo has been updated from the 2005 WEMO Final EIS (BLM 2005) to include USFWS bird of conservation concern in addition to the BLM Sensitive and California Species of Special Concern status (as described in Section 3.3.6.6, pp. 3-175 to 3-176 of the 2005 WEMO Final EIS).

Threats

Identified threats include habitat destruction through rural and urban development, off-road vehicle activity during the nesting season, wildland fires, and removal of yuccas and cholla cacti. Grazing has shown both positive and negative effects on this species. Fragmentation of the small remaining populations is a serious long-term threat.

LeConte's Thrasher

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information. All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.6.8, pg. 3-177 of the 2005 WEMO Final EIS.

Life History

The habitat for the LeConte's thrasher is creosote bush scrub with stands of cholla cactus, Joshua trees, and thorny shrubs.

Regulatory Status

The regulatory status for the LeConte's thrasher has been updated from the 2005 WEMO Final EIS (BLM 2005) to include USFWS bird of conservation concern in addition to the California Species of Special Concern status (as described in Section 3.3.6.8, pg. 3-177 of the 2005 WEMO Final EIS).

Threats

The primary threat is loss of habitat and fragmentation of habitat into segments too small to support a viable population in the long term. LeConte's thrashers are sensitive to vehicle traffic during the nesting season, especially off road travel in washes.

Bell's Vireo (Least Subspecies)

The Bell's vireo was not included in the 2005 WEMO Final EIS (BLM 2005), but is considered to potentially occur within the planning area based on recent documentation (Dudek and ICF International 2012) and consultation with BLM biologists. The information presented below is based on the species accounts prepared for the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012).

Life History

Bell's vireo is a neotropical migrant that breeds in the summer in riparian scrub. This species is largely associated with early successional cottonwood-willow and are known to nest in riparian woodlands dominated by willow (Peterson and others 2004) and Fremont cottonwood (Kus 2002b). Suitable willow woodlands are typically dense with well-defined vegetative strata or layers. The most critical structural component of nesting habitat in California is a dense shrub layer 2 to 10 feet aboveground (Goldwasser 1981; Franzreb 1989; Brown 1993). The presence of water, including ponded surface water or moist soil conditions, may be an important component of nesting habitat (Rosenberg and others 1991). Bell's vireo may forage in scrub or chaparral habitat near nesting habitat (USFWS 1986b).

Breeding least Bell's vireos begin arriving on their breeding grounds in late March and begin nesting in early April (Kus 2002a). Individuals may remain on the breeding grounds into early October, but nesting is typically finished by the end of July (Kus 1999).

Little is known about the migratory routes of this species. Individuals leave the northernmost breeding grounds by August or September (Barlow 1962). Most have left the United States by early October, although some may remain in the LCR Valley until late November (Brown 1993). During spring migration, adults return to their breeding grounds in early to mid-March and reach the northern limits of the breeding range in May (Brown 1993; Kus 1999). Home range and movement during the breeding season is limited to areas within dense riparian corridors.

Regulatory Status

The least Bell's vireo is both federally listed and California state listed as endangered. Bell's Vireo is also listed as a Bird of Conservation Concern by the USFWS within the Mojave Desert Bird Conservation Regions (USFWS 2008a). Critical habitat is not found within the study area for this species.

Threats

Historical loss of riparian habitat due to agricultural practices, urbanization, off-road vehicular activity, and exotic plant invasion has contributed to decline of the species (USFWS 2006a, Wildlife Action Plan Team 2006). Loss of breeding habitat due to water source alteration (e.g., channelization, urbanization, and firewood cutting) also threatens the species. In addition, nest parasitism by the brown-headed cowbird has greatly reduced nest success throughout most of its breeding range and has been suggested as a primary cause for decline throughout California. In urbanized areas, where habitat is fragmented and breeding habitat lacks buffers, nest predation may also increase due to meso-predator release and the addition of non-native predators such as domestic or feral cats (USFWS 2006a). The Argentine ant (*Linepithema humile*) also has been noted as a potential nest predator (Peterson and others 2004).

Swainson's Hawk

The Swainson's hawk was not included in the 2005 WEMO Final EIS (BLM 2005), but is considered to potentially occur within the planning area based on recent documentation (Dudek and ICF International 2012) and consultation with BLM biologists. The information presented below is based on the species accounts prepared for the March 2012 draft DRECP baseline biology report (Dudek and ICF International 2012).

Life History

Swainson's hawks breed in the grasslands, shrub-steppe, desert, and agricultural areas of the Columbia Basin, Great Basin, Great Plains, American Southwest, and the Central Valley of California. In California, remnant (or recolonizing) populations in Southern California are found in the western Mojave Desert in the Antelope Valley and in the eastern Mojave Desert in the Mojave National Preserve. Historically, Swainson's hawks nested throughout the California lowlands, including coastal valleys and plains where they no longer occur today. Specific locations where Swainson's hawks have been reported breeding in southeastern California include near Cima Dome and Lanfair Valley in San Bernardino County, at Oasis Ranch in Mono County, and near Lancaster in Los Angeles County. They generally nest in isolated trees, narrow bands of vegetation, or along riparian corridors in grassland, shrubland, and agricultural landscapes. Within the Western Mojave area, Joshua trees (*Yucca brevifolia*) and non-native ornamental trees or trees planted as windbreaks also function as nest sites. In North America, breeding Swainson's hawks prey chiefly upon small rodents such as young ground squirrels (*Spermophilis* spp.), pocket gophers (*Thomomys* spp.), deer mice (*Peromyscus* spp.), and voles (*Microtus* spp.). Swainson's hawks arrive on the breeding grounds in March-April.

Regulatory Status

The Swainson's hawk is California state listed as threatened and is also listed as a Bird of Conservation Concern by the USFWS within the Mojave Desert Bird Conservation Regions (USFWS 2008a).

Threats

Threats to this species include historical loss of riparian habitat due to agricultural practices, urbanization, and contracting range of Joshua trees and riparian habitats in the Mojave Desert (Bloom 1980). Chronic and acute pesticide poisoning also affects the Swainson's hawk (Goldstein et al. 1996, Risebrough et al. 1989).

California Condor (*Gymnogyps californianus*)

Life History

Currently, the condor is found in three disjunct populations: a reintroduced population in both Southern and central-coastal California, a reintroduced population in the Grand Canyon area of Arizona, and a reintroduced population in Baja, California, Mexico.

California condors are primarily a cavity nesting species and typically nest in cavities located on steep rock formations or in the burned out hollows of old-growth conifers. Less typical nest sites include cliff ledges, cupped broken tops of old-growth conifers, and in several instances, nests of other species. California condors are obligate scavengers, feeding only on the carcasses of dead animals, primarily medium- to large-sized mammals, but also occasionally on reptiles and birds. Condor food items within interior California in prehistoric times probably included mule deer (*Odocoileus hemionus*), tule elk (*Cervus elaphus nannodes*), pronghorn antelope (*Antilocapra americana*), and smaller mammals.

Regulatory Status

The California condor is listed as federally and state Endangered and state Fully Protected.

Reptiles and Amphibians

Desert Tortoise

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012). All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.2, pp. 3-69 to 3-144 of the 2005 WEMO Final EIS.

Life History

The desert tortoise can be found in a wide variety of habitats, such as alluvial fans, washes, canyons, and saltbush plains (Coachella Valley Conservation Commission 2007; Woodbury and Hardy 1948; Lovich and Daniels 2000; USFWS 1994). Occupied habitat for populations in the

Western Mojave Desert includes valleys, bajadas, and hills with sandy loams to rocky substrates (Germano and others 1994). The vegetation mostly consists of low growing sclerophyll shrubs with mostly winter germinating annuals (Germano and others 1994). Whereas most tortoises in the Mojave Desert are usually associated with creosote bush (*Larrea tridentata*) scrub on alluvial fans and bajadas (USFWS 2008), they can also be found in Saltbush scrub (*Atriplex* spp.) (Stewart 1991) and even in some man-made structures, such as artillery mounds (Baxter 1988).

The presence of shrubs in tortoise habitat is extremely important. Shrubs not only supply shade for the tortoises during hot weather (Marlow 1979), but also the roots provide support and protection for tortoise burrows. For instance, near Twentynine Palms, California, 71% of desert tortoise burrows were associated with creosote bush, and desert tortoises avoided the only community without creosote bush (Baxter 1988). However, other investigators found that burrows were not significantly closer to creosote bush than random sites in areas with vegetation representing both Mojave and Sonoran affinities. Burrows were significantly farther from yucca (*Yucca* spp.) than random sites (Lovich and Daniels 2000). In still another case, burrows were associated with Mojave yucca (*Yucca schidigera*) and catclaw acacia (*Acacia greggii*) even though these species were not particularly abundant (Burge 1978). Wilson and others (1999) found that most juvenile burrows were associated with shrubs. These studies point out that utilization of shrubs varies with the location of the study site; nevertheless, shrubs provide important resources for the desert tortoise.

Several studies have also shown that edaphic (soil) conditions are important for desert tortoises. Tortoises spend up to 98% of their lives underground (Nagy and Medica 1986). Where soils are so sandy that they cannot support the roof of a burrow, tortoises are unlikely to utilize the area (Baxter 1988). In a multivariate analysis of tortoise abundance criteria, Weinstein and others (1986) indicated that "soil digability" is a significant regression variable (i.e., this variable accounted for a significant amount of the variance in habitat use). Conversely, if a caliche horizon (a hardened deposit of calcium carbonate) is present, it may be so hard that tortoises cannot successfully burrow under it. For instance, at the Twentynine Palms Marine base, Baxter (1988) found that every "tank pit" supported tortoise burrows, most often located just under the hardpan.

Desert tortoises are herbivores, and wildflowers, grasses, and in some cases, cacti make up the bulk of their diet (USFWS 2010e; Woodbury and Hardy 1948). Some of the more common herbaceous species utilized by the desert tortoise include desert dandelion (*Malacothrix glabrata*), primrose (*Oenothera* spp.), gilia (*Gilia* spp.), showy desert-marigold, and filaree. Additionally, tortoises may eat some grasses, such as Indian rice grass (*Oryzopsis hymenoides*) or galleta grass (*Hilaria rigida*), although the nutritional value may be less. Also, tortoises are known to eat some cacti such as prickly pear (*Opuntia mohavensis*), beavertail (*Opuntia basilaris*), and various cholla cacti (*Opuntia* spp.). Spring desert annuals and grasses are particularly important in that they supply tortoises with much needed water (USFWS 2010e), which can be stored by desert tortoises for long periods of time (Marlow 1979; Woodbury and Hardy 1948). In Twentynine Palms, California, desert tortoises were found in plant communities with high plant species diversity, such as washes and ecotones between communities (Baxter 1988). Although tortoises were captured more frequently in the diverse wash community—significantly more than expected based on a random distribution—this could be a result of higher visibility to the surveyors in these areas. Nevertheless, their burrows were also significantly closer to ecotones than a set of random points. The use of these high plant diversity areas may therefore be related to increased food availability or possibly the nature of the annual herbs found in these areas.

In addition to the description of tortoise activity presented in the 2005 WEMO Final EIS (BLM 2005) (3.3.2.3, pp. 3-73 to 3-74), tortoise activity is focused on its home range and is primarily determined by temperature (USFWS 1994). Nevertheless, some relocated tortoises have moved significant distances from their release point, including crossing major highways (Stewart 1991). Duda and others (1999) found that tortoise home ranges tend to shrink during periods of drought compared to years of high rains. Following winter hibernation, tortoises become active as low temperatures abate in the spring months. During the spring, tortoises are active throughout the day, foraging on the fresh shoots of annual plants. But as the heat continues to increase into the summer months, tortoises are active only in the cooler morning, late afternoon, and evening hours. During the hot daytime temperatures, tortoises retreat to burrows to wait it out or, in some cases, will aestivate through the summer.

In addition to the description of tortoise activity presented in the 2005 WEMO Final EIS (BLM 2005) (3.3.2.3, pp. 3-75 to 3-76), the desert tortoise breeds in the late summer and fall, before going into hibernation for the winter. Males will “joust” to establish loosely defined home ranges, but these can overlap and are not exclusive. Home range size can vary dramatically, from 10 to over 450 acres (USFWS 1994). Females begin breeding at about 15 to 20 years of age, and will store the male’s sperm (Gist and Fisher 1993; Turner and Berry 1984). Egg laying occurs in the spring, but occasionally may also take place in the fall. Incubation is typically about 100 days, with the eggs hatching in the late summer and early fall. There is little or no parental care of the nest or the young. The sex of the offspring is determined by the incubation temperature; females being hatched at higher ground temperatures (above 89°F) while males are hatched below this temperature (Spotila and others 1994). Desert tortoises can produce from one to three clutches of eggs per year. On rare occasions, clutches can contain up to 15 eggs; most clutches contain 3 to 7 eggs, with an average clutch size of 4.5 eggs (Turner and others 1984, 1986).

The desert tortoise is a primary consumer; that is, they feed on plants. As such, they compete for vegetation resources with other primary consumers, such as the desert iguana, Gambel’s quail, mourning dove (*Zenaida macroura*), pronghorn antelope, and domestic cattle (*Bos taurus*). Adult tortoises are preyed on by few other animals; however, some may be taken by coyote and kit fox. Young tortoises are routinely preyed upon by kit fox and common raven.

Desert tortoise burrows supply important shade and thermoregulatory resources for a variety of species, including many species of snakes, insects and spiders, and small mammals.

Regulatory Status

The information from the 2005 WEMO Final EIS (BLM 2005) (Section 3.3.2.1, pg. 3-69), is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012).

The Agassiz’s desert tortoise (*Gopherus agassizii*) (hereafter simply referred to as desert tortoise) is both a California state- and federally listed threatened species. Critical habitat for desert tortoise was first designated for the Beaver Dam Slope (Utah) population in 1980 (45 FR 55654–55666). An initial recovery plan for the Mojave population of the desert tortoise was completed in 1994 (USFWS 1994). A revised draft recovery plan was completed in 2008 (USFWS 2008 and finalized in 2011 (USFWS 2011).

Under the 2011 Recovery Plan (USFWS 2011), a revision of the desert tortoise recovery units was made reducing the initial six units to five based on recent genetic work (Murphy and others 2007;

Hagerty and Tracy 2007). The principal changes are results of combining and expanding the previous northern Colorado and eastern Colorado units into one (i.e., Colorado Recovery Unit), a contraction of the Eastern Mojave Recovery Unit, an appurtenant expansion of the Northeastern Recovery Unit, and a contraction of the southern extreme of the Western Mojave Recovery Unit in the vicinity of the Coachella Valley.

Threats

Threats to desert tortoises within the WEMO Planning Area have not changed from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) and associated 2006 Biological Opinion, except as discussed herein. For a discussion of these threats, please refer to the 2006 Biological Opinion in Appendix F.

Mojave Fringe-toed Lizard

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information from the DRECP Baseline Biology Report (March 2012), field data collected by the Barstow and Ridgecrest Field Offices, and other literature cited herein. All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005) and is not discussed further in this supplemental EIS. For a general discussion of these species, please refer to Section 3.3.7.1, pp. 3-182 to 3-183 of the 2005 WEMO Final EIS.

Life History

The Mojave fringe-toed lizard is best described as an opportunistic omnivore. They feed primarily on sand-dwelling insects, but will also feed on the flowers, leaves, and seeds of annual plants (Jarvis 2009). Juvenile Mojave fringe-toed lizards feed primarily on arthropods including ants, beetles, and scorpions. As is seen in many reptiles that live in arid environments, these lizards obtain most of their water from the insects and plants that they ingest (76 FR 61321–61330).

Mating typically occurs between April and late June (76 FR 61321–61330). Reproductive activity is highly dependent on the availability of sand-dwelling plants that grow in response to winter (October–March) rainfall (76 FR 61321–61330). Clutch size ranges from two to five eggs, but average two or three eggs (Miller and Stebbins 1964). During years with low rainfall females produce smaller clutch sizes, or none at all. Conversely, they may have multiple clutches in years with abundant rainfall (76 FR 61321–61330).

Mojave fringe-toed lizards are most active from late spring through early fall, when they are active during the hotter periods of the day. They seek refuge in burrows or under the sand when daytime surface temperatures start to exceed 49°C (120°F).

Regulatory Status

The regulatory status for the Mojave fringe-toed lizard has been updated from the 2005 WEMO Final EIS (BLM 2005) to include BLM Sensitive in addition to the California Species of Special Concern status (as described in Section 3.3.7.1, pg. 3-182 of the 2005 WEMO Final EIS (BLM 2005)).

Threats

Threats to the Mojave fringe-toed lizard would not change from the previous analysis provided by the 2005 WEMO Final EIS (BLM 2005) within the planning area. For a discussion of these threats, please refer to Section 3.3.7.1, pp. 3-182 to 3-183.

Northern Sagebrush Lizard

Life History

The sagebrush lizard occurs in a wide variety of open forest and shrub habitat types and utilizes mammal burrows and rock crevices as hibernation sites during cold periods (Zeiner et al 1990). Individuals are active from March or April to late September or early October (Zeiner et al 1990). The reproductive season usually extends from late May to July (Zeiner et al 1990). Egg-laying usually occurs in June or July (Stebbins 1954) with newly emergent hatchlings observed from mid-August to late September (Zeiner et al 1990).

Regulatory Status

The sagebrush lizard is a BLM Sensitive species.

Threats

Threats to this species have not been identified for the planning area, but would most likely be similar to those described for the Mojave fringe-toed lizard including loss of habitat, an increases in local predator (i.e., common ravens), and OHV activities.

Tehachapi Slender Salamander (*Batrachoseps stebbinsi*)

Life History

The Tehachapi slender salamander inhabits moist canyons and ravines in oak and mixed woodlands. Vegetation in occupied habitat includes foothill pine, canyon live oak (*Quercus chrysolepis*), interior live oak, blue oak, Fremont cottonwood (*Populus fremontii*), western sycamore (*Platanus racemosa*), and California buckeye. In more exposed areas of Caliente Creek, habitat includes California juniper (*Juniperus californica*), yucca (*Yucca* spp.), bush lupine (*Lupinus* spp.), and buckwheat (*Eriogonum* spp.). In the lower elevation Caliente Creek areas, the species is restricted to the lower margins of northfacing slopes and side canyons among granitic or limestone talus and scattered rocks. The species also occurs on north-facing slopes in the Tehachapi Mountains within talus piles and fallen wood.

Individuals are primarily active November through May. During the moist periods of fall, winter, and spring precipitation, individuals seek cover under surface objects, especially rock talus during the day. Other substrates that may be used for cover include rocks, logs, bark, and other debris in moist areas but they are primarily associated with talus.

Similar species lay their eggs underground or on moist substrates underneath or within surface objects, especially pieces of bark. It is unknown how or whether juvenile Tehachapi slender salamander habitat differs from that of adults. Juveniles are rarely found, which may indicate that hatching occurs in the spring, as surface activity declines, and that juveniles may remain

underground. As a semifossorial species, the Tehachapi slender salamander is able to enter termite tunnels, earthworm burrows, and other small openings not accessible to larger salamanders.

Regulatory Status

The Tehachapi slender salamander is California state listed as threatened and is a BLM Sensitive Species.

Southwestern Pond Turtle (*Clemmys marmorata pallida*)

The information from the 2005 WEMO Final EIS (BLM 2005) is supplemented by the following updated information. All other background information for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005).

Life History

The southwestern pond turtle is found south of San Francisco Bay including the West Mojave Planning Area (WMPA) and is a subspecies of the western pond turtle. General life history information for this species can be found in the 2005 WEMO Final EIS (BLM 2005).

Regulatory Status

The Southwestern pond turtle is a federal USFWS Species of Concern, BLM Sensitive Species, and California Species of Special Concern.

Threats

Several threats to western pond turtle within the WEMO Planning Area have been identified. In Afton Canyon, the habitat is severely degraded as a result of ground water depletion from human activities and by infestations with the exotic shrub salt cedar (*Tamarix ramosissima*) (Lovich and Myer, 2001). "Betty Ford Crossing" is currently the single most viable habitat patch within Afton Canyon, but it is not the most protected habitat for this species since a currently designated open route crosses the river at this point and any remaining turtles are subject to crushing by vehicles (Lovich and Puffer, 2016).

Within Afton Canyon an additional risk is presented by a major rail line that parallels the Mojave River for most of its course crossing the river at two points. The proximity of trains to the riparian system provides the potential for toxic spills from wrecks (Lovich and Myer, 2001). Both spills and illegal dumping of toxic materials have occurred at Afton Canyon in the past.

E.5 Socioeconomics and Environmental Justice

E.5.1 Socioeconomics

E.5.1.1 Regulatory Framework

There are no federal, state, or local regulations associated with socioeconomics that are applicable to the WMRNP.

E.5.1.2 Regional and Background Information

The following information pertaining to existing economic and demographic conditions in the planning area is excerpted from the Socio-Economic Analysis developed for the 2005 WEMO Final EIS prepared by Alfred Gobar and Associates. Those data have been supplemented by being revised to reflect updated U.S. Census Bureau data, and additional discussion focusing on the role of access has been added. The complete socio-economic technical report is contained in Appendix N of the 2005 WEMO Final EIS. In addition, the presentation of the information in this section has been revised from that previously provided in the 2005 WEMO Final EIS by being focused on the role of access.

Encompassing nearly 9.4 million acres, the planning area is a substantial geographic region. This large study area includes over 974,000 residents per 2008-2012 ACS data, and encompasses portions of five separate counties. Motor vehicle access through such a large area is key to providing regional connectivity in such a dispersed area. The vast majority of travel is funneled to key arterial Interstates, highways and County roads, but access drives connectivity and commerce through all parts of the planning area, both for area residents and for all of Southern California.

In totality, the West Mojave's existing population base is significant, but also widely dispersed in scattered concentrations ranging from as few as less than 30,000 residents in the Barstow and Ridgecrest areas to more than 300,000 in the Palmdale-Lancaster area of Los Angeles County and the Victor Valley area of San Bernardino County. Given the large geographic area and widely dispersed population, OHV access is the key to maintaining regional connectivity across the area. The vast majority of OHV travel in the area is based on funneling traffic from dispersed areas into a few major arteries including interstate highways, State highways, and County roads. The planning area services this burgeoning, but widely dispersed, population that has, and uses the high desert as its recreational backyard.

Regional Environment

The WEMO planning area is also situated along the periphery of Southern California and its huge metropolitan population and employment base. Overall economic growth and trends throughout the WEMO Planning area are still greatly influenced and driven by growth and economic trends associated with the larger economic region of Southern California. The six-county Southern California region (Los Angeles, Orange, San Diego, San Bernardino, Riverside, and Ventura counties) had 21 million residents and 11 million nonagricultural wage and salary jobs in 2010.

A large number of workers residing in outlying areas, including the West Mojave planning area, commute to jobs in the more developed regions of Southern California because of the high volume of employment opportunities. Growth in employment throughout Southern California is one of the principal factors driving demand for living in outlying subregions, such as the West Mojave. Recent census data from 2010 strongly suggest that population and housing growth throughout the West Mojave was substantially concentrated within cities and unincorporated enclaves located closest to the major employment centers of Southern California. As a result, the WEMO Planning area population base has not been considered a self-generating economy even though certain industries such as aerospace, mining, military and government operations have long provided local employment to area residents.

This is rapidly changing. In 2000, about one in five workers residing in cities throughout the West Mojave commuted at least 60 minutes each way to work. In 2010, the average commute time in

cities throughout the West Mojave was 29.5 minutes. The rapid growth of high desert cities has created an economy that is sustaining itself, but still relies to a large extent on the influx of dollars from other Southern California areas.

The planning area provides the major connecting corridor between the Southern California area and two other key metro areas—the Las Vegas metro area and the Central Valley of California. Recreation-, service- and tourism-sector jobs in the planning area are largely influenced by the economic conditions in Southern California and these other metro areas. Other jobs in the high desert continue to service these metro populations, such as energy generation and transmission, and mining.

Between 1980 and 2010 nonagricultural employment in Southern California grew 88.0 percent from 5.85 million jobs in 1980 to 11.0 million in 2010, outpacing the national growth rate. U.S. Growth nonagricultural employment growth over this same time period was 58.0 percent. Aggregate employment has grown at a slower rate in absolute and relative terms since 1990 as a result of significant job losses during the early 90's. The overall slower pace of employment growth is indicative of broader trends describing the outlook of future economic growth in the region.

Study Area Demographics

The demographic characteristics of the eleven incorporated cities which make up the WEMO Planning area are shown in Table E.5-1.

The West Mojave extends across large portions of four Southern California counties (Los Angeles, San Bernardino, Kern, and Inyo), which all combined have 12.7 million residents (2010 Census) or nearly 37.2 percent of the Statewide population (34.1 million residents). Demographic characteristics describing an area are most often compared to corresponding characteristics describing a larger geographic setting of which it is a part. Roughly 80 to 90 percent of all residents within Southern California, however, reside in areas that are substantially more developed and urbanized than is the case with the WEMO Planning area. As noted in Table E.5-2, counties within the planning area are anticipated to grow by double digits over the 2010 to 2030 timeframe. All of the counties, except Inyo and Los Angeles, are expected to grow at a rate that exceeds that of the state.

Typical population densities generally range from roughly 2,500 persons per square mile in growing suburban areas to more than 7,500 persons per square mile in urbanized areas. By comparison, the corresponding population density for the eleven WEMO Planning area cities combined (accounting for 71 percent of the planning area population base) only averages about 865 persons per square mile (726,482 residents in 2010 divided by 840 square miles). The Census Bureau utilizes a minimum threshold of 1,000 persons per square mile to denote an urbanized setting. The WEMO Planning area is more characteristic of a large rural environment. As such, demographic traits that describe the WEMO Planning area reflect distinctly different circumstances than is true for more urbanized portions of Southern California, thereby minimizing the usefulness of direct comparisons. Instead, the State of California, which includes a sizeable rural population, serves as a more appropriate reference for comparing overall distinctions describing WEMO Planning area residents.

Compared to the State as a whole, the WEMO Planning area consists of a relatively young population base. The planning area includes a heavy composition of families, and similarly has a

greater proportion of residents 20 years of age or younger than the State. As result, there are relatively fewer small households (two persons or less). The West Mojave is still attracting a large number of new households but at a whole. The affordability of housing in the WEMO Planning area remains a principal attraction to the new households, resulting in population growth rates in the planning area being higher than in the more fully developed areas of the Inland Empire, and the attraction of those households to lower-cost, local recreation and tourism options.

*contains only one census tract within the planning area.

Workforce participation (workers, not jobs) among West Mojave households continues to lag the State and Southern California economy. Census data (2010) indicates there was an average of 1.35 workers (persons indicating a place of work) per household throughout the WEMO Planning area compared to a State-wide average of approximately 1.47 workers per household. Similarly, current estimates of local employment (local jobs, as distinct from resident workers) also indicate that there are fewer job opportunities in the WEMO Planning area (1.14 jobs per occupied household) than is true for the State economy or Southern California as a whole (1.34 jobs per household). The incidence of local job opportunities in the WEMO Planning area, is comparable to slightly less than other outlying regions of Southern California, including Kern County (1.33 jobs per household) and the Inland Empire (1.24 jobs per household).

Demographic traits and growth trends describing the WEMO Planning area overall vary considerably within the planning area. The San Bernardino sub-area of the planning area accounts for 64 percent of the planning area's land area, nearly 49 percent of the 2000 resident population, and nearly 48 percent of population growth between 1990 and 2000. By comparison, the Los Angeles sub-area only accounts for 7 percent of the planning area's land area, but 41 percent of the 2000 resident population, and over 50 percent of corresponding population growth. The Kern sub-area accounted for 11 percent of the 2000 population base, but less than 2 percent of total corresponding growth. The Inyo sub-area, with roughly 600 residents, accounts for less than 0.1 percent of the WEMO planning area population base and has experienced an overall decline in population since 1990. On a combined basis, the Los Angeles and San Bernardino sub-areas accounted for over 98 percent of total population growth between 1990 and 2000.

The population growth and changes in the planning area add stress to the transportation network in several ways:

- Regional and Planning Area population growth adds more vehicles to the existing network;

- Planning Area population growth requires retooling of the network and its uses as new communities are constructed, become more densely populated, and require additional access needs;
- The modest income characteristics of the Planning Area population also favor closer-to-home recreation options that add more vehicles to the existing network;
- Population growth in outlying portions of the Planning Area results in increases in average commute times and therefore a greater number of vehicle miles traveled per person; and
- The youthfulness of Planning Area population growth increases the number of persons engaged in vehicle-based recreation, and in particular in OHV use.

Regional Trends in Population and Employment

A wide variety of socioeconomic factors can be evaluated with regards to growth trends, but changes in population, employment, and housing tend to reflect principal drivers of urbanization and associated economic activity, and these in turn affect and are affected by the transportation network.

Total population within the six-county region of Southern California, plus Kern County, grew by 8.0 million residents over the 30-year period from 13.8 million residents in 1980 to 21.8 million residents in 2010. The resident population of Inyo County has remained relatively static since 1980 (about 18,000 residents) and is not explicitly evaluated in relation to regional trends since it hosts roughly 600 residents, or less than 0.1 percent of the WEMO population.

The total population throughout Southern California grew at an average annual rate of 1.93 percent. Los Angeles County continues to account for the largest share of the population in Southern California. The pattern of growth, however, is shifting and outlying subregions are capturing a greater share of total growth. Since 1980, outlying counties such as Riverside, San Bernardino, and Kern County have steadily increased their respective share of total population.

As shown in Table E.5-3, nonagricultural employment trends since 1970 has followed population growth in the planning area. Agriculture (including grazing activities) and mining have a long history in the WEMO Planning area, but account for less than 1 percent of current employment opportunities. Non-agricultural employment correlates better than total employment with household formation, associated housing demand, and population growth since a large segment of agricultural employment is transient and seasonal with limited capacity to occupy market rate housing. Non-agricultural employment growth will constitute a principal force driving future housing growth and urbanization in the WEMO Planning area. Employment directly associated with recreation accounts for about 2 percent of total service-based employment, but is growing. Accommodation and food services are a much larger proportion of total service-based employment, and are increasing at a faster rate than other sectors. While most of the services employment is expected to support the local population and through travelers, some proportion of it is also related to recreation and OHV access on public lands in the West Mojave, which accounts for about 1 percent of current employment opportunities or about 2,500 jobs in the area.

Factors that augment the current employment base of the WEMO Planning area include a higher proportion of service and trade sector jobs (consistent with rural and emerging growth areas).

The WEMO Planning area also has a moderately higher mix of government jobs, reflecting the historical role of federal and state agencies in the region. The manufacturing base within the WEMO Planning area is significantly underrepresented by comparison to the broader Southern California economy.

Table E.5-3. WEMO Planning Area Employment Since 1970

Sector	1970	1980	1990	2000	2011	Change 1970-2011 (%)	Change 1990-2011 (%)
Farm/Agriculture Services	31,611	46,428	42,019	68,182	52,503	66	25

Services	119,657	294,705	470,470	634,888	814,242	580	73
Government	103,363	122,057	160,440	178,983	199,450	93	24

Source: EPS-HDT 2013

Not only is total employment in Southern California slowly increasing, but the outlying areas which comprise the WEMO Planning area are capturing larger shares of the growth. In 1980, Los Angeles County accounted for 62.1 percent of nonagricultural employment throughout the Southern California region, including Kern County. In 2010, Los Angeles County's respective share was down to 47.3 percent. By comparison, San Bernardino County captured an increasing share of employment (from 4.2 percent in 1980 to 7.2 percent in 2010), while the corresponding share for Kern County has remained relatively constant (2.9 percent). Both Riverside and San Bernardino County are commonly recognized as a single metropolitan statistical area (Inland Empire) for purposes of tracking socio-economic trends. On the basis of this definition, the Inland Empire has led Southern California in net employment gains since 1990 (314,400 jobs). As these trends suggest, the proportionate share of nonagricultural employment growth has been shifting over the 30-year reference period, principally from Los Angeles County to the other six counties. As detailed in Table D.5-2, a large amount of the nonagricultural employment growth has taken place in the projected area, as is evidenced by the elevated gains in employment over the past decades.

Since the CDCA Plan was approved in 1980, the livestock industry in the California Desert has undergone major decline, especially in the last 10 years. Most of the grazing operations on public land within the planning areas are small family operations. As the permittee or lessee has aged and is less able to run their grazing operation stocking rates have typically declined. Unless a younger family member or partner is capable of maintaining the grazing operation, in addition to stocking rates declining, fewer range improvements are maintained and usually no new range improvements are developed. This trend has been especially hard on the sheep industry. Very few sons or daughters follow in their parent's footsteps and continue family sheep operations. Overall, the AUMs that BLM may annually authorize under good conditions have decreased from its peak of nearly 40,000 AUMs in 1992 to 13,039 AUMs in 2016 for all classes of livestock.

The cattle and sheep markets have also experienced substantial fluctuations over the past 30 years. These markets have a great deal of influence on family incomes and fluctuations in stocking rates. The overall costs of running a grazing operation has nearly doubled over the past 30 years while market returns have been fairly static along with BLM grazing fees.

E.5.2 Environmental Justice

E.5.2.1 Regulatory Framework

Federal

Executive Order 12898

In 1994 President Clinton issued Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, to direct federal attention on environmental and human health conditions in minority and low-income communities. EO 12898 promotes nondiscrimination in federal programs that substantially affect human health and the environment, and it guarantees information access and public participation relating to these matters. This order requires federal agencies to identify and address any disproportionately high or adverse human health or environmental effects on minority and/or low-income populations resulting from programs, policies, and activities of federal agencies. The Council on Environmental Quality (CEQ) oversees federal compliance with EO 12898.

Council on Environmental Quality's Environmental Justice Guidance under the National Environmental Policy Act

To ensure that federal agencies effectively identify and address environmental justice concerns according to EO 12898, the CEQ, in consultation with the Environmental Protection Agency (EPA), developed guidance to assist federal agencies to implement procedures. According to the CEQ's *Environmental Justice Guidance under NEPA*, agencies should consider the composition of affected areas to determine whether minority or low-income populations are affected by a proposed action, and, if so, whether those environmental effects may be disproportionately high or adverse (CEQ 1997).

According to the CEQ environmental justice guidelines, minority populations should be identified if:

- A minority population percentage either exceeds 50% of the population of the affected area, or:
- If the minority population percentage of the affected area is meaningfully greater than the minority population percentage in the general population or other appropriate unit of geographic analysis (e.g., a governing body's jurisdiction, neighborhood census tract, or other similar unit).

Environmental Protection Agency (EPA) Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses

The EPA's *Final Guidance for Incorporating Environmental Justice Concerns in EPA's Compliance Analyses* defines how the EPA will ensure that disproportionately high and adverse human health or environmental effects on minority communities and low-income communities

are identified and addressed. It establishes agency-wide goals for engaging American Indian, Alaska Native, Native Hawaiian, and other indigenous peoples. It also establishes agency-wide goals for environmental protection and lists actions the EPA would take to incorporate environmental justice into its mission (EPA 1998).

Environmental Protection Agency Plan Environmental Justice 2014

The EPA's Plan Environmental Justice (EJ) 2014 is a strategy to help the agency integrate environmental justice into its programs, policies, and activities. Plan EJ 2014 identifies Cross-Agency Focus Areas, Tools Development, and Program Initiatives as the three essential elements that will advance environmental justice across the EPA and other agencies of the federal government.

Bureau of Land Management Land Use Planning Handbook, Appendix D

The Plan Area includes all or part of the following Department of Interior (DOI) Bureau of Land Management (BLM) field office jurisdictions:

- Ridgecrest
- Barstow
- Needles
- Palm Springs/South Coast

Appendix D (Social Science Considerations in Land Use Planning Decisions) of the BLM Land Use Planning Handbook provides guidance on integrating social science information into the planning process for projects within BLM lands. Any information gathered for planning purposes must be considered in the context of BLM's legal mandates. To be effective, social scientific data and methods identified in Appendix D must be integrated into the entire planning process (BLM 2005). Furthermore, Section IV (Environmental Justice Requirements) of Appendix D provides guidance for assessing potential impacts on population, housing, and employment as they relate to environmental justice. It also describes variables such as lifestyles, beliefs and attitudes, and social organizations with respect to environmental justice.

Defining Environmental Justice Populations

The CEQ Environmental Justice Guidance defines "minorities" as individuals who are members of the following population groups: American Indian or Alaskan Native, Asian or Pacific Islander, Black not of Hispanic origin, or Hispanic (CEQ 1997). The total minority population has been calculated by subtracting the white alone, not Hispanic or Latino, population from the total population. An environmental justice population is identified when the minority population of the potentially affected area is greater than 50% or the minority population percentage is meaningfully greater than the minority population in the general population or other appropriate unit of geographical analysis. For this analysis, any census tract with a minority population greater than 50% was identified as an environmental justice tract of concern.

The CEQ Environmental Justice Guidance defines "low-income populations" as populations with mean annual incomes below the annual statistical poverty level. For this analysis, low-

income population was determined by utilizing the U.S. Census tract data for the 5-year period 2008-2012. For this purpose, “low-income” is equated with “below poverty level.” Other measures of “low-income” are also in use in California. For example, the State of California Department of Housing and Community Development, Division of Housing Policy Development establishes annually specific “low-income” thresholds for California counties. The Department distinguishes as well between “low-income,” “very low income,” and “extremely low” income thresholds for households of different sizes.

The CEQ and EPA guidance documents do not provide a discrete threshold for determining when a low-income population should be identified for environmental justice. For this analysis, a population of a U.S. Census tract that merits an environmental justice analysis has a percentage of its low-income population of the potentially affected census tract greater than the area-wide percentage of the low-income population across the entire West Mojave planning area.

E.5.2.2 Regional and Background Information

A discussion of the minority and low income populations in the WEMO planning area is presented in Section 3.6.

E.6 Recreation Activities

E.6.1 Regulatory Framework

Federal

Federal Land Policy and Management Act, 1976 as Amended

FLPMA establishes public land policy; guidelines for administration; and provides for the management, protection, development, and enhancement of public lands. In particular, the FLPMA’s relevance is that it establishes BLM’s authority to grant ROWs for multiple uses. Among those uses, FLPMA recognizes that the public lands should be managed in a manner that will provide for outdoor recreation.

California Desert Conservation Area Plan, 1980 as Amended

The CDCA Plan (BLM 1980) includes a Recreation Element to address use of, and access to, recreational destinations within the California Desert. The management goals of the CDCA Plan Recreation Element are as follows:

- 1) Provide for a wide range of quality recreation opportunities and experiences emphasizing dispersed undeveloped use.
- 2) Provide a minimum of recreation facilities. Those facilities should emphasize resource protection and visitor safety.
- 3) Manage recreation use to minimize user conflicts, provide a safe recreation environment, and protect desert resources.
- 4) Emphasize the use of public information and educational techniques to increase public awareness, enjoyment, and sensitivity to desert resources.

- 5) Adjust management approach to accommodate changing visitor use patterns and preferences.
- 6) Encourage the use and enjoyment of desert recreation opportunities by special populations, and provide facilities to meet the needs of those groups.

In order to accommodate the goals, access to the desert must be provided while protecting sensitive resources. The Recreation Element states the following with regard to access:

“To engage in most desert recreational activities outside of open areas, visitors must use motorized vehicles and usually travel on some previously used or marked motorized-vehicle route. Understandably, vehicle access is among the most important recreation issues in the Desert. A primary consideration of the recreation program, therefore, is to ensure that access routes necessary for recreation enjoyment are provided” (BLM 1980, p. 84).

E.6.2 Regional and Background Information

Located only 90 minutes from downtown Los Angeles, the WEMO Planning area is the recreational backyard of the metropolitan area's 21 million residents, of whom nearly 2 million participate in OHV activities and an even greater number camp, hike or drive for pleasure. The Mojave Desert provides an easily accessible, uncrowded recreation experience. The many recreation opportunities of the WEMO Planning area arise from the variety of its mountains, bajadas, dry lakes and badlands, the diversity and affluence of its visitors and the sheer volume of space that its landscape provides.

The types of recreation provided in the WEMO Planning area are highly varied. Due to its vastness, many visitors feel a greater freedom from regulations that encourages them to try new forms of recreation while not having to worry about bothering others. Given the scale of the desert and this sense of freedom, it is not surprising that many of the recreational activities center around vehicles, speed events or activities that require a great deal of acreage and separation from other visitors. These activities include motorcycle activities, four-wheel drive exploring, sightseeing, target shooting, hunting, using experimental vehicles/aircraft, model rocketry, and dry land windsailing. Many other recreational pursuits that do not revolve directly around the recreational aspect of vehicle use are, by necessity (due to the distances involved), dependent upon OHVs. Examples of this include endurance equestrian rides and support vehicles, hiking, mountain biking, bird watching, botany, rockhounding, camping, geocaching, and picnicking, for which vehicles are a means to access various destinations. In Chapter 4, the effect of the designated route network on recreational opportunities is quantified and evaluated through the mileage of routes designated for these various recreational uses.

Patterns of Use

Although most recreational activities are widely dispersed, certain activities have “hot spots” that have been established over time. How or why they were established varies from case to case, but may be due to the features (topography, geology) of the area, proximity to urban areas, the availability of access into the area, and publicity. Understanding recreation patterns and hot spots is critical to the design of an effective OHV access network. Particular features or land-characteristics may make a given area highly desirable for a certain type (or types) of recreational activity. For instance, flat, expansive terrain is often desirable for recreational

activities such as target shooting, driving for pleasure, and more quick-paced race events. On the other hand, mountainous terrain is often more conducive to such activities as rock climbing, hiking, rock hounding or technical four-wheel rock crawling. In addition, specific attractions of an area dictate the types of use, as well as the levels of use that predominate.

Some of the most popular hot spots in the desert portions of the WEMO planning area are dry lakebeds. Dry lakebeds pose unique access issues. This is due to the difficulty in following routes across lakebeds, and the adverse impacts and safety issues with marking them. Major lakebeds have been individually classified as to their availability for access and associated recreational use, and are generally identified as either open or closed, or available by permit. Smaller lakebeds are available for access consistent with the access parameters for surrounding areas, i.e., either open access or limited to designated routes. Two of the larger lakebeds in the West Mojave Desert that have not yet been specifically designated for access are Cuddeback and Koehn Lake Beds.

Cuddeback Lake is a sizeable lakebed that has been a popular destination for both casual recreational use, as well as commercial use, for several decades. Ease of access, the frequency that the lakebed is dry, and surrounding vistas contribute to its attraction. The casual recreational uses that occur on the lakebed include land sailing, model rocket launching, bicycling, photography, star-gazing, and camping. Additionally, motor vehicle use of all kinds is popular on the lakebed including motorcycles, ATV, recreational Off-Highway Vehicle, and four-wheel drive vehicles, as well as OHV and non-OHV use associated with commercial filming. Past and current levels of use are not currently consistent with the access designation for the surrounding area.

Koehn Lake is a sizeable lakebed located in the Fremont Valley northwest of the Rand Mountains and south of the Jawbone area that is not particularly popular for the public, but that has some unique safety issues. To the unfamiliar visitor, Koehn Lake's surface appearance is misleading. To the naked eye, the lakebed generally appears to be dry, but the lake actually only has a thin crust of a few inches on the surface. After one breaks through this crust, the subsurface is a clayish like material that acts similar to quicksand. Because of the potential hazard posed by the lakebed surface, recreational use and travel across the lakebed are a concern to BLM.

The southernmost, Coyote dry lakebed north of the Joshua Tree area is a popular destination for casual recreational users, due to its proximity to Copper Mountain Community College. Ease of access to college students and surrounding vistas contribute to their attraction. The casual recreational uses that occur on the lakebed are generally limited to day use riding, including motorcycles and all-terrain vehicles, with occasional OHV use associated with occasional overnight camping. The routes across the lakebed are difficult to ascertain for a user entering from a route adjacent to the lakebed, and they serve as a substantial source of route proliferation onto adjacent lands. This lakebed is currently designated as limited to designated routes, but the difficulty of the public identifying designated routes and BLM managing the limited use is a concern to BLM.

The relative proximity of the Mojave Desert to urban centers makes it easy and convenient for recreationists to visit those "hot spots" and other areas having the features that they desire. About 85% of all visitors to the Mojave Desert are from the urban areas of Southern California. The BLM public lands are closer to the Los Angeles basin than other similar desert-environment

recreation areas, such as the Mojave National Preserve and the national parks, and offer more expansive areas and a wider variety of recreational experiences.

OHV access is itself a feature or characteristic that may or may not be sought. For example, a recreationist hoping to photograph or film particular wildlife undisturbed in its natural habitat would not want access so convenient that it attracts a large number of other visitors. Recreationists seeking to hike and camp in remote, difficult to reach areas to experience solitude would not find a location that has ready access from a major highway to be desirable. Conversely, a recreationist seeking to ride his dune buggy over sand dunes with groups of other people may appreciate easy access. Many other OHV users are seeking ready OHV access to the desert landscape to experience the space and solitude that heavily used areas cannot offer.

Publicity about an area's recreational opportunity often attracts users. Although some of this publicity can come through the mainstream news media (newspapers, television news reports), much of it comes by "word of mouth." A recreation club (motorcycle riding club, four-wheel drive club, dune buggy club, hiking and camping club, equestrian endurance riding club, rock hounding club, rock climbing club, photography club, or wildlife viewing club) may send out newsletters to its members identifying areas that have those features that are considered ideal for the type of recreational activity that the club engages in. The popularity of the web (organizational websites, Facebook) and similar mechanisms to share information have further increased sharing of information about locations and destinations in the desert. Computer and cell phone applications can provide pictures and specific directions to sites, and have further expanded the reach of information beyond club members and small groups of individuals. This promotes discussion about specific areas and facilitates increased recreation at those sites. Recreation clubs are often drawn to specific hot spots where people participating in that particular type of recreation can gather and socialize.

Guidebooks and maps publicize favorite recreation sites. Guidebooks are available that describe areas in the Mojave Desert that offer significant opportunities for specific activities. These guidebooks typically describe the areas of interest in sufficient detail to lead recreationists to the most promising regions for the activity. Maps published by the American Automobile Association and regional user interest groups are particularly popular, for they indicate areas where different types of recreational activities occur.

Recreationists engage in activities that make use of more than one type of feature or terrain, and often desire to travel to locations where multiple types of terrain are readily available or that are relatively close to other areas having different terrain. For instance, in dual sport motorcycle touring, recreationists use motorcycles that are licensed for use on regular streets and highways but are capable of off-road travel. Recreationists engaged in such touring can ride to the desert on major highways, and then go off-road once a desired trail or special recreation opportunity has been reached. Their motorcycles can fit through tight spaces that larger vehicles, are unable to access.

Four-wheel drive vehicles have their attractions as well. A single four-wheel drive SUV can accommodate more people and items than can a dual sport motorcycle, and can also readily switch from regular highway travel to off-road touring.

E.7 Grazing

E.7.1 Regulatory Framework

Under the Taylor Grazing Act, allotments are classified under Section 3 as a grazing permit or under Section 15 as a grazing lease. Allotments with perennial forage have an established limit of forage based on the quality and quantity of perennial plants, stated in animal unit months (AUMs) for a defined period of grazing use. An AUM is a measure of perennial or ephemeral feed that will support a cow and its calf, a ewe and its lambs, or a bull for one month. Perennial forage consumption is typically authorized at the same level from year to year unless forage production does not meet seasonal norms. When the CDCA Plan (1980) originally allocated AUMs for forage consumption for livestock use it occasionally suspended AUMs for forage allocations to wildlife and for poor rangeland conditions to improve watershed stability.

In contrast, grazing use in allotments with ephemeral forage does not have an established level or specified period of use. Instead, the amount and length of grazing use in any particular season or year is based on ephemeral production and determined just prior to authorizing the grazing use. In the WEMO Planning area, minimum forage production is 230 lbs/acre to authorize ephemeral grazing for a season for most of the planning area. The 2006 WEMO Plan authorized ephemeral sheep grazing on two allotments within portions of the Fremont-Kramer DWMA (now designated as DT ACEC under the DRECP LUPA). In these areas the minimum forage production is 350 lbs/acre to authorize ephemeral grazing. This level of forage is anticipated to provide sufficient forage for both domestic livestock and wildlife, and still provide ample seed source to sustain production in subsequent years within the planning area.

E.7.2 Regional and Background Information

In most cases, BLM authorizes grazing by permit or lease for a period of 10 years. A shorter period of time is sometimes issued for special circumstances, such as to accommodate a shorter-term lease of the base property or when the Authorized Officer determines that a shorter-term authorization is in the best interest of range management. Additionally, temporary, non-renewable grazing authorization may be issued for special short-term needs such as trailing, or when there is short-term surplus forage available for grazing. All permits and leases are subject to modification and to annual adjustments. Such modifications are implemented through consultation between the permittee or lessee and the BLM, and consistent with terms of applicable biological opinions and Section 106 of NHPA review.

The permit or lease identifies mandatory terms and conditions that specify the number, kind and/or type of livestock that may graze the allotment, and the grazing period (usually with specific beginning and ending dates). In addition, many permits and leases also require adherence to prescribed grazing prescriptions in the form of grazing systems, such as deferred, deferred-rotation, or rest-rotation. Other authorizations may have conditions pertaining to turnout dates based on vegetation conditions. Based on range type, season of use and range condition all permittees and lessees have specific grazing utilization thresholds and other specified terms and conditions to protect site-specific areas such as riparian areas, wildlife habitat, and special status plant populations. These terms and conditions have been developed in consultation and cooperation between BLM and the livestock operator, were developed based on decisions made in the 2006 WEMO Plan, are the result of the 2006 WEMO Plan, and/or may be the result of biological opinions, other resource management strategies, or another planning effort.

Frequently, the permittee or lessee elects to graze fewer livestock than the full amount of grazing authorized under the active preference (permitted use) for the grazing season. Sometimes this is due to environmentally related factors such as droughts or fires, and in other cases it may be to accommodate the livestock operator's need to adjust livestock numbers for marketing or livestock husbandry purposes. Normally, the BLM will authorize the requested amount of non-use on a short-term basis. In rare situations, the BLM may temporarily authorize another qualified applicant to graze the amount of authorized non-use in an allotment, depending upon the reason for non-use.

E.8 Energy Production, Utility Corridors, and Other Land Uses

E.8.1 Regulatory Framework

Federal

Federal Land Policy and Management Act, 1976 as Amended

The United States Congress passed the FLPMA in 1976. Title V, "Rights-of-Way," of the FLPMA establishes public land policy and guidelines for administration, provides for management, protection, development, and enhancement of public lands, and provides the BLM authorization to grant ROW. Authorization of systems for generation, transmission, and distribution of electric energy is addressed in Section 501(4) of Title V. In addition, Section 503 specifically addresses "Right of Way Corridors" and requires common ROWs "to the extent practical." FLPMA, Title V, Section 501(a)(6) states, "[t]he Secretary, with respect to the public lands (including public lands, as defined in section 103(e) of this Act, which are reserved from entry pursuant to section 24 of the Federal Power Act (16 U.S.C. § 818)) [P.L. 102-486, 1992] and, the Secretary of Agriculture, with respect to lands within the National Forest System (except in each case land designated as wilderness), are authorized to grant, issue, or renew rights-of-way over, upon, under, or through such lands for roads, trails, highways, railroads, canals, tunnels, tramways, airways, livestock driveways, or other means of transportation except where such facilities are constructed and maintained in connection with commercial recreation facilities on lands in the National Forest System."

California Desert Conservation Area Plan, 1980 as Amended

Section 601 of the FLPMA required preparation of a long range plan for the CDCA. The CDCA Plan was adopted in 1980 to provide for the use of public lands and resources of the CDCA in a manner that enhances, wherever possible, and does not diminish, on balance, the environmental, cultural, and aesthetic values of the Desert and its productivity. The CDCA Plan is a comprehensive, long range plan covering 25 million acres. Approximately 10 million acres (about half) of this total are public lands administered by the BLM. These public lands are dispersed throughout the California Desert, which includes the Mojave Desert, the Sonoran Desert, and a small portion of the Great Basin Desert.

The CDCA Plan includes 12 elements: Cultural Resources; Native American; Wildlife; Vegetation; Wilderness; Wild Horse and Burro; Livestock Grazing; Recreation; Motorized Vehicle Access; Geology, Energy and Mineral Resources; Energy Production and Utility Corridors; and Land Tenure Adjustment. Each of the elements contains goals and specific actions for the management, use, development, and protection of the resources and public lands

within the CDCA, and is based on the concepts of multiple use, sustained yield, and maintenance of environmental quality. In addition, each element provides both a desert wide perspective of the planning decisions for one major resource or issue of public concern as well as more specific interpretation of multiple-use class guidelines for a given resource and its associated activities.

E.8.2 Regional and Background Information

A discussion of the land uses affected by the transportation network, and the specific land uses within the WEMO planning area, is presented in Section 3.8.

E.9 Cultural Resources

E.9.1 Regulatory Framework

Federal

National Historic Preservation Act

The National Historic Preservation Act (NHPA) of 1966 (Public Law [PL] 89-665, 16 United States Code [U.S.C.] 470-1), as amended, generally sets forth as the national policy of the federal government, in cooperation and partnership with the states, local governments, Native American tribes, and private organizations and individuals to (1) use measures, including financial and technical assistance, to foster conditions under which our modern society and our prehistoric and historic resources can exist in productive harmony and fulfill the social, economic, and other requirements of present and future generations; (2) administer federally owned, administered, or controlled prehistoric and historic resources in a spirit of stewardship for the inspiration and benefit of present and future generations; (3) contribute to the preservation of non-federal prehistoric and historic resources and give maximum encouragement to organizations and individuals undertaking preservation by private means; and (4) encourage the public and private preservation and utilization of all usable elements of the nation's historic built environment (16 U.S.C 470-1).

Sections 106 and 110 of the NHPA have specific bearing on federal agency historic preservation activities and the management of historic properties. Section 106 of the NHPA requires federal agencies to take into account the effects of their undertakings on such historic properties and to afford the Advisory Council on Historic Preservation a reasonable opportunity to comment on those undertakings. These regulations require federal agencies to conduct the necessary studies or consultations to identify cultural resources that may be affected by an undertaking, evaluate cultural resources that may be affected to determine if they are eligible for the NRHP, and to assess whether such historic properties would be adversely affected. Where historic properties would be adversely affected, the federal agency is required to consult with the State Historic Preservation Officer, Native American tribes that attach religious or cultural significance to historic properties, the Advisory Council on Historic Preservation, and other consulting parties to resolve the effects of the undertaking.

Section 110 of the NHPA (16 U.S.C. 470h-2) generally provides that all federal agencies assume responsibility for the preservation of historic properties that are owned or controlled by such agency. Under this section, federal agencies must establish a preservation program for the

identification, evaluation, and nomination to the NRHP, and for protection of historic properties. The agency's preservation program shall ensure:

- A. That historic properties under the jurisdiction or control of the agency are identified, evaluated, and nominated to the National Register.
- B. That such properties under the jurisdiction or control of the agency as are listed in or may be eligible for the National Register are managed and maintained in a way that considers the preservation of their historic, archaeological, architectural, and cultural values in compliance with Section 106 and gives special consideration to the preservation of such values in the case of properties designated as having national significance.
- C. That the preservation of properties not under the jurisdiction or control of the agency, but subject to be potentially affected by agency actions, are given full consideration in planning.
- D. That the agency's preservation-related activities are carried out in consultation with other federal, state, and local agencies, Indian tribes, Native Hawaiian organizations carrying out historic preservation planning activities, and with the private sector.
- E. That the agency's procedures for compliance with Section 106 of this Act
 - i. are consistent with regulations issued by the Council pursuant to this Act.
 - ii. Provide a process for the identification and evaluation of historic properties for listing in the National Register and the development and implementation of agreements, in consultation with State Historic Preservation Officers, local governments, Indian tribes, Native Hawaiian organizations, and the interested public, as appropriate, regarding the means by which adverse effects on such properties will be considered
 - iii. Provide for the disposition of Native American cultural items from federal or tribal land in a manner consistent with section 3(c) of the Native American Grave Protection and Repatriation Act" (25 U.S.C. 3002[c]) (16 U.S.C 470h-2(a)).

National Register of Historic Places

The NRHP is the official list of the nation's historic places worthy of preservation. Authorized by the NHPA, the NRHP is part of the national program to identify, evaluate, and protect America's historic and archaeological resources. Cultural resources listed or eligible for listing on the NRHP are called historic properties.

Eligibility for inclusion in the NRHP is specified in regulations at 36 CFR 60.4 and is based on the following:

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association; and:

- A. That are associated with events that have made a significant contribution to the road patterns of our history; or
- B. That are associated with the lives of persons significant in our past; or

- C. That embody the distinctive characteristics of a type, period, or method of construction, or representation of the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- D. That have yielded, or may be likely to yield, information important in prehistory or history.

An NRHP-eligible site must meet one or more of the above criteria and have integrity appropriate to the criteria. In most cases, archaeological sites typically qualify under Criterion D; non-archaeological properties often qualify for listing under Criterion A, B, or C. Integrity varies in terms of the criterion under which the site is evaluated. For example, an archaeological site evaluated under Criterion D would need to have the potential to provide meaningful scientific research data that is important to prehistory or history. If the site has been disturbed or damaged to the extent it cannot do this, it would lack integrity. Historic buildings, on the other hand, typically need to be in their original location and be relatively unmodified or restorable to have integrity under Criterion A, B, or C. Historic buildings and structures must also evoke the historic period of significance to a layperson. None of the four criteria are mutually exclusive. It is not uncommon for a historic structure to have a related archaeological component.

Under special consideration, some cultural resources not otherwise eligible may be considered eligible. These include religious properties, moved properties, birthplaces and graves, cemeteries, reconstructed properties, commemorative properties, and properties less than 50 years old.

National Environmental Policy Act, as amended

NEPA (42 U.S.C. §§ 4321–4370c.) provides the statutory basis for considering impacts on the cultural environment as a whole, as well as cultural resources that are not historic properties. NEPA places the responsibility on the federal government to “preserve important historic, cultural, and natural aspects of our national heritage, and maintain, whenever possible, an environment [that] supports diversity and a variety of individual choice” (42 U.S.C. § 4331[b][4]). NEPA requires federal agencies to conduct an interdisciplinary analysis of the environmental consequences of their actions early in the decision-making process. For cultural resources, this analysis considers the effects of agency actions on physical features such as archaeological sites, buildings, and structures, as well as the practice of religious and other traditional lifeways that reflect community heritage. Implementing regulations are found in 40 CFR §§ 1500–1508, 36 CFR § 800.8, and 32 CFR § Part 775.

Federal Land Policy and Management Act of 1976

The FLPMA (P.L. 94-579; 43 U.S.C. §§ 1701 et seq.) mandates that public lands be managed in a manner that will protect the quality of scientific, scenic, historic, ecological, environmental, air and atmospheric, water resource, and archeological values. Title VI of the FLPMA establishes the California Desert Conservation Area. BLM, under the Secretary of the Interior, is the implementing agency for FLPMA. However, under 43 U.S.C. § 1781.h, the Secretary of Agriculture and Secretary of the Defense manage public lands that fall within their respective jurisdictions if the lands are located within or adjacent to a California Desert Conservation Area. Permits authorizing the collection of fossils for scientific purposes are issued under FLPMA.

Archaeological Resources Protection Act

The Archaeological Resources Protection Act (as implemented by 43 CFR 7) was enacted to protect archaeological resources on public lands and Indian lands and to acknowledge that archaeological resources are an irreplaceable part of America's heritage. The Archaeological Resources Protection Act applies when a project may involve archaeological resources located on federal or tribal land. The Archaeological Resources Protection Act requires that a permit be obtained before excavation of an archaeological resource on such land can take place and that artifacts recovered during excavation are curated at an appropriate facility. Section 7.8 of 43 CFR 7 includes professional qualification standards for archaeologists conducting work under the permit covered by this act. The act also provides for the notification of Indian tribes when sites of cultural or religious importance could be harmed. In addition, it details descriptions of prohibited activities and financial and incarceration penalties for convicted violators. It provides authority to federal officials to better manage archaeological sites on public land (16 U.S.C. 470aa-470mm).

Antiquities Act; Title 16, U.S.C. Section 431-433

This act authorizes the president to designate as national monuments objects or areas of historic or scientific interest on lands owned or controlled by the United States. The act required that a permit be obtained for examination of ruins, excavation of archaeological sites, and the gathering of objects of antiquity on lands under the jurisdiction of the Secretaries of Interior, Agriculture, and Army, and provided penalties for violations.

Preserve America, Executive Order 13287

Agencies shall provide leadership in preserving America's heritage by actively advancing the protection, enhancement, and contemporary use of the historic properties owned by the federal government. Each agency is to provide and maintain an assessment of the status of its inventory of historic properties and their ability to contribute to community economic development initiatives.

Where consistent with its mission and governing authorities, and where appropriate, agencies shall seek partnerships with state and local governments, Native American tribes, and the private sector to (1) promote the unique cultural heritage of communities and of the nation and to realize the economic benefit that these properties can provide, and (2) cooperate with communities to increase opportunities for public benefit from, and access to, federally owned historic properties.

Indian Sacred Sites, Executive Order 13007

In managing federal lands, agencies shall, to the extent practicable, permitted by law, and not inconsistent with agency functions, accommodate Indian religious practitioners' access to and ceremonial use of Indian sacred sites. Agencies are to avoid adversely affecting the physical integrity of these sites, maintaining the confidentiality of such sites, and informing tribes of any proposed actions that could restrict access to, ceremonial use of, or adversely affect the physical integrity of, sacred sites.

Consultation and Coordination with Indian Tribal Governments, Executive Order 13175

In formulating or implementing policies that have tribal implications, agencies shall respect Indian tribal self-government and sovereignty, honor tribal treaty and other rights, and strive to meet the responsibilities that arise from the unique legal relationship between the federal government and Indian tribal governments. The Executive Memorandum of April 29, 1994, outlines the principles that agencies are to follow in their interactions with Native American tribal governments.

The Timbisha Shoshone Tribal Homeland Act of 2000 designated a 640-acre parcel within the northern portion of the planning area (Darwin Subregion) as trust land for the Timbisha-Shoshone Tribe (Whitley 2000, Caton 2009).

American Indian Religious Freedom Act, 42 U.S.C. 1996

This act recognizes that freedom of religion for all people is an inherent right and that traditional American Indian religions are an indispensable and irreplaceable part of Indian life. Establishing federal policy to protect and preserve the inherent right of religious freedom for Native Americans, this act requires federal agencies to evaluate their actions and policies to determine if changes should be made to protect and preserve the religious cultural rights and practices of Native Americans. Such evaluations are made in consultation with native traditional religious leaders.

Native American Graves Protection and Repatriation Act, 25 USC 3001-13

This act establishes requirements for the treatment of Native American human remains, and associated funerary objects, and objects of cultural patrimony on federal land. The implementing regulations for this act are found at 43 CFR 10. In the event of an inadvertent discovery of human remains and/or associated funerary objects, work shall stop in the immediate area and be protected. The federal agency is required to notify and consult with tribes that are, or likely to be, culturally affiliated with the remains and/or associated funerary objects. Upon request, each agency is required to return any such item to any lineal descendant or specific tribe with whom such item is associated.

CDCA Plan Cultural Resources Element

The general goals of the California Desert Conservation Area (CDCA) Plan Cultural Resources Element are to:

1. Broaden the archaeological and historical knowledge of the CDCA through inventory efforts and the use of the existing data. Continue the effort to identify the full array of the CDCA's cultural resources.
2. Preserve and protect representative sample of the full array of the CDCA's cultural resources.
3. Ensure that cultural resources are given full consideration in land use planning and management decisions, and ensure that BLM authorized actions do not result in inadvertent impacts.

4. Ensure proper data recovery of significant (NRHP quality) cultural resources where adverse impacts cannot be avoided.

These goals have not been modified in the West Mojave Plan.

E.9.2 Regional and Background Information

The evaluation of potential cultural resources in accordance with the criteria established by the federal and state legislation and regulations described earlier is made with reference to a historic context. The context is defined as “the patterns or trends by which a specific occurrence, property, or site is understood and its meaning (and ultimately its significance) within history or prehistory is made clear” (National Park Service 1995). A general context for the consideration of cultural resources within the West Mojave Area is presented below.

Prehistory

The prehistory of the West Mojave Area spans four general temporal periods: Late Pleistocene and Early, Middle, and Late Holocene. In light of the many cultural sequences, the temporal periods are described below.

Late Pleistocene (20,000-10,000 BP)

Despite some claims for very early human occupation within the Planning Area (Davis et al. 1980), the earliest well-documented evidence is found in the form of the distinctive fluted Clovis-style projectile points that have been found at scattered locations throughout the region (Rondeau et al. 2007). Because these points are typically found on the surface and are not associated with radiocarbon assays, the dating of these early occupations remains problematic. However, Olivella beads from several sites within the Planning Area, including the Stahl Site in Inyo County, one site in Riverside County, and four sites in San Bernardino County (Goldstone, Awl Site, Rodgers Ridge, and Flood Pond), have yielded radiocarbon dates within the Late Pleistocene range. These sites were located adjacent to lakes or marshes and often contain a variety of artifact forms such as scraping tools, leaf-shaped bifaces, and associated debitage (i.e., prehistoric debris) (Erlandson et al. 2007; Fitzgerald et al. 2005). Based on the relatively high frequency of points and scrapers, these early groups have traditionally been seen as mobile big-game hunters; however, recent studies suggest that their economies were more diverse and focused on smaller animals and plant foods, and that large game played a minor role (Erlandson et al. 2007). They are believed to have lived in small populations in temporary camps located near permanent water sources (Sutton et al. 2007).

Early Holocene (10,000-7,500 BP)

In general, the transition from the terminal Wisconsin to the Early Holocene within the Mojave Desert was characterized by somewhat warmer and increasingly drier conditions. Pluvial lakes, while still present in the region, were generally retreating and had dried completely by around 8,000 years ago. Human use of the desert is manifested by the Lake Mojave Complex, which occurred between approximately 10,000 and 8,000 years ago, and is characterized by projectile points of the Great Basin stemmed series and abundant bifaces, steep-edged unifaces, crescents, and occasional cobble-core tools and ground stone implements. Sites attributed to the Lake

Mojave Complex have usually been found only as surface deposits and lack materials suitable for dating. However, some radiocarbon dates have been obtained for sites at Lake Mojave, Fort Irwin, Twentynine Palms, Rosamond Lake, and China Lake (Sutton et al. 2007). These sites are frequently found on the shorelines of pluvial lakes. Site types include residential bases, lithic workshops, and small camps. Settlement patterns are seen as highly mobile, with small social units visiting resource patches on seasonal rounds. Faunal remains have been found in limited quantities at Lake Mojave sites, but evidence from excavations at Fort Irwin suggest hunting focused on small game, reptiles, and rodents (Sutton et al. 2007).

Middle Holocene (7,500 to 4,000 BP)

During the first part of the Middle Holocene, a drier climate resulted in sporadic and relatively short-duration appearance of shallow desert lakes. Researchers have posited that during this period settlement within the Mojave Desert focused on upland contexts, along remnant pluvial lake basins and channels, and at spring/seep locations. During the early part of the Middle Holocene, the Pinto Complex (7,000 to 4,000 BP) appeared in the area encompassed by the Planning Area. Radiocarbon data from some sites in the Mojave Desert suggest that there was an overlap between the Lake Mojave and Pinto complexes and that the Pinto Complex may have begun in the Early Holocene (Sutton et al. 2007). The artifact assemblage includes Pinto points, leaf-shaped points and knives, drills, heavy-keeled scrapers, retouched flakes, choppers, hammerstones, and shell beads. Manos and flat milling stones appear in abundance for the first time in the Mojave Desert. Based on this high abundance of milling tools, intensive plant exploitation was one of the inhabitants' subsistence strategies and access to plant resources must have been an important factor in determining site placement (Sutton et al. 2007). Groups most likely consisted of multiple families living in centralized sites logistically close to locations used to gather resources (Sutton et al. 2007).

Sutton et al. (2007) propose that the Deadman Lake Complex may be somewhat distinct from the Pinto Complex. To date, the Deadman Lake Complex has been identified in the Twentynine Palms area only. The assemblage has small- to medium-size contracting stemmed points, an abundance of battered cobbles and core tools, bifaces, simple flake tools, milling tools, and shell beads from the Pacific Ocean and the Sea of Cortez. The artifacts are similar to Pinto Complex artifacts, but use the local igneous materials. Sutton et al. (2007) note also that it is possible the Deadman Lake Complex reflects a localized version of the Pinto Complex in which the sites are located at higher elevations and thus have access to different resources than those of the Pinto Complex in remnant pluvial lake basins.

Late Holocene (after 4,000 BP)

Following an approximate 1,000-year period of reduced occupation in the Mojave Desert (Sutton et al. 2007), the Gypsum Complex (approximately 4,000 BP and 2000 BP) emerged amid the somewhat wetter and cooler climatic conditions of the Late Holocene. The artifact assemblage characteristic of Gypsum sites consists of Elko, Humboldt, and Gypsum Cave points; triangular knives; large points with straight bases and shoulders; hammerstones; choppers; flake-based scrapers; scraper-planes; large drills with expanding bases; stone pendants; limited shell beads; millings; manos; mortars; and pestles (Warren 1984). Faunal remains from Gypsum sites indicate hunting focused on artiodactyls, lagomorphs, and rodents (Sutton et al. 2007).

Prehistoric sites and features with diagnostic elements indicate use of the Darwin area from at least the Newberry Period (ca. 4,000 -1,350 BP) through contact, though the potential for evidence of earlier occupation exists in several sites where subsurface deposits have been identified and remain undisturbed.

In Owens Valley and the eastern Sierra, the period between 2000 BP and 1500 BP (the Newberry Period in regional chronologies) is characterized by highly mobile groups, caches of Elko and Humboldt Basal notched points, bifaces, and milling equipment (Eerkens and Spurling 2008; Faull 2007). Sites dating to the latter part of this period are typically base camps with structures and lithic reduction sites. Obsidian quarrying reached its peak during this period (Eerkens and Spurling 2008). Sites occur more in the Volcanic Tablelands and northern Owens Valley than in the southern Owens Valley area (Poulson 2009).

The Late Holocene from about 1500 BP to the time of the historic era is viewed by most archaeologists as the extension of the ethnographic present. A series of dry and wet episodes characterize the climate during this period (Larsen and Michaelsen 1989; Sutton 1996, Weide et al. 1974). Lakes in the Mojave Desert started to dry up and site locations are centered near ephemeral water sources during the latter part of this period.

The Rose Springs Complex during the latter part of the Late Holocene (1500 to 1000 BP) marked the beginning of the bow-and-arrow technology in the Mojave Desert. These sites have well-developed middens and a variety of material culture including Eastgate and Rose Spring projectile points, stone knives, drills, pipes, bone awls, milling tools, marine shell artifacts, and large quantities of obsidian (Sutton et al. 2007). The sites are found near springs (Saratoga, Rose) along washes and sometimes along lakeshores (Rogers/Rosamond and Koehn lakes). Evidence of wickiups and pit houses has been found in two sites in the western Mojave Desert (Sutton et al. 2007).

In the Owens Valley, sites dating to 1500-600 BP (identified in regional chronologies as the Haiwee Period) show evidence of more sedentary groups with semi-subterranean houses. The bow and arrow (Rose Spring and Eastgate points), and storage pits are introduced, and artifact caching mostly disappears (Faull 2007). Production at obsidian quarries drops off (Eerkens and Spurling 2008). The band-like structure is replaced by the household as the primary socioeconomic unit (Poulson 2009). Subsequently, (600 BP to contact, Marana Period Cottonwood and Desert Side-notched points and Owens Valley Brown ware (a coil and scrape type of construction) are introduced and there is an increase in ground stone tools as the harvesting of green pinyon nuts becomes a subsistence focus (Bettinger 1989; Eerkens and Spurling 2008).

Protohistory and Ethnographic Context

To evaluate cultural development, archaeological explanations need to be expanded. The similarities between the Late Holocene period and the ethnographically recorded occupation of the area have resulted in an extrapolation from the ethnographic present to Late Holocene patterns. While this has its difficulties, certain types of ethnographic information can be employed in the evaluation of the archaeological record. Perhaps the most valuable is the linguistic structure of the area.

The use of linguistic evidence for prehistory is more tenuous than the more substantial cultural material record but it can provide important insight. If the archaeological record and linguistic

evidence both reflect actual activities, the reconstruction proposed by one field should be substantiated by the other. When an area undergoes an intensive linguistic change (as from one stock to another), it may also undergo a corresponding change in the material remains left by the people involved. If two groups are in extended contact, their nonlinguistic elements can be assimilated while their language may remain relatively distinct (Bright and Bright 1965).

One of the most important questions that needs to be addressed and that requires consideration of ethnographic and linguistic information is the development of the location of the native populations at the time of contact. Where did they come from, and when did they arrive?

The major linguistic division within the Planning Area is the Uto-Aztecan stock, which includes the Numic and Takic subfamilies. Speakers of languages derived from the Numic branch of the Uto-Aztecan language group include the Kawaiisu, Southern Paiute, Western Shoshone, and Owens Valley Paiute; the speakers of the languages derived from the Takic branch include the Cupeño, Kitanemuk, Serrano, and Cahuilla (Warren 1984).

Evidence for population movements and the location of these groups at contact have been evaluated based on diagnostic artifacts, projectile points, milling technology and ceramics, burial patterns, and specialty items such as crescentics and beads.

Numic/Takic Language Subfamilies (Mojave Desert/Western Great Basin)

Golla (2007) proposes the development of the Numic and Takic languages in California as dating from about 2000 years ago, and that the Numic languages developed somewhat more recent between 1500 and 2000 years ago. Bettinger and Baumhof (1982) estimate a time depth for the split between the Numic dialects beginning around 800 years ago.

In most explanations, the expansion of the Uto-Aztecan languages within the Mojave Desert and Western Great Basin show similar time depths to the Yuman languages in the Colorado Desert. As with the Yuman languages, expansion toward the coast either filled a void or replaced an existing population. Early explanations described the "Uto-Aztecan wedge" based principally on the assumption of a broad Hokan dispersed language group and the position of the Uto-Aztecan languages relative to the Salinan and Yuman languages. This explanation is challenged by both the proposed timeline for their development and the archaeological record.

As noted earlier, the four tribes that speak languages from the Numic branch are the Kawaiisu, Southern Paiute (Chemehuevi), Western Shoshone, and Owens Valley Paiute, and the four tribes that speak languages from the Takic branch include the Cupeño, Kitanemuk, Serrano, and Cahuilla. As stated above, to understand what remnants may have been left behind by these tribes, it is important to know where their traditional territories are located. The following is a description of lands traditionally occupied by each tribe.

The Kawaiisu occupied the southern end of the Sierra Nevada watershed by the Piute and Tehachapi mountains at the line between the Great Basin and California cultures. The habitat was in the mountainous ridge between the Mojave Desert and the San Joaquin Valley. One source suggests that there were Mountain Kawaiisu who lived in the Piute and Tehachapi mountains and Desert Kawaiisu who lived east of Tehachapi into southern Death and Panamint valleys where they sometimes lived with Shoshone (Garfinkel and Williams 2009).

The Chemehuevi are considered a subgroup of the larger Southern Paiute group. The Chemehuevi occupied territory west of and along the Colorado River, south of Needles into

eastern Mojave Desert as far east as Providence Mountains (Kroeber 1925; Kelly and Fowler 1986). In 1776, there were no Chemehuevi along the Colorado River; however, they moved into the Chemehuevi Valley after the Halchidoma were forced to move east with the Maricopa. After 1876, they moved back to the remote desert when war broke out with the Mojave (Kroeber 1925).

The Western Shoshone occupied a region that included Death Valley through the highlands of central Nevada into northwestern Utah, Skull, Deep Creek, Panamint, and Saline valleys (Thomas et al. 1986, Norwood et al. 1980).

The Owens Valley Paiute occupied a narrow valley along the Owens River on the eastern side of the southeastern Sierra Nevada and extends north to Benton, California, and east to Fish Lake Valley, Nevada (Liljebland and Fowler 1986; Norwood et al. 1980; Steward 1934).

The Cupeño were a small group of about 500 to 750 who occupied an area approximately 10 miles in diameter south of the San Luis Rey River and centered on the area now known as Warner Springs within the valley of San Jose de Valle (Bean and Smith 1978b; Kroeber 1925).

The Kitanemuk lived in the Tehachapi Mountains at the southern end of the San Joaquin Valley with Antelope Valley being their southern boundary (Kroeber 1925; Blackburn and Bean 1978).

The Serrano territory generally encompassed the San Bernardino Mountains east of Cajon Pass, east to Twentynine Palms and south to Yucaipa Valley (Bean and Smith 1978a).

The Cahuilla occupied mountains, passes, canyons, valleys, and desert from the Colorado Desert north of the Chocolate Mountains and across to Borrego Springs, westerly along Palomar Mountain, northerly to the Santa Ana River near Riverside, then easterly along the San Bernardino Mountains to Orocopia Mountain, and encompassing the San Jacinto and Santa Rosa mountain ranges (Bean 1978).

Cultural Characteristics for Numic and Takic Language Speakers

Cultural characteristics similar for Numic and Takic language speakers in the Mojave Desert include diagnostic point types and coil and scrape pottery or paddle and anvil pottery (Bean 1978; Bean and Smith 1978a; Thomas et al, 1986). There are four point types that may be associated with contact populations in the Numic/Takic language area: Rose Spring, Eastgate, Cottonwood and Desert Side Notched. These tribes also traditionally cremated their dead with the exception of the Kitanemuk and Kawaiisu (Strong 1929, Blackburn and Bean 1978; Zigmond 1986; Kelly and Fowler 1986, Garfinkel and Williams 2009). The Western Shoshone and Owens Valley Paiute practiced both cremations and burials (Busby et al. 1979; Thomas et al. 1986). The Cahuilla and Southern Paiute (Chemehuevi) also were agriculturalists and the Owens Valley Paiute practiced a specialized irrigation system to grow crops (Bean 1978, Busby et al. 1979, Kelly and Fowler 1986; Steward 1933). Sutton et al. (2007) suggest a geographic difference for artifact types. They note that the northern Mojave Desert or the Numic language areas have a combination of Desert Side Notched and Cottonwood triangular points, brown ware pottery, some buff ware pottery near the Mojave River, and primarily Coso obsidian artifacts. The eastern portion of the Mojave Desert also representing Takic language areas have only Cottonwood triangular points, brown and buff ware pottery, and local obsidian artifacts. The Mojave River appears to have been a boundary between the Takic and Numic speakers (Sutton et al. 2007).

Historic Period

Initial Exploration by Europeans

The term historic period generally is defined as the period after initial contact between Native American groups and European explorers/settlers, when written sources about the area become available. An arbitrary date for the beginning of the historic period for California would be 1540, with the expedition of Spanish explorer Hernando de Alarcon. Alarcon's expedition brought the first Europeans to the Planning Area. The expedition sailed up the Colorado River as far as the confluence of the Colorado and Gila Rivers (Woznicki 1968). In the same year Melchor Diaz led an expedition by foot up to the confluence of the Colorado and Gila rivers. In 1700, Father Eusebio Francisco Kino traveled from Sonora, Mexico, to the Yuma area, and for the next few years Spanish priests and missionaries moved up and down the Colorado and Gila rivers visiting the tribes.

Exploration into central and northern portions of the Planning Area was slower and more intermittent. In 1772 Pedro Fages, a Spanish army officer and commander of California's Spanish force, crossed into the Planning Area while following a band of runaways from the presidio at San Diego (Greene 1983). His chase appears to have led him through the San Bernardino Valley, over to the high desert near Cajon Pass, and into the Mojave Desert before proceeding on to the south end of San Joaquin Valley and then on to Monterey (Greene 1983). Juan Maria de Rivera explored the southern portions of Colorado and Utah in 1765 during an expedition to find routes west from Santa Fe, New Mexico. In 1776, an expedition by Franciscan missionaries Francisco Atanasio Dominguez and Silvestre Velez de Escalante left Santa Fe, New Mexico, looking for a route to the California coast. They did not reach the coast, but did explore portions of the Great Basin before turning back (Malouf and Findlay 1986).

Trails, Trading Routes, and Transportation

The first Spanish period trails in the Planning Area were pioneered by the de Anza Expeditions in 1774-1775 and 1775-1776. Mexico gained its independence from Spain in 1821, but travel in the Planning Area was still limited. Travel on the existing trails in the area increased after restrictions against private traders were lifted (Malouf and Findlay 1986). American trappers and traders began working the northern portion of the Planning Area in increasing numbers in the early 1800s, including groups led by Jedediah Smith in 1826-1827 and Peter Ogden in 1829-1830 (Malouf and Findlay 1986). Both these groups came into California in the region of Needles and moved west through the Mojave Desert, using the Mojave Indian Trail, and then north into the San Joaquin Valley (Malouf and Findlay 1986).

A primary route for the growing trade was the Old Spanish Trail, pioneered by Antonio Armigo in 1829. The Old Spanish Trail began in Santa Fe, New Mexico, and ended at the Pacific Ocean at the Pueblo of Los Angeles. Armigo's route included portions of the routes blazed by de Rivera, Dominguez and de Escalante, and Jedediah Smith. The portion of the trail route within the Planning Area followed the Mojave River west past what is now Barstow, then southwest through the Cajon Pass to Mission San Gabriel and on to Los Angeles.

The Old Spanish Trail became increasingly important to trade in the 1830s, being used by many American trappers and traders. The Mojave River Valley was also a popular route for horse and cattle thieves and Native American slave traders bound for the established settlements in New Mexico. The trail was designated in 2002 as a National Historic Trail.

The Southern Pacific Railroad constructed a railroad line from Mojave to Needles, on the Colorado River, between 1882 and 1883, which increased the exploitation of the regions' mineral resources (Hector 1987). The town of Barstow, originally named Waterman, was founded in 1886 as a town for railroad workers. The establishment of a main transfer station at Yermo, 10 miles from Barstow, resulted in significant growth in Barstow itself (Hector 1987).

The completion of the San Pedro, Los Angeles, and Salt Lake Railway line from Salt Lake City, Utah, to Barstow in May of 1905 further increased the town's importance. Much of the route ran through only sparsely inhabited areas in the Planning Area, Barstow being the only town of any size. Although not a large town, Kelso, on the line east of Barstow, was a major staging stop for the railroad.

Numerous small railroads were constructed in the Planning Area for the express purpose of servicing mining operations. The Borate and Daggett Railroad, constructed in 1898, was used to haul borate the dozen miles from the mines at Borate to the Southern Pacific line at Daggett (Ross 2002). Many Navajo Native Americans worked on the construction of the line. The Borate and Daggett ran for nine years, carrying mail and passengers in addition to its main cargo of borate (Ross 2002).

When the railroad route from Barstow to Needles was constructed, a dirt road was also established adjacent to the tracks (Hatheway 2001). This road was most likely built as part of the construction of the railroad, but was soon used for wagon transportation. Through the rest of the 1800s and into the first decade of the 1900s, the road was only lightly used, since the train provided a much more cost-effective way of transporting people and goods through the area. After the turn of the century, however, the rise of the automobile made the road a potential route from Nevada to the west coast. The County of San Bernardino improved the existing dirt road in 1911 (Hatheway 2001), possibly to entice the State of California to adopt the route as a highway. Plans were being formed for a highway connecting the east coast and west coast, and the Needles to Barstow to Los Angeles route was one of the main considered alignments.

Mining

Mining has been a recurring and significant factor in the development of the Planning Area. By the early 1850s, gold deposits had been discovered in San Bernardino County around Leach Lake and Lytle Creek (Greene 1983.) In the early 1860s, gold was discovered in the Picacho Peak area north of Blythe and in the Bear and Holcomb Valleys in the San Bernardino Mountains. In the 1870s, gold mining began in earnest in both the northern and southern portions of the planning area. Silver and gold deposits were identified in Darwin in 1874, prompting a mining boom that, at its peak in 1876, included a population of 1000 miners, families, and immigrant workers, 20 mines, 200 buildings, 2 smelters and an extension route for the Cerro Gordo Freighting Company with regular service to the ports of Los Angeles. Further south in the same timeframe, mining began in the Little San Bernardino and Eagle Mountains near Twentynine Palms and Joshua Tree National Park. The oasis at Twentynine Palms had originally been explored by a military survey party led by Colonel Henry Washington in 1885 (Greene 1983). At its height of operations the area supported numerous mining districts (Greene 1983). At its full extent the area in and around the park supported numerous mining districts, including Twentynine Palms, Washington, Gold Park, Piñon, Cottonwood, Eagle Mountain, Monte Negras, Rattler, and Dale (Greene 1983:89-90).

One of the major mining areas opened up as a result of the Southern Pacific line from Mojave to Needles was the Buckeye Mining district, located in the mountains south of the rail line and approximately 50 miles east-southeast of Barstow. Two of the principal mines begun in the area in the late 1880s were the Bagdad and Roosevelt mines, established by John Suter (Ross 2001). A rich gold ore deposit was found in the late 1890s, after the claims had been sold by Suter. The first shipment of ore was delivered to the Randsberg-Santa Fe reduction company's stamp mill in Barstow in 1901 (Ross 2001). A second mining company, the Benjamin E. Chase Gold Mining Company, had been set up in the Buckeye district. Chase was also the president of the Ludlow & Southern Railway, which was built in 1903 to transport ore from the Chase mines to the railhead at Ludlow (Ross 2001). The two operations merged in 1904, and between then and 1910 it was the largest gold producing operation in San Bernardino County. It was also the largest copper producing operation in the county. Gold production fell after 1910, and the mines were worked intermittently from 1910 to the 1970s.

A mining boom started in the Mojave Valley in 1860 after silver was discovered by Robert W. Waterman and John L. Porter (Hector 1987). By the early 1880s the Calico silver mining district was established, and the town of Calico was founded in 1881 along the Mojave River. Silver deposits were also discovered around Ivanpah, which became a major mining district in the 1870s, and in the Providence Mountains in the 1870s-1880s (Greene 1983). In addition to silver and gold, borate deposits were found in 1883 north of Daggett by Hugh Stevens and Bill Neel. Mining commenced soon after, and in 1888 the most promising claims were purchased by Francis M. Smith, who also owned the borax mines in the Death Valley area.

Numerous silver mines were also established during the early 1860s in the Coso Range, resulting in the establishment of the Coso Mining Company and the Coso Gold and Silver Mining Company, among others (Norwood et al. 1980). Mining success fluctuated greatly in these areas and was never as successful as some other areas. A third mining area was established in 1865 in the Inyo Range on the southeast side of the Owens Valley, centered at Cerro Gordo. This area was very productive, and by 1868 the Union Mine at Cerro Gordo was the most productive silver mine in the United States (Norwood et al. 1980). Labor disputes, lack of a railroad, and economic recession caused problems sustaining mining activities in some areas. Other areas with gold and silver finds relatively quickly became played out, and miners move on to more productive areas.

In addition to gold and silver, salt was mined in the Saline Valley east of Independence. Salt mining began in 1864 and continued until 1918, but transportation costs kept the enterprise from growing to a major operation (Norwood et al. 1980). The Saline Valley Salt Tram, located just east of the planning area, was completed in 1913 to transport salt over the Inyo Mountains to Owens Valley where it was then shipped via railroad. It was the steepest tram in the United States rising from 1,100 feet in the Saline Valley to 8,500 feet at the crest of the Inyo Mountains, and then dropping to 3,600 feet in Owens Valley. The tram is on the National Register of Historic Places (#74000514) (Conrad 1973).

From 1945 to 1957, the Anaconda Copper Company made the Darwin area the largest lead producing area in California. The mines were reopened again in 1967 and have remained active, albeit in a much less productive state. In a 1968, a report on the town of Darwin, it was estimated that there are 30 miles of workings and tunnels in the surrounding hills and canyons (Norwood et al 1980).

Agriculture and Ranching

As a result of the mining operations in the area around the Owens and Panamint valleys, farmers and cattlemen also moved into the area, especially the Owens Valley, to supply food to the miners. The influx of Americans into the area resulted in conflicts with the indigenous Native American groups (Norwood et al. 1980). Camp Independence was established by the Army in 1862 in the Owens Valley to quell Native American-White miner violence that had broken out in the area. Temporarily abandoned in 1864, it was re-occupied in 1865 after violence again broke out and remained active until abandoned in March 1877 (California State Military Museum 2011c).

Agriculture began in the Owens Valley as a response to the miners' need for food in the area. Although the area received little rain, the Owens River supplied enough dependable water for irrigation. By the beginning of the twentieth century, the city of Los Angeles was experiencing a severe water shortage and it was proposed to William Mulholland, president of the Los Angeles Water Department, that the Owens River be tapped to supply Los Angeles with water (Norwood et al. 1980). A \$23 million bond was approved by Los Angeles voters, water rights were purchased, and an aqueduct was completed by 1913. The diversion of water to Los Angeles did not immediately impact agriculture in the Owens Valley, but a drought in 1921-1922 began a decline that ended farming in the area by the mid-1930s (Norwood et al. 1980).

During the 1880s, the area around Twentynine Palms began to be used as a cattle range, with a number of large cattle companies based in the Banning and Big Bear areas running their herds from Morongo Valley to Twentynine Palms (California State Military Museum 2011g). Ranches in the area included the Barker and Shay Ranch, Jim Mart's "I-S" outfit, the Chase and Law Ranch, and the Talmadge brand, all of which used the area during the winter months. Warren's Well was also the gathering point for the spring and fall cattle roundups until World War II (California State Military Museum 2011g).

Military Installations in the Planning Area

A chain of military posts was established in San Bernardino County between 1859 and 1860 by Captain James H. Carleton. These posts were created to protect the travel route, called the Old Government Road, from San Bernardino across the Mojave Desert to Fort Mojave, near Needles (Hector 1987). The posts were garrisoned by elements of the California Volunteers during the Civil War, and most were evacuated at the war's end. Due to local concerns for protection of travel route and increasing mining activity, the posts were reoccupied in the late 1860s (California State Military Museum 2011b). Two of the more substantial posts were Fort Piute and Camp Cady. Fort Piute was established about 20 miles east of Fort Mojave, and Camp Cady was located about 20 miles east of Barstow (California State Military Museum 2011b). Both had permanent buildings constructed of either adobe or rock. Both also had histories of abandonment and reoccupation, with Fort Piute finally being abandoned in 1868 and Camp Cady in 1871 (California State Military Museum 2011b).

In Inyo County, Camp Independence was established by the Army in 1862 as a result of disputes between the Owens Valley Paiute and local ranchers. As cattleman and ranchers moved into Owens Valley and cattle grazed on the Paiute food supply, the Paiute stole and killed some cattle for food. The ranchers armed themselves and violence between the Native Americans and whites escalated; this became known as the Owens Valley Indian War (1861-1865). The ranchers asked

the help of the military in Los Angeles and Fort Tejon. Camp Independence was built to quell the conflicts between the Native Americans and ranchers and protect the road to the mines in Nevada. The Paiute were escorted to San Sebastian Indian Reservation in 1863. The camp operated until 1877 when disputes subsided (California State Military Museum 2011c).

The presence of the military in the Planning Area increased dramatically in the years immediately before and after America entered World War II. One of the first to open was Fort Irwin. Originally established as the Mojave Anti-Aircraft Range, it was opened in 1940. In 1942 the range was renamed Camp Irwin, in honor of MG George LeRoy Irwin (California State Military Museum 2011e). It was deactivated in 1944 and reactivated in 1951 as Camp Irwin Armored Combat Training Area for troops destined for the Korean conflict (California State Military Museum 2011e). The first antenna to support the National Aeronautics and Space Administration's unnamed exploration of deep space, called Pioneer Deep Space Station, was constructed at Fort Irwin in 1958 (NPS 2013). Renamed Fort Irwin in 1961, it was declared a permanent installation. Deactivated again in 1971, it was reactivated in 1980 as the National Training Center and serves as a major training facility for the Army, Marine Corps, and National Guard (California State Military Museum 2011e). The Pioneer Deep Space Station National Historic Landmark is located within Fort Irwin and is on the National Register (#85002813).

Edwards Air Force Base (AFB), located north and east of Lancaster, was established in 1942 on land first purchased in 1933 for use as a bombing range of units stationed at March AFB (Miksell 2000). The facility was from inception used for testing of highly secret developmental aircraft (Miksell 2000). Rogers Dry Lake is located within the base and its natural attributes of clean air, isolated location, weather, variable terrain, and large expanse was ideal for the military to flight test aircraft. The base emerged during the Cold War as a premier Air Force high-technology complex, especially important in the areas of experimental flight testing, captive flight testing (test tracks), rocket propulsion research, and in the 1960s, a center for astronaut training (California State Military Museum 2011d). Edwards AFB continues to be a major testing facility of new and experimental aircraft. In 1985 Rogers Dry Lake was added as a National Historic Landmark and is now listed on the NRHP (# 85002816). It is also a National Historic Site and as such part of the National Park system.

The Marine Corps Air Ground Combat Center, Twentynine Palms (MCAGCC) was first opened in 1940 as an Army glider training area (California State Military Museum 2011g). Converted to an Army fighter pilot training and bombing range in 1943, it was decommissioned and the land transferred to the County of San Bernardino in 1945. In 1952 the Marine Corps took control of the property and named it Headquarters Marine Corps Training Center, Twentynine Palms, California (State Military Museum 2011g). It became the MCAGCC, Twentynine Palms in 1979. At approximately 495 square miles, it is the largest Marine Corps Base in existence.

The Marine Corps Logistics Base, Barstow, opened in the summer of 1942 as Navy Supply Depot, Barstow, but was transferred to the Marine Corps as it was being completed in December of the same year (Hector 1987). The logistics base supplied material needed for the Fleet Marine Forces in the Pacific theater during World War II. The base also saw significant expansion during the Korean War years, and has continued to expand its services to the Marine Corps in the subsequent decades (Hector 1987). Because it employs a large number of civilian workers, the growth of the base has also resulted in the growth of the nearby town of Barstow.

Naval Air Weapons Station China Lake (NAWS CL), originally called Naval Ordnance Test Station Inyokern, was established in 1943 for the California Institute of Technology to conduct research into rockets and rocket propellants (Miksell 2000). NAWS CL continued after World War II with development and testing of guided missiles, jet aircraft ejection systems, and later space program capsules and the intercontinental ballistic missile development program (Miksell 2000). NAWS CL is the Navy's largest single land holding at 19,600 square miles and continues as their center for research, testing and evaluation of weapons systems. The Coso Rock Art District National Historic Landmark is within the boundaries of NAWS CL and is on the National Register (#66000209).

E.10 Visual Resources

E.10.1 Regulatory Framework

Federal

Federal Land Policy and Management Act

The Federal Land Policy and Management Act of 1976 (FLPMA; 43 United States Code 1701) and the U.S. Department of the Interior's Bureau of Land Management (BLM) Land Use Planning Handbook (2005), and BLM Manual H-8410-1 all emphasize the importance of protecting the quality of scenic resources on public lands. The BLM, through FLPMA, is charged with protecting the scenic value of the public lands they administer. FLPMA sections relevant to the Desert Renewable Energy Conservation Plan (DRECP) Proposed Land Use Plan Amendment (LUPA) are:

Section 102(a): "The public lands [shall] be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archaeological values."

Section 103(c): Identifies "scenic values" as resources for public management. Section 201(a): "The Secretary shall prepare and maintain on a continuing basis and inventory of all public lands and their resources and other values (including...scenic values)."

Section 505(a): "Each right-of-way shall contain terms and conditions which will...minimize damage to the scenic and esthetic values."

FLPMA's legal mandate to protect the quality of scenic resources on public lands is carried out by the BLM and detailed in BLM's Visual Resource Management (VRM) system, as described in the FSEIS.

The BLM-established visual values for each VRI Class as outlined in BLM Manual H-8410-1 are as follows:

Scenic quality is a measure of the visual appeal of a tract of land. In the visual resource inventory process, public lands are given an A, B, or C rating based on the apparent scenic quality which is determined using seven key factors: landform, vegetation, water, color, adjacent scenery, scarcity, and cultural modifications (see Illustrations 1, 2, 3, and 4). During the rating process,

each of these factors are ranked on a comparative basis with similar features within the physiographic province. Use the physiographic provinces as delineated by Fenneman (see Illustrations 5 and 6) to the extent possible. The boundaries of these provinces may be refined to fit local situations. The "Ecoregions of the United States" by R. C. Bailey may be helpful in making these refinements. An important premise of the evaluation is that all public lands have scenic value, but areas with the most variety and most harmonious composition have the greatest scenic value. Another important concept is that the evaluation of scenic quality is done in relationship to the natural landscape. This does not mean that man-made features within a landscape necessarily detract from the scenic value. Man-made features that complement the natural landscape may enhance the scenic value. Evaluations should avoid any bias against man-made modification to natural landscape.

A. Delineating Scenic Quality Rating Units (SQRU's). The planning area is subdivided into scenic quality rating units for rating purposes. Rating areas are delineated on a basis of: like physiographic characteristics; similar visual patterns, texture, color, variety, etc.; and areas which have similar impacts from man-made modifications. The size of SQRU's may vary from several thousand acres to 100 or less acres, depending on the homogeneity of the landscape features and the detail desired in the inventory. Normally, more detailed attention will be given to highly scenic areas or areas of known high sensitivity. Map and number each SQRU on an overlay as shown in Illustration 7.

B. Evaluating Scenic Quality. It is recommended that an interdisciplinary team do the evaluations. Ideally, one team member should have an environmental design arts background. All participants should have an understanding of the visual resource inventory system and be familiar with the areas to be evaluated. Evaluate each SQRU by observing the area from several important viewpoints. Scores should reflect the evaluator's overall impression of the area. After evaluating all the SQRU's, show the scenic ratings on the scenic quality overlay (see Illustration 7). Record the rating on the Scenic Quality Rating Summary - Bureau Form 8400-5 (see Illustration 4). Bureau Form 8400-1 (see Illustration 3) may be used as a worksheet for completing each scenic quality evaluation. A photographic record should be maintained for the area. Photographs and completed evaluation forms should be filed for future reference.

Sensitivity levels are a measure of public concern for scenic quality. Public lands are assigned high, medium, or low sensitivity levels by analyzing the various indicators of public concern.

A. Factors to Consider.

1. Type of Users. Visual sensitivity will vary with the type of users. Recreational sightseers may be highly sensitive to any changes in visual quality, whereas workers who pass through the area on a regular basis may not be as sensitive to change.
2. Amount of Use. Areas seen and used by large numbers of people are potentially more sensitive. Protection of visual values usually becomes more important as the number of viewers increase.
3. Public Interest. The visual quality of an area may be of concern to local, State, or National groups. Indicators of this concern are usually expressed in public meetings, letters, newspaper or magazine articles, newsletters, land-use plans, etc. Public

controversy created in response to proposed activities that would change the landscape character should also be considered.

5. **Adjacent Land Uses.** The interrelationship with land uses in adjacent lands can affect the visual sensitivity of an area. For example, an area within the view shed of a residential area may be very sensitive, whereas an area surrounded by commercially developed lands may not be visually sensitive.
6. **Special Areas.** Management objectives for special areas such as Natural Areas, Wilderness Areas or Wilderness Study Areas, Wild and Scenic Rivers, Scenic Areas, Scenic Roads or Trails, and Areas of Critical Environmental Concern (ACEC), frequently require special consideration for the protection of the visual values. This does not necessarily mean that these areas are scenic, but rather that one of the management objectives may be to preserve the natural landscape setting. The management objectives for these areas may be used as a basis for assigning sensitivity levels.
7. **Other Factors.** Consider any other information such as research or studies that includes indicators of visual sensitivity.

B. Delineation of Sensitivity Level Rating Units (SLRU's). There is no standard procedure for delineating SLRU's. The boundaries will depend on the factor that is driving the sensitivity consideration. Consequently, a thorough review of the factors referred to in IIIA should be completed before any attempt is made to delineate SLRU's. Distance zone may also play an important role in identifying the SLRU boundaries.

C. Documentation Requirements.

1. **Narrative.** Prepare a summary statement with the essential facts and rationale to support the conclusions reached on sensitivity levels. The format for presenting this information is optional. As a minimum, the summary data must be entered on Form 8400-6 (see Illustration 8). Backup information used to evaluate each of the factors should be maintained with the inventory record.
2. **Map Overlay.** Prepare an overlay (see Illustration 9) showing the sensitivity rating units and ratings.

D. Completion of Sensitivity Rating. The instructions for completing the sensitivity ratings are shown in Illustration 8. Ideally, the rating should be done as a team effort involving the Area or District VRM Coordinator, Area Manager, and at least one other staff person. If timing or funding will allow this approach, the rating may be done by the VRM coordinator and reviewed by the Area Manager. Management should be in agreement on the summary rating for each SLRU.

Distance Zones. Landscapes are subdivided into 3 distanced zones based on relative visibility from travel routes or observation points. The 3 zones are: foreground-midleground, background, and seldom seen. The foreground-midleground (fm) zone includes areas seen from highways, rivers, or other viewing locations which are less than 3 to 5 miles away. Seen areas beyond the foreground-midleground zone but usually less than 15 miles away are in the

background (bg) zone. Areas not seen as foreground-middleground or background (i.e., hidden from view) are in the seldom-seen (ss) zone.

A. Mapping Distance Zones. Prepare a distance zone overlay (see Illustration 10) using a base map common to the scenic quality base map. Distance zones are determined in the field by actually traveling along each route and observing the area that can be viewed. If the route is a highway or trail, it should be traveled in both directions, unless it is a one-way route. River use usually is one way; however, if there is up-river travel, it too should be evaluated from both directions. If a vehicle or boat is used for this field survey, it is best to have both a driver and an observer. Distance zones should be mapped for all areas. While they are not necessary to determine classes in Class A scenic areas or for areas with low sensitivity levels, distance zones can provide valuable data during the RMP process when adjustments to VRM classes are made to resolve resource allocation conflicts.

1. Foreground-Middleground Zone. This is the area that can be seen from each travel route for a distance of 3 to 5 miles where management activities might be viewed in detail. The outer boundary of this distance zone is defined as the point where the texture and form of individual plants are no longer apparent in the landscape. In some areas, atmospheric conditions can reduce visibility and shorten the distance normally covered by each zone. Also, where the foreground-middleground zone from one travel route overlaps the background from another route, use only the foreground-middleground designation.
2. Background Zone. This is the remaining area which can be seen from each travel route to approximately 15 miles. Do not include areas in the background which are so far distant that the only thing discernible is the form or outline. In order to be included within this distance zone, vegetation should be visible at least as patterns of light and dark.
3. Seldom-Seen Zone. These are areas that are not visible within the foreground-middleground and background zones and areas beyond the background zones.

B. Coordinating Distance Zones Delineation and Sensitivity Level Analyses. It is recommended that distance zones be delineated before the sensitivity analysis is done. The distance zone delineations provide valuable information that can be very useful in the sensitivity analysis. For example, the foreground-middleground zones are more visible to the public and changes are more noticeable and are more likely to trigger public concern. Also, the boundaries of the distance zones are very useful in helping to establish sensitivity rating units.

Visual Resource Inventory Classification Matrix

Scenic Quality	VSL High	VSL High	VSL High	VSL Medium	VSL Medium	VSL Medium	VSL Low
Special Areas	I	I	I	I	I	I	I
A	II	II	II	II	II	II	II
B	II	III	III/IV	III	IV	IV	IV
C	III	IV	IV	IV	IV	IV	IV

Visual Resource Inventory Classification Matrix

Scenic Quality	VSL High	VSL High	VSL High	VSL Medium	VSL Medium	VSL Medium	VSL Low
Distance Zones	f/m	b	s/s	f/m	b	s/s	s/s

Source: BLM Manual H-8410-1 (BLM 1984b)

VSL – Visual Sensitivity Level

Key to Distance Zones:

f/m = foreground/middleground

b = background

s/s = seldom seen

The BLM-established management objectives for each VRM Class as outlined in BLM Manual H-8410-1 are as follows:

VRM Classes and Objectives

- VRM Class I: To preserve the existing character of the landscape. Allowed Level of Change: This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention.
- VRM Class II: To retain the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
- VRM Class III: To partially retain the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape should be moderate. Management activities may attract attention, but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
- VRM Class IV: To provide for management activities which require major modification of the existing character of the landscape. Allowed Level of Change: The level of change to the characteristic landscape can be high. Management activities may dominate the view and may be the major focus of viewer attention. However, the impact of these activities should be minimized through careful siting, minimal disturbance, and repeating the basic elements of form, line, color, and texture within the existing setting.

CDCA Plan

Under FLPMA §601, the BLM has developed the CDCA Plan to “provide for the immediate and future protection and administration of the public lands in the California desert within the framework of a program of multiple use and sustained yield, and the maintenance of environmental quality.” There is no stand-alone visual resource plan element within the CDCA; however, visual resources values are addressed within the recreation element of the CDCA Plan. According to the recreation element, the BLM will take the following actions to effectively

manage for activities involving the alteration of the natural character of the landscape (BLM 1980):

1. The appropriate levels of management, protection, and rehabilitation on all public lands in the CDCA will be identified, commensurate with visual resource management objectives in the multiple use class guidelines.
2. Proposed activities will be evaluated to determine the extent of change created in any given landscape and to specify appropriate design or mitigation measures using the BLM's contrast rating process.

The contrast rating process is a tool used to determine the extent of visual impact that proposed resource management activities would create in a landscape. It serves as a guide for reducing visual impacts to acceptable levels as defined by the visual management objectives and multiple use class guidelines.

E.10.2 Regional and Background Information

A discussion of the visual resources within the WEMO planning area is presented in Section 3.10.

E.11 Special Designations

E.11.1 Regulatory Framework

Federal

Federal Land Policy and Management Act, 1976 as Amended

FLPMA (Public Law 94-579, October 21, 1976), is called the BLM Organic Act because it consolidates and articulates BLM's management responsibilities. Many land and resource management authorities were established, amended, or repealed by FLPMA, and it proclaimed multiple use, sustained yield, and environmental protection as the guiding principles for public land management (BLM 2015).

Several sections of FLPMA provide guidance regarding the establishment, management, and inventory of resource values that are considered for special designations.

Lands in the vicinity of the Project were recently reviewed for wilderness characteristics based on FLPMA §201(a) requiring the BLM to:

prepare and maintain on a continuing basis an inventory of all public lands and their resource and other values (including, but not limited to, outdoor recreation and scenic values), giving priority to areas of critical environmental concern. This inventory shall be kept current so as to reflect changes in conditions and to identify new and emerging resource and other values. The preparation and maintenance of such inventory or the identification of such areas shall not, of itself, change or prevent change of the management or use of public lands.

Section 202(c)(3) requires the BLM, through the land use planning system, to "give priority to the designation and protection of areas of critical environmental concern." In §103(a), an ACEC is defined as the following:

An area within the public lands where special management attention is required (when such areas are developed or used or where no development is required) to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards.

Section 603(a) of FLPMA required BLM to conduct the original inventory of wilderness characteristics, which was completed in 1979, while §603(c) stated that “once an area has been designated for preservation as wilderness, the provisions of the Wilderness Act (16 USC 1131 et seq.) which apply to national forest wilderness areas shall apply with respect to the administration and use of such designated area”.

Wilderness Act of 1964

The “Wilderness Act” (Public Law 88-577; September 3, 1964) is the legislation authorizing the establishment and management of wilderness areas. Section 4(a) states:

.....each agency administering any area designated as wilderness shall be responsible for preserving the wilderness character of the area and shall so administer such area for such other purposes for which it may have been established as also to preserve its wilderness character. Except as otherwise provided in this Act, wilderness areas shall be devoted to the public purposes of recreational, scenic, scientific, educational, conservation, and historical use.

California Desert Protection Act of 1994

The CDPA (Public Law 103-433, October 31, 1994) designated 69 areas as components of the National Wilderness Preservation System on BLM-managed public lands in the California Desert. Section 103(d) states that “wilderness is a distinguishing characteristic of the public lands in the California desert” and “the wilderness values of desert lands are increasingly threatened by ...development.” The CDPA further states that there are no buffer zones designated along with the wilderness areas: “The fact that non-wilderness activities or uses can be seen or heard from areas within a wilderness area shall not, in itself, preclude such activities or uses up to the boundary of a wilderness area.”

Omnibus Public Lands Management Act of 2009

The Bureau of Land Management’s National Landscape Conservation System (NLCS) was created in June 2000 to conserve, protect, and restore special areas and unique resources. The lands are prized for their cultural, ecological, scientific, educational, wildlife, and aesthetic values for the benefit of current and future generations. The NLCS system gained legal permanence in 2009 with the passage of the Omnibus Public Land Management Act (Public Law 111-11, March 30, 2009) §2002(a). Section 2002(c) directed the BLM “to manage the system in accordance with any applicable law (including regulations) relating to any of component of the system in a manner that protects the values for which the components of the system were designated.” The Public Lands within the CDCA and components of the National Wilderness Preservation System are areas included under this authorization.

California Desert Conservation Area Plan, 1980 as Amended

The CDCA is a 25-million acre expanse of land designated by Congress in 1976 through §601 of FLPMA. The BLM administers about 10 million of those acres. When Congress created the CDCA, it recognized its special values, and the need for a comprehensive plan for managing the area.

The CDCA Plan recognized the need to maintain and perpetuate wilderness resources, including plants and animals indigenous to the area, and to the extent consistent provide the above for opportunities for public use, enjoyment, and understanding, and the unique experiences dependent upon a wilderness setting, including maintaining access to these areas. The plan also directed managers to consider valid nonconforming uses and activities in the management of the wilderness so as to have the least possible adverse effect and/or wherever possible a positive effect (BLM 1980).

In addition, the plan established ACECs as a management tool for the protection of special values, including cultural resources, prehistoric archaeological features, wildlife habitat, and sensitive plant species. Prior to its designation, management prescriptions are developed for each proposed ACEC. These prescriptions are site specific and include actions that the BLM has the authority to carry out, as well as recommendations for actions that the BLM does not have direct authority to implement, such as cooperative agreements with other agencies and mineral withdrawals (BLM 1980).

BLM Manual 6340, Management of Designated Wilderness Areas

This manual section identifies BLM's role in administering wilderness areas on public lands, provides policy guidance for BLM personnel, and sets the framework for wilderness management program development. It states the goals of wilderness management, as well as administrative functions and specific activities related to wilderness management.

BLM Handbook 1601-1 Land Use Planning Handbook

This handbook provides general guidance for the establishment of BLM administrative designations: ACECs and Back Country Byways. It specifically states that designated ACECs must be managed to protect the area and prevent irreparable damage or natural systems.

BLM Handbook 8357-1, 1993 BLM Byways Handbook

This handbook provides specific direction for BLM's Back Country Byways program, including information of Byways nomination and designation, planning criteria, visitor safety, and specifications for entrance kiosks (BLM 1993).

BLM Instruction Memorandum No. 2011-154

This Instruction Memorandum directs offices to continue to conduct and maintain inventories regarding the presence or absence of wilderness characteristics, and to consider lands with wilderness characteristics in land use plans and when analyzing projects under NEPA (BLM 2011).

E.11.2 Regional and Background Information

Wilderness

The purpose of wilderness, as defined in section 2(a) of the Wilderness Act, is "...to assure that an increasing population, accompanied by expanding settlement and growing mechanization, does not occupy and modify all areas in the United States...leaving no lands designated for preservation and protection in their natural condition...". Further, wilderness is defined in Section 2(c) of the Wilderness Act to be areas "...where the earth and its community of life are untrammelled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this Act an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions..."

Section 4(c) of the Wilderness Act prohibits certain uses of wilderness. These prohibitions include commercial enterprise, permanent roads, temporary roads, use of motor vehicles, motorized equipment or motorboats, landing of aircraft, use of other forms of mechanical transport, and structures or installations. There are three classes of exceptions to some or all of the prohibitions. These include private existing rights (e.g., rights associated with a lease for a microwave tower that existed at the time of wilderness designation), actions necessary to meet the minimum requirements for the administration of the area, (e.g., use of motorized equipment to remove hazardous materials), and "Special Provisions" (e.g., livestock grazing that was established prior to designation).

The California Desert Protection Act of 1994 (CDPA), at Title I for BLM Wilderness, provides for motorized vehicle access for (1) fish and wildlife management activities by appropriate State agencies and (2) law enforcement. At Title VII, the CDPA establishes explicit federal water rights, allows access for Indian religious purposes, and provides mandates and procedures for acquiring State and private inholdings.

Wilderness areas are managed according to several internal policies, including BLM Manual MS-6340, Management of Designated Wilderness Areas (BLM 2012), in addition to 43 CFR 6300, Wilderness Management, and Principles for Wilderness Management in the California Desert (Desert Managers Group 1995).

Wilderness Study Areas (WSA)

To fulfill direction from Congress, under Section 603 of FLPMA, the BLM conducted its wilderness review process. This process was carried out by first inventorying public lands to determine which lands had wilderness characteristics, which was done with extensive public involvement. Lands found to have wilderness characteristics were administratively designated as WSA. For the CDCA this was documented in the Wilderness Inventory Final Descriptive Narratives, completed in March 1979 (BLM 1979). That inventory identified 138 Wilderness Study Areas comprising more than 5.5 million acres. Section 603 of FLPMA requires that, until the Congress determines otherwise, the Secretary of Interior shall manage these lands so as not to impair the suitability of these lands for preservation as wilderness.

The CDPA and the Omnibus Public Land Management Act of 2009 designated wilderness based in part on these WSA. The CDPA also released some public lands from WSA status, and identified some existing WSA that would continue to be managed to the non-impairment

standard until Congress makes a future decision on these lands. The WEMO Planning area contains approximately 315,230 acres within seven WSA identified by Congress in the CDPA.

All WSA are managed so not to impair the suitability of the area for preservation as wilderness and prevent unnecessary or undue degradation, in accordance with the BLM Wilderness Study Area Manual MS-6330 (BLM 2012), and will continue to be managed in that manner until Congress either designates them as wilderness or releases them for other uses.

As with wilderness, allowable pre-existing use as described in FLPMA, only apply to grazing, mining, and mineral uses, or as specifically identified in the legislation, and do not include other uses such as recreational activities. Although most recreational activities (including hiking, horseback riding, fishing, hunting and trapping, camping, and other primitive forms of recreation) are allowed in WSA, some activities may be prohibited or restricted if they do not meet the non-impairment standard or one of the exceptions.

While access on primitive routes or ways in WSA is allowed, BLM policy does not provide for OHV use of these routes unless continuous use and designation of that use has been established from 1976 onward. The result of the policy is that routes, once eliminated from the travel network, cannot be established in the network again until Congress releases the land for other uses.

WSA Guidance directs BLM to comply with the wilderness non-impairment mandate (FLPMA Section 603(c)). BLM must monitor and regulate the activities of off-highway vehicles (OHVs) in WSA to assure that their use does not compromise these areas by impairing their suitability for designation as wilderness. The BLM's Off Road Vehicle Regulations (43 CFR 8342.1) require that BLM establish off-road vehicle designations of areas and routes that meet the non-impairment mandate. BLM's policy is that cross-country vehicle use in WSA does cause the impairment of wilderness suitability. As described in BLM Manual 1626—Travel and Transportation Manual, “Any motorized/mechanized linear transportation feature located within [WSA] will be identified in a transportation inventory as a motorized/mechanized ‘primitive route’...Primitive routes will not be made a part of the transportation system, classified as a transportation asset, or entered into the Facility Asset Management System (FAMS) unless one of the following conditions is met:

- A. The routes are designated as non-motorized and non-mechanized trails, or
- B. Congress releases the WSA from Wilderness consideration.”

Motorized/mechanized primitive routes may be signed only to the extent necessary to prevent resource damage or users getting lost; they may not be assigned names or numbers that would appear to create a de facto route system.

Though motorized and mechanical transport may be permitted to continue along existing primitive routes, “closed” designations may be appropriate for WSA, or portions of WSA, where LUP planning goals are to provide primitive recreational opportunities, or where needed for the protection of an identified natural resource.

Lands Managed for Wilderness Characteristics

In accordance with Section 201 of FLPMA, the BLM is required to prepare and maintain on a continuing basis an inventory of public lands and their resources and other values. Per Section

603 of FLPMA, this includes lands with wilderness characteristics as defined in Section 2 of the Wilderness Act of 1964. Such lands do not, in and of themselves, imply particular land uses. All lands that are not currently designated as wilderness or WSAs are assessed during the LUP process to determine if they possess one or more wilderness characteristics. These characteristics generally include naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation.

Considering wilderness characteristics in the land use planning process may result in several outcomes related to land use, including, but not limited to: (1) emphasizing other multiple uses as a priority over protecting wilderness characteristics; (2) emphasizing other multiple uses while applying management restrictions (conditions of use, mitigation measures) to reduce impacts to wilderness characteristics; (3) the protection of wilderness characteristics as a priority over other multiple uses. This process is described by BLM policy in Manual MS-6320, Considering Lands with Wilderness Characteristics in the Land Use Planning Process, and BLM Land Use Planning Handbook, H-1601-1, Appendix C, (K) Wilderness Characteristics.

Management of lands with wilderness characteristics is part of BLM's multiple-use mandate, and is recognized within the spectrum of resource values and uses within the WEMO Planning Area. Lands with wilderness characteristics are defined for this planning effort as areas:

- Having been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable.
- Having outstanding opportunities for solitude or a primitive and unconfined type of recreation.
- Potentially containing ecological, geological, or other features of scientific, educational, scenic, or historical value.

These lands may be managed for the use and enjoyment of area visitors and may be devoted to the public purposes of recreation, scenic, scientific, educational, conservation, and historical use. In addition, they could augment multiple-use management of adjacent and nearby lands through the protection of watersheds and water yield, wildlife habitat, natural plant communities, and similar natural values.

The process for these inventories is described in BLM Manual MS-6310, Conducting Wilderness Characteristics Inventory on BLM Lands. In addition to review and maintenance of existing lands with wilderness characteristics data, the inventory incorporates new data concerning resource conditions for lands previously determined not to possess wilderness characteristics; newly acquired lands; and citizen information (public nominations of the lands with wilderness characteristics) meeting the minimum standard for further review, to establish an updated, current inventory of lands with wilderness characteristics.

Areas of Critical Environmental Concern

ACECs Designated Prior to 2006 WEMO Plan

Information on these ACECs is summarized below. A CD of the complete ACEC Management Plans for each of these ACECs is available from the California Desert District Office. Where the ACEC Management Plans include management prescriptions related to transportation, including

stopping, parking, and camping distances, that information is included within the following descriptions.

Afton Canyon

This ACEC protects a sensitive Mojave River riparian community and the scenic canyon in which it is located. Originally 4,726 acres, in 2006 the WEMO Plan expanded the ACEC southward. An Afton Canyon Natural Area management plan (1989) was prepared in cooperation with the CDFW under the Sikes Act and covers a larger area than the ACEC. The plan protects the ACEC and the adjacent desert habitat in the Cady Mountains, which is occupied habitat for bighorn sheep and contains nest sites for prairie falcon and golden eagle. Visitor facilities include two campgrounds, an equestrian campground, the Mojave Road, and interpretive signs and kiosks.

The 2006 WEMO Plan adopted the 1989 management plan recommendations, amending the MUC Class from M to L on 1,225 acres. The plan also adopted the provisions of the WEMO Plan for protection of bighorn sheep, prairie falcon, golden eagle, vermilion flycatcher, yellow-breasted chat, yellow warbler, summer tanager, least Bell's vireo, western pond turtle, desert tortoise, Mojave fringe-toed lizard, and all species of bats.

Amboy Crater

BLM designated the Amboy Crater as an ACEC within the Amboy Crater National Natural Landmark in 1987. The transportation-related management prescriptions for the unit allow stopping and parking within 25 feet, and camping within 100 feet, of centerline of designated routes.

Barstow Woolly Sunflower

BLM established a botanical ACEC northeast of Kramer Junction to protect the Barstow woolly sunflower. Although the area protects a relatively large population of this species, the ACEC represents only a small proportion of the overall range, which is limited to the western Mojave Desert. The desert tortoise and Mohave ground squirrel are also found within the ACEC. The State of California owns nine sections of land to the east and west, which CDFW manages for protection of desert plants and animals.

The 2006 WEMO Plan adjusted the boundary to encompass additional public lands northwest of Kramer Junction.

Stopping and parking of motor vehicles can take place within 50 feet of either side of the centerline of designated routes, while camping is restricted to existing disturbed areas along open routes.

Bedrock Springs

Bedrock Springs ACEC, located at the edge of the Golden Valley Wilderness, was established by the CDCA Plan to protect prehistoric values.

The 2006 WEMO Plan included this ACEC within the Mohave Ground Squirrel Conservation Area, and applied all conservation measures to the ACEC.

Big Morongo Canyon

BLM established the Big Morongo Canyon ACEC to protect habitat qualities for least Bell's vireo and triple-ribbed milkvetch. The Big Morongo Canyon ACEC is managed as a wildlife reserve, with emphasis on strict protection of the flora and fauna. This desert oasis is known internationally for its bird diversity, and opportunities are provided for wildlife viewing and photography, including boardwalk trails, interpretive displays and brochures. The ACEC was established in the 1980 CDCA Plan. Expansion of the ACEC in 1996 created a habitat linkage between the Little San Bernardino Mountains and the San Bernardino Mountains, though several private parcels remain to be acquired.

Black Mountain

The Black Mountain ACEC is one of the largest areas in the western Mojave Desert to protect the prehistoric and Native American values of this area northwest of Barstow. A management plan was approved in 1988. The ACEC lies entirely within the Superior-Cronese and Fremont-Kramer DT ACECs. The southeastern half is within the Black Mountain Wilderness. The ACEC includes critical habitat for the desert tortoise, and known occupied habitat for the Mojave ground squirrel, LeConte's thrasher, desert cymopterus, and Barstow woolly sunflower. Nest sites are present for golden eagle and prairie falcon.

The 2006 WEMO Plan included amending this ACEC plan to include species protection as a goal.

Calico Early Man Site

This National Register Property was established as an ACEC in 1980, and a management plan was prepared in 1984. The plan designated a vehicle route network and specified ways to protect the evidence of ancient human occupation.

The 2006 WEMO Plan modified the ACEC Management Plan to require that all provisions for surveys, minimization, mitigation, and compensation for adverse impacts to biological resources that apply to the Superior-Cronese DT ACEC would also apply to this ACEC.

Christmas Canyon

The Christmas Canyon ACEC protects prehistoric values. Most of the ACEC lies within the Spangler Hills Open Area in San Bernardino County. The 1988 ACEC management plan prescribed ways that the archaeological resources could be protected within an area open to recreational vehicle use.

In the 2006 WEMO Plan, a small portion of the southern edge of this ACEC was included within the Mohave Ground Squirrel Conservation Area. All conservation measures associated with the Conservation Area apply to the ACEC.

Camping is prohibited, and other recreational activities are limited, in sensitive areas near rock art, rock shelters, and middens.

Cronese Basin

The BLM designated the Cronese Lakes, north of Interstate 15 between Barstow and Baker, as an ACEC to protect valuable cultural and natural resources. Ephemeral wetlands are present on the lakes, which serve as stopover points for migratory waterbirds and nesting sites for many species during very wet years. Mesquite hummocks and desert willow washes add to the biological importance, and the dunes and sand sheets are occupied habitat for the Mojave fringe-toed lizard. The desert tortoise is found in low densities. A management plan was published in 1985.

In the 2006 WEMO Plan, the southeastern portion of this ACEC was included within the Superior-Cronese DT ACEC. The 2006 WEMO Plan amended the ACEC Management Plan to incorporate protection of blowsand areas for the Mojave fringe-toed lizard.

Desert Tortoise Research Natural Area

The CDCA Plan of 1980 designated lands north of California City in Kern County as an ACEC and a Research Natural Area. A management plan for the ACEC, prepared under authority of the Sikes Act, was approved in 1988. The ACEC is jointly managed by the BLM, CDFW and the Desert Tortoise Preserve Committee, a non-profit group established to acquire and manage lands for protection of the desert tortoise.

The 2006 WEMO Plan expanded the boundaries of this area to include lands acquired by the Desert Tortoise Preserve Committee. The ACEC was also included within the Mohave Ground Squirrel Conservation Area and the Fremont-Kramer DT ACEC. Stopping and parking of motor vehicles can take place within 50 feet of either side of the centerline of designated routes, while camping is restricted to existing disturbed areas along open routes.

Fossil Falls

The Fossil Falls ACEC was established in 1980 to protect prehistoric values. A management plan was approved in 1986.

The 2006 WEMO Plan amended the management plan for this ACEC by recognizing provisions applicable to the Mohave Ground Squirrel Conservation Area.

Great Falls Basin

The Great Falls Basin ACEC management plan was prepared in 1987 in cooperation with the CDFW under the Sikes Act. The ACEC adjoins the Indian Joe Canyon Ecological Reserve and the northern portion is within the Argus Range Wilderness. The southern portion is within a BLM wilderness study area. The western boundary is contiguous with the China Lake Naval Air Weapons Station. The ACEC protects unique and valuable wildlife and scenic resources, particularly the dozens of seeps and springs that serve as habitat for the threatened Inyo California towhee. Designated critical habitat for the towhee is present within the ACEC. In addition, large populations of quail and chuckar are present, as is a remnant population of bighorn sheep. Raptors nesting within the ACEC include golden eagle, prairie falcon, and long-eared owl. Potential habitat exists for the Panamint alligator lizard.

The 2006 WEMO Plan amended the management plan to prohibit travel on certain routes that were previously designated as open. The area was included within the Mohave Ground Squirrel Conservation Area and the Argus Range Key Raptor Area.

No camping is permitted within 200 yards of springs and riparian areas.

Harper Dry Lake

The ACEC was established to protect the remnant marshes at the southwestern edge of Harper Dry Lake. The marsh and alkali wetland communities bordering Harper Dry Lake hold potential for discovery of several rare and restricted-range plant species. The playa bordering the marshes supported nesting Western snowy plovers in the past, and surveys conducted in 2001 found these birds to be present and probably nesting. Harper Dry Lake is an important area for the conservation of Western snowy plover nesting habitat. Harper Dry Lake is recognized as a Key Raptor Area by the BLM, which has designated 223 such areas nationwide. Key Raptor Areas are places known to be significant habitats for selected species of birds of prey, and Harper Dry Lake is one of seven Key Raptor Areas in the Mojave Desert. The species known to utilize the habitat at Harper Dry Lake are northern harrier, short-eared owl, ferruginous hawk, and long-eared owl. Harper Dry Lake has been improved as a Watchable Wildlife site, a program to provide access and facilities to visitors for birdwatching, photography and passive recreation. Arrangements are now being made to supply surface water to the remnant marsh, and interpretive kiosks, restrooms, and trails have been installed.

The 2006 WEMO Plan adjusted the boundary of this ACEC by adding 110 acres of the Watchable Wildlife Site on the southern boundary and deleting 110 acres of barren lakebed on the northern boundary. The plan also included revised management objectives for conservation of plant and animal species, including the Western snowy plover and several restricted-range alkali wetland species. The area was also recognized as a Key Raptor Area.

Lands within 100 yards of marsh are closed to camping.

Jawbone/Butterbredt

The 1982 Sikes Act Plan for Jawbone/Butterbredt ACEC addressed the Sierra/Mojave/Tehachapi Ecotone Wildlife Habitat Management Area, a designated "special area" in the CDCA Plan. The ACEC plan incorporated all of the Rudnick Common Grazing Allotment and the vehicle management boundary agreement between the BLM and the Rudnick Estate Trust. OHV routes of travel were designated within the ACEC, which includes both designated wilderness and the Jawbone Canyon and Dove Springs Open Areas. The Pacific Crest Trail crosses the ACEC as well. The ACEC was established to manage and protect significant cultural and wildlife values of this transition zone between the mountains and the northwestern Mojave Desert. Among the wildlife habitats present are Butterbredt Springs, an important migratory bird stopover site, habitat for the yellow-eared pocket mouse in Kelso Valley, and the raptor and vulture migratory corridor between the Kern River Valley and the Mojave River. Nearly the entire range of a West Mojave endemic, the Kelso Creek monkeyflower, is located within the ACEC.

In 1995 Jawbone Station Visitor Center opened its doors to the public to serve as a public information and outreach center to those coming to the Jawbone/Butterbredt ACEC and the

surroundings public lands. The facility's goal is to educate the public about the agency, its mission, the sensitive resources in the area, and responsible use of the public lands.

The 2006 WEMO Plan added protection of the Bendire's thrasher, Mohave ground squirrel, yellow-eared pocket mouse, and Kelso Creek monkeyflower as specific objectives of the ACEC management plan. Three new conservation areas, including the Mohave Ground Squirrel, Kelso Creek Monkeyflower, and Bendire's Thrasher Conservation Areas, were also established within the ACEC.

Since the approval of the 2006 WEMO Plan, an intensive effort has been underway to implement the designated route system and manage OHV use within the Jawbone/Butterbredt ACEC and surrounding areas. The efforts have included signing and resigning all designated open routes as needed, regular patrols and monitoring in the Jawbone area, installation of additional information kiosks at main entry portals to the management area, building boundary fences around the Dove Springs Open Area and along the northern boundary of the Jawbone Canyon Open Area, and continued focused restoration efforts.

For the last eight years BLM has partnered with a local non-profit, the Friends of Jawbone (FOJ), to assist with management plan implementation efforts in the Jawbone area. The FOJ is able to maintain a staff of between eight and twenty individuals for field work crews, without funding from BLM. These crew members take on many different tasks including regular monitoring patrols, replacement of route signs, trash pickup, and implementation of approved habitat restoration activities, route and trail maintenance, and recreation facility maintenance.

No camping is permitted within 600 feet of water sources.

Juniper Flats

An ACEC was established for the Juniper Flats Cultural Area in 1980, and a management plan was prepared in 1988. The foothill area south of Apple Valley containing springs and riparian habitat in a dense stand of junipers was an important Native American habitation and special use site. Juniper Flats also provides important habitat for the San Diego horned lizard and the gray vireo. The Willow fire in 2000 burned the entire ACEC, leading to a temporary closure of the area until vegetative recovery had begun. Juniper Flats is an important equestrian riding area and provides access to the Deep Creek hot springs in the San Bernardino National Forest.

The 2006 WEMO Plan included construction of a multi-use trailhead to allow parking and staging for equestrian users.

Last Chance Canyon

The CDCA Plan designated Last Chance Canyon in the El Paso Mountains as an ACEC in 1980. A Plan Amendment in 1984 adjusted the boundaries to include additional prehistoric sites. This amendment implemented a recommendation of the ACEC management plan, which was completed in 1982. The archaeological sites are part of a larger archaeological district placed on the National Register of Historic Places in 1971.

The 2006 WEMO Plan adopted an interim route network until a revised OHV access network could be established for the El Paso Mountains. The ACEC was also included within the Mohave Ground Squirrel Conservation Area.

Manix

The Manix ACEC, located 20 miles northeast of Barstow along the Mojave River, was established in 1990 to protect paleontological and cultural resources. This site contains blowsand habitat for the Mojave fringe-toed lizard.

The 2006 WEMO Plan designated public lands along the Mojave River as a conservation area for the Mojave fringe-toed lizard.

Mojave Fishhook Cactus

A CDCA Plan Amendment established the Mojave Fishhook Cactus ACEC in 1984. The ACEC is composed of two separate parcels in the Brisbane Valley. The purpose of the ACEC is to protect the yellow-spined form of the Mojave fishhook cactus. Subsequent studies have shown that this area may be important to the Mojave monkeyflower as well. A management plan was completed in 1990, which designated OHV routes within the ACEC.

The 2006 WEMO Plan amended the MUC Class from U to L for 628 acres. The plan also designated Brisbane Valley as a tortoise Special Review Area.

Rainbow Basin

The Rainbow Basin ACEC, established in 1980, lies ten miles north of Barstow and includes two campgrounds, a scenic loop drive, hiking trails, and an interpretive trail. The area is popular with visitors that come to see the colored geological formations. The ACEC protects two nest sites for the prairie falcon. The ACEC management plan, completed in 1991, addressed both the ACEC and a larger surrounding area where route designation was accomplished and recommendations were made for campground and trail improvements and closure to target shooting. Hunting is allowed in the ACEC.

This area is part of the Coolgardie Mesa conservation area and ACEC, the Mohave Ground Squirrel Conservation Area, and the Superior-Cronese DT ACEC. The 2006 WEMO Plan closed routes that served as links to regional routes in order to reduce disturbance to the Lane Mountain milkvetch. Objectives of the management plan were also revised to include protections for the Lane Mountain milkvetch and prairie falcon.

Red Mountain Spring

This area was designated as an ACEC by the CDCA Plan to protect prehistoric values. A 1982 CDCA Plan Amendment listed this area as closed to vehicle travel. A management plan was completed in 1987. This ACEC was included in the route designation inventory and designation process for the Red Mountain subregion.

The 2006 WEMO Plan formally changed the name of this ACEC from Squaw Spring to Red Mountain Spring. The ACEC was included in the Mohave Ground Squirrel Conservation Area and the Fremont-Kramer DT ACEC.

Camping, OHV and non-OHV travel is prohibited.

Rodman Mountains Cultural Area

A 1988 CDCA Plan Amendment established this ACEC to protect cultural resources. Most of the ACEC is within the Rodman Mountains Wilderness. Portions outside the wilderness are part of the Ord-Rodman route designation subregion. The site contains raptor nests and limited desert tortoise habitat.

The 2006 WEMO Plan incorporated most of the ACEC into the Ord-Rodman DT ACEC.

Vehicle camping is restricted to within 100 feet of centerline of designated routes, and competitive speed events prohibited.

Rose Springs

An area surrounding Rose Springs in Inyo County was designated as an ACEC by the CDCA Plan to protect prehistoric values. Access is limited by a gate, which has been vandalized in the past. A management plan was prepared in 1985 that recommended closure of the ACEC to OHVs. Access to the ACEC is available via a transmission line road and the Los Angeles Aqueduct road.

The 2006 WEMO Plan incorporated this area into the Mohave Ground Squirrel Conservation Area.

Sand Canyon

The Sand Canyon ACEC was established to protect riparian habitat and wildlife in a canyon on the eastern slope of the Sierra Nevada Mountains. The ACEC is one of the most diverse areas in the West Mojave for species of small mammals and supports a wide variety of reptiles and birds. Two species nearly endemic to the West Mojave are found within the ACEC: the Ninemile Canyon phacelia and the yellow-eared pocket mouse. Riparian habitat in the ACEC is important to migratory birds, including the willow flycatcher. An ACEC management plan was prepared in 1989.

The 2006 WEMO Plan modified the ACEC management plan to incorporate protections for the yellow-eared pocket mouse.

Short Canyon

The Short Canyon ACEC was established by an amendment to the CDCA Plan in 1988. Most of the ACEC lies within the Owens Peak Wilderness. The purpose of the ACEC is to protect the unusual vegetation and diverse flora. Short Canyon is known to support occurrences of Charlotte's phacelia (*Phacelia nashiana*), a limited-range plant whose distribution falls almost entirely within the western Mojave Desert. In addition, a significant population of the state-listed Mojave tarplant (*Deinandra [Hemizonia] mohavensis*) was detected in the canyon in 1998. A management plan was prepared in 1990. The primary management action was to exclude grazing from the ACEC, which has been implemented through fencing and placement of cattle guards.

The 2006 WEMO Plan modified the ACEC management plan to incorporate protections for the Charlotte's phacelia and Mojave tarplant.

Soggy Dry Lake

BLM established the Soggy Dry Lake ACEC in the 1980 CDCA Plan. The Soggy Dry Lake Creosote Rings Preserve was established to protect ancient vegetation in the Fry Valley, where creosote bushes have developed as clonal rings, attaining an age of up to 11,700 years. A management plan for this ACEC was approved in 1982. The CDFW owns 488 acres adjacent to the ACEC, managed as the King Clone Ecological Reserve.

Steam Well

This ACEC protects historic and prehistoric values within the Golden Valley Wilderness in San Bernardino County.

The 2006 WEMO Plan incorporated this area into the Mohave Ground Squirrel Conservation Area.

Trona Pinnacles

The 1989 management plan for the Trona Pinnacles ACEC focused on protection of the outstanding scenery and geological features of this area, which is located ten miles south of Trona. The site is used for commercial filming and sightseeing. At least one prairie falcon nest site was reported within the ACEC, but falcons have not been recorded there for the past ten years.

Upper Johnson Valley Yucca Rings

The CDCA Plan of 1980 established this ACEC for the unique clonal yucca rings found near the Fry Mountains within the Johnson Valley Open Area. The yucca plants are believed to have grown in a manner similar to the ancient creosote rings near Soggy Dry Lake and represent a stable, old plant community. A management plan was completed in 1982, and a Plan Amendment in 1984 adjusted the boundary along parcel lines. The ACEC Management Plan was developed to provide for continued use to meet the recreational needs of the Johnson Valley Open Area while protecting the sensitive resources. This area is within an OHV Open Area, and is completely fenced, so it would not be affected by designation of the route network.

Western Rand Mountains

The Western Rand Mountains ACEC (RMMA) formerly supported high densities of desert tortoises, though tortoise numbers have declined substantially from historical levels. The ACEC is believed to support the Mohave ground squirrel, and is known to harbor burrowing owls and LeConte's thrasher. A Rand Mountains Fremont Valley Management Plan was completed in 1993, and adopted in 1994. This plan, which also addressed surrounding lands such as Koehn Lake and lands to the northeast, was prepared in cooperation with the CDFW under authority of the Sikes Act. The plan received a "no jeopardy" Biological Opinion from the USFWS. The plan recommended several amendments to the BLM's CDCA Plan:

- Expand the Western Rand Mountains ACEC by 13,120 acres
- Change Class M lands in the ACEC expansion and adjacent alluvial fan areas to Class L.

- Withdraw 32,590 acres within the RMMA from mineral location and entry. The 6,090-acre Koehn Lake and an additional 8,320 acres within the management area will remain as class M and open to mineral entry.
- Change the RMMA OHV network from an “existing routes” system to a designated trail system that was mapped and marked in the field. The network of available routes of travel adopted in the plan reduced the network from the existing network of 764 miles down to 129 miles of designated Open routes..
- Categorize portions of the RMMA as Desert Tortoise Category I habitat. These lands lie on both sides of the Randsburg-Mojave Road southwest of Red Mountain and are shown on Illustration #9 in the 1993 management plan.

Implementation of the Rand Mountains Fremont Valley Management Plan related to the management of off-highway vehicle use within the area has included:

- Mapping, marking, and maintaining of the designated trail network with brown numbered post to identify the trail system.
- Installing a 17-mile long fence on the southern boundary of the RMMA with portals allowing entry only on the designated trail system.
- Installing fences along both side of designated routes R5 and R50 within the ACEC to prevent off route travel by motorized vehicle.
- Installing fencing along the northern boundary of ACEC to control access into the area. Through the connection of the boundary fence lines and the R5 and R50 fence lines about 5,700 acres of desert tortoise habitat have been encircled and protected from uncontrolled vehicle trespass.
- Installing 12 information kiosks around the management area with maps, rules, and information brochures for the public.
- Performing active desert restoration on 50 miles of closed trails at roughly 700 sites, covering 32 acres of desert tortoise habitat restoration. Active restoration efforts have included ripping, barricading, vertical mulching, and replanting areas with desert vegetation.
- Performing outreach efforts on major holiday weekends during the use season to inform visitors of the vehicle-use regulations within the management area.
- Conducting patrols of the area by both Law Enforcement staff and Resource staff to make public contacts about the management area. The Rand Mountains Fremont Valley Management Plan proposed a goal of ranger patrols eight hours per week plus eight hours each weekend from March 1 to June 30, September 1 to November 1, and holiday weekends. Ranger staffing levels were not adequate to consistently to so until 2002. In 2002, a ranger was specifically assigned primary patrol responsibilities for the Rand Mountains, Fremont Valley, and the Desert Tortoise Natural Area in order to facilitate implementation of other plan goals.

The 2006 WEMO Plan adopted the recommendations of the management plan, including adjustment of the boundary; amending the MUC Class from M to L for 34,835 acres; adopting the route network; designating Category 1 tortoise habitat as DWMA; implementing mineral

withdrawal; and implementing an OHV-use permit program. The adoption of the route network was vacated by the Court in its Remedy Order of 2011, but the other actions were kept in place.

Since the adoption of the 2006 WEMO Plan, the first phase of a permit system has begun. The permit is required for all persons desiring to operate a motor vehicle within RMMA, as specified in the 2006 WEMO Plan.

Stopping and parking of motor vehicles can take place within 50 feet of either side of the centerline of designated routes, while camping is restricted to existing disturbed areas along open routes.

Whitewater Canyon

BLM established the Whitewater Canyon ACEC in the 1980 CDCA Plan. The Whitewater Canyon ACEC straddles the WEMO Planning area boundary, with the upper elevations lying within the planning area. All of the ACEC within the WEMO Planning area lies within the San Gorgonio Wilderness. Wildlife protection is a goal of the ACEC Plan, and the ACEC protects a substantial herd of bighorn sheep and harbors golden eagle and prairie falcon nests. Significant riparian areas are found in lower Whitewater Canyon, and these are known to support several species of riparian birds as well as the arroyo toad. Potential habitat exists for the triple-ribbed milkvetch within upper Whitewater Canyon. The Pacific Crest Trail and the California Riding and Hiking Trail cross the ACEC.

New ACECs Designated in the 2006 WEMO Plan

The 2006 WEMO Plan established 10 new ACECs within the planning area, as discussed below.

Bendire's Thrasher Conservation Area

The conservation strategy for Bendire's thrasher is based on conservation of habitat on public lands where thrashers were seen in 2001 or were abundant in the mid-1980s and conditions appear unchanged. Four public land conservation areas were established. These are within Joshua Tree National Park (106,710 acres), the Jawbone/Butterbrecht ACEC (7,678 acres), northern Lucerne Valley (9,805 acres), and Coolgardie Mesa (7,646 acres).

Carbonate Endemic Plants Research Natural Area

BLM designated public lands within an area east of Highway 18 in the foothills of the San Bernardino Mountains as a Research Natural Area and manages the land as an ACEC to protect four federally listed and one unlisted species of plants, as well as the San Diego horned lizard, gray vireo, and bighorn sheep.

No camping is permitted in critical habitat.

Coolgardie Mesa

The Coolgardie Mesa ACEC lies within the Superior-Cronese DT ACEC and contains conservation areas for the desert tortoise, Mohave ground squirrel, Bendire's thrasher, and Lane

Mountain milkvetch. The ACEC serves as a multispecies reserve for these four species as well as the Barstow Woolly sunflower.

Kelso Creek Monkeyflower Conservation Area

The Kelso Creek Monkeyflower Conservation Area was established by the 2006 WEMO Plan. The plan included conservation prescriptions such as maintaining regional rangeland health standards, requiring botanical surveys for proposed projects, and monitoring of habitat. In the 2016 DRECP LUPA, the Kelso Creek Monkeyflower ACEC was eliminated as a separate ACEC, and was incorporated into the Jawbone/Butterbrecht ACEC.

Middle Knob

The BLM designated the Middle Knob area as a new ACEC in the 2006 WEMO Plan. Management of this area includes requirements for avoidance of all listed species of plants and animals, designation of vehicle routes of travel to ensure compatibility with the purposes of the ACEC and with the Pacific Crest Trail, and prohibition of new wind energy development on public lands. Surveys for flax-like monardella in suitable habitat would be required for any ground-disturbing projects in the Middle Knob ACEC.

Mojave Monkeyflower

Conservation of Mojave monkeyflower is based on establishment of two reserve areas that include the majority of the known populations. These reserves, including southern Brisbane Valley and an area near Daggett Ridge, were designated as an ACEC in the 2006 WEMO Plan. The plan amended the MUC Class from U to L for 10,448 acres, and amended the MUC Class from M to L for 25,351 acres. Part of the ACEC lies within the Ord-Rodman DT ACEC. In the 2016 DRECP LUPA, this ACEC was split into two stand-alone ACECs, the Daggett Ridge ACEC and the Brisbane Valley ACEC.

Mojave Fringe-Toed Lizard Conservation Area

Two separate areas were designated as conservation areas for the Mojave fringe-toed lizard and are managed as an ACEC. The ACEC is found along the Mojave River east of Barstow and in and adjacent to the Sheephole Wilderness east of Twentynine Palms. Three other ACECs (Pisgah, Manix, and Cronese Lakes) serve to protect the Mojave fringe-toed lizard as well.

Parish's Phacelia Conservation Area

BLM established a new ACEC for conservation of Parish's phacelia northeast of Barstow along the Manix Trail. The plan designated 898 acres as a conservation area for this species of which 386 acres (43%) are located on private land and 512 acres (57%) are located on BLM land.

Camping is not an allowable use in this area.

Pisgah Crater

BLM designated a portion of the Pisgah Crater and surrounding area as an ACEC in the 2006 WEMO Plan. This crater and lava flow, an uncommon landform in the western Mojave Desert,

was previously designated as a Research Natural Area. The Pisgah Crater contains lava tubes of several types, some of which are used as bat roosts. The mix of dark lava and white sand has resulted in interesting color adaptations in the reptiles and small mammal fauna, called cryptic coloration or background color matching. These white and dark forms occurring together represent a location of high genetic biodiversity within species. The ACEC includes areas where populations of crucifixion thorn, white-margined beardtongue, sand linanthus, and Mojave fringe-toed lizard occur. Desert tortoise also occurs in the area.

West Paradise

The West Paradise ACEC lies within the Superior-Cronese DT ACEC and contains conservation areas for the desert tortoise, Mohave ground squirrel, and Lane Mountain milkvetch. The ACEC serves as a multispecies reserve for these three species.

DWMAs Designated in the 2006 WEMO Plan

The 2006 WEMO Plan established four Desert Wildlife Management Areas (DWMAs, now designated as DT ACECs under the DRECP LUPA), totaling 1,523,936 acres for the protection of the desert tortoise. The boundaries of these DT ACECs correspond to the general boundaries identified by the Desert Tortoise (Mojave Population) Recovery Plan (Recovery Plan): the Fremont-Kramer (803 square miles) and Superior-Cronese (1,003 square miles) DT ACECs, which are adjacent; the Ord-Rodman DT ACECs (392 square miles); and the Pinto DT ACECs (183 square miles). Tortoise DT ACECs are managed for tortoise conservation and recovery until which time the tortoise may be delisted as per criteria given in the Recovery Plan.

Public lands administered by the BLM within DT ACECs are designated as ACECs. The 2006 WEMO Plan serves as the ACEC management plan for the four Tortoise DT ACECs. Existing ACECs that lie within the boundary of the Tortoise DT ACECs (“included ACECs”) are still maintained for the purpose of their original designation, unless specifically deleted by the 2006 WEMO Plan. Management provisions for resource protection in the Tortoise DT ACECs augment, rather than replace, the pre-existing ACEC provisions.

The 2006 WEMO Plan also established the Mohave Ground Squirrel (MGS) Conservation Area comprising 1,726,712 acres for the long-term survival and protection of the MGS. The MGS Conservation Area includes portions of the Fremont-Kramer and Superior-Cronese Tortoise DT ACECs, and additional, essential habitats located west and north of the two tortoise DT ACECs.

New ACECs Designated in the 2016 DRECP LUPA

The 2016 DRECP LUPA made changes to some existing ACECs, and also established 17 new ACECs within the planning area, as discussed below.

Under the DRECP LUPA, the Kelso Creek Monkeyflower ACEC was eliminated as a separate ACEC, and was incorporated into the Jawbone/Butterbrecht ACEC. In addition, the Mojave Monkeyflower ACEC was split into two stand-alone ACECs, the Daggett Ridge ACEC and the Brisbane Valley ACEC. The new ACECs are described below.

Ayre's Rock

The Ayre's Rock ACEC encompasses 1,530 acres near Coso Junction. Ayer's Rock was formally listed on the National Register of Historic Places in 2003. The Ayer's Rock ACEC encompasses a complex of prehistoric archaeological resources, the most prominent of which is a monolithic boulder renowned for panels of Native American rock art, specifically painted polychrome pictographs. The area also includes Mohave ground squirrel (MGS) core habitat within the MGS Conservation Area.

Camping and recreational off highway vehicle use are prohibited within the National Register District.

Big Rock Creek Wash

The Big Rock Creek Wash ACEC encompasses 310 acres near the town of Pear Blossom in Los Angeles County. The BLM parcel of the ACEC is part of a proposed Significant Ecological Area (Big Rock Creek SEA) designated by Los Angeles County. Short-joint beavertail cactus is a USFWS Species of Concern that occurs here. In addition, remote sensing shows that the Big Rock Wash ecosystem is unique in the region. The red color exhibited in Landsat aerial photos indicates unique soil and vegetation characteristics. The vegetation consists of a diversity of plant species that are unusually dense and robust. This type of habitat supports a variety of wildlife species including the special status San Diego horned lizard.

Bristol

The Bristol ACEC encompasses 214,910 acres south of Interstate 40 and between the Mojave National Preserve and the Twentynine Palms Marine Base. The unit links the Cady Mountain Wilderness Study Area and the Bristol Mountains, Kelso Dunes, Trilobite, and Clipper Mountains wilderness areas with Mojave National Preserve. The ACEC also connects with the Pisgah ACEC on the west and the Chemehuevi ACEC on the east. This creates a contiguous conservation area which encompasses a transition zone between both Mojave and Sonoran/Colorado Desert ecosystems. The unit includes prehistoric trails and evidence of trading, habitation, and migration of various Native American groups. There are numerous remnants of early 20th century mining and transportation efforts including the ghost towns of Stedman, Ragtown, Ludlow, and the Tonopah and Tidewater Railroad grade.

The transportation-related management prescriptions for the unit allow stopping and parking within 25 feet, and camping within 100 feet, of centerline of designated routes.

Cady Mountains WSA

The Cady Mountain WSA ACEC encompasses 101,380 acres between Interstate 15 and Interstate 40, approximately 20 miles southwest of Baker. The unit provides regional habitat connection for bighorn sheep, and overlaps a portion of the Old Spanish Trail.

Eagles Flyway

The Eagles Flyway ACEC encompasses 10,980 acres south of CA State Highway 178, east of CA State Highway 14, and west of the El Paso Mountain Wilderness. This area connects

Robber's Roost Birds of Prey Nesting Area to the El Paso Wilderness. It is an important area for maintaining connectivity for raptors and other wildlife between the Sierras and the El Paso Mountains. Golden eagles, which are protected under the Bald and Golden Eagle Protection Act, have frequently been seen flying from the Sierras across this area to the El Pasos. This area provides prime upland foraging for these birds of prey. The area also includes Mohave ground squirrel (MGS) core habitat within the MGS Conservation Area.

El Paso to Golden Valley Wildlife Corridor

The El Paso to Golden Valley Wildlife Corridor ACEC encompasses 57,920 acres south and east of the El Paso Mountains Wilderness. This area is of local importance to the residents of the town of Ridgecrest as is evident from the request by them to separate it in the El Paso Collaborative Access Plan (CAPA). The area is avidly used for rock hounding and other various recreation types. A variety of songbirds use the area, both during migration and as nesting habitat. Resident songbird species include loggerhead shrikes and Le Conte's thrashers. There are at least four special status bat species, including the sensitive Townsend's big-eared bat, that call this area home.

Granite Mountain Corridor

The Granite Mountain Corridor ACEC encompasses 39,290 acres between Lucerne Valley and Apple Valley. The area is critical for bighorn sheep, golden eagles, desert tortoise, prairie falcons and several other species. Additionally, numerous rare and sensitive plants have major populations here, and Joshua tree woodland is present, making the area regionally significant. The area provides critical links for wildlife populations to the north and south of this linkage area.

Mesquite Hills/Crucero

The Mesquite Hills/Crucero ACEC encompasses 5,040 acres southwest of Baker. The area includes extensive mesquite groves that among the few mesquite bosques remaining in the California deserts. The area is critical for fringed toed lizard, desert tortoise, burrowing owl, and several bat species. Nomadic tribes of the past to recent Native Americans have occurred within the Mesquite Hills/Crucero Hills for over 4,000 years. Evidence of Native American visitation within the Mesquite Hills/Crucero Hills spans over 4,000 years and are scattered throughout the area.

The transportation-related management prescriptions for the unit allow stopping and parking within 25 feet, and camping within 100 feet, of the centerline of designated routes.

Mojave Ground Squirrel

The Mojave Ground Squirrel ACEC encompasses 198,500 acres south of CA State Highway 190, and east of the Tehachapi, Scodie, and Sierra Nevada Mountain Ranges. This area contains the habitat for the state threatened Mohave ground squirrel (*Spermophilus mohavensis*), and was established to protect the long-term survival of this species. This area includes greater connectivity between the large, mostly undeveloped and protected Mohave Ground Squirrel

(MGS) habitat found within the three Military Ranges to the north, east (China Lake NAWS) and south (Edwards).

Northern Lucerne Valley Linkage

The Northern Lucerne Valley Linkage ACEC encompasses 21,900 acres approximately 16 miles south-southwest of Barstow. The area is critical for bighorn sheep, golden eagles, desert tortoise, prairie falcons and several other species. Additionally, numerous rare and sensitive plants have major populations here, and Joshua tree woodland is present, making the area regionally significant. The area provides critical links for wildlife populations to the north and south of this linkage area.

Olancha Greasewood

The Olancha Greasewood ACEC encompasses 26,620 acres south of CA State Highway 190 and east of CA State Highway 395. This area of sand dunes has a UPA described in the CDCA Plan as a Great Basin Enclave with greasewood (*Sarcobatus vermiculatus*) as the dominant plant.

Old Woman Springs Wildlife Linkage

The Old Woman Springs Wildlife Linkage ACEC encompasses 55,980 acres south and west of Highway 247, between Lucerne Valley, Yucca Valley, and Pioneertown. The area is critical for bighorn sheep, Mojave fringed toed lizards, desert tortoise, burrowing owl, and several other species. Additionally, numerous rare and sensitive plants have major populations here; Joshua tree woodland is also present, making the area regionally significant.

Panamints and Argus

The Panamints and Argus ACEC encompasses 34,005 acres between the Argus Wilderness and Death Valley National Park. This area encompasses an essential movement corridor which links wildlife habitats in the China Lake Naval Air Weapons Station and Argus Wilderness to those protected by the Death Valley National Park. Desert Bighorn sheep and Mojave ground squirrels are two of those focal species that occur here. In addition, the area provides excellent habitat for foraging and nesting of numerous raptor species, including golden eagles and prairie falcons. There are numerous prehistoric and historic sites in the area. Panamint Lake was an important location in prehistory when water and riparian resources were abundant, allowing prehistoric Native Americans a refuge from the harsh environment around them. The Lake has many National Register eligible properties and has ethnographic significance to several Paiute and Shoshone Tribal groups today.

No camping is permitted within 200 meters of desert wildlife watering holes.

Pipes Canyon

The Pipes Canyon ACEC encompasses 8,720 acres north of Yucca Valley. The ACEC area has numerous prehistoric resources that meet criteria for inclusion in the National Register of Historic Places (NRHP) as contributing elements of an Eligible District. This area has the greatest concentration of known NRHP eligible sites within the Barstow Field Office. Sites

include petroglyphs, pictographs, rock shelters, village sites, and milling sites. This area is of particular cultural interest to local Native American Tribes.

Santos Manuel

The Santos Manuel ACEC encompasses 27,550 acres approximately 10 miles east of Twentynine Palms. The area provides high density Desert tortoise habitat and serves as a critical tortoise habitat linkage. The area is the location of the recent discovery of an important archaeological site. The site is similar to the Topok Maze site near Needles, California, and is an example of an extremely rare site type. This site meets criteria for eligibility for the National Register of Historic Places. Native Americans have determined this area of high significance to maintain the cultural landscape.

Soda Mountains Expansion

The Soda Mountains Expansion ACEC encompasses 16,720 acres between Interstate 15 and the southern border of the Soda Mountain Wilderness Study Area. This area provides important plant and wildlife connectivity between surrounding Wilderness and Wilderness Study Areas which encompass large blocks of intact habitat. There is one known site within the Soda Mountain Expansion that meets criteria for inclusion to the National Register of Historic Places. The site is a geoglyph which is of sacred value to Tribes.

Soda Mountains WSA

The Soda Mountains WSA ACEC encompasses 88,780 acres approximately three miles west of Baker. The unit includes prehistoric and historic cultural resources associated with various indigenous and early European occupation periods. The Soda Mountains also provide important connectivity between large habitat blocks.

E.12 Noise

E.12.1 Regulatory Framework

Ambient noise standards are maintained at the federal, state, and local levels. In 1974, the EPA published "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety" (EPA 550/9-74-004). This document provides information for state and local agencies to use in developing their ambient noise standards to assist state and local government entities in development of state and local ordinances, regulations, and standards for noise (Department of State 2007).

Federal

Noise and land use guidelines have been produced by a number of federal agencies including the Federal Highway Administration, the EPA, the Department of Housing and Urban Development, and the American National Standards Institute. These guidelines are all based upon statistical noise criteria such as Leq, Ldn or CNEL.

The EPA "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety" identified outdoor and indoor noise levels to protect public health and assets (Table E.12-1). A Leq (24) of 70 dB was identified as the level of environmental noise that would prevent any measurable hearing loss over a lifetime. An Ldn of 55 dBA outdoors and 45 dBA indoors were identified as noise thresholds that would prevent activity interference or annoyance (Department of State 2007).

Table E.12-1. EPA Noise Control Guidelines

Use	Measure	Indoor activity interference (dBA)	Hearing loss consideration (dBA) ^b	To protect against both effects (dBA) ^c	Outdoor activity interference (dBA)	Hearing Loss consideration (dBA) ^b	To protect against both effects (dBA) ^c
Residential with Outside Space	Ldn Leq(24)	45	70	45	55	70	55
Residential with No Outside Space	Ldn Leq(24)	45	70	45			
Commercial	Leq(24)	^a	70	70 ^d	^a	70	70 ^d
Inside Transportation	Leq(24)	^a	70	^a			
Industrial	Leq(24)	^a	70	70 ^d	^a	70	70 ^d
Hospitals	Ldn Leq(24)	45	70	45	55	70	55
Educational	Ldn Leq(24)	45	70	45	55	70	55
Recreational Area	Leq(24)	^a	70	70 ^d	^a	70	70 ^d
Farm Land and General Unpopulated Land	Leq(24)				^a	70	70 ^d

Source: City of Rialto 1992

Notes:

^a Since different types of activities appear to be associated with different levels, identification of a maximum level for activity interference may be difficult except in those circumstances where speech communication is a critical activity.

^b Level of hearing loss is defined as the exposure period which results in hearing loss at the identified level is a period of 40 years.

^c Based on lowest level

^d Based on hearing loss

A Leq of 75 dBA during 8 hours may be identified in these situations so long as the exposure over the remaining 16 hours per day is low enough to result in a negligible contribution to the 24-hour average.

EPA has regulations that are specific to motor vehicle and motorcycle noise emissions. These regulations apply to motorcycles manufactured after 1982, except for motorcycles designed for closed-course competition only. Under 40 CFR Part 205, both street and off-road motorcycles manufactured after 1986 meet a noise standard of 80 dB, and must be labeled to indicate compliance with the standard.

State

California Government Code section 65302(f) encourages each local governmental entity to perform noise studies and implement a noise element as part of its General Plan. In addition, the California Office of Planning and Research has published guidelines for preparing noise elements, which include recommendations for evaluating the compatibility of various land uses as a function of community noise exposure.

The California Department of Health Services has established the Office of Noise Control, which has prepared studies associated with noise levels and their effects on various land uses. Based upon these studies, the State has established interior and exterior noise standards by land use category and standards for the compatibility of various land uses and noise levels (Table E.12.-2). In addition, noise limits for highway vehicles are regulated under the California Vehicle Code, §§23130 and 23130.5. The limits are enforceable on the highways by the California Highway Patrol and the County Sheriff's Office.

Motorcycles registered in the state that are manufactured on or after 2013 or have an aftermarket exhaust system manufactured on or after 2013 must have the federal EPA noise emission label affixed to it in order to be operated, used, or parked in the state.

Table E.12-2. Noise/Land Use Compatibility Matrix for Community Noise Environments

Land Use Category	Community Noise Exposure Level (CNEL, dBA)						
	50	55	60	65	70	75	80
Residential – Low density single-family, duplex, and mobile homes	Compatible			Compatible		Compatible	
	Compatible			Compatible		Compatible	
Residential – Multi-family	Compatible			Compatible		Compatible	
	Compatible			Compatible		Compatible	
Transient Lodging – Hotels, motels	Compatible			Compatible		Compatible	
	Compatible			Compatible		Compatible

	Compatible			Compatible		Compatible	

Table E.12-2. Noise/Land Use Compatibility Matrix for Community Noise Environments

Land Use Category	Community Noise Exposure Level (CNEL, dBA)					
	55-60	60-65	65-70	70-75	75-80	80-85
Cemeteries	Normally acceptable	Normally acceptable	Normally acceptable	Normally acceptable	Normally unacceptable	Clearly unacceptable
Office and Professional Buildings, Retail Commercial, Banks, Restaurants	Normally acceptable	Normally acceptable	Normally acceptable	Conditionally acceptable	Normally unacceptable	Clearly unacceptable
Industrial, Manufacturing, Utilities, Service Stations, Warehousing, Agriculture	Normally acceptable	Normally acceptable	Normally acceptable	Normally acceptable	Normally unacceptable	Clearly unacceptable

Source: State of California Office of Noise Control, Department of Health Services 1976

-  Normally acceptable: Specified land use is satisfactory based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
-  Conditionally acceptable: New construction or development should be undertaken only after a detailed analysis of the noise requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air systems or air conditioning, normally suffices.
-  Normally unacceptable: New construction or development should generally be discouraged. If it does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
-  Clearly unacceptable: New construction or development should generally not be undertaken.

E.12.2 Regional and Background Information

Noise is defined as unwanted sound. The Environmental Protection Agency (EPA, 40CFR205.166) has set noise emissions standards for many types of sources, under the Noise Control Act (1972). Noise can be described in terms of three variables: amplitude (loud or soft), frequency (pitch), and time pattern (variability), and its potential effects can be described in terms of a noise generating source, a propagation path, and a receiver (FTA 2006). The ambient sound level of a region is defined by the total noise generated within the specific environment and is usually composed of sound emanating from natural sources such as birds and wind blowing through leaves, and from human activities, including traffic on roads and highways. Ambient sound levels vary with time of day, wind speed and direction, and level of human activity. In this context, the ambient noise level constitutes the normal or existing level of environmental noise at a given location. Ambient noise levels will generally vary across a region. Because traffic on roads constitutes a substantial part of ambient noise levels, the ambient noise levels will generally be higher in close proximity to major transportation arteries such as urban centers and Interstate highways, and lower in undeveloped and remote areas.

Noise is defined as unwanted sound that exceeds the ambient level. Noise can be described in terms of three variables: amplitude (loud or soft), frequency (pitch), and time pattern (variability), and its potential effects can be described in terms of a noise generating source, a propagation path, and a receptor (FTA 2006). Excessive noise exposure has been shown to cause interference with human activities at home, work, or recreation; community annoyance, hearing loss, and affect people's health and well-being. Even though hearing loss is the most

clearly measurable health hazard, noise is also linked to other psychological, sociological, physiological, and economical effects, either temporary or permanent (EPA 1974).

Potential human annoyance and health effects associated with noise may vary depending on factors such as: (1) the difference between the new noise and the existing ambient noise levels; (2) the presence of tonal noise, noticeable or discrete continuous sounds, such as hums, hisses, screeches, or drones; (3) low frequency noise (frequency range of 8 to 1,000 Hertz [Hz]); (4) intermittent or periodic sounds, such as a single vehicle passing by, backup alarms, or machinery that operates in cycles; and (5) impulsive sounds from impacts or explosions (Brüel and Kjaer 2000). In some cases, noise can also disrupt the normal behavior of wildlife. Although the severity of the effects varies depending on the species being studied and other conditions, research has found that wildlife can suffer adverse physiological and behavioral changes from intrusive sounds and other human disturbances (NPS 2012).

With respect to the transportation network in the WEMO Planning area, the types of noises from use of routes on public lands are generally intermittent noises created by the passage of single vehicles or vehicles in small groups on an irregular and infrequent basis. In developed areas or areas near major highways that have higher ambient noise levels, the additional noise created by these vehicles is expected to have little or no adverse impact. However, in remote areas with low ambient noise levels, the additional noise may have an adverse impact on wildlife or sensitive receptors. This can especially be the case where routes used for organized activities create greater use levels, and therefore greater noise impacts, even if these impacts are only intermittent.

Noise Measurement

To describe environmental noise and to assess impacts on areas sensitive to community noise, a frequency weighting measure that simulates human perception is customarily used. The frequency weighting scale known as A-weighting best reflects the human ear's reduced sensitivity to low frequencies and correlates well with human perceptions of the annoying aspects of noise. The A-weighted decibel scale (dBA) is cited in most noise criteria. In general, a difference of more than 3 dBA is a perceptible change in environmental noise, while a 5 dBA difference typically causes a change in community reaction. An increase of 10 dBA is perceived by people as a doubling of loudness, and almost certainly causes an adverse community response. Noise containing discrete tones (tonal noise) is much more noticeable and more annoying at the same relative loudness level than other types of noise, because it stands out against background noise (BLM 2005).

Decibels are logarithmic units that conveniently compare the wide range of sound intensities to which the human ear is sensitive. Therefore, the cumulative noise level from two or more sources will combine logarithmically, rather than linearly (i.e., simple addition). For example, if two identical noise sources produce a noise level of 50 dBA each, the combined noise level would be 53 dBA, not 100 dBA.

The predominant rating scales for noise impacts to human communities in the State of California are the equivalent continuous sound level (Leq) and Community Noise Equivalent (CNEL) based on A-weighted decibels (dBA). Leq is the total sound energy of time-varying noise over a sample period. CNEL is the time-varying noise over a 24-hour period, with a weighting factor of 5 dBA applied to the hourly Leq for noises occurring from 7:00 p.m. to 10:00 p.m. (defined as

relaxation hours) and with a weighting factor of 10 dBA from 10:00 p.m. to 7:00 a.m. (defined as sleeping hours). The noise adjustments are added to the ambient noise levels occurring during the more sensitive hours. Day-night average noise (Ldn) is similar to the CNEL but without the adjustment for nighttime noise events. CNEL and Ldn are normally exchangeable and within 1 dB of each other. Other noise-rating scales used to assess an annoyance factor include the maximum instantaneous noise level, or Lmax, and percentile noise exceedance levels, or LN. Lmax is the highest exponential time-averaged sound level that occurs during a stated time period. It reflects peak operating conditions and addresses the annoying aspects of intermittent noise. LN is the noise level that is exceeded "N" percent of the time during a specified time period. For example, the L10 noise level represents the noise level exceeded 10 percent of the time during a stated period. The L90 noise level represents the noise level exceeded 90 percent of the time and is considered the lowest noise level experienced during a monitoring period. It is normally referred to as the background noise level.

Community noise levels are closely related to the intensity of human activity and land use. Noise levels are generally considered low when ambient levels are below 45 dBA, moderate in the 45 to 60 dBA range, and high above 60 dBA. In wilderness areas, the Ldn noise levels can be below 35 dBA. In small towns or wooded and lightly used residential areas, the Ldn is more likely to be around 50 or 60 dBA. Levels around 75 dBA are more common in busy urban areas (e.g., downtown Los Angeles), and levels up to 85 dBA occur near major freeways and airports. Although people often accept the higher levels associated with very noisy urban residential and residential-commercial zones, they nevertheless are considered to be adverse to public health.

The surrounding land uses dictate what noise levels would be considered acceptable or unacceptable. Most of the surrounding land use within close proximity to transportation routes in the WEMO Planning area is rural.

Typical Sound Levels

People experience a wide range of sounds in the environment. Table E.12-3 shows the relative A-weighted noise levels of common sounds measured in the environment and industry for various sound levels, including transportation sources. Excessive noise cannot only be undesirable but may also cause physical and/or psychological damage. The amount of annoyance or damage caused by noise is dependent primarily upon the amount and nature of the noise, the amount of ambient noise present before the intruding noise, and the activity of the person working or living in the area. Environmental and community noise levels rarely are of sufficient intensity to cause irreversible hearing damage, but disruptive environmental noise can interfere with speech and other communication and be a major source of annoyance by disturbing sleep, rest, and relaxation.

Table E.12-3. Typical Sound Levels Measured in the Environment and Industry

Noise source at a given distance ¹	A-Weighted Sound Level (dBA)	Noise Environments	Qualitative Description
Carrier deck jet operation	140	Carrier flight deck	Painfully loud
Civil defense siren (100 feet)	130		
Jet takeoff (200 feet)	120		Threshold of pain

Table E.12-3. Typical Sound Levels Measured in the Environment and Industry

Noise source at a given distance ¹	A-Weighted Sound Level (dBA)	Noise Environments	Qualitative Description
Military jets (200-500 ft) flying through the sound barrier	110-120	Rural open space	
Loud rock music	110	Rock music concert	
Diesel Train (50 ft)	105	Rural open space	Very loud / very annoying
Pile driver (50 feet)	100		
Ambulance siren (100 feet)	90	Boiler room	Annoying
Dirt Bike ²	86-96	Dirt Bike	
Motorcycle (50 feet) ³	80	California State Standard for post-1985 motorcycles	
Pneumatic drill (50 feet)	80	Noisy restaurant	
Motorcycle (25 feet)	80	Rural open space	
Freeway traffic (50 feet)	70		Intrusive / Moderately loud
Air conditioning unit (20 feet)	60	Data processing center	
Typical Conversation	60	Average Living Room	
Single auto	60	Rural open space	
Light auto traffic (100 feet); rainfall	50	Private business office	
Bird calls	40	Average living room library	Quiet
Soft whisper (5 feet); rustling leaves	30	Quiet bedroom	Very Quiet
Broadcasting/Recording studio	20		
Normal breathing	10		Threshold of hearing

(3) Source is California Code 27202; Realistic Bomber Training Initiative Final EIS, Appendix G. 2000. Dept of Defense, USAF Air Combat Command.

Sound is generally propagated by spherical spreading according to the “inverse square law”. For noise, the sound energy decreases with the square of the distance. As such, the sound pressure level would be reduced by 6 dB per doubling of distance from a ground-level stationary or point source. For a noise source which is relatively long, such as a constant stream of highway traffic (line source), the sound pressure spreads at a rate of 3 dB per doubling of distance. The drop-off rate also varies with both terrain conditions and the presence of obstructions in the sound propagation path. At very large distances, beyond several hundred feet (ft), wind and temperature gradients influence sound propagation. Changes in noise levels due to wind are generally short-term without persistent directional winds, where some hours may be a decibel or two louder than others within the margin of precision of such an assessment.

Lower levels are expected in rural or suburban areas than what would be expected for commercial or industrial zones. Nighttime ambient levels in urban environments are about seven decibels lower than the corresponding daytime levels. In rural areas away from roads and other human activity, the day-to-night difference can be considerably less. Areas with full-time human

occupation that are subject to nighttime noise are often considered objectionable because of the likelihood of disrupting sleep. Noise levels above 45 dBA at night can result in the onset of sleep interference effects. At 70 dBA, sleep interference effects become considerable (EPA 1974).

E.13 Travel and Transportation Management Network

E.13.1 Regulatory Framework

A discussion of the regulatory framework associated with the BLM transportation and travel management program is presented in Section 1.2.

E.13.2 Regional and Background Information

The Travel Management Plans (TMPs) for each TMA are presented in Appendix G.

E.14 Paleontological Resources

E.14.1 Regulatory Framework

The management and preservation of paleontological resources on public lands are governed under various laws, regulations, and standards, including the Paleontological Resources Preservation Act summarized in this section. Additional statutes for management and protection include the Federal Land Policy and Management Act (Public Law 94-579, codified at 43 U.S.C. 1701-1782 and 18 U.S.C. 641), which penalizes the theft or degradation of property of the U.S. Government. Other federal acts—the Federal Cave Resources Protection Act (16 U.S.C. 4301 et seq.) and the Archaeological Resources Protection Act (16 U.S.C. 470 et seq.)—protect fossils found in significant caves or in association with archeological resources. The BLM has also developed general procedural guidelines (Manual H-8720-1; IM 2008-009; IM 2009-011) for the management of paleontological resources.

Paleontological Resources Preservation, Omnibus Public Land Management Act, Public Law 111-011, Title VI, Subtitle D.

The Omnibus Public Land Management Act, Paleontological Resource Preservation Subtitle (16 U.S.C. 470aaa et seq.), directs the secretaries of the Department of the Interior and the Department of Agriculture to manage and protect paleontological resources on federal land using scientific principles and expertise. (This act is known by its common names, the Omnibus Act or the Paleontological Resources Preservation Act.) The Paleontological Resources Preservation Act incorporates most of the recommendations of the report of the Secretary of the Interior titled “Assessment of Fossil Management on Federal and Indian Lands” to formulate a consistent paleontological resources management framework. In passing the Paleontological Resources Preservation Act, the U.S. Congress officially recognized the scientific importance of paleontological resources on some federal lands by declaring that fossils from these lands are federal property that must be preserved and protected. The act codifies existing policies of BLM, National Park Service, U.S. Forest Service, Bureau of Reclamation, and the U.S. Fish and Wildlife Service, and provides:

- Uniform criminal and civil penalties for illegal sale and transport, theft, and vandalism of fossils from federal lands.
- Uniform minimum requirements for paleontological resource-use permit issuance (terms, conditions, and qualifications of applicants).
- Uniform definitions for “paleontological resources” and “casual collecting.”
- Uniform requirements for curation of federal fossils in approved repositories.

Federal legislative protections for scientifically significant fossils apply to projects that take place on federal lands (with certain exceptions, such as the Department of Defense, which continue to protect paleontological resources under the Antiquities Act). Such protections involve federal funding, require a federal permit, or involve crossing state lines.

Antiquities Act of 1906 (16 U.S.C. 431-433).

The Antiquities Act of 1906 states, in part:

Any person who shall appropriate, excavate, injure or destroy any historic or prehistoric ruin or monument, or any object of antiquity, situated on lands owned or controlled by the Government of the United States, without the permission of the Secretary of the Department of the Government having jurisdiction over the lands on which said antiquities are situated, shall upon conviction, be fined in a sum of not more than five hundred dollars or be imprisoned for a period of not more than 90 days, or shall suffer both fine and imprisonment, in the discretion of the court.

Although there is no specific mention of natural or paleontological resources in the Antiquities Act, or in the act’s uniform rules and regulations (43 Code of Federal Regulations [CFR] 3), “objects of antiquity” has been interpreted by the National Park Service, BLM, the U.S. Fish and Wildlife Service, and other federal agencies to include fossils. Permits to collect fossils on lands administered by federal agencies are authorized under this act. Therefore, projects involving federal lands will require permits for both paleontological resource evaluation and mitigation efforts.

Archaeological and Paleontological Salvage (23 U.S.C. 305).

Statute 23 U.S.C. 305 amends the Antiquities Act of 1906. Specifically, it states:

Funds authorized to be appropriated to carry out this title to the extent approved as necessary, by the highway department of any State, may be used for archaeological and paleontological salvage in that state in compliance with the Act entitled “An Act for the preservation of American Antiquities,” approved June 8, 1906 (PL 59-209; 16 U.S.C. 431-433), and State laws where applicable.

This statute allows funding for mitigation of paleontological resources recovered pursuant to federal aid highway projects, provided that “excavated objects and information are to be used for public purposes without private gain to any individual or organization” (Federal Register 46[19]; 9570).

National Registry of Natural Landmarks (16 U.S.C. 461-467).

The National Natural Landmarks Program, established in 1962, is administered under the Historic Sites Act of 1935. Regulations were published in 1980 under 36 CFR 1212 and the program was re-designated as 36 CFR 62 in 1981. A National Natural Landmark is defined as:

... an area designated by the Secretary of the Interior as being of national significance to the United States because it is an outstanding example(s) of major biological and geological features found within the boundaries of the United States or its Territories or on the Outer Continental Shelf (36 CFR 62.2).

National significance describes:

... an area that is one of the best examples of a biological community or geological feature within a natural region of the United States, including terrestrial communities, landforms, geological features and processes, habitats of native plant and animal species, or fossil evidence of the development of life (36 CFR 62.2).

Federal agencies and their agents should consider the existence and location of designated National Natural Landmarks, and of areas found to meet the criteria for national significance, in assessing the effects of their activities on the environment under Section 102(2)(c) of the National Environmental Policy Act (42 U.S.C. 4321). The National Park Service is responsible for providing requested information about the National Natural Landmarks Program for these assessments (36 CFR 62.6[f]). However, other than consideration under the National Environmental Policy Act, National Natural Landmarks are afforded no special protection. Furthermore, there is no requirement to evaluate a paleontological resource for listing as a National Natural Landmark.

BLM Manuals, Handbooks, and Instruction Memoranda

BLM Manual 8270 and BLM Handbook H-8270-1 contain BLM's policy and guidance for the management of paleontological resources on public lands. The manual has more information on the authorities and regulations related to paleontological resources. The handbook gives procedures for permit issuance, requirements for qualified applicants, and information on paleontology and planning. The classification system for potential fossil-bearing geologic formations on public lands in the handbook has been revised and replaced by the PFYC, as discussed in this section.

The manual and handbook will be revised after the new regulations (currently being developed and reviewed) are promulgated under the PRPA. Until that time, BLM will continue to follow the policy and guidelines in the manual and handbook that are not superseded by the PRPA. The BLM's overarching guidance for paleontological resources is that locating, evaluating, and classifying paleontological resources and developing management strategies for them must be based on the best scientific information available. Management of paleontological resources should emphasize:

- The uniqueness of fossils.
- Their usefulness in deciphering ancient and modern ecosystems.

- The public benefits and public expectations arising from their scientific, recreational, and educational values.
- The BLM's interest in and need for the continued advancement of the science of paleontology.
- The importance of minimizing resource conflicts within a multiple use framework.

Potential Fossil Yield Classification System

On October 15, 2007, with the release of IM 2008-009, BLM formalized a new classification system for identifying fossil potential on public lands. This classification system is based on the presence of significant paleontological resources in a geologic unit and its potential risk for impacts to the resource. It is a broad approach to planning efforts and an intermediate step in evaluating specific projects. IM 2008-009 will be incorporated into the next update of BLM Handbook H-8270-1, General Procedural Guidance for Paleontological Resource Management.

Using the PFYC system, geologic units are classified as Class 1 (very low) through Class 5 (very high), based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts. A higher class number indicates a higher potential for adverse environmental impacts. This system is used to set management policies and is not intended to apply to specific paleontological localities or small areas within geologic units. The PFYC system is used to assess the potential for discovery of significant paleontological resources or the impact of surface disturbing activities to such resources by using a five-class ranking system:

1. Class 1 – Very Low. Geologic units that are not likely to contain recognizable fossil remains. This class usually includes units that are igneous or metamorphic, excluding reworked volcanic ash units; or units that are Precambrian in age or older. Management concern for paleontological resources in Class 1 units is usually negligible or not applicable and assessment or mitigation is usually unnecessary except in very rare or isolated circumstances. The probability for impacting any fossils is negligible and assessment or mitigation of paleontological resources is usually unnecessary.
2. Class 2 – Low. Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant nonvertebrate fossils. This class typically includes vertebrate or significant invertebrate or plant fossils not present or very rare, units that are generally younger than 10,000 years before present, recent aeolian deposits, or sediments that exhibit significant physical and chemical changes (i.e., diagenetic alteration). Management concern for paleontological resources is generally low. Assessment or mitigation is usually unnecessary except in rare or isolated circumstances and the probability for impacting vertebrate fossils or scientifically significant invertebrate or plant fossils is low. Localities containing important resources may exist, but would be rare and would not influence the overall classification. These important localities would be managed on a case-by-case basis.
3. Class 3 – Moderate or Unknown. Fossiliferous sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence; or sedimentary units of unknown fossil potential. This class includes sedimentary rocks that are marine in origin with sporadic known occurrences of vertebrate fossils or other rocks where

vertebrate fossils and scientifically significant invertebrate or plant fossils are known to occur intermittently. The predictability of fossils within these units is known to be low or the units have been poorly studied and/or poorly documented. Potential yield cannot be assigned without ground reconnaissance. This class is subdivided into two groups: Class 3(a) and Class 3(b).

- a) Class 3(a) is assigned to rock units where sufficient information has been developed to know that the unit has widely scattered occurrences of vertebrate fossils and/or scientifically significant invertebrate or plant fossils. Common invertebrate or plant fossils may be found in the area, and opportunities may exist for hobby collecting.
 - b) Class 3(b) is assigned to rock units that exhibit geologic features and preservational conditions that suggest significant fossils could be present, but little information about the paleontological resources of the unit or the area is known. This may indicate the unit or area is poorly studied, and the field survey may uncover significant finds. The units in this Class may eventually be placed in another Class when sufficient survey and research is performed.
4. Class 4 – High. Geologic units containing a high occurrence of significant fossils. Vertebrate fossils or scientifically significant invertebrate or plant fossils are known to occur and have been documented, but may vary in occurrence and predictability. Surface disturbing activities may adversely affect paleontological resources in many cases. This class is subdivided into two groups, based primarily on the degree of soil cover: Class 4(a) and Class 4(b):
- a) Class 4(a) is assigned to rock units that are exposed with little or no soil or vegetative cover. Outcrop areas are extensive with exposed bedrock areas often larger than two acres. Paleontological resources may be susceptible to adverse impacts from surface disturbing actions and illegal collecting activities may impact some areas.
 - b) Class 4(b) is assigned to areas underlain by geologic units with high potential but have lowered risks of human-caused adverse impacts and/or lowered risk of natural degradation due to moderating circumstances. The bedrock unit has high potential, but a protective layer of soil, thin alluvial material, or other conditions may lessen or prevent potential impacts to the bedrock resulting from the activity.
5. Class 5 – Very High. Highly fossiliferous geologic units that consistently and predictably produce vertebrate fossils or scientifically significant invertebrate or plant fossils, and that are at risk of human-caused adverse impacts or natural degradation. This class is subdivided into Class 5(a) and Class 5(b) in the same manner as Class 4 above.

Assessment and Mitigation of Potential Impacts to Paleontological Resources

On October 10, 2008, BLM introduced guidelines for assessing potential impacts to paleontological resources to determine mitigation steps for federal actions on public lands covered under both the Federal Lands Policy and Management Act of 1976 and the National Environmental Policy Act (IM 2009-011). This IM provides field survey and monitoring

procedures to help minimize impacts to paleontological resources in cases where a federal action could adversely affect significant paleontological resources.

These assessment and mitigation guidelines show the conditions under which no specific paleontology assessment is required, including when:

1. A project will only affect geologic units unlikely to contain significant fossils or that have a very low or low potential for significant fossils (i.e., PFYC Class 1 or 2).
2. No scientifically important localities are identified in the area.

However, pre-project field surveys, a paleontological monitoring program, or other mitigation measures may be needed if a project would disturb geologic units assigned PFYC classes 3, 4, or 5, possible fossil-bearing alluvium, or known significant localities. The BLM guidelines also outline procedures for conducting field surveys and monitoring on-site surface-disturbing activities.

E.14.2 Regional and Background Information

A paleontological resource is defined in the federal Paleontological Resources Preservation Act (PRPA) as the “fossilized remains, traces, or imprints of organisms, preserved in or on the earth’s crust, that are of paleontological interest and that provide information about the history of life on earth” (16 United States Code [U.S.C.] 470aaa[1][c]). For the purpose of this analysis, a significant paleontological resource is considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils. A significant paleontological resource is considered to be scientifically important for one or more of the following reasons:

- The fossil extends the temporal (stratigraphic) or geographic distribution for a specific taxonomic group of fossils.
- It is a rare or previously unknown species.
- It represents an exceptionally high-quality, well-preserved and morphologically complete specimen.
- It preserves a previously unknown anatomical feature or exhibits other characteristic features which represent ontogenic, pathologic, or traumatic variations.
- It provides new information about the history of life on Earth.
- It has identified educational or recreational value.

Paleontological resources that may be considered not to have paleontological significance include those that lack provenance or context, lack physical integrity because of decay or natural erosion, or are overly redundant or otherwise not useful for academic research (BLM Instruction Memorandum [IM] 2009-011).

The intrinsic value of paleontological resources largely stems from the fact that fossils serve as the only direct evidence of prehistoric life. They are thus used to understand the history of life on earth, the nature of past environments and climates, the biological membership and structure of ancient ecosystems, and the patterns and processes of organic evolution and extinction. Despite the tremendous volume of sedimentary rocks preserved worldwide and the enormous number of

organisms that have lived during the vast expanse of geologic time, preservation of plant and animal remains as fossils is rare. Further, because of the infrequency of fossil preservation and the extinction of most fossilized species, fossils are considered nonrenewable resources. Once destroyed, a particular fossil can never be replaced. Essentially, paleontological resources include fossil remains and traces as well as the fossil-collecting localities and the geological rock units (e.g., formations) containing those localities. Knowing the geographic and topographic distribution of fossil-bearing rock units makes it possible to predict where fossils will, or will not, be encountered.

This chapter discusses applicable regulatory framework and the physical setting relevant to paleontological resources within the WEMO planning area. The chapter provides site-specific details for known paleontological resource areas within the planning area. In addition, the analysis uses the regional scale (1:750,000) mapping of fossil yield potential developed for the 2015 DRECP EIS. The Potential Fossil Yield Classification (PFYC) developed for the DRECP area represents an estimate based on the available regional-scale geologic data; it is not meant to replace the project and site-specific identification and evaluation of potential paleontological resources. Individual route designation actions which involve ground disturbance would be required to evaluate paleontological resources at a project-level of detail and would need to use the most detailed geologic and paleontological data available as part of project-level assessments.

APPENDIX E-1

MOJAVE AIR QUALITY MANAGEMENT DISTRICT REPORT (2013)

This page intentionally left blank.

West Mojave Plan Air Quality Evaluation Report

This report was prepared by the Mojave Desert Air Quality Management District Planning, Rulemaking and Grants staff on behalf of the West Mojave Planning Area air districts in April, 2013. Contact Alan De Salvio, Supervising Air Quality Engineer at 760-245-1661 x6726 or adesalvio@mdaqmd.ca.gov.

Introduction

The West Mojave (WEMO) Planning Area includes all or portions of five air quality districts (Mojave Desert Air Quality Management District (MDAQMD), Antelope Valley Air Quality Management District (AVAQMD), East Kern Air Pollution Control District (EKAPCD), the Great Basin Unified Air Pollution Control District (GBUAPCD), and the South Coast Air Quality Management District (SCAQMD)).

Air districts have statutory responsibility, in conjunction with the California Air Resources Board (CARB), to monitor air quality data (California Health and Safety Code §39607), with the intent of monitoring the public health, safety and welfare, including, but not limited to, health, illness, irritation to the senses, aesthetic value, interference with visibility, and effects on the economy (H&SC §39606(a)(2)). The WEMO Planning Area air districts (and CARB) operate an extensive ambient air monitoring network to meet this statutory requirement.

This report will summarize the nature of emissions within the WEMO Planning Area, how those emissions are monitored, summarize existing monitoring data, and discuss the existing monitoring network's ability to monitor off-highway vehicles and Open Areas.

WEMO Planning Area Emissions

The WEMO Planning Area includes the full gamut of emissions generated by mankind's activity, with the notable exception of emissions from waterborne activity, as the WEMO Planning Area has no coastal and sparse river and lakefront area. Emissions within the WEMO Planning Area are currently tabulated by CARB and air districts for State and Federal air quality planning purposes. Existing emission inventory efforts meet all State and Federal statutory and guidance inventory requirements. Specific emission inventory elements are presented below:

Substance	Nature	Basis for Inventory
Volatile Organic Compounds (VOC)	Ozone and fine particulate precursor	No direct ambient standard, indirect ozone standard, regional pollutant
Oxides of Nitrogen (NO _x)	Ozone and fine particulate precursor, includes air pollutant Nitrogen Dioxide (NO ₂)	Ambient standard, indirect ozone standard, regional pollutant
Carbon Monoxide (CO)	Air pollutant	Ambient standard, local and regional pollutant
Respirable Particulate Matter (PM ₁₀)	Air pollutant, includes PM _{2.5} , interferes with visibility	Ambient standard, local and regional pollutant
Fine Respirable Particulate	Air pollutant, interferes	Ambient standard, regional

Matter (PM2.5)	with visibility	pollutant
Oxides of Sulfur (SOx)	Air pollutant, fine particulate precursor, includes air pollutant Sulfur Dioxide (SO2)	Ambient standard, local and regional pollutant
Hazardous and Toxic Compounds (HAPs and TACs)	Unhealthy	No ambient standard, localized health effects, facility inventory only

Existing emission inventory efforts cover all sources within the WEMO Planning Area. Emissions are typically grouped into three categories. For complete inventory details please refer to Appendix A of this report.

Inventory Category	Contributors in WEMO Planning Area
Stationary Sources	Industrial activity (mining, manufacturing, electricity generation, natural gas transmission) and military bases
Mobile Sources	On-road vehicles, off-road vehicles, aircraft and trains
Area Sources	Solvent use (fuel, paint, chemical), small combustion (fires, heating, cooking), small widespread sources (consumer products)

The WEMO Planning Area emissions inventory is presented below, in tons of emissions per day:

Type	Category	VOC	NOx	SOx	PM10	PM2.5
Stationary	Fuel Combustion	0.90	24.02	2.31	5.20	4.02
Stationary	Waste Disposal	0.27	0.07	0.12	0.30	0.07
Stationary	Cleaning and Surface Coatings	6.62	0.00	0.00	0.40	0.38
Stationary	Petroleum Production and Marketing	5.99	0.02	0.00	0.00	0.00
Stationary	Industrial Processes	2.42	55.69	5.83	41.15	17.83
Area	Solvent Evaporation	13.67	0.00	0.00	0.00	0.00
Area	Miscellaneous Processes	5.78	2.43	0.13	221.03	31.84
Mobile	On-Road Motor Vehicles	28.45	135.88	0.22	6.27	5.16
Mobile	Other Mobile Sources	38.31	62.99	0.99	6.00	5.59
Totals:		102.41	281.10	9.60	280.35	64.89

The relative contributions of sources within the WEMO Planning Area are presented below. Note that mobile sources dominate ozone precursor emissions, SOx emissions are relatively minor, and area sources dominate particulate emissions.

WEMO Category Contributions

Off-Highway Vehicle Exhaust Contribution

Off-Highway Vehicles (OHVs) are directly inventoried as mobile sources, as the subcategory off-highway recreational vehicles. OHV exhaust is a negligible contributor to the WEMO Planning Area inventory except for VOC emissions. OHV VOC emissions are relatively high (in relation to other OHV exhaust emissions) because OHV engines are typically carbureted, rich burn engines without catalytic controls and hence have greater unburned fuel in their exhaust. Nevertheless VOC emissions are not a local pollutant but are a precursor to ozone formation – ozone is a regional pollutant. OHV exhaust is a negligible contributor to local emissions, and is a significant contributor only to VOC (a regional pollutant precursor).

OHV Open Area Contribution

OHV Open Areas are indirectly inventoried as area sources, as an element of the unpaved road dust and the fugitive windblown dust subcategories. OHV Open Areas are not significant contributors to either subcategory due to scale – the WEMO Planning Area includes thousands of miles of maintained and unmaintained unpaved roads and tracks, and tens of millions of acres of disturbed surface, and the contribution of the relatively small OHV Open Areas is equally relatively small. Regional experience with windblown dust has shown that heavily traveled unpaved roads and similar frequently disturbed (on at least a daily basis) surfaces are the primary contributor to regional dust problems. Confining OHV activity to existing defined OHV Open Areas has been an element of regional dust control planning for more than twenty years, and is an element of Federal PM10 planning. OHV Open Areas are not a significant contributor to regional dust (PM10) emissions.

WEMO Planning Area Ambient Monitoring

Forty-six ambient air monitoring sites are located in or adjacent to the WEMO Planning Area, operated by various air quality agencies or on their behalf. This existing network of sites monitors ambient pollutants and meteorological data to meet State and Federal ambient monitoring requirements, and represents a mix of neighborhood and regional scale monitors:

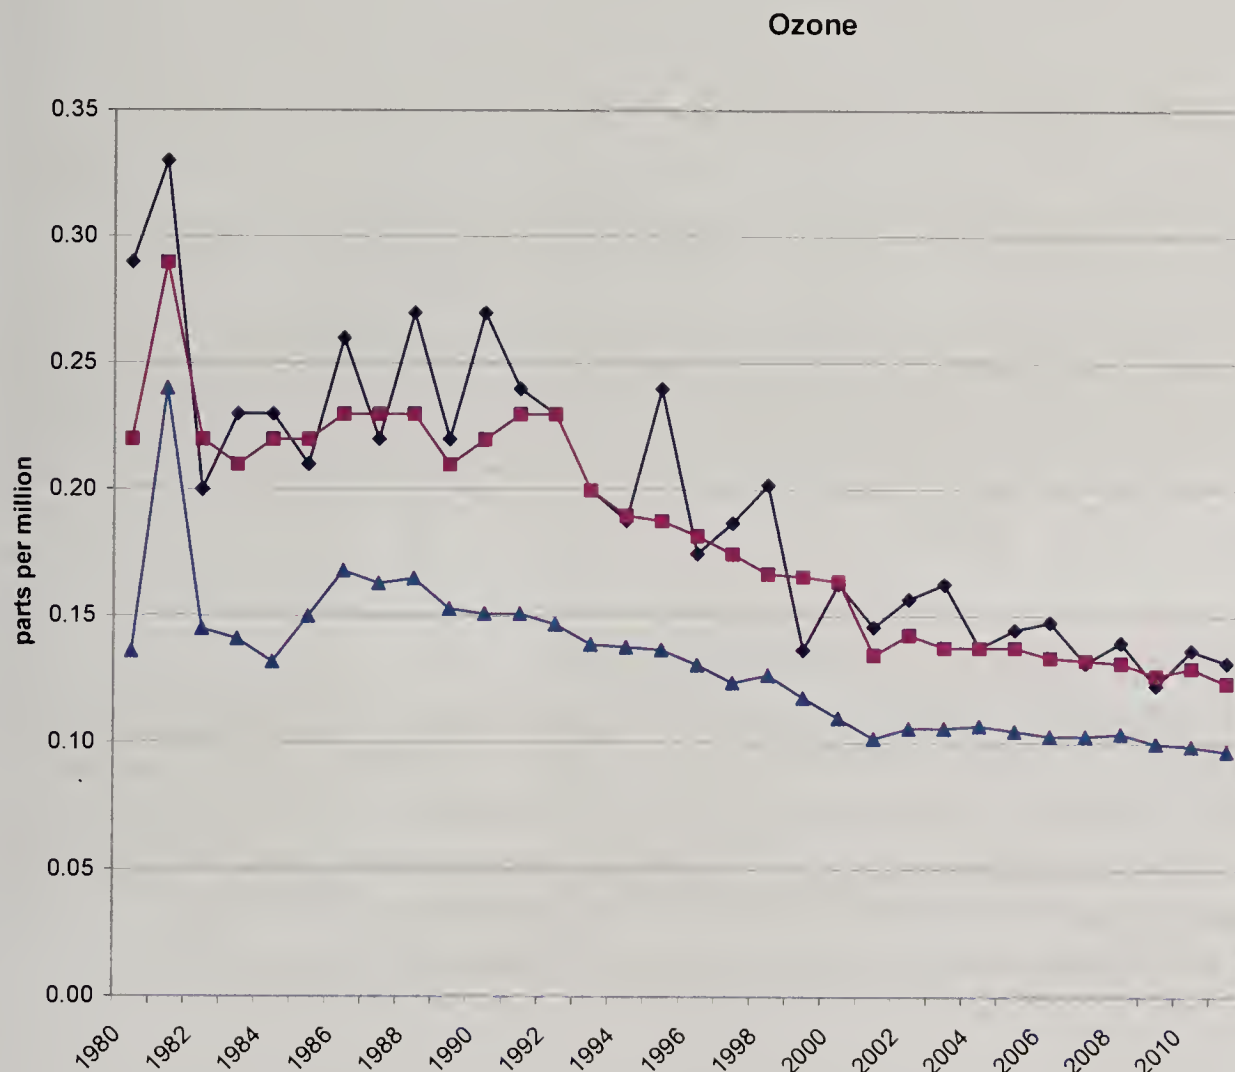

Name	OP Agency	Latitude	Longitude	Elev (m)

Neighborhood scale monitors are located near population centers, and regional scale monitors are located in rural areas. Neighborhood scale monitors are used to characterize and monitor ambient air affecting nearby population, while tracking attainment of ambient air pollutant standards (or tracking progress towards attainment of those standards). Regional scale monitors are used to evaluate large geographic regions, and track overall background levels of ambient air pollutants.

WEMO Planning Area Ambient Ozone Data

Ambient ozone values in the WEMO Planning Area are trending down as a result of Federal, State and local ozone precursor emission controls. These trends represent significant improvement in population exposure to ozone (at neighborhood scale monitors) and regional improvement in ozone levels (at regional scale monitors), despite significant increases in WEMO Planning Area population and associated emissions. Ambient ozone data for the WEMO Planning Area monitors is presented below.

WEMO Planning Area Ambient PM₁₀ Data

Ambient PM₁₀ values in the WEMO Planning Area have been reduced as a direct result of Federal PM₁₀ planning efforts, particularly in Owens Lake and Searles Valley areas.

Construction and demolition PM10 emissions have been reduced throughout the planning area through increased local regulation. The WEMO Planning Area population (and population-related emissions and surface disturbances) has increased over this time period. The WEMO Planning Area is predominately a windy, arid, low vegetation area, with relatively high dust levels due to exposed soils and high winds lifting those soils into the area. As a result the background levels of PM10 tend to be elevated, with common “exceptional” high wind dust events. The annual average ambient PM10 data for the WEMO Planning Area is presented below.

Ambient Monitoring Coverage of OHVs and OHV Open Areas

As discussed above, OHVs and OHV Open Areas are minor contributors to regional pollution, but are monitored by regional scale monitors by definition. The contribution of OHV use and OHV Open Area emissions near population centers are also monitored by the neighborhood scale monitors covering those population centers. The existing ambient air monitoring network in the WEMO Planning Area meets all Federal, State and local ambient air monitoring requirements, including monitoring ambient impacts from OHVs and OHV Open Areas.

Air Quality Analysis

West Mojave (WEMO) Planning Area Route Network

Introduction

This report provides a quantitative air quality analysis for the BLM's West Mojave (WEMO) Route Network Planning Area, in the form of baseline and project alternative emissions inventories and an existing SIP compliance assessment. Information contained in this analysis is intended for use or reference in the *West Mojave (WEMO) Route Network Project Final Supplemental Environmental Impact Statement (FSEIS)*. This report is intended as an appendix to the SEIS.

The BLM WEMO planning area covers 9.1 million acres, over 14,600 square miles, of the Western Mojave Desert and includes parts of three air basins and five different local air pollution control district jurisdictions:

Air Basins within WEMO:

1. Mojave Desert Air Basin
2. Great Basin Valleys Air Basin
3. Salton Sea Air Basin

Jurisdictions within WEMO:

1. Mojave Desert Air Quality Management District (MDAQMD)
2. Eastern Kern Air Pollution Control District (EKAPCD)
3. Antelope Valley Air Quality Management District (AVAQMD)
4. Great Basin Unified Air Pollution Control District (GBUAPCD)
5. South Coast Air Quality Management District (SCAQMD)

This Air Quality Analysis includes emissions inventories for the total 2017 WEMO area baseline, the BLM WEMO Route Network, and the BLM Route Network plus BLM OHV Open Riding areas 2017 baseline and 2035 future conditions for five project alternatives, including the no action alternative. The baseline WEMO area emissions inventories are developed using area-based annual inventory information, inventorying methods, and calculation assumptions available from the following agency sources:

1. California Air Resources Board (ARB)
2. United States Environmental Protection Agency (USEPA)
3. Mojave Desert Air Quality Management District (MDAQMD)
4. Bureau of Land Management (BLM)

This report contains four chapters:

- Chapter 1 – Baseline WEMO Planning Area Total Emissions Estimate
- Chapter 2 – BLM-Attributable WEMO Planning Area Baseline Emissions
- Chapter 3 – Current BLM WEMO Planning Area SIP Air Quality Compliance
- Chapter 4 – 2035 Nonattainment/Maintenance Area BLM Emissions

Descriptions of the specific methods, assumptions, and data used to complete the emissions inventories summarized in this report are documented in more detail in Chapters 1 through 4. An appendix to this report provides additional tabulated examples of the specific assumptions, data, and calculations used to create these inventories.

Mr. Alan De Salvio of the Mojave Desert Air Quality Management District reviewed and concurs with the general methods and assumptions used to create these emissions inventories.

1. Baseline WEMO Planning Area Total Emissions Estimate

Summary of Results

A summary for all sources contributing criteria pollutants inside the boundaries of the WEMO Planning Area is in Table 1-1 for daily emissions and Table 1-2 for annual emissions.

Table 1-1. WEMO Planning Area 2017 Total Average Daily Emissions by Air District (tons/day)

Jurisdiction	VOC	CO	NO _x	SO _x	PM ₁₀	PM _{2.5}
MDAQMD	23.56	81.52	68.77	2.03	99.53	19.47

Source: Appendix A.

These emissions inventories do not include emissions that enter the planning area from other nearby sources of emissions such as Owens Lake or the South Coast Air Basin.

Methods and Assumptions

The 2017 baseline year emissions within the WEMO area includes all area-relevant anthropogenic federal criteria pollutant¹ emissions sources, excluding lead, that are included in available inventories of emissions from air quality regulatory agencies. The scope of this inventory does not include toxic air contaminants, greenhouse gases, and certain State of California criteria pollutants such as hydrogen sulfide and vinyl chloride that are not emitted, or are only emitted in negligible quantities, by WEMO Route Network use. The anthropogenic emissions sources inventoried include: stationary sources, such as power plants and cement production facilities; mobile sources, such as on- and off-road vehicle travel, trains, and aircraft; and area sources, such as consumer goods use, construction equipment, and anthropogenic fugitive dust sources stemming from wind erosion of disturbed areas and travel on unpaved roads. For this project natural emissions sources were not included in the prepared inventories, which includes nonanthropogenic biogenic emissions sources (such as emissions from forests), geogenic

¹ Pollutants that are subject to National Ambient Air Quality Standards. These pollutant are ozone (with nitrogen oxides [NO_x] and volatile organic compounds [VOC] as precursors), carbon monoxide (CO), nitrogen dioxide (NO₂), sulfur dioxide (SO₂), particulate matter (PM₁₀, PM_{2.5} and lead.

emissions sources (such as emissions from non-disturbed area wind erosion and geothermal areas²), and wildfires.

This Air Quality Analysis uses the following steps to determine the entire WEMO area 2017 baseline emissions.

- Step 1. Gather 2017 ARB Emissions Inventories for the Jurisdictions within WEMO.
- Step 2. Adjust the ARB emission inventory data to fit the WEMO area based on area and population.
- Step 3. Determine additional specific adjustments to the ARB inventory data where appropriate.
- Step 4. Provide corrections to the ARB inventory for specific BLM inventory line item values as appropriate based on BLM 2017 WEMO Route Network use and GIS data (PM₁₀ and PM_{2.5} only).
- Step 5. Provide corrections to other non-BLM specified ARB Emissions Inventory data for fugitive dust sources as appropriate and where possible based on the corrections made to the BLM-specific line item data (PM₁₀ and PM_{2.5} only). These non-BLM specified data sources include road travel fugitive dust on city and county unpaved roads, US Forest Service and State and National Park roads, farm roads, and the windblown dust from the disturbed areas of these unpaved road areas; and windblown dust emissions from agricultural land .

Step 1. Emissions estimates from the California Air Resources Board CEPAM database (ARB 2018a) were used to determine estimated 2017 baseline year emission rates for the areas covered by the WEMO planning area. Specifically, estimates from the following areas with detailed emissions estimates in CEPAM were used:

- a. MDAQMD
- b. EKAPCD
- c. AVAQMD
- d. GBUAPCD, Inyo County portion

For the small SCAQMD portion in the WEMO planning area, the emissions were calculated based on the BLM Recreation Management Information System (RMIS) estimated activity within the WEMO BLM area, and these emission were multiplied by two to account for activity related to unpaved road use in this small and very remote area from non-WEMO BLM sources, primarily Joshua Tree National Park,. This remote area has no known stationary sources, paved roads, residences or structures of any kind, or any other anthropogenic emissions sources.

An example of the CEPAM output is provided in the appendix to this report.

² Geothermal springs can emit large amounts of carbon dioxide and/or methane greenhouse gas (GHG) emissions and toxic air contaminant emissions (primarily hydrogen sulfide), and these natural emissions occurring within WEMO, such as in the Coso area, may be substantial. However, this air quality analysis does include an inventory of GHG emissions or hydrogen sulfide emissions, just the pollutants that the US EPA regulate as criteria pollutants (excluding lead), and that inventory does include criteria pollutant emissions from geothermal power plants.

Step 2. The CEPAM data for most emissions source categories were adjusted by either area or population ratios depending on whether the emission source being adjusted were more specifically related to the size of the area covered by WEMO or the population within the WEMO area. These specific adjustments were calculated as follows:

WEMO Area Multipliers

Area	In WEMO	Total	Multiplier
AVAQMD	1070	1323	0.809
MDAQMD	9401	20226	0.465
EKAPCD	2453	3792	0.647
MDAB	13208	27404	0.482
GBUAPCD	1298	10227	0.127

WEMO Population Multipliers

Population	In WEMO	Total	Multiplier
AVAQMD	389695	401810	0.970
MDAQMD	504881	567819	0.889
EKAPCD	110829	146050	0.759
MDAB	979286	1048819	0.934
GBUAPCD	3259	18434	0.177

Areas were determined using Graphic Information System (GIS) shapefiles, with the BLM providing the WEMO area shapefile, and the local air district boundaries shapefile coming from online ARB resources. Population was determined using United States Census block data. An example of using these multipliers for a specific air district and emissions source type is shown in the following example for MDAQMD PM₁₀ Emissions from cooking:

Base Emissions Estimate for MDAQMD in 2017 = 2.2804 tons/day
WEMO Area MDAQMD adjustment is based on Population Multiplier = 0.889
WEMO Area Cooking PM₁₀ Emissions = 2.2804 x 0.889 = 2.0276 tons/day

The vast majority of emissions source types used one of these two simplified emissions multipliers. An example table of which multiplier was used for each emissions source type, for the MDAQMD, is provided in the Appendix to this report.

Step 3. Where area and population multipliers did not seem relevant to particular emissions sources, based on referenced information or observation of the areas being inventoried, other specific WEMO area relevant multipliers were developed for those sources individually. For example, specific multipliers were developed for the Inyo County stationary sources based on available data in the ARB Facility Search Engine database (ARB 2018b), where multipliers were determined by the types of stationary source emissions that existed within the Inyo County portion of WEMO divided by all of the emissions from those source types within Inyo County. An example of those Inyo County stationary source multipliers is a multiplier of 1 for power plant emissions as the only power plant in Inyo County (Coso Generating Station) is located within the WEMO planning area. In specific cases, where data was unavailable, other assumptions based on review of Google Earth or other sources were used. Examples of those include the assumption that there are no recreational boat emissions in Inyo County as the navigable water bodies within the WEMO planning area do not allow motorized recreational boats. The emissions sources with these multiplier assumptions were generally those with limited emissions within the WEMO area.

Step 4. For BLM route network and OHV area use, BLM OHV recreation staffs at the Barstow and Ridgecrest Field Offices provided Recreation Management Information System (RMIS) data on the number of participants and visitor days for each OHV activity in each RMIS geographic sub-division in the WEMO planning area. The staffs also provided data on the average number of passengers for vehicles in each RMIS OHV vehicle class and the ranges of high and low speeds for the vehicle classes. BLM Field Office Managers proposed using the average of the high and low speeds as the basis for Aspen Environmental to correct CEPAM model assumptions and to depict the vehicle velocities for modeling emissions on BLM public lands in the WEMO plan. The BLM California Desert District furnished the GIS data for the Route Network in each EIS alternative. Corrections for these emissions sources include the following:

- a. Windblown road fugitive dust emissions for BLM lands were corrected based on the total disturbed area calculated for each route network design, on the miles of route network provided by the BLM, and average estimate across the planning area of a 12-foot route width.
- b. Emissions from travel on unpaved BLM roads were corrected using the RMIS generated vehicle miles traveled (VMT) data. The RMIS vehicle category designations were reclassified into the 2011 EMFAC vehicle categories as follows:
 - i. The on-road vehicle categories ranged in size from motorcycles and light duty autos through Light Heavy Duty Trucks (such as an F350 pickup truck). Heavy trucks and motorhome use in the route network and in the OHV areas is considered minimal.
 - ii. The reclassification of the on-road vehicle categories was based on whether the activity was considered "driving for pleasure" or was considered OHV recreational riding. Where it was considered driving for pleasure the percentages of VMT were based on VMT averaged splits for the assumed vehicle types, while in OHV areas the use of light duty autos and light duty trucks dropped to 10 percent of the normal VMT based use.
 - iii. The reclassification in areas with RMIS-category vehicles with both on-road and off-road vehicle use used area-specific assumptions on how much use was on-road and how much was off-road.

The final determined vehicle mix for the RMIS use categories is as follows:

On-Road Vehicle Class	Driving for Pleasure	OHV - UTV	OHV - Car, Trucks, SUVs	OHV- Dunebuggy	OHV - Motorcycle	High Speed Time Trials	Racing - UTV	Racing - Motorcycle	Racing - OHV, Cars, Trucks, Buggies
Light Duty Auto	60.37%	0.00%	13.36%	25.00%	0.00%	50.00%	0.00%	0.00%	12.02%
Light Duty Trucks (LDT1)	4.70%	0.00%	1.04%	0.00%	0.00%	0.00%	0.00%	0.00%	0.94%
Light Duty Trucks (LDT2)	20.25%	0.00%	44.80%	0.00%	0.00%	0.00%	0.00%	0.00%	40.32%
Light Heavy Duty Trucks (LHDT1)	0.00%	0.00%	6.62%	0.00%	0.00%	0.00%	0.00%	0.00%	5.96%
Light Heavy Duty Trucks (LHDT2)	0.00%	0.00%	1.72%	0.00%	0.00%	0.00%	0.00%	0.00%	1.55%
Motorcycles	0.00%	0.00%	0.00%	0.00%	50.00%	0.00%	0.00%	50.00%	0.00%
Medium Duty Trucks (MDV)	14.68%	0.00%	32.47%	0.00%	0.00%	0.00%	0.00%	0.00%	29.23%
Off-Road Recreational Vehicles	0.00%	100.00%	0.00%	75.00%	50.00%	50.00%	100.00%	50.00%	10.00%

For the determination of unpaved road emissions, the emissions factors were determined using the unpaved road methods contained in the US EPA Compilation of Air Pollutant Emissions Factors, Volume

1: Stationary Point and Area Sources, Section 13.2.2, equation 1b methodology for determining emissions factors for publicly accessible unpaved roads (USEPA 2006). The calculated emissions factor was determined as follows:

$$E = [k * (s/12)^a * (S/30)^d / (M/0.5)^c - C] * [(365 - P) / 365]$$

Where:

k =	1.8	lb/VMT Constant for PM ₁₀ (k = 0.18 lb/VMT Constant for PM _{2.5})
s =	15	Percent Silt Content in Soil (MDPA PM ₁₀ Plan Assumption)
a =	1	Equation Constant
S =	20	Speed (MPH) (MDPA PM ₁₀ Plan Assumption ³)
d =	0.5	Equation Constant
M =	2	Percent Moisture (SCAQMD 1993 CEQA Handbook, "dry")
c =	0.2	Equation Constant
C =	0.00047	Brake Wear emissions constant, 0.00036 for PM _{2.5}
P =	15	Days per year with Precipitation over 0.01 inches

EF = 1.335 lb/VMT for PM₁₀

EF = 0.133 lb/VMT for PM_{2.5}

To estimate emissions for all on-road vehicles, with four or more wheels, the emissions factors shown above remained unaltered, while motorcycles (whether on-road or off-road recreational motorcycles) used these emissions factors divided by eight to account for one half of the wheels and the much lower vehicle weight. Other off-road recreational vehicles emissions were calculated using one-half of these emissions factors to account for much lower average vehicle weights.

The overall WEMO area on-road vehicle tailpipe emissions were assumed to be accurately depicted in the CEPAM WEMO area totals. CEPAM emission inventories use data from the EMFAC2014 model, which is the current State Implementation Plan (SIP) approved model. Separate emissions estimates for a number of different off-road recreational vehicles and associated assumptions (e.g., two-cycle vs. four-cycle engine percentages for each vehicle type) were too complex to re-create or to be useful in determining potential errors in assumptions.

Step 5. Reviewing the GIS and RMIS data from the BLM showed that the inputs used in CEPAM generally substantially underestimated the BLM route network disturbed area and the unpaved traffic VMT as noted above. Additional review found that certain assumptions used in CEPAM were inconsistent for other fugitive dust emissions calculations for other non-BLM specified fugitive dust source emissions in the Mojave Desert. Therefore, two corrections were made to address these inconsistencies to non-BLM emissions sources. These specific corrections are:

- a. The windblown emissions estimate for non-BLM roads was corrected using a consistent climatological factor.
- b. The windblown emissions estimate for agricultural lands was corrected using a consistent climatological factor.

The climatological factor is a factor for soil erosion used in calculations of windblown emissions that varies directly with the wind velocity and inversely with the soil surface moisture. The entire WEMO

³ The RMIS WEMO Planning Area VMT estimates are based on various speed estimates depending on use, but the VMT weighted average speed is 19.45 MPH which is nearly identical to, and consistent with, the 20 MPH speed assumption used by MDAQMD in the 1995 MDPA PM₁₀ Attainment Plan.

planning area has a fairly consistent very low soil moisture and high average wind velocity. A climatological factor of 2, from the Final Mojave Desert Planning Area Federal Particulate Matter (PM₁₀) Attainment Plan (MDAQMD 1995a), was consistently applied in the corrected emissions for estimates for non-BLM area windblown emissions. The CEPAM estimates, as documented in the ARB emissions inventory sections 7.12 and 7.13 (ARB 1997), had county-wide climatological factors that did not consider substantially different climate regions within counties, with regional values ranging from 0.061 to 1.274. This correction is a simple ratio of the cited ARB method factor and the corrected factor of 2.

Other Specific Assumptions/Databases Used

Particulate Size Profiles

ARB PM Size Profiles (ARB 2017) were used to determine the share of PM_{2.5} emissions as part of the PM₁₀ emissions for limited emissions cases where corrections were made to the CEPAM estimates.

Relevant ARB PM size profiles are as follows:

	PM _{2.5} /PM ₁₀
WINDBLOWN DUST-UNPAVED RD/AREA	0.1322564
WINDBLOWN DUST - AGRIC. LANDS	0.1730134

EKAPCD Agricultural Lands Windblown Dust Climatological Factor Correction

The windblown dust calculated in CEPAM for the EKAPCD area was disproportionate to the amount of agricultural activity in EKAPCD. CEPAM calculations for agricultural windblown dust likely use an agricultural lands area factor applicable to western Kern County in the San Joaquin Valley where agriculture is extensive. Therefore, in this one case the climatological factor correction was not performed as the emissions estimated for EKAPCD are likely overestimated, not underestimated based on the climatological factor.

BLM WEMO Area Off-Road Recreational Vehicle Emission Assumptions

The general basis for correcting CEPAM area wide emissions to BLM for off-road recreational vehicle attributable emissions relies on the conservative assumption that the BLM has 90 percent of the attributable MDAQMD emission for this emissions category. The BLM attributable emissions for all other areas are based on the ratio of the RMIS assumed VMT for the off-road recreational vehicles.

Miscellaneous Assumptions

Assumption	Value	Source
Route Network Average Unpaved Road Width	12 Feet	BLM
Windblown Unpaved Road Dust Emissions Factor	3,042 lbs/PM ₁₀ /Mile	MDAQMD 1997

Notes and Limitations

The baseline emissions estimate includes sources known and reported in CEPAM and sources in CEPAM that are corrected to address apparent errors in the estimation methodology or assumptions. Wherever those apparent errors were, they received due-diligence corrections. Sometimes available information was limited. Therefore, the baseline emissions estimate has the following known limitations:

- 1) The CEPAM database appears to underestimate many of the fugitive dust emissions sources within the WEMO area, as noted above, including the emissions for vehicle travel on unpaved roads and for wind erosion PM₁₀ and PM_{2.5} emissions on unpaved roads and other disturbed areas. Corrections were made as identified above, but information was not available to check and correct all of the assumptions and estimates for these types of emissions sources contained in CEPAM.
- 2) The BLM attributable particulate emissions corrections use BLM supplied estimates. These estimates include the GIS based Route Network length data which is not completely ground-truthed, and the RMIS based vehicle use estimates. Additionally, several other generalized assumptions, much like they are used in CEPAM emissions methodologies or in the various attainment plan emissions estimates. These generalized assumptions also include soil silt content, soil moisture content, and unpaved traffic speed. The following is noted in the MDAQMD MDPA PM10 attainment plan:

Most non-stationary sources are inventoried using planning areawide assumptions, such as a single value for silt content, average vehicle speed, number of trips per mile, etc. The MDAQMD believes these MDPA-wide constants are justified based on the large number of sources within each category; which allows individual differences to average out.

This also applies to the assumptions used in the emissions estimate corrections, which are based on agency referenced values or determined through a best engineering estimate.

- 3) Windblown emissions from OHV disturbed areas (BLM OHV Open Riding areas and State of California Department of Parks and Recreation OHV areas), as opposed to the calculated emission from the route network disturbed area, were not quantified due to the following reasons:
 - a. CEPAM includes, or attempts to include, windblown emissions from unpaved roads such as those in the BLM WEMO route network, but CEPAM does not appear to account for fugitive dust emissions resulting directly or indirectly from the disturbance in OHV Open Riding areas.
 - b. None of the available attainment plans for the areas that include BLM or other OHV areas appears to attempt to calculate the windblown emissions from OHV Open Riding areas.
 - c. The BLM does not have an estimate of the area disturbed within the BLM OHV Open Riding areas located in the WEMO planning area; therefore, reliable estimates for the BLM OHV area windblown emissions cannot be completed.
 - d. None of five alternatives in the Route Network Project, the subject of the SEIS, includes any significant changes to BLM WEMO OHV Open Riding areas⁴ or anticipates any further changes to the BLM WEMO OHV areas; therefore, these emissions are not directly of concern to the operations of the BLM Route Network.
- 4) The CEPAM estimate also does not appear to include all federal lands emissions sources, most notably area source emissions, primarily fugitive dust emissions, related to military installation operations. The WEMO planning area is home to all or parts of large military installations, including Edwards Air Force Base, the China Lake Naval Air Weapons Station, Fort Irwin National Army Training Center, and the Twenty-nine Palms Marine Corps Air Ground Combat Center.

⁴ The alternatives do include two different OHV Open Riding assumptions for Koehn Dry Lake in Eastern Kern County, whether to designate the area as open use or as open by special permit use. RMIS data limitations do not allow for the estimation of use assumptions at Koehn Dry Lake, and the use of this dry lake is considered insignificant in comparison of the other uses in Eastern Kern County.

These installations have potentially large sources of fugitive dust emissions from the use of large ground-based military off-road equipment and on-road vehicles on unpaved roads and from disturbed areas windblown emissions that do not appear to be included in the CEPAM emissions database.

These limitations will generally result in an underestimation in the total anthropogenic emissions baseline within the entire WEMO planning area. As such, calculations of BLM PM₁₀ and PM_{2.5} emissions are disproportionately high to the actual total emissions based on the emissions corrections completed for the BLM attributable emissions. The baseline emissions estimate, with these noted limitations finds the following results in relations to the WEMO BLM attributable baseline emission compared to the total WEMO area baseline emissions. Table 1-3 summarizes the results of BLM attributable emissions found in this air quality analysis as a fraction of all baseline sources calculated for the WEMO planning area.

Table 1-3. BLM Attributable Percentage of 2017 WEMO Area Total Baseline Emissions

BLM Attributable Percentage of 2017 WEMO Area Total Baseline Emissions						
	VOC	CO	NO _x	SO _x	PM ₁₀	PM _{2.5}
BLM Route Network	0.67%	0.98%	0.05%	0.00%	22.45%	13.07%
BLM Route Network + OHV Areas	1.40%	2.00%	0.11%	0.01%	34.47%	18.92%

Source: Appendix A.

As the table above shows the WEMO BLM Route Network use, with or without the OHV areas included, contributes very small fractions of all emissions of criteria pollutants except for PM₁₀ and PM_{2.5}. As noted above, the PM₁₀ and PM_{2.5} estimated emissions for the BLM are likely shown disproportionately greater than actuality due to the inability to correct and include all other fugitive dust emissions sources within the WEMO planning area.

Future Baseline Emissions Estimate (2035)

In addition to the 2017 WEMO Area Emissions Baseline, the 2035 WEMO Area Future Emissions Baseline was completed (Chapter 4). This future baseline emissions estimate applied the same methods as for the 2017 WEMO Area baseline emissions estimate. The results of the 2035 future baseline estimate are summarized in Table 1-4 for daily emissions and Table 1-5 for annual emissions.

Table 1-4. WEMO Area Total Estimated Average Daily 2035 Emissions by Air District (tons/day)

Additionally, this air quality analysis presents a separate table designed to mirror the Draft SEIS Table 3.2-6. Table 2-3 includes both the results for all sources of emissions in the WEMO Planning Area baseline (2017) and the BLM WEMO emissions. The estimate for BLM emissions in Table 2-3 includes the route network and the route network plus OHV area emissions estimates. Table 2-4 presents the same information on an annual basis.

BLM Route Network WEMO Source Totals	116	589	20	0	14,382	1,720

Source: Appendix A.

Methods and Assumptions

The BLM WEMO 2017 baseline emissions are limited to the following specific emissions sources that are directly related to the operation of the BLM's WEMO Route Network:

- On-Road Vehicle Emissions
- Off-Road Vehicle Emissions
- Unpaved Road Travel Fugitive Dust Emissions
- Windblown Fugitive Dust Emissions from Unpaved Roads

The methods and assumptions used to develop the emissions totals are as follows:

On-Road Vehicle Emissions

The BLM route network and OHV area on-road vehicle emissions were calculated using emissions factors from the ARB EMFAC2014 model and VMT estimates provided by the BLM RMIS database. The EMFAC2014 model was used to determine emissions factors by vehicle type and local area. The 2017 on-road vehicle emissions factors determined by EMFAC2014 are provided in data tables included in the appendix to this report. On-road vehicle types were reclassified from RMIS category designations into EMFAC2011 categories for determining emissions using the EMFAC2014 derived emissions factors.

Off-Road Vehicle Tailpipe Emissions

The estimate of off-road recreational vehicle tailpipe emissions attributable to the BLM is based on the following two assumptions:

- The BLM MDAQMD attributable off-road recreational emissions are conservatively estimated to be 90 percent of the CEPAM MDAQMD area estimate.
- The BLM attributable off-road recreational emissions for other areas within WEMO are determined as a ratio of the MDAQMD emissions using the ratio of RMIS off-road vehicle VMT in each area. For example, EKAPCD off-road recreational vehicle emissions = MDAQMD emissions x EKAPCD off-road vehicle VMT / MDAQMD off-road vehicle VMT.

Unpaved Road Travel Fugitive Dust Emissions

The assumptions and methods are the same as those described in Chapter 1. The corrections for emissions of fugitive dust from vehicle travel on BLM unpaved roads are the same as those used for the BLM WEMO Area Baseline.

Windblown Fugitive Dust Emissions from Unpaved Roads

The assumptions and methods are the same as those described in Chapter 1. The corrections for emissions of fugitive dust from vehicle travel on BLM unpaved roads are the same as those used for the BLM WEMO Area Baseline.

Notes and Limitations

Several indirect sources of emissions in the BLM WEMO public lands, that would be considered minor or that are not part of the recreational Route Network use, are not included in this estimate. These sources include:

- Cooking or open fires emissions from route network users.
- Consumer products use, such as spray-on suntan lotions, from route network users.
- BLM permitted livestock grazing within WEMO on BLM lands, including their BLM route network roads use.
- Other non-recreational BLM permitted land uses (e.g., mining), including their BLM route network roads use.

3. Current BLM WEMO Planning Area SIP Compliance

This assessment reviews current BLM compliance with air quality regulations and state implementation plans (SIPs) for emissions reduction that apply to BLM public lands in the WEMO planning area. The WEMO planning area includes parts of the following local air quality management districts:

- Mojave Desert Air Quality Management District (MDAQMD)
- Eastern Kern Air Pollution Control District (EKAPCD)
- Antelope Valley Air Quality Management District (AVAQMD)
- Great Basin Unified Air Pollution Control District (GBUAPCD)
- South Coast Air Quality Management District (SCAQMD), with jurisdiction over the small portion of the WEMO planning area in Riverside County.

The primary direct emissions from actions covered by the WEMO SEIS originate from the BLM WEMO route network. This review includes emissions from the following sources:

- On-Road Vehicles Traveling on the Route Network
- Off-Road Recreational Vehicles
- Windblown Dust from Unpaved Routes (when vehicles are not present)
- Fugitive Windblown Dust from Unpaved Routes (generated by vehicles on the route network)

The emissions sources that are either not under BLMs management control are not part of this assessment. Cooking, personal consumer product use, RV generators, and campfires, for example, are assumed to be negligible compared to route network emissions.

California Air Resources Board

The ARB has primary jurisdiction, along with USEPA, for most mobile sources of emissions including on-road vehicles and off-road recreational vehicles that would use unpaved roads/routes in the BLM WEMO route network.⁵ A number of regulations control emissions from on-road vehicles and off-road vehicles (BLM 2018). The BLM does not have its own specific control requirements on BLM lands. The BLM monitors compliance with the Department of Motor Vehicles (DMV) green- and red-sticker programs covering OHVs that do not comply with California emissions standards. The ARB limits the use of red-sticker vehicles (higher emitting off-road recreational vehicles) during the peak summer ozone season where OHV recreation is occurring in ozone nonattainment areas. The BLM WEMO Area OHV Open Riding areas that are subject to this program are (ARB 2007):

- Jawbone Canyon
- Dove Springs
- Spangler Hills
- El Mirage
- Stoddard Valley
- Rasor
- Johnson Valley

⁵ The BLM custom is to call unpaved/dirt transportation surfaces “routes” to be distinct from maintained paved roads. However, the custom in air quality regulations and emissions estimates is to use the term “unpaved road”, so for consistency with air quality agency and regulation convention the terminology used herein will typically be “unpaved road” rather than “unpaved route”.

The BLM enforces the red-sticker seasonal ban through public education and law enforcement efforts. To date, the Air Districts in the WEMO planning area have not found compliance problems with ARB regulations regarding the BLM’s existing WEMO Route Network operations.

Mojave Desert Air Quality Management District

SIP Documents

The MDAQMD has one ozone nonattainment area and two PM₁₀ nonattainment/maintenance areas that have relevant SIP documents.

Ozone

The applicable ozone nonattainment area SIP document is the *MDAQMD Federal 75 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)* (MDAQMD 2017). This attainment plan does not include any emissions reduction measures that would be relevant to the operation of the WEMO Route Network. The MDAQMD Plan provides the following emissions inventory for the two source categories, within the Federal Ozone Nonattainment Area (FONA), relevant to the WEMO Route Network operation (Table 3-1).

Table 3-1. Federal Ozone Attainment Plan Emissions Inventory

	2018 (tons/day)		2026 (tons/day)	
	VOC	NO _x	VOC	NO _x
MDAQMD/AVAQMD FONA				
On-Road Mobile	7.65	21.74	5.03	10.40
Off-Road Recreational Vehicles	0.65	0.05	0.57	0.06
Other Source Categories	30.52	61.61	33.27	58.10
Total FONA Ozone Precursor Emissions	38.82	83.40	38.87	68.56

Source: MDAQMD 2017.

These estimates indicate that the on-road mobile plus off-road recreational vehicle emissions are less than 30 percent of the total FONA ozone precursor emissions in 2018, and forecast a decrease to approximately 15 percent of emissions of ozone precursor chemicals (volatile organic compounds, abbreviated as VOC, and nitrogen oxides, abbreviated as NO_x) in the ozone nonattainment area in 2026.

This Attainment Plan estimate of emissions does not include specific estimates for emissions from BLM public lands in either the MDAQMD or AVAQMD portions of this FONA. The 2017 baseline emissions within the WEMO area inside this FONA have been estimated using the following methods:

- On-Road Mobile emissions are calculated using vehicle VMT estimates provided by BLM and emissions factors derived from EMFAC2014.
- Off-Road Recreational Vehicle emissions are calculated using BLM-attributable multiplier assumptions of the total CEPAM annual emissions estimates for this emissions category.

Please see Chapter 1 for more detailed information on the methods and assumptions used for emissions calculations.

The estimated BLM baseline ozone precursor (VOC and NO_x) emissions inside this FONA are shown in Table 3-2.

Table 3-2. BLM WEMO Route Network Emissions, MDAQMD/AVAQMD FONA

MDAQMD/AVAQMD FONA	2017 (tons/day)	
	VOC	NOx
On-Road Mobile	0.036	0.016
Off-Road Recreational Vehicles	0.071	0.005
Estimated BLM Emissions in FONA	0.107	0.021

Source: Appendix A

The BLM WEMO Route Network ozone precursor emissions are a very small percentage of precursor emissions for this nonattainment area. The BLM related on-road mobile emissions are a very small percentage of the total on-road mobile emissions. The BLM related off-road mobile emissions are a high percentage of this emissions category, but the emissions from this emissions category are very low in comparison with the total VOC and NO_x emissions within this FONA. Continued operation of the BLM WEMO Route Network in this nonattainment area would not significantly affect the future attainment of the federal ozone air quality standard.

PM₁₀

The MDAQMD jurisdiction area includes two PM₁₀ nonattainment areas: the Trona area nonattainment area in Searles Valley in northwestern San Bernardino County and the San Bernardino County nonattainment covering the remainder of the county. These two areas have separate SIP plans completed in 1996 and 1995 respectively.

The MDAQMD focused their San Bernardino County PM₁₀ attainment plan within a designated Mojave Desert Planning Area (MDPA) within San Bernardino County (MDAQMD 1995a). The 1995 MDPA attainment plan focused on achieving emissions reductions on unpaved roads in cities and high-travel areas to achieve attainment. This plan provided the following emissions estimates related to BLM roads within the MDPA area. The activities within the BLM WEMO Route Network and OHV areas were found to account for approximately 10 percent of the PM₁₀ emission estimated to occur within the MDPA in 1990 and to increase to account for approximately 20 percent of the MDPA PM₁₀ emissions by 2000 (refer to Table 3-3).

Table 3-3. MDPA PM₁₀ Attainment Plan Emissions Inventory

MDPA PM10	PM ₁₀ (tons/year)	
	1990	2000
On-road Mobile	1,323	1,003
Off-road Recreational Vehicles	n/a	n/a
BLM Unpaved Road Dust	10,860	18,888
BLM Unpaved Road Windblown Dust	2,476	2,476
Other Source Categories	92,208	62,684
Total MDPA PM10 Emissions	106,867	85,051

Source: MDAQMD 1995a.

The current baseline (2017) and Alternative 1 future (2035) PM₁₀ emissions estimated for BLM activities within the MDPA PM₁₀ Nonattainment Planning Area are shown in Table 3-4.

Table 3-4. BLM WEMO Route Network Emissions, MDPA

MDPA PM10	PM ₁₀ (tons/year) 2017
BLM On-Road Mobile Sources	0.46
BLM Off-Road Recreational Vehicles	0.70
BLM Unpaved Road Dust	6,692
BLM Unpaved Road Windblown Dust	3,426
Estimated BLM Emissions in MDPA	10,119

Source: Appendix A

The estimated BLM route network emissions within the MDPA (Table 3-4) are consistent with, and a bit lower than, those estimated in the MDAQMD MDPA PM₁₀ Attainment Plan. The differences are that the MDAQMD plan assumed higher total vehicle travel mileages than the BLM is currently estimating. This Plan, unlike the CEPAM inventory data, includes estimates for BLM OHV Open Riding Area traffic unpaved road dust. The MDAQMD population growth forecast in the Attainment Plan increases VMT for the year 2000, resulting in a higher estimate for PM₁₀ emissions. However, the Attainment Plan estimate for the total mileage in the route network within the MDPA (1,628 miles) is lower than the BLM's baseline estimate (2,253 miles), which causes the attainment plan to have a lower estimate for windblown fugitive dust emissions from the BLM route network. The estimate of emissions attributable to BLM lands in the MDAQMD MDPA plan did not include an estimate of the windblown dust emissions from the disturbed acreage within the OHV Open Riding Areas

The MDAQMD completed an attainment plan for the Trona portion of the Searles Valley PM₁₀ nonattainment area in 1995, and completed a maintenance plan and redesignation request in 1996 (MDAQMD 1995b, 1996). Although the maintenance plan and redesignation request were not approved formally, the emissions from the 1995 attainment plan are considered to be the approved SIP emissions for this nonattainment area. This plan provided the following PM₁₀ emissions estimates, where only the BLM unpaved road travel emissions were separately estimated (Table 3-5).

Table 3-5. MDAQMD Searles Valley PM₁₀ Plan Emissions Inventory

	PM ₁₀ (tons/year)		
	1987	1990	1994
Searles Valley (Trona)			
On-Road Mobile Sources	22	22	22
Off-Road Recreational Vehicles	n/a	n/a	n/a
BLM Unpaved Road Dust	106	106	84
Public Area Windblown Dust	1,248	1,248	898
Other Source Categories	3,526	3,044	3,000
Total Searles Valley PM10 Plan Emissions	4,902	4,420	4,004

Source: MDAQMD 1995b, 1996.

The current baseline (2017) PM₁₀ emissions estimated for BLM activities within the MDPA PM₁₀ Nonattainment Planning Area are shown in Table 3-6.

Table 3-6. BLM WEMO Route Network Emissions, Searles Valley (Trona) PM₁₀ Plan Area

Searles Valley (Trona)	PM ₁₀ (tons/year) 2017
BLM On-Road Mobile Sources	0.04
BLM Off-Road Recreational Vehicles	0.21
BLM Unpaved Road Dust	1,196
BLM Unpaved Road Windblown Dust	511
Estimated BLM Emissions in Searles Valley (Trona) Area	1,708

Source: Appendix A

The BLM emissions estimate for unpaved road dust is higher in comparison with the 1995 MDAQMD attainment plan. This difference is due to an upwardly adjusted figure to correct for unpaved road use and unpaved road areas within the Trona PM₁₀ nonattainment area and does not represent an increase in the baseline emissions. OHV use on BLM lands in this area has not increased over time.

Air monitoring data indicate that the entire MDAQMD jurisdiction is now in attainment of the federal PM₁₀ standard. The MDAQMD is not planning at this time to complete and submit redesignation requests and maintenance plans for the either of their two nonattainment areas which remain designated as moderate nonattainment.

Regulations

MDAQMD has three separate fugitive dust rules that apply to the WEMO area as follows (MDAQMD 1977 and 1996):

- Rule 403 applies everywhere.
- Rule 403-1 applies in the Trona portion of the Searles Valley.
- Rule 403-2 applies in the Mojave Desert Planning Area portion of the Mojave PM₁₀ nonattainment area.

Rule 403 is a general dust prohibition that does not have any specific requirements that apply to BLM WEMO Area Route Network operations.

Rule 403-1 has a requirement for the BLM to reduce emissions by 20 percent and for the BLM and the MDAQMD to jointly prepare a fugitive dust plan for the BLM to use within the Trona portion of the Searles Valley Nonattainment Area. Shortly after this rule was approved, this area was found to attain the federal PM₁₀ standard and the redesignation request/maintenance plan was submitted. This removed the requirement for the BLM to continue to reduce emissions or complete the fugitive dust plan noted in the rule.

Rule 403-2 has a requirement for the BLM to complete and implement a fugitive dust plan that has the following specified fugitive dust mitigation measures:

- (a) *Stipulate that all new authorizations for stationary emission sources obtain all necessary MDAQMD permits and satisfy all applicable SIP provisions, including project- or activity-specific RACM;*
- (b) *Control dust emissions from certain roads and routes as per the Wilderness classification in the California Desert Protection Act;*
- (c) *Control dust emissions from certain roads and routes as identified through general BLM planning;*
- (d) *Implement those PM₁₀ control measures required to manage organized off-road events and/or competitions on public land;*

- (e) Use BLM-standard road design and drainage specifications when maintaining existing roads or authorizing road maintenance and new road construction; and
- (f) Include public educational information on PM₁₀ emissions with BLM open area literature and in information in heavily used areas.

The BLM submitted the required dust control plan to the MDAQMD in February 1997 (BLM 1997) that covers specific projects apart from day-to-day management of the OHV route network. BLM has continued to implement the requirements of dust control plan.

MDAQMD Summary

Compliance issues related to air quality regarding the existing WEMO Area Route Network operations have not come up for the BLM within the MDAQMD jurisdiction.

Eastern Kern Air Pollution Control District

The EKAPCD was formed at the same time the San Joaquin Valley Air Pollution Control District (SJVAPCD) was created through the consolidation of all of the county level air districts within the San Joaquin Valley. The western part of Kern County that lies within the San Joaquin Valley Air Basin was absorbed into the SJVAPCD. Air quality management the eastern part of Kern County is now overseen by the EKAPCD. Portions of the northwestern part of the EKAPCD were regulated by EPA, in terms of NAAQS attainment, as if they were located within the San Joaquin Valley Air Basin, but now are considered to be within the Mojave Desert Air Basin. Regulatory remnants of this air basin misidentification remain to this day in the "Eastern Kern County Area" PM₁₀ NAAQS nonattainment area designation.

SIP Documents

The EKAPCD jurisdiction includes a federal ozone nonattainment area, a federal PM₁₀ nonattainment area, and a federal PM₁₀ maintenance area.

Ozone

The applicable SIP document for the ozone nonattainment area is the *2017 Ozone Attainment Plan for 2008 Federal 75 ppb 8-Hour Ozone Standard* (EKAPCD 2017). This attainment plan does not include any emissions reduction measures that cover the operation of the WEMO Area Route Network. This EKAPCD Plan provides the following emissions inventory for project relevant sources, and total emissions, within the Federal Ozone Nonattainment Area (FONA) (Table 3-7).

Table 3-7. Eastern Kern FONA Emissions Inventory

	2017 (tons/day)		2020 (tons/day)	
	VOC	NO _x	VOC	NO _x
Eastern Kern FONA				
On-Road Mobile Sources	1.347	4.226	1.052	3.361
Off-Road Recreation Vehicles	0.059	0.001	0.059	0.001
Other Source Categories	5.815	24.945	5.804	25.351
Total Eastern Kern FONA Ozone Precursor Emissions	7.221	29.172	6.915	28.713

Source: EKAPCD 2017.

The estimated BLM baseline ozone precursor (VOC and NO_x) emissions inside this FONA are shown in Table 3-8.

Table 3-8. BLM WEMO Route Network Emissions, Eastern Kern FONA

Eastern Kern FONA	2017 (tons/day)	
	VOC	NOx
On-Road Mobile	0.036	0.012
Off-Road Recreational Vehicles	0.078	0.006
Estimated BLM Emissions in Eastern Kern FONA	0.114	0.018

Source: Appendix A

The BLM WEMO Route Network ozone precursor emissions are a very small percentage of precursor emissions for this nonattainment area. The BLM related on-road mobile emissions are a very small percentage of the total on-road mobile emissions. The BLM related off-road mobile emissions are high percentage of this emissions category, but the emissions from this emissions category are very low in comparison with the total VOC and NO_x emissions within this FONA. Continued operation of the BLM WEMO Route Network in this nonattainment area would not significantly affect the future attainment of the federal ozone air quality standard.

PM₁₀

The applicable PM₁₀ SIP document for the Indian Wells PM₁₀ Maintenance Area is the PM₁₀ (Respirable Dust) Attainment Demonstration, Maintenance Plan, and Redesignation Request, Kern County Portion of the Indian Wells Valley Segment of "Searles Valley" Federal Planning Area (KCAPCD 2002). This document provided BLM Unpaved Road Dust estimates for the entire air district but did not partition the estimates of BLM emissions for the Indian Wells area inventory. This document also provides for expected overall reductions in unpaved road dust emissions, but does not specify any detailed requirements for emissions reductions by the BLM. The Indian Wells Inventory provided in this plan estimates the following annual emissions for PM₁₀ (Table 3-9).

Table 3-9. KCAPCD Indian Wells PM₁₀ Maintenance Plan Emissions Inventory

Indian Wells PM10 Maintenance Area	PM ₁₀ (tons/day)		
	1991	1990	1994
On-Road Mobile Sources	0.10	0.10	0.10
Off-Road Recreational Vehicles	n/a	n/a	n/a
Unpaved Road Dust	1.26	0.93	0.93
Unpaved Road Windblown Dust	n/a	n/a	n/a
Other Source Categories	4.97	4.73	4.15
Total Indian Wells Maintenance Area PM10 Emissions	6.33	5.76	5.18

Source: KCAPCD, 2002.

The current baseline (2017) PM₁₀ emissions estimated for BLM activities within the Indian Wells PM₁₀ Maintenance Area are shown in Table 3-10.

Table 3-10. BLM WEMO Route Network Emissions, Indian Wells PM₁₀ Maintenance Area

Indian Wells PM ₁₀ Maintenance Area	PM ₁₀ (tons/day) 2017
BLM On-Road Mobile Sources	0.000105
BLM Off-Road Recreational Vehicles	0.000281
BLM Unpaved Road Dust	1.75
BLM Unpaved Road Windblown Dust	2.29
Estimated BLM Emissions in Indian Wells PM₁₀ Maintenance Area	4.04

Source: Appendix A

The BLM emissions estimate is high in comparison to the estimate contained in the 2002 KCAPCD maintenance plan because of upward adjustment of unpaved OHV route use and the amount of unpaved routes areas within the Indian Wells PM₁₀ maintenance area. This correction does not represent an actual increase in the baseline emissions, as the BLM recreational vehicle use in this area is not known to have increased over time. In fact, as noted in Appendix E of this Maintenance Plan the overall competitive OHV use demand had dropped 60 percent from the Maintenance Plan's baseline year. Additionally, as noted in Appendix E of the Maintenance Plan, reductions in casual OHV use have also occurred, due to the BLM closing motorized routes in this area following enactment of the California Desert Protection Act (1994) and repurposing other motorized routes to hiking, mountain biking, and equestrian use as part of the Rademacher Hills Trail project. Collectively, the BLM closed over 80 miles of old unpaved OHV use roads (KCAPCD 2002).

The Eastern Kern PM₁₀ Nonattainment area, designated as a serious PM₁₀ nonattainment area, was part of the Kern County portion of the former San Joaquin Valley nonattainment area. No agencies have prepared attainment or redesignation/maintenance plans for this nonattainment area. EKAPCD does not consider the Eastern Kern PM₁₀ Nonattainment area, called the Kern River Valley, Bear Valley, and Cummings Valley by the EKAPCD, to be included within the EKAPCD for the PM₁₀ NAAQS (EKAPCD 2018a). PM₁₀ monitoring suggests that this area is in attainment of the federal PM₁₀ standard, but has not been redesignated by USEPA because the USEPA has not received a request for redesignation. Because no SIP documents exist for this nonattainment area, no SIP-related requirements are applicable to the BLM in this area.

Regulations

The only potentially relevant EKAPCD regulation that has specific control measure requirements is Rule 402 – Fugitive Dust (EKAPCD 2018b). This regulation (part IV.A.14.) exempts unpaved roads that are in officially designated public parks and recreational areas, and (part IV.A.6.) also exempts unpaved roads that are not part of a “large operations” and are outside of the Indian Wells Valley. If inside Indian Wells Valley, the Rule exempts unpaved roads that are less than 75 feet long, or have a traffic volume of less than 25 vehicle trips per day, or have greater than 25 vehicles trips per day not more than six times per year. It appears that most of the BLM WEMO Area Route Network within the EKAPCD would fall under one or more of these exemptions, so that the requirements of this rule, including the dust control Reasonably Available Control Measures (RACM) for unpaved roads are not applicable.

EKAPCD Summary

There do not appear to be any existing BLM WEMO Area Route Network operations compliance issues related to air quality within the EKAPCD jurisdiction.

Great Basin Unified Air Pollution Control District

SIP Documents

The WEMO area within the GBUAPCD jurisdiction includes one federal PM₁₀ nonattainment area and one federal PM₁₀ maintenance area.

The applicable PM₁₀ SIP document for the Owen Valley Planning Area serious PM₁₀ nonattainment area is the 2016 Owens Valley Planning Area PM₁₀ State Implementation Plan (GBUAPCD 2016). This plan, which is for a subarea of the entire Owens Valley PM₁₀ Serious Nonattainment Area, includes only a very small portion of the WEMO planning area near Olancha Dunes OHV Open Riding Area. This plan focuses on the control of dust from Owens Lake and Keeler Dunes, both of which are outside of the WEMO planning area. Therefore, BLM WEMO Area Route Network relevant emissions estimates or emissions mitigation are not part of this plan.

The applicable PM₁₀ SIP document for the Coso Junction PM₁₀ maintenance area is the 2010 PM₁₀ Maintenance Plan and Redesignation Request for the Coso Junction Planning Area (GBUAPCD 2010). The Coso Junction Planning area is part of the former Searles Valley PM₁₀ nonattainment area, which was split into three subareas by local air districts. This plan has no BLM-specific references, nor any applicable mitigation measures. The Coso Junction maintenance plan provides the following relevant PM₁₀ emissions estimate (Table 3-11).

Table 3-11. Coso Junction PM₁₀ Maintenance Plan Emissions Inventory

Coso Junction PM ₁₀ Maintenance Area	PM ₁₀ (tons/day) 2008 to 2025
On-Road Mobile Sources	0.006
Off-Road Recreational Vehicles	n/a
Unpaved Road Dust	0.04
Unpaved Road Windblown Dust	n/a
Other Source Categories	0.69
Total Coso Junction PM₁₀ Maintenance Plan Emissions	0.74

Source: GBUAPCD 2010.

The current baseline (2017) PM₁₀ emissions estimated for BLM activities within the Coso Junction PM₁₀ Maintenance Area are shown in Table 3-12.

Table 3-12. BLM WEMO Route Network Emissions, Coso Junction PM₁₀ Plan Area

Coso Junction PM ₁₀ Maintenance Area	PM ₁₀ (tons/day) 2017
BLM On-Road Mobile Sources	< 0.0001
BLM Off-Road Recreational Vehicles	< 0.0001
BLM Unpaved Road Dust	0.16
BLM Unpaved Road Windblown Dust	1.24
Estimated BLM Emissions in Coso Junction Maintenance Area	1.40

Source: Appendix A

The BLM emissions estimate is higher compared to the 2010 GBUAPCD Coso Junction maintenance plan. This discrepancy is due to corrected unpaved road use and unpaved road areas within the Coso Junction PM₁₀ maintenance area, and inclusion of emissions sources not included in the maintenance plan

(primarily windblown dust from unpaved roads). This estimate is a correction and does not represent an increase in the baseline emissions, as the BLM use in this area has not increased overtime.

Regulations

The only potentially relevant GBUAPCD regulation is Rule 401 – Fugitive Dust (GBUAPCD 2018). The applicable part of this regulation requires a person to take reasonable precautions to prevent visible particulate matter from being airborne, under normal wind conditions, beyond the property from which the emissions originates. This rule further identifies application of asphalt, water or suitable chemicals on dirt roads as a potential reasonable precaution. However, the use of asphalt, water, or suitable chemicals is not considered a reasonable precaution for the BLM to apply to their unpaved road network within this jurisdiction, where the total route distance exceeds 300 miles.

GBUAPCD Summary

There do not appear to be any existing BLM WEMO Area Route Network operations compliance issues related to air quality within the GBUAPCD jurisdiction.

Antelope Valley Air Quality Management District

SIP Documents

The AVAQMD has one federal ozone nonattainment area and is attainment/unclassified for the federal PM₁₀ ambient air quality standard, so there are no AVAQMD SIP relevant documents for PM₁₀.

Ozone

The applicable ozone nonattainment area SIP document is the *AVAQMD Federal 75 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)* (AVAQMD 2017). This attainment plan does not include any emissions reduction measures that would be relevant to the operation of the WEMO Area Route Network. This document provides the same emissions inventory for the federal ozone nonattainment area (FONA) that covers the AVAQMD jurisdiction and parts of the MDAQMD jurisdiction. The discussion above under the MDAQMD provides more information and a comparison with this plan's emissions estimate with the estimated BLM baseline emissions.

Regulations

The only potentially relevant AVAQMD regulation is Rule 403 – Fugitive Dust (AVAQMD 2018). This regulation, part (F)(1)(b), exempts unpaved roads that are not part of an industrial complex or commercial facility. Therefore, the BLM WEMO Area Route Network roads are not subject to this rule.

AVAQMD Summary

There do not appear to be any existing BLM WEMO Area Route Network operations compliance issues related to air quality within the AVAQMD jurisdiction.

South Coast Air Quality Management District

SIP Documents

The BLM WEMO area within the SCAQMD includes areas within the Salton Sea Air Basin, which has no BLM lands or roads, and a portion within the Mojave Desert Air Basin (MDAB). This portion of the MDAB

is designated as in attainment of all federal ambient air quality standards. Therefore, while SCAQMD has SIP documents, such as the *2016 Air Quality Management Plan* (SCAQMD 2016) and the *2003 Coachella Valley PM₁₀ State Implementation Plan* (SCAQMD 2003) that address nonattainment and maintenance within the South Coast Air Basin and the Salton Sea Air Basin, these plans do not specifically address their jurisdiction within the Mojave Desert Air Basin. Therefore, at this time no control measures from these plans would potentially apply to BLM WEMO area operations in the SCAQMD portion of the MDAB.

Regulations

The only potentially relevant SCAQMD regulations that have specific control measure requirements are Rule 403, Fugitive Dust, and Rule 1186, PM₁₀ Emissions from Paved and Unpaved Roads and Livestock Operations (SCAQMD 2018).

Under Rule 403 there is a partial exemption for “officially-designated public parks and recreational areas, including national parks, national monuments, national forests, state parks, state recreational areas, and county regional parks.” This exemption covers additional requirements for large operations, which do not specifically apply to an unpaved road network. There do not appear to be any other exemptions related to the Rule 403 dust control requirements. This rule requires that the roads meet the required rule performance standards as follows:

- *No person shall cause or allow the emissions of fugitive dust from any active operation, open storage pile, or disturbed surface area such that:*
 - *the dust remains visible in the atmosphere beyond the property line of the emission source; or*
 - *the dust emission exceeds 20 percent opacity (as determined by the appropriate test method included in the Rule 403 Implementation Handbook), if the dust emission is the result of movement of a motorized vehicle.*

To meet those performance standards, in Table 1 of Rule 403, SCAQMD specifies are two control measures for unpaved road fugitive dust control:

- *Control Measure 19-1. Stabilize soils to meet the applicable performance standards; and*
- *Control Measure 19-2. Limit vehicular travel to established unpaved roads (haul routes) and unpaved parking lots.*

While the BLM may not be actively initiating actions related to Control Measure 19-1, the BLM does enforce Control Measure 19-2, to keep vehicles on BLM-designated unpaved roads within the BLM WEMO Area Route Network. There are no known instances of rule violation enforcement by the SCAQMD; so it is assumed that these roads are being maintained in a manner to meet the Rule 403 performance standards.

SCAQMD Rule 1186 has an exemption for all unpaved roads 3,000 feet above sea level with fewer than 500 average daily trips (ADT) and unpaved roads owned by government agencies if that agency notifies the Executive Officer that its unpaved roads have 20 average daily trips or less. A portion of the BLM roads located in the SCAQMD MDAB area are more than 3,000 feet above sea level. Based on data provided by the BLM, the daily ADT throughout the WEMO Area Route Network in this area appears to be less than 20 ADT. Therefore, it appears that the BLM is exempt from the requirements of Rule 1186 in its SCAQMD MDAB WEMO Area Route Network.

SCAQMD Summary

There do not appear to be any existing BLM WEMO Planning Area Route Network operations compliance issues related to air quality within the SCAQMD jurisdiction.

Overall Compliance Summary

The BLM WEMO Planning Area Route Network activities appear to comply with the SIP-approved applicable rules and regulations for all of the jurisdictions covered by the WEMO area. While stationary source operators, permitted to operate on BLM lands within the WEMO area have received notices of violation from local air districts in the past, the BLM itself has never received an official notice of violation of any rule or regulation related to the operation of the WEMO Planning Area Route Network.

A separate review of the compliance with the federal General Conformity Rule is provided in the Chapter 4 discussion.

4. 2035 Nonattainment/Maintenance Area BLM Emissions

General Conformity Applicability Analysis

Summary of PM₁₀ Nonattainment/Maintenance Area Results

There is no assumed change in vehicle use on the route network between 2017 and 2035, so the change in emissions from baseline is solely based on change in the miles of open route and the related amount of windblown fugitive dust coming from the associated disturbed area. For alternatives that will have miles of route removed from service and rehabilitated, it is assumed that the windblown dust emissions potential will be reduced to natural conditions over time. The estimated route network mileage by non-attainment/maintenance area by alternative is provided in Appendix A. A summary of the alternatives PM₁₀ emissions in 2035 compared to the 2017 baseline PM₁₀ emissions and the General Conformity applicability thresholds for each of the relevant air quality nonattainment and maintenance management areas is provided in Table 4-1.

Table 4-1. 2035 Forecast Nonattainment/Maintenance Areas Windblown PM₁₀ Emissions (tons/year)

Alternative	PM ₁₀ Non-Attainment/Maintenance Areas					
	Coso Junction	East Kern	Indian Wells	Owens Valley	SB County	Trona (SVPA)
Nonattainment/Maintenance Status	Maintenance	Serious	Maintenance	Serious	Moderate	Moderate
General Conformity Threshold	100	70	100	70	100	100
2017 Baseline/2035 Alternative 1 PM ₁₀	451	141	834	237	5,625	511
Alternative 2 2035 PM₁₀	353	154	754	189	4,888	416
Change from 2017 Baseline	-99	13	-80	-48	-737	-96
Exceeds Threshold?	No	No	No	No	No	No
Alternative 3 2035 PM₁₀	707	284	1,923	439	8,879	934
Change from 2017 Baseline	256	144	1,088	202	3,254	422
Exceeds Threshold?	YES	YES	YES	YES	YES	YES
Alternative 4 2035 PM₁₀	470	217	970	282	5,654	517
Change from 2017 Baseline	19	76	136	45	30	6
Exceeds Threshold?	No	YES	YES	No	No	No
Alternative 5 2035 PM₁₀	486	219	1,039	289	5,935	557
Change from 2017 Baseline	34	78	205	52	310	45
Exceeds Threshold?	No	YES	YES	No	YES	No

Source: General Conformity Applicability Thresholds (USEPA 2010), Appendix A

Please note that by definition as the No Action Alternative, Alternative 1 and baseline conditions have the same route mileage assumptions and so there would be no emissions fugitive dust differences, so Alternative 1 would not exceed any of the General Conformity applicability thresholds. The changes in tailpipe PM₁₀ emissions from 2017 to 2035 are not presented as they are negligible in comparison to the General Conformity applicability thresholds.

Summary of Ozone Nonattainment Area Results

All alternatives have the same emissions, for ozone precursors (VOC and NO_x), as all alternative assume no growth in traffic. Unlike the PM₁₀ emissions, the amount of route network length does not influence the estimate of ozone precursor emissions. Ozone precursor emissions in 2035 under all alternatives in the relevant air quality management areas are provided in Table 4-2.

Table 4-2. 2035 Forecast Nonattainment Areas Ozone Precursor Emissions (tons/year)

All Alternatives	Ozone Non-Attainment Areas			
	West Mojave Desert		Eastern Kern	
	VOC	NO _x	VOC	NO _x
Non-Attainment Status	Severe		Serious	
On-Road 2017 Baseline	13.28	5.77	13.31	4.43
Off-Road Rec Vehicle 2017 Baseline	25.92	1.93	28.35	2.12
Total 2017 Baseline	39.20	7.70	41.67	6.54
On-Road 2035	11.34	4.46	11.19	4.00
Off-Road Rec Vehicle 2035	21.99	2.89	24.05	3.16
Total 2035	33.33	7.34	35.24	7.16
Change from 2017 Baseline	-5.87	-0.36	-6.42	0.61
General Conformity Threshold	25	25	50	50
Exceeds?	No	No	No	No

General Conformity Applicability Conclusions

PM₁₀ Inventory Results Discussion

The PM₁₀ emissions results, as provided above in Table 4-1, show that there is the potential for future PM₁₀ to increase above the general conformity applicability thresholds depending on the alternative and the specific assumptions for the route network in that alternative. The General Conformity Regulation has the following definitions for direct and indirect emissions (USEPA 2010):

Direct emissions means those emissions of a criteria pollutant or its precursors that are caused or initiated by the Federal action and originate in a nonattainment or maintenance area and occur at the same time and place as the action and are reasonably foreseeable.

Indirect emissions means those emissions of a criteria pollutant or its precursors:

- (1) That are caused or initiated by the Federal action and originate in the same nonattainment or maintenance area but occur at a different time or place as the action;
- (2) That are reasonably foreseeable;
- (3) That the agency can practically control; and
- (4) For which the agency has continuing program responsibility.

Both direct and indirect emissions are counted as emissions when identifying whether a federal action would exceed a General Conformity applicability threshold. However, whether the emissions from route network use are considered direct or indirect emissions, any growth of use in the route network is not

considered reasonably foreseeable. So, while emissions for a population growth-based case are provided later in this section they are not relevant to the General Conformity applicability findings. Since the BLM cannot reasonably control use on the route network while maintaining the route network for its purpose of public recreation, General Conformity findings should be based on BLMs identified non-elastic, no increase in growth, assumption for the route network.

Assuming no growth is the proper case for General Conformity assessment purposes, Alternatives 3 through 5 have an assumed emissions increase that exceeds one or more of the PM₁₀ nonattainment/maintenance area General Conformity emissions applicability thresholds.

Based on the emissions methodologies and assumptions, the derived emissions factor for windblown fugitive dust emissions on unpaved roads indicate that the following increases in route length would exceed the General Conformity thresholds:

- Serious Nonattainment Areas – 70 Ton/Year PM₁₀ Threshold = 46 miles
- Moderate Nonattainment/Maintenance Areas – 100 Ton/Year PM₁₀ Threshold = 66 miles

Therefore, in order to avoid a full general conformity analysis the route network length should not be increased by these quantities as appropriate for each nonattainment/maintenance area.

Ozone Nonattainment Area Inventory Results Discussion

The inventory results, as provided above in Table 4-1, indicate that the ozone precursor emissions will not exceed the General Conformity applicability thresholds regardless of the alternative.

Methods and Assumptions

For estimating emissions of all pollutants in 2035, EMFAC2014 emissions factors were used for the 2035 horizon with the EMFAC2011 vehicle categories included in the on-road vehicle emissions estimates. The 2035 EMFAC2014 on-road vehicle emissions factors are presented in the report Appendix.

The other methods and assumptions are the same as those discussed in Chapters 1 and 3, where the only other differences in assumptions are the specific route network disturbed areas, based on the route length in each PM₁₀ non-attainment/maintenance area, and the VMT assumptions for each of the non-attainment/maintenance areas. The BLM RMIS and GIS data used to calculate the emissions for the various nonattainment and maintenance areas are presented in the Appendix.

The estimates for the ozone precursor 2035 emissions for off-road recreational vehicles are higher than 2017 estimates as they are based on the CEPAM 2035 estimates that must assume some growth in vehicle use (ARB 2018a). Those growth assumptions are not readily available, and this assumption does not impact the findings, so no adjustment to remove this growth assumption was made.

2035 Emissions Analyses With Population Growth Assumption

For informational purposes, in addition to the General Conformity applicability emissions analysis presented above, an emissions estimate for PM₁₀ and ozone precursors emissions for a population growth based route network traffic increase case was prepared. The population growth was determined by using State of California population projections for the five counties that make up the WEMO area (CDOF 2018), with the overall increase being a population weighted average for the population between the ages of 18 to 70. This population based use/VMT increase from 2017 to 2035 was determined to be

7.775 percent, which translates to a 7.775 percent increase in the baseline road travel fugitive dust for all alternatives.

PM₁₀ Emissions Estimates for Population Based Traffic Growth Case

A comparison of the alternatives estimated 2035 PM₁₀ emissions versus 2017 baseline for the population based traffic growth case, in the relevant nonattainment and maintenance air quality management areas, is provided in Table 4-3.

Table 4-3. 2035 Forecast Nonattainment/Maintenance Areas PM₁₀ Windblown plus Traffic Fugitive Dust Emissions – Traffic Growth Proportional to Adult Population Growth (tons/year)

Alternative	PM ₁₀ Non-Attainment/Maintenance Areas					
	Coso Junction	East Kern	Indian Wells	Owens Valley	SB County	Trona (SVPA)
2017 Baseline PM ₁₀	511	201	1,435	268	8,847	774
Alternative 1 with w/growth PM ₁₀	515	206	1,482	270	9,098	794
Change from 2017 Baseline	5	5	47	2	251	20
Alternative 2 w/growth PM ₁₀	417	219	1,402	222	8,360	699
Change from 2017 Baseline	-94	18	-34	-46	-487	-75
Alternative 3 w/growth PM ₁₀	771	350	2,571	473	12,352	1,217
Change from 2017 Baseline	261	148	1,135	205	3,505	443
Alternative 4 w/growth PM ₁₀	534	282	1,618	315	9,127	801
Change from 2017 Baseline	23	80	183	47	280	27
Alternative 5 w/growth PM ₁₀	550	284	1,687	322	9,408	840
Change from 2017 Baseline	39	83	251	54	561	66

Source: Appendix A

As Table 4.3 (in comparison with Table 4.1), indicates the increase in PM₁₀ emissions, change from 2017 baseline, for the population growth based traffic increase case is fairly substantial, ranging from 2 to 251 tons per year .

Ozone Precursor Emissions Estimates for Population Based Traffic Growth Case

A comparison of the project alternatives estimated 2035 ozone precursor emissions versus 2017 baseline for the population based traffic growth case, in the relevant nonattainment air quality management areas, is provided in Table 4-4.

Table 4-4. 2035 Forecast Ozone Nonattainment Areas Ozone Precursor Emissions – Traffic Growth Proportional to Adult Population Growth (tons/year)

All Alternatives	Ozone Non-Attainment Areas			
	West Mojave Desert		Eastern Kern	
	VOC	NO _x	VOC	NO _x
Total 2017 Baseline	39.20	7.70	41.67	6.54
Total 2035 with Population Increase	35.92	7.91	37.98	7.72
Change from 2017 Baseline	-3.28	0.21	-3.68	1.17

Source: Appendix A

As Table 4.4 (in comparison with Table 4.2), indicates the increase in ozone precursor emissions for the population growth based traffic increase case is not substantial, less than 3 tons per year for VOC and less than a ton per year for NO_x.

Emissions Inventory Results for PM_{2.5} State Nonattainment Area

In addition to the Federal non-attainment and maintenance area emissions estimates prepared for the purposes of General Conformity Rule review, a calculation of BLM Route Network emissions in the State of California PM_{2.5} nonattainment area was prepared for baseline 2017 conditions and for future 2035 no traffic growth assumption conditions for all 5 project alternatives. The State PM_{2.5} nonattainment covers the southwestern part of San Bernardino County in the Mojave Desert Air Basin. Table 4-5 shows the BLM Route Network emissions for PM_{2.5} in the nonattainment area for informational purposes.

Table 4-5. Forecast for State PM_{2.5} Nonattainment Area BLM WEMO Area Emissions (tons/year)

	2017 Baseline	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5
BLM Route Network	857.92	857.94	783.37	1245.22	869.47	895.27
BLM Route Network + OHV	1341.28	1341.34	1266.77	1728.62	1352.88	1378.68

Source: Appendix A

These emissions were calculated using the assumptions and methods previously discussed. The only different information is the GIS and RMIS route network specific to each alternative within the boundaries of this state-level PM_{2.5} nonattainment area. That GIS and RMIS VMT data are summarized in Appendix A.

SPECIAL STATUS SPECIES SUMMARY

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Mammals					
Bighorn Sheep (<i>Ovis canadensis nelsoni</i>)	BLM-S	Bighorn sheep require a variety of habitat characteristics and prefer areas on or near mountainous terrain that are visually open, as well as steep and rocky. Alluvial fans and washes in flatter terrain are also used for forage and water and as connectivity habitat between more rugged areas. Aerial surveys in 2009 and 2010 documented 1,022 bighorn sheep, including ewes, lambs, and rams, in the following mountain ranges: Marble Mountains; Clipper Mountains; Kelso Peak and Old Dad Peak; Clark, Kingston, and Mesquite Mountains; Orocopia Mountains; Sheephole Mountains; South Bristol Mountains; Cady Mountains; White Mountains; and San Gorgonio Mountains.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Mohave Ground Squirrel (<i>Xerospermophilus mohavensis</i>)	BLM-S; ST	Range: Endemic to California, the Mohave ground squirrel is exclusively found in the northwestern Mojave Desert in San Bernardino, Los Angeles, Kern, and Inyo counties. Habitat: The MGS generally occurs in flat to moderate terrain and is not found in steep terrain. Substrates in occupied habitats have ranged from being very sandy to, less frequently, very rocky.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
California Leaf-Nosed Bat (<i>Macrotus californicus</i>)	BLM-S; SSC	Range: In California, the California leaf-nosed bat occurs in the desert regions of eastern San Bernardino (i.e., excluding the western Mojave region), Riverside, and San Diego counties and all of Imperial County. The recent records for this species are generally concentrated in southern portions of the planning area, including several records for Joshua Tree National Park, with four roost sites observed. Habitat: The California leaf-nosed bat is primarily a cave and mine dwelling species, but also occupies buildings.	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Hoary Bat (<i>Lasiurus cinereus</i>)	None	<p>Range: The hoary bat winters in Southern California. There are no recent (i.e., since 1990) records of occurrence for this species within the planning area, but historic records indicate occurrence near Hesperia and Joshua Tree National Park.</p> <p>Habitat: This species typically roosts in tree foliage and sometimes cavities. Habitat exists for this species within the planning area.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Long-legged Myotis (<i>Myotis volans</i>)	None	<p>Range: The Dale Mining District in the Pinto Mountains, including portions of Joshua Tree National Park, contains many shafts and adits known to harbor bats of several species. Six significant roosts have been located, and the potential for several more is present.</p> <p>Habitat: The long-legged myotis is primarily a tree-dweller occurring at higher elevations than those found in the planning area.</p>	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Pallid Bat (<i>Antrozous pallidus</i>)	BLM-S; SSC	<p>Range: The known occurrence data for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.4, pp. 3-169 to 3-170.</p> <p>Habitat: In desert habitats, pallid bats roost mostly in rock crevices, although they might be found in tree cavities, old buildings, under bridges, in caves and mine adits, and mud tubes when these sites are available.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Spotted Bat (<i>Euderma maculatum</i>)	BLM; SSC	<p>This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.4, pp. 3-169 to 3-170.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Western Mastiff Bat (<i>Eumops perotis</i>)	BLM; SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.4, pp. 3-169 to 3-170.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Townsend's Big-eared Bat (<i>Corynorhinus townsendii</i>)	BLM; SSC	Range: The known occurrence data for this species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.4, pp. 3-169 to 3-170. Habitat: The Townsend's big-eared bat is a colonial cave dwellers thought to have declining populations. The Townsend's big-eared bat is dependent on riparian habitat within five miles of the roosts.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Fringed Myotis (<i>Myotis thysanodes</i>)	BLM-S	Range: The fringed myotis is widespread in California, with its range occurring along the western and northern boundaries of the planning area. Habitat: The fringed myotis occurs in a wide variety of habitats, but optimal habitats include pinyon-juniper, valley foothill hardwood and hardwood-conifer, generally at 1300-2200 m (4000-7000 ft). This species roosts in caves, mines, buildings, and crevices.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Zeiner, D.C. et al 1988-1990; CNDDDB 2018
Western Small-footed Myotis (<i>Myotis ciliolabrum</i>)	BLM-S	Range: This species occurs from on the west and east sides of the Sierra Nevada, and in Great Basin and desert habitats from Modoc to Kern and San Bernardino counties, with its range occurring along the western and northern boundaries of the planning area. Habitat: This species roosts in caves, mines, buildings, and crevices and is a common resident of arid uplands in California	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Zeiner, D.C. et al 1988-1990

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Western Red Bat (<i>Lasiurus blossevillii</i>)	BLM; SSC	Range: Breeding are from the Sacramento and San Joaquin rivers, with other breeding records from the San Diego, Santa Ana, and Los Angeles rivers. There are no records of occurrence for this species within the planning area, but suitable habitat exists for this species. Habitat: The western red bat, as a tree bat, is closely associated with well-developed riparian habitats that provide suitable roosting sites.	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Mojave River Vole (<i>Microtus californicus mohavensis</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.5.2, pg. 3-172.	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Yellow-eared Pocket Mouse (<i>Perognathus xanthonotus</i>)	BLM-S	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.5.3, pg. 3-172.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Birds					
Bendire's Thrasher (<i>Toxostoma bendirei</i>)	BLM; SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.1, pg. 3-173.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a
Brown Crested Flycatcher (<i>Myiarchus tyrannulus</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.2, pp. 3-173 to 3-174.	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Burrowing Owl (<i>Athene cunicularia</i>)	BLM; SSC	<p>Range: In California, the burrowing owl's range extends throughout the lowlands from the northern Central Valley to the U.S.–Mexico border, with large populations in the Imperial Valley region of southeast California (Gervais et al. 2008) and a small (perhaps extirpated) population in the Great Basin bioregion in northeast California.</p> <p>Habitat: This species requires habitats with three basic attributes: open, well-drained terrain; short, sparse vegetation generally lacking trees; and underground burrows or burrow-like structures.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Ferruginous Hawk (<i>Buteo regalis</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.4, pg. 3-174.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a
Golden Eagle (<i>Aquila chrysaetos</i>)	BLM-S; SFP	<p>Range: There are golden eagle concentrations in the west Mojave, the region between Victorville and Barstow east on I-15, the Mojave National Preserve, and the eastern portion of Joshua Tree National Park. The BLM identified “Key Raptor Areas” for golden eagles encompassing the Granite, El Paso, Newberry, and Red mountains (Raptor Research Foundation 1989), as well as important occupied habitat in the Clark Mountain Range and Calico Mountains.</p> <p>Habitat: In California, golden eagles inhabit open grasslands and oak savanna, but can also be found in desert grasslands and chaparral habitats. Secluded cliffs with overhanging ledges and large trees are used for nesting and cover.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Gray Vireo (<i>Vireo vicinior</i>)	BLM; SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.6, pp. 3-175 to 3-176.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a
Inyo California Towhee (<i>Pipilo crissalis eremophilus</i>)	FT; SE	Range: Southern Argus Range and the upland areas immediately surrounding them. Recent records for this species are generally concentrated north of Ridgecrest within the planning area. Habitat: The principal habitat consists of dense riparian willow thickets along a few isolated streams, springs, and rocky canyons.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
LeConte's Thrasher (<i>Toxostoma lecontei</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.8, pg. 3-177.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a
Long-eared owl (<i>Asio otus</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.9, pp. 3-177 to 3-178.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Prairie Falcon (<i>Falco mexicanus</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.10, pg. 3-178.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Southwestern Willow Flycatcher (<i>Empidonax traillii</i> extimus)	FE; SE	Range: In addition to the known breeding sites documented in the 2005 WEMO Final EIS (Section 3.3.6.11, pp. 3-178 to 3-179), the CNDDDB contains one historical (i.e., pre-1990) occurrence for the southwestern willow flycatcher located north of Independence in Inyo County (CDFG 2012b). Four additional historical occurrences for willow flycatchers (subspecies not identified) are located in the vicinity of the cities of Mojave and California City (Dudek 2012 2011). Habitat: In California, the southwestern willow flycatcher is restricted to riparian habitats occurring along streams or in meadows.	Yes	Yes. Habitat for this species exists within the proposed action area.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Summer Tanager (<i>Piranga rubra</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.12, pg. 3-179.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Vermillion Flycatcher (<i>Pyrocephalus rubinus</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.13, pg. 3-179 to 3-180.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Western Snowy Plover (<i>Charadrius alexandrinus nivosus</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.14, pg. 3-180.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Western Yellow-billed Cuckoo (<i>Coccyzus americanus occidentalis</i>)	FC; BLM-S; SE	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.15, pg. 3-181.	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Yellow-breasted Chat (<i>Icteria virens</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.16, pg. 3-181.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
Yellow Warbler (<i>Setophaga petechia</i>)	SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.6.17, pp. 3-181 to 3-182.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a
American Peregrine (<i>Falcon Falco peregrinus anatum</i>)	SFP	Range: Within the planning area, one historic nesting location has been documented within the BLM Ridgecrest Field Office Boundary. Additionally, eBird data within the species occurrence database includes numerous occurrences in the planning area dating back to 2003. The occurrences in the planning area generally occur north of Independence at the northern end of the planning area, and south in Inyo, near Lancaster. Habitat: Peregrine falcons in general use a large variety of open habitats for foraging, including tundra, marshes, seacoasts, savannahs, grasslands, meadows, open woodlands, and agricultural areas. Sites are often located near rivers or lakes.	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Bald Eagle (<i>Haliaeetus leucocephalus</i>)	BLM-S; SE; SFP	Range: The bald eagle's main breeding population in California is still largely restricted to the northern part of the state in Butte, Lake, Lassen, Modoc, Plumas, Shasta, Siskiyou, and Trinity counties. Populations in Southern California remain low with only two successful nests documented since the year 2000 on Santa Catalina Island, and none within the planning area. Habitat: Bald eagles typically occupy forested areas adjacent to large bodies of water.	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Bank Swallow (<i>Riparia riparia</i>)	BLM-S; ST	<p>Range: Historic occurrences (i.e., pre-1990), or occurrences with unknown observation date, are located within the planning area. These include records in the following areas: north of Hesperia, Edwards Air Force Base, east of Barstow along the Mojave River, and west of Barstow near the town of Lockhart, evidently in association with wetlands marginal to Harper Dry Lake.</p> <p>Habitat: Breeding habitat for the bank swallow in California consists exclusively of vertical banks or bluffs with friable soils suitable for burrow excavation by the birds.</p>	No	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Least Bell's Vireo (<i>Vireo bellii pusillus</i>)	FE; SE	<p>Range: Recent occurrence records of least Bell's vireo in the planning area in the following areas: near Lancaster and Palmdale, north of Hesperia, north of Victorville, and southwest of Yucca Valley.</p> <p>Habitat: This species is largely associated with early successional cottonwood-willow and are known to nest in riparian woodlands dominated by willow and Fremont cottonwood.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Dudek 2012 and ICF International 2012
California Condor (<i>Gymnogyps californianus</i>)	FE; SE; SFP	<p>Range: The California condor occurs principally along the western edges of the planning area, specifically within the Tehachapi Mountains east of Interstate 5, the Wind Wolves Preserve and Bitter Creek and Hopper Mountain National Wildlife Refuges (NWRs), and portions of the Los Padres National Forest west of Interstate 5.</p> <p>Habitat: California condors nest in rock formations (crevices, overhung ledges, and potholes), and deep caves. Nesting has not been documented in the planning area; condor use of the planning area is limited to foraging and temporary roosting.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Greater Sandhill Crane (<i>Grus canadensis tabida</i>)	BLM-S; ST; SFP	<p>Range: The greater sandhill crane is considered a winter migrant through the planning area and a recent documented occurrence was located within the planning area in Kern County, south of Ridgecrest.</p> <p>Habitat: Greater sandhill cranes are found primarily in open freshwater wetlands, including shallow marshes and wet meadows.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Mountain Plover (<i>Charadrius montanus</i>)	BLM; SSC	<p>Range: Within the planning area, there are recent (i.e., since 1990) documented occurrences near Palmdale, west of Lancaster, and in the Harper Lake area.</p> <p>Habitat: This species occupies open, flat lands or sparsely vegetated areas, including xeric shrublands, short-grass prairie, and barren agricultural fields.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Swainson's Hawk (<i>Buteo swainsoni</i>)	BLM-S; ST	<p>Range: There are multiple historical occurrence records in the planning area located east of Lancaster, north of Fremont Wash and east of SR 395 (CDFG 2012b; Dudek 2012 2011). Recent Swainson's hawk breeding populations inside the planning area have occurred in the Antelope Valley and Owens River Valley. The vast majority of these occurrences are clustered in the western Mojave region along the base of the San Gabriel and Tehachapi mountain ranges and in Antelope Valley. Scattered occurrences are located in the Fremont Valley and the Ridgecrest/China Lake Naval Air Weapons Station.</p> <p>Habitat: Swainson's hawks are primarily a grassland bird but they are also found in sparse shrubland and open woodlands.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Dudek 2012 and ICF International 2012; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Tricolored Blackbird (<i>Agelaius tricolor</i>)	BLM-S; SSC	<p>Range: Breeding colonies occur in eastern Kern County from Ridgecrest along the base of the Tehachapi Mountains to Antelope Valley, around Palmdale and Lancaster in northeast Los Angeles County, and east of Barstow in San Bernardino County. There are 41 recent (i.e., since 1990) occurrences for the planning area (CDFG 2012b; Dudek 2012 2011). These occurrences generally are located in the Lancaster/Palmdale area; in the southwestern portion of Edward Air Force Base; just north of SR 138; along SR 158 in the Tehachapi Mountain range foothills; west and south of Red Rock Canyon State Park; along the Trona Road cutoff north of SR 395; in the southern portion of the China Lake Naval Air Weapons Station north of Ridgecrest; and along the Mojave River east of Barstow.</p> <p>Habitat: Breeding tricolored blackbirds form large colonies, typically in freshwater wetlands dominated by cattails or bulrushes and thorny vegetation.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
White-tailed Kite (<i>Elanus leucurus</i>)	SFP	<p>Range: Numerous sightings of white-tailed kite for the period of March through July have also been reported in the eBird database for the planning area. White-tailed kite have been observed at the following locations in the Antelope Valley: Holiday Lake (May 1994 near the community of Neenach); Piute Ponds (most recently in July 2006 north of Lancaster); 60th Street East at East Avenue H and East Avenue G (May 1993 in Lancaster); 110th Street East at East Avenue J (May 1996); and Lake Palmdale (April 2007 in Palmdale).</p> <p>Habitat: White-tailed kites are associated with riparian, wetland, and irrigated habitats.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Yuma Clapper Rail (<i>Rallus longirostris yumanensis</i>)	FE; ST; SFP	<p>Range: All recent observations of this species are located outside the planning area to the south and west (Dudek 2012 and ICF International 2012). However, there is one historic occurrence documented within the planning area from 1977 at Harper Lake.</p> <p>Habitat: The Yuma clapper rail is the only rail known to breed in freshwater marshes and the preferred habitat consists of cattails and bulrush.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Fish					
Mojave Tui Chub (<i>Gila bicolor mohavensis</i>)	FE; SE; SFP	<p>Range: The current populations are located in primarily man-made or man-supported habitats. The population in Lark Seep is in a perennial body of water that is fed from the wastewater treatment facility in Ridgecrest, California. The population at Camp Cady is located in a man-made, lined pond that receives water from a pump. The populations at Soda Springs occur in two bodies of water, one is a man-made pond that receives water from a pump, and the other is an isolated spring on the edge of Soda Lake. The population at the Lewis Center is in two small man-made ponds with water supplied from a pump, and at Morning Star Mine, the population is in a man-made pond created by a perched aquifer.</p> <p>Habitat: Historically, within the Mojave River, the Mohave tui chub was associated with deep pools and sloughs of the river and was not found very far into small tributaries.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Reptiles/Amphibians					
Tehachapi Slender Salamander (<i>Batrachoseps stebbinsi</i>)	BLM-S; ST	<p>Range: The Tehachapi slender salamander is endemic to California and is reported to occur only in Kern County and Los Angeles counties. According to the USFWS 12-month review, there are two populations of the Tehachapi slender salamander that represent two DPSs of a single species: the Tehachapi Mountains DPS and the Caliente Canyon DPS, which together constitute the entire range of the species (76 FR 62900–62926).</p> <p>Habitat: The Tehachapi slender salamander inhabits moist canyons and ravines in oak and mixed woodlands.</p>	Yes	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Mojave Fringe-Toed Lizard (<i>Uma scoparia</i>)	BLM-S; SSC	<p>Range: This species is currently found within more than 35 named and unnamed sand dune complexes within the three major river drainages in the planning area: the Amargosa, Mojave, and Colorado rivers.</p> <p>Habitat: This species is an obligate sand-dweller, found in dunes, sand fields, sand hummocks, and other sand deposits throughout the Mojave Desert in California. Its elevation ranges from 300 to 3000 feet.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Desert Tortoise (<i>Gopherus agassizii</i>)	FT; ST	<p>Range: It is anticipated that the desert tortoise will occur throughout the planning area, although its abundance may vary locally due to habitat characteristics, including anthropocentric disturbances.</p> <p>Habitat: The desert tortoise can be found in a wide variety of habitats, such as alluvial fans, washes, canyons, and saltbush plains. Occupied habitat for populations in the Western Mojave Desert includes valleys, bajadas, and hills with sandy loams to rocky substrates.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Southwestern Pond Turtle (<i>Clemmys marmorata pallida</i>)	BLM-S; SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.7.3, pp. 3-183 to 3-184.	Yes	Yes. There are two river crossings in Afton Canyon where potentially occupied habitat may be impacted.	BLM 2005 and 2013a
Panamint Alligator Lizard (<i>Elgaria panamintina</i>)	BLM-S; SSC	This species would not change from the previous analysis included in the affected environment of the 2005 WEMO Final EIS (BLM 2005 and 2013a) and is not discussed further in this supplemental EIS. For a general discussion of this species, please refer to Section 3.3.7.4, pg. 3-184.	Yes	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a

Coast Horned Lizard/San Diego Horned Lizard (<i>Phrynosoma coronatum blainvillei</i>)	BLM-S; SSC	<p>Range: The coast horned lizard is a fringe species in relation to the planning area. Primarily sequestered on the coast and the coastal valleys, it spills over into the planning area in four principal locations: the Tehachapi (California Poppy Reserve) area, the Palmdale area, the Cajon Pass area, and the Morongo Valley/Little San Bernardino Mountain areas.</p> <p>Habitat: This species is found in a fairly wide variety of habitats within its range. These habitats can include various scrublands, grasslands, coniferous and broadleaf forests, and woodlands.</p>	No	No. No further analysis for this species for the proposed action.	CNDD 2011; BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Northern Sagebrush Lizard (<i>Sclerophorus graciosus</i>)	BLM-S	<p>Range: This species is widely distributed in montane chaparral, hardwood and conifer habitats, eastside pine and juniper habitats, and Great Basin shrub habitats of the Cascades and Sierra Nevada, and also east of the Sierra-Cascade crest in northern California. Isolated populations exist at Sutter Buttes in the Sacramento Valley, in the Coast Ranges along the entire length of the state, in the mountains of southern California, and in the desert mountains of Inyo County. Elevation: 900-3200 m (3000-10,400 ft).</p> <p>Habitat: The sagebrush lizard occurs in a wide variety of open forest and shrub habitat types and utilizes mammal burrows and rock crevices as hibernation sites during cold periods.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Zeiner, D.C. et al 1988-1990; CNDDDB 2018

Plants					
Alkali Mariposa-lily (<i>Calochortus striatus</i>)	BLM-S	<p>Range: Known mostly from California, with several occurrences in western Nevada.</p> <p>The Western Mojave comprises the majority of the species' range. Occurrences in the Plan Area include Red Rock Canyon, Edwards AFB, the Lancaster area, Box "S" Springs, Cushenbury Springs, Rabbit Springs, Paradise Springs, and Joshua Tree National Park. Population estimates are crude due to wide fluctuations in numbers from year to year, but Edwards AFB is estimated to host > 100,000 individuals with smaller, scattered populations occurring elsewhere.</p> <p>Habitat: Found in seasonally moist, alkaline habitats such as meadows, seeps and springs, washes, sinks, playas, along dune drainages, and on claypans. Substrate may be calcareous sandy or alkali soils. Found in chaparral, chenopod scrub, Mojavean desert scrub, and saltbrush scrub vegetation communities, with associated species including saltgrass, rushes, sedges (<i>Carex</i> spp.), beard grass (<i>Polypogon</i> sp.), dock, alkali sacaton (<i>Sporobolus airoides</i>), beardless wildrye (<i>Elymus triticoides</i>), dwarf checkerbloom (<i>Sidalcea malviflora</i>), rabbitbrush, Baltic rush (<i>Juncus balticus</i>), and small melilot (<i>Melilotus indicus</i>). Elevation range 224 to 5,240 feet amsl. Flowering April to June.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Amargosa Beardtongue (<i>Penstemon fruticiformis</i> var. <i>amargosae</i>)	BLM-S	<p>Range: Known mostly from California (Inyo and San Bernardino Counties) and western Nevada (Nye and Clark Counties), with most of the occurrences in the vicinity of Death Valley. Occurrence in the Plan Area is limited to one population in the northeast corner. Population within the Plan Area estimated at approx. 20 to 58 individuals.</p> <p>Habitat: Found in rocky or sandy washes and adjacent slopes within steep-walled canyons. Substrate is sand or gravel soils. Found in Mojave Desert scrub and pinyon-juniper woodland vegetation communities, with associated species including desert almond (<i>Prunus fasciculata</i>), skunk bush sumac (<i>Rhus trilobata</i>), desert needle grass (<i>Stipa speciosa</i>), Parry's beargrass (<i>Nolina parryi</i>), Mojave yucca (<i>Yucca schidigera</i>), Mojave aster (<i>Xylorhiza tortifolia</i>), Utah mortonia (<i>Mortonia utahensis</i>), and Utah agave (<i>Agave utahensis</i>). Elevation range 1,148 to 6,200 feet amsl. Flowering April to June.</p>	No	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012
Barstow Woolly Sunflower (<i>Eriophyllum mohavense</i>)	BLM-S	<p>Range: Endemic to California (San Bernardino and Kern Counties) in the west-central portion of the Mojave Desert. The current range is restricted to within 30 miles of Barstow, with most occurrences in the area between Kramer Junction and Harper Dry Lake. The Plan Area contains all 63 known occurrences. Total population estimated at approx. 10,600 individuals.</p> <p>Habitat: Found on bare areas with little soil. Substrate is sandy or rocky often containing a shallow subsurface caliche layer. Found in Chenopod scrub, Mojavean desert scrub, and Creosote bush scrub vegetation communities. Elevation range 1,640 to 3,150 feet amsl. Flowering March to April or May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Beaver dam scurfpea, also beaver dam breadroot (<i>Pediomelum castoreum</i>)	BLM-S	<p>Range: Known from California (San Bernardino County), Arizona, and Nevada (CNPS 2013) in the Mojave Desert (Jepson 2013). Present in the Project Area (pers. comm. Chavez 2013). Known occurrences within the Project Area are widely distributed between Barstow and Victorville and in one area on the north side of the San Bernardino NF (CNPS 2013).</p> <p>Habitat: Found in open areas and on roadcuts (Jepson 2013) and in washes. Substrate is sandy. Found in Joshua tree woodland and Mojavean desert scrub vegetation communities. Elevation range 2,001 to 5,003 feet amsl (CNPS 2013) or < 5,741 feet amsl (Jepson 2013). Flowering April to May (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; Chavez 2013; CNPS 2013; Jepson 2013; CNDDDB 2018
Boyd's monardella (<i>Monardella boydii</i>)	BLM-S	<p>Range: Endemic to California (San Bernardino County) (CNPS 2013) in the south-central Mojave Desert (Jepson 2013). Present in the Project Area (pers. comm. Chavez 2013). Known occurrences within the Project Area are clustered to the southeast of Barstow, near Ord Mountain, Camp Rock Mine, and Silver Bell Mine (CNPS 2013).</p> <p>Habitat: Found on rocky slopes and in canyon bottoms or washes (Jepson 2013). Substrate is usually alluvial soils and bedrock cracks. Found in Mojavean desert scrub, pinyon and juniper woodland, and desert riparian scrub vegetation communities. Elevation range 4,593 to 5,413 feet amsl (CNPS 2013). Flowering August to October (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; Chavez 2013; CNPS 2013; Jepson 2013; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Charlotte's Phacelia (<i>Phacelia nashiana</i>)	BLM-S	<p>Range: Endemic to California (Tulare, Inyo, Kern, and San Diego Counties) in the desert-facing foothills of the Sierra Nevada and in the El Paso Mountains. Occurrences in the Plan Area are concentrated in northeast Kern County in the areas of Red Rock Canyon and southwest of Indian Wells. No population estimates available.</p> <p>Habitat: Found on unstable sites, including steep slopes, flats, canyons, washes and adjacent slopes, and on recently disturbed sites. Substrate is sandy or rocky soils of granitic origin, or talus. Found in Joshua tree woodland, Mojavean desert scrub, and pinyon-juniper woodland vegetation communities, often associated with green ephedra (<i>Ephedra viridis</i>) and single-leaf pinyon (<i>Pinus monophylla</i>). Elevation range 1,600 to 7,200 feet amsl. Flowering March or April to June.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Clokey's Cryptantha (<i>Cryptantha clokeyi</i>)		<p>Range: Endemic to California (Inyo, Kern, Los Angeles, and San Bernardino Counties) (CNPS 2013). Found in the northwest Mojave Desert and in the north desert mountains.</p> <p>Habitat: Found on slopes and ridge crests. Substrate is rocky to gravelly. Found in desert woodland vegetation communities (CNPS 2013). Elevation range 3,445 to 5,413 feet amsl. Flowering April to May (Jepson 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013; CNDDDB 2018
Cushenbury Buckwheat (<i>Eriogonum ovalifolium</i> var. <i>vineum</i>)	FE	<p>Range: Endemic to California (San Bernardino County) in the San Bernardino Mountains. Occurrences in the Plan Area are on BLM land adjacent to the northern border of the San Bernardino NF. Total population estimated at approx. 13,000 individuals.</p> <p>Habitat: Found on stable slopes and bedrock outcrop. Closely associated with carbonate (limestone and dolomite) substrates and fine-textured soils. Found in pinyon-juniper woodland, Joshua tree woodland, and Mojavean desert scrub vegetation communities with a wide range of associated species. Elevation range 4,600 and 7,900 feet amsl. Flowering May and June.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018

Table E.3-1. Special Status Species

Cushenbury Milk-vetch (<i>Astragalus albens</i>)	FE	<p>Range: Endemic to California (San Bernardino County) in the San Bernardino Mountains. Occurrences in the Plan Area are on BLM land adjacent to the northern border of the San Bernardino NF. Total population estimated at approx. 5,000 to 10,000 individuals.</p> <p>Habitat: Found on carbonate soils and bedrock outcrop, as well as carbonate alluvium over granite. Closely associated with carbonate (limestone and dolomite) substrates. Found in pinyon-juniper woodland, Joshua tree woodland, Mojavean desert scrub, rabbitbrush, blackbush, and Great Basin sagebrush vegetation communities with a wide range of associated species. Elevation range 4,000 and 6,600 feet amsl. Flowering late March to mid June.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Cushenbury Oxytheca (<i>Acanthoscyphus parishii</i> var. <i>goodmaniana</i>)	FE	<p>Range: Found in California with the majority of the population in the San Bernardino NF. Occurrences in the Plan Area are on BLM land adjacent to the northern border of the San Bernardino NF. No population estimates available.</p> <p>Habitat: Found on limestone and other carbonate talus slopes. Substrate is limestone and dolomite derived soils with very little organic horizon. Found mostly in pinyon-juniper woodland, but also found in Joshua tree woodland, Mojavean desert scrub, Jeffrey pine-western juniper woodland vegetation communities, and with associated species including single-leaf pinyon pine (<i>Pinus monophylla</i>), Utah juniper (<i>Juniperus osteosperma</i>),. Elevation range 4,000 to 7,800 feet amsl. Flowering May to October.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Darwin Mesa Milk-vetch (<i>Astragalus atratus</i> var. <i>mensanus</i>)	BLM-S	<p>Range: Endemic to California (Inyo County) (CNPS 2013). Found in the desert mountains to the north and west of Panamint Valley (Jepson 2013).</p> <p>Habitat: Found on open foothills (Jepson 2013). Substrate is volcanic clay or gravelly. Found in Great Basin scrub, sagebrush, Joshua tree woodland, and pinyon and juniper woodland vegetation communities. Elevation range 4,396 to 7,595 feet amsl. Flowering April to June (CNPS 2013).</p>	No	No. No further analysis for this species for the proposed action.	Calflora 2013; CNPS 2013; Jepson 2013

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Death Valley Sandpaper-plant (<i>Petalonyx thurberi</i> ssp. <i>gilmanii</i>)	BLM-S	<p>Range: Endemic to California (Inyo and San Bernardino Counties). Found in the north Mojave Desert (Jepson 2013). Known within the Project Area from Old Ibex Pass (CNPS 2013).</p> <p>Habitat: Found on dunes and in sandy washes (Jepson 2013). Substrate is sandy. Found in desert dunes and Mojavean desert scrub vegetation communities (CNPS 2013). Elevation range reported as 0 to 3,937 (Jepson 2013) and 853 to 4,741 feet amsl (CNPS 2013). Flowering May to June and September to November (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013
Dedecker's Clover (<i>Trifolium dedeckerae</i> also <i>Trifolium kingii</i> ssp. <i>dedeckerae</i>)	BLM-S	<p>Range: Endemic to California (Inyo, Kern, Mono, and Tulare Counties) (CNPS 2013) in the southern high Sierra Nevada Mountains and to the east (Jepson 2013). Known occurrences within the Project Area include Coso Peak north of Ridgecrest and in the foothills adjacent to Sequoia NF from Ridgecrest north to Owens Lake (CNPS 2013).</p> <p>Habitat: Found on alpine crests and in rock crevices (Jepson 2013). Substrate is granitic and rocky. Found in lower montane coniferous forest, pinyon and juniper woodland, subalpine coniferous forest, and upper montane coniferous forest vegetation communities. Elevation range 6,890 to 11,483 feet amsl (CNPS 2013). Flowering May to July (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Desert Cymopterus (<i>Cymopterus deserticola</i>)	BLM-S	<p>Range: Endemic to California (San Bernardino, Kern, and Los Angeles Counties) in the western Mojave Desert. Found from California City east to the Superior Valley and from the Cuddeback Lake area south to near Kramer Junction. Total population estimates unknown, but the population on Edwards AFB is approx. 14,093 individuals.</p> <p>Habitat: Found on alluvial fans and basins, stabilized sand fields, and occasionally sandy slopes of desert dry lake basins, especially on the east side of desert playas where blowsand has accumulated. Substrate is loose, sandy soils. Found in Joshua tree woodland, saltbush scrub, and Mojavean desert scrub vegetation communities. Elevation range 2,000 to 3,000 feet amsl. Flowering early March to mid May. NOTE: flowering can be irregular and the above-ground portion of the plant dies back after the flowering season.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Forked buckwheat (<i>Eriogonum bifurcatum</i>)	BLM-S	<p>Range: Known from California (Inyo and San Bernardino Counties) and Nevada (CNPS 2013) in the Mojave Desert (Jepson 2013). Wide-spread distribution in plan area (pers. comm. Chavez 2013). Known occurrences within the Project Area appear to be limited (compared to “wide-spread”) to the northeast corner of the Project Area in northern San Bernardino County (CNPS 2013).</p> <p>Habitat: Found on sand. Substrate is sandy. Found in Chenopod scrub vegetation communities (CNPS 2013). Elevation range is 1,969 to 2,625 feet amsl (Jepson 2013) or 2,116 to 2,657 feet amsl (CNPS 2013). Flowering April to June (Calflora 2013).</p>	No	No. No further analysis for this species for the proposed action.	Calflora 2013; Chavez 2013; CNPS 2013; Jepson 2013

Hall's Daisy (<i>Erigeron aequifolius</i>)	BLM-S	<p>Range: Endemic to California (Fresno, Kern, and Tulare Counties) (CNPS 2013) in the southern high Sierra Nevada Mountains (Jepson 2013). Known within the Project Area from Owens Peak west of Indian Wells (CNPS 2013).</p> <p>Habitat: Found on rock ledges and in crevices (Jepson 2013). Substrate is granitic and rocky. Found in broadleafed upland forest, lower montane coniferous forest, pinyon and juniper woodland, and upper montane coniferous forest vegetation communities. Elevation range 4,921 to 8,005 feet amsl (CNPS 2013). Flowering June to August (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013; CNDDDB 2018
Kelso Creek Monkeyflower (<i>Mimulus shevockii</i>)	BLM-S	<p>Range: Endemic to California (Kern County) in the southern Sierra Nevada Foothills and western edge of the Mojave Desert within the Kern River drainage. Total population estimated at approx. 53,400 individuals.</p> <p>Habitat: Found on alluvial fans, dry streamlets, or washes and granitic deposits. Substrates are usually granitic or metamorphic, and sandy or gravelly. Found in Joshua tree or California juniper xeric woodland vegetation communities, and is strongly associated with pygmy poppy (<i>Canbya candida</i>), silver cholla (<i>Cylindropuntia echinocarpa</i>), purple sage (<i>Salvia dorrii</i>), golden gilia (<i>Leptosiphon aureus</i>), Tehachapi monkeyflower (<i>Mimulus androsaceus</i>), Fremont's monkeyflower (<i>M. fremontii</i>), and cheesebush or burrobrush (<i>Ambrosia salsola</i>). Elevation range 2,625 to 4,396 feet amsl. Flowering March to May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Kern Buckwheat (<i>Eriogonum kennedyi</i> <i>var. pinicola</i>)	BLM-S	<p>Range: Endemic to California (Kern County) and located in the Sweet Ridge area of the southeastern Sierra Nevada Foothills. Known within the Ridgecrest Recreation Area and on the Zond Windfarms property. All known occurrences are within the Project Area. Total population estimated at approx. 10,000 individuals.</p> <p>Habitat: Found on ridge tops in poorly draining depressions in white bentonite clay soils thought to be from volcanic ash. Substrate may have pebbles, gravel and rock cemented into the soil surface. Found in chaparral and pinyon and juniper woodland vegetation communities with associated species including California sagebrush (<i>Artemisia californica</i>), Great Basin sagebrush (<i>Artemisia tridentata</i>), adobe yampah (<i>Perideridia pringlei</i>), fivetooth spineflower (<i>Chorizanthe watsonii</i>), and old fallen Jeffrey pines (<i>Pinus jeffreyi</i>). Elevation range 4,396 to 6,397 feet amsl. Flowering May to June.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Lane Mountain Milk-vetch (<i>Astragalus jaegerianus</i>)	FE	<p>Range: Endemic to California (San Bernardino County) and located entirely within the Project Area. Four populations are known from a 13 mile radius area north of Barstow including NASA Goldstone, Brinkman Wash/Montana Mine, Paradise Valley, and Coolgardie Mesa. Total population estimated at approx. 14,120 to 141,200 individuals.</p> <p>Habitat: Found on Jurassic or Cretaceous granitic bedrock growing with a host species for support. Substrate is granitic, shallow soils. Found in Mojave creosote scrub and Mojave mixed woody scrub with widely scattered Joshua trees (<i>Yucca brevifolia</i>) and almost always associated with a host species, such as turpentinebroom (<i>Thamnosma montana</i>), white bursage (<i>Ambrosia dumosa</i>), Eastern Mojave buckwheat (<i>Eriogonum fasciculatum</i> ssp. <i>polifolium</i>), Cooper's goldenbush (<i>Ericameria cooperi</i>), and Nevada jointfir (<i>Ephedra nevadensis</i>). Elevation range 3,100 to 4,200 feet amsl. Flowering April and May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Little San Bernardino Mtns. Linanthus (<i>Linanthus maculatus</i>)	BLM-S	<p>Range: Endemic to Southern California (San Bernardino, Riverside, and Imperial Counties) in the Little San Bernardino Mountains. Known occurrences within the Project Area are near Desert Hot Springs and the north side of Joshua Tree NP. No total population estimates available, but one population at the mouth of Big Morongo Canyon was estimated at approx. 10,000 individuals.</p> <p>Habitat: Found in dry canyons and on sandy benches along desert washes, or on alluvial fans. Substrate is sandy, well-aerated soil on flat ground with few or no competing species. Found in desert wash systems, desert dunes, and sparse Joshua tree woodland vegetation communities and is associated with species including sigmoid threadplant (<i>Nemacladus sigmoideus</i>), blushing threadplant (<i>N. rubescens</i>), evening primrose (<i>Camissonia pallida</i>), common loeflingia (<i>Loeflingia squarrosa</i>), Arizona nest straw (<i>Filago arizonica</i>), and Wallace's woolly sunflower (<i>Eriophyllum wallacei</i>). Elevation range 305 to 4,002 feet amsl. Flowering March to May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Mojave menodora (<i>Menodora spinescens</i> var. <i>mohavensis</i>)	BLM-S	<p>Range: Endemic to California (Inyo and San Bernardino Counties) (CNPS 2013) on the north slope of the San Bernardino Mountains (Jepson 2013). Wide-spread distribution in Project Area (pers. comm. Chavez 2013). Known occurrences within the Project Area occur in the general vicinity of Barstow and on the north side of Joshua Tree NP into the Yucca Valley (CNPS 2013).</p> <p>Habitat: Found on rocky desert hillsides and in canyons (Jepson 2013). Substrate is andesite gravel. Found in Mojavean desert scrub vegetation communities. Elevation range 2,264 to 6,562 feet amsl (CNPS 2013). Flowering April to May (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; Chavez 2013; CNPS 2013; Jepson 2013; CNDDDB 2018

Mojave Monkeyflower (<i>Mimulus mohavensis</i>)	BLM-S	<p>Range: Endemic to California (San Bernardino County) in the Mojave Desert. Known occurrences within the Project Area are restricted to areas south of Daggett and Barstow. No population estimates available.</p> <p>Habitat: Found in areas not subjected to water flow, including the gravelly banks of desert washes with granitic soils and rocky slopes above washes, as well as the sandy openings. Substrate is sandy, granitic soils. Found in Joshua tree woodland and Mojavean desert scrub, specifically creosote bush scrub vegetation communities, and is associated with species including creosote bush (<i>Larrea tridentata</i>), desert senna (<i>Senna armata</i>), cheese bush (<i>Ambrosia salsola</i>), ratany (<i>Krameria erecta</i> and <i>K. grayi</i>), chollas (<i>Cylindropuntia</i> spp.), burro bush (<i>Ambrosia dumosa</i>), prairie-clovers (<i>Dalea</i> spp.), catclaw (<i>Senegalia greggii</i>), Bigelow's monkeyflower (<i>Mimulus bigelovii</i>), desert bells (<i>Phacelia campanularia</i>), desert fivespot (<i>Eremalche rotundifolia</i>), spiny hopsage (<i>Grayia spinosa</i>), and desert trumpet (<i>Eriogonum inflatum</i> var. <i>inflatum</i>). Elevation range 1,968–3,937 feet amsl. Flowering period unknown; it appears to be dependent on rainfall.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Mojave Tarplant (<i>Deinandra mohavensis</i>)	SE; BLM-S	<p>Range: Known from California (Kern, Riverside, and San Diego Counties) on the desert slopes of the southern Sierra Nevada Mountains. Known occurrences within the Project Area include eight sites located west of Highway 14 and east of the Sequoia National Forest. No population estimates available.</p> <p>Habitat: Found near springs, seeps, wetland margins, swales and stream channels. Substrate is clay or silty soils that are saturated with water early in the year. Found near the margins of the desert, within chaparral, coastal scrub, and riparian scrub vegetation communities. Elevation range 2,100–5,250 feet amsl. Flowering June to January.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018

Nine Mile Canyon Phacelia (<i>Phacelia novemmillensis</i>)	BLM-S	<p>Range: Endemic to California (Inyo, Kern, and Tulare Counties) (CNPS 2013) on the east slope of the southern high Sierra Nevada Mountains and on the west edge of the Mojave Desert (Jepson 2013). Known occurrences within the Project Area are concentrated in the Sierra Nevada foothills west of Indian Wells including Owens Peak, Ninemile Canyon, Lamont Peak, and Walker Pass.</p> <p>Habitat: Found in open foothills. Substrate is sandy to gravelly soil (Jepson 2013). Found in broadleafed upland forest, Cismontane woodland, pinyon and juniper woodland, and upper montane coniferous forest vegetation communities. Elevation range is 5,397 to 8,661 feet amsl (CNPS 2013). Flowering May to June (Calflora 2013) or February to June (CNPS 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013; CNDDDB 2018
Owens Peak Lomatium, also Owens Peak desertparsley (<i>Lomatium shevockii</i>)	BLM-S	<p>Range: Endemic to California (Kern County) (CNPS 2013) in the southern high Sierra Nevada Mountains (Jepson 2013). Known within the Project Area from Owens Peak and Mt. Jenkins west of Indian Wells (CNPS 2013).</p> <p>Habitat: Found on rocky slopes and talus (Jepson 2013). Substrate is rocky. Found in lower montane coniferous forest and upper montane coniferous forest vegetation communities. Elevation range 5,807 to 7,218 feet amsl (CNPS 2013) or 7,218 to 8,202 feet amsl (Jepson 2013). Flowering April to May (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013; CNDDDB 2018
Parish's Alkali Grass (<i>Puccinellia parishii</i>)	BLM-S	<p>Range: Known from California (San Bernardino County), Arizona, and New Mexico. Known occurrence in the project area is limited to one disjunct population at Rabbit Springs, near Lucerne Valley. Population at the known occurrence is estimated at approx. 150 individuals.</p> <p>Habitat: Found in alkali seeps and springs. Substrate is wet, alkaline clay soils without dense vegetation. Strongly alkaline and/or saline surface water must be present for at least part of the year. Elevation range 2,296 to 7,216 feet amsl. Flowering April to May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Parish's Daisy (<i>Erigeron parishii</i>)	FT	<p>Range: Endemic to California on the slopes of the San Bernardino Mountains and the Little San Bernardino Mountains. Known occurrences within the Project Area are concentrated in areas adjacent to the northeast edge of the San Bernardino NF and both in and adjacent to the northwest corner of Joshua Tree NP. Total population estimated at approx. 16,000 individuals.</p> <p>Habitat: Found along washes on canyon bottoms or on loose carbonate alluvium. Substrate is often carbonate soils, but it can also grow on granitic soils. Found in Mojavean desert scrub and pinyon and juniper woodland vegetation communities and can co-occur with Cushenbury oxytheca (<i>Acanthoscyphus parishii</i> var. <i>goodmaniana</i>). Elevation range 3,000 to 6,600 feet amsl. Flowering May to August.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018
Parish's Phacelia (<i>Phacelia parishii</i>)	BLM-S	<p>Range: Known from California (San Bernardino and Inyo Counties), Nevada, and Arizona. Known occurrences within the Project Area are concentrated in the vicinity of Barstow, south of Fort Irwin, and around Lucerne Dry and Coyote Dry Lakes. Total population estimates are far ranging, with a single occurrence once estimated at 200 million plants in a good year, but completely absent in a dry year.</p> <p>Habitat: Found along dry lake margins and on playas and valley floors. Substrate is clay and alkaline soils. Found in Playas, alkali sinks, and Mojavean desert scrub vegetation communities, usually in sparsely vegetated areas. Elevation range 1,772 to 3,937 feet amsl. Flowering April to July.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Piute Mountains Jewel-flower (<i>Streptanthus cordatus</i> var. <i>piutensis</i>)	BLM-S	<p>Range: Endemic to California (Kern County) in the southern Sierra Nevada. Known occurrences within the project area are concentrated near Sweet Ridge, south of Cache Peak near the City of Mojave. Total population estimates are unavailable, but an estimate of the largest known occurrence is approx. 75 individuals.</p> <p>Habitat: Found on metamorphic rocks and sandy slopes, though the limited distribution makes it difficult to generalize these observations. Substrates range from metamorphic rock, reddish clay-like soils, heavy clay, stony gabbro substrate, and very dark brown-red soil and rock. Found in broadleaf upland forests, closed-cone coniferous forest, and pinyon-juniper woodland vegetation communities and is associated with species including associated with Bodfish Piute cypress (<i>Cupressus nevadensis</i>) and California juniper (<i>Juniperus californica</i>). Elevation range 3,592 to 7,000 feet amsl. Flowering June to July.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Dudek 2012 and ICF International 2012; CNDDDB 2018
Red Rock Poppy (<i>Eschscholzia minutiflora</i> ssp. <i>Twisselmannii</i>)	BLM-S	<p>Range: Endemic to California (Kern and San Bernardino Counties) in the western Mojave Desert in the Rand and El Paso mountains. Known occurrences within the Project Area are concentrated in Red Rock Canyon State Park with one other occurrence on Edwards AFB. Total population estimated at approx. 41,000 individuals.</p> <p>Habitat: Found on desert washes, flats, bajadas, alluvial fans, and slopes. Substrate includes sedimentary mounds, limestone, metamorphic rocks, and rocky basalt, but has also been reported as being restricted to rhyolite tuffs and granitic soils. Found in Mojavean desert scrub vegetation communities. Elevation range 2,176 to 4,040 feet amsl. Flowering March to May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Red Rock Tarplant (<i>Deinandra arida</i>)	SR; BLM-S	<p>Range: Endemic to California (Kern County) in the el Paso Mountains. Known occurrences within the Project Area are in Red Rock and Last Chance Canyons in Red Rock Canyon State Park and on adjacent BLM land. Total population estimated at approx. 3,400 individuals, but high annual variability exists.</p> <p>Habitat: Found in sandy to gravelly washes, moist alkaline margins of seeps and springs, sandy alluvium at the foot of ridges and cliffs, and ledges of dry colluvium supported by ribs of bedrock on cliffs. Substrate is clay soils and volcanic tuft. Found in Mojavean desert scrub communities and is associated with seep-spring monkeyflower (<i>Mimulus guttatus</i>) and Palmer's monkeyflower (<i>Mimulus palmeri</i>) at moist sites. Elevation range 900 to 2,850 feet amsl. Flowering April to November.</p>	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012
Robison's Monardella (<i>Monardella robisonii</i>)	BLM-S	<p>Range: Endemic to California (Riverside and San Bernardino Counties) (CNPS 2013) in the Little San Bernardino Mountains (Jepson 2013). Known occurrences within the Project Area are in the general area north of Desert Hot Springs and Yucca Valley, parts of Joshua Tree NP, and adjacent lands to the north (CNPS 2013).</p> <p>Habitat: Found among granite boulders. Found in desert scrub (Jepson 2013) and pinyon and juniper woodland vegetation communities. Elevation range 2,001 to 4,921 feet amsl (CNPS 2013). Flowering April to September (Calflora 2013) or February to October (CNPS 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Sanicle Cymopterus (<i>Cymopterus ripleyi</i> var. <i>saniculoides</i>)	BLM-S	<p>Range: Known from California (Inyo County) and Nevada in the southern high Sierra Nevada Mountains, southeast of the Sierra Nevada Mountains, and in the north desert mountains (Jepson 2013). Known occurrences within the Project Area are located to the south and east of Owens Lake (CNPS 2013).</p> <p>Habitat: Substrate is gravelly, sandy, or carbonate soils. Found in Joshua tree woodland and Mojavean desert scrub vegetation communities. Elevation range 3,609 to 5,446 feet amsl (CNPS 2013). Flowering April to June (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Calflora 2013; CNPS 2013; Jepson 2013; CNDDDB 2018
Short-joint Beavertail (<i>Opuntia basilaris</i> var. <i>brachyclada</i>)	BLM-S	<p>Range: Known from California (Los Angeles and San Bernardino Counties) (Calflora 2013) from the Anaverde Valley west of Palmdale east to the Cajon Pass. Also found within the Angeles National Forest south of the West Mojave boundary.</p> <p>Habitat: Found in open streambeds and on rocky slopes. Substrate is variable, ranging from sandy to rocky. Found in Joshua tree, pinyon pine, and juniper woodlands, although it also occurs in chaparral and Mojave desert scrub vegetation communities. Elevation range 3,000 to 6,500 feet amsl. Flowering April to June (Calflora 2013).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Calflora 2013; CNDDDB 2018
Spanish Needle Onion (<i>Allium shevockii</i>)	BLM-S	<p>Range: Known from California (Kern County). Known occurrences within the Project Area include Spanish Needle Peak and the Horse Canyon/Jawbone Canyon area in the Tehachapi Mountains. No population estimates available.</p> <p>Habitat: Found at the edge of rock outcrops and talus derived from volcanic and metamorphic rock. Substrate is rocky soil. Found in sparsely vegetated areas. Elevation range 1,050 to 5,400 feet amsl. Flowering May to June or June to July (not well documented).</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Dudek 2012 and ICF International 2012

Stephen's Beardtongue (<i>Penstemon stephensii</i>)	BLM-S	<p>Range: Endemic to California (Inyo and San Bernardino Counties) (CNPS 2013) in the desert mountains (Jepson 2013). Populations near Yucca Valley (pers. comm. Chavez 2013). Known occurrences within the Project Area are undocumented (CNPS 2013) except for the personal communication.</p> <p>Habitat: Found on rocky slopes and in washes and rock crevices (Jepson 2013). Substrate is usually carbonate and rocky. Found in Mojavean desert scrub and pinyon and juniper woodland vegetation communities. Elevation range 3,806 to 6,070 feet amsl (CNPS 2013) or 3,281 or 7,218 feet amsl (Jepson 2013). Flowering April to June (Calflora 2013).</p>	No	No. No further analysis for this species for the proposed action.	Calflora 2013; Chavez 2013; CNPS 2013; Jepson 2013
White-margined Beardtongue (<i>Penstemon albomarginatus</i>)	BLM-S	<p>Range: Known from California (San Bernardino County), Nevada, and Arizona. Known occurrences within the Project Area are in the vicinity of Pisgah Crater. No total population estimates available.</p> <p>Habitat: Found on desert dunes and in washes and along roadsides. Substrate is deep, stabilized desert sands and fine alluvial sands. Found in Mojave Desert scrub and desert dune vegetation communities and is associated with species including big galleta (<i>Hilaria [Pleuraphis] rigida</i>), winter fat (<i>Krascheninnikovia lanata</i>), and Shockley's goldenhead (<i>Acamptopappus shockleyi</i>). Elevation range 1,398 to 3,494 feet amsl. Flowering March to April.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Dudek 2012 and ICF International 2012

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Parish's Popcorn Flower <i>(Plagiobothrys parishii)</i>	None	<p>Range: Endemic to California (Inyo, Los Angeles, Mono, and San Bernardino Counties) (CNPS 2013) and found east of the Sierra Nevada Mountains and in the central Mojave Desert (Jepson 2013). Wide-spread distribution in Project Area (pers. comm. Chavez 2013). A single site at Rabbit Springs in Lucerne Valley supports this species. The only other recent records of this plant in California are from freshwater springs at the edge of Owens Lake in Inyo County (BLM 2005 and 2013a).</p> <p>Habitat: This species is a wetland obligate. It is supported in the Project Area due to the reliability of the groundwater at the known alkali seep. Substrate is alkaline, mesic soils. Found in Great Basin scrub and Joshua tree woodland vegetation communities (CNPS 2013). Elevation range 2,461 to 4,593 (CNPS 2013) or 7,251 feet amsl (Jepson 2013). Flowering May to June (Calflora 2013) or March to November (CNPS 2013).</p>	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a; Calflora 2013; Chavez 2013; CNPS 2013; Jepson 2013
Salt Springs Checkerbloom <i>(Sidalcea neomexicana)</i>	None	<p>Range: Known from California (Kern, Los Angeles, Orange, Riverside, San Bernardino, San Diego, and Ventura Counties), Arizona, Colorado, Idaho, New Mexico, Nevada, Oregon, Sonora (Mexico), Texas, Utah, and Wyoming (CNPS 2013). Only population in Project Area on private land (pers. comm. Chavez 2013). Although formerly widespread outside the desert, virtually no records are available since 1966. A single site at Rabbit Springs in Lucerne Valley supports this species, which emerges and flowers every year because of the reliability of the groundwater at this alkali seep (BLM 2005 and 2013a).</p> <p>Habitat: Found in alkaline springs and marches (Jepson 2013). Substrate is alkaline mesic soils (CNPS 2013). Found in chaparral, coastal sage scrub and yellow pine forest. In the desert, it appears to be restricted to alkali seeps and springs. Elevation range 49 to 5,020 feet amsl (CNPS 2013). Flowering April to June then dying back to ground level in the late summer, fall and winter.</p>	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a; Chavez 2013; CNPS 2013

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Shockley's Rock Cress (<i>Boechea shockleyi</i>)	None	<p>Range: Known from California (Inyo, Mono, and San Bernardino Counties), Nevada, and Utah, primarily in the San Bernardino National Forest on the north slope of the San Bernardino Mountains. Nine occurrences have been reported by the NDDDB within the planning area, 3 on public lands and 6 on private lands. The latter have been surveyed more intensively. In 1998, this plant was found within 51 plots randomly placed across the proposed carbonate plants conservation area, mainly within the San Bernardino National Forest. One isolated historical record is from Highway 247 north of its junction with Highway 18 in Lucerne Valley.</p> <p>Habitat: Found on limestone and quartzite outcrops. Substrates are gravelly (BLM 2005 and 2013a). Found in pinyon and juniper woodland vegetation communities (CNPS 2013). Elevation range 3,000 - 6,000 feet amsl (BLM 2005 and 2013a). Flowering April to May (Jepson 2013) or May to June (CNPS 2013).</p>	No	No. No further analysis for this species for the proposed action.	BLM 2005 and 2013a; CNPS 2013; Jepson 2013

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
Triple-ribbed Milkvetch (<i>Astragalus tricarinatus</i>)	FE	<p>Range: Known from California (Riverside and San Bernardino Counties), mainly in the eastern San Bernardino Mountains/Whitewater Canyon area, Morongo Canyon, and the western part of the Little San Bernardino Mountains, with disjunctive occurrences in the Orocopia and Santa Rosa mountain ranges. On edge of Project Area, no designated routes in habitat (pers. comm. Chavez 2013). Known occurrences within the Plan Area are in Big Morongo Canyon and adjacent canyons. Rangewide population estimated at approx. 500 individuals, but surveys have not been extensive.</p> <p>Habitat: Found commonly on rocky slopes and ridges that are mostly barren. Substrate is coarse and granitic. Found in Joshua tree woodland and Sonoran desert scrub vegetation communities with associated species including associated plants including giant needlegrass (<i>Achnatherum coronatum</i>), California buckwheat (<i>Eriogonum fasciculatum</i>), ceanothus (<i>Ceanothus greggii</i>), bush poppy (<i>Dendromecon rigida</i>), bigberry manzanita (<i>Arctostaphylos glauca</i>), bitter snakewood (<i>Condalia globosa</i>), yerba santa (<i>Eriodictyon trichocalyx</i>), and Spanish bayonet (<i>Yucca schidigera</i>). Elevation range 2,300 to 4,000 feet amsl. Flowering February to May.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	BLM 2005 and 2013a; Chavez 2013; Dudek 2012 and ICF International 2012; CNDDDB 2018

Table E.3-1. Special Status Species

Species	Status ¹	Range/Habitat within the WEMO Planning Area	Potential For Occurrence within the Vicinity of the Proposed Action	Potentially affected by TMA Route Designations	Sources
San Bernardino Mountains dudleya (<i>Dudleya abramsii</i> ssp. <i>affinis</i>)	BLM-S	<p>Range: Endemic to California (San Bernardino County) and known from a small area of the San Bernardino Mountains. Only population on BLM land in the Bighorn Mountain Wilderness (pers. comm. Chavez 2013). Known occurrences within the project area are limited to Cushenbury Springs and the northeast slope of White Mountain. No good population estimates are available.</p> <p>Habitat: Found on pebble plain or pavement. Substrate is granitic or quartzite and rarely limestone. Found in pinyon and juniper woodland and upper montane coniferous forest vegetation communities with associated species including junipers (<i>Juniperus</i> spp.), pines (<i>Pinus</i> spp.), mountain-mahogany (<i>Cercocarpus</i> spp.), hedgehog cactus (<i>Echinocereus</i> spp.), Cushenbury milkvetch (<i>Astragalus albens</i>), Parish's daisy (<i>Erigeron parishii</i>), Cushenbury buckwheat (<i>Eriogonum ovalifolium</i> ssp. <i>vineum</i>), and Cushenbury oxytheca (<i>Acanthoscyphus parishii</i> var. <i>goodmaniana</i>). Elevation range 4,101 to 8,530 feet amsl. Flowering April to June.</p>	Yes	Yes. Habitat has been documented for this species within the proposed action area on BLM lands.	Chavez 2013; Dudek 2012 and ICF International 2012; CNDDDB 2018
Tracy's eriastrum (<i>Eriastrum tracyi</i>)	SR	<p>Range: Known from California (Colusa, Fresno, Glenn, Kern, Santa Clara, Shasta, Stanislaus, Tehama, Trinity, and Tulare Counties) in the foothills on the east and west sides of the Central Valley. Known occurrences within the Project Area are clustered on the desert slope of the southern Sierra Nevada Mountains in Kern County. No population estimates available.</p> <p>Habitat: Found in openings, sometimes recently disturbed. Substrate unspecified. Found in chaparral and cismontane woodland vegetation communities commonly in association with cheatgrass (<i>Bromus tectorum</i>) and red brome (<i>B. madritensis</i>). Elevation range 950 to 3,400 feet amsl. Flowering June to July.</p>	No	No. No further analysis for this species for the proposed action.	Dudek 2012 and ICF International 2012

APPENDIX F
RELATIONSHIP TO OTHER STATUTES, REGULATIONS, AND POLICIES

This page intentionally left blank.

Appendix F

Relationship to Other Statutes, Regulations, and Policies

F.1 Federal

F.1.1 BLM

OHV Open and Closed Areas

The programs and management of two CDCA Plan Motor Vehicle Access designations are relevant to BLM's travel management program—closed and open areas. Closed areas include those areas closed under the CDCA Plan, as well as legislatively designated wilderness, and cover 17 percent of the planning area. In closed areas, no vehicle travel is allowed and access is limited to non-mechanized travel. Wilderness management and other closed area activities include signage, kiosks, fencing and step-over gates to manage the boundary ingress/egress points, and thereby prevent mechanized travel into the designated wilderness. Therefore, these access points are important considerations when designating the limited access route network.

There are eight Open areas designated as OHV Areas that have been designated in the CDCA Plan that are located within the WEMO Planning area, covering 7.8 percent of the planning area. In Open areas, vehicle travel is not restricted to routes, except as specifically closed or otherwise marked, such as within fenced ACEC or abandoned mine features. OHV Areas may have one or two main improved or well-maintained routes that provide primary access to the area. The OHV Areas also have staging areas that were designated in the OHV Open Area Plan or have been established by a long history of use. These staging areas are intensive-use areas, and may include surrounding OHV Area lands, particularly in adjacent hillsides. As vehicles move farther away from staging areas most users stay on well-established paths. These well-established paths lead to key ingress/egress points to the OHV areas from surrounding Limited Access lands, and link to the designated route network or a boundary road. Signage, kiosks, and selective fencing are utilized to manage the boundary ingress/egress points, and thereby prevent off-route travel outside of the OHV areas. The locations of these pathways are important considerations when designating the limited access route network adjacent to OHV Open Areas.

Livestock Grazing

The current grazing program in the West Mojave Planning Area is managed consistent with allotment-specific Environmental Assessments (EAs) prepared between 2007 and 2013 for the renewal of active grazing permits and leases. These EAs contain resource- and geographic-specific analysis by allotment for the current grazing program in the planning area, and were tiered to the analysis presented in the 2005 WEMO Plan EIS. As noted in the court's remedy order (p.11), the grazing decisions are to remain in effect pending revisions of the FEIS and ROD during remand, and are to be re-considered within 6 months after the ROD is approved by the BLM.

National Monument Designations

The Mojave Trails and Sand to Snow National Monuments were designated by Presidential Proclamations 9395 and 9396, respectively, on February 12, 2016. The WEMO Planning Area includes portions of both national monuments. Decisions that apply to the lands within the national monuments will be consistent with care and protection of the objects described in the respective Proclamations. The Proclamation designating the Mojave Trails National Monument directs the BLM to prepare a transportation plan that designates roads and trails where OHV or non-motorized and non-mechanized use will be permitted within the national monument. The WMRNP will meet this requirement for the portion of the national monument within the WEMO Planning Area. A separate plan will be prepared for the portion of the Mojave Trails National Monument that falls outside of the WEMO Planning Area. There is no requirement to prepare a transportation plan within the Sand to Snow National Monument.

F.1.2 U.S. Fish and Wildlife Service

BLM's decisions as part of this planning effort will be consistent with the Biological Opinion (BO) previously developed for the 2006 WEMO Plan, except as specifically identified in a revised BO. The revised BO will incorporate effects to federally endangered or threatened species not previously considered or which may have changed since 2006, as well as any changes based on a proposed route network different from that proposed and adopted in 2006. A summary of the discussions of travel management and the route networks in the previous BOs is included below. A revised BO will be developed through re-initiation of formal consultation with the U.S. Fish and Wildlife Service (USFWS) in relation to this Draft SEIS.

January 9, 2006 BO

The BO developed to evaluate the effects of the proposed 2006 WEMO Plan considered the effects of each of the 12 separate CDCA Plan Amendment decisions made in the 2006 ROD. Effects were considered on four species (desert tortoise, Parish's daisy, Cushenbury milk-vetch, and Lane Mountain milk-vetch), and three types of critical habitat (desert tortoise, Parish's daisy, and Cushenbury milk-vetch). The USFWS considered the effects of each of the 12 CDCA Plan Amendment decisions proposed by BLM, including those that focused on travel management issues.

The manner in which the USFWS addressed the travel-related and grazing issues, decisions, and other strategies is summarized below.

- The USFWS evaluated the potential effects of the Rand Mountains-Fremont Valley Management Plan on the desert tortoise and its critical habitat. The BO concluded that the plan may benefit the tortoise, and may promote the conservation role and function of designated critical habitat. This conclusion was due to the reduction in the extent of the route network in this area.
- The USFWS evaluated the expansion of the boundaries of the Afton Canyon ACEC, and the adoption of the route network in the Afton Canyon Natural Area. The USFWS concluded that the effect of these actions on the desert tortoise would be beneficial.
- The USFWS evaluated the potential effects of the proposed route network on the desert tortoise and its critical habitat. The BO specified that the USFWS did not have any

definitive information on the size of a route network that would have minimal effects on the tortoise, but concluded that the proposed network should have a net benefit to the tortoise by implementing route closures. The BO also evaluated the effect of the proposed network on the Lane Mountain milk-vetch, and concluded that the reduction in the route network would diminish effects of unauthorized motor vehicle use on the Lane Mountain milk-vetch. The BO concluded that the route network would not affect the Cushenbury milk-vetch or Parish's daisy, and therefore, the 2006 BO did not re-consider effects on these species.

- The USFWS evaluated the potential effects of the proposed stopping, parking, and camping restrictions on the desert tortoise and its critical habitat. The BO concluded that the stopping, parking, and camping measures would reduce impacts to tortoise and critical habitat in DWMA's, and would not increase impacts in areas outside of DWMA's, and therefore, would not adversely affect tortoise or its critical habitat. The BO also evaluated the effect of the stopping, parking, and camping measures on the Lane Mountain milk-vetch, and concluded that the limitations on the distance of stopping, parking, and camping from the routes would reduce potential damage to the species from that currently existing. The BO discussed that the 2003 BO had concluded that the stopping, parking, and camping measures would not affect the Cushenbury milk-vetch or Parish's daisy, and therefore, the 2006 BO did not re-consider effects on these species.
- The BO concluded that because the regional standards of public land health and guidelines for grazing management are designed to ensure the maintenance of high quality habitat or to improve the condition of habitat that is not functioning properly, their implementation is not likely to adversely affect the desert tortoise or its critical habitat.
- The USFWS evaluated the potential effects of the proposed grazing program and concluded that the grazing program proposed by the Bureau is not likely to appreciably affect the reproduction, numbers, or distribution of the desert tortoise or compromise the conservation role and function of critical habitat of the desert tortoise.
- The BO concluded that the closure of the Barstow to Vegas Race Course would benefit the desert tortoise and its critical habitat.
- The BO concluded that the elimination of the Stoddard Valley to Johnson Valley Race Corridor would benefit the desert tortoise and its critical habitat.

The 2006 BO concluded with an incidental take statement. That statement superseded the previous incidental take statements issued by USFWS for livestock grazing, for the 1993 Rand Mountains-Fremont Valley Management Plan and the 2003 West Mojave Desert Off-Road-Vehicle Designation Project route designations. For the desert tortoise, the BO concluded that the number of desert tortoises that would be killed or injured as a result of BLM's actions could not be quantified because of the large size of the action area, the patchy distribution of tortoises, and the unpredictability of when the activities could cause injury or mortality. However, the BO estimated that relatively few desert tortoises would be injured or killed by BLM's action. The statement also listed mandatory terms and conditions to be followed, and made recommendations for additional conservation measures.

November 30, 2007 BO

An amendment to the 2006 BO dated November 30, 2007, was comprised of a revised desert tortoise incidental take statement that replaced the incidental take statement of 2006. The 2007 amendment included a quantitative estimate of the numbers of tortoises that could be killed or injured as a result of BLM's 2006 WEMO Plan decisions, including take as a result of livestock grazing, casual use and motorized vehicle use. The BO concluded that the estimated take was not likely to jeopardize the continued existence of the species. Other aspects of the January 9, 2006 BO were not changed.

June 8, 2007 BO

This is an amendment to the 2006 BO dated November 30, 2007, and Re-initiation of Formal Consultation Regarding the Proposed Grazing Lease Renewal for the Valley Well Allotment. This 2007 amendment included the Valley Well Allotment as part of the Incidental Take Statement and livestock grazing must adhere to the terms and conditions contained in the 2006 BO for the 2006 WMP.

May 6, 2011 Desert Tortoise Recovery Plan

This recovery plan superseded the original 1994 Desert Tortoise Recovery Plan. The plan contains 16 recovery actions that include restricting, designating, closing, and fencing roads and routes. In addition, the plan includes actions restricting OHV events within tortoise habitat, and minimizing impacts to tortoises from livestock grazing.

F.2 Bordering Jurisdictions

Public lands within the WEMO Planning area and adjacent to the Planning area boundaries are bordered on all sides by other jurisdictions. Because routes cross jurisdictional boundaries, the access needs that frame the route network within the WEMO planning area may be affected by route networks, access needs, and planning efforts associated with the adjacent jurisdictions. These include federal land managed by the USDA Forest Service, National Park Service, Department of Defense (DoD); state lands managed by the California Department of Fish and Wildlife (CDFW) (formerly California Department of Fish and Game, or CDFG), State Lands Commission, California Department of Parks and Recreation, and California Department of Water Resources; City lands inside the municipal boundaries of which BLM may manage small isolated parcels, and private lands and roads subject to state, County, or municipal jurisdiction. Travel management on adjacent lands is managed through various management plans, general plans, and regulations, as follows:

- Land outside of the West Mojave Planning area but under the jurisdiction of the BLM is subject to the CDCA Plan or other applicable Land Use or Travel Management Plans, as discussed below;
- Adjacent National Forest Land is subject to applicable Forest, Land, and/or Travel Management Plans;
- Adjacent DoD land is subject to Installation Management Plans and, for the land area to be included within the expansion area for Twentynine Palms Marine Air Ground Combat

Center, by the travel-related decisions in the February, 2013 Record of Decision for Land Acquisition and Airspace Establishment To Support Large-Scale Marine Air Ground Task Force Live-Fire and Maneuver Training at the Marine Corps Air Ground Combat Center;

- Adjacent State-, County- or City-owned land is subject to agency or jurisdiction-specific regulations and requirements for travel on those lands;
- Adjacent routes on private land that are designated as part of a County or city network may be subject to the applicable General Plan for that County or city;
- Adjacent routes on private land that are not designated as part of a County or city network may not be subject to any jurisdiction, but will be considered by BLM in the network development process.

Issues to be considered with respect to these adjacent route networks include maintaining continuity of access across jurisdictional boundaries; maintaining access (where appropriate) to private lands, approved facilities, and recreational opportunities located outside of the WEMO Planning Area; addressing access compatibility and consistency with local plans, and coordinating trespass issues with responsible local law enforcement and County agencies.

Specific information related to travel management on adjacent planning areas is provided below:

Northern and Eastern Mojave (NEMO) CDCA Plan Amendment

The NEMO planning area lies to the northeast of the western Mojave Desert, in the area that generally lies between Death Valley National Park and the Mojave National Preserve and directly abuts the West Mojave Planning Area to the east. The NEMO Plan amendment to the CDCA Plan was implemented in a ROD that was signed in December 2002. With respect to travel management, the NEMO ROD designated all routes within the NEMO area as “open”, “limited”, or “closed”. The NEMO Plan also eliminated the portion of the Barstow to Las Vegas Race Course within the NEMO planning area.

Northern and Eastern Colorado (NECO) CDCA Plan Amendment

The NECO planning area lies to the southeast of the western Mojave Desert, in the area that generally lies south of I-40, and adjacent to the eastern half of Joshua Tree National Park. The NECO Plan amendment, like the NEMO Plan amendment, was signed by BLM in December 2002. With respect to travel management, the NECO ROD designated all routes within the NECO area as “open”, “limited”, or “closed”. Some wash areas were designated open or closed such that all wash routes in those areas would be available or not available for use. The NECO Plan also left in place the portion of the Johnson Valley-Parker route within the NECO area because it lay entirely outside of DWMA's and had minimal species sensitivity issues. However, the Johnson Valley-Parker route has not been proposed and authorized for use for competitive events since the approval of the NECO Plan.

National Forest Plans

The National Forests which border the WEMO area include the San Bernardino National Forest, Angeles National Forest, Inyo National Forest, and Sequoia National Forest. Both the San

Bernardino National Forest Management Plan and Angeles National Forest Land Management Plan RODs were signed in April, 2006. These plans included a variety of program strategies, some of which focused on travel management. National forest lands generally provide specific designated access routes to and through each forest onto adjacent public and private lands, consistent with forest land designations and overall recreation management goals.

The San Bernardino National Forest (SBNF) identified lands along the boundary of the National Forest and public lands as a major focal point for travel management, and BLM is working with the local and regional SBNF office to identify appropriate public access strategies and achieve shared goals along shared boundaries and watersheds. These strategies are being incorporated into the WMRNP to the extent consistent with public land laws. The Inyo National Forest Land and Resource Management Plan was signed in 1988, and is currently being revised. The 1988 Plan provided definition of management requirements for OHV use in certain areas of the Forest. The Inyo National Forest also prepared a Travel Management Plan in August 2009 which made changes to routes included within the National Forest Transportation System (NFTS), and that include some routes adjacent to the WEMO route network.

The Sequoia National Forest Land and Resource Management Plan was signed in 1988. The Forest released a Final EIS for their Motorized Travel Management Plan in 2009.

National Park/Preserve Plans

The National Parks and National Preserves which border the WEMO area include Sequoia, Joshua Tree, and Death Valley National Parks and the Mojave National Preserve. The Sequoia National Park General Management Plan was finalized on September 14, 2007. The Death Valley National Park General Management Plan and Mojave National Preserve General Management Plan were both authorized in April, 2002. The Joshua Tree General Management Plan is currently being developed. These federal lands generally provide specific designated access routes to and through the Park onto adjacent public and private lands, consistent with Park goals.

Department of Defense Plans

The DoD installations that border the WEMO Planning area include Fort Irwin, Twentynine Palms Marine Corps Air-Ground Combat Center (MCAGCC), Edwards Air Force Base, and Naval Air Weapons Station China Lake. Each of these installations operates under an Installation Management Plan which address OHV access and management. BLM coordinates closely with the installations to ensure maintenance of access, as well as to address use of BLM routes for unauthorized access to the installations.

The February, 2013 Expansion of Twentynine Palms MCAGCC includes development of a mechanism to allow limited OHV access on portions of the Expansion Area in a manner similar to access in BLM OHV Open Areas, when the land is not being used for military exercises. Legislation titled the Military Lands Withdrawals Act of 2013 was passed as an element of PL 113-66, which expanded the 29 Palms MCAGCC adjacent to the Johnson Valley OHV Open Area. Congress modified alternative 6 enabling the USMC to withdraw lands to the south and west of the current 29 Palms MCAGCC within an Exclusive Military Use Area (EMUA), and to also conduct Marine Expeditional Brigade level live-fire training while increasing the amount of land available for recreational use in a Shared Use Area (SUA). The MCAGCC Expansion

includes approximately 79,000 acres to the west, and approximately 19,000 acres to the south, of the 29 Palms MCGACC that were withdrawn for the EMUA, and to be managed by the Secretary of the Navy.

In the legislation, approximately 53,000 acres is designated as a SUA to be managed by the Secretary of the Interior for public recreation during any period in which the land is not being used for military training and as determined suitable for public use, as well as natural resource conservation. For two 30-day periods per year, the SUA will be used and managed by the Secretary of the Navy for military training. The SUA together with approximately 43,000 acres to the west of the authorized MCAGCC withdrawal boundary has been designated as the *Johnson Valley Off-Highway Vehicle Recreation Area* in PL 113-66, totaling approximately 96,000 acres.

Red Rock Canyon State Park

The California Desert Protection Act (1994) conveyed lands from BLM to the State to add to Red Rock Canyon State Park. The State did not accept some of these lands because they were encumbered with mining claims pursuant to the Mining Law of 1872. The California Department of Parks and Recreation and the BLM jointly manage these lands. BLM published a 20-year Segregation Order for Public Lands within Red Rock Canyon State Park that is in effect until May, 2017 (Public Land Order No. 7260, 62 Federal Register 26324, May 13, 1997). This order withdraws all BLM-managed lands in Red Rock Canyon State Park from operation of all public land laws and mineral laws subject to valid existing rights to protect the Park. Routes in and out of the Park cross BLM-managed public lands within the El Paso TMA and the Jawbone TMA.

Other State Lands

State Lands are intermingled with BLM public and private lands throughout the planning area and are managed by various State agencies. Generally travel management strategies on State lands are handled on a case by case basis. Most State Lands are managed by the California State Lands Commission (CSLC). The California Department of Fish and Wildlife (CDFW) also has land holdings or easements in the planning area. Other State agencies have very modest land holdings. CSLC generally does not identify travel routes on State lands, except where those lands have been identified or zoned for specific uses or for conservation purposes. The California Department of Fish and Wildlife has acquired mitigation lands for conservation of sensitive resources, and has otherwise obtained conservation easements on lands managed by third parties. When identified, BLM travel management strategies to address these conservation, mitigation, or easement lands respond to particular access needs or easement terms to the extent consistent with federal law and FLPMA.

County Route Networks

The WEMO Planning area covers parts of San Bernardino, Kern, Inyo, Los Angeles, and Riverside Counties. Each of these counties has a General Plan which includes a Transportation Element and maps of dedicated County Roads, some of which cross BLM-managed lands as well as County ordinances on private lands that directly or indirectly affect OHV use of the network. Although the General Plans are not applicable to activities on Federal lands, BLM coordinates

with the Counties and associated Special Districts and strives to achieve consistency between federal and local plans, address unresolved issues and identify opportunities, maintain continuity of access across jurisdictional boundaries, and generally utilize the County Road system as a backbone for OHV routes on public lands, consistent with Bureau policy.

Local Route Networks

The WEMO Planning area covers many municipalities. Generally, few BLM-managed lands are within these municipal boundaries and the lands within most municipalities are unclassified to facilitate management with surrounding lands. Municipalities generally have a General Plan which includes a maintained and unmaintained road network that links to surrounding County or BLM lands. Although the General Plans are not applicable to activities on Federal lands, BLM coordinates with the cities to assure appropriate through access on municipal routes and to address community needs and unresolved issues, consistent with Bureau policy. BLM also seeks to link its network to municipality networks to support their recreational goals and enhance their community recreational and economic opportunities, consistent with their plans and policies.

F.3 Coordination and Consultation

Prior to the start of the scoping period, the BLM mailed 51 Cooperating Agency invitation letters to federal, state, and local agencies identified as having special expertise or jurisdiction by law applicable to the WEMO Project. The letters notified potential Cooperating Agencies of the WEMO Project, provided an overview of the WMRNP, invited participation as a Cooperating Agency, and provided contact information to submit questions.

The BLM also mailed 16 Tribal consultation letters to potentially affected Tribes formally initiating government-to-government consultation regarding the WEMO Project. The Tribal consultation letters provided an overview of the WEMO Project; requested consultation and invited input; and provided contact information to submit any questions, concerns, or comments on the WEMO Project.

The DAC is a citizen-based Resource Advisory Council that provides recommendations on the management of public lands in the BLM's California Desert District. The DAC operates under a Charter established under Section 309 and Section 601 (g)(1) of the FLPMA, as amended (43 U.S. Code 1739); and all other provisions of the law. In December 2011, in response to the WEMO Project, the DAC established the WEMO Route Network Project Subgroup (WRNPS), which provides input regarding route-specific and network issues pertinent to the WEMO planning area for BLM to consider. The WRNPS is composed of members representing industry, recreation, conservation and the public at large and holds regularly scheduled meetings that are open to the public. The WRNPS has met more than a dozen times, held additional public outreach sessions, and prepared two reports for the District Manager identifying issues and providing recommendations and rationales for area-wide strategies and route-specific designations in the planning area.

Federal Endangered Species Act (FESA)

The USFWS has jurisdiction to protect threatened and endangered species under the Federal Endangered Species Act (ESA) (16 U.S.C Section 1531 et. seq.). Formal consultation with the

USFWS under Section 7 of the ESA is required for any federal action that may adversely affect a federally-listed species. The consultation associated with the 2006 WEMO Plan amendment to the CDCA Plan was completed. The USFWS previously issued three BOs in association with BLM's route network designations in the WEMO Planning area. The first BO was issued in 2003 in association with BLM 2003 Decision Record establishing the route network in the WEMO area. The second BO was issued in 2006, in association with the 2006 WEMO Plan amendment itself, and addressed travel and route network issues along with all other decisions considered in the 2006 WEMO Plan. The third BO, issued in 2007, revised the 2006 BO by quantifying potential tortoise impacts, and modifying terms and conditions with respect to transportation and other issues. BLM will evaluate whether re-initiation of consultation on the 2007 BO based on changes proposed in this SEIS is required, and, if so, such consultation shall be completed prior to the signing of any Record of Decision associated with the proposed changes.

National Historic Preservation Act (NHPA)

Section 106 of the National Historic Preservation Act (NHPA) (54 U.S.C. § 306108) requires Federal agencies with jurisdiction over a proposed Federal project to take into account the effect of the undertaking on cultural resources listed or eligible for listing on the National Register of Historic Places, and requires that the agencies afford the Advisory Council on Historic Preservation (ACHP) with an opportunity to comment on the undertaking. The Section 106 of the NHPA implementing regulations at 36 C.F.R. Part 800 also requires that Federal agencies consult with the State Historic Preservation Office (SHPO), affected Indian tribes, and other consulting parties on undertakings. The BLM is utilizing and coordinating the NEPA commenting process to partially satisfy the public involvement requirements for Section 106 of the NHPA, as provided for in 36 C.F.R. § 800.2(d)(3).

BLM initiated the Section 106 consultation process with a letter to the California SHPO on February 16, 2012. In a 2012 agreement, BLM and the SHPO cooperatively developed initial data acquisition and analysis needs in support of the current planning effort. The ACHP was invited to participate in consultation by letter dated June 2, 2014 and elected to participate by letter response dated June 24, 2014.

In coordination with the California SHPO and the ACHP, the BLM is complying with Section 106 through the implementation of the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015) (Agreement). The Agreement was developed following the regulations at 36 C.F.R. §800.14 (b) and is consistent with BLM guidance (IM-2012-067) for cultural resource considerations in off-highway vehicle designations and travel management efforts. The Agreement was developed in consultation with the ACHP, SHPO, Indian tribes, and other consulting parties identified by the BLM, between June 2012 and September 2015.

To date, BLM has completed a Phase I records-review for the Supplemental EIS, updated GIS cultural resources location layers, and conducted field monitoring of specific sites as outlined in the 2012 agreement with SHPO. In compliance with the provisions of the Agreement, BLM has used the Phase I information to develop a GIS-based sensitivity analysis and predictive

modelling program (Model), and is currently working on field verification of the Model. The Model will be used to inform the implementation of the Historic Properties Management Plan (HPMP), as required by the Agreement. The Model and HPMP will guide the BLM in designing inventory strategies for the WEMO Planning Area; in evaluating identified resources for NRHP eligibility; in assessing effects to historic properties; in the application of appropriate avoidance, minimization, or mitigation measures and adjustments to the travel network where adverse effects to eligible historic properties are occurring; and in following all other Stipulations established in the Agreement.

The travel management decisions in the WMRNP will include the designation of off-highway routes in the West Mojave Desert and portions of the Great Basin Transition Zone. Pursuant to 36 C.F.R. §800.14(b)(1)(i) and (ii), the effects on historic properties are likely to be similar and repetitive, cross multiple regions, and cannot be fully determined prior to the approval of the undertaking. As allowed under 36 C.F.R. §800.4 (b)(2), the Agreement includes procedures for phasing the implementation of the HPMP for the identification and evaluation of historic properties after the Record of Decision is signed. The Agreement also specifies programmatic procedures for addressing effects to eligible historic properties, including effects from routes that are open and would remain open, routes that would be newly opened or closed, and routes that are unauthorized.

The BLM California currently utilizes *Supplemental Procedures for Livestock Grazing Permit/Lease Renewals: A Cultural Resources Amendment to the State Protocol Agreement between California Bureau of Land Management and the California State Historic Preservation Officer* (Supplement) to address the NHPA Section 106 compliance for processing grazing permit renewals for existing livestock allotments. The Supplement calls for BLM to address impacts of grazing on cultural resources through a Class II sampling and reconnaissance survey strategy. Inventory is focused on areas of high cultural resource sensitivity that overlap areas of livestock congregation, including springs, water courses, meadows, and range improvement areas such as troughs and salting areas. Class I records searches and tribal and interested party consultation is to occur with each grazing permit renewal. Standard protective measures have been developed to address impacts to resources from livestock activities and an annual monitoring protocol is incorporated into the agreement. The Supplement applies to the continued use of a grazing allotment at or below the authorized levels. Under the Supplement, range undertakings, including improvements and increases in AUMs allowed within the allotment will be reviewed on a case-by-case basis by BLM Cultural Resources Specialists.

Tribal Consultation

Tribal consultation is being conducted in accordance with applicable laws, regulations, and policies. Tribal concerns, if any, are given due consideration in evaluation of Plan amendment alternatives and in the implementation of the Programmatic Agreement. Consultation was initiated in 2011 with Federally- and non-Federally recognized tribal groups. Five tribal outreach open house meetings were held in early 2014 to hear additional input from the tribes, in advance of the SHPO meeting to initiate development of the Agreement. Tribes were invited to participate in the development of the Agreement, and tribal representatives participated in the consultation, held between June, 2012 and September, 2015, including providing comments on multiple drafts of the Agreement. Tribal representatives also participated in the consultation to develop the HPMP between April and October, 2016. Consultation is ongoing and will continue

throughout the development and implementation of the West Mojave Route Network Project and throughout the implementation of the Programmatic Agreement.

RETURN RECEIPT REQUESTED

The Honorable Timothy Williams
Chairman
Fort Mojave Indian Tribe
500 Merriman Avenue
Needles, CA 92363

Dear Chairman Williams:

On September 13, 2011, the Bureau of Land Management (BLM) published a Notice of Intent announcing the preparation of a supplemental environmental document to analyze a proposed plan amendment and alternatives covering the management of motorized vehicles on public lands in the West Mojave area. In appreciation of tribal resources and heritage, the BLM would like to invite the Fort Mojave Indian Tribe into government-to-government consultation.

A Record of Decision for The West Mojave Plan (WEMO), a federal land use plan amendment to the California Desert Conservation Area (CDCA) plan of 1980, was signed in March 2006. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers 9.3 million acres in the western portion of the Mojave Desert in southern California covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties: 3.3 million acres of public lands administered by BLM, 3.0 million acres of private lands, 102,000 acres administered by the State of California, and the balance of military lands administered by the Department of Defense. The Plan presents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part.

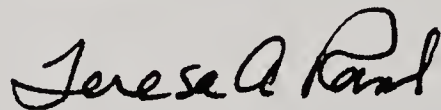

The Western Mojave Desert Off-Road Vehicle Designation Project (2003), as modified and adopted in the WEMO Plan, identified a network of motorized vehicle routes on public lands. The network provides access to nearly 3 million acres of public lands within the western Mojave Desert. Travel Management Plans are sub-region specific activity plans which include route designations for adjacent areas with similar issues, and associated signing, monitoring, and enforcement strategies. The BLM is undertaking a planning effort to reevaluate the off-highway vehicle route designations throughout the WEMO Plan area.

We would appreciate your help in identifying any issues or concerns including identifying sacred sites and places of traditional religious and cultural significance which might be affected. If the Tribe believes the WEMO plan area lies outside your area of interest, and you do not wish to consult or be contacted in the near future, the BLM would greatly appreciate your notice accordingly.

With this letter we respectfully request your assistance in identifying who the Tribal government has officially authorized to serve as the representative spokesperson(s) in matters relating to the BLM and Government-to-Government consultation. In addition, please let us know if there are traditional cultural or religious leaders and practitioners whom the Tribe has designated to serve as contacts for the BLM for notification and consultation. Finally, when we send out notification letters about our projects and invitations to consult, we are requesting your direct participation and input into the decision making process. Government-to-Government consultation has occurred in tribal chambers, at the BLM Office, in the field, or other locations identified as appropriate by the respective Tribe. Please identify where you would prefer Government-to-Government consultation to take place so that we can plan for future meetings.

Our tribal point of contact for this project is Jim Shearer, Barstow Field Office Archaeologist. He can be reached by email at: jshearer@blm.gov and by phone (760) 252-6034. We look forward to the opportunity to work effectively with the Fort Mojave Indian Tribe.

Sincerely,

Teresa A. Raml
District Manager

The Honorable Isreal Naylor
Chairman
Fort Independence Band of Paiute Indians
P.O. Box 67
Independence, CA 93526

Dear Chairman Naylor:

On September 13, 201d, the Bureau of Land Management (BLM) published a Notice of Intent announcing the preparation of a supplemental environmental document to analyze a proposed plan amendment and alternatives covering the management of motorized vehicles on public lands in the West Mojave area. In appreciation of tribal resources and heritage, the BLM would like to invite the Fort Independence Band of Paiute Indians government consultation.

A Record of Decision for The West Mojave Plan (WEMO), a federal land use plan amendment to the California Desert Conservation Area (CDCA) plan of 1980, was signed in March 2006. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers 9.3 million acres in the western portion of the Mojave Desert in southern California covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties: 3.3 million acres of public lands administered by BLM, 3.0 million acres of private lands, 102,000 acres administered by the State of California, and the balance of military lands administered by the Department of Defense. The Plan presents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part.

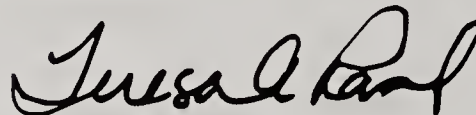

The Western Mojave Desert Off-Road Vehicle Designation Project (2003), as modified and adopted in the WEMO Plan, identified a network of motorized vehicle routes on public lands. The network provides access to nearly 3 million acres of public lands within the western Mojave Desert. Travel Management Plans are sub-region specific activity plans which include route designations for adjacent areas with similar issues, and associated signing, monitoring, and enforcement strategies. The BLM is undertaking a planning effort to reevaluate the off-highway vehicle route designations throughout the WEMO Plan area.

We would appreciate your help in identifying any issues or concerns including identifying sacred sites and places of traditional religious and cultural significance which might be affected. If the Tribe believes the WEMO plan area lies outside your area of interest, and you do not wish to consult or be contacted in the near future, the BLM would greatly appreciate your notice accordingly.

With this letter we respectfully request your assistance in identifying who the Tribal government has officially authorized to serve as the representative spokesperson(s) in matters relating to the BLM and Government-to-Government consultation. In addition, please let us know if there are traditional cultural or religious leaders and practitioners whom the Tribe has designated to serve as contacts for the BLM for notification and consultation. Finally, when we send out notification letters about our projects and invitations to consult, we are requesting your direct participation and input into the decision making process. Government-to-Government consultation has occurred in tribal chambers, at the BLM Office, in the field, or other locations identified as appropriate by the respective Tribe. Please identify where you would prefer Government-to-Government consultation to take place so that we can plan for future meetings.

Our tribal point of contact for this project is Jim Shearer, Barstow Field Office Archaeologist. He can be reached by email at: jshearer@blm.gov and by phone (760) 252-6034. We look forward to the opportunity to work effectively with the Fort Independence Band of Paiute Indians.

Sincerely,

Teresa A. Raml

The Honorable Eldred Enas
Chairman
Colorado River Indian Tribes
26600 Mohave Road
Parker, AZ 85344

Dear Chairman Enas:

On September 13, 2011, the Bureau of Land Management (BLM) published a Notice of Intent announcing the preparation of a supplemental environmental document to analyze a proposed plan amendment and alternatives covering the management of motorized vehicles on public lands in the West Mojave area. In appreciation of tribal resources and heritage, the BLM would like to invite the Colorado River Indian Tribes into government-to-government consultation.

A Record of Decision for The West Mojave Plan (WEMO), a federal land use plan amendment to the California Desert Conservation Area (CDCA) plan of 1980, was signed in March 2006. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers 9.3 million acres in the western portion of the Mojave Desert in southern California covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties: 3.3 million acres of public lands administered by BLM, 3.0 million acres of private lands, 102,000 acres administered by the State of California, and the balance of military lands administered by the Department of Defense. The Plan presents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part.

The Western Mojave Desert Off-Road Vehicle Designation Project (2003), as modified and adopted in the WEMO Plan, identified a network of motorized vehicle routes on public lands. The network provides access to nearly 3 million acres of public lands within the western Mojave Desert. Travel Management Plans are sub-region specific activity plans which include route designations for adjacent areas with similar issues, and associated signing, monitoring, and enforcement strategies. The BLM is undertaking a planning effort to reevaluate the off-highway vehicle route designations throughout the WEMO Plan area.

We would appreciate your help in identifying any issues or concerns including identifying sacred sites and places of traditional religious and cultural significance which might be affected. If the Tribe believes the WEMO plan area lies outside your area of interest, and you do not wish to consult or be contacted in the near future, the BLM would greatly appreciate your notice accordingly.

With this letter we respectfully request your assistance in identifying who the Tribal government has officially authorized to serve as the representative spokesperson(s) in matters relating to the BLM and Government-to-Government consultation. In addition, please let us know if there are traditional cultural or religious leaders and practitioners whom the Tribe has designated to serve as contacts for the BLM for notification and consultation. Finally, when we send out notification letters about our projects and invitations to consult, we are requesting your direct participation and input into the decision making process. Government-to-Government consultation has occurred in tribal chambers, at the BLM Office, in the field, or other locations identified as appropriate by the respective Tribe. Please identify where you would prefer Government-to-Government consultation to take place so that we can plan for future meetings.

Our tribal point of contact for this project is Jim Shearer, Barstow Field Office Archaeologist. He can be reached by email at: jshearer@blm.gov and by phone (760) 252-6034. We look forward to the opportunity to work effectively with the Colorado River Indian Tribes.

The planning area covers 9.3 million acres in the western portion of the Mojave Desert in southern California covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties: 3.3 million acres of public lands administered by BLM, 3.0 million acres of private lands, 102,000 acres administered by the State of California, and the balance of military lands administered by the Department of Defense. The Plan presents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part.

The Western Mojave Desert Off-Road Vehicle Designation Project (2003), as modified and adopted in the WEMO Plan, identified a network of motorized vehicle routes on public lands. The network provides access to nearly 3 million acres of public lands within the western Mojave Desert. Travel Management Plans are sub-region specific activity plans which include route designations for adjacent areas with similar issues, and associated signing, monitoring, and enforcement strategies. The BLM is undertaking a planning effort to reevaluate the off-highway vehicle route designations throughout the WEMO Plan area.

We would appreciate your help in identifying any issues or concerns including identifying sacred sites and places of traditional religious and cultural significance which might be affected. If the Tribe believes the WEMO plan area lies outside your area of interest, and you do not wish to consult or be contacted in the near future, the BLM would greatly appreciate your notice accordingly.

With this letter we respectfully request your assistance in identifying who the Tribal government has officially authorized to serve as the representative spokesperson(s) in matters relating to the BLM and Government-to-Government consultation. In addition, please let us know if there are traditional cultural or religious leaders and practitioners whom the Tribe has designated to serve as contacts for the BLM for notification and consultation. Finally, when we send out notification letters about our projects and invitations to consult, we are requesting your direct participation and input into the decision making process. Government-to-Government consultation has occurred in tribal chambers, at the BLM Office, in the field, or other locations identified as appropriate by the respective Tribe. Please identify where you would prefer Government-to-Government consultation to take place so that we can plan for future meetings.

Our tribal point of contact for this project is Jim Shearer, Barstow Field Office Archaeologist. He can be reached by email at: jshearer@blm.gov and by phone (760) 252-6034. We look forward to the opportunity to work effectively with the Bishop Paiute Tribe.

Sincerely,

Teresa A. Raml
District Manager

**RE: Record of Management of Motorized vehicles on Public Lands in the West
Mojave Area, CA**

To Whom It May Concern:

The Agua Caliente Band of Cahuilla Indians appreciates your efforts to include the Agua Caliente Tribal Historic Preservation Office in your project. The project area is beyond the Agua Caliente Indian Reservation lands and our Traditional Use Area. We currently have no concerns regarding this project. This letter shall conclude our consultation efforts.

Again, we appreciate your interest in our tribal resources and heritage. If you have questions or require additional information, please do not hesitate to call me at (760) 699-6907. You may also email me at ptuck@aguacaliente-nsn.gov.

Cordially,

A handwritten signature in black ink, appearing to read "Patricia Garcia-Tuck".

RETURN RECEIPT REQUESTED

Mr. Edward Smith, Chairman
Chemehuevi Reservation
P.O. Box 1976
Havasu Lake, CA 92363

Subject: Bureau of Land Management West Mojave Plan Tribal Workshops

Dear Chairman Smith:

On November 9, 2011, the Bureau of Land Management (BLM) initiated tribal consultation on the Supplemental Western Mojave (WEMO) Plan. The BLM presented information to tribes about WEMO at various tribal meetings upon request. Tribes were provided with hard copies and CDs of the WEMO Plan area, route inventory, and current route network maps during the summer of 2013. The BLM will host tribal informational workshops in three different locations to seek input from tribes on cultural and other important resources. This letter serves as an invitation for tribal representatives to attend any of the workshops and meet with the BLM to discuss the Supplemental WEMO Plan and tribal interests.

On September 13, 2011, the BLM published a Notice of Intent announcing the preparation of the Supplemental WEMO Plan. A Record of Decision for the WEMO Plan, a federal land use plan amendment to the California Desert Conservation Area plan of 1980, was signed in March 2006. The 2006 WEMO Plan represents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part, as well as the transportation network within those public lands. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers over 9.3 million acres in the western portion of the Mojave Desert covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties. The plan applies to the 3.3 million acres of public lands. The transportation component to the WEMO Plan identified a network of approximately 5,000 miles of motorized vehicle routes on public lands. The network provides access to the public lands within the western Mojave Desert, considering adjacent jurisdiction and land-owner travel patterns.

Since initiating tribal consultation in 2011, the BLM has been reevaluating the transportation and related component of the WEMO Plan, including the specific off-highway vehicle route and non-motorized trail designations on public lands throughout the West Mojave Planning area. The BLM has developed proposed objectives for the reanalyzed network, completed mapping routes of travel using Geographic

Information Systems technology, and developed a program to capture important information about each route or trail that will be used to determine the final route network. This program assists with the identification of specific route uses, resources issues, and any additional data that may be pertinent to future management actions.

Travel Management Plans will also be developed to implement the transportation network. These travel plans are specific to sub-areas and each covers a different portion of the West Mojave, with shared or similar characteristics (Figure 1). Each travel management plan includes specific route and trail designations, the signing, monitoring, and enforcement strategies, priorities for improvements, and rehabilitation priorities and strategies for routes and trails within that part of the West Mojave transportation network.

The upcoming tribal workshops will serve as a critical component to inform the planning process. All three workshops will have two sessions from 2-4 pm and 6-8 pm at the following locations:

January 21, 2014 - BLM Ridgecrest Field Office
300 S. Richmond Rd.
Ridgecrest, CA 93555

January 23, 2014 - BLM Bishop Field Office
350 Pacu Lane, Suite 100
Bishop, CA 93504

January 28, 2014 - BLM Barstow Field Office
2601 Barstow Road
Barstow, CA 92301

We look forward to continuing consultation and informational workshops with the Chemehuevi. You will be contacted in the next few weeks to confirm participation in the workshops. If you have any questions, please contact Jim Shearer, Barstow Field Office Archaeologist, by email atgshearer@blm.gov or by telephone at (760) 252-6034; or Ashley Blythe, Ridgecrest Field Office Archaeologist, by email at ablythe@blm.gov or by telephone at (760) 384-5424.

Sincerely,

Teresa A. Raml

Dear Chairperson Jones:

On November 9, 2011, the Bureau of Land Management (BLM) initiated tribal consultation on the Supplemental Western Mojave (WEMO) Plan. The BLM presented information to tribes about WEMO at various tribal meetings upon request. Tribes were provided with hard copies and CDs of the WEMO Plan area, route inventory, and current route network maps during the summer of 2013. The BLM will host tribal informational workshops in three different locations to seek input from tribes on cultural and other important resources. This letter serves as an invitation for tribal representatives to attend any of the workshops and meet with the BLM to discuss the Supplemental WEMO Plan and tribal interests.

On September 13, 2011, the BLM published a Notice of Intent announcing the preparation of the Supplemental WEMO Plan. A Record of Decision for the WEMO Plan, a federal land use plan amendment to the California Desert Conservation Area plan of 1980, was signed in March 2006. The 2006 WEMO Plan represents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part, as well as the transportation network within those public lands. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers over 9.3 million acres in the western portion of the Mojave Desert covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties. The plan applies to the 3.3 million acres of public lands. The transportation component to the WEMO Plan identified a network of approximately 5,000 miles of motorized vehicle routes on public lands. The network provides access to the public lands within the western Mojave Desert, considering adjacent jurisdiction and land-owner travel patterns.

Since initiating tribal consultation in 2011, the BLM has been reevaluating the transportation and related component of the WEMO Plan, including the specific off-highway vehicle route and non-motorized trail designations on public lands throughout the West Mojave Planning area. The BLM has developed proposed objectives for the reanalyzed network, completed mapping routes of travel using Geographic Information Systems technology, and developed a program to capture important information about each

route or trail that will be used to determine the final route network. This program assists with the identification of specific route uses, resources issues, and any additional data that may be pertinent to future management actions.

Travel Management Plans will also be developed to implement the transportation network. These travel plans are specific to sub-areas and each covers a different portion of the West Mojave, with shared or similar characteristics (Figure 1). Each travel management plan includes specific route and trail designations, the signing, monitoring, and enforcement strategies, priorities for improvements, and rehabilitation priorities and strategies for routes and trails within that part of the West Mojave transportation network.

The upcoming tribal workshops will serve as a critical component to inform the planning process. All three workshops will have two sessions from 2-4 pm and 6-8 pm at the following locations:

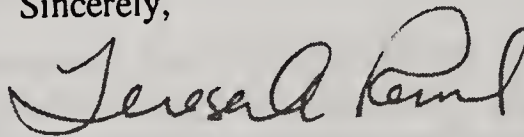

January 21, 2014 – BLM Ridgecrest Field Office
300 S. Richmond Rd.
Ridgecrest, CA 93555

January 23, 2014 – BLM Bishop Field Office
351 Pacu Lane, Suite 100
Bishop, CA 93514

January 28, 2014 – BLM Barstow Field Office
2601 Barstow Road
Barstow, CA 92311

We look forward to continuing consultation and informational workshops with the Big Pine Paiute. You will be contacted in the next few weeks to confirm participation in the workshops. If you have any questions, please contact Jim Shearer, Barstow Field Office Archaeologist, by email at jshearer@blm.gov or by telephone at (760) 252-6034; or Ashley Blythe, Ridgecrest Field Office Archaeologist, by email at ablythe@blm.gov or by telephone at (760) 384-5424.

Sincerely,

Teresa A. Raml
District Manager

Parker, AZ 85344

Subject: Bureau of Land Management West Mojave Plan Tribal Workshops

Dear Chairman Patch:

On November 9, 201d , the Bureau of Land Management (BLM) initiated tribal consultation on the Supplemental Western Mojave (WEMO) Plan. The BLM presented information to tribes about WEMO at various tribal meetings upon request. Tribes were provided with hard copies and CDs of the WEMO Plan area, route inventory, and current route network maps during the summer of 2013. The BLM will host tribal informational workshops in three different locations to seek input from tribes on cultural and other important resources. This letter serves as an invitation for tribal representatives to attend any of the workshops and meet with the BLM to discuss the Supplemental WEMO Plan and tribal interests.

On September 13, 2011, the BLM published a Notice of Intent announcing the preparation of the Supplemental WEMO Plan. A Record of Decision for the WEMO Plan, a federal land use plan amendment to the California Desert Conservation Area plan of 1980, was signed in March 2006. The 2006 WEMO Plan represents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part, as well as the transportation network within those public lands. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers over 9.3 million acres in the western portion of the Mojave Desert covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties. The plan applies to the 3.3 million acres of public lands. The transportation component to the WEMO Plan identified a network of approximately 5,000 miles of motorized vehicle routes on public lands. The network provides access to the public lands within the western Mojave Desert, considering adjacent jurisdiction and land-owner travel patterns.

Since initiating tribal consultation in 201d , the BLM has been reevaluating the transportation and related component of the WEMO Plan, including the specific off-highway vehicle route and non-motorized trail designations on public lands throughout the West Mojave Planning area. The BLM has developed proposed objectives for the reanalyzed network, completed mapping routes of travel using Geographic

Information Systems technology, and developed a program to capture important information about each route or trail that will be used to determine the final route network. This program assists with the identification of specific route uses, resources issues, and any additional data that may be pertinent to future management actions.

Travel Management Plans will also be developed to implement the transportation network. These travel plans are specific to sub-areas and each covers a different portion of the West Mojave, with shared or similar characteristics (Figure 1). Each travel management plan includes specific route and trail designations, the signing, monitoring, and enforcement strategies, priorities for improvements, and rehabilitation priorities and strategies for routes and trails within that part of the West Mojave transportation network.

The upcoming tribal workshops will serve as a critical component to inform the planning process. All three workshops will have two sessions from 2-4 pm and 6-8 pm at the following locations:

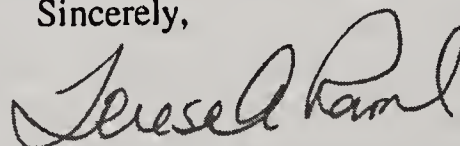

January 21, 2014 – BLM Ridgecrest Field Office
300 S. Richmond Rd.
Ridgecrest, CA 93555

January 23, 2014 – BLM Bishop Field Office
351 Pacu Lane, Suite 100
Bishop, CA 93514

January 28, 2014 – BLM Barstow Field Office
2601 Barstow Road
Barstow, CA 92311

We look forward to continuing consultation and informational workshops with the Colorado River Indian Tribes. You will be contacted in the next few weeks to confirm participation in the workshops. If you have any questions, please contact Jim Shearer, Barstow Field Office Archaeologist, by email at jshearer@blm.gov or by telephone at (760) 252-6034; or Ashley Blythe, Ridgecrest Field Office Archaeologist, by email at ablythe@blm.gov or by telephone at (760) 384-5424.

Subject: Bureau of Land Management West Mojave Plan Tribal Workshops

Dear Chairman Gomez:

On November 9, 2011, the Bureau of Land Management (BLM) initiated tribal consultation on the Supplemental Western Mojave (WEMO) Plan. The BLM presented information to tribes about WEMO at various tribal meetings upon request. Tribes were provided with hard copies and CDs of the WEMO Plan area, route inventory, and current route network maps during the summer of 2013. The BLM will host tribal informational workshops in three different locations to seek input from tribes on cultural and other important resources. This letter serves as an invitation for tribal representatives to attend any of the workshops and meet with the BLM to discuss the Supplemental WEMO Plan and tribal interests.

On September 13, 2011, the BLM published a Notice of Intent announcing the preparation of the Supplemental WEMO Plan. A Record of Decision for the WEMO Plan, a federal land use plan amendment to the California Desert Conservation Area plan of 1980, was signed in March 2006. The 2006 WEMO Plan represents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals and the natural communities of which they are a part, as well as the transportation network within those public lands. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The planning area covers over 9.3 million acres in the western portion of the Mojave Desert covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties. The plan applies to the 3.3 million acres of public lands. The transportation component to the WEMO Plan identified a network of approximately 5,000 miles of motorized vehicle routes on public lands. The network provides access to the public lands within the western Mojave Desert, considering adjacent jurisdiction and land-owner travel patterns.

Since initiating tribal consultation in 2011, the BLM has been reevaluating the transportation and related component of the WEMO Plan, including the specific off-highway vehicle route and non-motorized trail designations on public lands throughout the West Mojave Planning area. The BLM has developed proposed objectives for the reanalyzed network, completed mapping routes of travel using Geographic

Information Systems technology, and developed a program to capture important information about each route or trail that will be used to determine the final route network. This program assists with the identification of specific route uses, resources issues, and any additional data that may be pertinent to future management actions.

Travel Management Plans will also be developed to implement the transportation network. These travel plans are specific to sub-areas and each covers a different portion of the West Mojave, with shared or similar characteristics (Figure 1). Each travel management plan includes specific route and trail designations, the signing, monitoring, and enforcement strategies, priorities for improvements, and rehabilitation priorities and strategies for routes and trails within that part of the West Mojave transportation network.

The upcoming tribal workshops will serve as a critical component to inform the planning process. All three workshops will have two sessions from 2-4 pm and 6-8 pm at the following locations:

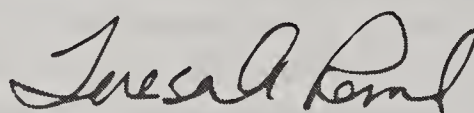

January 21, 2014~~e~~ BLM Ridgecrest Field Office
300 S. Richmond Rd.
Ridgecrest, CA 93555

January 23, 2014~~e~~ BLM Bishop Field Office
351 Pacu Lane, Suite 100
Bishop, CA 93504

January 28, 2014~~e~~ BLM Barstow Field Office
2601 Barstow Road
Barstow, CA 9231d

We look forward to continuing consultation and informational workshops with the Tubatulabals. You will be contacted in the next few weeks to confirm participation in the workshops. If you have any questions, please contact Jim Shearer, Barstow Field Office Archaeologist, by email at jshearer@blm.gov or by telephone at (760) 252-6034; or Ashley Blythe, Ridgecrest Field Office Archaeologist, by email at ablythe@blm.gov or by telephone at (760) 384-5424.

Sincerely,

Teresa A. Raml

Ms. Patricia Malone-Henry
Chairperson
Kern River Paiute Council
P.O. Box 3984
Wofford Heights, CA 93285

Dear Chairperson Malone-Henry:

The Bureau of Land Management (BLM) is continuing our consultation on the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide a summary of our project activities to date and to invite the Kern River Paiute Council to the May 23, 2018 Consulting Parties Meeting.

Summary of Activities to Date

The BLM would like to take this opportunity to provide you with a short summary of activities under the Agreement since the January Consulting Parties Meeting. The activities summarized here will be discussed further at the May Consulting Parties Meeting.

Pursuant Stipulation IV (A)(i) of the Agreement the BLM has conducted an updated records search for the WEMO Planning Area. The update included information on all new site records submitted to the California Historical Resource Information System (CHRIS) within the Planning Area since our original records search in 2012. The update also included gathering information on all previous archaeological studies conducted within the Planning Area. A summary of this effort is provided to the Consulting Parties (Enclosure I) for a 30-day review, consistent with Stipulation IV (A)(i)(b). Please provide any comments to the BLM at your earliest convenience, or by **June 15, 2018**.

The inventory report for the FY 2017 WEMO route network random sample inventory is still in development. This report, along with the BLM proposed determinations of eligibility for all archaeological sites identified during the FY 2017 inventory effort, will be distributed to the Consulting Parties for review when they are available.

The BLM continues to maintain a WEMO Archaeological Intern crew for the ongoing random sample inventory of the WEMO route network for FY 2018. The WEMO crew has inventoried approximately 22 miles of routes, which includes about 690 acres total, to date for FY 2018.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties Meetings, generally held in January, May and September of each year, for the first three years of the Agreement. Pursuant to Stipulation IV.F (ii) of the Agreement, the BLM invites you to attend the May 2018 Consulting Parties Meeting, scheduled for:

Wednesday, May 23, 2018

10:00 AM to 12:00 PM

Barstow Field Office, 2601 Barstow Rd., Barstow CA. 92311

To participate by phone: 866-718-7405 Passcode: 5042867

To participate by Instant Net Conference

Dear Chair Tanner:

The Bureau of Land Management (BLM) is continuing our consultation on the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide a summary of our project activities to date and to invite the Monache Intertribal Association to the May 23, 2018 Consulting Parties Meeting.

Summary of Activities to Date

The BLM would like to take this opportunity to provide you with a short summary of activities under the Agreement since the January Consulting Parties Meeting. The activities summarized here will be discussed further at the May Consulting Parties Meeting.

Pursuant Stipulation IV (A)(i) of the Agreement the BLM has conducted an updated records search for the WEMO Planning Area. The update included information on all new site records submitted to the California Historical Resource Information System (CHRIS) within the Planning Area since our original records search in 2012. The update also included gathering information on all previous archaeological studies conducted within the Planning Area. A summary of this effort is provided to the Consulting Parties (Enclosure 1) for a 30-day review, consistent with Stipulation IV (A)(i)(b). Please provide any comments to the BLM at your earliest convenience, or by **June 15, 2018**.

The inventory report for the FY 2017 WEMO route network random sample inventory is still in development. This report, along with the BLM proposed determinations of eligibility for all archaeological sites identified during the FY 2017 inventory effort, will be distributed to the Consulting Parties for review when they are available.

The BLM continues to maintain a WEMO Archaeological Intern crew for the ongoing random sample inventory of the WEMO route network for FY 2018. The WEMO crew has inventoried approximately 22 miles of routes, which includes about 690 acres total, to date for FY 2018.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties Meetings, generally held in January, May and September of each year, for the first three years of the Agreement. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the May 2018 Consulting Parties Meeting, scheduled for:

Wednesday, May 23, 2018

10:00 AM to 12:00 PM

Barstow Field Office, 2601 Barstow Rd., Barstow CA. 92311

To participate by phone: 866-718-7405 Passcode: 5042867

To participate by Instant Net Conference

The update also included gathering information on all previous archaeological studies conducted within the Planning Area. A summary of this effort is provided to the Consulting Parties (Enclosure 1) for a 30-day review, consistent with Stipulation IV (A)(i)(b). Please provide any comments to the BLM at your earliest convenience, or by **June 15, 2018**.

The inventory report for the FY 2017 WEMO route network random sample inventory is still in development. This report, along with the BLM proposed determinations of eligibility for all archaeological sites identified during the FY 2017 inventory effort, will be distributed to the Consulting Parties for review when they are available.

The BLM continues to maintain a WEMO Archaeological Intern crew for the ongoing random sample inventory of the WEMO route network for FY 2018. The WEMO crew has inventoried approximately 22 miles of routes, which includes about 690 acres total, to date for FY 2018.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties Meetings, generally held in January, May and September of each year, for the first three years of the Agreement. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the May 2018 Consulting Parties Meeting, scheduled for:

Wednesday, May 23, 2018

10:00 AM to 12:00 PM

Barstow Field Office, 2601 Barstow Rd., Barstow CA. 92311

To participate by phone: **866-718-7405** Passcode: **5042867**

To participate by Instant Net Conference

1. Join the meeting now:

Mr. Dennis Patch, Sr
Chairman
Colorado River Indian Tribes
26600 Mohave Road
Parker, AZ 85344

Dear Chairman Patch:

The Bureau of Land Management (BLM) is continuing our consultation on the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide a summary of our project activities to date and to invite the Colorado River Indian Tribes to the May 23, 2018 Consulting Parties Meeting.

Summary of Activities to Date

The BLM would like to take this opportunity to provide you with a short summary of activities under the Agreement since the January Consulting Parties Meeting. The activities summarized here will be discussed further at the May Consulting Parties Meeting.

Pursuant Stipulation IV (A)(i) of the Agreement the BLM has conducted an updated records search for the WEMO Planning Area. The update included information on all new site records submitted to the California Historical Resource Information System (CHRIS) within the Planning Area since our original records search in 2012. The update also included gathering information on all previous archaeological studies conducted within the Planning Area. A summary of this effort is provided to the Consulting Parties (Enclosure 1) for a 30-day review, consistent with Stipulation IV (A)(i)(b). Please provide any comments to the BLM at your earliest convenience, or by **June 15, 2018**.

The inventory report for the FY 2017 WEMO route network random sample inventory is still in development. This report, along with the BLM proposed determinations of eligibility for all archaeological sites identified during the FY 2017 inventory effort, will be distributed to the Consulting Parties for review when they are available.

The BLM continues to maintain a WEMO Archaeological Intern crew for the ongoing random sample inventory of the WEMO route network for FY 2018. The WEMO crew has inventoried approximately 22 miles of routes, which includes about 690 acres total, to date for FY 2018.

Mr. Octavio Escobedo
Chairperson
Tejon Indian Tribe
1731 Hasti Acres Dr., Suite 108
Bakersfield, CA 93309

Dear Chairperson Escobedo:

The Bureau of Land Management (BLM) is continuing our consultation on the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide a summary of our project activities to date and to invite the Tejon Indian Tribe to the May 23, 2018 Consulting Parties Meeting.

Summary of Activities to Date

The BLM would like to take this opportunity to provide you with a short summary of activities under the Agreement since the January Consulting Parties Meeting. The activities summarized here will be discussed further at the May Consulting Parties Meeting.

Pursuant Stipulation IV (A)(i) of the Agreement the BLM has conducted an updated records search for the WEMO Planning Area. The update included information on all new site records submitted to the California Historical Resource Information System (CHRIS) within the Planning Area since our original records search in 2012. The update also included gathering information on all previous archaeological studies conducted within the Planning Area. A summary of this effort is provided to the Consulting Parties (Enclosure I) for a 30-day review, consistent with Stipulation IV (A)(i)(b). Please provide any comments to the BLM at your earliest convenience, or by **June 15, 2018**.

The inventory report for the FY 2017 WEMO route network random sample inventory is still in development. This report, along with the BLM proposed determinations of eligibility for all archaeological sites identified during the FY 2017 inventory effort, will be distributed to the Consulting Parties for review when they are available.

The BLM continues to maintain a WEMO Archaeological Intern crew for the ongoing random sample inventory of the WEMO route network for FY 2018. The WEMO crew has inventoried approximately 22 miles of routes, which includes about 690 acres total, to date for FY 2018.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties Meetings, generally held in January, May and September of each year, for the first three years of the Agreement. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the May 2018 Consulting Parties Meeting, scheduled for:

Wednesday, May 23, 2018

10:00 AM to 12:00 PM

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

Mr. Jeff Grubbe
Chairman
Agua Caliente Band of Cahuilla Indians
5401 Dinah Shore Drive
Palm Springs, CA 92264

Dear Chairman Grubbe:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Agua Caliente Band of Cahuilla Indians 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

**CERTIFIED MAIL
RETURN RECEIPT REQUESTED**

Ms. Genevieve Jones
Chairwoman
Big Pine Indian Reservation
P.O. Box 700
Big Pine, CA 93513

Dear Chairwoman Jones:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project (Agreement)*. The purpose of this letter is to provide the Big Pine Indian Reservation 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E(ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransd@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that site CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. Mr. Charles Wood
Chairman
Chemehuevi Indian Tribe
P.O. Box 1976
Havasu Lake, CA 92363

Dear Chairman Wood:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Chemehuevi Indian Tribe 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

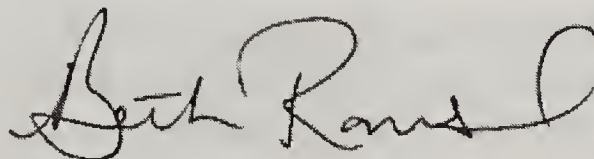

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.F (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

Mr. Dennis Patch, Sr
Chairman
Colorado River Indian Tribes
26600 Mohave Road
Parker, AZ 85344

Dear Chairman Patch:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Colorado River Indian Tribes 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

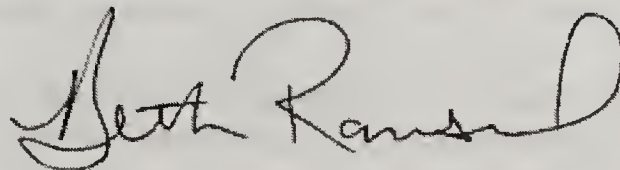

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

Mr. Carl Dahlberg
Chairman
Fort Independence Band of Paiute Indians
P.O. Box 67
Independence, CA 93526

Dear Chairman Dahlberg:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Fort Independence Band of Paiute Indians 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. Mr. Timothy Williams
Chairman
Fort Mojave Indian Tribe
500 Merriman Avenue
Needles, CA 92363

Dear Chairman Williams:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Fort Mojave Indian Tribe 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

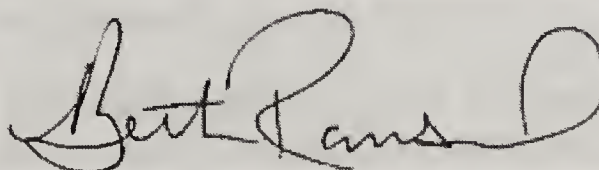

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. Dear Chairwoman Wuester:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Lone Pine Paiute-Shoshone Tribe 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

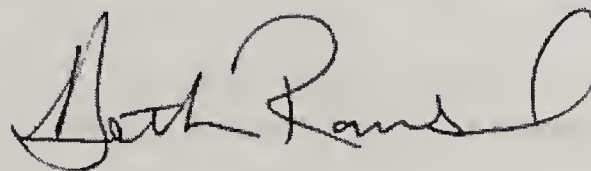

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

Mr. Robert Martin
Chairman
Morongo Band of Mission Indians
12700 Pumarra Rd.
Banning, CA 92220

Dear Chairman Martin:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Morongo Band of Mission Indians 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement: The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

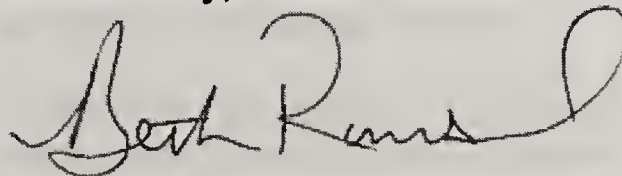

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that site CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

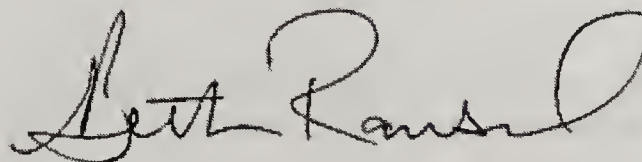

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

P.O. Box 487
San Jacinto, CA 92581

Dear Chairwoman Morillo:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Soboba Band of Luiseno Indians 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by September 21, 2018.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

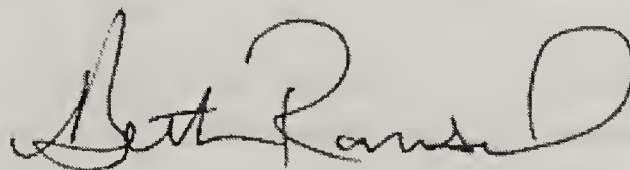

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

CERTIFIED MAIL
RETURN RECEIPT REQUESTED

Mr. Octavio Escobedo
Chairperson
Tejon Indian Tribe
1731 Hasti Acres Dr., Suite 108
Bakersfield, CA 93309

Dear Chairperson Escobedo:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Tejon Indian Tribe 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

AUG 17 2018

**CERTIFIED MAIL
RETURN RECEIPT REQUESTED**

Mr. George Gholson
Chairman
Timbi-sha Shoshone Tribe
P.O. Box 1779
Bishop, CA 93514

Dear Chairman Gholson:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project (Agreement)*. The purpose of this letter is to provide the Timbi-sha Shoshone Tribe 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM² determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

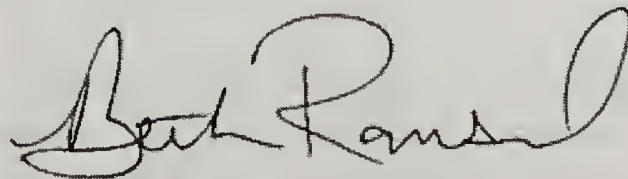

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. Mr. Tina Braithwaite
Chairperson
Utu Utu Gwaitu Paiute Tribe
25669 Highway 6 PMB1
Benton, CA 93512

Dear Chairperson Braithwaite:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Utu Utu Gwaitu Paiute Tribe 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

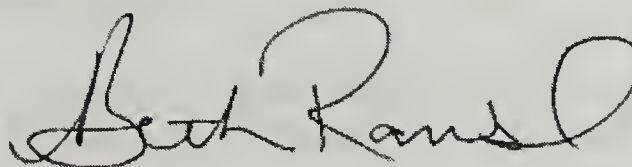

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

**CERTIFIED MAIL
RETURN RECEIPT REQUESTED**

Ms. Patricia Malone-Henry
Chairperson
Kern River Paiute Council
P.O. Box 3984
Wofford Heights, CA 93285

Dear Chairperson Malone-Henry:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Kern River Paiute Council 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that site CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760)252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

**CERTIFIED MAIL
RETURN RECEIPT REQUESTED**

Mr. Bob Robinson
Chairperson
Kern Valley Indian Community
P.O. Box 1010
Lake Isabella, CA 93240

Dear Chairperson Robinson:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Kern Valley Indian Community 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

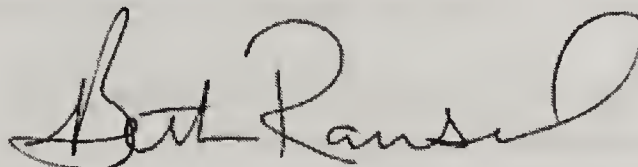

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. Dear Chair Tanner:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Monache Intertribal Association 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018.**

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. Bishop, CA 93515

Dear Ms. West:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Owens Valley Career Development Center 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow

Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure I.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase

development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

Mr. Rudy Ortega, Jr
President
San Fernando Band of Mission Indians
1019 2nd St
San Fernando, CA 91340

Dear President Ortega:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the San Fernando Band of Mission Indians 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

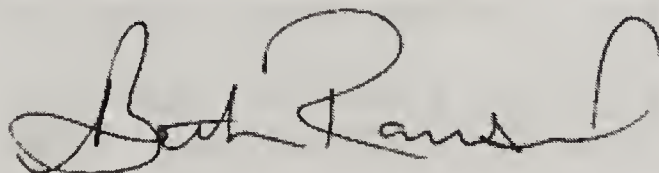

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

The BLM committed to holding three times yearly Consulting Parties meetings, generally to be held in January, May and September of each year. Pursuant to Stipulation IV.E (ii) of the Agreement, the BLM invites you to attend the September 2018 Consulting Parties Meeting, scheduled for **September 13, 2018** from 10:00 AM to 12:00 PM at the Ridgecrest Field Office. Meeting location information and web-ex information for those who are unable to attend in person are available in Enclosure 3.

If you would like to discuss the Agency's proposed determinations, to request a copy of the FY2017 Inventory report, or to discuss any other interests your Tribe may have regarding the WMRNP, please do not hesitate to contact me, or one of the field managers in charge of this project. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov. You may also contact Carl Symons, Ridgecrest Field Office Manager at (760) 384-5400 or csymons@blm.gov; Katrina Symons, Barstow Field Office Manager at (760) 252-6000 or ksymons@blm.gov; or Jim Shearer, Barstow Field Office Archaeologist at (760) 252-6034 or jshearer@blm.gov.

Sincerely,

Beth Ransel
District Manager

Dear Chairperson Gomez:

The Bureau of Land Management (BLM) continues to implement the *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (Agreement). The purpose of this letter is to provide the Tubatulabals of Kern Valley 1) a summary of the Fiscal Year 2017 (FY2017) sample survey (Inventory); 2) the Agency's determinations of National Register of Historic Places (NRHP) eligibility for all sites identified during the FY2017 Inventory, consistent with Stipulation IV(B)(v) of the Agreement; 3) a copy of the draft research themes for the Evaluation Plan; and 4) to invite the Tribe to participate in the third of the three-times-yearly Consulting Parties meetings for 2018.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing maintenance, restoration and rehabilitation activities associated with the West Mojave Route Network Project (WMRNP). The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. A report of the FY2015 Inventory entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* has been developed by

the BLM. If you would like a copy of the report, please coordinate your request with the BLM Barstow Field Office Archaeologist, Jim Shearer, whose contact information is provided at the close of this letter. A summary of the report is provided in Enclosure 1.

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites, all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

The BLM is providing these determinations of eligibility for your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's determinations. Please provide any comments to the BLM at your earliest convenience, or by **September 21, 2018**.

Evaluation Plan Update

Stipulation IV (A)(vi) of the WEMO PA requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The PA allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. The Evaluation Plan will be included as Attachment 7 to the HPMP once it is finalized.

BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider (Enclosure 2). Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting. BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

Three Times Yearly Consultation Meeting

CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Mr. Jeff Grubbe
Chairman
Agua Caliente Band of Cahuilla Indians
5401 Dinah Shore Drive
Palm Springs, CA 92264

Dear Chairman Grubbe:

The Bureau of Land Management (BLM) is continuing its consultation with the Agua Caliente Band of Cahuilla Indians on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

eligibility for all resources identified. The California State Historic Preservation Officer (SHPO) concurred with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

Mr. Charles Wood
Chairman
Chemehuevi Indian Tribe
P.O. Box 1976
Havasu Lake, CA 92363

Dear Chairman Wood:

The Bureau of Land Management (BLM) is continuing its consultation with the Chemehuevi Indian Tribe on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

concluded with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. NOV 30 2018

CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Mr. Dennis Patch, Sr
Chairman
Colorado River Indian Tribes
26600 Mohave Road
Parker, AZ 85344

Dear Chairman Patch:

The Bureau of Land Management (BLM) is continuing its consultation with the Colorado River Indian Tribes on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstov, Needles, and Palm Springs Field Offices* (July 2018)

concluded with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

NOV 30 2018

CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Mr. Carl Dahlberg
Chairman
Fort Independence Band of Paiute Indians
P.O. Box 67
Independence, CA 93526

Dear Chairman Dahlberg:

The Bureau of Land Management (BLM) is continuing its consultation with the Fort Independence Band of Paiute Indians on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

eligibility for all resources identified. The California State Historic Preservation Officer (SHPO) concurred with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

Ms. MaryR. Wuester
Chairwoman
Lone Pine Paiute-Shoshone Tribe
P.O. Box 747
Lone Pine, CA 93545

Dear Chairwoman Wuester:

The Bureau of Land Management (BLM) is continuing its consultation with the Lone Pine Paiute-Shoshone Tribe on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

concluded with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Mr. Robert Martin
Chairman
Morongo Band of Mission Indians
12700 Pumarra Rd.
Banning, CA 92220

Dear Chairman Martin:

The Bureau of Land Management (BLM) is continuing its consultation with the Morongo Band of Mission Indians on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

concluded with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Ms. Lynn Valbuena
Chairwoman
San Manuel Band of Mission Indians
26569 Community Center Drive
Highland, CA 92346

Dear Chairwoman Valbuena:

The Bureau of Land Management (BLM) is continuing its consultation with the San Manuel Band of Mission Indians on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure I). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

eligibility for all resources identified. The California State Historic Preservation Officer (SHPO) concurred with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on **Wednesday, March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Ms. Rosemary Morillo
Chairwoman
Soboba Band of Luiseno Indians
P.O. Box 487
San Jacinto, CA 92581

Dear Chairwoman Morillo:

The Bureau of Land Management (BLM) is continuing its consultation with the Soboba Band of Luiseno Indians on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

concluded with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Mr. Octavio Escobedo
Chairperson
Tejon Indian Tribe
1731 Hasti Acres Dr., Suite 108
Bakersfield, CA 93309

Dear Chairperson Escobedo:

The Bureau of Land Management (BLM) is continuing its consultation with the Tejon Indian Tribe on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. CERTIFIED MAIL: RETURN RECEIPT REQUESTED

Mr. Tina Braithwaite
Chairperson
Utu Utu Gwaitu Paiute Tribe
25669 Highway 6 PMB1
Benton, CA 93512

Dear Chairperson Braithwaite:

The Bureau of Land Management (BLM) is continuing its consultation with the Utu Utu Gwaitu Paiute Tribe on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive model, which included 5,026 acres of Class III inventory. The BLM completed the FY2017 Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. The California State Historic Preservation Officer (SHPO)

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

³ *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017: Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (July 2018)

concurrent with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

To participate by phone: **866-718-7405**

Passcode: **5042867**

To participate by Instant Net Conference:

1. Join the meeting now:

CERTIFIED – RETURN RECEIPT REQUESTED
7008 1140 0000 2690 2017

Milford Wayne Donaldson
State Historic Preservation Officer
California Office of Historic Preservation
PO Box 942896
Sacramento, CA 94926-0001

Dear Mr. Donaldson:

The Bureau of Land Management, Barstow Field Office (BLM) would like to consult with the California State Historic Preservation Office (SHPO) on BLM's West Mojave Plan (WEMO). In August of 2006, eleven environmental organizations sued the BLM asserting that WEMO, including the designation of an off-highway vehicle route network throughout the planning area, violated the Federal Land Policy and Management Act (FLPMA) and the National Environmental Policy Act of 1969 (NEPA). The WEMO route network will remain in place, at least through the remand period (March 31, 2014).

Subsequently, a court Remedy Order of January 2011 remanded the 2006 WEMO Plan to the BLM and directed the BLM to prepare a revised NEPA document for the OHV route network that:

- (1) complies with the California Desert Conservation Area (CDCA) Plan language or changes outdated CDCA Plan language,
- (2) expands the route network alternatives considered, and
- (3) shows how the adopted network will minimize conflicts with other regulatory route designation criteria in 43 CFR 8342.1, in addition to threatened and endangered species.

All work, including the revised NEPA documentation and the decision to adopt the current or revised network, must be made and submitted to the court by March 31, 2014 to comply with the court Remedy Order.

The West Mojave Plan is a federal land use plan amendment that presents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel and over 100 other sensitive plants and animals and the natural communities of which they are a part. The planning area covers 9.3 million acres in the western portion of the Mojave Desert in

southern California covering parts of San Bernardino, Los Angeles, Kern, and Inyo Counties. This interagency planning process was prepared by the BLM in collaboration with the region's cities, counties, state and federal agencies. The plan applies to the 3.2 million acres of public lands within the planning area.

The Record of Decision for the West Mojave Plan /Amendment to the California Desert Conservation Area Plan was signed in March 2006.

The Western Mojave Desert Off Road Vehicle Designation Project, as modified and adopted in the WEMO Plan is a CDCA Plan Amendment that adopts a network of motorized vehicle routes on public lands as a component of the WEMO Plan. The network provides access to nearly 3 million acres of public lands within the western Mojave Desert.

The *Interim Management Program for Identifying, Evaluating, and Protecting Cultural Resources along Designated Routes of Travel in the California Desert Conservation Area* ("Program"), the administrative plan attached to *Supplemental Procedures for Desert Routes of Travel: A Cultural Resources Amendment to the State Protocol Agreement between California Bureau of Land Management and the California State Historic Preservation Officer* ("Amendment") provided the initial guidance for resolving the issue of foreclosure of the Council's opportunity to comment on decisions concerning route designations in the California Desert Conservation Area. The Program provided a research design for the BLM California Desert District to satisfy the obligations of Section 106 not completed for the *Final Environmental Impact Report and Statement for the West Mojave Plan* (WEMO). The Program and Amendment were signed in 2004, with a completion date scheduled for 2009. The Amendment expired in 2009 and has not been renewed.

In 2009, the United States District Court for the Northern District of California issued a summary judgment (Case 3:06-cv-04884-SI) in response to suit brought by eleven environmental organizations to the Bureau of Land Management and the U.S. Fish and Wildlife Service. The BLM is revising and updating the WEMO Plan according to the specifications of the Court.

The Court identified specific deficiencies in the cultural resources portions of the original WEMO EIS/EIR. The judge found that:

- a. No clear definition of significant impacts to cultural resources was demonstrated.
- b. No expenditure of reasonable cost was made to ascertain impacts to cultural resources.
- c. No clear understanding of how the Decision Tree was used to protect cultural resources.
- d. Discrepancies in information about BLM inventory of routes and the data known about cultural resources were apparent throughout the document.

Cultural Resource specific issues identified by the Court as well as the SHPO will be addressed through the following plan of action.

I. Data Synthesis

The original Program required BLM to conduct an assessment of approximately 900 site records for resources along designated open routes, as well as those with a 600 foot corridor of the route, 300 feet on either side of the centerline. The assessment focused specifically on the paper site records and topographic maps.

The following determinations were to be made:

Does the site record and sketch map contain detailed information on cultural constituents sufficient to understand the nature of the site?

Is the locational information in the site record and accompanying USGS map credible?

Given the unknown number of inventories conducted and sites recorded since the publication of the Amendment and Program, a search and review of resources and inventories, in both paper and digital format, will be completed for each route of travel. The routes with a 600 foot buffer will serve as the Area of Potential Effect, with a one-half mile buffer to provide a broader, landscape level overview of resources within the proximity of these routes.

The search will encompass private, state, and county in-holdings, however only the results for resources on public lands administered by the BLM will be subject to further investigation as outlined below.

a. Tribal and Interested Party Consultation

The California Desert District Manager will be responsible for contacting and consulting with Tribes and interested parties as outlined in 36 CFR 800 and the 8120 manual guidelines. This will also meet BLM government-to-government responsibilities for consultation.

The records review will include consultation with Native American or other cultural groups to ensure that areas of traditional cultural or religious importance are incorporated into the analysis. Interested members of the public will be invited to provide additional information about known impacts to cultural resources; resources identified by the public as being impacted will be included in the field inspections outlined below, regardless of eligibility determinations.

b. Update of GIS Systems and Sensitivity Analysis

A critical element of the initial Program was the required reporting and evaluation of the sites identified during the records review. To meet long term data management requirements and goals set by the BLM and OHP (DOI 2007: III.C.2), the GIS Cultural Resource Geodatabase systems for WEMO field offices will be brought up to date. This is a critical aspect to the

WEMO effort that will facilitate route-related decisions, as well as future management actions in the planning areas.

The initial WEMO EIS identified 33 "sub-regions" for route designation planning purposes. Using updated GIS information of resource and inventory locations, a rating of "sensitivity" will be determined for each sub-region. Sensitivity will be based on the amount of acceptable survey coverage completed within the sub-regions, number of recorded cultural resources, and number of National Register of Historic Places eligible or listed resources.

Sensitivity rating may be skewed by the amount and focus of inventory completed thus far for each sub-region. To account for this, portions of the predictive model proposed in the Program (Task III) will be incorporated into the GIS analysis; specifically topography, hydrological resources, and geologic formations. Existing data derived during the Desert Wide Inventory conducted for the CDCA Plan, while dated, sampled a variety of environmental communities throughout the WEMO area, providing baseline relationship data between environs and cultural resources. The sensitivity ratings will be further developed once the initial records search is complete, and will be used only to identify the portions of the WEMO planning areas that may be most heavily impacted by designated routes.

II. Evaluation

Evaluation of impacts to sites will be prioritized by GIS-based sensitivity ratings for each sub-region and the intensity of recreational use by sub-region. Intensity of use by sub-region will be determined by the total acreage of each sub-region, the total acreage of designated routes (mileage by 600 foot corridor), the number of developed recreational areas, and the recorded permanent residential population. Sub-regions with the highest potential visitation from the public and highest cultural resource sensitivity will be targeted first for evaluation. Based on the records review, all sites which have been determined eligible that lie within the 600 foot corridor of a designated route will be visited to assess the impacts resulting from the open route of travel. Sites which may be considered eligible will be visited and evaluated to assess impacts as a result of open routes of travel. Areas identified by Tribes and interested parties as being sensitive will be visited to assess the impacts resulting from open routes.

A sample of unevaluated sites will be field inspected along designated routes of travel. Because of funding, staff, and time constraints the BLM is proposing to sample one unevaluated site within each sub-region which would be a total of 33 sites. Determinations of eligibility to the National Register of Historic Places shall only be undertaken on sites or properties where it can be reasonably ascertained or it is ambiguous that OHV activities will continue to impact sites and further consultation with SHPO could be required.

a. Effects Determinations

BLM initially proposed to collect empirical data associated with site attributes impacted by OHV and associated activities. The proposed recordation of impacts will continue as part of the evaluation process. The impacts to each site, the dominant environmental features on site, and impacts to those environmental features will be recorded for each site. Environmental features

associated with a site may be the attractants to a site, or may contribute the degree of impacts to a site. A methodology for collecting and documenting this information shall be developed and reviewed by peers prior to implementation.

b. Specific Undertakings

As routes are identified for specific undertakings during the course of the WEMO revision, specifically where rehabilitation or improvement is proposed, a full Class III Cultural Resource Inventory will be completed. Route undertakings where historic properties are not affected may be implemented under the Protocol without prior consultation with SHPO. These undertakings shall be documented in the Protocol Annual Report. Route undertakings where historic properties are identified within APEs, and where historic values are likely to be affected or diminished by project activities, require consultation with SHPO, and ACHP if necessary, on a case-by-case basis pursuant to 36 CFR 800.5-6.

III. Standard Protection Measures

The initial Program proposed to develop Standard Protection Measures for application to a sample of sites for efficacy testing. It stated that closure and rerouting measures derived from the 1980 CDCA Plan were based on assumptions that OHV impacts were adverse and additive. The Program sought to incorporate several years of research into a host of prospective standard protection measures that were crafted for specific classes of impacts, in specific environments, and for specific classes of cultural resources.

The data necessary to develop OHV-specific Standard Protection Measures has yet to be collected. The evaluation phase of the currently proposed plan of action will provide baseline data from which Measures can be developed. For sites immediately threatened or adversely impacted by OHV use and associated activities, the following Standard Protective Measures may be applied until OHV-specific measures are developed.

Standard Protective Measures can include but are not limited to:

- A. Fencing or enclosure of a cultural resource, sufficient to ensure long-term protection, according to the following specifications:
 - a. The construction of the enclosure will not be a hazard to life and safety
 - b. The area within the enclosure must be inventoried to locate and record all cultural resources; and
 - c. The enclosure (i.e.) fence must not divide a cultural resource so that a portion is outside of the fence; and
 - d. The cultural resource specialist will determine the appropriate buffer to be provided between the cultural resource and its enclosing fence.

- B. Closure and restoration of the route using standard methods developed by the Recreation Staff and approved by the cultural resources specialists.
 - a. Access to sacred sites or areas of cultural or religious importance is allowable following consultation
- C. Withdrawal of sensitive areas from Special Recreation Permitted events (e.g. Race courses, organized group camping sites, filming locations)
- D. Removal of man-made, non-contributing, or intrusive attractants to a cultural resource when such removal, in the judgment of the cultural resource specialist, will create no disturbance to the cultural resource (e.g. removing fire rings, picnic tables, modern trash or structures).
- E. Other protective measures established in consultation with and accepted by SHPO.

The Standard Protective Measures defined above may be used to halt or minimize on-going damage to cultural resources. If the standard protection measures can be effectively applied, then no evaluation or further consultation with SHPO on effects will be necessary.

IV. Monitoring

The records review and analysis and field observations will provide baseline data for future monitoring along designated routes. Monitoring shall be conducted for sites with observable impacts as well as those where impacts have not been noted or recorded but fall within the APE of the WEMO routes.

Field Offices shall adopt the following monitoring guidelines:

Monitoring shall be conducted yearly and documented to ensure that prescribed treatment measures are effective.

- A. When damaging effects to cultural resources from OHV activities are ambiguous or indeterminate, Field Offices shall conduct monitoring, as necessary, to determine if degrading effects are resulting from OHV activities and if they are continuing to affect the characteristics that may make properties eligible to the NRHP or if they are otherwise adversely affecting the values of cultural resources.
- B. When monitoring has yielded sufficient data to make effect determinations, the following apply:
 - a. When no additional degrading damage will likely occur because standard treatment measures are adequate to prevent further damage from OHV activities, SHPO consultation on a case-by-case basis is unnecessary.

- b. When no additional degrading damage will likely occur, even without implementation of standard treatment measures, then no further treatment will be needed.
- C. When additional degrading damage will likely occur, mitigation of adverse effects shall be addressed on a case-by-case basis, pursuant to 36 CFR 800.5-6.

V. Reporting

Each participating Field Office shall report annually to the SHPO and the State Office, a summary of activities carried out under this amendment to the Protocol during the previous fiscal year. The reporting shall be included in the Protocol Annual Report.

Annual reports shall summarize activities carried out under this amendment. These reports are not meant to be compilations of the individual project reports prepared for the OHV projects; they are meant to be programmatic summaries of data and significant findings.

Annual reporting shall include at least three major sections:

- a. schedules and status of accomplishments in meeting schedules for cultural resource activities in relation to the route management program as identified in the plan; and
- b. results, as annual summaries of accomplishment and significant findings resulting from route management cultural resource activities; and
- c. appendices to the report that would include project, coverage and cultural resource location maps and tabular summaries of total number of cultural resources located, new cultural resources located, cultural resources evaluated, types of treatment measures employed at each location, and cultural resources monitored.

If you have questions or wish to discuss information contained in this document, please contact Jim Shearer, BLM Staff Archaeologist, at (760) 252-6034 or write to him at the above address or e-mail jshearer@blm.gov.

Sincerely,

Roxie C. Trost
Field Manager

Subject: National Historic Preservation Act (NHPA) Section 106 Notification for Development of a Programmatic Agreement (PA) for the West Mojave (WEMO) Plan in California

Dear Mr. Nelson:

The Bureau of Land Management, California State Office (BLM) invites the Advisory Council on Historic Preservation (ACHP) to consult under Section 106 of the National Historic Preservation Act of 1966, as amended (NHPA), for the West Mojave Plan Supplemental Environmental Impact Statement (EIS) and the West Mojave Route Network Project (RNP). The West Mojave planning area includes approximately 17,000¹ miles of routes of travel on 3.1² million acres of public lands in the West Mojave Desert, located within San Bernardino, Los Angeles, Kern, and Inyo Counties, California. The BLM and the California Office of Historic Preservation (OHP) are in consultation concerning the undertaking, the area of potential effect (APE), identification of historic properties, assessment of effects, and resolution of adverse effect. The BLM and the OHP agree that the identification efforts within the APE are not yet complete; existing and newly designated routes of travel have the potential to affect adversely historic properties; and adverse effects would be resolved through a Programmatic Agreement (PA). Pursuant to 36 CFR Subpart C§800, the BLM is inviting the ACHP to participate in the development of the PA. The information specified at 36 CFR §800.11(e) is provided in this letter.^a

Project Background and Undertaking

The West Mojave (WEMO) Plan is a Federal land use plan amendment to the California Desert Conservation Area (CDCA) Plan that presents a comprehensive strategy on public lands to conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals, and their natural communities. The planning area covers 9.3 million acres in the western portion of the Mojave Desert in southern California covering parts of San Bernardino, Los Angeles,

¹ This includes OHV Open Area miles and acres that are not in the proposed action.

² Ibid.

Kern, and Inyo counties. The WEMO Plan is an interagency planning process prepared by the BLM in collaboration with the region's cities, counties, state, and Federal agencies. The proposed West Mojave RNP is a supplement to the WEMO Plan and applies to 3.1 million acres of public lands within the planning area (Map 1).

The Record of Decision (ROD) for the WEMO Plan was signed in March 2006. As a component of the WEMO Plan, the West Mojave Desert Off Road Vehicle Designation Project identified a network of motorized vehicle routes on public lands. The designation project was incorporated with the ROD and included a network of 5,000 miles of routes available for off-highway travel.

In 2009, the United States District Court for the Northern District of California issued a summary judgment (Case 3:06-cv-04884-SI) in response to the lawsuit brought by eleven environmental organizations to the Bureau of Land Management and the U.S. Fish and Wildlife Service for the WEMO Plan. Subsequently, a court Remedy Order of January 2011 remanded the 2006 WEMO Plan to the BLM and directed the BLM to prepare a revised National Environmental Policy Act (NEPA) document for the off-highway vehicle (OHV) route network and supplement the WEMO Plan according to the specifications of the court. All work, including the revised NEPA documentation and the decision to adopt the current or updated network, must be made and submitted to the court by May 31, 2015, to comply with the court Remedy Order.

The proposed undertaking is to re-evaluate the current West Mojave Plan route network, identify OHV routes of travel suitable for use, and implement the management of designated routes that is compliant with all relevant authorities. The BLM will designate the 17,000 miles of existing routes outside of OHV open-areas as open or closed to off-highway travel, or limited to specific types of travel including non-motorized (e.g., bicycle) or non-mechanized (e.g., equestrian or pedestrian). These designations will result in on-the-ground implementation and management strategies that may include the installation of barriers and signs, rehabilitation of closed routes, realignment of routes to avoid resources, or other actions designed to minimize impacts to all varieties of resources while maintaining the BLM multiple use mission of allowing access to public lands.

Area of Potential Effects

The BLM identifies the Area of Potential Effects (APE) for the West Mojave Plan as the 3.1 million acres of public lands.

The BLM tentatively identifies the APE for the West Mojave Route Network Project route designations as the road features plus a 600-foot-wide corridor. This includes the area allowable by BLM regulations for pulling off, parking, and dispersed camping along each route, and areas near or adjacent to routes that may be subject to effects related to use of the route. In areas where cultural and historical landscapes are identified through the consultation process, the APEs may be extended beyond the route and the 600-foot corridor of use.

Identification and Evaluation of Resources to Date

Cultural resource inventories completed to date in the WEMO planning area include the sampling survey associated with the original CDCA Plan, large-scale renewable energy projects, infrastructure projects such as highway and transmission corridors, and small-scale development projects. The BLM has also conducted 90 inventories associated with OHV travel, equating to approximately 20,000 acres of inventory.

Approximately 9,500 historic properties have been identified within the West Mojave RNP planning area. Of these, 3,345 have been identified within the 600-foot APE. There are 16 properties listed in the National Register of Historic Places (NRHP) within the planning area, 8 of which have been designated as a District with multiple properties within the boundaries (Table 1). Approximately 150 properties have been recommended eligible for listing to the NRHP. The majority of resources within the APE have not been evaluated.

Prehistoric property types located within the project area include lithic scatters, temporary campsites, large habitation sites, milling features, quarry sites, and rock art. Historic property types include trash scatters, mining sites, ranches and homesteads, town sites, and military installments associated with the Desert Training Center. Linear features include the Los Angeles Aqueduct, the Old Spanish Trail, the Pacific Crest Trail, several railroads, and networks of historic roads and prehistoric trails. In addition, ethnographic villages, routes of forced migration marches, and areas of traditional cultural use have been identified through previous and an on-going consultation with Tribal groups and other interested parties.

Table 1. National Register of Historic Places Listed Properties within the APE

Property Name	County	Sites Included	Known Values
Bandit Rock (Robber's Roost)	Kern	1	Historic (Prehistoric sites within boundary)
Blackwater Well	Kern	17	Prehistoric
Walker Pass NHL	Kern	1	Historic
Burro Schmidt Tunnel	Kern	1	Historic
Last Chance Canyon	Kern	160	Prehistoric/historic/Native American
Ayers Rock	Inyo	INY-134	Prehistoric
Fossil Falls Archaeological District	Inyo	32	Prehistoric
Trona Pinnacles Railroad Camp	San Bernardino	1	Historic
Red Mountain Spring Archaeological District	San Bernardino	23	Mostly prehistoric but some historic remains
Steam Well Archaeological District	San Bernardino	4	Prehistoric
The 20-Mule Team Borax Wagon Road	San Bernardino	KER-3927H	Historic
Fossil Canyon	San Bernardino	SBR-284d, SBR-2058	Scientific, conservation, traditional use, public
Rodman Mountain Petroglyphs	San Bernardino	SBR-307A, B, C/ SBR-306A, B, C	Scientific, conservation, traditional use, public
Black Mountain Rock Art District	San Bernardino	5	Prehistoric/Native American
Newberry Cave	San Bernardino	SBR-199	Prehistoric
Calico Mountains Archaeological District	San Bernardino	2	Prehistoric
Lake Mojave	San Bernardino	CA-SBR-140	Prehistoric

Plan for Assessment and Resolution of Effects

The BLM has determined through the monitoring of 85 previously recorded properties within the APE in 2013, including all the NRHP listed resources, that off-highway travel is impacting known sites and is likely to be occurring in sites yet to be identified. Effects to historic and prehistoric properties observed during the 2013 monitoring program and in previous OHV specific inventories were determined to be associated with authorized and unauthorized travel. These effects include travel through properties located adjacent to routes; camping and the construction of fire ring features within historic and prehistoric properties; looting; "scrapping" of historic materials at sites accessible by road; and increased erosion and loss of vegetation as a result of vehicle use. The BLM anticipates that effects to historic properties resulting from the adoption and implementation of the West Mojave RNP are likely to be similar and repetitive across the entire plan area.

Because much of the West Mojave RNP planning area, and particularly routes of travel, have not been completely inventoried for cultural resources, the BLM is developing a Geographic Information System (GIS) model to identify areas where cultural resource properties are likely be located. This GIS model will not replace Class III inventory, but will instead provide a method through which the BLM will prioritize areas where inventory, evaluation, and the resolution of adverse effect needs are the most immediate.

The identification of historic properties, assessment of effects, and resolution of effects will not be completed prior to the West Mojave RNP Record of Decision; the BLM is proposing a phased approach pursuant to 36 CFR§800.4 through the development of a programmatic agreement as allowable at 36 CFR§800.14 (b).

Tribal Consultation

Previous and on-going tribal consultations indicate that the West Mojave RNP planning area includes the traditional cultural area of 13 federally recognized Tribal groups and 5 non-federally recognized Tribal groups and communities. Consistent with NHPA (36 CFR§800) and BLM (43 CFR§8100) regulations, the BLM initiated consultation with these Tribes in November 2011. The BLM has made presentations to Tribal councils during regularly scheduled consultations since initial contact, and has provided information at Open Houses for Tribes in numerous locations in 2013 and 2014, along with conducting individual meetings with deliveries of project maps and digital shapefiles.

Table 2. Tribal Entities Consulted To Date

Federally Recognized Tribes	Non-Federally Recognized Tribes
Agua Caliente Band of Cahuilla Indians	Kawaiisu Tribe
Big Pine Paiute Tribe of the Owens Valley	Kern Valley Indian Council
Bishop Paiute Tribe	Kern Valley Paiute Council
Chemehuevi Reservation	Monache Intertribal Council
Colorado River Indian Tribes	Tubatulabals of Kern Valley
Fort Independence Band of Paiute Indians	
Lone Pine Paiute-Shoshone Tribe	
Morongo Band of Mission Indians	
San Manual Band of Mission Indians	

Timbi-sha Shoshone Tribe Tejon Indian Tribe Twenty-Nine Palms Band of Mission Indians	
---	--

Consultation with these Tribes has indicated that concerns include avoidance of historic properties and sites regardless of NRHP eligibility, avoidance of burials, protection and preservation of resources for generations to come, and continued access for Tribal members to areas of importance and sacred sites.

Interested Party Outreach

The BLM has identified interested groups who will be invited as consulting parties to the PA, including several local Friends groups; the Desert BLM Advisory Council; historical societies; local, county, state, and Federal agencies. Meetings recently took place or are scheduled with San Bernardino, Kern, and Inyo County governments; California City and Ridgecrest City councils; and San Bernardino, Sequoia, and Inyo National Forests. These entities have been or will be briefed on the PA, given informational materials, and asked to consider participating in the PA process. Officials from Death Valley National Park have indicated verbal interest in consulting on the PA. Similar outreach will be made to Joshua Tree National Park, the Mojave National Preserve, and other local entities.

In closing, this letter provides formal notification of the WEMO Plan Supplemental EIS and West Mojave RNP. We invite the ACHP to participate in consultation to resolve any adverse effects from this proposed project through a PA as provided at 36 CFR §800.4 (b). For additional information concerning this project, contact Ashley Blythe, Archaeologist, BLM Ridgecrest Field Office, at (760) 384-5424, and by email at ablythe@blm.gov.

I appreciate your consideration to this request and look forward to hearing from you regarding your participation.

Sincerely,

James G. Kenna
California State Director

Subject: National Historic Preservation Act (NHPA) Section 106 Notification for Development of a Programmatic Agreement (PA) for the West Mojave (WEMO) Plan in California

Dear Mr. Nelson:

The Bureau of Land Management, California State Office (BLM) invites the Advisory Council on Historic Preservation (ACHP) to consult under Section 106 of the National Historic Preservation Act of 1966, as amended (NHPA), for the West Mojave Plan Supplemental Environmental Impact Statement (EIS) and the West Mojave Route Network Project (RNP). The West Mojave planning area includes approximately 17,000¹ miles of routes of travel on 3.1² million acres of public lands in the West Mojave Desert, located within San Bernardino, Los Angeles, Kern, and Inyo Counties, California. The BLM and the California Office of Historic Preservation (OHP) are in consultation concerning the undertaking, the area of potential effect (APE), identification of historic properties, assessment of effects, and resolution of adverse effect. The BLM and the OHP agree that the identification efforts within the APE are not yet complete; existing and newly designated routes of travel have the potential to adversely affect historic properties; and adverse effects would be resolved through a Programmatic Agreement (PA). Pursuant to 36 CFR Subpart C§800, the BLM is inviting the ACHP to participate in the development of the PA. The information specified at 36 CFR §800.11(e) is provided in this letter.

Project Background and Undertaking

The West Mojave (WEMO) Plan is a federal land use plan amendment to the California Desert Conservation Area (CDCA) Plan that presents a comprehensive strategy on public lands to

¹ This includes OHV Open Area miles and acres that are not in the proposed action.

² Ibid.

conserve and protect the desert tortoise, the Mohave ground squirrel, and over 100 other sensitive plants and animals, and their natural communities. The planning area covers 9.3 million acres in the western portion of the Mojave Desert in southern California covering parts of San Bernardino, Los Angeles, Kern, and Inyo counties. The WEMO Plan was prepared by the BLM in collaboration with the region's cities, counties, state, and federal agencies. The proposed West Mojave RNP is a supplement to the WEMO Plan and applies to 3.1 million acres of public lands within the planning area (Map 1). A supplemental EIS is being prepared.

The Record of Decision (ROD) for the WEMO Plan was signed in March 2006. As a component of the WEMO Plan, the West Mojave Desert Off-Road Vehicle Designation Project identified a network of motorized vehicle routes on public lands. The designation project was incorporated with the ROD and included a network of 5,000 miles of routes available for off-highway travel.

In 2009, the United States District Court for the Northern District of California issued a summary judgment (Case 3:06-cv-04884-SI) in response to the lawsuit brought by eleven environmental organizations to the Bureau of Land Management and the U.S. Fish and Wildlife Service for the WEMO Plan. Subsequently, a court Remedy Order of January 2011 remanded the 2006 WEMO Plan to the BLM and directed the BLM to prepare a revised **National Environmental Policy Act (NEPA)** document for the off-highway vehicle (OHV) route network and supplement the WEMO Plan according to the specifications of the court. All work, including the revised NEPA documentation and the decision to adopt the current or updated network, must be made and submitted to the court by May 31, 2015, to comply with the court Remedy Order.

The proposed undertaking is to re-evaluate the current West Mojave Plan route network, identify OHV routes of travel suitable for use, and implement the management of designated routes that are compliant with all relevant authorities. The BLM will designate the 17,000 miles of existing routes outside of OHV open-areas as open or closed to off-highway travel, or limited to specific types of travel including non-motorized (e.g., bicycle) or non-mechanized (e.g., equestrian or pedestrian). These designations will result in on-the-ground implementation and management strategies that may include the installation of barriers and signs, rehabilitation of closed routes, realignment of routes to avoid resources, or other actions designed to minimize impacts to all varieties of resources while maintaining the BLM multiple use mission of allowing access to public lands.

Area of Potential Effects

The BLM identifies the Area of Potential Effects (APE) for the West Mojave Plan as the 3.1 million acres of public lands in the West Mojave RNP.

The BLM tentatively identifies the APE for the West Mojave RNP route designations as the road features plus a 600-foot-wide corridor. This includes the area allowable by BLM regulations for pulling off, parking, and dispersed camping along each route, and areas near or adjacent to routes that may be subject to effects related to use of the route. In areas where cultural and historical landscapes are identified through the consultation process, the APEs may be extended beyond the route and the 600-foot corridor of use.

Identification and Evaluation of Resources to Date

Cultural resource inventories completed to date in the WEMO planning area include the sampling survey associated with the original CDCA Plan, large-scale renewable energy projects, infrastructure projects such as highway and transmission corridors, and small-scale development projects. The BLM has also conducted 90 inventories associated with OHV travel, equating to approximately 20,000 acres of inventory.

Approximately 9,500 historic properties have been identified within the West Mojave RNP planning area. Of these, 3,345 have been identified within the 600-foot APE. There are 16 properties listed in the National Register of Historic Places (NRHP) within the planning area, 8 of which have been designated as a District with multiple properties within the boundaries (Table 1). Approximately 150 properties have been recommended eligible for listing to the NRHP. The majority of resources within the APE have not been evaluated.

Prehistoric property types located within the project area include lithic scatters, temporary campsites, large habitation sites, milling features, quarry sites, and rock art. Historic property types include trash scatters, mining sites, ranches and homesteads, town sites, and military installments associated with the Desert Training Center. Linear features include the Los Angeles Aqueduct, the Old Spanish Trail, the Pacific Crest Trail, several railroads, and networks of historic roads and prehistoric trails. In addition, ethnographic villages, routes of forced migration marches, and areas of traditional cultural use have been identified through previous and on-going consultation with Tribal groups and other interested parties.

Table 1. National Register of Historic Places Listed Properties within the APE

Plan for Assessment and Resolution of Effects

The BLM has determined through the monitoring of 85 previously recorded properties within the APE in 2013, including all the NRHP listed resources, that off-highway travel is impacting known sites and is likely to be occurring in sites yet to be identified. Effects to historic and prehistoric resources observed during the 2013 monitoring program and in previous OHV specific inventories were determined to be associated with authorized and unauthorized travel. These effects include travel through properties located adjacent to routes; camping and the construction of fire ring features within historic and prehistoric resources; looting; "scrapping" of historic materials at sites accessible by road; and increased erosion and loss of vegetation as a result of vehicle use. The BLM anticipates that effects to historic properties resulting from the adoption and implementation of the West Mojave RNP are likely to be similar and repetitive across the entire plan area.

Because much of the West Mojave RNP planning area, and particularly routes of travel, have not been completely inventoried for cultural resources, the BLM is developing a Geographic Information System (GIS) model to identify areas where cultural resource properties are likely be located. This GIS model will not replace Class III inventory, but will instead provide a method through which the BLM will prioritize areas where inventory, evaluation, and the resolution of adverse effect needs are the most immediate.

The identification of historic properties, assessment of effects, and resolution of effects will not be completed prior to the West Mojave RNP Record of Decision; the BLM is proposing a phased approach pursuant to 36 CFR§800.4 through the development of a programmatic agreement as allowable at 36 CFR§800.14 (b).

Tribal Consultation

Previous and on-going tribal consultations indicate that the West Mojave RNP planning area includes the traditional cultural area of 13 Federally-recognized Tribal groups and 5 non-Federally- recognized Tribal groups and communities. Consistent with NHPA (36 CFR§800) and BLM (43 CFR§8100) regulations, the BLM initiated consultation with these Tribes in November 2011. The BLM has made presentations to Tribal councils during regularly scheduled consultations since initial contact, and has provided information at open houses for Tribes in

numerous locations in 2013 and 2014, along with conducting individual meetings with deliveries of project maps and digital shapefiles.

Table 2. Tribal Entities Consulted To Date

Federally Recognized Tribes	Non-Federally Recognized Tribes
Agua Caliente Band of Cahuilla Indians Big Pine Paiute Tribe of the Owens Valley Bishop Paiute Tribe Chemehuevi Reservation Colorado River Indian Tribes Fort Independence Band of Paiute Indians Lone Pine Paiute-Shoshone Tribe Morongo Band of Mission Indians San Manuel Band of Mission Indians Timbi-sha Shoshone Tribe Tejon Indian Tribe Twenty-Nine Palms Band of Mission Indians	Kawaiisu Tribe Kern Valley Indian Council Kern Valley Paiute Council Monache Intertribal Council Tubatulabals of Kern Valley

Consultation with these Tribes has indicated that concerns include avoidance of historic properties and sites regardless of NRHP eligibility, avoidance of burials, protection and preservation of resources for generations to come, and continued access for Tribal members to areas of importance and sacred sites.

Interested Party Outreach

The BLM has identified interested groups who will be invited as consulting parties to the PA, including several local Friends groups; the Desert BLM Advisory Council; historical societies; local, county, state, and federal agencies. Meetings recently took place or are scheduled with San Bernardino, Kern, and Inyo County governments; California City and Ridgecrest City councils; and San Bernardino, Sequoia, and Inyo National Forests. These entities have been or will be briefed on the PA, given informational materials, and asked to consider participating in the PA process. Officials from Death Valley National Park have indicated verbal interest in consulting on the PA. Similar outreach will be made to Joshua Tree National Park, the Mojave National Preserve, and other local entities.

In closing, this letter provides formal notification of the WEMO Plan Supplemental EIS and West Mojave RNP. We invite the ACHP to participate in consultation to resolve any adverse effects from this proposed project through a PA as provided at 36 CFR §800.4 (b). For additional information concerning this project, contact Ashley Blythe, Archaeologist, BLM Ridgecrest Field Office, at (760) 384-5424, and by E-mail at ablythe@blm.gov

I appreciate your consideration to this request and look forward to hearing from you regarding your participation.

State Historic Preservation Officer
Office of Historic Preservation
1725 23rd Street, Suite 100
Sacramento, CA 95816

RE: West Mojave Route Network Project, Programmatic Agreement Implementation

Dear Ms. Polanco,

The Bureau of Land Management (BLM), California Desert District office would like to consult with the State Historic Preservation Office (SHPO) on our agency's determinations of eligibility for the Fiscal Year 2017 (FY2017) inventory efforts associated with the ongoing West Mojave (WEMO) Route Network Project (WMRNP). This notification is pursuant to the *Programmatic Agreement*¹ (Agreement) for the WMRNP executed September 30, 2015. The agreement requires that the BLM make determinations of eligibility consistent with 36 CFR 800.4. The BLM is requesting your review of our determinations and findings pursuant to Stipulation IV(B)(v) of the Agreement.

The WEMO Agreement also requires BLM to develop a Historic Properties Management Plan (HPMP), to include an Evaluation Plan, for the WMRNP. The Agreement allows BLM to phase development of the HPMP. The HPMP was completed in October 2016, with the Evaluation Plan phased for completion at a later date. This letter provides an update on the development of the Evaluation Plan, and transmits draft research themes for your review, consistent with Stipulation IV (A)(vi)(c) of the Agreement.

Identification Efforts

We would like to summarize inventory activities for FY2017, which the BLM has taken to identify historic properties within the Area of Potential Effect (APE) for the WMRNP.

The WEMO Planning Area consists of over 15,000 miles of travel routes. Pursuant to Stipulation IV(A)(iii) of the Agreement, the BLM has developed a GIS-Based Cultural Resources Sensitivity Model (Model), which will be used to guide future inventory efforts conducted as a result of ongoing

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management-California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project (September 2015)*

maintenance, restoration and rehabilitation activities associated with the WMRNP. The Model was developed using known cultural resource location data and environmental factors. The BLM is in the process of testing the validity of the Model through a random sampling strategy that includes a one-percent BLM Class III survey of the WEMO Planning Area each year, for five years. Information gathered during the sample surveys will be used to further refine the Model.

The results of the FY2017 Inventory are documented in the report entitled *West Mojave Route Inventory: Sample Survey for Fiscal Year 2017. Ridgecrest, Barstow, Needles, and Palm Springs Field Offices* (Enclosure 1). The FY2017 Inventory included 142.78 linear miles of routes, which accounted for 5,020 acres. The BLM observed and documented 115 newly recorded archaeological sites, 55 newly recorded isolates, monitored 29 previously recorded sites, and updated 7 previously recorded archaeological sites during the survey. Tables 1, 2, and 3 include all archaeological resources documented during the FY2017 Inventory (Enclosure 2).

Evaluation Efforts

Stipulation IV (B) of the Agreement allows the BLM to make phased determinations of eligibility for activities described in Stipulation I(A) of the Agreement. The BLM has evaluated all resources identified in the FY2017 Inventory for their eligibility for listing in the National Register of Historic Places (NRHP). One previously recorded site is determined eligible for listing on the NRHP, and one previously recorded site remains unevaluated. All 115 newly identified archaeological sites and all 55 isolates documented during the FY2017 Inventory are determined not eligible for NRHP listing.

Thirty-six previously recorded sites were revisited in order to assess their condition. Seven were updated and re-evaluated for NRHP eligibility. One of the updated sites was determined eligible for listing on the NRHP during the FY2017 Inventory (CA-KER-349). It is located within the Sheep Springs/Last Chance Canyon Archaeological District and contains two petroglyphs located on separate basalt boulders. The site has been determined eligible under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Style petroglyphs. The site is located within an archaeological district that has been determined eligible under Criterion D for its potential to yield information significant to our understanding of prehistory. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District. Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion C. Five sites (CA-INY-1381, CA-KER-9917H, CA-SBR-5288, CA-SBR-6493H, and EP-144) were updated and determined not eligible for listing on the NRHP. The other 29 previously recorded sites were previously evaluated as not eligible. No changes were noted at these sites during the FY2017 Inventory and the BLM concurs with and reaffirms these prior determinations.

Tribal Consultation

The BLM continues to consult with 15 federally recognized Indian tribes regarding the WMRNP, including the Agua Caliente Band of Cahuilla Indians, Big Pine Paiute Tribe of the Owens Valley, Bishop Paiute Tribe, Chemehuevi Indian Tribe, Colorado River Indian Tribes, Fort Independence Band of Paiute Indians, Fort Mojave Indian Tribe, Lone Pine Paiute-Shoshone Tribe, Morongo Band of Mission Indians, San Manuel Band of Mission Indians, Soboba Band of Luiseno Indians, Tejon Indian Tribe, Timbi-sha Shoshone Tribe, Twenty-nine Palms Band of Mission Indians, and Utu Utu Gwaitu Paiute Tribe. The BLM is also continuing consultation with seven non-federally recognized tribes and Tribal Organizations including the Kawaiisu Tribe, Kern River Paiute Council, Kern Valley Indian Community, Monache Intertribal Association, Owens Valley Career Development

Center, San Fernando Band of Mission Indians, and Tabatulabals of Kern Valley. Formal government-to-government consultation was requested in the early stages of project planning by letter on November 9, 2011. The fifteen Tribes and seven Tribal Organizations were consulted throughout the ongoing WMRNP review and the development of the Agreement (executed on September 30, 2015.)

The BLM is continuing consultation with the Tribes consistent with the Tribal Consultation and Reporting requirements of the Agreement. Pursuant to Stipulation IV(B) of the Agreement, the BLM is concurrently providing the agency's determinations of eligibility for the FY2017 Inventory to all Consulting Parties and Tribes for a 30-day review. The BLM will also discuss the Agency determinations at the third, three-times-yearly Consulting Parties Meeting scheduled for September 13, 2018.

Agency Determinations of Eligibility

Based on the results of the FY2016 Survey, BLM staff review, and pursuant to the WMRNP Agreement, the BLM has made the following determinations regarding NRHP eligibility:

- The BLM determines that 29 sites were previously determined not eligible for the NRHP. The BLM concurs with and reaffirms these prior determinations.
- The BLM determines that sites CA-KER-349 is eligible for listing on the NRHP under Criterion C as containing representative samples of Great Basin Curvilinear and Great Basin Representational Styles of petroglyph. Additional research is necessary to determine whether the artistic elements of CA-KER-349 would be considered contributing elements to the significant themes of the Sheep Springs/Last Chance Canyon Archaeological District.
- The BLM determines that the remaining 120 archaeological and historic resources documented during the FY2017 Inventory are not eligible for listing on the NRHP.
- The BLM has determined that all 55 isolates identified are not eligible for listing on the NRHP.

As noted at the outset, the purpose of this letter is to provide the SHPO with BLM's formal determinations of eligibility for all sites identified within the WMRNP APE during the FY2017 Inventory and to request your review pursuant to Stipulation IV(B)(v) of the Agreement. The Agreement provides a 30-day period for Consulting Parties to review the BLM's eligibility determinations, which closes on **September 21, 2018**. The BLM will forward any comments received from the Consulting Parties during the 30-day review period. The Agreement provides for an additional 10 days for your office to comment or concur on the Agency determinations.

Evaluation Plan Update

As stated above, the BLM would also like to take this opportunity to provide an update on the development of the WEMO Evaluation Plan, which will be included as Attachment 7 to the HPMP once it is finalized. BLM has previously requested input from Consulting Parties regarding significant research themes that should be included in the Evaluation Plan. During the January 2018 Consulting Parties meeting BLM was requested to provide a draft of the research themes for the Parties to review and consider. Draft research themes were developed and preliminarily provided to participants of the May 2018 Consulting Parties Meeting (Enclosure 3). BLM is formally distributing the draft Evaluation Plan research themes for a 30-day Consulting Parties review, consistent with Stipulation IV (A)(vi)(c) of the WEMO PA. Please provide any comments or considerations to the BLM at your earliest convenience, or by **September 21, 2018**.

If you have specific questions or we can provide any clarification, do not hesitate to contact us. The cultural resources point of contact for the WMRNP is Jim Shearer, Barstow Field Office Archaeologist. He can be reached by telephone at (760) 252-6034, and by email at jshearer@blm.gov. I can be reached by telephone at (951) 697-5200 or by email at bransel@blm.gov.

Sincerely,

Beth Ransel
District Manager

**West Mojave Route Inventory Summary: Sample Survey for Fiscal Year 2017 California
Desert District, Ridgecrest, Barstow, Needles, and Palm Springs Field Offices**
July 2018

PURPOSE AND SCOPE

In 2006, the Bureau of Land Management (BLM) California Desert District Office signed the Record of Decision for the West Mojave Plan Amendment (WEMO) as an amendment to the California Desert Conservation Area (CDCA) Plan, which included designating a network of routes of travel on 3.2 million acres of public lands in Barstow, Ridgecrest, Needles, and Palm Springs Field Offices. Through the development of specific implementation-level travel management plans, referred to as the WEMO Route Network Project (WMRNP), the BLM will decide upon the management of approximately 15,000 miles of existing transportation-related linear features outside of Off-Highway Vehicle (OHV). Open Areas managed by the BLM, include the designation of transportation-related linear features as either Motorized; Non-Motorized, Non-Mechanized use or transportation linear disturbances (Routes); and the routine maintenance, restoration and rehabilitation of existing routes, and the classification of routes for competitive use (“C” Routes).

The WMRNP is considered an undertaking pursuant to 36 CFR § 800.16 (y) and subject to compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended. These regulations require federal agencies to identify historic properties that may be affected by undertakings and provide the Advisory Council on Historic Preservation with an opportunity to comment. The BLM, California State Historic Preservation Office (SHPO), and Advisory Council on Historic Preservation (ACHP) executed a Programmatic Agreement (Agreement) to phase final identification and evaluation of historic properties for the WMRNP, in accordance with 36 CFR 8000.4(b)(2). The BLM has developed a GIS-based Cultural Resource Sensitivity Model (Model) using known cultural resource location data and environmental factors. The BLM will compare the results of the Model with the results of randomly selected cultural resource inventories of Routes conducted during the Fiscal Year 2017 (FY2017) Inventory to test the validity and help to refine the Model.

AREA OF POTENTIAL EFFECT

The Area of Potential Effect (APE) for the WMRNP includes the 50 feet of allowable distance for OHV users to park, pull off, and camp along either side of designated routes. This APE was incorporated for the survey of non-designated routes as well, to better identify cultural resources during inventories. The APE also varies whether or not the WEMO Routes are located in areas formerly designated as Desert Wildlife Management Areas (DWMA). The APE outside of

former DWMA includes an additional 100 feet for a total of 150 feet on either side of the Route. Inside former DWMA, the APE includes an additional 50 feet for a total of 100 feet on either side of the Route. Under the Desert Renewable Energy Conservation Plan (DRECP) and Land Use Plan Amendment (LUPA), DWMA became ACEC. For consistency, BLM will maintain the APE, as defined, with smaller buffers in former DWMA, throughout the testing of the Model.

FISCAL YEAR 2017 (FY2017) IDENTIFICATION EFFORTS

A crew of four American Conservation Experience (ACE) archaeological technician interns conducted a random one percent cultural resource inventory of Routes in the WEMO Planning Area during FY2017 as part of WMRNP to identify cultural resources along those Routes. Fieldwork took place between August 25, 2016 and October 2017.

Routes Selected for Survey

Utilizing the route network that was digitized into GIS for the WMRNP, BLM GIS technician, Margaret Margosian, designed a one percent random sample of all routes within the planning area. The selected one percent route inventory included a sample of routes from each of the 31 OHV “sub-regions” that were created for the Designation Project. The FY2017 inventory effort included a random one percent sample inventory of the 15,000 miles of identified OHV routes in the WEMO Planning Area, which totaled 142.78 linear miles, or 5,020 linear acres of BLM Class III pedestrian surveys. The completed random one percent sample inventory included 92 segments of OHV routes within the planning area. Figure 1 is a map of the chosen route segments for the FY2017 Inventory.

Investigation Constraints

The FY2017 Inventory consisted of Class III pedestrian surveys of Routes in the WEMO Planning Area. Investigations were conducted wholly within the APE and did not divert unless a cultural resource was found to extend past the APE boundary. These investigations were only conducted on BLM administered public lands; portions of Routes that crossed private land, or lands administered by State or other Federal agencies were not inventoried. Collection of artifacts occurred sparingly and only when it was determined by BLM archaeologists to be necessary.

Figure 1: Route Inventory Segments FY2017

NATIONAL REGISTER OF HISTORIC PLACES EVALUATION

National Register of Historic Places (NRHP) eligibility is based on criteria defined by the regulations at 36 CFR 60.4, which are described below. All updated sites and new documented were evaluated for their eligibility for listing on the NRHP. Subsurface testing was only conducted at two sites (BA-S186 and RI-S254) where additional information was necessary to evaluate for NRHP eligibility.

Criteria for Evaluation

The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

- A. That are associated with events that have made a significant contribution to the broad patterns of our history; or
- B. That are associated with the lives of significant persons in our past; or

- C. That embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- D. That have yielded or may be likely to yield, information important in history or prehistory.

All cultural resources identified during the FY2017 Inventory were evaluated for their eligibility for listing on the NRHP. NRHP Criteria considerations were applied by BLM archaeological technician interns and eligibility recommendations made for each resource. BLM archaeologists reviewed these recommendations and will make formal determinations of eligibility. These determinations have been broken down by county.

RESULTS OF INVESTIGATION

The completion of the West Mojave Route Inventory for FY2017 resulted in the identification of 115 new archaeological sites, 55 isolates, and the inventory of 92 route segments. Thirty-four of the 115 sites that were located during survey were found to have been impacted by OHV activity. A total of 29 sites were monitored and 7 sites were updated during the course of the survey. All newly recorded sites and all monitored and updated sites were evaluated for their eligibility for listing on the NRHP.

Monitored/Updated Sites

Sites recorded within the last fifteen years were monitored, while sites recorded more than fifteen years ago were updated and re-recorded. Site monitoring was conducted to assess whether there were any impacts to the site since its last recordation. Re-recording sites was employed when additional artifacts or features were encountered during a revisit of the site. Sites are updated if there are significant natural or manufactured impacts, and/or if the site's last recordation was more than 15 years ago and did not include complete information. Additionally, sites may have been mapped incorrectly or the boundaries may have been incomplete in older site records. In those instances updated location maps were created.

During the FY2017 Inventory of the WEMO Planning Area, 36 previously recorded archaeological sites were encountered. Twenty-nine of these previously recorded sites were monitored, seven were updated. Thirty-four of the monitored and updated sites have been determined not eligible, one site with significant rock art elements is determined eligible under Criterion C (CA-KER-349). Site CA-INY-2348H contains a historic cabin that requires evaluation by an architectural historian and remains unevaluated under Criterion D. Tables 1 and 2 detail the monitored and updated sites, including NRHP eligibility.

Newly Identified Sites

During the FY2017 Inventory of the WEMO Planning Area, 115 newly recorded sites were identified. Of the 115 archaeological sites recorded, 70 were historic, 39 were prehistoric, and six were multicomponent (Table 3). All new sites were recorded in their entirety, including any portions of the site that extended beyond the APE. Table 4 includes all sites documented during the inventory and NRHP eligibility

Summary of FY2017 Inventory Results

Historic sites have a slightly greater presence than prehistoric sites located during the FY2017 Inventory, the difference between the site totals can be attributed in part to WEMO Routes located near expansive mining complexes. Figure 3 identifies the percentage site types documented during the FY2017 Inventory. The results of the FY2017 Inventory will be incorporated into the next run of the Model, which is actively being refined and tested each year for validity and effectiveness of the randomly selected one-percent sample survey.

Figure 2: Newly Recorded Sites by Percent

Historic Resources

Historic refuse scatters were the most numerous site type recorded during the FY2017 Inventory. A total of 41 refuse scatters were inventoried, a majority of which were products of roadside dumping events. Diagnostic historic cans and glass make up the bulk of this assemblage, and as they have a commonly accepted dating schema, they are the artifacts that are emphasized during recordation. As cans are highly susceptible to alluvial and aeolian forces, refuse dumps can be scattered far beyond the original depositional context. Despite this, the majority of the refuse dumps recorded had some semblance of a concentration that suggests roadside dumping, with a majority of sites (58%) being a product of a single depositional event. The dumping of trash away from mines, homes, towns and larger population centers was quite common in the desert until the codification of waste management laws in the 1960s and 1970s (Sullivan and Griffith 2005:7).

The second most prevalent site type includes historic mining sites with features present. A total of 28 mining sites were found during the course of the FY2017 Inventory.

Prehistoric Resources

The third most common site type identified were lithic scatters, with 24 documented during the FY2017 Inventory. Edge modified flakes comprise the majority of artifacts at these sites, with a significant number of cores and core trimmings also present. This is not uncommon to the region, as flaked stone implements are ubiquitous at lithic scatters throughout the Mojave. While the assemblages appear to be quite similar, the quality and composition of materials

manufactured was heavily dependent on the site's location, and if it was situated on or near a secondary or primary quarry.

The material at most lithic scatter sites appear to be locally sourced with the exception of a few sites that contain imported materials; signifying evidence of trade or long distance procurement of coveted raw materials for stone tool manufacture. The level of refinement in both the debitage and tools fashioned from imported materials seems to indicate that the material traveled long distances and was continually refined until it could be used no further or was discarded for unknown reasons.

The fourth most common site type were secondary lithic quarries. Pavement quarries are a type of secondary lithic quarry that allows for opportunistic testing of a surface scatter for the purpose of manufacturing stone tools. However, secondary pavement quarries appear to lack temporal and formalized tools, while flaked stone implements are ubiquitous (2011). During the FY2017 Inventory, nine secondary lithic quarries were recorded.

DRAFT

Outline for North-Central Mojave Desert Prehistoric Research Design

This brief document outlines major themes to be considered in the WEMO research design for the north-central and western Mojave Desert. It is informed by recent and ongoing research at major military installations (e.g., Fort Irwin, NAWS China Lake, Edwards AFB) and adjacent public lands. For purposes of presentation, the general themes identified are in some cases accompanied by more specific issues that relate to those broader concerns.

Past Climates and Environments

Although not directly archaeological in nature, details regarding paleoenvironmental conditions in the study area have obvious implications for understanding the history of human activity. Especially among mobile hunter-gatherer populations reliant on wild foods and scattered water sources, variation in the distribution and abundance of such resources have significant affects on how people, technologies, and economic activities are arrayed across a landscape. From a temporal perspective, there are three blocks of time of particular interest:

- Late Pleistocene/Early Holocene Environments. Regional data indicate more cool and mesic conditions at the close of the Pleistocene period, gradually becoming warmer and drier through the early Holocene era. Desert lakes frequently held water during this span, woodlands still existed in many upland areas, and the density of spring/seep features was substantial in many areas. These conditions were most robust in geographic areas that benefited from run-off from adjacent ranges, boosting the productivity of hydrologic systems in localities such as China Lake and Rosamond Lake basin.
- Mid-Holocene Climatic Optimum. Climatic conditions worsened during the middle Holocene, with major lakes systems becoming wholly desiccated even in well-watered areas (i.e., Owens Lake). Regional chronological profiles indicate either a drop-off in human activity during this span or at least a major adjustment to settlement patterns and how landscapes were used. Occupation appears to have become less repetitive and archaeological deposits less robust where they occur.
- Medieval Climatic Anomaly. Following a return to more moderate condition, two extended drought periods are indicated for the late prehistoric period. Some researchers suggest these droughts had major impacts on regional populations, others see the human affects as less substantial. The extent of this climate event should be evident in profiles of occupation intensity across different habitats and hydrologic regimes.
- Persistence of Landforms and Habitats. Archaeology can provide invaluable information regarding the long-term persistence of landform and habitat mosaics. Dune fields, for example, often witnessed intensive human occupation and the temporal record of habitation in such contexts can be used to infer how long such features have existed; springs and seeps offer similar insight, where the chronology of adjacent archaeological remains helps determine when such water sources were active in the past. Finally, in much the same way, food remains like animal bone and carbonized seeds and nutshell provide a direct indications of past shifts in fauna and flora, documenting the presence of desert tortoise in areas they no longer occupy or signaling a past presence of mesquite

in places where groundwater pumping has eliminated such trees. Indeed, recent research shows the utility of combining archaeological data with traditional paleoecological approaches.

Culture History and Chronological Control

While there is fair agreement on the general sequence of archaeological complexes in the study area, uncertainty still exists regarding the calendrical dates of particular artifact styles and their cultural significance. Direct radiocarbon dates remain few, most deposits are primarily surficial in nature, and obsidian is relatively scarce in much of the Mojave Desert. Recent attempts to “phase” what are in fact extended temporal blocks cannot be presently justified on the basis of empirical data.

- Refining Cultural Sequences. Broad parameters of existing culture-historical sequences are similar, but calendrical ages proposed by different researchers can vary by a millennium or more. This has obvious consequences when trying to assess the cultural affinities of individual radiocarbon dates or obsidian hydration measurements: for example, does a date of 4000 years relate to the Pinto or Gypsum complex, or in fact some other archaeological manifestation.
- Temporal Parameters of Projectile Point Series. There is considerable debate regarding the precise temporal distribution of many Mojave Desert projectile point series, especially for earlier periods. Data now suggest that markers such as fluted points, Great Basin Stemmed, and Pinto series points in fact overlap in time, while regionally atypical types such as Humboldt series and large side-notched forms have minimal chronological controls. Age boundaries are better documented for the later Holocene, though there is still uncertainty regarding the precise dating of some point styles and how these relate to similar forms from surrounding areas. Further complicating this situation is the real possibility that dating parameters may vary geographically across the area. Efforts are required to clarify these relationships using radiometric dates, excavated samples, and obsidian hydration dates.
- Obsidian Hydration. Beyond the Coso area, obsidian artifacts occur in low frequencies across most of the study area and, when present, often represent a diverse array of geochemical types. There is also significant variation in the intensity of obsidian use over time, most volcanic glass occurring in either very early or late cultural components. Efforts need to be increased to maximize the utility of obsidian hydration data from across the region, particularly in how micron readings can be translated into calendrical ages via source- and environment-specific rate formulations.
- Chronological Implications of Toolstone Use. Notwithstanding geographic variability in the distribution of lithological sources and certain toolstone classes, there appear to have been major changes in the dependency on raw materials across the record. Coarser-grained igneous stone was employed primarily for bifacial implements through the Pinto period, replaced by siliceous material during the last 4000 years or so. There is clear variability in the exact composition of igneous stone depending on local geology, basalt/dacite dominating early collections at Fort Irwin and rhyolite at Edwards AFB. As raw material variability offers a rough-and-ready means of assessing site and artifact age in the absence of other chronological indicators, these patterns need to be refined and extended to other localities.
- Other Artifactual Markers. There are no doubt additional artifact categories that possess good temporal controls, such classes as beads, ceramics, and probably certain kinds of milling tools (e.g.,

thin-slab millingstones, mortars/pestles) due to vagaries in trade and social interaction or economic orientation and subsistence practices. These parameters need to be better documented as well.

Settlement Organization and Mobility

Much has been written regarding the settlement organization of Mojave Desert populations, but most such models have only limited empirical support and justification. This gap is exacerbated by the spatial lacunae where intensive investigations have been conducted, poor temporal controls, a dearth of quantitative data, and major environmental differences across the region. A settlement system during any given time period may have been structured very differently in another habitat mosaic.

- Early Period Settlement Patterns. Available data document two distinct kinds of settlement organization in the north-central Mojave Desert during the early Holocene. The Lake Mohave complex appears to have resembled a typical forager system, with short term occupation of scattered locations by small, highly mobile, probably family-based groups. Larger concentrations of artifacts seem to reflect recurrent use of favored places rather than prolonged occupations or larger group size. By contrast, the Pinto complex more closely corresponds to a so-called collector system where residential bases are occupied for greater duration and resources are being returned to centralized sites via logistical strategies. Residential bases were likely inhabited by multi-family groups, while smaller deposits represent contexts of immediate resource extraction. It is quite possible that other parts of the study area had entirely different kinds of settlement organization during the early Holocene, so that needs to be assessed independently.
- Middle Archaic Settlement. While there may be greater variation in Middle Archaic settlement in response to localized environmental conditions and resource distributions, this needs to be more formally established with better regional data. Several models have been proposed: at Fort Irwin it appears that a more mobile system returned, most of the sites of this interval representing small accumulations of diverse residential debris that were occupied only briefly. Some have suggested that this characterization is incorrect, that the Irwin sites represent logistical camps and that major, centralized villages are situated in more productive contexts like the Mojave River drainage; such sites are at present only hypothetical. In the western Mojave Desert, researchers have evidently documented more permanent settlements, probably occupied by more people for longer spans, some of which may even have discrete ceremonial areas. Existing data can be re-assessed to better substantiate the reality of such geographic variability and, if it actually occurs, to explore the factors contributing to it.
- Late Archaic Settlement. Similar to the preceding interval, late Archaic settlement appears to include both short-term camps occupied for brief periods by small family groups and, in contexts with abundant water and subsistence resources, perhaps larger aggregation sites that were used for longer duration. The fact that much of the study area appears to have lacked resident populations during the late prehistoric/ethnohistoric interval, when groups appear to have entered the marginal desert environments on an episodic basis during short pulses of enhanced resource productivity, argues primarily for the first model. More permanent settlements were probably situated in resource-rich settings along the desert perimeter.

Trends in Prehistoric Subsistence

Poor organic preservation, shallow archaeological deposits, and a lack of systematic excavation data for many parts of the study area complicate attempts to directly assess changes in prehistoric subsistence. Faunal and floral remains are sparse, sample sizes are small, and much of what is known has been inferred from changes in flaked and ground stone technologies. Archaeological studies in the region need to make better and more consistent use of available methods to recover and study the dietary remains frequently present in site deposits, and also begin incorporating newer techniques that can extract information from protein residues, starch grains, and the like.

- Early Subsistence Patterns. Despite the fact that early environments were more permissive, direct subsistence remains portray a pattern fairly similar to those that followed. Faunal collections may contain slightly more large game remains than later ones, but they are still dominated by smaller taxa like lagomorphs, rodents, and reptiles. This same constellation of animals is found in both Lake Mohave and Pinto deposits, which do in contrast differ in their representation of seed grinding implements. While the former characteristically contain few or no such tools, the latter components often have scores of millingstones and handstones that attest to the importance of seed processing. Given the temporal overlap between these two complexes, such differences need to be explained and any geographic variation documented across the study area.
- Middle Archaic Subsistence. Climate amelioration following the Altithermal period led to a more broad subsistence base that included a host of plant and animal resources that varied, of course, according to local habitat characteristics. It is during this interval that mesquite exploitation seems to have begun in earnest, a productive, storable foodstuff that has a very sporadic distribution in the project area. The changing role of mesquite use needs to be better documented in areas such as Edwards AFB where substantial stands still exist today; prehistoric distributions were probably much wider given how susceptible the trees are to modern groundwater pumping. Increases in mesquite use can be measured both via paleobotanical samples from excavated deposits and by the presence of mortar/pestle technology used in processing the beans.
- Later Prehistoric Resource Intensification. Although some manner of resource intensification likely began as early as the Pinto period judging by the sudden proliferation in milling tools, it was not until the last 1500 years that the process became increasingly accelerated. More and more distant habitats are brought into the foraging range and a wider range of often less efficient foods are added to the diet. These trends require further documentation via excavation and more enhanced regional explication, as do changes in technological investment such as production of bedrock features, specialized processing features, and tool design. It is during the same interval that low-ranked resources such as freshwater mussels and crustaceans are exploited in places they occur.

Technological Organization

Flaked and ground stone technologies of the Mojave Desert were organized in two distinct ways. In some times and places, groups were reliant mainly on expedient tools that were made and used largely as needed on a situational basis. These implements were generally unformalized, exhibit limited use-wear, and had mostly specific functions. During earlier periods, by contrast, many implements show intensive investment in manufacture, were often retained in tool-kits for extended periods, and frequently had multiple roles. It

is these differences that have important implications for past mobility strategies and how people moved across regional landscapes.

- Lithological Terrain. The study area is extremely complex geologically, which makes it difficult to determine where specific lithological materials were procured. There are some known sources of obsidian (the extensive Coso quarry in the north, smaller float deposits in the east), as well as a handful of high quality volcanic production areas (basalt/dacite at Fort Irwin, rhyolite at Edwards AFB, felsite at MCAGCC), but many potential source localities are still undiscovered. This is especially true of the ubiquitous cryptocrystalline varieties that occur, mostly as secondary cobbles, across much of the region. This is an issue that requires more in-depth study, if only to identify more circumscribed areas that contain an abundance of toolstone-quality lithics.
- Strategies of Lithic Acquisition. Toolstone materials generally occur in two geologic contexts, either as primary lithic deposits that represent distinct point locations or, more commonly, as secondary cobbles in fluvial and alluvial deposits. The latter workshop areas were exploited opportunistically, characterized by segregated reduction loci where one or several cobbles were assayed for suitability and in some cases further reduced into more refined core and tool forms. Understanding how the exploitation of these primary and pavement quarries was tied to variability in tool manufacturing and mobility strategies is essential to deciphering technological organization.
- Raw Material Use and Artifact Function. Mojave Desert lithic assemblages show significant correlations between artifact function and material qualities. Flaked stone from early components includes substantial quantities of fine-grained volcanic material, used mostly for the production of bifacial implements; the formalized scraping tools from these same contexts are manufactured mainly from siliceous stone that is more durable and can hold a sharper edge. During the last 4000 years this dichotomy disappears and virtually all flaked stone tools are produced from the latter materials or, where locally abundant, obsidian. These relationships need to be verified throughout the study area.
- Ground Stone Technologies. Similar to flaked stone, the design of Mojave Desert ground stone technologies shows important variability over time and space. In some contexts implements are highly formalized, express intensive modification and use-wear, and were evidently made to be transported from location to location. Other tools seem far more expedient, casual in their nature, exhibiting limited wear, and probably used at or near the place of manufacture. These differences have important implications for how populations organized plant processing activities and the intensity of same.
- Ceramic Technology. The introduction of ceramic technology significantly altered lifeways in the Mojave Desert. Pottery not only made water transport much easier, but provided opportunities for extended cooking of foods that required long boiling times; classes of resources became available that were too inefficient to process using traditional hot rock/basket cooking methods. It is important to better document variation in the frequency and distribution of prehistoric ceramics, where the clays used in pottery production were acquired, and what the residues present on vessel interiors say about the resources being processed. These can be expected to change over time and space.

Ethnic Identity and Regional Interaction

Ethnohistoric documentation attests to the fact that numerous distinct ethnolinguistic groups occupied the study area, if possibly only on a sporadic basis when resource productivity provided a reason to enter such marginal habitats. It is likewise clear from such non-perishable items as obsidian, ceramics, shell beads, and turquoise that numerous populations in and around the north-central Mojave Desert interacted socially and economically.

- Pottery Production and Exchange. While few sites in the study area contain large numbers of potsherds, they occur widely in low frequencies. Most of the ceramics can probably be attributed to the Paiute Brown Ware series, more limited quantities of Patayan wares are also reported. Notwithstanding likely errors in ceramic identification by non-expert site recorders, differences in the origin, distribution, and condition of regional pottery samples has much to say about where such technologies were produced and how they moved around the landscape.
- Shell Bead Trade and Exchange. Marine shell beads offer another avenue into assessing regional interaction spheres. Archaeological finds document a long record of bead use in the project area, early components at both Fort Irwin and Little Lake containing artifacts that are nearly 10,000 years old. These artifacts can be traced to both the Pacific coast and the Sea of Cortez in Mexico, which suggests transport via multiple routes and socioeconomic conduits. Bead use increases through time, perhaps reaching its apex in the northwestern Mojave Desert during the last 1000 years, when most types can be traced to the southern California coast. A more careful and focused examination of regional shell bead samples will provide further insight into the intensity of bead exchange in different times and places. Isotopic methods are also available that can pinpoint the location shells were originally procured.
- Turquoise Exploitation. Early archaeologists identified extensive turquoise mines near Cronese Lakes, east of Fort Irwin. The association of painted Southwestern ceramics suggested that these quarries were being exploited by extra-regional traders acquiring turquoise for their home markets. This is an issue that requires further consideration insofar as turquoise has been identified in many Mojave Desert sites and the materials may derive from the same source areas, a problem that geochemical studies can surely resolve.
- Acquisition and Use of Obsidian. Geochemical data from the study area suggest that most obsidian used in the area originated in the Coso Volcanic Field along the northern boundary of the study area. Smaller amounts of volcanic glass have been traced to more far-flung quarry sources, either to the north along the eastern Sierra front or the cluster of sources to the northeast in southern Nevada. As many of the data derive from intensive studies at regional military installations, there are many geographic gaps in the information that require further documentation. But such as the information is at present, it appears that much of the northern glass occurs in earlier contexts, while the eastern sources relate primarily to the late prehistoric period; these patterns indicate an extensive north-south procurement range during the early and middle Holocene, probably carried out in the context of broad residential moves, and an emerging east-west connection between Paiute-speaking groups during recent times.

- Distribution of Fine-grained Volcanic Toolstone. Offering a contrast to the obsidian profiles, recent geochemical analyses of fine-grained volcanic material from early temporal contexts shows movement of basalt and related toolstone from quarries in Panamint Valley and, more frequently, at Goldstone Lake in Fort Irwin. The assessment is based strictly on diagnostic marker types and additional artifact categories require analysis to confirm these relationships.
- Articulating Archaeology and Trail Systems. The study area is traversed by numerous trail systems, many that are well documented as transportation corridors during the historic period and others presumed to have been used into the deeper past. These routes offer a significant opportunity to explore the correlation of trails and specific archaeological signatures (e.g., exotic goods, site types, art styles).

Patterns of Inter-Regional Cultural Interaction

Unlike most other sectors of southern California, ethnohistorical records for much of the Mojave Desert are comparatively sparse. This fact has led many researchers to suggest the north-central desert was largely a “joint use area” that was visited and occupied by numerous groups who routinely resided in more productive environments surrounding the Mojave. People would move into the desert when conditions were optimal in terms of water and subsistence resources, otherwise targeting better habitats along its perimeter and in adjacent uplands. There may have been extended periods, especially during the middle Holocene arid period, when the project area saw minimal occupation.

- Inter-Regional Relationships. How neighboring peoples articulated with the less productive desert environment is perhaps best assessed by comparing the record of adjacent areas with those within the WEMO study area. This can be done on the basis of artifact and feature types, the presence of extralocal materials, and patterns of settlement and mobility. It is, for example, evident that some projectile point forms in the central Mojave Desert either do not occur in areas to the north or are found in much reduced numbers. Likewise, shell bead types and frequencies indicate a much closer relationship between desert areas and the southern California coast during the last couple millennia.
- Regions of Principal Interest. Comparisons of this sort will benefit most from an inter-regional comparison with the Transverse Ranges to the south/southwest, the southern San Joaquin Valley to the west, the greater Owens Valley area to the north, and more distant Mojave Desert locales east of the project area. It seems clear that all these locations share archaeological similarities with the study area, but also have important distinctions in dietary focus, technology, and occupational profiles. It is expected that temporal variation will be evident in these relationships due to internal and external conditions at different times.

Understanding Rock Art and Earth Art

The study area and adjacent sectors of the desert preserve a staggering quantity of petroglyphs, pictographs, and surface feature constructions that speak to symbolic behavior. Future research needs to consolidate this information into a uniform data set to better understand the context and distribution of various motif clusters and their broader spatial distributions. Many of the art styles are known to have cultural affinities beyond the project area and these geographic profiles will enhance our understanding of ethnicity and regional cultural interactions.

- The geographic context of such phenomena provides clues into the purpose of such productions, for example whether the art is public and easily viewable or positioned in a more discreet location. Rock art theory suggests that much art production correlates with population aggregations and that the intensity decreases when group size becomes small and people are more dispersed.
- Variability in the kind of art and stylistic motifs can reflect important cultural distinctions and/or functional differences. Around Coso, for example, most rock art consists of representational petroglyphs of animals and people, while just to the south much of the art consists of painted pictographs of abstract forms; these imply two entirely different social spheres and perhaps the influence of extra-local populations connected to southern Nevada.

DRAFT

**West Mojave Route Network Project
Programmatic Agreement
September Consulting Parties Meetings**

Date/Time:

September 13, 2018
10:00 AM. to 12:00 P.M.

Location:

BLM Ridgecrest Field Office
300 S Richmond Rd
Ridgecrest, CA 93555

Phone/Webex Info:

To join the meeting online:

1. Go to <http://www.mymeetings.com/nc/join.php?sigKey=blm&i=444401194&p=&t=c>
2. Fill out the required fields
3. No participant Conference/Meeting Passcode is required

To join the audio conference only:

1. Call the toll-free number (US/Canada): 1-866-718-7405
2. Enter the Passcode: 5042867

ATTN: Brendon Greenaway, Associate State Archaeologist

Subject: West Mojave Route Network Project, Programmatic Agreement, FY2018 Annual Report

Dear Ms. Polanco,

The Bureau of Land Management (BLM) is continuing its consultation with the California State Historic Preservation Office (SHPO) on the West Mojave (WEMO) Route Network Project and Programmatic Agreement¹ (Agreement). Pursuant to Stipulation E of the Agreement, the BLM is providing a copy of the Fiscal Year 2018 (FY2018) Annual Report and an update on the Consulting Parties meeting schedule. Additionally, this letter provides a copy of the draft Historic Trails Context Study for your review, consistent with Stipulation IV.A (vi)(d) of the Agreement.

Summary of FY2018 Implementation Activities

Pursuant to Stipulation IV.E (iv) of the Agreement and Section II.E of the Historic Properties Management Plan (HPMP), the BLM is providing the *West Mojave Route Network Project: Fiscal Year 2018 Annual Report to Consulting Parties, Regarding Implementation of the Programmatic Agreement* (Enclosure 1). The Annual Report summarizes all Agreement implementation activities performed during FY2018.

In FY2018, the BLM held three Consulting Parties Meetings² to provide updates on the progress of the implementation of the Agreement. The BLM WEMO Cultural Resource Team continued the required one-percent random sample survey to test the GIS-based archaeological predictive

¹ *Programmatic Agreement among the Advisory Council on Historic Preservation, the Bureau of Land Management California, and the California Office of Historic Preservation Regarding National Historic Preservation Act Responsibilities for the West Mojave Plan Environmental Impact Statement and the West Mojave Route Network Project* (September 2015)

² The BLM held three Consulting Party Meetings in 2018: January 25, May 23, and September 13

Inventory Report³ and made determinations of National Register of Historic Places (NRHP) eligibility for all resources identified. Your office concurred with the BLM determinations by letter dated November 9, 2018. During FY2018, the BLM completed the five-year Records Search Update for WEMO, as required by Stipulation IV.A (i) of the Agreement. Progress was also made on several other deliverables identified in the Agreement and the HPMP, including the Evaluation Plan and the Historic Trails Context Study.

Historic Trails Context Study

Pursuant to Stipulation IV.A (vi)(f)(4) of the Agreement, the BLM has developed a draft Historic Trails Context Study for WEMO, as a phased portion of the HPMP. The BLM contracted with ASM Affiliates (ASM) to develop this document. The Study includes a summary of prehistoric, contact-era, and historic trails in the WEMO Planning Area. The document contains a historic context, research themes and questions, and an evaluation framework and methodology for trails resources. The draft Historic Trails Context Study is provided here (Enclosure 2) for a 30-day Consulting Parties review, consistent with Stipulation IV.A (vi)(c) of the Agreement. Please provide any comments to the BLM at your earliest convenience, or by **January 11, 2019**.

Consulting Parties Meeting Schedule and Next Meeting

As required by Stipulation IV.E (iii) of the Agreement, the BLM reviewed the three times per year meeting schedule with Consulting Parties in FY2018. This review included a discussion during the September 13, 2018 Consulting Parties Meeting. A proposed revision to the meeting schedule was developed based on this discussion and provided to all Consulting Parties for review in an email sent September 21, 2018. No additional comments were received during the 30-day review period.

The Consulting Parties Meeting schedule for 2019 will include two (2) meetings total: one in March and one in September. This reduced schedule is based on the outstanding implementation items scheduled to be completed in the next year. The BLM will again discuss the meeting schedule with the Consulting Parties during the September 2019 Meeting.

The next Consulting Parties Meeting will be held on Wednesday, **March 13, 2019**, from 10:00 AM to 12:00 PM. The meeting will be held at the Barstow Field Office located at 2601 Barstow Road, Barstow, CA 92311. The BLM invites you or a representative to attend this meeting. If you are unable to attend the meeting you can participate remotely using the call-in and web-ex information below.

JUL 25 2012

Mr. Alan Desalvio
Supervising Engineer
Mojave Desert Air Quality District
14306 Park Avenue
Victorville CA 92392

Dear Mr. Desalvio:

This is a follow-up message to a phone call you received from Jim Keeler, from our State Office in Sacramento.

On December 15, 2011, a team of BLM staff visited you and your staff at the request of the BLM California Desert District manager. The group discussed BLM California Desert District's need for additional information and advice about techniques for monitoring dust emissions (specifically PM10) caused by recreational vehicles used on roads, trails, and open riding areas.

The specific area we discussed was the BLM's West Mojave Plan area, most of which is in lands within the jurisdiction of the Mojave Desert Air Quality District, but also includes lands within the jurisdiction of the East Kern, Antelope, and Great Basin Districts.

To briefly summarize the December 15 meeting, as part litigation on the West Mojave Management Plan (WEMO), a Remedy Order included the requirement: *"The BLM shall carry out additional information gathering and monitoring regarding (a) air quality in and around open areas through air quality monitoring..."*

The BLM obtained a grant from the California State Park's Off-Highway Vehicle program to contract a process to meet this requirement, or provide better information for the court on the current status of monitoring already in place. Before the end of the meeting, it became very apparent that your agency was an obvious choice for a cooperative report. You offered to have your staff prepare a report, with our assistance, to document the status of emissions monitoring already in place, and the difficulties of point source monitoring. The BLM offered to prepare a contract for your services.

Unfortunately, other pressing issues by the BLM delayed a more prompt response. On a telephone follow-up conversation of July 19, 2012, Jim Keeler, informed you that two members of the original team, Jim Keeler and Karl Stein, will be retiring and unable to continue with coordination of the project. BLM has appointed a new Physical Scientist, David Jones, for our Air Quality Program (shared position between BLM California and Nevada), who will be leading the continuation of this project, with assistance from Glenn Harris.

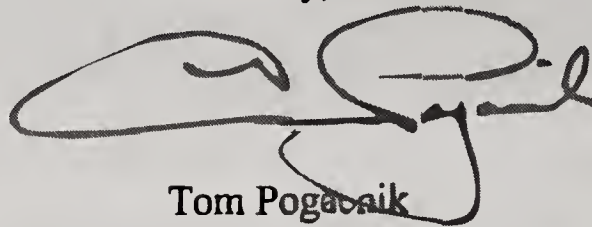

Contact Information Is:

David Jones
Physical Scientist, Air Quality
BLM, Nevada State Office
(775) 861-6473

Glenn Harris
Natural Resource Specialist
BLM, Ridgecrest Field Office
(760) 384-5434

David or Glenn will be contacting you during the next few weeks to set up a follow-up meeting to take the next steps to initiate this evaluation and discuss any related activities. We apologize for the earlier delay, and look forward to working with you soon.

Sincerely,

A handwritten signature in black ink, appearing to read "Tom Pogabaik". The signature is stylized with a large, sweeping initial "T" and a long horizontal stroke.

Tom Pogabaik
Deputy State Director, Resources

January 9, 2006

Memorandum

To: District Manager, California Desert District, Bureau of Land Management,
Moreno Valley, California

From: 
Field Supervisor, Ventura Fish and Wildlife Office, Ventura, California

Subject: Biological Opinion for the California Desert Conservation Area Plan
[West Mojave Plan] (6840(P) CA-063.50) (1-8-03-F-58)

This document transmits the U.S. Fish and Wildlife Service's (Service) biological opinion based on our review of the California Desert Conservation Area Plan, as proposed to be amended by the West Mojave Plan. At issue are the effects of the California Desert Conservation Area Plan, as proposed to be amended by the West Mojave Plan, on the federally threatened desert tortoise (*Gopherus agassizii*) and Parish's daisy (*Erigeron parishii*) and the endangered Cushenbury milk-vetch (*Astragalus albens*) and Lane Mountain milk-vetch (*A. jaegerianus*); you also requested formal consultation regarding critical habitat of the first three species. This document was prepared in accordance with section 7(a)(2) of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 et seq.) (Act). Your request for formal consultation was dated July 15, 2003.

This biological opinion is based on information in: the final environmental impact report and statement for the West Mojave Plan (Bureau of Land Management (Bureau) et al. 2005); various written and oral communications, including meetings among staff of the Service and the Bureau; and various reports and publications. A complete administrative record of this consultation is on file at the Service's Ventura Fish and Wildlife Office.

CONSULTATION HISTORY

History of the West Mojave Plan

Preparation of the West Mojave Plan began in January 1992 with several scoping meetings. The Bureau sought and obtained the participation of local and State agencies, resource agencies, and stakeholders in attempting to craft a plan that balanced conservation, recreation, and economic needs. The participants in the planning process met, either in full groups or committees, numerous times over approximately 10 years. A final round of scoping meetings, to assist in

preparing the draft environmental impact statement, was held in June and July 2002. In January and February 2003, local agencies held scoping meetings to begin preparation of environmental documents, pursuant to the California Environmental Quality Act (Bureau et al. 2005). The draft environmental impact report and statement was released to the public in May 2003; the final environmental impact report and statement was released in March 2005. These documents contain a more detailed description of the planning process that generated the West Mojave Plan.

The final environmental impact report and statement for the West Mojave Plan (Bureau et al. 2005) actually describes two separate but related processes. The environmental impact report and statement describes the Bureau's proposed amendment to the California Desert Conservation Area Plan, which is the subject of this consultation. It also describes a habitat conservation plan in support of an incidental take permit, pursuant to section 10(a)(1)(B) of the Act, that non-federal entities in the western Mojave Desert planning area are in the process of preparing. If the Service issues an incidental take permit to the non-federal entities, the habitat conservation plan would complement the management actions that the Bureau has proposed to undertake on public lands. At the appropriate time, the effects of the proposed issuance of an incidental take permit for the non-federal portion of the West Mojave Plan will be evaluated in a separate biological opinion.

History of the California Desert Conservation Area Plan Consultations

On March 16, 2000, the Center for Biological Diversity, the Sierra Club, and the Public Employees for Environmental Responsibility filed a lawsuit against the Bureau. The plaintiffs alleged that the Bureau violated section 7(a)(2) of the Act and its implementing regulations by failing to initiate and complete a programmatic consultation with the Service on the effects of the California Desert Conservation Area Plan, its amendments, and all related actions that may affect listed species in the California Desert Conservation Area that are authorized, approved, allowed, or otherwise carried out pursuant to the California Desert Conservation Area Plan and its amendments. The plaintiffs also alleged that the Bureau violated section 7(d) of the Act and its implementing regulations by authorizing, allowing, or otherwise carrying out a variety of land use practices and other projects that may affect federally listed species prior to completing consultation with the Service on the California Desert Conservation Area Plan and its amendments.

On August 25, 2000, the plaintiffs and the Bureau signed a settlement agreement that was approved by the U.S. District Court, Northern California Division as a Consent Decree. Terms of the agreement required that the Bureau enter into formal consultation with the Service under section 7(a)(2) of the Act on the California Desert Conservation Area Plan as it would be modified by proposed amendments resulting from various planning efforts, such as the Northern and Eastern Mojave Desert Management Plan and Northern and Eastern Colorado Desert Coordinated Management Plan. On January 16, 2001, the plaintiffs and the Bureau agreed to a second settlement agreement that described 58 interim measures intended to promote the conservation of various listed species within the California desert.

The Consent Decree was amended on May 1, 2002. This amendment incorporated 15 additional interim measures intended to promote the conservation of various listed species within the California desert. Two measures were specific to the planning area in the western Mojave Desert.

Because the California Desert Conservation Area covers approximately 25 million acres and land management issues are substantially different across the desert landscape, the Bureau divided the California Desert Conservation Area into five bioregional planning areas. These planning areas include the western Mojave Desert, the northern and eastern Mojave Desert, the northern and eastern Colorado Desert, the western Colorado Desert, and the Coachella Valley. Planning efforts have been completed in all regions, except for the western Mojave Desert bioregion.

The Bureau and Service agreed that the most efficient means of consulting on the California Desert Conservation Area Plan was to address specific groups of species in separate consultations. Therefore, the requirement of the first settlement agreement was satisfied in a series of consultations, with the Service issuing biological opinions for numerous species throughout the California desert; this biological opinion will complete the consultation process on the California Desert Conservation Area Plan. The following paragraphs describe those consultations that are relevant to the western Mojave Desert planning area.

In a biological opinion dated June 17, 2002, we concluded that the California Desert Conservation Area Plan, as it had been formally amended since 1980, modified by previous consultations related to grazing in the western Mojave Desert, modified by proposed interim conservation measures, and proposed to be modified by the Northern and Eastern Mojave Desert Management Plan and Northern and Eastern Colorado Desert Coordinated Management Plan, was not likely to jeopardize the continued existence of the desert tortoise or adversely modify its critical habitat (Service 2002a).

On December 17, 2002, we issued a biological opinion in which we concluded that the California Desert Conservation Area Plan, as it had been formally amended since 1980, modified by previous consultations related to grazing in the western Mojave Desert, modified by proposed interim conservation measures, and proposed to be modified by the Northern and Eastern Mojave Desert Management Plan and Northern and Eastern Colorado Desert Coordinated Management Plan, was not likely to jeopardize the continued existence of the endangered southwestern willow flycatcher (*Empidonax traillii extimus*), least Bell's vireo (*Vireo bellii pusillus*), or arroyo toad (*Bufo californianus*) (Service 2002b).

By memorandum dated March 17, 2003 (Bureau 2003d), the Bureau requested the Service's concurrence, pursuant to section 7(a)(2) of the Act, that the proposed designation of routes of travel in the western Mojave Desert was not likely to adversely affect the desert tortoise, the listed carbonate plants, and their critical habitats (i.e., Parish's daisy and the endangered Cushenbury oxytheca (*Oxytheca parishii* var. *goodmaniana*), Cushenbury milk-vetch, and Cushenbury buckwheat (*Eriogonum ovalifolium* var. *vineum*)). By memorandum dated April 7, 2003 (Bureau 2003e), you requested our concurrence that the proposed designation of routes of travel in the western Mojave Desert was not likely to adversely affect Lane Mountain milk-

vetch. In these memoranda, you also requested our concurrence that the proposed designation of routes of travel would not affect the bald eagle (*Haliaeetus leucocephalus*), least Bell's vireo, southwestern willow flycatcher, California red-legged frog (*Rana aurora draytonii*), arroyo toad, Mohave tui chub (*Gila bicolor mohavensis*), and triple-ribbed milk-vetch (*A. tricarinatus*). (The bald eagle and California red-legged frog are federally listed as threatened; the Mohave tui chub and triple-ribbed milk-vetch are listed as endangered.) On June 30, 2003, we responded, via memorandum that we concurred with your determinations for all of the species except for the desert tortoise and Lane Mountain milk-vetch. In the same document, we provided our biological opinion that the proposed designation of routes of travel in the western Mojave Desert was not likely to jeopardize the continued existence of the desert tortoise or Lane Mountain milk-vetch or adversely modify the critical habitat of the desert tortoise (Service 2003a).

On September 25, 2003, we issued a biological opinion in which we concluded that the California Desert Conservation Area Plan, as it had been formally amended since 1980, modified by previous consultations related to grazing in the western Mojave Desert, and modified by proposed interim conservation measures, was not likely to jeopardize the continued existence of the carbonate plant species or adversely modify their critical habitat (Service 2003b).

By memorandum dated October 17, 2003, we concurred with your determinations that the California Desert Conservation Area Plan, as it had been formally amended since 1980, modified by previous consultations related to grazing in the western Mojave Desert, and modified by proposed interim conservation measures, was not likely to adversely affect the threatened Inyo California towhee (*Pipilo crissalis eremophilus*) and bald eagle and the endangered Yuma clapper rail (*Rallus longirostris yumanensis*) and Mohave tui chub. On September 8, 2003, the Service withdrew its proposal to list the mountain plover (*Charadrius montanus*) as an endangered species; consequently, we notified you via memorandum that we would not consider this species in our evaluation of your determination (Service 2003c).

On May 27, 2003, the plaintiffs (joined by Desert Survivors) filed a related lawsuit in U.S. District Court, Northern District of California against the Bureau and the Service challenging issuance of the June 17, 2002, biological opinion and implementation of the California Desert Conservation Area plan (as amended). On June 20, 2003, the American Motorcycle Association District 37, Off-road Business Association, San Diego Off-road Vehicle Association, and Utah Shared Access Alliance filed a lawsuit in U.S. District Court, District of Utah against the Bureau and the Service for the alleged failure to implement the recovery plan for the desert tortoise. The suit was later transferred to the Northern District of California and amended to challenge the June 17, 2002, biological opinion.

In an August 3, 2004, order, the District Court held that the Service had relied on an invalid regulatory definition of "adverse modification" while analyzing effects to designated critical habitat in the June 17, 2002, biological opinion. The biological opinion was vacated and remanded to the Service with instructions to reissue the biological opinion after applying the appropriate definition of adverse modification, which the District Court defined as "a direct or

indirect alteration of critical habitat which appreciably diminishes the value of that habitat for either the survival or recovery of a listed species.”

The District Court responded to the defendants’ and plaintiffs’ subsequent motions to alter or amend the judgment and for injunctive relief, respectively, in a December 30, 2004, order that, among other things, no longer prescribes a specific definition for adverse modification but adopts the following language amending the August 3, 2004, order:

The Court finds, for example, that a proper definition of “destruction or adverse modification” would be “a direct or indirect alteration of critical habitat which appreciably diminishes the value of that habitat for either the survival or recovery of a listed species.” The Court hereby vacates and remands the biological opinion to the Service to reconsider its biological opinion of the (California Desert Conservation Area) Plan in light of the appropriate standard.

Proposed Critical Habitat of Lane Mountain Milk-Vetch

Subsequent to your original request for formal consultation on the West Mojave Plan, the Service published a proposed rule to designate critical habitat for Lane Mountain milk-vetch (69 *Federal Register* 18018). By memorandum dated August 20, 2004, the Bureau requested formal conference, pursuant to section 7(a)(4) of the Act, with regard to proposed critical habitat of Lane Mountain milk-vetch (Bureau 2004a). However, on April 8, 2005, we published a final rule that did not designate any critical habitat (70 *Federal Register* 18220). Consequently, we will not address your request for formal conference regarding proposed critical habitat of Lane Mountain milk-vetch in this biological opinion.

Other Listed Species within the West Mojave Planning Area

In your request for formal consultation, you also requested our concurrence that the proposed action is not likely to adversely affect the Inyo California towhee or its critical habitat. As noted in the previous paragraph, we concurred with your determination that the California Desert Conservation Area Plan, as it had been formally amended since 1980, modified by previous consultations related to grazing in the western Mojave Desert, and modified by proposed interim conservation measures, was not likely to adversely affect the Inyo California towhee or its critical habitat. The proposed action does not change the management of the lands upon which this species occurs; consequently, we again concur with your determination that the proposed action is not likely to adversely affect the Inyo California towhee or its critical habitat. We note that the Bureau has proposed to remove invasive plant species, such as tamarisk (*Tamarix* spp.) and common reed (*Phragmites australis*) over time at 11 springs in the Great Falls Basin Area of Critical Environmental Concern. It will also monitor Peach Springs in the Argus Mountains Wilderness to ensure that burros are not damaging habitat. These actions, in general, would benefit the Inyo California towhee; the Bureau will consult with the Service, pursuant to section 7(a)(2) of the Act, at the time specific actions are implemented, if appropriate.

You also requested our concurrence that the proposed action is not likely to adversely affect the Cushenbury buckwheat and Cushenbury oxytheca or the critical habitat of these carbonate plant species. Through the West Mojave Plan, the Bureau will create an area of critical environmental concern for the Cushenbury oxytheca and Cushenbury buckwheat and will designate all the roads therein as limited (to use by claimholders only). The Bureau also proposes a land exchange with the Cushenbury Mine Trust to attempt to acquire lands within the area of critical environmental concern that support both the Cushenbury oxytheca and Cushenbury buckwheat. The only occurrence of Cushenbury oxytheca within the California Desert Conservation Area is located on Cushenbury Mine Trust lands near the boundary with the San Bernardino National Forest east of Highway 18. The new area of critical environmental concern would protect on public lands at least 5 polygons totaling 160 acres of Cushenbury buckwheat. An additional 160 acres of the Cushenbury buckwheat are located on the Cushenbury Mine Trust lands that the Bureau hopes to acquire by exchange. Acquired lands will not be opened to mineral entry. A land use standard of no surface disturbance to prevent undue degradation would apply within the area of critical environmental concern. Underground mining could be allowed; however, the Bureau must first approve a plan of operations. Because the only occurrences of the Cushenbury oxytheca and Cushenbury buckwheat within the California Desert Conservation Area would be protected by the measures proposed by the Bureau, we concur with your determination that the West Mojave Plan, as proposed, is not likely to adversely affect the Cushenbury oxytheca and Cushenbury buckwheat and their critical habitat.

The Bureau also determined that the proposed action will not affect the bald eagle, Yuma clapper rail, least Bell's vireo, southwestern willow flycatcher, mountain plover, California red-legged frog, Mohave tui chub, triple-ribbed milk-vetch, and Hoover's woolly-star. Bald eagles traverse the western Mojave Desert but do not winter on public lands or breed in this region. We acknowledge that the bald eagle will not be affected by the Bureau's programs because its occurrence on public lands within the planning area is transitory.

Yuma clapper rails were documented at Harper and East Cronese Dry Lakes over 23 years ago; Garrett and Dunn (1981) consider these locations to be "extralimital" or not within the normal range of the species. Consequently, because it has not been detected in the western Mojave Desert since the early 1980s and is not currently known to occur within the planning area, implementation of the West Mojave Plan will not affect the Yuma clapper rail.

We are not aware of southwestern willow flycatchers breeding on lands managed by the Bureau in the planning area (Service 2002b). Least Bell's vireos breed within the Big Morongo Canyon Area of Critical Environmental Concern (LaPre 2005i). Both species migrate through the western Mojave Desert and, during migration, could use any type of riparian habitat in the planning area in a transitory manner. The proposed action will not affect individuals of these species during migration because of their transitory presence at any given site within the planning area and because provisions of the proposed action are generally protective of riparian habitat throughout the planning area. The proposed action will not affect breeding least Bell's vireos at the Big Morongo Canyon Area of Critical Environmental Concern because the Bureau is not proposing any actions within this area in the West Mojave Plan; additionally, the focus of

the Bureau's management direction for this area of critical environmental concern is the conservation of wildlife, including particularly migratory songbirds.

As we noted previously in this document, the Service withdrew its proposal to list the mountain plover. The California red-legged frog and Mohave tui chub do not occur on lands managed by the Bureau. We published a final rule to remove the Hoover's woolly-star from the list of threatened and endangered species on October 7, 2003 (68 Federal Register 57829). Consequently, we will not discuss these species further in this document.

The triple-ribbed milk-vetch occurs on public lands in the planning area only within the Big Morongo Canyon Area of Critical Environmental Concern. The goal of this area of critical environmental concern is to protect the biological resources found in that area; consequently, little ground disturbance occurs within the area of critical environmental concern. Additionally, as part of the proposed action, the Bureau will require the proponents of any future action to avoid impacts to individuals and their habitat on public lands (section 2.2.4.10.22 in Bureau et al. 2005). For these reasons, the triple-ribbed milk-vetch will not be affected by implementation of the West Mojave Plan.

Finally, the endangered arroyo toad also occurs in the planning area, near Little Horsethief Creek, which eventually flows into the West Fork of the Mojave River; this area is located along the north slope of the San Bernardino Mountains. Although the Bureau did not address this species in its request for consultation, the final environmental impact report and statement notes that the multiple use classification of 1,814 acres of public land will be changed from unclassified to Class M. (Note that the final environmental impact report and statement also states that this change would affect lands designated as critical habitat for the arroyo toad; however, in a final rule dated April 13, 2005, the Service did not include these lands within the boundaries of critical habitat (70 *Federal Register* 19562).) We have addressed the potential effects of the California Desert Conservation Area Plan on the arroyo toad in a previous biological opinion (Service 2002b). The only proposed change in the West Mojave Plan from the management direction analyzed in that consultation is the change in multiple use classification. The former unclassified designation would have allowed the Bureau to dispose of this land for any purpose. Under the Class M designation, the Bureau will be able to offer these lands to a public agency, such as the California Department of Parks and Recreation, for a Recreational and Public Purposes lease; the lessee will then manage the lands for the conservation of the arroyo toad. Consequently, this proposed amendment of the California Desert Conservation Area Plan is not likely to adversely affect the arroyo toad.

For the various reasons cited in the preceding paragraphs, we will not consider any of the species discussed in this section further in this biological opinion.

Review of the Draft Biological Opinion

We provided a draft biological opinion for your review on August 16, 2005. We received your comments on the draft document by memorandum, dated November 4, 2005. We have incorporated your comments into this final biological opinion, as appropriate.

BIOLOGICAL OPINION

This biological opinion does not rely on the regulatory definition of “destruction or adverse modification of critical habitat” at 50 *Code of Federal Regulations* 402.02. Instead, we have relied upon the statutory provisions of the Act to complete the following analysis with respect to critical habitat.

Note that, during the development of this biological opinion, the Service requested clarification from the Bureau regarding several aspects of the proposed action in relation to the areas within and outside of desert wildlife management areas and critical habitat; we also conducted additional analyses using our GIS layers. Given the variations in data used in the various GIS layers and the numerous actions under consideration in this consultation, the resulting calculations occasionally presented variations in results; these variations may occasionally appear in this biological opinion. Although a few numbers may vary to some degree, the differences are minor and do not affect the basic outcome of any analysis.

DESCRIPTION OF THE PROPOSED ACTION

Purpose and Function of the California Desert Conservation Area Plan

Congress designated the California Desert Conservation Area under the authority of section 601(c) of the Federal Land Policy and Management Act of 1976. To provide for management of recreational use and to resolve other resource and public land use conflicts, the Federal Land Policy and Management Act also directed the Secretary of the Interior to “prepare and implement a comprehensive, long-range plan for management, use, development, and protection of the public lands within the California Desert Conservation Area.” The purpose, as specified by Congress, was “to provide for the immediate and future protection and administration of the public lands in the California Desert within the framework of a program of multiple use and sustained yield, and the maintenance of environmental quality.” The California Desert Conservation Area Plan was signed in January 1980 and now serves as the primary document that describes the basic management principles the Bureau uses for managing its portion of the California Desert Conservation Area. Since its adoption, the Bureau has completed 12 major amendments to the California Desert Conservation Area Plan.

The California Desert Conservation Area Plan employs three basic tools for managing resources in the California Desert Conservation Area. These tools are:

1. Four multiple-use classes are the basis of a land zoning system that allows for a variety of uses and resource conservation activities. Class C lands are those that have been formally designated as wilderness by Congress; it is also used for lands that are being recommended for wilderness designation. Lands within Class L (limited use) include areas that are managed to provide for lower density, carefully controlled multiple uses of resources while ensuring that sensitive values are not significantly diminished. Lands within Class M (moderate use) include areas that are managed to provide for a wide variety of present or future uses that include mining, livestock grazing, recreation,

energy, and utility development. The purpose of Class I (intensive use) lands is to provide for concentrated use of lands and resources to meet human needs (Bureau 1999).

2. The following twelve California Desert Conservation Area Plan elements provide detailed treatments and prescriptions addressing the management of different land uses and resources: cultural resources; Native American; wildlife; vegetation; wilderness; wild horse and burro; livestock grazing; recreation; motorized-vehicle access; geology, energy and mineral; energy production and utility corridors; and land-tenure adjustment.
3. The designation of special management areas, including, but not limited to special areas and areas of critical environmental concern, which require “special management attention ... to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards.”

The California Desert Conservation Area Plan (Bureau 1999) contains detailed descriptions of the multiple-use class guidelines and elements that the Bureau uses to direct its management of public lands in the California desert. Our previous biological opinions on the effects of the California Desert Conservation Area Plan, as amended and proposed for amendment, describe the effects that the implementation of these multiple-use class guidelines and elements may have on the listed species and their critical habitat in the California desert. These multiple-use class guidelines and elements do not describe specific, on-the-ground actions; with the exception of casual use, all future actions that the Bureau may propose under the program direction of the California Desert Conservation Area Plan are subject to the consultation requirements of section 7(a)(2) of the Act. Because we have analyzed the potential effects of these multiple-use class guidelines and elements in previous biological opinions and because these multiple-use class guidelines and elements would not change as a result of approval of the West Mojave Plan, we will not repeat these descriptions and analyses herein. Instead, we will focus our analysis on the changes in land uses that the Bureau has proposed as part of its plan amendments for the western Mojave Desert.

Alternative B of the West Mojave Plan

The Bureau requested consultation on alternative B, as described in the draft environmental impact report and statement (Bureau 2003c, Bureau et al. 2003). This alternative consists of the elements of alternative A that are applicable to and can be implemented on Bureau-administered lands. Under alternative A, non-federal entities within the planning area would apply for an incidental take permit, pursuant to section 10(a)(1)(B) of the Act, for activities that would occur without a Federal nexus; if the Service consequently issues an incidental take permit to local agencies, alternative A of the West Mojave Plan would be implemented. The Bureau issued the final environmental impact report and statement (Bureau et al. 2005) before we completed the biological opinion; consequently, where the final environmental impact report and statement differed from the draft document, we altered the proposed action described in this biological opinion to correspond to the Bureau's current proposal.

The essence of the Bureau's component (alternative B) of the West Mojave Plan is the adoption of an amendment to the California Desert Conservation Area Plan. (Note that the environmental impact report and statement describes the various actions the Bureau proposes to undertake as separate amendments; however, any changes to the California Desert Conservation Area Plan that result from the West Mojave Plan will be considered a single amendment to the California Desert Conservation Area Plan. We have maintained the discussion of the 11 amendments in this biological opinion to be consistent with the environmental impact report and statement.) We will describe the portions of these amendments that pertain to the species under consideration in this biological opinion in detail in the following sections; that is, if a species does not occur in an area that would be affected by the amendment, we will not discuss that species in relation to the amendment. The titles of the amendments are derived from Table 2-2 of the final environmental impact report and statement (Bureau et al. 2005).

Amendment 1, New Areas of Critical Environmental Concern. The Bureau will designate 14 new areas of critical environmental concern to conserve listed species, sensitive species, and areas that protect groups of species or important habitat. The new areas of critical environmental concern and the amount of land, in acres, currently managed by the Bureau in those areas that occur within areas that may be inhabited by the desert tortoise and listed carbonate plants are:

- Fremont-Kramer Desert Wildlife Management Area (1,023,329 – includes all four desert wildlife management areas)
- Superior-Cronese Desert Wildlife Management Area
- Ord-Rodman Desert Wildlife Management Area
- Pinto Mountain Desert Wildlife Management Area
- Bendire's Thrasher Conservation Area (28,046)
- Carbonate Endemic Plants Research Natural Area (4,393)
- Coolgardie Mesa Conservation Area (10,107)
- Mojave Monkeyflower Conservation Area (36,630)
- West Paradise Conservation Area (257)
- Parish's Phacelia Conservation Area (512)
- Pisgah Conservation Area (14,224)

The Coolgardie Mesa, West Paradise, and Parish's Phacelia conservation areas are located within the Superior-Cronese Desert Wildlife Management Area and the Superior-Cronese critical Habitat Unit of the desert tortoise. Desert tortoises likely occur in very low numbers within and immediately surrounding the Parish's Phacelia Conservation Area, which is centered around a series of small dry lakes. The primary constituent elements of critical habitat are not well represented in this conservation area because substrates are either high in clay content or rocky, portions of the area flood, and perennial vegetation is sparse or absent. Therefore, the management prescriptions associated with this conservation area are not likely to benefit the desert tortoise. The other two conservation areas support higher quality habitat and greater numbers of desert tortoises. Consequently, the management prescriptions for these areas, such as withdrawal from mineral entry, could benefit desert tortoises on a local basis. Because the effects of the management prescriptions for these conservation areas are entirely beneficial to the

desert tortoise and its critical habitat, we will not discuss these conservation areas further in this biological opinion.

We recognize that the Bureau has, in the final environmental impact report and statement, proposed establishment of the desert wildlife management areas and conservation areas as part of its amendments; until the Bureau signs a record of decision on the proposed amendment to the California Desert Conservation Area Plan, these areas will remain proposed. To simplify the writing of our biological opinion, we have not inserted the word "proposed" prior to each use of the phrases "desert wildlife management area" and "conservation area" in reference to the conservation areas being proposed by the Bureau as part of the West Mojave Plan.

The following description of special management areas, such as areas of critical environmental concern or research natural areas, is summarized from the California Desert Conservation Area Plan (Bureau 1999). Normally, after an area has been formally designated as a special management area, a site-specific activity plan is prepared that clearly identifies the ongoing management objectives for the area. The activity plans for the new special management areas, mentioned previously, are described in the final environmental impact report and statement and appendices.

Development, when wisely planned and properly managed, may occur in areas of critical environmental concern if the basic intent of protection of historic, cultural, scenic, or natural values is ensured. In the interests of certain wildlife and cultural resources, surface disturbances from mining, motorized-vehicle access, and grazing or other uses will be controlled. In some cases, fencing may be used to prevent unintentional impacts. Fencing may also be used to reduce or eliminate competition for water sources or forage to benefit particular species of wildlife. Some valuable wildlife resources may require assistance in the way of habitat restoration or enhancement. Directional signs and visitor use areas will be developed and designated to encourage visitor cooperation, and informational facilities and interpretive programs will be instituted to increase visitors' knowledge of and sensitivity to the need to protect important natural and cultural resource values. Consultation with the adjacent land owners will be conducted when management of an area of critical environmental concern conflicts with adjacent owners' land uses and requirements (Service).

Management prescriptions for areas of critical environmental concern may override the multiple-use class guidelines for the local area. The Bureau monitors existing conditions within an area of critical environmental concern to ensure that resource degradation is not occurring. Monitoring data will be used to guide corrective actions that may be necessary.

We have included detailed discussions only of the special management areas that occur within the ranges of the listed species under consideration in this biological opinion and provide conservation benefits to these species and their habitats. The environmental impact report and statement contains greater detail on and maps of the special management areas.

The desert wildlife management areas for the desert tortoise will be managed for the conservation and recovery of this species until it is delisted pursuant to the criteria described in

the recovery plan. Multiple use classes within the desert wildlife management areas will be changed to Class L. We described other changes in multiple use classes within desert tortoise habitat in the section of this biological opinion on amendment 3.

An important component of the Bureau's management of these desert wildlife management areas is the establishment of a one percent threshold for new ground disturbance for the 30-year life of the plan. New ground disturbance includes any clearing, excavating, grading or other manipulation of the terrain, whether or not a permanent use is proposed for the site. The final environmental impact report and statement notes that, if the Bureau exceeds its allowable ground disturbance, it may be required to conduct individual consultations, pursuant to section 7(a)(2) of the Act, for all future actions. In fact, although we will work with the Bureau to attempt to develop expedited means of conducting future consultations, the regulations that implement section 7(a)(2) of the Act and recent court cases clearly indicate that the Bureau will need to continue to consult on individual projects. If the Bureau exceeds its allowable ground disturbance, it may be required to re-initiate formal consultation, pursuant to section 7(a)(2) of the Act, on the California Desert Conservation Area Plan for the western Mojave Desert planning area, as required by 50 *Code of Federal Regulations* 402.16.

The Bureau will track the amount of new ground disturbance within each conservation area. (Many features of the West Mojave Plan apply to all conservation areas, although the specific names of these areas may vary (e.g., desert wildlife management area, conservation area, research natural area); therefore, in the preceding sentence, the concept of 'allowable ground disturbance' applies to all conservation areas and the specific amount of allowable ground disturbance for the desert tortoise desert wildlife management areas is 13,000 acres. Simply stated, all desert wildlife management areas are also conservation areas, but not all conservation areas are desert wildlife management areas.) The baseline acreage for the allowable ground disturbance will be adjusted if land transfers from one agency to another.

The Bureau will apply a mitigation fee to new ground-disturbing activities that may occur on its lands. The Bureau will require applicants for permits to compensate for all new land disturbance at the time the permit is issued. The fee would not be additive where multiple species exist on site or where conservation areas for species overlap. The fee would be based on the average value of an acre of land within the habitat conservation area. Within conservation areas, the compensation ratio will be 5:1; that is, for each acre of land disturbed, the project proponent would provide five times the average value of an acre of land. Outside of the conservation areas on lands delineated as disturbed habitat, the ratio will be 0.5:1. Within all other areas outside of the habitat conservation area, the ratio will be 1:1. Table 2-7 and Map 2-8 of the environmental impact report and statement display the criteria used to delineate disturbed habitat and areas where the three compensation ratios apply, respectively. Table 2-9 of the environmental impact report and statement describes minor exceptions to the requirement for compensation on the Bureau's lands. Grazing is not considered a new ground-disturbing activity.

The Bureau will manage compensation fees collected on its lands; it will maintain the fees in a special account established for the acquisition of mitigation lands within the habitat conservation area. Appendix C and section 2.2.4.1 of the environmental impact report and statement identify

priorities for the acquisition of land within the conservation areas. These funds could also be expended on other implementation measures established by the West Mojave Plan. Appendix C also lists these measures and provides an initial prioritization for their implementation.

Fire Management. The Bureau has not proposed any changes in the manner in which it manages fire in the western Mojave Desert. Because this element was evaluated in previous biological opinions on the California Desert Conservation Area Plan, we will not discuss this issue further in this document (Service 2003b [Parish's daisy and Cushenbury milk-vetch], 2002c [Lane Mountain milk-vetch], 2005c [desert tortoise]).

Land Acquisition within Habitat Conservation Areas. The Bureau will seek to maintain existing public lands in an unfragmented state and to acquire private land within conservation areas. The environmental impact report and statement describes the variables the Bureau will consider when attempting to acquire land. In some cases, conservation easements may be used as an alternative to acquisition. After acquisition of a parcel of private land, the Bureau will designate routes, monitor biological resources, and implement other appropriate management actions, pursuant to the provisions of the California Desert Conservation Area Plan. Lands that are acquired to promote the conservation of the species considered in the West Mojave Plan will not be opened to mineral entry. Because the acquisition of lands within a conservation area will not adversely affect desert tortoises, Lane Mountain milk-vetch, Parish's daisy, or Cushenbury milk-vetch or their designated critical habitat, we will not discuss it further in this biological opinion.

The Bureau will adopt a standard of no surface occupancy to prevent undue and unnecessary degradation of lands, under the surface mining regulations, within the Carbonate Endemic Plants Area of Critical Environmental Concern. Public lands within the Coolgardie and West Paradise conservation areas will be withdrawn from mineral entry, subject to valid existing rights.

In other areas, access for mining exploration, conducted in accordance with the General Mining Law of 1872, will be limited to public roads and designated open routes unless otherwise permitted under a plan of operations approved by the Bureau. Drilling to explore for minerals and the development of access routes to drill sites will be considered as temporary disturbances. If the access route is closed within 120 days of the beginning of surface-disturbing activities, all activities are appropriately monitored to minimize impacts as they occur, and any surface disturbance at the drill site is reclaimed, these activities would not be counted against the one percent allowable ground disturbance for the conservation areas.

Native Plant Harvesting. The harvesting of native plants will not be allowed within conservation areas. This prohibition does not include salvage of plants from ground-disturbing activities, collection of seeds or propagules for restoration, eradication of non-native weeds, or research. Outside of the conservation areas, plant harvesting will be regulated in accordance with the California Desert Native Plant Protection Act.

Recreation. No vehicle speed events will be allowed in the portions of the conservation area that lie within the desert wildlife management areas and the Mohave Ground Squirrel Conservation

Area. The Bureau will continue to implement the existing biological opinion on dual sport events, subject to the following guidelines:

1. Dual sport events would be allowed seasonally in desert wildlife management areas, including the Rand Mountains. Dual sport events will be allowed from November 1 to March 1 while most desert tortoises are inactive. Existing education materials will be supplemented to indicate that very young desert tortoises may be encountered during the fall and winter and should be avoided; this information will be provided to participants at the time of the event.
2. Dual sport events in those portions of the Mohave Ground Squirrel Conservation Area outside of the desert wildlife management area will be allowed from September through February only. The prescriptions described in the biological opinion for desert tortoises will apply.
3. Dual sport events outside of desert wildlife management areas and the Mohave Ground Squirrel Conservation Area would be allowed year-round. Within the Pisgah and Carbonate Endemic Plants areas of critical environmental concern, specific stipulations, to be developed at the time of event application, will apply.
4. The Bureau will revise its educational materials provided to dual sports participants to indicate that both adult, and particularly hatchling, desert tortoises may be active at Thanksgiving and riders should watch for and avoid such animals.

Because the Bureau will limit vehicle events to designated open routes, we do not anticipate that they will affect the listed plant species or their designated critical habitat being considered in this biological opinion. Consequently, we will not discuss this topic in relation to these species again in this biological opinion.

Minimum impact recreation (e.g., hiking, equestrian uses, bird watching, photography, etc.) would be allowed within the conservation areas.

Wildlife Water Sources. Existing springs, seeps, and artificial water sources (guzzlers, drinkers, tanks) would remain in place. Water sources at natural springs and seeps will not be diverted and native riparian vegetation will not be removed to create artificial water sources for wildlife. The Bureau, Service, California Department of Fish and Game, and non-profit organizations, such as Quail Unlimited, would be allowed access to the waters for maintenance and for removal of invasive vegetation, subject to existing restrictions (e.g., vehicle travel in wilderness areas). Retaining livestock water sources would be at the discretion of the grazing permittee.

These activities will not affect the listed plant species or designated critical habitat addressed in this biological opinion. We are unaware of any springs or guzzlers within the range of Lane Mountain milk-vetch. Springs and artificial waters are more likely to occur within the ranges of Parish's daisy and Cushenbury milk-vetch because of the terrain these species inhabit. However, the proposed management direction should not affect these species for several reasons. First,

these species do not occur in wetland or riparian areas and the Bureau's proposed management direction indicates that natural waters will not be diverted or its surrounding vegetation removed. Second, Dove Springs is the only water source in this area that has been developed for cattle. The area immediately adjacent to Dove Springs is already disturbed to a degree that the listed plant species are not present; additionally, the Bureau has fenced critical habitat of the carbonate species to exclude cattle. For these reasons, we will not discuss management direction with regard wildlife water sources and listed plant species again in this biological opinion.

Commercial Activities. Commercial activities, such as commercial filming that result in ground disturbance or adverse effects, are allowed in the desert wildlife management areas but only if the project proponent applies measures to avoid killing desert tortoises that are applicable to temporary construction impacts. The Bureau has not proposed any changes to its current management of filming activities; these measures are summarized in appendix C of the final environmental impact report and statement. In addition, the following measures will apply:

1. The Bureau will develop a brochure, to be provided to the proponent, showing the boundaries of the desert wildlife management areas and areas where higher densities of desert tortoises occur within the desert wildlife management areas that should be avoided, as far as possible.
2. Where filming activities may occur equally well on alternative sites, the Bureau will direct proponents to lands outside desert wildlife management areas. Within desert wildlife management areas, the Bureau will direct proponents to areas that support lower densities of desert tortoises.
3. Preplanning, including implementation of the preceding measures, will rely on the expertise of the Bureau's biologists to help the location manager choose sites where filming would have the least impact on desert tortoises.

Domestic Dogs. Dogs would be allowed off leash if they are accompanied by and under the control of their owners. Off-leash dogs will be prohibited in some situations (e.g., construction sites in desert wildlife management areas).

Highway Construction and Maintenance. The Bureau will encourage proponents who wish to construct new roads or railroads to locate them outside of desert wildlife management areas. The final environmental impact report and statement suggests that seasonal restrictions for maintenance activities may be appropriate; that is, on public lands, road work should be restricted to the period from November 1 through February 1. The final environmental impact report and statement also notes that roadbeds should not be lowered and berms should not exceed 12 inches in height or a slope of 30 degrees. Invasive weeds will not be used in landscaping within or adjacent to desert wildlife management areas. These measures are likely to protect desert tortoises, the listed plant species, and their habitats to some degree. We will not consider these measures further in this biological opinion, however, because they do not constitute specific management practices, in and of themselves. The degree to and manner in which they are implemented will be determined during the planning of specific projects.

Hunting and Shooting. Hunting is regulated by State law; the Bureau cannot regulate hunting. Consequently, we will not discuss this issue further in this biological opinion.

The shooting or discharge of firearms would generally be permitted on public lands except in specified areas (e.g., off-highway vehicle management areas), as long as State and local laws permit such activity. On public lands within desert wildlife management areas, the only firearm discharges allowed would be during hunting season in pursuit of game and target practice using retrievable targets, such as paper targets.

Utility Construction and Maintenance. The Bureau will review new linear utility projects within conservation areas at the time they are proposed. The Bureau will consider the following guidelines, which have been modified slightly from those contained in the draft environmental impact report and statement as a result of discussions with the Service during consultation:

1. To the degree possible, new utility right-of-ways in designated, active, and contingent corridors will be situated as close together as practical, given engineering specifications, human safety, and other limiting factors.
2. If at all possible, future utilities will be located in an alternative corridor rather than Corridor Q.
3. Within existing corridors, already disturbed areas will be used, if possible.
4. Pipelines within desert wildlife management areas will be revegetated after installation. Construction rights-of-way will be narrowed, to the degree possible, in all management areas.
5. In desert wildlife management areas, the effects of ground disturbance caused by projects will be restored in a manner that: (a) stabilizes soil surfaces control erosion by wind and water; (b) minimizes or eliminates future vehicle use in areas to be revegetated; (c) minimizes or eliminates future vehicle use of adjacent, undisturbed areas; (d) curtails the spread of exotic weeds; and (e) provides habitat for the target species.
6. The Bureau or its appointee will develop a standardized revegetation plan and apply it equitably throughout desert wildlife management areas. The revegetation plan will clearly state goals, methods based on the best available scientific information, and success criteria that are realistic for desert restoration. A technical advisory team of regulatory personnel, restoration experts, knowledgeable utilities personnel, and others will be assembled to devise and write guidelines for a standardized revegetation plan.

The measures proposed by the Bureau with regard to the construction and maintenance of utilities should generally function to reduce the adverse effects of these actions on the desert tortoise and its critical habitat. The specific measures to be used will be determined by the Bureau and other responsible agencies at the time specific actions are proposed. For this reason and because we have evaluated the general effects of the construction and maintenance of

utilities in the biological opinion for the California Desert Conservation Area Plan (Service 2005c), we will not discuss this issue further in this biological opinion. Note that the Service and Bureau have consulted on the operation and maintenance on a programmatic basis for several pipelines; these biological opinions will remain in effect unless specifically modified through re-initiation of formal consultation, pursuant to 50 *Code of Federal Regulations* 402.16.

No utility corridors are located within the occupied or critical habitat of the three listed plant species within the action area. Consequently, we will not discuss this portion of the West Mojave Plan in relation to these species again in this biological opinion.

Surveys for Desert Tortoises. Presence-absence surveys and clearance surveys will be required for all actions on all public lands within desert wildlife management areas. The former surveys are used to determine whether desert tortoises may be present at a project site; the latter are used to remove desert tortoises from areas where they may be killed or injured during implementation of a project. Outside of desert wildlife management areas, the Bureau will require only clearance surveys to be conducted.

Standard guidelines for handling (Desert Tortoise Council 1999) and disposing of (Berry 2003) desert tortoises will be implemented. We will not repeat the provisions of these protocols here because they have been reviewed previously by Service staff and have been in wide use for years.

Best Management Practices for Construction Projects. The final environmental impact report and statement contains descriptions of the measures that the Bureau and any project proponents it authorizes will undertake to reduce the adverse effects of construction activities on the desert tortoise and its habitat. In general, these measures reflect the current management strategy employed by the Bureau. Additionally, individual reviews of projects as they are proposed will allow for modification of these procedures, as necessary and appropriate. Consequently, we will not discuss these guidelines further in this biological opinion.

Disease. The environmental impact report and statement notes that "(i)ssues related to disease would be considered at the level of the interagency desert tortoise Management Oversight Group." The environmental impact report and statement also suggests a strategy to manage disease; however, the Bureau notes that "(i)mplementation of the [program to manage disease] would occur only after all other [desert] tortoise management programs established by [the West Mojave] Plan have been funded and implemented."

The strategy includes provisions for control of vectors, such as installing boundary fences between desert wildlife management areas and urban areas, developing procedures to quarantine areas if disease is detected, and using headstarting or other procedures to re-introduce desert tortoises into areas where they are extirpated. It includes an education component to alert the public about incompatible human activities in the desert and the problems with releasing captive desert tortoises into the wild. The strategy would include the establishment of an emergency trust fund for use during epidemics. It includes a proposal to develop captive colonies to maintain the genetic heterogeneity of desert tortoises in the Western Mojave Recovery Unit.

The strategy calls for promoting the health of desert tortoises by improving habitat conditions through reducing the amount of ground disturbance, removing sludge and biosolids from near critical habitat, and providing supplemental food and water under experimental conditions. Monitoring would be implemented to determine if dust from mines, agricultural fields, the edges of roads, and disturbed playas is affecting desert tortoises; the health status of desert tortoises would also be monitored. Finally, research would be conducted on the epidemiology of diseases encountered in desert tortoises, the relationship of toxicants and disease, headstarting, transmission of diseases, and other disease-related topics.

The management and control of diseases that may be affecting desert tortoises are critical issues that must be resolved if the recovery is to occur. We note that most of the elements of the strategy proposed by the Bureau are highly experimental in nature (e.g., developing procedures to quarantine areas if disease is detected), will require additional approvals to implement (e.g., any headstarting program will need authorization under section 10(a)(1)(A) of the Act), or are beneficial in terms of habitat management (e.g., reducing the amount of ground disturbance). Consequently, we will not analyze this strategy further in this biological opinion.

The Bureau will sign or otherwise designate the boundaries of desert wildlife management areas to identify them and facilitate enforcement. The signs would be placed in specific areas, as needed. This action will benefit the conservation of desert tortoises and management of critical habitat by providing information to the public; a slight possibility exists that desert tortoises or their critical habitat may be affected during placement of the signs; however, this possibility is insignificant because such adverse effects are easily avoided. Consequently, we will not discuss this issue further in this biological opinion.

Headstarting. The Bureau proposed to implement a headstarting program in areas where desert tortoises have apparently been extirpated or their numbers substantially reduced. Any headstarting program for desert tortoises will require separate approval from the Service under the appropriate authorities of the Act. At the time someone requests our authorization for such a program, the Service will also consult internally, pursuant to section 7(a)(2) of the Act, regarding the effects of our potential authorization. Consequently, although headstarting may, at some point, be a mechanism we use to attempt to recover the desert tortoise, we will not consider it further in this biological opinion.

Law Enforcement. The Bureau would attempt to ensure more law enforcement rangers and maintenance workers are in the field; it will also attempt to focus their efforts on the conservation of biological resources. However, the Bureau cannot commit to any specific level of implementation at this time. For this reason, we will not analyze this portion of the West Mojave Plan further in this biological opinion.

Predation by Common Ravens. The Bureau has proposed numerous actions that are designed to reduce predation on desert tortoises by common ravens. These measures include habitat modifications to reduce roosting and nesting opportunities on artificial structures, lethal control of problem individuals, and reducing the overall number of common ravens in selected areas.

Weed Abatement. The Bureau will cooperate with known specialists and organizations (including the Kern County Weed Management Agency, the Mojave Desert Resource Conservation District, and the California Exotic Pest Plant Council) to fund, coordinate, encourage, implement, and facilitate programs that contribute to the conservation of the desert tortoise and other listed species in the planning area. If successfully implemented, a program to control weeds would benefit the desert tortoise and improve the function of critical habitat by reducing the abundance of non-native species that are of little or no value and increasing the abundance of important forage plants. Future implementation of such a program, however, depends upon additional research, acquisition of funds and other factors; consequently, because the potential future actions have not been defined on any fundamental level, we will not discuss this issue further in this biological opinion.

Other Measures. The Bureau will require a study to determine if desert tortoises are being killed in quail guzzlers in the Western Mojave Recovery Unit. If the mortality level is considered unacceptable, a study would be designed to determine the best method of eliminating entrapment of desert tortoises while not impairing the function of the guzzler.

Amendment 2, New Boundaries of Existing Areas of Critical Environmental Concern. The boundary of the Afton Canyon Area of Critical Environmental Concern would be expanded by 3,840 acres and 480 acres would be deleted; the size of the expanded area of critical environmental concern will be 8,160 acres. The motorized vehicle access network of the California Desert Conservation Area Plan will be adopted as the network of vehicle access routes for the area of critical environmental concern. All lands within the expanded boundary will be withdrawn from mineral location and entry. These actions are likely to benefit the desert tortoise to some degree. The Afton Canyon Area of Critical Environmental Concern is located in the Cady Mountains. Desert tortoises occur in the Cady Mountains at very low densities. Increasing the size of the area in which the management guidelines for areas of critical environmental concern would be implemented and reducing the potential for ground disturbance and vehicular traffic related to minerals would promote the conservation of the few desert tortoises in this area. The Afton Canyon Area of Critical Environmental Concern is not within critical habitat of the desert tortoise. Consequently, this proposal will not affect critical habitat of the desert tortoise.

The Western Rand Area of Critical Environmental Concern will be expanded by 13,120 acres. This action should benefit the desert tortoise and promote the conservation role and function of the Fremont-Kramer Critical Habitat Unit by increasing the size of the area in which the management guidelines for areas of critical environmental concern would be implemented. Maintenance of desert tortoises in this area of the western Mojave Desert is crucial because it provides a link between the Desert Tortoise Natural Area, which is managed primarily for the conservation of the species, and the remainder of the Fremont-Kramer Desert Wildlife Management Area; if desert tortoises cannot persist in the Western Rand Area of Critical Environmental Concern, the Fremont-Kramer Desert Wildlife Management Area would essentially be split into eastern and western components.

The effects of expanding the Afton Canyon and Western Rand areas of critical environmental concern on the desert tortoise (and its critical habitat, in the latter case) are entirely beneficial. Consequently, we will not discuss these actions again in this document.

Changes in the boundaries of the Barstow Woolly Sunflower and Harper Dry Lake areas of critical environmental concern would not affect listed species. These areas of critical environmental concern overlap only the range of the desert tortoise. The Barstow Woolly Sunflower Area of Critical Environmental Concern is completely included within desert wildlife management areas for the desert tortoise; therefore, its management would not alter that of the desert tortoise. The Harper Dry Lake Area of Critical Environmental Concern is located entirely within Harper Dry Lake, which does not normally provide habitat for desert tortoises. Consequently, we will not discuss these areas of critical environmental concern again in this document.

Amendment 3, Changes in Multiple-use Class Designations. The specific changes resulting from this amendment are as follows. We have included only those changes in multiple-use class that may affect listed species under consideration in this biological opinion.

Afton Canyon Area of Critical Environmental Concern. The multiple-use class designations will be changed from M to L on certain lands within the expanded area of critical environmental concern.

Bendire's Thrasher Area of Critical Environmental Concern. The Bureau will change the multiple-use class designations from M to L on 9,809 acres in the northern Lucerne Valley.

Carbonate Endemic Plants Area of Critical Environmental Concern. The Bureau will change the multiple-use class designations from M to L on 4,393 acres on the north slope of the San Bernardino Mountains.

Desert Tortoise Desert Wildlife Management Areas. The Bureau will change the multiple-use class designations from M to L on 365,485 acres and from U to L on 34,566 acres within the boundaries of the desert wildlife management areas.

Disposal Parcels in Inyo County. The Bureau will change the multiple-use class designations from M and L to unclassified on 6,828 acres in southern Inyo County. This area is partially within the range of the desert tortoise but outside of any desert wildlife management area.

West Mojave Land Tenure Adjustment Program. Under this program, the Bureau designated consolidation zones where it would attempt to acquire private lands and retain public lands, retention zones where it would retain public lands, and disposal zones where it would dispose of public lands. The Environmental Baseline for the Desert Tortoise and its Critical Habitat - Previous Consultations section of this biological opinion contains a more detailed discussion of the history and status of this program. As part of the West Mojave Plan, the Bureau will change the multiple-use class designation of unclassified lands within the current disposal zone that are adjacent to the existing retention zone to Class L. The primary areas where this measure would

affect desert tortoises are in the area around the junction of Highway 58 and Harper Lake Road, where the Bureau added approximately 12,503 acres to the retention area, and north of the El Mirage Off-highway Vehicle Management Area, where approximately 8,502 acres were added. Because the effects of this proposed action are beneficial to the desert tortoise and its critical habitat, we will not analyze this action further in this biological opinion.

Note that the adjustment to the West Mojave Land Tenure Adjustment Program contained in the West Mojave Plan constitutes a re-initiation of the consultation on the original program. By memorandum dated June 29, 1990, the Bureau indicated it would not acquire lands in the easternmost portion of the consolidation zone until a decision had been reached regarding the proposed expansion of the Department of the Army's Fort Irwin. The original biological opinion on the West Mojave Land Tenure Adjustment Program states that, should the expansion of Fort Irwin occur in this area, the Bureau would not be able to complete the land tenure adjustment project, as proposed, and that re-initiation of formal consultation would be required (Service 1990). Through Public Law 107-107, approximately 118,600 acres were added to Fort Irwin along its southwestern and eastern boundaries in 2002. Consequently, this biological opinion constitutes our revised biological opinion for the West Mojave Land Tenure Adjustment Program; it supercedes previous biological opinions (Service 1990, 1998) on the land tenure adjustment program in the western Mojave Desert.

Little San Bernardino Mountains Gilia Habitat. The Bureau will change the multiple-use class designations from unclassified to M on 1,922 acres adjacent to Joshua Tree National Park.

Mojave Fishhook Cactus Area of Critical Environmental Concern. The Bureau will change the multiple-use class designations from unclassified to L on 628 acres south of Helendale.

Mojave Monkeyflower Area of Critical Environmental Concern. The Bureau will change the multiple-use class designations from unclassified and I to L on 10,633 acres in Brisbane Valley.

Mohave Ground Squirrel Conservation Area. The Bureau will change the multiple-use class designations from Class I to Class L on 5,391 acres east of Searles Dry Lake.

Non-Wilderness Class C. The Bureau must reclassify any lands that were not designated as wilderness through the California Desert Protection Act. Several of the parcels for which the Bureau proposes to change the multiple-use class do not support habitat of the desert tortoise and are not discussed herein. Four parcels may support desert tortoises (LaPre 2004b).

Near the Rodman Mountains Wilderness, small strips of land, totaling 242 acres, on the boundaries of the wilderness and the Red Top Cinder Mine "cherrystem" would be changed from multiple-use class C to L; this area is within the Ord-Rodman Critical Habitat Unit and Desert Wildlife Management Area. An additional 240 acres at the mine site, which has been disturbed by previous mining activities and is higher than 4,000 feet in elevation, would be changed from multiple-use class C to M; this area was excluded from the desert wildlife management area but is within the critical habitat unit.

The Bureau would change the multiple-use class from C to L on 219 acres near the Newberry Mountains Wilderness. The Bureau also proposes to change 50 acres from multiple-use class C to M. Both areas are almost entirely within the Ord-Rodman Desert Wildlife Management Area and Critical Habitat Unit.

The Bureau proposes to change the multiple-use class designation from C to L on 52 acres near the Golden Valley Wilderness, from C to M on 501 acres, and from C to I on 105. All of these are out of the Fremont-Kramer Desert Wildlife Management Area and Critical Habitat Unit. These areas may contain habitat for the desert tortoise and low numbers of animals.

Near the El Paso Mountains Wilderness, the Bureau proposes to change the multiple-use class designation from C to L on 362 acres. This area is not located within a desert wildlife management area or critical habitat unit. As in the case of Golden Valley, the area may support desert tortoises and their habitat.

Pisgah Area of Critical Environmental Concern. The Bureau will change the multiple-use class designations from M to L on 14,224 acres generally north of the Marines Corps Air Ground Combat Center.

Western Rand Area of Critical Environmental Concern. The Bureau will change the multiple-use class designation from Class M to L on 13,120 acres in the area between State Highway 395 on the east and the existing area of critical environmental concern on the west.

Amendment 4, Designation of the Mohave Ground Squirrel Conservation Area. The Bureau will establish a 1,308,877-acre conservation area for the Mohave ground squirrel (*Spermophilus mohavensis*). This area overlaps, to some degree, the Fremont-Kramer and Superior-Cronese critical habitat units of the desert tortoise. The conservation area also extends beyond the desert wildlife management areas to the north and west. This area will be managed under many of the same provisions that will apply in the desert wildlife management areas.

Amendment 5, Implementation of the Rand Mountains – Fremont Valley Management Plan. The Bureau will amend the California Desert Conservation Area Plan to implement the Rand Mountains – Fremont Valley Management Plan that was drafted in 1994. The changes to current management include expansion of the Western Rand Area Of Critical Environmental Concern by 13,120 acres, designation of the lands in the expanded area of critical environmental concern as Class L, the closure of the entire management area to off-highway vehicle use except for 129 miles of designated open routes, and categorization of a portion of the Rand Mountains - Fremont Valley Management Area as Category I habitat for the desert tortoise. The Bureau would also withdraw 32,590 acres within the Rand Mountains - Fremont Valley Management Area from mineral location and entry. The 6,090-acre Koehn Lake and an additional 8,320 acres within the management area would remain as Class I and open to mineral entry.

The Bureau has also proposed to require visitors to obtain a permit if they wish to use vehicles in the Rand Mountains. To obtain a permit, visitors would be required to complete a short

educational program and, once this is accomplished, could purchase a permit. The goal would be to increase compliance with applicable rules and regulations.

The Bureau's request for consultation on the proposed amendment of the California Desert Conservation Area Plan in this planning area also serves as re-initiation of formal consultation regarding the implementation of the Rand Mountains – Fremont Valley Management Plan. The Service and Bureau previously consulted on this management plan (Service 1992c, 1993a). This biological opinion also addresses the effects of the implementation of the management plan on the critical habitat of the desert tortoise.

Amendment 6, Afton Canyon Natural Area. We will discuss the adoption of an access network for routes as part of our analysis of Amendment 2. Therefore, we will not discuss Amendment 6 again in this biological opinion.

Amendment 7, West Mojave Land Tenure Adjustment Program. We will discuss proposed changes in the West Mojave Land Tenure Adjustment Program as part of our analysis of Amendment 3. Therefore, we will not discuss Amendment 7 again in this biological opinion.

Amendment 8, Adoption of Standards and Guidelines for Management of Grazing.

Standards and Guidelines. The Bureau will use regional standards and guidelines for public land health, the California Desert Conservation Area Plan, allotment management plans, and terms and conditions from existing biological opinions to manage livestock grazing. The standards express the level of physical and biological condition or degree of function required for healthy, sustainable public lands; the guidelines for grazing management are the types of activities and practices determined to be appropriate to ensure that the standards can be met or that substantial progress can be made towards meeting them. Section 2.2.5 of the final environmental impact statement (Bureau et al. 2005) contains a more complete discussion of standards and guidelines and how they relate to management of livestock. A standard is an expression of the level or physical and biological condition or degree of function required for healthy, sustainable rangelands. Guidelines are types of grazing management activities and practices determined to be appropriate to ensure that the standards can be met or significant progress can be made toward meeting them.

The standards for the West Mojave Plan include the management of substrates, native species, the function of riparian areas and wetlands, and water quality; the function of riparian areas and wetlands and water quality are not relevant to the desert tortoise or its critical habitat so we will not discuss them further in this biological opinion. Substrates should have infiltration rates and permeability rates that are appropriate for substrate type, climate, geology, land form, and past uses; the Bureau uses canopy and ground cover, the diversity of plant species, the amount of litter and organic matter, microbiotic soil crusts, evidence of wind or water erosion, and other factors to indicate whether the standards for substrates are being met. To determine whether standards for native species are being met, the Bureau evaluates photosynthetic and ecological processes, plant vigor, nutrient cycles, the production of litter, age class distribution of plants and animals, distribution and cover of plant species, and other factors. The guidelines for grazing

management are intended to maintain existing conditions, if the standards are being met, or to set management on a course toward improving conditions so that the standards can be met.

These standards and guidelines are generally compatible with the management of critical habitat of the desert tortoise because the standards provide descriptions for the physical and biological functioning that is appropriate for any given area of range and the guidelines establish management practices for grazing that either maintain habitat in good condition or seek to improve habitat quality where it is not functioning properly. Because the regional standards of public land health and guidelines for grazing management are designed to ensure the maintenance of high quality habitat or to improve the condition of habitat that is not functioning properly, we conclude that their implementation is not likely to adversely affect the desert tortoise or its critical habitat; consequently, we will not discuss them again in this biological opinion.

Only the Rattlesnake Canyon Allotment occurs within or near habitat occupied by the carbonate plants; Cushenbury milk-vetch does not occur in areas that are grazed (Bureau 2001). Additionally, the Bureau has constructed a boundary fence on the Rattlesnake Canyon Allotment to exclude from grazing from all areas occupied by Parish's daisy. As proposed by the Bureau, no livestock allotments overlap areas inhabited by the Lane Mountain milk-vetch. Consequently, Lane Mountain milk-vetch, Cushenbury milk-vetch, and Parish's daisy and the critical habitat of the latter two species are not likely to be adversely affected by livestock grazing; we will not discuss this activity further in this document.

Measures Regarding Specific Cattle Allotments. The Lacey-Cactus-McCloud Allotment boundary will be modified to exclude those portions that occur on the Naval Air Weapons Station, China Lake. Only the portion of the Lacey-Cactus-McCloud Allotment that was located within the Naval Air Weapons Station supported desert tortoises; because this portion of the allotment has been cancelled, desert tortoises will no longer be affected by grazing within this allotment. Therefore, we will not discuss the Lacey-Cactus-McCloud Allotment substantially again in this biological opinion.

The Valley Well Allotment occupies 524 acres east of Highway 247; it is authorized for 24 animal unit months and has been grazed 5 of the last 10 years. The Bureau's biologist recommended that it not be included in the Ord-Rodman Desert Wildlife Management Area because of its proximity to the base property of the rancher and its degraded condition (Chavez 2004). This allotment is within the boundaries of the Ord-Rodman Critical Habitat Unit. Because of the small size of the allotment, its degraded condition, and location adjacent to the heavily used Highway 247 and other human disturbances, we do not consider that it supports the primary constituent elements of critical habitat and will not discuss it further in this biological opinion.

Cattle Grazing within Desert Tortoise Habitat. The following prescriptions for management of livestock grazing will be implemented for all cattle allotments managed by the Bureau in the planning area that occur in desert tortoise habitat. The table in this general section of the biological opinion lists the relevant allotments. We note that the Bureau also states (page 2-126

of Bureau et al. 2005) that it will continue to ensure compliance with the terms and conditions of previous biological opinions that addressed grazing in the California Desert Conservation Area; we will not analyze the measures contained in those biological opinions further in this document.

All cattle carcasses found within 300 feet of a road or watering source will be removed and disposed of in an appropriate manner (i.e., not buried) within 2 days of being found or, if this is not practicable, such reasonable time as is acceptable to the Bureau's authorized officer. If the carcass is in a wilderness area or if it requires cross-country travel by a vehicle, the operator must obtain authorization from the Bureau prior to conducting this activity. Carcasses that are located more than 300 feet from a road or watering source will not be removed unless the Bureau determines they pose a health or safety hazard (Bureau 2005c).

New cattle guards will be designed and installed to prevent entrapment of desert tortoises. All existing cattle guards within suitable habitat will be modified within 3 years of adoption of the West Mojave Plan to prevent entrapment of desert tortoises.

Any hazards to desert tortoises that may be created, such as auger holes and trenches, will be eliminated before the rancher, contractor, or work crew leaves the site. This measure would serve to protect desert tortoises by reducing the likelihood that they would become trapped in hazards that are created during work on range improvements. Because it would be implemented as part of future specific actions that would undergo separate review by the Bureau and Service, we will not discuss it further in this biological opinion.

Grazing use will continue until a lessee voluntarily relinquishes all grazing use.

Cattle Grazing within Desert Wildlife Management Areas. The grazing prescriptions in this section will be implemented for all cattle allotments managed by the Bureau in the planning area that occur in desert wildlife management areas. The Cronese Lake, Harper Lake, Ord Mountain, and Pilot Knob allotments occur within desert wildlife management areas.

No ephemeral authorizations would occur in desert wildlife management areas. Allotments currently capable of authorizing ephemeral and perennial forage for cattle use will be designated for perennial forage use only. Therefore, the Pilot Knob Allotment would no longer be available for cattle grazing and all ephemeral production would be available for the conservation of the desert tortoise. Authorizations related to grazing activities (e.g., range improvements) on the Pilot Knob Allotment would be cancelled and the allotment designation would be removed from the California Desert Conservation Area Plan.

The Bureau will prohibit issuance of temporary non-renewable grazing permits in desert wildlife management areas for all lands below an elevation of 4,000 feet.

When ephemeral forage production is less than 230 pounds per acre, cattle will be substantially removed from portions of the allotment within the desert wildlife management areas referred to as "designated exclusion areas" (see Map 2-13 from the final environmental impact report and statement, Bureau et al. 2005) from March 15 to June 15. The designated exclusion areas

correspond to critical habitat of the desert tortoise. The term "substantially removed" recognizes that a few cattle might wander into the designated exclusion areas despite the operator's best efforts and regardless of management facilities (e.g., fences, water sources) that are in place.

Cattle may remain past March 15 if ephemeral forage production is likely to surpass 230 pounds per acre. If this level of forage is not attained when weather conditions (e.g., warming of the soil) are appropriate, cattle must be substantially removed from designated exclusion areas until such time as 230 pounds per acre ephemeral forage is achieved or June 15, whichever is earlier. If cattle must be removed, the operator would be given 2 weeks to remove them from the designated exclusion area.

The Ord Mountain Allotment Management Plan will be revised after adoption of the West Mojave Plan. As part of the implementation of the revised allotment management plan, based upon available funding, range fences would be installed in two places to exclude cattle from areas of high concentration of desert tortoises along the southern boundary of the allotment, west of the Cinnamon Hills, and along the eastern boundary of the allotment, in the vicinity of Box Canyon. Excluding cattle from areas where desert tortoises occur in higher concentrations would be beneficial because the effects on individuals and on the primary constituent elements would be eliminated. Because the allotment management plan has not been developed to date, we will not analyze this proposed action further in this biological opinion. The Bureau and Service will consult on the allotment management plan, under the auspices of section 7(a)(2) of the Act, when appropriate.

Cattle Grazing outside of Desert Wildlife Management Areas. In all cattle allotments occurring in desert tortoise habitat outside of desert wildlife management areas, ephemeral authorization will only be granted when ephemeral production exceeds 230 pounds per acre.

Measures Regarding Specific Sheep Allotments. The Goldstone Allotment is located on lands that Congress transferred from the Bureau to the Army, in support of the expansion of Fort Irwin. Therefore, the Goldstone Allotment will no longer be grazed. Because this allotment is no longer within the action area of this consultation, we will not discuss it further in this biological opinion.

Grazing use in the Cantil Common, Bissell, Boron, Monolith-Cantil, Buckhorn Canyon, Spangler, Stoddard Mountain, Lava Mountains, and Rudnick Common allotments will continue until the lessee voluntarily relinquishes the grazing lease.

Sheep Grazing within Desert Tortoise Habitat. The following prescriptions for management of livestock grazing will be implemented for all sheep allotments managed by the Bureau in the planning area that occur in desert tortoise habitat. The table in this general section of the biological opinion lists the relevant allotments. We note that the Bureau also states (page 2-130 of Bureau et al. 2005) that it will continue to ensure compliance with the terms and conditions of the 1994 biological opinion (Service 1994d) regarding the grazing of sheep in the California Desert Conservation Area; we will not analyze the measures contained in that biological opinion further in this document.

Turnout of sheep in all allotments will not occur until 230 pounds per acre of ephemeral forage are available. The lessee will be required to remove sheep from the area or the entire allotment if production falls below 230 pounds per acre. This prescription is not applicable to those allotments that authorize sheep use of perennial forage.

Following the removal of lambs, multiple bands of sheep are typically combined. At this time, no more than 1,600 adult sheep will be allowed in a combined band.

Sheep Grazing within the Mohave Ground Squirrel and Mojave Monkeyflower Conservation Areas. The prescriptions in this section will be implemented on sheep allotments located within the Mohave Ground Squirrel and the Mojave Monkeyflower conservation areas. Unless otherwise noted, all prescriptions listed in the previous section for sheep allotments will also be implemented in these areas. The Cantil Common, Gravel Hills, Hansen Common, Lava Mountains, Monolith-Cantil, Rudnick Common, Shadow Mountain, Spangler Hills, and West and Middle Stoddard Mountain allotments will be affected by these prescriptions.

To avoid competition between sheep and the Mohave ground squirrel once the ephemeral forage is no longer available and both species are relying on perennial forage, all sheep will be removed from the Mohave Ground Squirrel Conservation Area when ephemeral plants are no longer the primary forage being used by sheep.

The Bureau will use winterfat (*Krascheninnikovia lanata*), spiny hopsage (*Grayia spinosa*), four-winged saltbush (*Atriplex canescens*), shadscale (*A. confertifolia*), and allscale (*A. polycarpa*), which have been identified as important to the foraging ecology of the Mohave ground squirrel, as key species. The maximum utilization levels for sheep grazing in the Mohave Ground Squirrel Conservation Area will be 30 percent for winterfat and 25 percent for the other species; sheep will be removed from the entire or specific portions allotment when these levels are reached.

To facilitate adaptive management, if future research shows that key species different from those in the previous paragraph are important to the Mohave ground squirrel, those species will be added to the monitoring program. Similarly, if a species identified in the previous paragraph is not considered important to the Mohave ground squirrel in another part of its range, that species may be dropped from the list.

Sheep grazing will be prohibited from the Middle Stoddard Mountain Allotment where it coincides with the Mojave Monkeyflower Conservation Area in Brisbane Valley. The Bureau will work with the lessee to clearly identify Mohave monkeyflower habitat to be avoided.

Sheep Grazing within Desert Wildlife Management Areas. These measures will be in effect within 2 years of adoption of the West Mojave Plan. The Gravel Hills and Superior Valley allotments, which are located entirely within desert wildlife management areas, will no longer be available for sheep grazing.

The boundaries of the Buckhorn Canyon, Lava Mountains, Monolith-Cantil, and East and West Stoddard Mountain allotments will be modified so that areas within desert wildlife management areas will no longer be available for sheep grazing. Consistent with the 1994 biological opinion, small portions of the Shadow Mountains and Cantil Common allotments would continue to be grazed (see map 2-14 of Bureau et al. 2005) within desert wildlife management areas. On the Shadow Mountain Allotment, 600 acres of public land that are within the Fremont-Kramer Critical Habitat Unit would be grazed (Chavez 2005a). On the Cantil Common Allotment, approximately 6,196 acres of critical habitat on public lands, also within the Fremont-Kramer Critical Habitat Unit, would be grazed (Chavez 2005b). In both of these cases, the Bureau will use roads to define manageable boundaries of grazed areas, rather than relying on the boundaries contained in the final rule for the designation of critical habitat of the desert tortoise; in many cases, the boundaries of critical habitat were drawn on section lines, which cannot be detected on the ground.

Sheep grazing use would be authorized in the Shadow Mountains and Cantil-Common allotments where they overlap desert wildlife management areas under the following conditions. Turnout of sheep will not occur until 350 pounds per acre of ephemeral forage are available. The lessee will be required to remove sheep from an area of the allotment if ephemeral forage production falls below 350 pounds per acre. The last day of sheep use will be June 1. Watering and loading and unloading will occur at established previously disturbed sites. The conditions summarized in Appendix O of the final environmental impact report and statement (Bureau et al. 2005) would also apply.

Voluntary Relinquishment of Cattle and Sheep Allotments. The California Desert Conservation Area Plan does not currently provide for voluntary relinquishment of cattle and sheep allotments, but it would be amended to allow for this action. Voluntary relinquishment of a grazing permit or lease, combined with a decision in the West Mojave Plan designating selected public lands as not available for livestock grazing, is an important method for achieving conservation goals for desert tortoise and other sensitive species. By itself, voluntary relinquishment has no effect on whether an allotment may be grazed. The Bureau may transfer the forage made available as a result of the relinquishment to a new permittee or lessee if grazing is an allowable use under the existing land use plan. Any qualified applicant can apply for the available forage. When combined with a land use planning decision designating public lands as not available for livestock grazing, voluntary relinquishment can result in long-term reduction or elimination of grazing on public lands. Land use planning decisions are not irreversible, however, and a decision to designate lands as available or not available for livestock grazing can be changed through a subsequent plan amendment or revision.

Upon approval of the West Mojave Plan, allotments identified for voluntary relinquishment would continue to be available for livestock grazing under the terms and conditions of the plan until a permittee or lessee submits a written request for voluntary relinquishment, the Bureau and the permittee or lessee agree on a timeframe, and the Bureau complies with all statutory requirements including issuance of a grazing decision in accordance with 43 *Code of Federal Regulations* 4160.1 based on site-specific environmental review, consultation with affected

parties, and such other procedures as may be required by statute or regulation. A grazing decision can be appealed to the Interior Board of Land Appeals.

The Bureau has been contacted by third parties who have expressed an interest in acquiring the grazing preference and permit/lease in the west Mojave Desert planning area for purposes other than livestock grazing. Private parties may use a variety of financial arrangements and sale contracts to acquire ranches and transfer the associated grazing permit. The Bureau is not a party to these private agreements. Although the Bureau may acknowledge an agreement during the planning process in connection with a voluntary request for relinquishment, the Bureau conducts its own analysis and makes its own independent decision about devoting public rangelands to a use other than livestock grazing.

The Bureau's decision whether to identify an allotment for voluntary relinquishment and subsequent designation of the public lands as not available for grazing is based on criteria set forth in the its Land Use Planning Handbook, H-1790-1, Appendix C. A separate plan amendment or revision will not be required where voluntary relinquishment is identified as a management action for an allotment. In the planning area, the Cady Mountain, Cronese Lake, Harper Lake, Ord Mountain, Pilot Knob, Bissell, Boron, Buckhorn Canyon, Cantil Common, Lava Mountains, Monolith-Cantil, Shadow Mountains, Spangler Hills, East Stoddard Mountain, Middle Stoddard Mountain, West Stoddard Mountain, and Rudnick Common allotments may potentially be relinquished.

Grazing use would continue until the lessee voluntarily relinquishes its grazing preference and lease. Upon relinquishment, the Bureau would, without further analysis or notice: not reissue the lease; remove the allotment designation; assume any and all private interest in range improvements located on public land; and designate the land within the allotment as no longer available for livestock grazing.

Voluntary relinquishment would only occur where the action would ultimately result in direct conservation benefits for special-status plant and animal species covered by the West Mojave Plan. Table 2-20 of the final environmental impact report and statement lists the grazing allotments that may be relinquished and species that would benefit from this action. (Note that the habitat conservation plan in development for the western Mojave Desert includes numerous sensitive species that are not subject to the consultation requirements of section 7(a)(2) of the Act.)

Allotments identified as "Common" (e.g., Rudnick Common) are so-named because multiple lessees have grazing rights on those allotments; several of them are identified for both cattle and sheep grazing. Lessees may request voluntary relinquishment of the portion of common allotments they are permitted to graze where use areas have been identified through an allotment management plan or where management areas or pastures have been assigned by the Bureau in accordance with 43 *Code of Federal Regulations* 4110.2-4. Where common allotments are not divided into use areas, voluntary relinquishment must be requested by all lessees permitted to graze the allotment.

Amendment 9, Public Land Vehicle Access Network. The Bureau, through the West Mojave Plan, will designate routes on public lands that it manages as open, closed to motorized vehicle access, or open on a limited basis. The designation process included an extensive revision of the route network within critical habitat of the desert tortoise, the design of a route network compatible with sensitive resources in specific areas, and retention of existing route networks in specific areas, such as portions of the networks designated in 1985 and 1987, and within existing areas of critical environmental concern, the Rand Mountains - Fremont Valley Management Area, and the Ord Mountain pilot program area.

Because of court-ordered deadlines, the Bureau signed a decision record in June 2003 regarding the adoption of a motorized vehicle access network in the western Mojave Desert; the Service issued a biological opinion on the proposed network on June 30, 2003 (Service 2003a). That decision record amended the California Desert Conservation Area Plan to adopt the network. However, because the motorized vehicle access network is also a component of the West Mojave Plan's conservation strategy, the analysis presented in the environmental assessment for route designation was included in the draft environmental impact report and statement for this amendment of the California Desert Conservation Area Plan. Consequently, the Bureau accepted comments regarding suggested modifications of the network during the public review of the draft environmental impact report and statement. The record of decision for the California Desert Conservation Area Plan amendment regarding the West Mojave Plan will incorporate the route network that was approved in June 2003, as modified during completion of the West Mojave Plan. The final environmental impact report and statement contains a full discussion of the history of route designation and the methods and criteria used to develop the currently proposed network. Adoption of the California Desert Conservation Area Plan amendment for the western Mojave Desert will result in a route network that consists of 5,433.4 miles of open routes and 30.6 miles of limited routes within habitat of the desert tortoise (LaPre 2005e and 2005h, respectively).

The Bureau will retain approximately 20 miles of the competition route network located to the northeast of the Spangler Hills Off-highway Vehicle Management Area. Approximately 10 miles of new open routes adjacent to the southern boundary of the Spangler Hills Off-highway Vehicle Management Area would be provided to provide touring loops and access connections. In total, approximately 15 miles of new open routes would be designated and 20 miles of open routes would be designated as competition routes. To offset the opening of new routes, approximately 35 miles of currently open routes within the Fremont-Kramer Desert Wildlife Management Area will be closed.

In a biological opinion, dated June 30, 2003, we concluded that the proposed designation of routes of travel in the western Mojave Desert was not likely to jeopardize the continued existence of Lane Mountain milk-vetch (Service 2003a). The Bureau proposed closure of an additional 12 routes and designated 2 routes as open on a limited basis within the West Paradise and Coolgardie conservation areas, but did not quantify the length of these routes (see Appendix R and Chapter 6 [response 182-26] of the final environmental impact report and statement). These reductions in the extent of the route network within the area occupied by Lane Mountain milk-vetch should be protective of this species and its habitat by reducing the potential for

unauthorized use of the area. Consequently, we will not include additional discussion of this proposal with regard to the listed plant species and their critical habitat in this biological opinion. We note, however, that unauthorized off-road vehicle use continues to threaten Lane Mountain milk-vetch in the southern portion of Coolgardie Mesa; we will provide additional detail on this issue in the Environmental Baseline - Status of the Lane Mountain Milk-vetch in the Action Area section of this biological opinion.

Measures to Avoid Adverse Effects. Routes designated as open would be available for commercial, recreational, casual access, permitted non-competitive, and other uses. Motorized vehicles will not be allowed to travel off of designated routes, except in emergency situations or with the explicit permission of the Bureau. The current law regarding speed limits on unimproved roads will apply. Basic Speed Law (38305) of the 2001 Vehicle Code, Traffic Laws states: "no person would drive an off-highway motor vehicle at a speed limit greater than is reasonable or prudent and in no event at a speed which endangers the safety of other persons and property." If monitoring or studies show that certain unimproved roads are causing increased mortality of desert tortoises, the Bureau will consider ways, including speed regulators, to reduce or avoid the level of mortality. On public lands, motorized vehicle travel in washes will be allowed only in those washes that are designated as "open routes" and signed as appropriate.

The final environmental impact statement notes that various groups volunteer to organize and complete projects such as the removal of trash and debris on desert lands, the installation of signs, fencing, barriers, and routine maintenance activities. To eliminate the need for separate documents to comply with the National Environmental Policy Act for each project, the Bureau proposed to conduct these actions under a set of standard programmatic stipulations. We note that desert tortoises and their habitat can benefit from actions such as the removal of trash and debris on desert lands, the installation of signs, fencing, and barriers; however, these actions also pose some threat because desert tortoises may be killed during implementation of these projects. We also note that the Bureau did not include standard programmatic stipulations in the final environmental impact statement. Consequently, although we agree that many of these projects may benefit the desert tortoise and its critical habitat, we will not discuss them further in this biological opinion; additional consultation, pursuant to section 7(a)(2) of the Act, may be required if the Bureau determines that these actions may affect the desert tortoise or its critical habitat.

We have previously concurred with your determination that the proposed route designation in the western Mojave Desert was not likely to adversely affect the Cushenbury milk-vetch and Parish's daisy or their designated critical habitat because of the relatively limited occurrences of the listed carbonate plants on Bureau lands, the relatively limited number of open routes, and the steep terrain that generally reduces the level of unauthorized off-road use (Service 2003a). The final environmental impact report and statement does not include any changes to the route network within habitat of the carbonate plants. Consequently, we will not discuss these species further with regard to route designation in this biological opinion.

Amendment 10, Stopping and Parking of Motorized Vehicles and Vehicular Camping. Within desert wildlife management areas, camping in association with motorized vehicles would be

allowed in previously existing disturbed camping areas adjacent to motorized vehicle routes designated as open. Stopping and parking of motorized vehicles would be allowed within 50 feet of the centerline of the designated route. Outside of desert wildlife management areas, on public lands administered by the Bureau, stopping, parking and camping associated with motorized vehicles must occur within 300 feet of routes designated as open in accordance with existing regulations. The existing regulations state that "... no person shall operate an off-road vehicle on public lands ... in a manner causing, or likely to cause significant, undue damage to or disturbance of the soil, wildlife, wildlife habitat, improvements, cultural, or vegetative resources or other authorized uses of the public lands" (43 *Code of Federal Regulations* 8341.1(f)(4)). Stopping, parking and camping must be done in a manner that would not cause uncontrolled widening of routes and undue degradation of sensitive or fragile resources.

Because stopping and parking motorized vehicles and vehicular camping can only occur along open routes, we analyzed the potential for this activity to affect the Parish's daisy and Cushenbury milk-vetch in our earlier consultation (Service 2003a). As noted in the previous section, we have previously concurred with your determination that the proposed route designation in the western Mojave Desert was not likely to adversely affect the Cushenbury milk-vetch and Parish's daisy or their designated critical habitat. Consequently, we will not discuss these species further with regard to stopping and parking motorized vehicles and vehicular camping in this biological opinion. We will discuss the potential effects of this activity on the Lane Mountain milk-vetch in the Effects of the West Mojave Plan on Lane Mountain Milk-Vetch - Amendment 10, Stopping and Parking of Motorized Vehicles and Vehicular Camping section of this biological opinion.

Amendment 11, Barstow to Vegas Race Course. The record of decision for the Bureau's Northern and Eastern Mojave Management Plan amended the California Desert Conservation Area Plan to eliminate the portion of the Barstow to Vegas course located within that planning area (Bureau 2002b). That action eliminated the eastern three-quarters of the route. Under Alternative B of the West Mojave Plan, the Bureau will amend the California Desert Conservation Area Plan to eliminate the western fragment of the old course. This action will benefit the desert tortoise and its critical habitat by eliminating an event that likely resulted in disturbance of habitat each year it was conducted; at least some desert tortoises have also likely been killed during this event in previous years. Consequently, we will not discuss this proposed action further in this biological opinion.

Amendment 11, Stoddard Valley to Johnson Valley Race Corridor. The Bureau will eliminate the Stoddard Valley to Johnson Valley race corridor. A designated open route would be retained between the two off-highway vehicle management areas. Any special events using this open route will be managed as non-speed events outside of the off-highway vehicle management areas. This action will benefit the desert tortoise and its critical habitat by eliminating an event that likely resulted in disturbance of habitat when events were conducted; the use of this corridor as an open route, subject to the same management prescriptions as other routes, will likely result in the same type of effects that have been discussed elsewhere in this biological opinion. Consequently, we will not discuss this proposed action further in this biological opinion.

Miscellaneous Actions. The Bureau proposed several additional actions as part of the West Mojave Plan that were not included in a specific amendment. We have summarized the actions that may be relevant to the listed species under consideration in this biological opinion in the following sections.

Johnson Valley to Parker Race Corridor. The Johnson Valley to Parker race corridor would be retained. The Johnson Valley to Parker race would continue on designated open routes as a permitted, organized event. Races in this corridor would require a special event permit from the Bureau. Stipulations in the special event permit would address issues such as law enforcement, sanitation, safety and resource protection, and any necessary minor modifications of the route. Where this corridor borders the boundaries of a desert wildlife management area, it will be run under yellow flag conditions.

The Bureau also proposes to designate a route network for the El Paso Mountains and Ridgecrest regions using a collaborative process involving stakeholders. We will not consider this action further in this biological opinion because the planning process has not been completed.

The Bureau proposes to nominate certain segments of the route network for inclusion by the California Department of Parks and Recreation as part of the California Back Country Discovery Trail. Because this trail would be located on existing routes, we envision that it would affect listed species in the same manner as the route network. Consequently, we will not consider this action further in this biological opinion.

Education Programs. The Bureau proposes to work with the general public, special interest groups, schools, government agencies, and development and commercial interests through a variety of media to make them aware of the resource values of the western Mojave Desert. We have generally found that properly implemented educational and outreach programs are vital to most successful conservation efforts. Because we do not anticipate any adverse effects to the desert tortoise from this program, we will not discuss it further in this biological opinion.

Additional Measures Related to Livestock Grazing

By memorandum dated March 17, 2005, the Bureau (2005a) requested that we include, in the biological opinion regarding the effects of the California Desert Conservation Area Plan on the desert tortoise and its critical habitat, a different mechanism of reporting on the conditions of livestock allotments than was contained in the original biological opinion on the California Desert Conservation Area Plan (Service 2002a). The revision reflected current grazing management, including the public land health standards, the regional standards and guidelines, and allotment-specific measures to protect the desert tortoise. Your memorandum also described the procedures to be used in the western Mojave Desert until the planning process for that area is completed; by electronic mail dated May 20, 2005, the Bureau indicated that it will also use this method of reporting for grazing in the western Mojave Desert (LaPre 2005b).

Specifically, the Bureau will authorize grazing activities in allotments within the planning area under the prescribed parameters for grazing use in desert tortoise habitat. If the Bureau finds that

grazing activities within an allotment are no longer in conformance with the plans, the Bureau will investigate and establish a corrective management action. The Bureau will contact the Service within 30 days of determining a management action. A determination will include either short-term or long-term management actions to resolve the conflict. Short-term corrective actions will require notification to the Service. A determination by the Bureau of a conflict that requires a long-term management measure may require informal or formal consultation with the Service. The Bureau will provide periodic reporting until the conflict within desert tortoise habitat is resolved or receipt of an allotment-specific biological opinion.

This method of reporting and resolving instances where grazing may occur in a manner that is not consistent with the parameters that the Bureau proposed achieves the goals intended by the first term and condition of the original biological opinion for the desert tortoise on the California Desert Conservation Area Plan (Service 2002a). Specifically, this method provides a mechanism by which the Bureau will ensure that livestock grazing does not affect desert tortoises in a manner that was not considered in this biological opinion. Consequently, we will not discuss general reporting requirements with regard to livestock grazing again in this biological opinion.

Action Area

The implementing regulations for section 7(a)(2) of the Act describe the action area to be all areas affected directly or indirectly by the Federal action and not merely the immediate area involved in the action (50 *Code of Federal Regulations* 402.02). The Federal action being considered in this biological opinion is the proposed amendment of the California Desert Conservation Area Plan through the adoption of the West Mojave Plan. Consequently, the action area under consideration in this biological opinion generally consists of public lands managed by the Bureau within the planning area for the West Mojave Plan, as described in the final environmental impact statement and report (Bureau et al. 2005). The planning area is located in the western Mojave Desert of California. In some portions of the planning area, land managed by the Bureau occurs in a checkerboard pattern with land owned by private entities and the State of California. We have generally considered the action area to include non-federal lands that are intermixed with or immediately adjacent to public lands; we have included these lands that are immediately adjacent or intermingled in the action area because the Bureau's management direction can profoundly affect such areas. Examples of this influence occur within grazing allotments, where livestock graze relatively small areas of non-federal land in the same manner as the larger tracts of public land, and along linear rights-of-way, where utility companies implement the same actions and protective measures for listed species on both public and non-federal lands. We considered large blocks of land that are not managed by the Bureau to be outside the action area. Because of their size and location, these large blocks of non-federal land are not affected by the Bureau's management of public lands. For example, we considered the intermingled public and non-federal lands in the area where the Fremont-Kramer and Superior-Cronese critical habitat units for the desert tortoise meet as being within the action area. However, we do not consider the large blocks of non-federal lands to the east of California City or to the west of the Cady Mountains and between Interstates 15 and 40 to be part of the action area.

Because of the scale and complexity of the proposed action and the number of species involved with this consultation, we have elected to present the Status of the Species (and Critical Habitat, where appropriate), Environmental Baseline, Effects of the Action, Cumulative Effects, and Conclusion sections for each species separately.

BIOLOGICAL OPINION FOR THE DESERT TORTOISE AND ITS CRITICAL HABITAT

STATUS OF THE DESERT TORTOISE AND ITS CRITICAL HABITAT

Basic Ecology of the Desert Tortoise

The desert tortoise is a large, herbivorous reptile found in portions of the California, Arizona, Nevada, and Utah deserts. It also occurs in Sonora and Sinaloa, Mexico. In California, the desert tortoise occurs primarily within the creosote, shadscale, and Joshua tree series of Mojave desert scrub, and the lower Colorado River Valley subdivision of Sonoran desert scrub. Optimal habitat has been characterized as creosote bush scrub in which precipitation ranges from 2 to 8 inches, diversity of perennial plants is relatively high, and production of ephemerals is high (Luckenbach 1982, Turner and Brown 1982, Schamberger and Turner 1986). Soils must be friable enough for digging of burrows, but firm enough so that burrows do not collapse. In California, desert tortoises are typically associated with gravelly flats or sandy soils with some clay, but are occasionally found in windblown sand or in rocky terrain (Luckenbach 1982). Desert tortoises occur in the California desert from below sea level to an elevation of 7,300 feet, but the most favorable habitat occurs at elevations of approximately 1,000 to 3,000 feet (Luckenbach 1982, Schamberger and Turner 1986).

Desert tortoises may spend more time in washes than in flat areas outside of washes; Jennings (1997) notes that, between March 1 and April 30, desert tortoises “spent a disproportionately longer time within hill and washlet strata” and, from May 1 through May 31, hills, washlets, and washes “continued to be important.” Jennings’ paper does not differentiate between the time desert tortoises spent in hilly areas versus washes and washlets; however, he notes that, although washes and washlets comprised only 10.3 percent of the study area, more than 25 percent of the plant species on which desert tortoises fed were located in these areas. Luckenbach (1982) states that the “banks and berms of washes are preferred places for burrows;” he also recounts an incident in which 15 desert tortoises along 0.12 mile of wash were killed by a flash flood.

Desert tortoises are most active in California during the spring and early summer when annual plants are most common. Additional activity occurs during warmer fall months and occasionally after summer rain storms. Desert tortoises spend most of their time in the remainder of the year in burrows, escaping the extreme conditions of the desert; however, recent work has demonstrated that they can be active at any time of the year. Further information on the range, biology, and ecology of the desert tortoise can be found in Burge (1978), Burge and Bradley (1976), Hovik and Hardenbrook (1989), Luckenbach (1982), Weinstein et al. (1987), and Service (1994c).

Food resources for desert tortoises are dependent on the availability and nutritional quality of annual and perennial vegetation, which is greatly influenced by climatic factors, such as the timing and amount of rainfall, temperatures, and wind (Beatley 1969, 1974, Congdon 1989, Karasov 1989, Polis 1991 in Avery 1998). In the Mojave Desert, these climatic factors are typically highly variable; this variability can limit the desert tortoise's food resources.

Desert tortoises will eat many species of plants. However, at any time, most of their diet often consists of a few species (Nagy and Medica 1986, Jennings 1993 in Avery 1998). Additionally, their preferences can change during the course of a season (Avery 1998) and over several seasons (Esque 1994 in Avery 1998). Possible reasons for desert tortoises to alter their preferences may include changes in nutrient concentrations in plant species, the availability of plants, and the nutrient requirements of individual animals (Avery 1998). In Avery's (1998) study in the Ivanpah Valley, desert tortoises consumed primarily green annual plants in spring; they ate cacti and herbaceous perennials once the winter annuals began to disappear. Medica et al. (1982 in Avery 1998) found that desert tortoises ate increased amounts of green perennial grass when winter annuals were sparse or unavailable; Avery (1998) found that desert tortoises rarely ate perennial grasses.

Desert tortoises can produce from one to three clutches of eggs per year. On rare occasions, clutches can contain up to 15 eggs; most clutches contain 3 to 7 eggs. Multi-decade studies of the Blanding's turtle (*Emydoidea blandingii*), which, like the desert tortoise, is long lived and matures late, indicate that approximately 70 percent of the young animals must survive each year until they reach adult size; after this time, annual survivorship exceeds 90 percent (Congdon et al. 1993). Research has indicated that 50 to 60 percent of young desert tortoises typically survive from year to year, even in the first and most vulnerable year of life. We do not have sufficient information on the demography of the desert tortoise to determine whether this rate is sufficient to maintain viable populations; however, it does indicate that maintaining favorable habitat conditions for small desert tortoises is crucial for the continued viability of the species.

Desert tortoises typically hatch from late August through early October. At the time of hatching, the desert tortoise has a substantial yolk sac; the yolk can sustain them through the fall and winter months until forage is available in the late winter or early spring. However, neonates will eat if food is available to them at the time of hatching; when food is available, they can reduce their reliance on the yolk sac to conserve this source of nutrition. Neonate desert tortoises use abandoned rodent burrows for daily and winter shelter; these burrows are often shallowly excavated and run parallel to the surface of the ground.

Neonate desert tortoises emerge from their winter burrows as early as late January to take advantage of freshly germinating annual plants; if appropriate temperatures and rainfall are present, at least some plants will continue to germinate later in the spring. Freshly germinating plants and plant species that remain small throughout their phenological development are important to neonate desert tortoises because their size prohibits access to taller plants. As plants grow taller during the spring, some species become inaccessible to small desert tortoises.

Neonate and juvenile desert tortoises require approximately 12 to 16 percent protein content in their diet for proper growth. Desert tortoises, both juveniles and adults, seem to selectively forage for particular species of plants with favorable ratios of water, nitrogen (protein), and potassium. The potassium excretion potential model (Ofstedal 2001) predicts that, at favorable ratios, the water and nitrogen allow desert tortoises to excrete high concentrations of potentially toxic potassium, which is abundant in many desert plants. Ofstedal (2001) also reports that variation in rainfall and temperatures cause the potassium excretion potential index to change annually and during the course of a plant's growing season. Therefore, the changing nutritive quality of plants, combined with their increase in size, further limits the forage available to small desert tortoises to sustain their survival and growth.

In summary, the ecological requirements and behavior of neonate and juvenile desert tortoises are substantially different than those of subadults and adults. Smaller desert tortoises use abandoned rodent burrows, which are typically more fragile than the larger ones constructed by adults. They are active earlier in the season. Finally, small desert tortoises rely on smaller annual plants with greater protein content to be able to gain access to food and to grow, respectively.

Status of the Desert Tortoise

The Mojave population of the desert tortoise includes those animals living north and west of the Colorado River in the Mojave Desert of California, Nevada, Arizona, southwestern Utah, and in the Colorado Desert in California. On August 4, 1989, the Service published an emergency rule listing the Mojave population of the desert tortoise as endangered (54 *Federal Register* 32326). In its final rule, dated April 2, 1990, the Service determined the Mojave population of the desert tortoise to be threatened (55 *Federal Register* 12178).

The desert tortoise was listed in response to loss and degradation of habitat caused by numerous human activities including urbanization, agricultural development, military training, recreational use, mining, and livestock grazing. The loss of individual desert tortoises to increased predation by common ravens, collection by humans for pets or consumption, collisions with vehicles on paved and unpaved roads, and mortality resulting from diseases also contributed to the Service's listing of this species.

The following paragraphs provide general information on the results of efforts to determine the status and trends of desert tortoise populations across a large portion of its range; we present information on the status of the desert tortoise within the action area in the Environmental Baseline section of this biological opinion. We have grouped these paragraphs by recovery unit and critical habitat unit; we will describe these units in more detail later in this biological opinion.

Before entering into a discussion of the status and trends of desert tortoise populations across its range, a brief discussion of the methods of estimating the numbers of desert tortoises would be useful. Three primary methods have been widely used: permanent study plots, triangular transects, and line distance sampling.

Generally, permanent study plots are defined areas that are visited at roughly 4-year intervals to determine the numbers of desert tortoises present. Desert tortoises found on these plots during the spring surveys were registered; that is, they were marked so they could be identified individually during subsequent surveys. Between 1971 and 1980, 27 plots were established in California to study the desert tortoise; 15 of these plots were used by the Bureau to monitor desert tortoises on a long-term basis (Berry 1999). Range-wide, 49 plots have been used at one time or another to attempt to monitor desert tortoises (Tracy et al. 2004).

Triangular transects are used to detect sign (i.e., scat, burrows, footprints, etc.) of desert tortoises. The number of sign is then correlated with standard reference sites, such as permanent study plots, to allow the determination of density estimates.

Finally, line distance sampling involves walking transects while trying to detect live desert tortoises. Based on the distance of the desert tortoise from the centerline of the transect, the length of the transect, and a calculation of what percentage of the animals in the area were likely to have been above ground and visible to surveyors during the time the transect was walked, an estimation of the density can be made. Each of these methods has various strengths and weaknesses; the information we present on the density of desert tortoises across the range and in the action area is based on these methods of collecting data.

Note that, when reviewing the information presented in the following sections, determining the number of desert tortoises over large areas is extremely difficult. The report prepared by the Desert Tortoise Recovery Plan Assessment Committee (Tracy et al. 2004) acknowledges as much. Desert tortoises spend much of their lives underground or concealed under shrubs, are not very active in years of low rainfall, and are distributed over a wide area in several different types of habitat. Other factors, such as the inability to sample on private lands and rugged terrain, further complicate sampling efforts. Consequently, the topic of determining the best way to estimate the abundance of desert tortoises has generated many discussions over the years. As a result of this difficulty, we cannot provide concise estimations of the density of desert tortoises in each recovery unit or desert wildlife management area that have been made in a consistent manner.

Given the difficulty in determining the density of desert tortoises over large areas, the reader needs to understand fully that the differences in density estimates in the recovery plan and those derived from subsequent sampling efforts may not accurately reflect on-the-ground conditions. Despite this statement, the reader should also be aware that the absence of live desert tortoises and the presence of carcasses over large areas of some desert wildlife management areas provide at least some evidence that desert tortoise populations seem to be in a downward trend in some regions.

Upper Virgin River Recovery Unit

The Upper Virgin River Recovery Unit is located in the northeastern most portion of the range of the desert tortoise; the Red Cliffs Reserve was established as a conservation area within this

critical habitat unit. The recovery plan states that desert tortoises occur in densities of up to 250 adult animals per square mile within small areas of this recovery unit; overall, the area supports a mosaic of areas supporting high and low densities of desert tortoises (Service 1994c). We have summarized the information in this paragraph from a report by the Utah Division of Wildlife Resources (McLuckie et al. 2003). The Utah Division of Wildlife Resources has intensively monitored desert tortoises, using a distance sampling technique, since 1998. Monitoring in 2003 indicated that the density of desert tortoises was approximately 44 per square mile throughout the reserve. This density represents a 41 percent decline since monitoring began in 1998. The report notes that the majority of desert tortoises that died within one year (n=64) were found in areas with relatively high densities; the remains showed no evidence of predation. Upper respiratory tract disease has been observed in this population; the region also experienced a drought from 1999 through 2002, with 2002 being the driest year. McLuckie et al. (2003) attribute the primary cause of the die-off to drought, but note that disease, habitat degradation, direct mortality of animals, and predation by domestic dogs and common ravens were also factors in the decline.

Northeastern Mojave Recovery Unit

The Northeastern Mojave Recovery Unit is located to the southwest of the Upper Virgin River Recovery Unit and extends through Nevada and into California in Ivanpah Valley. Several critical habitat units and four desert wildlife management areas are located within this recovery unit. Tracy et al. (2004) note that densities of adult desert tortoises for the overall region do not show a statistical trend over time.

The Beaver Dam Slope Desert Wildlife Management Area covers portions of Nevada, Utah, and Arizona; it is located to the southwest of the Red Cliffs Reserve. Based on various methods, the recovery plan estimates the density of desert tortoises in this desert wildlife management area as being from 5 to 56 animals per square mile (Service 1994c). McLuckie et al. (2001) estimated the density in 2001 to be approximately 7.9 reproductive desert tortoises per square mile, using a distance sampling method. However, they also note several problems with the sampling effort, including too few transects and transects placed in habitat types not normally inhabited by desert tortoises; we also note that, as described in the previous paragraph, the survey occurred during a year of lower-than-average rainfall, which would decrease activity levels of desert tortoises and make them more difficult to detect. The encounter rate during this survey was so low that the precision level of the results is low; other monitoring plots, from earlier years, showed higher density estimates.

The Gold Butte-Pakoon Desert Wildlife Management Area covers portions of Nevada and Arizona, generally south of the Beaver Dam Slope Desert Wildlife Management Area. The recovery plan states that densities of desert tortoises in this recovery unit vary from 5 to 56 animals per square mile (Service 1994c).

The Mormon Mesa Desert Wildlife Management Area is located entirely in Nevada, generally west and northwest of the Beaver Dam Slope and Gold Butte-Pakoon desert wildlife management areas, respectively. The recovery plan states that densities of desert tortoises in this recovery unit vary from 41 to 87 subadult and adult animals per square mile (Service 1994c).

The Coyote Springs Desert Wildlife Management Area is located entirely in Nevada, generally west of the Mormon Mesa Desert Wildlife Management Area and east of the Desert National Wildlife Refuge. The recovery plan states that densities of desert tortoises in this recovery unit vary from 0 to 90 adult animals per square mile (Service 1994c). Kernel analysis for the Coyote Springs Desert Wildlife Management Area showed areas where the distributions of carcasses and living desert tortoises do not overlap (Tracy et al. 2004); this scenario is indicative of a higher than average rate of mortality. (The Desert Tortoise Recovery Plan Assessment Committee used a kernel analysis to examine the distribution of live desert tortoises and carcasses over large areas of the range of the species (Tracy et al. 2004). The intent of this analysis is to determine where large areas with numerous carcasses do not overlap large areas with live animals. Regions where the areas of carcasses do not overlap areas of live animals likely represent recent die-offs or declines in desert tortoise populations.) Because permanent study plots for this region were discontinued after 1996, recent declines in numbers would not be reflected in the kernel analysis if they had occurred.

The Ivanpah Desert Wildlife Management Area lies east of the Mojave National Preserve and covers approximately 36,795 acres. It is contiguous with National Park Service lands; note that the National Park Service did not designate desert wildlife management areas within the Mojave National Preserve because it considers that all of its lands are managed in a manner that is conducive to the recovery of the desert tortoise. The permanent study plot in the Ivanpah Valley is located within the Mojave National Preserve and provides information on the status of desert tortoises in this general region. Data on desert tortoises on this permanent study plot were collected in 1980, 1986, 1990, and 1994; the densities of desert tortoises of all sizes per square mile were 386, 393, 249, and 164, respectively (Berry 1996). (Numerous data sets are collected from the study plots and various statistical analyses conducted to provide information on various aspects of trends. We cannot, in this biological opinion, provide all of this information; therefore, we have selected the density of desert tortoises of all sizes per square mile to attempt to indicate trends.) The number of juvenile and immature desert tortoises on the study plot declined, although the number of adult animals remained fairly constant. The notes accompanying this report indicated that the "ill juvenile and dead adult male (desert) tortoises salvaged for necropsy contained contaminants;" it also cited predation by common ravens and the effects of cattle grazing as causative factors in the decline in the number of juvenile and immature desert tortoises on the study plot (Berry 1996). In 2002, workers found 55 desert tortoises on this plot; this number does not represent a density estimate (Berry 2005).

Eastern Mojave Recovery Unit

The Eastern Mojave Recovery Unit extends from west of Clark Mountain, south through the Mojave National Preserve, and east into southern Nevada. Within this recovery unit, the Bureau designated the Shadow Valley and Piute-Fenner desert wildlife management areas within California and the Piute-El Dorado Desert Wildlife Management Area in Nevada.

The Shadow Valley Desert Wildlife Management Area, which occupies approximately 101,355 acres, lies north of Interstate 15 and west of the Clark Mountains. The Mojave National Preserve is located to the south of the interstate. Data on desert tortoises on a permanent study plot in this

area were collected in 1988 and 1992; the densities of desert tortoises of all sizes per square mile were 50 and 58, respectively (Berry 1996). Although these data seem to indicate a slight increase in the number of desert tortoises, in 2002, workers found five desert tortoises on this plot; this number does not represent a density estimate (Berry 2005). Some signs of shell disease have been observed in the population in recent years (Bureau 2002c).

The Bureau's Piute-Fenner Desert Wildlife Management Area lies to the east of the southeast portion of the Mojave National Preserve and is contiguous with National Park Service lands. It occupies approximately 173,850 acres. The Goffs permanent study plot, which is located within the Mojave National Preserve, provides information on the status of desert tortoises in this general region. Data on desert tortoises on this permanent study plot were collected in 1980, 1990, and 1994; Berry (1996) estimated the densities of desert tortoises of all sizes at approximately 440, 362, and 447 individuals per square mile, respectively. As Berry (1996) noted, these data seem to indicate that this area supported "one of the more stable, high density populations" of desert tortoises within the United States. Berry (1996) also noted that "a high proportion of the animals (had) shell lesions." In 2000, only 30 live desert tortoises were found; Berry (2000) estimated the density of desert tortoises at approximately 88 animals per square mile. The shell and skeletal remains of approximately 393 desert tortoises were collected; most of these animals died between 1994 and 2000. Most of the desert tortoises exhibited signs of shell lesions; three salvaged desert tortoises showed abnormalities in the liver and other organs and signs of shell lesions. None of the three salvaged desert tortoises tested positive for upper respiratory tract disease.

The Piute-Eldorado Desert Wildlife Management Area is located entirely in southern Nevada and is contiguous with California's Piute-Fenner Desert Wildlife Management Area. Based on various methods, the recovery plan estimates the density of desert tortoises in this desert wildlife management area as being from 40 to 90 adults per square mile (Service 1994c). A kernel analysis of the results of distance sampling data from 2001 depicted large areas where only carcasses were detected (Tracy et al. 2004). Only six live desert tortoises were encountered in approximately 103 miles of transects during this sampling effort; this encounter rate is very low.

Northern Colorado Recovery Unit

The Northern Colorado Recovery Unit extends from Interstate 40 south, almost to Interstate 10 and from the eastern portions of Joshua Tree National Park east to the Colorado River; it is located immediately south of the Eastern Mojave Recovery Unit. The 874,843-acre Chemehuevi Desert Wildlife Management Area, which is managed by the Bureau, is the sole conservation area for the desert tortoise in this recovery unit.

Two permanent study plots are located within this desert wildlife management area. At the Chemehuevi Valley and Wash plot, 257 and 235 desert tortoises were registered in 1988 and 1992, respectively (Berry 1999). During the 1999 spring survey, only 38 live desert tortoises were found. The shell and skeletal remains of at least 327 desert tortoises were collected; most, if not all, of these animals died between 1992 and 1999. The frequency of shell lesions and nutritional deficiencies appeared to be increasing and may be related to the mortalities.

The Upper Ward Valley permanent study plot was surveyed in 1980, 1987, 1991, and 1995; Berry (1996) estimated the densities of desert tortoises of all sizes at approximately 437, 199, 273, and 447 individuals per square mile, respectively. In 2002, workers found 17 desert tortoises on this plot; this number does not represent a density estimate (Berry 2005).

Eastern Colorado Recovery Unit

The Eastern Colorado Recovery Unit, which is located immediately south of the Northern Colorado Recovery Unit, extends from just north of Interstate 10 south to the Mexico border near Yuma, Arizona; the Salton Sink and Imperial Valley form the western edge of this recovery unit, which extends east to the Colorado River. The Chuckwalla Desert Wildlife Management Area, which covers 818,685 acres, is the sole conservation area for the desert tortoise in this recovery unit. The Marine Corps (Chocolate Mountains Aerial Gunnery Range), Bureau, and National Park Service (Joshua Tree National Park) manage the Federal lands in this recovery unit and desert wildlife management area. Two permanent study plots are located within this desert wildlife management area.

At the Chuckwalla Bench plot, Berry (1996) calculated approximate densities of 578, 396, 167, 160, and 182 desert tortoises per square mile in 1979, 1982, 1988, 1990, and 1992, respectively. In 1997, workers found 52 desert tortoises on this plot; this number does not represent a density estimate (Berry 2005). At the Chuckwalla Valley plot, Berry (1996) calculated approximate densities of 163, 181, and 73 desert tortoises per square mile in 1980, 1987, and 1991, respectively. Tracy et al. (2004) concluded that these data show a statistically significant decline in the number of adult desert tortoises over time; they further postulate that the decline on the Chuckwalla Bench plot seemed to be responsible for the overall significant decline within the recovery unit.

Western Mojave Recovery Unit

Although desert tortoises were historically widespread in the western Mojave Desert, their distribution within this region was not uniform. For example, desert tortoises likely occurred at low densities in the juniper woodlands of the western Antelope Valley and in the sandier habitats in the Mojave River valley. They were also likely largely absent from the higher elevations of the Ord and Newberry mountains and from playas and the areas immediately surrounding these dry lakes. Several large areas of land that are not managed by the Bureau lie within the Western Mojave Recovery Unit; because of their size, these areas are not affected by the Bureau's management of public lands and are therefore not part of the action area for this consultation. These areas lie primarily on military bases, within Joshua Tree National Park, and in areas of private land.

Desert tortoises occur over large areas of Fort Irwin, which is managed by the Department of the Army (Army). At Fort Irwin, the Army conducts realistic, large-scale exercises with large numbers of wheeled and tracked vehicles. In areas where training has occurred for many decades, desert tortoises persist in relatively low numbers primarily on the steep, rugged slopes of the mountain ranges that occur throughout Fort Irwin. Through Public Law 107-107,

approximately 118,600 acres were added to Fort Irwin along its southwestern and eastern boundaries in 2002. Approximately 97,860 acres of the Superior-Cronese Critical Habitat Unit lie along the original southern boundary of Fort Irwin and in the parcel to the southwest that was added in 2002 (Charis Professional Services Corporation 2003, Army 2004). Currently, the Army may conduct some low intensity training in these areas on occasion and some preparations for the onset of force-on-force training should begin soon. To date, these parcels have not been used for force-on-force training; within the next few years, the Army will begin to use a large portion of these lands for maneuvers with numerous wheeled and tracked vehicles. In our biological opinion regarding the effects of the use of these lands for training on the desert tortoise (Service 2004a), we noted that approximately 1,299 to 1,349 adult desert tortoises may occur within the action area for that consultation. The Army established several conservation areas, totaling approximately 16,900 acres, just inside the boundaries of Fort Irwin where maneuvers would not occur. The Army calculated that approximately 152 desert tortoises may reside within these areas; these animals are unlikely to be affected by use of the new training lands. Additionally, because of other restrictions that the Army will follow during training, approximately 5,500 acres of critical habitat of the desert tortoise within the additional training lands will not be used for force-on-force training. These lands lie primarily on and around dry lakes, which generally do not support large numbers of desert tortoises, because the lake beds themselves do not provide suitable habitat and the areas immediately surrounding the playas usually support substrates composed of clays and silt that are not suitable for burrowing. Finally, in the Eastgate portion of Fort Irwin, approximately 288 desert tortoises may be exposed to additional training; however, most of these animals are located in an area that is unlikely to receive much use by vehicles and are thus unlikely to be affected. The Army and Service have agreed that desert tortoises within new training areas that are likely to be killed by maneuvers will be translocated to newly acquired lands to the south of Fort Irwin; a plan for this translocation is currently under development.

The Navy has designated approximately 200,000 acres of the South Range at the Naval Air Weapons Station, China Lake as a management area for the desert tortoise (Service 1995). Through a consultation with the Service (1992a), the Navy agreed to try to direct most ground-disturbing activities outside of this area, to use previously disturbed areas for these activities when possible, and to implement measures to reduce the effects of any action on desert tortoises. This area also encompasses the Superior Valley Tactical Bombing Range located in the southernmost portion of the Mojave B South land management unit of the Naval Air Weapons Station; it continues to be used as an active bombing range for military test and training operations by the Navy and Department of Defense. In the 3 years for which we had annual reports available, activities conducted by the Navy did not kill or injure any desert tortoises (Navy 1995, 2001, 2002). In general, desert tortoises occur in low densities on the North Range of the Naval Air Weapons Station; Kiva Biological Consulting and McClenahan and Hopkins Associates (in Service 1992a) reported that approximately 136 square miles of the North Range supported densities of 20 or fewer desert tortoises per square mile. The South Range supported densities of 20 or fewer desert tortoises per square mile over an area of approximately 189 square miles and densities of greater than 20 per square mile on approximately 30 square miles. The higher elevations and latitude in this area may be responsible for these generally low densities (Weinstein 1989 in Bureau et al. 2005).

The Indian Wells Valley, which is located to the southwest of the Naval Air Weapons Station, likely supported desert tortoises at higher densities in the past. Urban, suburban, and agricultural development in this area is likely cause of the lower densities that are currently found in this area.

Edwards Air Force Base is used primarily to test aircraft and weapons systems used by the Department of Defense. Desert tortoises occur over approximately 220,800 acres of the installation. Approximately 80,640 acres of the base have been developed for military uses or are naturally unsuitable for use by desert tortoises, such as Rogers and Rosamond dry lakes. Based on surveys conducted between 1991 and 1994, approximately 160,640 acres of the base supported 20 or fewer desert tortoises per square mile. Approximately 55,040 acres supported densities between 21 and 50 desert tortoises per square mile; from 51 to 69 desert tortoises per square mile occurred on several smaller areas that totaled 5,120 acres (U.S. Air Force 2004). We expect that current densities are somewhat lower, given the regional declines in desert tortoise numbers elsewhere in the Western Mojave Recovery Unit.

Desert tortoises may have been more common in the past the area west of Highway 14 between the town of Mojave and Walker Pass; high levels of off-road vehicle use and extensive livestock grazing are potential causes for the current scarcity of desert tortoises in this area. Four townships of private land east of the city of California City and south of the Rand Mountains supported large numbers of desert tortoises as late as the 1970s; high levels of off-road vehicle use, extensive grazing of sheep, scattered development, and possibly poaching have greatly reduced the density of desert tortoises in this area.

The direct and indirect effects of urban and suburban development extending from Lancaster in the west to Lucerne Valley in the east has largely eliminated desert tortoises from this area. A few desert tortoises remain on the northern slopes of the San Bernardino Mountains, south of Lucerne Valley; however, they seem to be largely absent from the portion of this area in Los Angeles County (Bureau et al. 2005).

The northern portion of Joshua Tree National Park is within the planning area for the West Mojave Plan. Given the general patterns of visitor use at Joshua Tree National Park, we expect that this area receives little use.

Private lands between the northern boundary of Joshua Tree National Park and the southern boundary of the Marine Corps Air Ground Combat Center continue to support desert tortoises; the primary threat to desert tortoises in this area is urbanization.

Desert tortoises occur within the Marine Corps Air Ground Combat Center in densities of greater than 50 per square mile in limited areas; most of the installation, however, supports from 0 to 5 animals per square mile (Jones and Stokes Associates 1998 in Natural Resources and Environmental Affairs Division 2001). The Marine Corps' integrated natural resource

management plan also notes that the number of desert tortoises may have declined in the more heavily disturbed areas of the Marine Corps Air Ground Combat Center and that vehicles, common ravens, and dogs are responsible for mortalities. In general, the Marine Corps Air Ground Combat Center supports a wide variety of training exercises that include the use of tracked and wheeled vehicles and live fire.

Recovery Plan for the Desert Tortoise

The recovery plan for the desert tortoise is the basis and key strategy for recovery and delisting of the desert tortoise. The recovery plan divides the range of the desert tortoise into 6 distinct population segments or recovery units and recommends the establishment of 14 desert wildlife management areas throughout the recovery units. Within each desert wildlife management area, the recovery plan recommends implementation of reserve level protection of desert tortoise populations and habitat, while maintaining and protecting other sensitive species and ecosystem functions. The recovery plan also recommends that desert wildlife management areas be designed to follow the accepted concepts of reserve design and be managed to restrict human activities that negatively affect desert tortoises (Service 1994c). The delisting criteria established by the recovery plan are:

1. The population within a recovery unit must exhibit a statistically significant upward trend or remain stationary for at least 25 years;
2. Enough habitat must be protected within a recovery unit or the habitat and desert tortoises must be managed intensively enough to ensure long-term viability;
3. Populations of desert tortoises within each recovery unit must be managed so discrete population growth rates (λ s) are maintained at or above 1.0;
4. Regulatory mechanisms or land management commitments that provide for long-term protection of desert tortoises and their habitat must be implemented; and
5. The population of the recovery unit is unlikely to need protection under the Endangered Species Act in the foreseeable future.

The recovery plan based its descriptions of the six recovery units on differences in genetics, morphology, behavior, ecology, and habitat use over the range of the Mojave population of the desert tortoise. The recovery plan contains generalized descriptions of the variations in habitat parameters of the recovery units and the behavior and ecology of the desert tortoises that reside in these areas (pages 20 to 22 in Service 1994c). The recovery plan (pages 24 to 26 from Service 1994c) describes the characteristics of desert tortoises and variances in their habitat, foods, burrow sites, and phenotype across the range of the listed taxon. Consequently, to capture the full range of phenotypes, use of habitat, and range of behavior of the desert tortoise as a species, conservation of the species across its entire range is essential.

Assessment of the Recovery Plan

In 2003, the Service appointed a group of researchers to conduct a scientific assessment of the recovery plan for the desert tortoise, which was completed in 1994. This group, called the Desert Tortoise Recovery Plan Assessment Committee, completed its assessment in 2004. The group found that the recovery plan was “fundamentally sound, but some modifications for contemporary management will likely make recovery more successful” (Tracy et al. 2004). The group also found that analyses showed desert tortoise populations were declining in some portions of the range, assessing the density of desert tortoises is difficult, and “the original paradigm of desert tortoises being recovered in large populations relieved of intense threats may be flawed...” (Tracy et al. 2004). Finally, the group reviewed the distinct population segments (or recovery units) described in the recovery plan and concluded they should be modified; briefly, the Desert Tortoise Recovery Plan Assessment Committee recommends leaving the Western Mojave and Upper Virgin River units intact and recombining the remaining four into three distinct population segments.

Status of Critical Habitat

The Service designated critical habitat for the desert tortoise in portions of California, Nevada, Arizona, and Utah in a final rule, published February 8, 1994 (59 *Federal Register* 5820). Critical habitat is designated by the Service to identify the key biological and physical needs of the species and key areas for recovery and focuses conservation actions on those areas. Critical habitat is composed of specific geographic areas that contain the biological and physical attributes that are essential to the species' conservation within those areas, such as space, food, water, nutrition, cover, shelter, reproductive sites, and special habitats. These features are called the primary constituent elements of critical habitat. The specific primary constituent elements of desert tortoise critical habitat are: sufficient space to support viable populations within each of the six recovery units and to provide for movement, dispersal, and gene flow; sufficient quality and quantity of forage species and the proper soil conditions to provide for the growth of these species; suitable substrates for burrowing, nesting, and overwintering; burrows, caliche caves, and other shelter sites; sufficient vegetation for shelter from temperature extremes and predators; and habitat protected from disturbance and human-caused mortality.

The final rule for designation of critical habitat did not explicitly ascribe specific conservation roles or functions to the various critical habitat units. Rather, it refers to the strategy of establishing recovery units and desert wildlife management areas recommended by the recovery plan for the desert tortoise, which had been published as a draft at the time of the designation of critical habitat, to capture the “biotic and abiotic variability found in desert tortoise habitat” (59 *Federal Register* 5820, see page 5823). Specifically, we designated the critical habitat units to follow the direction provided by the draft recovery plan for the establishment of desert wildlife management areas. Note that each critical habitat unit functions independently of the others in terms of providing the physical and biological needs of individual desert tortoises; that is, desert tortoises are not required to move between or among units to complete their life histories. For this reason, we have not presented specific information related to the status of individual critical habitat units that are located outside of the action area. We also note that the critical habitat units

in aggregate are intended to protect the variability that occurs across the large range of the desert tortoise; the loss of any specific unit would eliminate elements of the species' behavioral, ecological, and genetic variability.

We did not designate the Desert Tortoise Natural Area and Joshua Tree National Park in California and the Desert National Wildlife Refuge in Nevada as critical habitat because they are "primarily managed as natural ecosystems" (59 *Federal Register* 5820, see page 5825) and provide adequate protection to desert tortoises. Since the designation of critical habitat, Congress increased the size of Joshua Tree National Park; a portion of the expanded boundary of Joshua Tree National Park lies within critical habitat of the desert tortoise.

Note that, for all critical habitat units, the primary constituent elements are generally functioning, to the best of our knowledge, in a manner that would support the key biological and physical needs of the desert tortoise. In some specific areas within the boundaries of critical habitat, such as within and adjacent to dry lakes, some of the primary constituent elements are naturally absent; desert tortoises do not usually reside in such areas in large numbers. In other areas, human activities have decreased the ability of some of the primary constituent elements to function to the maximum extent; such areas include but are not limited to unpaved roads and areas around water sources within cattle allotments. These areas are too numerous to mention specifically; generally, however, these areas comprise a relatively small portion of the critical habitat unit and do not compromise the conservation role of the units as a whole. Non-native annual plant species are an exception to the general statements in the previous sentences. These species are widely distributed throughout critical habitat units and, in some cases such as Sahara mustard (*Brassica tournefortii*), continuing to spread rapidly; their abundance in any given area varies annually according to weather patterns. Although we do not understand their complete role in relation to the ecology of the desert tortoise, we know that these species can exclude the native annual species on which the desert tortoise depends and can lead to the spread of wildfires. The role of these species with regard to the proper functioning of critical habitat units is an important topic for further research.

The following sections provide a brief description of the portions of the critical habitat units that are within the Western Mojave Recovery Unit but outside of the action area of this consultation. We present similar information for the critical habitat units within the action area in the Environmental Baseline section of this biological opinion.

Superior-Cronese Critical Habitat Unit. Approximately 97,860 acres of the Superior-Cronese Critical Habitat Unit lie within the boundaries of the Army's National Training Center (Charis Professional Services Corporation 2003, Army 2004). Currently, the Army may conduct some low intensity training in these areas on occasion and some preparations for the onset of force-on-force training should begin soon. To date, these parcels have not been used for force-on-force training; within the next few years, the Army will begin to use a large portion of these lands for maneuvers with numerous wheeled and tracked vehicles. In our biological opinion regarding the effects of the use of these lands for training on the desert tortoise (Service 2004a), we noted that approximately 75,439 acres of critical habitat located within Fort Irwin would be affected by force-on-force training. As part of the consultation regarding the effects of the use of these lands

for training on the desert tortoise and its critical habitat (Service 2004a), the Army established several conservation areas, totaling approximately 16,900 acres, just inside the boundaries of Fort Irwin where maneuvers would not occur. Because of other restrictions that the Army will follow during training, approximately 5,500 acres of critical habitat of the desert tortoise within the additional training lands will not be used for force-on-force training. These lands lie primarily on and around dry lakes, which generally do not support high quality habitat of the desert tortoise, because the primary constituent elements are absent from the lake beds themselves and usually of lower quality in the immediately surrounding areas.

Approximately 87,265 acres in the southern portion of the Naval Air Weapons Station at China Lake are designated as critical habitat for the desert tortoise. This area encompasses the Superior Valley Tactical Bombing Range located in the southernmost portion of the Mojave B South land management unit of the Naval Air Weapons Station. This area continues to be used as an active bombing range for military test and training operations by the Navy and other branches of the Department of Defense. Within the area designated as critical habitat, approximately 675 acres are disturbed to date. Disturbed areas support the required road network, associated facilities and infrastructure, and target impact areas (O'Gara 2005).

Fremont-Kramer Critical Habitat Unit. Approximately 65,560 acres of Edwards Air Force Base are designated as critical habitat of the desert tortoise. Disturbance within the portion of the Fremont-Kramer Critical Habitat Unit that occurs within Edwards Air Force Base includes targets, buildings, parking lots, roads, road shoulders, trails, and cleared areas. Approximately 1,670 acres within critical habitat have been disturbed by human activities, including approximately 323 acres of primary and secondary roads. Additionally, approximately 195.3 miles of abandoned jeep trails and other minor routes are located within critical habitat (Collis pers. comm. 2005).

Pinto Mountain Critical Habitat Unit. Approximately 55,596 acres of this critical habitat unit lie within Joshua Tree National Park (Service 2005a). Given the general patterns of visitor use at Joshua Tree National Park, we expect that this area receives little use.

Relationship of Recovery Units, Distinct Population Segments, Desert Wildlife Management Areas, and Critical Habitat Units

The recovery plan (Service 1994c) recognized six recovery units or evolutionarily significant units across the range of the listed taxon, based on differences in genetics, morphology, behavior, ecology, and habitat use of the desert tortoises found in these areas. The boundaries between these areas are vaguely defined. In some cases, such as where the Western Mojave Recovery Unit borders the Eastern Mojave Recovery Unit, a long, low-lying, arid valley provides a fairly substantial separation of recovery units. In other areas, such as where the Eastern Mojave Recovery Unit borders the Northern Colorado Recovery Unit, little natural separation exists. Because of the vague boundaries, the acreage of these areas has not been quantified. Over the years, workers have commonly referred to the areas as "recovery units;" the term "distinct population segment" has not been in common use. As mentioned previously in the Assessment of the Recovery Plan section of this biological opinion, the Desert Tortoise Recovery Plan

Assessment Committee suggests that five recovery units (or distinct population segments) would more appropriately represent variation across the range of the desert tortoise rather than the six described in the recovery plan; because this concept is not yet universally accepted, we will continue to refer to the recovery units described in the recovery plan in this biological opinion.

The recovery plan recommended that land management agencies establish one or more desert wildlife management areas within each recovery unit. As mentioned previously in the Recovery Plan for the Desert Tortoise section of this biological opinion, the recovery plan recommended that these areas receive reserve-level management to remove or mitigate the effects of the human activities responsible for declines in the number of desert tortoises. As was the case for the recovery units, the recovery plan did not determine precise boundaries for the desert wildlife management areas; the recovery team intended for land management agencies to establish these boundaries, based on the site-specific needs of the desert tortoise. At this time, desert wildlife management areas have been established throughout the range of the desert tortoise, except in the Western Mojave Recovery Unit.

Based on the recommendations contained in the draft recovery plan for the desert tortoise (59 *Federal Register* 5820), the Service designated critical habitat units throughout the range of the desert tortoise. The 14 critical habitat units have defined boundaries and cover specific areas throughout the 6 recovery units.

The Bureau used the boundaries of the critical habitat units and other considerations, such as conflicts in management objectives and more current information, to propose and designate desert wildlife management areas through its land use planning processes. In California, the Bureau also classified these desert wildlife management areas as areas of critical environmental concern, which, as we mentioned in the Description of the Proposed Action section of this biological opinion, allows the Bureau to establish management goals for specific resources in defined areas. Through the land use planning process, the Bureau established firm boundaries for the desert wildlife management areas.

Finally, we note that the Department of Defense installations and National Park Service units in the California desert did not establish desert wildlife management areas on their lands. Where the military mission is compatible with management of desert tortoises and their habitat, the Department of Defense has worked with the Service to conserve desert tortoises and their habitat. Examples of such overlap include the bombing ranges on the Navy's Mojave B and the Chocolate Mountains Aerial Gunnery Ranges; although the target areas are heavily disturbed, most of the surrounding land remains undisturbed. Additionally, the Army has established several areas along the boundaries of Fort Irwin where training with vehicles is prohibited; desert tortoises persist in these areas, which are contiguous with lands off-base. We discussed the situation at Joshua Tree National Park in the Status of Critical Habitat section of this biological opinion. The National Park Service did not establish desert wildlife management areas within the Mojave National Preserve, because the entire preserve is managed at a level that is generally consistent with the spirit and intent of the recovery plan for the desert tortoise.

The following table depicts the relationship among recovery units, desert wildlife management areas, and critical habitat units through the range of the desert tortoise.

Critical Habitat Unit	Desert Wildlife Management Area	Recovery Unit	State	Size of Critical Habitat Unit (acres)
Chemehuevi	Chemehuevi	Northern Colorado	CA	937,400
Chuckwalla	Chuckwalla	Eastern Colorado	CA	1,020,600
Fremont-Kramer	Fremont-Kramer	Western Mojave	CA	518,000
Ivanpah Valley	Ivanpah Valley	Eastern Mojave	CA	632,400
Pinto Mountain	Joshua Tree	Western Mojave/Eastern Colorado	CA	171,700
Ord-Rodman	Ord-Rodman	Western Mojave	CA	253,200
Piute-Eldorado- CA	Fenner	Eastern Mojave	CA	453,800
Piute-Eldorado- NV	Piute-Eldorado	Northeastern Mojave/Eastern Mojave	NV	516,800
Superior-Cronese	Superior-Cronese Lakes	Western Mojave	CA	766,900
Beaver Dam:		Northeastern Mojave (all)		
NV	Beaver Dam		NV	87,400
UT	Beaver Dam		UT	74,500
AZ	Beaver Dam		AZ	42,700
Gold Butte-Pakoon		Northeastern Mojave (all)		
NV	Gold Butte-Pakoon		NV	192,300
AZ	Gold Butte-Pakoon		AZ	296,000
Mormon Mesa	Mormon Mesa Coyote Spring	Northeastern Mojave	NV	427,900
Upper Virgin River	Upper Virgin River	Upper Virgin River	UT	54,600

Recent Fires

Since December 2004, numerous wildfires have occurred in desert tortoise habitat across its range. In Nevada, the Bureau estimates that 300,000 acres of desert tortoise habitat burned; this figure includes 15,000 to 20,000 acres of critical habitat. Although the greatest extent of burned habitat has occurred in Nevada, desert tortoise habitat also burned in Utah, Arizona, and California. Post-wildfire analyses are underway to quantify the number of acres of both critical and non-critical habitat affected by these wildfires. Although we know that some desert tortoises were killed by the wildfires, mortality estimates are not available at this time (Burroughs 2005).

ENVIRONMENTAL BASELINE FOR THE DESERT TORTOISE AND ITS CRITICAL HABITAT

Previous Consultations

The Bureau and Service have completed numerous formal consultations for actions affecting the desert tortoise or its critical habitat within the boundary of the California Desert Conservation Area. This number does not accurately reflect the number of actions that the Bureau has authorized or implemented for several reasons. First, several formal consultations were programmatic in nature and considered the effects of numerous separate actions; several biological opinions that evaluated the effects of pipeline maintenance are examples of this type of consultation. Other consultations were conducted as a result of the designation of critical habitat for the desert tortoise; these biological opinions evaluated the effects on critical habitat of actions for which consultation on the desert tortoise had already been completed. Finally, we have completed consultation on several actions that were never implemented; the waste disposal sites in the Cady Mountains and at Broadwell Dry Lake are examples of such actions. In addition to these formal consultations, the Bureau and Service have engaged in numerous informal consultations.

The Service has issued several biological opinions to the Bureau with regard to the effects of cattle on the desert tortoise in the northern and eastern Mojave Desert and northern and eastern Colorado Desert planning areas. In August 1992, we issued a biological opinion regarding cattle grazing within desert tortoise habitat along the eastern slopes of the Sierra Nevada (1-6-92-F-55, Service 1992b). In March 1994, we issued a biological opinion regarding 25 grazing allotments within the California Desert Conservation Area (1-8-94-F-17, Service 1994b). That biological opinion concluded that the Bureau's cattle grazing program in the California Desert Conservation Area was not likely to jeopardize the continued existence of the desert tortoise. On April 20, 1994, the Service issued a biological opinion that evaluated the effects of cattle grazing on critical habitat of the desert tortoise, which had recently been designated; the Service concluded that the Bureau's rangewide cattle grazing program was not likely to adversely modify critical habitat of the desert tortoise (1-5-94-F-107, Service 1994a). Several of the allotments that were included in these biological opinions are located within the Western Mojave Recovery Unit. Attachment 1 depicts the current status of grazing allotments within the planning area. Note that several allotments no longer are grazed as a result of various actions that have occurred since the publication of the California Desert Conservation Area Plan in 1980.

The Service and Bureau consulted on the development of several large mines in the early 1990s. Hundreds of acres of habitat were lost as the result of these projects. Several of these mines were in the eastern end of the Rand Mountains where desert tortoises seem to be less common; we do not know whether desert tortoises are less common in this area because the habitat is more rugged and at slightly higher elevation (and therefore not as suitable) or as a result of historical mining activities in the region.

The Service and Bureau have also consulted programmatically on the effects of small mines, small projects, remediation of illegal dumps, installation of minor electrical utilities, and pipeline

maintenance on the desert tortoise and its critical habitat within the Western Mojave Recovery Unit. These consultations were conducted to expedite the consultation process for numerous projects that were similar in nature and had relatively minor effects on the desert tortoise; because of compensation requirements imposed by the Bureau, some acquisition of lands important to the recovery of the species has also occurred as a result of these programs. In the biological opinions for all of these consultations, the Service concluded that the proposed actions were not likely to jeopardize the continued existence of the desert tortoise or adversely modify its critical habitat because of the protective measures proposed by the Bureau, the likelihood that these actions could be undertaken with little or no injury to or mortality of desert tortoises, and the small area of disturbance in relation to the available habitat of the species. Under the auspices of one such consultation on mining activities, the Bureau authorized 25 projects between 1998 and 2002. In total, these projects resulted in 41.28 acres of habitat loss or disturbance; no desert tortoises were known to have been killed and one was moved from harm's way. Between 1992 and 1997, the Bureau authorized projects that resulted in approximately 41 acres of disturbance; we were not able to determine the number of individual actions or number of desert tortoises encountered during this period. The Service and Bureau also consulted on a similar process under which various types of activities could be implemented; the same basic criteria were used to screen projects for this consultation. Between 1997 and 2002, the Bureau authorized 35 projects under the auspices of this consultation; these projects resulted in approximately 22 acres of habitat loss or disturbance; monitors were not aware of any desert tortoises being killed and none were handled during implementation of these projects. These biological opinions remain in effect throughout the California Desert Conservation Area.

We have consulted with the Bureau regarding off-highway vehicle management areas in the western Mojave Desert; the Johnson Valley, Stoddard Valley, El Mirage, and Spangler Hills areas had either been established or were in the process of being established when the desert tortoise was listed. Johnson and Stoddard valleys and portions of the El Mirage area likely supported high quality habitat and higher densities of desert tortoises prior to their use for off-road recreation; densities of desert tortoises in the Spangler Hills may not have been as great because of its more northerly location.

We also consulted with the Bureau on programs for dual sport events. We are unaware of any desert tortoises being killed during the hundreds of these events that have occurred since its listing; however, we recognize that desert tortoises may have been killed but not detected. These events are conducted within critical habitat only during periods when desert tortoises are less active; additionally, vehicles are restricted to authorized routes during these events. These factors likely contribute to the lack of mortalities of desert tortoises.

As noted in the Consultation History section of this biological opinion, the Service and Bureau consulted on a network of designated routes in the western Mojave Desert (Service 2003a). As a result of the amendment that was addressed in that consultation, the amount of existing open routes in subregions that overlap critical habitat of the desert tortoise in the western Mojave Desert was reduced from approximately 4,062 to 2,475 miles (Coyote, El Mirage, Fremont, Kramer, Newberry-Rodman, Ord, and Superior subregions, plus the Black Mountain, Rainbow Basin, and Western Rand Mountains areas of critical environmental concern). The Bureau

(2003a) noted that, for several subregions, a proportionately higher number of route closures were in areas characterized by bajada topography. Conversely, a proportionately higher number of routes were designated as open in more mountainous terrain. We and the Bureau expect that roads in more mountainous terrain are less likely to affect desert tortoises because they are generally less common in this type of habitat; also, vehicles are less likely to leave established routes in steep, rugged terrain. The Desert Tortoise Recovery Plan Assessment Committee (Tracy et al. 2004) notes that the western Mojave Desert contains a higher density of roads than any other recovery unit. This density comparison is based on the route inventory conducted in 2001 and not the route designation implemented in 2003.

The Service (1990) and Bureau completed formal consultation on a land tenure adjustment program which the Bureau, Air Force, and County of San Bernardino have been implementing since before the desert tortoise was listed. Under the provisions of the Western Mojave Land Tenure Adjustment Program, which is funded by the Air Force, the Bureau exchanges isolated parcels of public land in areas that are more appropriate for development for private lands that are more remote. This program has resulted in the direct acquisition by the Bureau of approximately 9,174 acres of land and of approximately 52,073 acres through exchanges; the Bureau has provided approximately 18,359 acres of land to non-federal entities in exchange (Gonzales 2004). The West Mojave Land Tenure Adjustment Program was amended in 1998 to include some lands near Barstow within the boundaries of the program. This action was part of a complex land exchange with the Catellus Corporation. The Bureau re-initiated consultation on the West Mojave Land Tenure Adjustment Program at that time and we issued a biological opinion on the amended program (Service 1998).

The Service has also issued several biological opinions to other Federal agencies that have affected the desert tortoise and its critical habitat. Several of these biological opinions are notable in their scope and public visibility. The Service issued two biological opinions to the Federal Energy Regulatory Commission regarding the effects of the installation of three large pipelines across the desert. During the first installation, in the early 1990s, approximately 30 desert tortoises were killed; only one desert tortoise was killed in the most recent installation, which occurred in 2003. Portions of these pipelines cross the Western Mojave Recovery Unit.

In 2004, the Service issued a biological opinion to the Army for the use of additional training lands at its National Training Center. The biological opinion considered the loss or degradation of approximately 75,000 acres of desert tortoise habitat within the Superior-Cronese Critical Habitat Unit, the loss or degradation of additional areas of lower quality habitat outside of critical habitat, the translocation of several hundred desert tortoises from areas that will be regularly used for training to locations off-base, and the possible loss of desert tortoises that are not found during the translocation effort. As part of the conservation measures included in the proposed action, Congress will appropriate \$75 million over several years to implement numerous conservation measures (Service 2004a). To date, the Army has purchased approximately 99,000 acres of lands from the Catellus Corporation and the private interests in 3 cattle allotments in the western Mojave Desert as part of the conservation measures for the expanded training areas. We are currently participating in an inter-agency working group to develop a translocation plan for desert tortoises affected by the Army's use of additional training

lands. We mention this consultation because, although the area within the boundaries of Fort Irwin is not within the action area for this consultation, the conservation measures being implemented by the Army as part of the proposed action are likely to have substantial beneficial effects on the desert tortoise and its critical habitat within the action area.

The Department of Defense consulted on a competitive race for robotic vehicles (Service 2004c). Despite the high visibility of this event, most vehicles failed within a short distance of the starting line. Impacts to desert tortoise habitat were insignificant, if any occurred at all; no desert tortoises were killed or injured.

The Federal Highways Administration has funded the widening of many miles of Interstate and State highways in the California Desert Conservation Area. Although hundreds of acres of habitat were destroyed by these actions, the vast majority of the loss was immediately adjacent to the freeways, where desert tortoises are usually scarce and the habitat of poor quality. To mitigate the loss of habitat, the California Department of Transportation has, through its consultations with the California Department of Fish and Game under the authorities of the California Endangered Species Act, fenced dozens of miles of highway to prevent desert tortoises from being killed and acquired thousands of acres of private lands that are being managed for the benefit of the desert tortoise. Boarman and Sazaki (1996) determined that desert tortoises suffer significantly less mortality along fenced roads than along those that are not fenced. In balance, desert tortoises have likely benefited from the actions of the Federal Highways Administration and the California Department of Transportation.

The Service has also consulted many times with the Federal Communications Commission on the installation of cell towers in the California Desert Conservation Area. Although several towers have been installed, the aggregated effects are minor in that desert tortoises are usually avoided during construction and little habitat is affected.

The Bureau notes that, between 1990 and 1995, 101 projects were authorized by 13 Federal agencies throughout the California desert; these actions resulted in the handling, to move desert tortoises from harm's way, 922 desert tortoises and in the deaths of 54 individuals (Appendix L, Bureau et al. 2005). Although we do not have specific data on these projects, most likely occurred in the Western Mojave Recovery Unit, simply because this area is subject to a far greater amount of human activity than the eastern portion of the California Desert Conservation Area. Thirty-eight of the 54 desert tortoises were killed during the installation of the Kern and Mojave pipelines; 3 were killed during construction of the Mead-McCullough-Victorville transmission line. Both of these projects crossed more than one recovery unit; therefore, the 41 desert tortoises that died during these projects were likely distributed across several recovery units. Note also that 733 desert tortoises were handled during implementation of the Kern and Mojave pipelines and Mead-McCullough-Victorville transmission line.

For the period after 1994, LaRue perused files and interviewed staff in the Bureau's Ridgecrest and Barstow field offices to gather information. LaRue (informal notes 2004) found information on eleven consultations for actions located, at least in part, in the western Mojave Desert. Additionally, several pipeline companies implemented maintenance actions under the auspices of

“programmatic” consultations; little disturbance of habitat generally occurs with these projects and, to date, we are unaware of any desert tortoises being killed during these maintenance activities. One of the larger projects, in terms of the amount of habitat disturbance, was the new Kern River Pipeline; it followed the route of the Boulder Utility Corridor through the western Mojave Desert. No desert tortoises were killed or injured during the installation of this pipeline. Portions of the Level 3 fiber optic cable were also installed along this corridor; no mortalities of desert tortoises were reported, 53 animals were moved from harm’s way, and 59 acres of habitat were disturbed. Note that this fiber optic cable also crossed several recovery units. Finally, nine desert tortoises were relocated during construction of a gas line between Kramer Junction and Adelanto; approximately 323 acres of habitat were disturbed.

We find it notable that, with the exception of the original Kern River Pipeline and the Mojave Pipeline, no single project has resulted in the deaths of more than three desert tortoises; during most actions, no desert tortoises have been killed. We attribute the low level of mortality to the protective measures implemented during the consultation process, the fact that many projects are implemented in the winter when desert tortoises are mostly inactive, and, at least in part, to the decline in the number of desert tortoises over large parts of the Mojave Desert over the past several years.

For most projects, the Bureau, under the authorities of the Federal Land and Management Policy Act, requires project proponents to compensate for the unavoidable impacts of projects. Generally, proponents acquire lands that are important for the conservation of the desert tortoise and donate the lands to the Bureau; alternatively, proponents contribute funds to a special account that the Bureau manages for the acquisition of land. Between 1990 and 2002, the Bureau acquired approximately 6,426 acres of compensation lands as a result of projects that were implemented on public lands. For many projects, the California Department of Fish and Game also receives compensation lands from impacts that occur on non-federal lands that are adjacent to public lands.

Status of the Desert Tortoise in the Action Area

Desert tortoises occur over large areas of public lands within the Western Mojave Recovery Unit; however, as we have noted previously in this biological opinion, their distribution is uneven. On public lands, they occur as far north as Olancho and the northern Panamint Valley south to the boundary of Joshua Tree National Park; desert tortoises also occur from the lower foothills of the southern Sierra Nevada and Tehachapi Mountains in the west east to Death Valley and the eastern side of Joshua Tree National Park. Note that the planning area of the West Mojave Plan covers more area than the range of the desert tortoise; for example, the western part of the planning area, along the higher flanks of the Sierra Nevada, reaches elevations where desert tortoises do not occur. The planning area also extends farther north than desert tortoises normally occur in this part of their range.

The recovery plan for the desert tortoise considered the Western Mojave Recovery Unit to be one of the most threatened units (Service 1994c). Desert tortoises in this recovery unit continue to face numerous threats. Predation by common ravens and feral dogs, mortality on paved and

unpaved roads, vandalism, and poaching continue to cause loss of individuals. The cause or causes of mortality in many individuals cannot be determined; drought, one or more diseases, and physiological stress may be factors. Appendix L of the final environmental impact report and statement (Bureau et al. 2005) notes that the cause of death could be determined for 148 of the 1,779 carcasses that were found during transect work conducted from 1998 through 2002 and during line-distance sampling conducted in 2001 and 2002. These data indicate that predation by mammals (71 individuals), crushing by off-highway vehicles (35), predation by common ravens (12), and gunshot (9) accounted for most of the identifiable causes of death on lands managed by the Bureau (see Table L-6 of Appendix L).

Based on recommendations contained in the recovery plan, the Service has been coordinating an effort to determine trends in number of desert tortoises that occur in each recovery unit. This effort, which is called line-distance sampling, relies on detecting live animals during the spring. Data from this sampling have not been fully analyzed to date. Based on density values derived from line-distance sampling conducted within the Fremont-Kramer, Superior-Cronese, and Ord-Rodman critical habitat units, Heaton et al. (2004) calculated that approximately 20,420 to 41,224 adult desert tortoises reside in the western Mojave Desert. (The Desert Tortoise Recovery Plan Assessment Committee does not consider the Pinto Mountain Desert Wildlife Management Area to be part of the Western Mojave Recovery Unit [Heaton et al. 2004]; therefore, this range does not include animals from that area.) They arrived at this estimate by multiplying the average density for each critical habitat unit by the acreage of suitable habitat that was sampled within the unit and totaling the results. Note that the sampling excludes areas over 4,200 feet in elevation and playas, where desert tortoises are not expected to live, and private lands, which are not sampled because of lack of access. Desert tortoises that reside within suitable habitat on private lands are not included in the estimate; consequently, the predicted range of the number of desert tortoises may be greater than estimated. Conversely, as we noted previously in this section, the most favorable habitat for desert tortoises occurs between 1,000 and 3,000 feet, therefore, including elevations of up to 4,200 feet in the abundance calculation may result in an overestimate of the number of desert tortoises. Finally, statistical issues with the methodology of line-distance sampling may introduce even greater variances in the estimated total than those shown in the depicted range. Regardless of the variance that may exist in these estimates, they represent the best available scientific and commercial information.

From 1998 to 2001, biologists working for the Bureau surveyed 3,362 transects covering 3,378 square miles in the western Mojave Desert (Bureau et al. 2005). The transects are generally conducted by walking a triangular transect, 0.5 mile on each side, and recording all sign (i.e., scats, burrows, or other evidence of the presence of animals) of desert tortoises. The surveyors did not find any sign of desert tortoises on 1,405 (42 percent) of the transects; the surveyors failed to detect sign in areas where desert tortoises were previously considered to be common. Map 3-8 in the final environmental impact report and statement (Bureau et al. 2005) depicts the distribution of above-average sign counts; higher sign counts generally indicate the areas that support a higher relative abundance of desert tortoises. The following sections describe the results of work related to the abundance of desert tortoises that has been conducted within and adjacent to the proposed desert wildlife management areas in the Western Mojave Recovery Unit.

Vicinity of the Pinto Mountains Desert Wildlife Management Area

The proposed Pinto Mountains Desert Wildlife Management Area is located in the southeastern portion of the Western Mojave Recovery Unit; Tracy et al. (2004) suggest that it would be more appropriately placed in the Eastern Colorado Recovery Unit. No permanent study plots are located in this proposed desert wildlife management area. Little information exists on the densities of desert tortoises in this area. Tracy et al. (2004) noted that the distribution of carcasses and live desert tortoises appeared to be what one would expect in a "normal" population of desert tortoises; that is, carcasses occurred in the same areas as live animals and were not found in extensive areas in the absence of live desert tortoises. No higher density areas were found in the proposed Pinto Mountain Desert Wildlife Management Area during the survey work conducted by the Bureau from 1998 to 2001.

Vicinity of the Ord-Rodman Desert Wildlife Management Area

The proposed Ord-Rodman Desert Wildlife Management Area is located to the southeast of the city of Barstow. The recovery plan notes that the estimated density of desert tortoises in this area is 5 to 150 animals per square mile (Service 1994c). During the survey work conducted by the Bureau from 1998 to 2001, the proposed Ord-Rodman Desert Wildlife Management Area contained three higher concentration areas, located in its eastern, northwestern, and southern corners. Three permanent study plots are located within and near this proposed desert wildlife management area. The following table contains the density estimates for these plots; the data are from Berry (1996); all data are in the approximate number of desert tortoises of all sizes per square mile.

	Stoddard Valley	Lucerne Valley	Johnson Valley
1980		176	114
1981	146		
1986		150	80
1987	178		
1990		82	18
1991	225		
1994		73	73

Berry (1996) notes that, for various reasons, surveys at the Stoddard Valley plot encountered various difficulties; some desert tortoises from this plot were taken by poachers and at least one animal became ill with upper respiratory tract disease and contained environmental contaminants. Common ravens and feral dogs have killed desert tortoises at the Lucerne Valley plot; Berry (1998) notes that little recruitment into adult size classes was occurring. Berry (1996) notes that at least two desert tortoises from the Johnson Valley plot were killed by off-road vehicle use or cattle; at least one ill and salvaged animal contained environmental contaminants.

Vicinity of the Superior-Cronese Desert Wildlife Management Area

The proposed Superior-Cronese Desert Wildlife Management Area is located north of the Ord-Rodman Desert Wildlife Management Area; two interstate freeways and rural, urban, and agricultural development separate them. No permanent study plots have been established in this area; the density of desert tortoises has been estimated through numerous triangular transects and line distance sampling efforts. The recovery plan notes that this desert wildlife management area supports densities of approximately 20 to 250 desert tortoises per square mile. The survey work conducted by the Bureau from 1998 to 2001 indicated that the western portion of the proposed Superior-Cronese Desert Wildlife Management Area did not contain any high density areas; desert tortoises seemed to be concentrated in the south-central portion of the proposed desert wildlife management area and along portions of the southern boundary of Fort Irwin.

Vicinity of the Fremont-Kramer Desert Wildlife Management Area

The proposed Fremont-Kramer Desert Wildlife Management Area is located west of the Superior-Cronese Desert Wildlife Management Area; the two desert wildlife management areas are contiguous. The recovery plan notes that the estimated density of desert tortoises in this area was 5 to 100 animals per square mile (Service 1994c). The southern portion supported the vast majority of the high density areas in the proposed Fremont-Kramer Desert Wildlife Management Area, as determined during the survey work conducted by the Bureau from 1998 to 2001.

Five permanent study plots are located within this proposed desert wildlife management area; one plot, the Interpretive Center plot at the Desert Tortoise Natural Area, is split into two subplots. The following table contains the density estimates for these plots; the data are from Berry (1996); all data are in the approximate number of desert tortoises of all sizes per square mile.

	Fremont Valley	Desert Tortoise Natural Area, Interior	Desert Tortoise Natural Area, Interpretive Center		Fremont Peak	Kramer Hills
			Inside Fence	Outside Fence		
1979		387	339	296		
1980					99	223
1981	278					
1982		332				314
1985			229	134	45	
1987	179					130
1988		195				
1989			106	80	32	
1991	101					60
1992		47				

1993			61	42	8	
1995						139
1996		18				
1997		8*	34#	23#		
2001	19*					
2002			28#	10#		

* These values represent the actual numbers of desert tortoises found on the plot and do not represent a density estimate; the data are from Berry (pers. comm. 2005).

These data are from Connor (2003).

Berry (1996) notes that the overall trend in this proposed desert wildlife management area is “a steep, downward decline” and lists predation by common ravens and domestic dogs, off-road vehicle activity, illegal collecting, upper respiratory tract disease, and environmental contaminants as contributing factors.

Summary of the Status of the Desert Tortoise in the Action Area

A decline in numbers of desert tortoises in the Western Mojave Recovery Unit can be quantitatively demonstrated. Between 1971 and 1980, 27 plots were established in California to study the desert tortoise; 15 of these plots were used by the Bureau to monitor desert tortoises on a long-term basis (Berry 1999). Generally, the plots were visited at roughly 4-year intervals to determine the numbers of desert tortoises they supported. Desert tortoises found on these plots during the spring surveys were registered; that is, they were marked so they could be identified individually during subsequent surveys. The Desert Tortoise Recovery Plan Assessment Committee (Tracy et al. 2004) evaluated data from long-term study plots in the western Mojave Desert and concluded that the population densities of adult desert tortoises exhibited a significant downward trend ($P < 0.0001$) from approximately 1975 through 2000.

Status of Critical Habitat of the Desert Tortoise within the Action Area

In the last 10 years, the Bureau has acquired more than 500,000 acres of private lands in critical habitat of the desert tortoise and wilderness areas through the California Desert Conservation Area (LaPre 2005f). These acquisitions have improved the ability of the Bureau to manage critical habitat of the desert tortoise within the California Desert Conservation Area. Additionally, to offset the impacts of the use of additional training lands at Fort Irwin, the Army has acquired slightly more than 99,000 acres within the Superior-Cronese, Fremont-Kramer, and Ord-Rodman critical habitat units (Kernek pers. comm. 2005); these lands are interspersed among public lands generally to the south and southwest of Fort Irwin. We mention these facts here because these lands have been acquired in all the recovery units in the California Desert Conservation Area; the Army’s acquisitions have also contributed to the manageability of the critical habitat units in the Western Mojave Recovery Unit.

Ord-Rodman Critical Habitat Unit. The Ord-Rodman Critical Habitat Unit covers approximately 254,142 acres. The Bureau manages approximately 202,845 acres of this area;

the State of California manages 3,245 acres. Approximately 47,483 acres are privately owned (LaPre 2005d).

Two livestock allotments lie within the boundaries of the Ord-Rodman Critical Habitat Unit. The Bureau (2004c) provided the following information regarding grazing in this critical habitat unit. Large portions of the Ord Mountain Allotment are located at 4,000 feet or higher in elevation; although the Service conducts line distance sampling up to elevations of 4,200 feet, most desert tortoises reside at elevations between 1,000 and 3,000 feet (Luckenbach 1982). A visual comparison of preliminary data points from line distance sampling (Everly 2005) and elevation maps of the Ord Mountain Allotment (Bureau 2004b) indicates that few desert tortoises have been detected at elevations over 4,000 feet. Although the areas over 4,000 feet in elevation are within the boundaries of the Ord-Rodman Critical Habitat Unit, they likely do not support the primary constituent elements of critical habitat on a widespread basis.

Two out of the five key areas on the Ord Mountain Allotment are located below 4,000 feet in elevation; consequently, these areas are of interest in assessing the baseline conditions of this critical habitat unit relative to grazing. Key Area #1 had utilization levels ranging from 10 to 50 percent on key species; the average utilization level over a 12-year period is 21 percent, which the Bureau characterizes as light. From 1988 to 1994, utilization at Key Area #5 ranged from 2.5 to 10 percent, with an average of 3 percent; the Bureau characterizes this level as non-use.

Between 1995 and 1997, the Bureau conducted utilization transects at sites other than the key areas. Most of the transects were located above 4,000 feet; however, two sites located in the southwest portions of the allotment are located below 4,000 feet and within critical habitat. Utilization levels at these two sites ranged from 12 to 68 percent, with an average close to 50 percent.

The Bureau estimates that cattle are present within critical habitat over 90 percent of the year, although 75 percent of the area they occupy is above 4,000 feet in elevation. All of the developed water sources are within critical habitat. Between 1990 and 2003, the number of head of cattle within the allotment has ranged from 145 to 385. In 6 of those years, more than 300 head were present; less than 200 were present during 4 years.

Over the last 12 years, the overall densities of key species, especially perennial bunch grasses, have decreased. Galleta grass (*Hilaria rigida*) and spiny hopsage (*Grayia spinosa*) at Key Area #1 have all but died off, probably resulting from a combination of prolonged drought and overgrazing. Desert needlegrass (*Stipa* spp.) occurs primarily within the protection of shrubs and is rarely found in inter-shrub spaces; the lack of this perennial bunchgrass in inter-shrub spaces may be an indication of the amount of grazing pressure.

Unless otherwise noted, the information in the following paragraphs is from LaPre (2005a). The Ord-Rodman Critical Habitat Unit contains three active utility corridors. Corridor G, which is 2 miles wide, lies along Interstate 40 at the northern boundary; most of the facilities associated

with the one 30-inch pipeline in this corridor are placed outside the critical habitat unit. Corridor D is 2 miles wide; it contains two 287-kilovolt power lines and one 500-kilovolt power line. Corridor H contains one 34-inch pipeline; it is 2 miles wide.

Several off-highway vehicle routes are found within the Ord-Rodman Critical Habitat Unit, which is situated between the Johnson Valley and Stoddard Valley off-highway vehicle management areas. The Western Mojave Off-Road Vehicle Designation Project, completed by the Bureau in June 2003, designated all routes as open, closed or limited in use within the critical habitat unit. The Service issued a biological opinion for this recreational use in 2003 (1-8-03-F-21, Service 2003b); this consultation evaluated the effects of route designation throughout the western Mojave Desert, including the other three critical habitat units in the Western Mojave Recovery Unit.

The Newberry Mountains Wilderness, which includes 26,453 acres, is located entirely within the critical habitat unit. The 34,315-acre Rodman Mountains Wilderness is also located within the Ord-Rodman Critical Habitat Unit.

Fremont-Kramer Critical Habitat Unit. The Fremont-Kramer Critical Habitat Unit is approximately 518,000 acres in size. The following information regarding land ownership is from LaPre (2005d). The critical habitat unit includes 65,483 acres within Edwards Air Force Base, which is outside of the action area of this biological opinion. The Bureau manages approximately 283,710 acres of this area. The State Lands Commission manages 457 acres. Approximately 163,857 acres are privately owned.

The California Department of Fish and Game's Fremont Valley Ecological Reserve consists of 1,090 acres in 5 properties. The California Department of Fish and Game also manages the West Mojave Desert Ecological Reserve, which consists of 22 properties totaling 11,817 acres northeast of Kramer Junction. The parcels managed by the California Department of Fish and Game are scattered within public lands and are thus considered to be within the action area.

The California Desert Conservation Area Plan of 1980 designated lands north of California City in Kern County as an area of critical environmental concern and a research natural area. The Desert Tortoise Research Natural Area, which includes 25,695 acres, is managed jointly by the Bureau, California Department of Fish and Game, and the Desert Tortoise Preserve Committee, a non-profit group established to acquire and manage lands for protection of the desert tortoise. The northern portion of the Desert Tortoise Research Natural Area (3,045 acres) is within the Fremont-Kramer Critical Habitat Unit.

Approximately 174 acres of the Golden Valley Wilderness is included within the Fremont-Kramer Critical Habitat Unit, just outside the southwestern corner of the U.S. Navy's Mojave B Range. The remaining wilderness extends the protected habitat to the northwest.

In past years, sheep grazed this critical habitat unit in several allotments. No sheep grazing has occurred within the vast majority of the critical habitat unit since at least the early 1990s, as a result of section 7(a)(2) consultations between the Bureau and Service. A portion of the Pilot

Knob Allotment, which was grazed by cattle, overlies this critical habitat unit. It has not been grazed for approximately 10 years; the private interests in that allotment have been acquired by a conservation group.

Contingent corridor P, which is 2 miles wide, traverses the critical habitat adjacent to Highway 395; this corridor contains two 115-kilovolt power lines, a coaxial cable, and a 12-inch pipeline. Utility corridors G and Q cross the Fremont-Kramer Critical Habitat Unit. Corridor G is 2 miles wide and contains a 30-inch pipeline. Corridor Q is also 2 miles wide; it contains a 12-inch pipeline.

Several popular off-highway vehicle routes are found within the Fremont-Kramer Critical Habitat Unit. The Rand Mountains, which are located between the Desert Tortoise Research Natural Area on the west and the Rand Mining District on the east, are extremely popular with off-highway vehicle users. The Bureau has expended considerable effort to control recreational use in this area.

Superior-Cronese Critical Habitat Unit. The Superior-Cronese Critical Habitat Unit is approximately 772,000 acres in size. The following information regarding land ownership is from LaPre (2005d). Approximately 189,304 acres are within military bases, which are outside of the action area of this biological opinion. The Bureau manages approximately 380,592 acres of this area. The State Lands Commission manages 5,530 acres; the California Department of Fish and Game manages 3,861 acres. Approximately 192,237 acres are privately owned.

The critical habitat unit is contiguous with critical habitat on the Mojave B Range of the Naval Air Weapons Station and the Fort Irwin National Training Center; however, these areas, which include 201,914 acres, are outside of the action area of this biological opinion. The Air Force's Cuddeback Gunnery Range, which is no longer in use, is entirely contained within critical habitat.

A small portion of utility corridor BB is within the southeast portion of the Superior-Cronese Critical Habitat Unit. Corridor BB is an east-west corridor, 3 miles wide, which follows Interstate 15. Major utilities located in this corridor include one 131-kilovolt transmission line, two gas pipelines, and two fiber optic cables. This corridor also includes Interstate 15. The 2-mile wide Boulder Corridor (Corridor D) also traverses this critical habitat unit. The 5-mile wide corridor Q also runs east-west through the critical habitat unit.

Several popular off-highway vehicle routes are found within the Superior-Cronese Critical Habitat Unit. Cultural sites include the 61,805-acre Black Mountain Cultural Area and the 898-acre Calico Early Man Site. The Rainbow Basin/Owl Canyon area contains a campground and highly eroded geological formations; this 4,087-acre site is popular with visitors.

The Black Mountain Wilderness overlaps 20,929 acres of the critical habitat unit. The Grass Valley Wilderness consists of 32,835 acres. Both of these wilderness areas are entirely within the critical habitat unit. Approximately 1,715 acres of the Golden Valley Wilderness are within

the Superior-Cronese Critical Habitat Unit; the remainder of the 37,700 acres adjoins the critical habitat unit on its northern edge.

Pinto Mountain Critical Habitat Unit. The Pinto Mountain Critical Habitat Unit is approximately 171,700 acres in size. The following information regarding land ownership is from LaPre (2005d). Joshua Tree National Park includes 19,329 acres within this critical habitat unit; however, it is outside of the action area of this biological opinion. Approximately 111,668 acres of the critical habitat unit are within the planning area for the West Mojave Plan; the remainder of the critical habitat unit lies within the boundaries of the Northern and Eastern Colorado Desert Coordinated Management Plan. The Bureau manages approximately 103,771 acres of this area. The State of California owns 5,633 acres; the State Lands Commission, California Department of Fish and Game, and California Department of Parks and Recreation manage these lands. Approximately 2,264 acres are privately owned.

Within the public lands, the Bureau manages 683 acres as Class C and 109,510 acres as Class M. This area currently does not contain any Class L or I lands. Unclassified lands comprise 1,502 acres.

The northwestern corner of the critical habitat unit is within the city of Twentynine Palms. This segment contains nearly all of the private land within the Pinto Mountain Critical Habitat Unit.

This area represents a transition between Colorado Desert and Mojave Desert flora and fauna. Wash species include smoke trees (*Dalea spinosa*), palo verdes (*Cercidium* spp.), and ironwoods (*Olneya tesota*). Ocotillo and barrel cacti are present, though these species are more common to the south.

This critical habitat unit does not contain any livestock allotments or utility corridors. Off-highway vehicle routes are utilized primarily by prospectors, rockhounds, and claimholders.

Most of the Pinto Mountain Critical Habitat Unit is within the Old Dale Mining District. Many small-scale historical mines are present.

A small portion of the Sheephole Valley Wilderness lies within the critical habitat unit. It occupies approximately 683 acres.

Summary of the Status of Critical Habitat of the Desert Tortoise in the Action Area

The four critical habitat units within the Western Mojave Recovery Unit contain numerous types of habitats, cover the full range of the elevations used by desert tortoises, and are subject to varying degrees of human use. The proximity of the Los Angeles Basin is responsible for making the Western Mojave Recovery Unit important to recreational users and economic interests. Despite this level of use, large areas of critical habitat in the western Mojave Desert remain undisturbed. We base this statement on information provided by the Bureau that was gathered in support of the West Mojave Plan. Using aerial photographs from 1994 of the proposed desert wildlife management areas in the planning area for the western Mojave Desert

region, the Bureau used numerous conservative calculations (i.e., it erred on the side of overestimating the amount of disturbance) and concluded that approximately 1.3 percent of the proposed desert wildlife management areas has been disturbed to date (LaPre 2005c). We acknowledge that the critical habitat units and desert wildlife management areas do not overlap completely; however, this information comprises the best available data with regard to surface disturbance in the planning area. At this level of disturbance, we anticipate that the critical habitat units should function fully to support the conservation of the desert tortoise.

We have historically measured the degree of functionality of the primary constituent elements of critical habitat of the desert tortoise by evaluating the amount of ground disturbance. In recent years, however, research conducted by Oftedal (2005) indicates that other, more subtle changes in some of the primary constituent elements may also be important. Oftedal postulates that changes in the composition of annual plants, from certain native species that are high in protein and water to less nutritive non-native species, may be placing desert tortoises in a state of chronic stress. At this time, we continue to consider that evaluation of the degree of ground disturbance is the most pertinent indicator of the health and status of the critical habitat units; however, we should closely track the development of new information with regard to environmental factors and how they may affect the physiology of desert tortoises.

EFFECTS OF THE ACTION ON THE DESERT TORTOISE AND ITS CRITICAL HABITAT

Methodology

We conducted our analysis in a stepwise fashion. We began our analysis with a general description of how various anthropogenic activities could affect the desert tortoise and its habitat, including the primary constituent elements of its critical habitat.

We then analyzed the effects of the actions proposed in the amendment to the California Desert Conservation Area Plan for the western Mojave Desert. We did not analyze the effects of any site-specific future actions that are beyond the scope of this plan amendment. As the California Desert Conservation Area Plan notes, site-specific actions may be allowed after they are analyzed pursuant to the National Environmental Policy Act; the Bureau must also comply with section 7(a)(2) of the Act when it is considering these future actions. Because the California Desert Conservation Area Plan also provides the fundamental authorization for many ongoing activities, such as casual recreational use, that do not require site-specific analysis by the Bureau, we analyzed the effects of this type of activity. We conducted our analysis of all of these effects, whether beneficial or adverse, to the desert tortoise and its critical habitat within the action area in relation to its survival and recovery needs and to the function of designated critical habitat, respectively.

We note that the Bureau's proposed action includes many types of actions that may affect the desert tortoise and its critical habitat over a very large area. In such cases, we frequently do not have extensive data upon which to base our analyses. In developing this biological opinion, we used the best available information as described and required by the implementing regulations for section 7(a)(2) of the Endangered Species Act. Specifically, 50 *Code of Federal Regulations*

402.14(d) requires the Federal agency requesting formal consultation to provide us “with the best scientific and commercial data available or which can be obtained during the consultation for an adequate review of the effects that an action may have upon listed species or critical habitat.” The consulting Federal agency bears the responsibility, “to the extent practicable,” to obtain the requested data “which can be developed within the scope of the extension” (50 *Code of Federal Regulations* 402.14(f)). Finally, 50 *Code of Federal Regulations* 402.14(g)(8) states that “In formulating its biological opinion, any reasonable and prudent alternatives, and any reasonable and prudent measures, the Service will use the best scientific and commercial data available and will give appropriate consideration to any beneficial actions taken by the Federal agency or applicant, including any actions taken prior to the initiation of consultation.”

The Bureau will consult on each future action that it proposes to approve, undertake, or fund, pursuant to the requirements of section 7(a)(2) of the Act, if the action may affect a listed species or critical habitat. Although this biological opinion may conclude that the proposed amendment of the California Desert Conservation Area Plan is not likely to jeopardize the continued existence of the desert tortoise or adversely modify its critical habitat, a specific action may be proposed in the future that could result in a finding of jeopardy or adverse modification of critical habitat. Such a circumstance could occur when permit applications contain project-specific details that cannot be evaluated at this programmatic level.

Finally, we have indicated, in the Effects to the Desert Tortoise sections of the following analyses, whether the action being discussed is fundamentally authorized by the California Desert Conservation Area Plan or whether future approvals by the Bureau are required. In the former case, the action will become effective with the signing of the record of decision for the West Mojave Plan (e.g., establishment of the desert wildlife management areas) or is a casual use (e.g., individuals driving vehicles on routes that are designated as open). In the latter case, the Bureau has discretionary authority over the implementation of future actions (e.g., mining plans of operation).

General Effects of Human Activities on the Desert Tortoise and its Critical Habitat

Numerous activities are likely to occur as a result of implementing the management actions proposed in the West Mojave Plan. These activities have the potential to adversely affect the desert tortoise and its critical habitat by: injuring or killing individuals; disrupting their breeding, feeding, or sheltering behavior; and by disturbing or degrading the primary constituent elements of critical habitat.

Effects of Human Activities on the Desert Tortoise

Vehicles that are driving on paved and unpaved roads and cross-country can strike desert tortoises (Boarman and Sazaki 1996). Cross-country travel can also result in the destruction of burrows; desert tortoises could either be trapped inside the burrows or find them unavailable when they are needed to escape predation or extreme weather conditions. In general, cross-country travel occurs less frequently than travel on roads but can cause substantial impacts

because of the presence of burrows and the greater difficulty in detecting and avoiding desert tortoises.

In most areas on public lands within the planning area, the Bureau has restricted the use of vehicles to designated routes; consequently, cross-country travel should not occur in most areas on a casual basis. The final environmental impact report and statement notes, however, that cross-country travel was observed on 833 of 1,572 (53 percent) transects that were conducted to assess the distribution of desert tortoises within the Fremont-Kramer and Superior-Cronese desert wildlife management areas. This unauthorized use, which can affect the desert tortoise as we described previously in this section of the biological opinion, is an indirect effect of the authorized access that the Bureau provides through its system of open routes.

Whether it is on a road or not, hatchling desert tortoises are the most difficult individuals to detect. Hatchlings may be somewhat less susceptible to being killed on roads because their territories are presumably smaller, they may move around less, and therefore be less likely to encounter a road. On the other hand, their propensity to be more active during cooler times of the year may extend the periods during which they are at risk of vehicle strikes.

We are unaware of any research that conclusively shows the density at which roads would be likely to extirpate desert tortoises from a region; based on their research, Hoff and Marlow (2002) contend that a large portion of an area conserved for desert tortoises in Nevada is degraded by heavily used roads. Although they showed that less frequently traveled unpaved roads also affect the distribution of desert tortoise sign, we cannot extrapolate this information directly to roads elsewhere because of varying factors, such as the amount of traffic, the density of desert tortoises, and probably, to some extent, the local terrain. Intuitively, fewer desert tortoises are likely to be killed if fewer roads are available for travel. Factors other than density also likely enter into the effects of roads; for example, few desert tortoises are likely killed on a lightly used road but this number may rise if the road becomes more heavily used as a result of closures elsewhere. Conversely, at some point, vehicle use on roads (combined with other activities that accompany vehicle use) would likely reduce the number of desert tortoises to a point where the level of mortality also decreases, simply because fewer desert tortoises live in the region. At the present time, desert tortoises seem to have become so rare in areas where they were formerly abundant that they are unlikely to be struck by vehicles.

Although desert tortoises are generally more easily observed on roads, vehicles can travel at increased speed that again reduces the ability of drivers to detect and avoid desert tortoises. Rises and turns in roads also decrease the ability of drivers to detect desert tortoises. The actual level of injury or mortality that would occur along a specific road will be influenced by many variables and is difficult to predict; the level and type of use of the road by vehicles and the number of desert tortoises present during periods of heavy use are two of the primary factors that are difficult to predict. Mortality associated with vehicle strikes, both on and off roads, will be greatest in the spring and fall, in areas where desert tortoises are most common. Along heavily used roads, the number of desert tortoises is depressed for some distance from the edge of the road as a result of road-associated mortality; this distance varies with the level of use of the road. For example, Hoff and Marlow (2002) found that "reductions in (desert) tortoise sign are easily

detectable more than (2.48 miles) from the roadway” on heavily used paved roads. They also found “evidence from unpaved utility access roads ... that even lower traffic levels may have a significant detectable impact.” Of the roads that Hoff and Marlow (2002) investigated, only a poorly maintained paved road, with a traffic volume of approximately 25 vehicles per day seemed to have no effect on the distribution of sign of the desert tortoise.

In the western Mojave Desert, the Bureau has authorized the use of some washes as designated routes of travel; vehicles using washes may kill or injure desert tortoises. The risk to desert tortoises of being struck by a vehicle while in a wash may be different than that associated with a road. For example, desert tortoises are likely more difficult to see when they are in washes because of the generally greater variation in contours and substrates in washes as compared to those on roads; desert tortoises likely also spend more time in washes than on roads because washes support resources that they require, such as shrubs for cover and annual plants for forage. However, vehicles traveling on roads usually do so at greater speeds than can be used in washes, thus reducing the ability of the driver to see desert tortoises; finally, more vehicles use roads than washes. Note that these statements are generalizations and exceptions likely apply to each statement. Desert tortoises may use washes to varying degrees in different portions of their range; therefore, the likelihood that any given wash supports desert tortoises at densities greater than the surrounding desert would depend on the location of the wash.

The final environmental impact report and statement contains additional discussion regarding the effects of roads on desert tortoise populations. It reaches the conclusion that, despite many studies showing reduced numbers of desert tortoises near roads, an absolute connection between the presence of roads and the status of the desert tortoise is difficult to make. For example, the presence of other factors in the area, such as sheep grazing and disease, may also contribute to local declines in the number of desert tortoises. Regardless of the difficulty in linking declines in the status of desert tortoise populations to the effects of vehicle use, the final environmental impact report and statement notes that, in two surveys, vehicles were responsible for crushing 28 of 104 (27 percent) and 14 of 44 (32 percent) desert tortoises where the cause of death could be ascertained. Consequently, based on this information, the level of mortality of desert tortoises attributable to vehicles is not insignificant.

Desert tortoises would be at risk during the construction, operation, and maintenance phases of any projects that would employ large equipment. Animals can be crushed on the ground's surface, trapped in their burrows, and buried in overburden piles. During the construction of the Kern and Mojave pipelines, numerous desert tortoises were killed by vehicles traveling to and from the project sites on the rights-of-way; although this mortality was not directly caused by the heavy equipment at the construction sites, the right-of-way traffic was occurring in direct support of that activity.

Because of their small size, hatchlings and slightly larger desert tortoises could be trampled by foot traffic of people working or recreating in the desert. Nests are also vulnerable, but their typical location, near the mouth of a burrow, likely protects them to some degree.

Desert tortoises have died as a result of other factors associated with human activities. They have fallen into trenches that were excavated for various types of projects and into mine shafts. Approximately 45 desert tortoises were rescued from abandoned mine shafts on one weekend in the El Paso Mountains in 1983 (Aardahl pers. comm. 2005); in the mid-1990s, we heard of similar rescues of smaller numbers of desert tortoises from mining excavations near Daggett Ridge. Improperly constructed cattle guards can also trap smaller individuals. Desert tortoises have become entangled in netting or wire. Desert tortoises may seek shelter in the shade of vehicles and be crushed when those vehicles are subsequently moved. Improper disposal of food wastes and trash often attracts predators of the desert tortoise, especially common ravens. Pet dogs brought onto public lands by recreationists or workers associated with specific projects can disturb, injure, or kill desert tortoises. Desert tortoises have also been found trapped in guzzlers and between the rails of a railroad track.

Some ill, dying, and recently dead desert tortoises have been found to contain elevated levels of potential toxicants, such as cadmium, chromium, mercury, nickel, and lead (Jacobson et al. 1991, Homer et al. unpublished data in Chaffee and Berry 1999). Chaffee and Berry (1999) compared concentrations of elements found in plants and soils and found elevated concentrations of cadmium, potassium, and zinc in all plants; other elements, such as chromium, nickel, and selenium were enriched only in certain plants. Because desert tortoises seem to forage selectively on certain plant species, they may eat or avoid those species containing elevated levels of potential toxicants. They also found anomalous concentrations of arsenic, which could be toxic to desert tortoises in large quantities, near areas that have been mined for gold; arsenic occurs in some gold ores. Avery (1998) notes that concentrations of heavy metals, such as chromium, iron, copper, zinc, and aluminum, were higher in Mediterranean grass (*Schismus barbatus*) than in evening-primrose (*Camissonia boothii*), four o'clocks (*Mirabilis bigelovii*), or filaree (*Erodium cicutarium*). Avery (1998) found that Mediterranean grass had greater concentrations of chromium, iron, copper, zinc, and aluminum than the latter three species. He speculated that, because its fibrous roots are near the surface of the soil, it may accumulate heavy metals that are deposited from airborne pollution more readily than the other species, which have tap roots. Mediterranean grasses (*S. barbatus* and *arabicus*) are widely distributed, non-native plants that are common in disturbed soils and readily consumed by desert tortoises. To date, although desert tortoises seem to have been exposed to elevated levels of potentially toxic elements, we do not know if this exposure has caused any adverse effects.

The use of pesticides could result in direct mortality of desert tortoises; we are unaware of specific studies regarding the effects of pesticides on the desert tortoise. Herbicides may reduce or eliminate the abundance of plants that the desert tortoise uses for forage or shelter; other pesticides could reduce the abundance of pollinators, which, in turn, could reduce the germination success of plant species that are important to the desert tortoise. Both the active ingredient and surfactants may be toxic to desert tortoises, plant species that it uses for forage and shelter, and the pollinators of these plant species.

Through legitimate and authorized use of desert lands, people make contact with desert tortoises. This contact can lead to uninformed or malicious interactions that result in injury or mortality of desert tortoises. For example, unauthorized handling or restraint of a desert tortoise could induce

physiological stress that reduces the animal's ability to withstand high temperatures. Desert tortoises are occasionally killed by gunshots. Some mortality associated with gunshots may be accidental; however, most are probably intentional simply because of the low likelihood of a bullet randomly striking a desert tortoise. Although this consultation addresses only legal actions that are implemented or authorized by the Bureau, the access provided by the Bureau's authorizations can increase the number of adverse interactions between desert tortoises and people.

The presence of people in the desert has provided subsidies that allow at least some species, including some predators of the desert tortoise, to be present in greater numbers than they were prior to the development of cities, towns, agriculture, and other human features. Perhaps most importantly, the number of common ravens in the Mojave Desert increased ten-fold between 1968 and 1992 (Boarman and Berry 1995). Common ravens find human-produced subsidies in many forms; they nest on power pylons, drink at artificial water sources, and eat road-killed animals, refuse at landfills, and the products of agricultural areas. Activities that the Bureau authorizes under the auspices of the California Desert Conservation Area Plan have the potential to add to these subsidies. Although alterations to habitat have increased the number of common ravens, we included a discussion of these in this section because the indirect impact of subsidies to the desert tortoise is an increased level of predation, which was, as we mentioned in the Status of the Species section of this biological opinion, one of the factors that influenced the listing of the species as threatened.

Human activities in the desert increase the spread of non-native plants. These species can increase the ability of the desert to carry wild fires (Lovich and Bainbridge 1999). Desert tortoises are not adapted to fire; consequently, fires could result in a substantial loss of desert tortoises.

In summary, desert tortoises may be killed or injured by a wide variety of human activities that the Bureau can authorize under the auspices of the West Mojave Plan. The number of desert tortoises that may be killed or injured by any given activity depends on a variety of factors. The nature of the activity, its location and timing, and the density of desert tortoises in the action area are key factors that affect the number of animals that may be killed or injured. Given the broad nature of this consultation, we are unable to estimate the number of desert tortoises that may be killed or injured. However, we note that, because desert wildlife management areas and critical habitat were established to include the largest aggregations of desert tortoises, activities occurring in these areas are generally more likely to kill or injure desert tortoises than those occurring outside their boundaries.

Finally, to restate the methodology we are using in this biological opinion, the discussion in this section provided a general overview of the effects of human activities on the desert tortoise; we did not intend for this overview to address the scale or intensity of potential impacts associated with implementation of specific activities proposed in the West Mojave Plan. A complete analysis of the actions proposed in the West Mojave Plan, including addressing the scale of the potential effects, is contained in the Effects of the West Mojave Plan on the Desert Tortoise and its Critical Habitat section of this biological opinion.

Effects of Human Activities on Critical Habitat

The final rule designating critical habitat for the desert tortoise describes the specific primary constituent elements of its critical habitat. These primary constituent elements are: sufficient space to support viable populations within each of the six recovery units and to provide for movement, dispersal, and gene flow; sufficient quality and quantity of forage species and the proper substrate conditions to provide for the growth of these species; suitable substrates for burrowing, nesting, and overwintering; burrows, caliche caves, and other shelter sites; sufficient vegetation for shelter from temperature extremes and predators; and habitat protected from disturbance and human-caused mortality (59 *Federal Register* 5820).

The implementation of the guidelines and elements of the California Desert Conservation Area Plan can remove, disturb, or fragment habitat of the desert tortoise, including the primary constituent elements of critical habitat. We conducted the following analysis by generally using the primary constituent elements as the basis for our discussion.

Note that, regardless of whether a specific area is within the boundaries of critical habitat, various activities generally affect the physical and biological attributes of habitat that supports desert tortoises in the same manner. In the analysis that follows and throughout the biological opinion, we discuss how the primary constituent elements of critical habitat of the desert tortoise may be affected by various activities. The same principles apply to suitable habitat that has not been designated as critical by the Service. Therefore, for example, livestock grazing has the same general effects on desert tortoise habitat, regardless of whether that habitat has been designated as critical. For the purposes of this biological opinion, we do not consider the effects on habitat outside of critical habitat in our conclusions regarding any effects to designated critical habitat.

Sufficient space to support viable populations within each of the six recovery units and to provide for movement, dispersal, and gene flow. This primary constituent element addresses the need to conserve sufficiently large areas to maintain the ecological processes that are necessary to support the recovery of the species. The final rule designating critical habitat also notes that these large reserve areas allow desert tortoises to move, disperse, and maintain gene flow.

We will conduct a specific analysis of the desert wildlife management areas proposed by the Bureau and the means by which the Bureau proposes to maintain the viability of these areas later in this document. At this point in our review, we note that the implementation of the West Mojave Plan has the potential to reduce the amount of space that is available to the desert tortoise to recover. Such reductions can result from disturbance or removal of habitat by a variety of means and scales. For example, the installation of a small informational kiosk at the side of a road to provide information to recreationists may cause the loss of a few hundred square feet of suitable habitat. However, this loss, in and of itself, is inconsequential in relation to the acreage of suitable habitat in any given desert wildlife management area; in fact, the possibility exists that the benefits to the desert tortoise of a more informed public may outweigh any adverse effects of the habitat loss.

Conversely, removal of habitat on a sufficiently large scale can eliminate the ability of entire regions to support desert tortoises. In the worst cases, such large removals may also fragment and isolate additional aggregations of desert tortoises. Such isolation or fragmentation reduces the ability of desert tortoises to move over large areas in response to changes in habitat conditions, prevents genetic interchange, and substantially reduces the likelihood of the re-establishment of desert tortoises in the event of local extirpations. Desert tortoises may be substantially isolated from larger populations by natural features, such as mountain ranges or low valleys, or, in more limited circumstances, by canals, roads, and other human activity. Although the adverse effects of isolation are likely to outweigh the benefits over the long term, isolated groups of desert tortoises may be less susceptible to the transmission of disease on a short-term basis. Few areas that support desert tortoises are likely completely isolated from all other populations. For example, desert tortoises occasionally cross even the busiest roads during periods of low traffic or when assisted by concerned motorists.

Heavily used roads, even if they do not pose a physical barrier to desert tortoises, cause fragmentation because animals cannot cross them safely. Some roads, such as Highway 58, have been fenced to exclude desert tortoises and fitted with underpasses that allow animals to move from side to side; such roads may reduce mortality levels and allow passage of animals to the degree that the potential has increased for the desert tortoise to recover in these areas (Boarman et al. 1998).

Unpaved roads that are used infrequently likely do not pose a threat of fragmentation. However, ongoing road maintenance can lower the bed of the road and raise berms to a degree that desert tortoises which enter the roadway cannot exit. These animals are subsequently threatened with predation, exposure to extreme temperatures, collection, and collision with vehicles.

Sufficient quality and quantity of forage species and the proper substrate conditions to provide for the growth of these species; and sufficient vegetation for shelter from temperature extremes and predators. We have combined a discussion of the potential effects of implementation of the West Mojave Plan on these two primary constituent elements because they both deal with the plant communities that support desert tortoises; additionally, the effects are similar in that the disturbance or removal of annual and perennial plants often occurs as a result of the same activities.

The most direct and obvious potential effect of the implementation of the West Mojave Plan is the direct removal of annual and perennial plants that desert tortoises use for food and cover. When such effects occur within the boundaries of critical habitat, the specific primary constituent elements that may be affected are the quality and quantity of forage species, the proper substrate conditions to provide for the growth of these species, and vegetation for shelter from temperature extremes and predators. Simply stated, the disturbance or removal of annual plants and shrubs reduces the ability of the desert tortoise to find food and shelter. Without a diverse assemblage of plant species upon which to forage, desert tortoises cannot maintain an appropriate nutritive balance (Oftedal 2005); without the cover of shrubs, desert tortoises are more vulnerable to predators and the temperature extremes that are common in the desert. Note that the discussion of the effects of livestock grazing on desert tortoises and their habitat, which is located under the

analysis of the livestock grazing element, contains a more detailed evaluation of the relationship between desert tortoises and their habitat.

Numerous activities can result in the removal or disturbance of vegetation at varying scales and intensities. For example, parking of vehicles off of established routes may crush shrubs or annual species and affect smaller amounts of habitat on a relatively short-term scale. Large-scale mines, on the other hand, generally cause the complete removal of plant communities over substantial areas, most likely on a permanent basis. Note that the degree of restoration at a large mine is subject to some variation; substantial efforts to restore habitat have occurred at Viceroy Mine in the eastern Mojave Desert but reclaiming as habitat the pit made by U.S. Borax at Boron is likely impossible.

In general, short-term disturbances that cover small areas likely do not cause an appreciable reduction in the value of habitat to support desert tortoises; however, if such disturbances are repeated numerous times in a localized area, the aggregate effects of this disturbance are likely to result in the complete loss of habitat value. Large-scale removal of habitat renders the area completely unsuitable for desert tortoises; in the worst case, large areas of removal of habitat may fragment and isolate aggregations of desert tortoises.

Suitable substrates for burrowing, nesting, and overwintering; and burrows, caliche caves, and other shelter sites. We have combined a discussion of the potential effects of implementation of the West Mojave Plan on these two primary constituent elements because they both deal with shelter sites; additionally, the potential effects to these primary constituent elements are similar in that the disturbance or removal of shelter sites or the substrates in which they are constructed often occurs as a result of the same activities.

The use of heavy equipment and driving of vehicles off of designated routes causes compaction of substrates. If the level of compaction is sufficient, substrates could become unsuitable for burrowing by desert tortoises. Additionally, the complete removal of all available habitat from an area would preclude the construction of burrows by desert tortoises. If the local area affected by human activities is extensive, desert tortoises may be precluded from using that area on a long-term basis.

Vehicle use or other ground disturbance, such as construction activities, in areas where caliche caves are present can result in the destruction of these shelter sites. Caliche caves are an important resource for desert tortoises; individuals often use the same caves for extended periods of time. Additionally, desert tortoises cannot construct caliche caves as they do burrows; instead, they are dependent upon finding appropriate sites. Consequently, their loss may have a longer term effect on a desert tortoise than the loss of a burrow.

Most burrows of desert tortoises occur in areas that exhibit less topographical relief than do sites where caliche caves are present. Consequently, cross-country travel by vehicles can result in the destruction of burrows.

In general, the loss of shelter sites renders desert tortoises more vulnerable to predation and exposure to the temperature extremes that are common in the desert. Additionally, if desert tortoises spend time constructing new burrows, they are likely less able to seek mates or spend appropriate amounts of time foraging. Potentially, if desert tortoises are frequently forced to construct new burrows, their energy budgets may be adversely affected.

Habitat protected from disturbance and human-caused mortality. The establishment of open routes and development of various facilities have the potential of increasing the degree to which people interact with desert tortoises and of affecting the other primary constituent elements of their critical habitat. Even if proposed actions are planned carefully and potential impacts to desert tortoises and their habitat carefully considered, their proximity to the primary constituent elements increases the potential that some effects, whether direct or indirect, may accrue to critical habitat. In addition, the indirect effects of at least some development activities often lead to increased disturbance of habitat and human-caused mortality (e.g., stray and feral dogs from housing developments kill desert tortoises beyond the foot print of the housing, common ravens attracted to a poorly managed landfill consume desert tortoises for miles around the site); at times, these indirect effects cause more serious and long-term degradation of habitat value than the initial action.

Additional effects of human activities on critical habitat. The final rule designating critical habitat for the desert tortoise did not include a specific primary constituent element that discussed invasive non-native plant species. However, we have recognized that, in recent years, the desert is being continually invaded by such species.

Disturbance of substrates that can result from implementation of many of the elements of the West Mojave Plan can accelerate the spread of invasive non-native plant species by destruction of substrate crusts and cryptogams; these non-native species, in turn, can compete with the native plant species (Lovich and Bainbridge 1999) that the desert tortoise requires for nutrients and shelter. Non-native plants can also increase the ability of the desert to carry wild fires (Lovich and Bainbridge 1999). The plant species upon which desert tortoises depend are not adapted to fire; consequently, fires could severely alter the plant community structure by removing species upon which the desert tortoise is dependent and facilitating the spread of fire-tolerant taxa.

In summary, desert tortoise habitat (including both its critical habitat and other areas not so designated) may be disturbed or removed by a wide variety of human activities that the Bureau can authorize under the auspices of the West Mojave Plan. The amount and quality of the habitat that may be disturbed or removed by any given activity depends on a variety of factors. The nature of the activity, its location, and the quality of the habitat in the action area are key factors that determine the extent and intensity of the effect on the primary constituent elements of critical habitat and habitat of the desert tortoise in general. Given the broad nature of this consultation, we are unable to estimate the amount of desert tortoises that may be disturbed or removed, other than that the Bureau has proposed to limit the amount of new ground disturbance to less than one percent of the area within each desert wildlife management area. However, we note that, because desert wildlife management areas and critical habitat were established in the best quality habitat for desert tortoises, activities occurring in these areas are generally more

likely to disturb or remove habitat that supports desert tortoises than those occurring outside their boundaries. Note that, through the amendments to the California Desert Conservation Area Plan, the Bureau has changed the multiple-use class within desert wildlife management areas from Class M to Class L; as noted previously in this biological opinion, lands within Class L include areas that are managed to provide for lower density, carefully controlled multiple uses of resources while ensuring that sensitive values are not significantly diminished.

Effects of the West Mojave Plan on the Desert Tortoise and its Critical Habitat

The area where the desert tortoise may be affected by the Bureau's proposals includes all public lands within the planning area that have been designated as its critical habitat, plus all public lands upon which it occurs that are outside of the boundaries of critical habitat. These latter areas certainly do not include all public lands in the planning area; for example, the Bureau manages lands, such as in Summit Valley and at Middle Knob, that are well outside the expected range of the species. Because desert tortoises occur so patchily within their range, but particularly so outside of critical habitat, defining a precise action area is difficult. As we noted previously in this biological opinion, non-federal lands that support desert tortoises and are intermixed with public lands are considered to be part of the action area.

Amendment 1, New Areas of Critical Environmental Concern

The Bureau will designate new areas of critical environmental concern to conserve listed species, sensitive species, and areas that protect groups of species or important habitat. The four desert wildlife management areas that will be designated for the desert tortoise (i.e., Fremont-Kramer, Superior-Cronese, Ord-Rodman, and Pinto Mountain) include, in total, 1,023,329 acres of public lands.

The Bureau's general management strategy includes a one percent limit on cumulative ground disturbance within areas of critical environmental concern, adoption of management prescriptions and measures to reduce the effects of proposed projects on the desert tortoise and its critical habitat, a program to reduce predation by common ravens on the desert tortoise, a requirement for project proponents to compensate for loss or disturbance of habitat of the desert tortoise, and numerous other features. These additional features are listed in the Description of the Proposed Action section of this biological opinion and more fully described in the final environmental impact report and statement.

Effects on the Desert Tortoise

The Bureau's designation of areas of critical environmental concern provides the framework to identify clearly the management objectives of these desert wildlife management areas. It also serves as an informational guide to users of the desert that future uses, activities, or management practices must be compatible with the recovery of the desert tortoise. This designation will not have direct, on-the-ground effects, on the desert tortoise; however, it appropriately sets the stage for future management of public lands and the implementation of recovery actions for the desert

tortoise. On that basis, this portion of the West Mojave Plan is very beneficial to the desert tortoise.

In addition to the four desert wildlife management areas, the Bureau's proposal to establish conservation areas for other species may provide some conservation value for the desert tortoise. In the following paragraphs, we do not discuss conservation areas that overlap desert wildlife management areas established for the desert tortoise because they are not likely to provide substantially increased protection.

The Bendire's Thrasher Conservation Area, which lies within the sphere of influence of the Town of Apple Valley in northern Lucerne Valley, includes 8,908 acres of public lands. Within this area, the one percent limitation on new ground disturbance, retention of public lands, and designation of vehicle routes will protect desert tortoises to some degree. The number of desert tortoises within this area is likely relatively low.

A conservation area for the Mojave monkeyflower (*Mimulus mohavensis*) in Brisbane Valley includes 10,633 acres; this entire area comprises lands managed by the Bureau. The Bureau's proposals to retain public lands in this area, designate routes of travel, amend its land tenure adjustment program to remove these public lands from the disposal zone, change the multiple use class from Unclassified and Class I to Class L, implement mitigation and monitoring procedures, and discontinue sheep grazing in this area will improve the likelihood that desert tortoises will persist in this area. Although this parcel is isolated from larger areas of desert tortoise habitat, desert tortoises are likely to persist in this area with the proposed level of management. The Mojave Monkeyflower Conservation Area likely supports at least medium densities of desert tortoises.

Within the 14,224-acre Pisgah Conservation Area, desert tortoises occur in lava flows, which is an uncharacteristic habitat type for this species. The Bureau's proposal to designate routes within the area of critical environmental concern as open or closed, restore or block routes to be closed, and change the multiple use class from M to L will likely reduce threats to desert tortoises in this region. Although the density of desert tortoises in this area is likely not great, maintaining desert tortoises in an area where they exist in an unusual ecological setting, such as the lava flows, is important in conserving the full range of habitats and behavioral adaptations that the species exhibits in the Western Mojave Recovery Unit.

Finally, the Carbonate Endemic Plants Research Natural Area, on the north slope of the San Bernardino Mountains, includes 4,393 acres of lands managed by the Bureau. Within this area, lands will be subject to a standard of no surface occupancy to prevent undue and unnecessary degradation under the surface mining regulations, private lands within the proposed area of critical environmental concern may be purchased or exchanged for Bureau lands in Lucerne Valley, acquired lands will not be opened to mineral entry, and the multiple use class will change from Class M to L. These changes in the California Desert Conservation Area Plan will benefit the relatively low density of desert tortoises in this area, which are likely to occur at the lower elevations of the area of critical environmental concern. As we mentioned in the previous paragraph, the conservation of desert tortoises in this area is important in conserving the full

range of habitats and behavioral adaptations that the species exhibits in the Western Mojave Recovery Unit because these animals exist at the edge of the natural range of the species.

Limiting the amount of cumulative ground disturbance to one percent of the public lands in each of the desert wildlife management areas will likely ensure that proposed actions do not cause injury to or mortality of a large number of desert tortoises. Conversely, approximately 99 percent of the area inhabited by desert tortoises within the desert wildlife management areas will remain undisturbed; this lack of disturbance to the majority of the area inhabited by desert tortoises should ensure that large numbers of individuals are not disturbed by activities associated with specific projects. The following table depicts the amount of habitat in each of the desert wildlife management areas that may be disturbed and conserved as a result of the proposed action.

Desert Wildlife Management Area ¹	Acres of Habitat to be Conserved	Acres of Habitat that may be Disturbed
Superior-Cronese	610,157	6,163
Fremont-Kramer	489,773	4,947
Ord-Rodman	245,837	2,483
Pinto Mountain	115,949	1,171
Total	1,461,716	14,764

¹ Acreages are based on information in Table 4-6 of the final environmental impact report and statement.

The actions discussed in the preceding paragraphs will be authorized under the California Desert Conservation Area Plan and would become effective upon the Bureau's signing of the record of decision. Consequently, the Bureau and Service will not consult on these issues again, unless the agencies determine that re-initiation of consultation is required, as described at 50 *Code of Federal Regulations* 402.16.

Given the success that the Bureau generally has had in reducing the number of desert tortoises killed or injured during the implementation of proposed actions, combined with these limitations on the amount of activity that will be permitted in these desert wildlife management areas, we anticipate that few desert tortoises are likely to be killed or injured during future project-specific activities. We cannot, at this time, predict how many desert tortoises are likely to die or be injured as a result of actions proposed within the one percent limit on habitat loss or disturbance because we do not know the location of such actions, the number of desert tortoises in these areas, and other specific attributes of any given future action. Such effects will be analyzed in future section 7(a)(2) consultations on specific projects developed under the direction of the California Desert Conservation Area Plan, as appropriate.

Through numerous consultations, the Bureau, Service, and others have developed management prescriptions and protective measures to reduce the effects of proposed projects on the desert tortoise; in general, these measures seem to be effective. The Bureau's adoption of such measures should, in general, ensure that projects implemented throughout occupied habitat of the

desert tortoise in the planning area for the western Mojave Desert are implemented in a manner that reduces adverse effects to individuals. Note that these measures are not actions, in and of themselves, and will be implemented, as necessary, in conjunction with future activities. We cannot, at this time, predict how effective any given measure will be because of the large degree of differing circumstances that surround future actions.

The Bureau's requirement that project proponents compensate for loss or disturbance of habitat of the desert tortoise within desert wildlife management areas at a ratio of five acres of acquisition for every acre adversely affected will promote the conservation of the desert tortoise. This requirement will assist the Bureau in acquiring non-federal lands. Once acquired, the provisions of section 7(a)(2) would be in force; the consultation mandate for Federal agencies provides greater protection to listed species than the prohibitions contained in section 9 of the Act. Additionally, the Bureau can close roads and regulate other activities on acquired parcels and ultimately reduce the level of threat to desert tortoises.

Mining and Access for Mining Exploration. Mining and access for mining exploration conducted under the casual use provisions of the California Desert Conservation Area Plan will be limited to public roads and designated open routes unless otherwise permitted under a plan of operations approved by the Bureau. Desert tortoises could be crushed by the foot traffic of operators or equipment during exploration. Without off-road vehicle use, the amount and size of other equipment that may be employed during casual use is likely to be limited. For this reason, the number of desert tortoises that may be killed as a result of casual use within the Western Mojave Recovery Unit is likely to be limited.

Note that casual use without specific approval by the Bureau may occur in any area that is open to mineral entry; therefore, site-specific consultation will not occur on casual use activities and the Bureau likely does not have data on the level of use. Given commercial and recreational interest in mineral exploration, this type of casual use is likely fairly common in areas that may have potential to contain geothermal, oil, gas, or mineral resources. Maps 11 through 15 in the California Desert Conservation Area Plan (Bureau 1999) depict areas within the planning area for the western Mojave Desert that have been identified as potential or known resource areas for various types of mineral and energy; based on a visual comparison of these maps with areas known to support desert tortoises, a substantial amount of overlap seems to exist.

In summary, casual use related to mining operations in the Western Mojave Recovery Unit likely occurs in a scattered fashion throughout the area occupied by desert tortoises. Because of the low-intensity nature and localized scale of activities involved with casual use, few desert tortoises are likely to be killed or injured as result of activities implemented under the authorization provided by this element of the California Desert Conservation Area Plan. We do not anticipate that mining activities, conducted under the casual use provisions of the California Desert Conservation Area Plan, are likely to cause substantial effects to the reproduction, numbers, and distribution of the desert tortoise within the action areas.

Activities associated with mining plans of operation could result in the loss of desert tortoises. As one would expect, larger mines are more likely to kill or injure more desert tortoises because

of their size, the greater number of large vehicles that would be in use, and the greater number of employees. The size of the area to be mined under a plan of operation can vary greatly, from the rather small decorative rock mines that are fairly common in the vicinity of Barstow to large open pit mines, such as the Yellow Aster Mine near Randsburg. The development of geothermal, oil, gas, or mineral resources within occupied habitat could result in substantial mortality of desert tortoises because of the generally large scale of the associated facilities. Vehicles accessing mines or other facilities along unpaved roads through desert tortoise habitat are also potential sources of mortality; the level of mortality would vary according to the length of the road, the level of use, and the density of desert tortoises in the area that it traverses.

Mineral development may have indirect effects on desert tortoises. Preliminary work indicates that desert tortoises near hard rock mines may contain elevated levels of metals (Chaffee and Berry 1999). We do not understand the full implications of this research to date or the pathway by which the metals entered the desert tortoise. Desert tortoises could have inhaled the metals as dust that was carried by wind from the mine site; they could also consume dust that had settled on plants or the ground when they eat or mine soil. Alternatively, substrate and plants may normally contain higher levels of these metals because they are located in heavily mineralized areas. If the metals are emanating from mines and are found to affect desert tortoises negatively, the impacts of specific mines would need to be revisited. If mines or other sites maintain ponds as part of the processing facility that desert tortoises can access, animals may die from drinking contaminated water or drown if the sides are too steep. Common ravens may be attracted to waters and other subsidies offered by mines or energy developments.

To date, large-scale development of mineral resources has generally been relatively limited in the Western Mojave Recovery Unit, although substantial overlap exists between occupied habitat of the desert tortoise and areas that contain geological resources (see maps, 12, 13, and 14 in Bureau 1999). Some mines (e.g., Yellow Aster) are located at higher elevations where desert tortoises are less abundant; however, the access roads to these mines may cross areas where desert tortoises are common. Fewer mines are located on bajadas and in the valleys where desert tortoises are more abundant; desert tortoises are generally more abundant within the actual mine site in these areas. The Hector Mine, which lies north of the Marine Corps Air Ground Combat Center, is such a facility. Numerous factors are involved in determining whether large mines can be developed, including the presence of minerals of sufficient quality and quantity and the ability of operators to consolidate a sufficient number of claims. Consequently, to date, the large-scale development of mineral resources has not caused a substantial amount of direct mortality of desert tortoises in the Western Mojave Recovery Unit.

To date, large-scale development of energy from geological resources has generally been limited in the Western Mojave Recovery Unit. In this planning area, geothermal development has been limited to the Coso region at the Naval Air Weapons Station, China Lake; the U.S. Navy manages this area. In general, high potential for geothermal resources does not occur in areas occupied by the desert tortoise (see map 15 in Bureau 1999). Consequently, the likelihood of geothermal development in areas occupied by the desert tortoise in the Western Mojave Recovery Unit seems to be low.

To the best of our knowledge, development of oil and gas resources in the California Desert Conservation Area has not been proposed since the listing of the desert tortoise in 1990. Based on the lack of this activity in the last 15 years, the development of oil and gas resources in the Western Mojave Recovery Unit is unlikely to occur in areas occupied by the desert tortoise in the foreseeable future.

Numerous small mines that produce decorative rock and sand and gravel have been developed; we anticipate that these facilities will continue to be developed under the guidelines for plans of operation contained in the West Mojave Plan and the California Desert Conservation Area Plan. Because of the location of these mines in rockier areas and their small size, few desert tortoises are likely to be killed or injured as a result of this type of mining activity. For those reasons, we do not anticipate substantial impacts to the reproduction, numbers, or distribution of the desert tortoise with respect to plans of operation within the Western Mojave Recovery Unit.

The California Desert Conservation Area Plan, and therefore the West Mojave Plan, incorporates the Bureau's guidelines and regulations that implement mining laws relative to the approval of mining activities. The Bureau may refuse to approve a plan of operations until the plan meets its mitigation and compensation requirements. The mitigation required by the Bureau could reduce the level of the adverse effects of a mining operation by requiring operators to implement measures to reduce the level of mortality of desert tortoises.

The mining laws and regulations incorporated into the California Desert Conservation Area Plan require avoidance of unnecessary and undue degradation of public lands and reclamation of disturbed areas. If the Service found that a proposed plan of operations developed under the guidelines for this element in the California Desert Conservation Area Plan was likely to jeopardize the continued existence of the desert tortoise, the Bureau, with the authorities at 43 *Code of Federal Regulations* 3809.411(d)(3)(iii), "may disapprove of or withhold a plan of operations if the proposed operations 'would result in unnecessary or undue degradation of public lands'" (Bureau 2002a). Unnecessary or undue degradation is defined as "conditions, activities, or practices that, among other things, 'fail to comply with ... other Federal or State laws related to environmental protection...'" (Bureau 2002a). The Bureau also noted that a biological opinion from the Service concluding that a plan of operations would likely jeopardize the continued existence of a species "would certainly indicate a failure to comply with the standards of the Endangered Species Act, and would, therefore, constitute unnecessary and undue degradation (Bureau 2002a)."

This aspect of the California Desert Conservation Area Plan ensures that large-scale mines will not be developed in a manner that would likely jeopardize the continued existence of the desert tortoise. We are unable to provide an estimate of the level of mortality of desert tortoises that mining activities may cause. We would be better able to provide such estimates during site- and project-specific reviews, conducted under the authorities of section 7(a)(2) of the Act.

Native Plant Harvesting. The harvesting of native plants will not be allowed within habitat conservation areas. This prohibition should reduce, by a very small degree, the amount of use of desert wildlife management areas; consequently, this action may benefit the desert tortoise.

Outside of the habitat conservation areas, plant harvesting will be regulated in accordance with the California Desert Native Plant Protection Act. The level of this type of use in the planning area is likely low; consequently, we expect that few desert tortoises are likely to be killed by the harvesting of native plants.

The Bureau will consider whether to authorize individual actions when they are proposed by applicants. Consequently, it will consult with the Service, under the auspices of section 7(a)(2) of the Act, as appropriate if a specific action is proposed.

Recreation. The prohibition of vehicle speed events within the desert wildlife management areas and the Mohave Ground Squirrel Conservation Area will reduce the threat that vehicles will strike desert tortoises. Permitting dual sport events from November 1 to March 1 in desert wildlife management areas, including the Rand Mountains, poses a low level of risk to desert tortoises because they are less active during this portion of the year. The Bureau's proposals to supplement education materials to indicate that young desert tortoises may be encountered during the fall and winter and should be avoided is likely to provide little benefit. Biologists who are experienced in conducting surveys for desert tortoises have difficulty detecting small individuals; riders of motorcycles and all-terrain vehicles will certainly be even less likely to be able to see and avoid such small individuals. Despite this fact, the risk to desert tortoises of these seasonal events is likely low because, although desert tortoises may be active at any time of the year, they usually do not wander far from their burrows during the shorter and cooler days from November 1 to March 1.

Allowing dual sport events in those portions of the Mohave Ground Squirrel Conservation Area outside of the desert wildlife management area only from September through February will benefit desert tortoises because events will not occur when they are most active. This beneficial effect will be minor because desert tortoises are not common in most of these areas. Conversely, some potential exists that desert tortoises could be killed during these events, although this likelihood is low.

The Bureau will consider whether to authorize individual speed and dual sport events when they are proposed by applicants. Consequently, it will consult with the Service, under the auspices of section 7(a)(2) of the Act, as appropriate when a specific action is proposed.

Minimum impact recreation (e.g., hiking, equestrian uses, bird watching, photography, etc.) would be allowed within the conservation areas. The degree of threat posed to desert tortoises by recreation increases with the speed, weight, and numbers of recreational units. Consequently, although these activities may lead to some level of mortality of desert tortoises, we expect few animals will be killed because of the dispersed nature and low intensity of this use. Recreational use of the California desert may benefit desert tortoises to some degree if users gain an appreciation for the land and its wildlife and undertake actions to conserve this resource. We will not conduct any further evaluation of the potential effects on the desert tortoise of causal use with regard to recreation in this biological opinion because its fundamental authorization occurs under the auspices of the California Desert Conservation Area Plan.

Wildlife Water Sources. The Bureau's proposal to allow existing artificial water sources (guzzlers, drinkers, tanks) to remain in place could pose some level of risk to desert tortoises. Desert tortoises have, in the past, drowned or been trapped in certain types of watering devices, when the slope of the device to the water's surface was steep and slippery with algae; Hoover (1988 in Boarman 2002) found 26 carcasses in 89 watering devices for upland game in California.

Enhancing the water supply for wildlife has the potential to increase the density of predators, which may result in increased predation on desert tortoises. In general, we have not observed any effects on populations of desert tortoises that can be attributed to increases in the numbers of individuals of native species caused by human-augmented sources of water. The common raven provides an exception to this statement. Common ravens are known to use numerous types of water sources; such subsidies likely increase their distribution and abundance in the Western Mojave Recovery Unit. We have no information on whether the presence of artificial waters substantially increases the range or reproductive capabilities of the common raven beyond those afforded by other sources of water. Knight et al. (1999) have demonstrated that common ravens are found more often at stock tanks than at natural springs and in the open desert, but similar data do not exist for guzzlers.

Desert tortoises may be struck by vehicles being used to gain access to existing waters for maintenance. We expect the level of mortality associated with the maintenance of existing waters to be low because the amount of maintenance work likely to be needed should be fairly minor.

We cannot predict how many desert tortoises would be killed or injured by the operation and maintenance of artificial waters. Even at the time of a project-specific review, we would be unable to predict the level of mortality of desert tortoises in artificial waters because we cannot assess when animals would encounter the waters and the precise circumstances under which they may become trapped; however, appropriately designed waters are unlikely to entrap many desert tortoises. The Bureau has proposed to modify guzzlers that are found to entrap desert tortoises; such an action would reduce the number of animals that are likely to be killed in these artificial waters.

Commercial Activities. Commercial activities within desert wildlife management areas may result in injury or mortality of desert tortoises, although the protective measures imposed by the Bureau should reduce the number of animals that are killed. The Bureau's proposal to direct proponents to lands outside desert wildlife management areas and to lower density areas within desert wildlife management areas, when possible, should assist in reducing effects to desert tortoises. The number of desert tortoises that would be killed or injured by any commercial activity can only be estimated based on a site-specific project review, which is beyond the scope of the proposed action; such reviews will be the subject of future consultations under section 7(a)(2) of the Act, as appropriate.

Domestic Dogs. Allowing dogs off leash if they are accompanied by and under the control of their owners poses a low level of risk to desert tortoises because such animals would be unlikely

to find and injure wildlife. Dogs in this situation may startle or disturb desert tortoises; in this case, the desert tortoise is likely to respond to the dog as it would to a coyote. Because we do not expect desert tortoises to be disturbed to the degree that they would be unable to feed, seek shelter, or engage in other necessary behavior, this level of disturbance is unlikely to impair their survival. Off-leash dogs in some situations (e.g., construction sites in desert wildlife management areas) may be left alone to a greater degree and hence have more opportunity to disturb or injure desert tortoises; therefore, prohibiting them in such situations, as proposed by the Bureau, is protective of desert tortoises. This provision of the West Mojave Plan would be in effect with the signing of the record of decision; consequently, it is a casual use that will not receive future action-specific consultation.

Shooting. The shooting or discharge of firearms, in accordance with State and local laws, on most public lands and during hunting season in pursuit of game and target practice using retrievable targets within desert wildlife management areas is unlikely to kill desert tortoises. If the use of firearms is legitimate, desert tortoises are unlikely to be struck by stray bullets, simply because of the low probability of hitting such a small target inadvertently. As we stated previously in this biological opinion, legitimate uses of the desert can facilitate unauthorized abuse. Berry (1986a in Boarman 2002) found that 20.7 percent of the desert tortoise carcasses showing evidence of being shot were from the western Mojave Desert; this statistic is more striking when compared with rates of 1.5 and 2.0 percent from the eastern Mojave and Colorado Deserts, respectively. In all, Berry examined 91 carcasses that showed evidence of being shot.

We expect that the enforcement of State regulations and county ordinances will be minimal, simply because protecting desert tortoises is not a high priority for law enforcement agencies of the State of California (with the obvious exception of the California Department of Fish and Game) and local agencies; additionally, these agencies are generally understaffed. We cannot predict how many desert tortoises may be killed by the unauthorized use of firearms; for the reasons cited in the previous paragraph, we do not expect desert tortoises to be shot during the legitimate discharge of firearms. This provision of the West Mojave Plan would be in effect with the signing of the record of decision; consequently, it is a casual use that will not receive future action-specific consultation.

Predation by Common Ravens. Implementation of a management program for the common raven has the potential to promote the conservation of the desert tortoise. If the program is successful in reducing the number of desert tortoises that are killed by common ravens, it will increase reproductive success, which is a key need for recovery of the desert tortoise. Workers implementing the program may kill or injure desert tortoises as they travel through the desert both on foot and in vehicles, but these effects are likely to be very minimal and involve few desert tortoises. Any program to kill individual common ravens will need additional permitting because of the Migratory Bird Treaty Act; the lead agency for implementing the program will also need to consider whether the desert tortoise (or its critical habitat) may be affected. Because any program to manage common ravens will require a substantial amount of future development, review, and approval by the Bureau and other agencies (including the Service), we will not discuss this issue further in this biological opinion.

Effects on the Critical Habitat of the Desert Tortoise

The recovery plan recommends that each desert wildlife management area be at least 1,000 square miles in area and that more than one desert wildlife management area be included within each recovery unit. The following table depicts the sizes of the critical habitat units and desert wildlife management areas in the Western Mojave Recovery Unit.

	Critical Habitat Unit ¹		Desert Wildlife Management Area ¹	
	Acres	(Square Miles)	Acres	(Square Miles)
Fremont-Kramer	518,000	(809)	494,720	(773)
Superior-Cronese	766,900	(1,198)	616,320	(963)
Ord-Rodman	253,200	(396)	248,320	(388)
Pinto Mountain	171,700	(268)	117,120	(183)

¹ Acreages for desert wildlife management areas are based on information in Table 4-6 of the final environmental impact report and statement. Acreages for critical habitat units are based on information in the final rule designating critical habitat for the desert tortoise (59 *Federal Register* 5820).

On-the-ground circumstances, however, dictate what any single agency with jurisdiction over desert wildlife management areas can accomplish. Although the Bureau has included virtually all public lands within the critical habitat units in its desert wildlife management areas, all four desert wildlife management areas are smaller than the size recommended in the recovery plan. The Bureau omitted some small parcels of critical habitat from desert wildlife management areas because they were completely surrounded by large blocks of private land and difficult to manage. In fact, approximately 18,460 acres of Bureau land within the boundaries of the critical habitat units were not included in the four desert wildlife management areas (Service 2005d).

Specifically, 9,678 acres of the Ord-Rodman Critical Habitat Unit were not included within a desert wildlife management area; these lands lie within the northern portion of the Johnson Valley Off-highway Vehicle Management Area. In this situation, the Service used section lines to draw the boundaries of the critical habitat unit; however, the Bureau had previously established the boundary of the off-highway vehicle management area along an unpaved road, which provides a much more well-defined boundary than section lines. The 9,678 acres are located in numerous parcels along approximately 16 miles of the boundary. The primary constituent elements on at least some of these parcels, particularly along the western portion of the boundary, were degraded prior to the designation of critical habitat; along the eastern portion of the boundary, habitat is generally less disturbed because the level of off-road vehicle use is lower. Given the location of the critical habitat that was excluded from the desert wildlife management area (i.e., at its edge) and the degraded condition of the primary constituent elements in at least a portion of the unit, its exclusion from the desert wildlife management area will not affect the conservation role and function of the Ord-Rodman Critical Habitat Unit.

In the Fremont-Kramer Critical Habitat Unit, the Bureau did not include approximately 1,734 acres within the desert wildlife management area. In the northern portion of the desert wildlife

management area, the Bureau again used established roads as the boundary; in the southern portion of the critical habitat unit, the Bureau did not include two parcels that were separated from other public land by large blocks of private land and another parcel that is located within the El Mirage Off-highway Vehicle Management Area. Given the location of the critical habitat that was excluded from the desert wildlife management area (i.e., at its edge) and the degraded condition of the primary constituent elements in at least a portion of the unit, its exclusion from the desert wildlife management area will not affect the conservation role and function of the Fremont-Kramer Critical Habitat Unit. Note also that the Bureau's designation of a conservation area for the Mohave ground squirrel will extend the one percent limit on future ground disturbance to areas of critical habitat that are north of the Fremont-Kramer Desert Wildlife Management Area; see the Amendment 4, Designation of the Mohave Ground Squirrel Conservation Area - Effects on Critical Habitat section of this biological opinion for a discussion of measures regarding the Mohave ground squirrel.

The Bureau did not include approximately 3,853 acres of the Superior-Cronese Critical Habitat Unit within the Superior-Cronese Desert Wildlife Management Area. Generally, the Bureau excluded four parcels of public lands for the same reasons discussed in the previous two critical habitat units. As in those cases, the conservation role and function of the Superior-Cronese Critical Habitat Unit will not be compromised by the exclusion of these areas. Note also that the Bureau's designation of a conservation area for the Mohave ground squirrel will extend the one percent limit on future ground disturbance to areas of critical habitat that are north of the Superior-Cronese Desert Wildlife Management Area; see the Amendment 4, Designation of the Mohave Ground Squirrel Conservation Area - Effects on Critical Habitat section of this biological opinion for a discussion of measures regarding the Mohave ground squirrel.

Finally, in the Pinto Mountain Critical Habitat Unit, the Bureau did not include approximately 3,195 acres in two parcels in the northwestern and northeastern corners of the desert wildlife management area. The exclusion of these parcels, at the corners of the Pinto Mountain Desert Wildlife Management Area, will not affect the conservation role and function of the Pinto Mountain Critical Habitat Unit.

Limiting the amount of cumulative ground disturbance to one percent of the public lands in each of the desert wildlife management areas will likely ensure that proposed actions do not appreciably compromise the function and conservation role of critical habitat units in the western Mojave Desert planning area. Conversely, approximately 99 percent of the critical habitat within the desert wildlife management areas will remain undisturbed; this lack of disturbance will clearly promote the ability of the critical habitat unit to achieve its conservation role and function.

We note that the one percent limit is tied to the size of the desert wildlife management area but not to the critical habitat unit. For this reason and because we do not know where future actions may occur, we cannot, with absolute certainty, state that only one percent of the critical habitat unit will be affected. We expect, however, that project impacts within the portions of the Superior-Cronese, Fremont-Kramer, Ord-Rodman, and Pinto Mountain critical habitat units managed by the Bureau will not exceed the one percent limit for several reasons. First, given the

past history of this area, most actions will be relatively small in scale and will be spread across the critical habitat unit. Second, the large degree of overlap between the desert wildlife management areas and critical habitat should ensure that many actions would not be concentrated within critical habitat but outside of the desert wildlife management areas. Finally, at least some projects will likely occur within the desert wildlife management area but outside of critical habitat. Consequently, we conclude that the one percent limit on cumulative ground disturbance within desert wildlife management areas is also likely to confer a high degree of protection to critical habitat.

Although the primary constituent elements of critical habitat may be disturbed or lost within areas of disturbance, the relatively small amount of disturbance (in relation to the size of the critical habitat) that the Bureau will permit should ensure that desert tortoises will continue to have sufficient area in which to feed, breed, and find shelter. Additionally, because the disturbance and loss of habitat would likely occur through the implementation of numerous actions, separated through the desert wildlife management area by distance and over time, we do not anticipate that habitat is likely to be fragmented to the extent that the function and conservation role of the critical habitat unit as a whole is compromised.

The Bureau requirement that project proponents compensate for loss or disturbance of desert tortoise habitat within desert wildlife management areas at a ratio of five acres of compensation for every acre loss or disturbed will promote the conservation of the desert tortoise by protecting more critical habitat of the desert tortoise. Once acquired, the provisions of section 7(a)(2) would be in force. The consultation mandate requires Federal agencies to avoid adverse modification of critical habitat of listed species.

Additionally, the Bureau can use funds generated in this manner to close roads, regulate activities, and attempt to restore the primary constituent elements of critical habitat on acquired parcels and ultimately reduce the level of threat and disturbance to critical habitat of the desert tortoise. Although the compensation requirement will generally benefit the conservation role and function of critical habitat, the limit on loss or disturbance of habitat within desert wildlife management areas and the general lack of activity in the planning area may result in the acquisition of a fairly small amount of habitat through this means; one exception to this general rule may be compensation acquired for large utility projects.

Mining Exploration Access. Foot traffic of operators or equipment during exploration may disturb habitat and subsequently lead to an invasion of non-native plants. Under most mining activities that could be conducted under the casual use provisions, the primary constituent elements of critical habitat could be removed from a small area; the impacts of casual use on the maintenance of sufficient space to support viable populations of desert tortoises within the western Mojave Desert and to provide for their movement, dispersal, and gene flow, are likely to be minor, given that, by definition, these activities are minor in size and intensity.

The guidelines require that disturbances created during casual use be restored. Restoration attempts often fail in the harsh climate of the desert. However, because the disturbance allowed under casual use is minimal, the required restoration may be attainable. A possible exception

would be invasion by non-native plants, in part, because this effect would likely not be seen for months after the casual use and restoration occurred.

Without off-road vehicle use, the amount and size of other equipment that may be employed during casual use is likely to be limited. For this reason, the amount of disturbance to critical habitat of the desert tortoise that may occur as a result of casual use under the mining guidance of the California Desert Conservation Area Plan is likely to be limited and fairly close to authorized routes of travel.

As we noted in the previous section, the level of casual use is likely to be fairly common in areas that may have potential to contain geothermal, oil, gas, or mineral resources. Such areas have a substantial degree of overlap with critical habitat of the desert tortoise.

Because casual use generally has minor effects on relatively small areas and these activities are likely to be scattered over large areas, it would be highly unlikely to affect the primary constituent elements of critical habitat of the desert tortoise in a manner or at a scale that would compromise the function and conservation role of any critical habitat unit. Note that casual use may occur in any area that is open to mineral entry without specific approval by the Bureau; therefore, site-specific consultation will not occur on casual use activities. Note also that we will not conduct any further evaluation of the potential effects on critical habitat of casual use with regard to mining in this biological opinion because its fundamental authorization occurs under the auspices of the California Desert Conservation Area Plan.

Activities associated with mining plans of operation could result in the temporary or permanent loss of desert tortoise habitat and the introduction or spread of non-native plant species. Under most mining activities that would require a plan of operations, the mining may locally remove or seriously degrade most of the primary constituent elements of critical habitat. The impacts of a mining action on the first primary constituent element, the maintenance of sufficient space to support viable populations within each of the six recovery units and to provide for movement, dispersal, and gene flow, could only be evaluated on a site- and project-specific basis.

Under the authority and guidelines of the California Desert Conservation Area Plan, the Bureau will require restoration of lands disturbed during mining activities conducted under plans of operations. However, restoration efforts may not be successful in re-establishing the same quality and type of habitat that existed prior to the mining activity. Large areas are more difficult to restore; however, large mining companies have devoted extensive funding and resources to at least some restoration efforts (e.g., Viceroy Mine in the eastern Mojave Desert near Lanfair Valley). To date and to the best of our knowledge, desert tortoises have not used large mines that have been reclaimed from past mining activities.

Preliminary work indicates that desert tortoises near hard rock mines may contain elevated levels of metals. As we discussed in the previous section, we do not understand the full implications of this research to date or the pathway by which the metals entered the desert tortoise. If the metals are emanating from mines and are found to compromise the primary constituent elements of

critical habitat of the desert tortoise in a substantial negative manner, the impacts of specific mines would need to be revisited.

To date, large-scale development of mineral resources has generally been relatively limited in the California Desert Conservation Area, although substantial overlap exists between critical habitat of the desert tortoise and areas that contain geological resources (see maps, 12, 13, and 14 in Bureau 1999). Some mines (e.g., Yellow Aster) are located at higher elevations that do not support the primary constituent elements of critical habitat. The access roads to these mines may cross areas where the primary constituent elements are present. Fewer mines are located on bajadas and in the valleys where the primary constituent elements are usually present. The Hector Mine, which lies north of the Marine Corps Air Ground Combat Center, is such a facility. Numerous factors are involved in whether a large mine can be developed; the presence of minerals of sufficient quality and in sufficient quantity and the ability of operators to consolidate a sufficient number of claims are pertinent factors. Consequently, to date, the large-scale development of mineral resources in the California Desert Conservation Area has not caused the removal of substantial amounts of critical habitat that support primary constituent elements.

To date, large-scale development of energy from geological resources has generally been limited in the Western Mojave Recovery Unit. Geothermal development has been limited to the Coso region at the Naval Air Weapons Station, China Lake; this area is outside the boundaries of critical habitat of the desert tortoise. In general, high potential for geothermal resources does not occur within critical habitat of the desert tortoise (see map 15 in Bureau 1999). Consequently, the likelihood of geothermal development within critical habitat of the desert tortoise in the Western Mojave Recovery Unit seems to be low.

To the best of our knowledge, development of oil and gas resources in the California Desert Conservation Area has not been proposed since the listing of the desert tortoise in 1990. Based on the lack of this activity in the last 15 years, the development of oil and gas resources in the Western Mojave Recovery Unit is unlikely to occur in areas that support the primary constituent elements of critical habitat of the desert tortoise in the foreseeable future.

Numerous small mines that produce decorative rock and sand and gravel have been developed; we anticipate that these facilities will continue to be developed under the guidelines for plans of operation contained in the California Desert Conservation Area Plan. Because of the location of these mines in rockier areas and their small size, we anticipate that they will cause localized and minor effects to the primary constituent elements of critical habitat of the desert tortoise.

The California Desert Conservation Area Plan incorporates the Bureau's guidelines and regulations that implement mining laws relative to the approval of mining activities. The Bureau may refuse to approve a plan of operations until the plan meets its mitigation and compensation requirements. The mitigation required by the Bureau could reduce the level of the adverse effects of a mining operation to the primary constituent elements of desert tortoise critical habitat.

The mining laws and regulations incorporated into the California Desert Conservation Area Plan require avoidance of unnecessary and undue degradation of public lands and reclamation of disturbed areas. If the Service found that a proposed plan of operations developed under the guidelines for this element in the California Desert Conservation Area Plan was likely to jeopardize the continued existence of the desert tortoise, the Bureau, with the authorities at 43 *Code of Federal Regulations* 3809.411(d)(3)(iii), "may disapprove of or withhold a plan of operations if the proposed operations 'would result in unnecessary or undue degradation of public lands'" (Bureau 2002a). Unnecessary or undue degradation is defined as "conditions, activities, or practices that, among other things, 'fail to comply with ... other Federal or State laws related to environmental protection..." (Bureau 2002a). The Bureau also noted that a biological opinion from the Service concluding that a plan of operations would likely jeopardize the continued existence of a species "would certainly indicate a failure to comply with the standards of the Endangered Species Act, and would, therefore, constitute unnecessary and undue degradation (Bureau 2002a)." Adverse modification of critical habitat would also constitute unnecessary and undue degradation because it would violate section 7(a)(2) of the Act (Lorentzen pers. comm. 2005a).

In summary, the Bureau's unnecessary and undue degradation standard provides assurance that mining activity is unlikely to cause the permanent loss or temporary disturbance of large amounts of critical habitat. The unnecessary and undue degradation standard and the low likelihood that large-scale mines would be developed in numerous locations throughout the desert should ensure that the program direction for mining activities does not diminish appreciably the function and conservation role of critical habitat of desert tortoise. We are unable to provide any estimate of the amount of critical habitat of the desert tortoise that mining activities may disturb or remove. We would be better able to provide such estimates during site- and project-specific reviews.

Native Plant Harvesting. Because of the large degree of overlap between critical habitat units and desert wildlife management areas, the prohibition against harvesting of native plants within habitat conservation areas will protect the primary constituent elements regarding the maintenance of plants as forage and shelter for the desert tortoise; additionally, to the best of our knowledge, this activity occurs relatively infrequently. The relatively minor amount of harvesting of native plants that occurs outside of desert wildlife management areas is unlikely to reduce the suitability of habitat for the desert tortoise in these portions of the desert.

Recreation. The use of vehicles on roads that are designated as open or limited during recreational activities, such as dual sport events, will not, in general, adversely affect the primary constituent elements of critical habitat because these biological and physical attributes are not present within roadbeds. Some roads support annual plants, possibly even at greater local densities than on adjacent, undisturbed habitat, because of alterations in the hydrological regime caused by the road. Although such areas may be of value to a few desert tortoises, they are not so extensive that they substantially alter the patterns of the distribution of forage plants.

The degree of threat posed to critical habitat by recreation increases with the speed, weight, and numbers of recreational units. For example, a small group of hikers poses much less threat to the

primary constituent elements of critical habitat than a race involving numerous all-terrain vehicles. Additionally, most minimum impact recreation likely occurs relatively close to roads so the impact away from roaded areas is even less intense. Consequently, the minimum impact recreation that the Bureau proposes to allow within desert wildlife management areas are unlikely to disturb the primary constituent elements to the extent that the conservation role and function of the critical habitat units are compromised.

Wildlife Water Sources. The Bureau's proposal to leave existing springs, seeps, and artificial water sources (e.g., guzzlers, drinkers, tanks) in place will not have a substantial effect on the primary constituent elements of critical habitat. Natural springs and seeps do not support the primary constituent elements of critical habitat of the desert tortoise; the plant communities and substrates at springs are generally more characteristic of wetland habitats, which are not primary constituent elements of critical habitat of the desert tortoise. We recognize that leaving artificial water sources, such as facilities to water cattle, would likely maintain the level of disturbance that is common around such features; we will address that issue in the section of this biological opinion on livestock grazing. Finally, the maintenance of existing guzzlers would have an insignificant effect on the primary constituent elements of critical habitat because any disturbance associated with such activities will be limited to the immediate area of the facility; vehicle access to guzzlers would be via existing designated routes.

Commercial Activities. Commercial activities within critical habitat units may result in disturbance or loss of primary constituent elements. The Bureau's proposal to direct proponents to lands outside desert wildlife management areas and, therefore, to a large degree outside of critical habitat, when possible, should assist in reducing effects to the primary constituent elements. The precise amount of critical habitat that would be disturbed or lost as a result of any commercial activity can only be determined on a site-specific project review, which is beyond the scope of the proposed action; such reviews will be the subject of future consultations under section 7(a)(2) of the Act, as appropriate. The Bureau's proposals to direct commercial activities to areas outside of desert wildlife management areas (and, therefore, outside of critical habitat) and the fact that any disturbance of land with desert wildlife management areas will be subject to the one percent limit on new ground disturbance leads us to conclude that commercial activities are unlikely to compromise the conservation role and function of critical habitat units in the Western Mojave Recovery Unit.

Domestic Dogs. Dogs that are accompanied by and under the control of their owners may adversely affect the primary constituent elements of critical habitat by trampling annual plants, damaging shrubs, and digging. Because these impacts would likely occur on a very limited scale, in relation to the size of the critical habitat units, we conclude that allowing domestic dogs within desert wildlife management areas is unlikely to compromise the conservation role and function of critical habitat units in the Western Mojave Recovery Unit. We will not conduct any further evaluation of the potential effects on critical habitat of domestic dogs in this biological opinion because their presence in the California Desert Conservation Area is authorized under the auspices of the California Desert Conservation Area Plan.

Shooting. Allowing the use of firearms for target practice may result in some level of damage to the primary constituent elements of critical habitat of the desert tortoise. Persons involved in legitimate hunting and target shooting could potentially damage the quality of the primary constituent elements of critical habitat by introducing lead to substrates that desert tortoises mine for minerals. We do not have information on the effects of lead on desert tortoises, but we expect that the areas in which lead could be ingested in this manner would be fairly localized within the extensive areas available for target shooting. At least some portions of the public will likely shoot at shrubs to the extent that they are damaged and may no longer provide shelter for desert tortoises. Although we cannot predict the extent of damage to the primary constituent elements of tortoise critical habitat that may result from the use of firearms, given the size of the critical habitat units, we expect that most detectable impacts will be very localized and that only negligible adverse effects are likely to occur to the primary constituent elements and function of the critical habitat units in the Western Mojave Recovery Unit.

Amendment 3, Changes in Multiple-use Class Designations

The Bureau has proposed to change the land use designations within numerous areas of critical environmental concern and other areas in the planning area.

Effects on the Desert Tortoise

Changing the multiple-use class designations from M to L on certain lands within the expanded Afton Canyon Area of Critical Environmental Concern will, as we noted in our previous discussion regarding this area of critical environmental concern, provide a conservation benefit to the desert tortoise. The Bureau's decision to change the multiple-use class designations from Class M to Class L on 9,809 acres in the northern Lucerne Valley within the Bendire's Thrasher Area of Critical Environmental Concern, from M to L on 14,224 acres of the Pisgah Area of Critical Environmental Concern, from Class M to Class L on 9,809 on 4,393 acres on the north slope of the San Bernardino Mountains within the Carbonate Endemics Plants Area of Critical Environmental Concern, from unclassified to Class L on the 628-acre Mojave Fishhook Cactus Area of Critical Environmental Concern south of Helendale, and from unclassified and Class I to Class L on 10,633 acres in Brisbane Valley within the Mojave Monkeyflower Area of Critical Environmental Concern will also benefit the desert tortoise. These actions will benefit desert tortoises because designation of the areas as Class L limits, to a certain degree, the amount of development activity that may occur. We recognize that all development is not prohibited on Class L lands. Our previous biological opinion on the California Desert Conservation Area Plan evaluated the program direction provided by the Bureau's land use classification; we will not repeat that analysis herein.

The Bureau will also change the multiple-use class designations from Class I to Class L on 5,391 acres to the east of Searles Dry Lake. This change, which is being made primarily for the conservation of the Mohave ground squirrel, will occur in areas where desert tortoises exist in low numbers; consequently, desert tortoises may benefit from the change to some degree.

Changing the land use designation from unclassified to Class M on 1,922 acres adjacent to Joshua Tree National Park to protect the Little San Bernardino Mountains gilia is also protective of the desert tortoise. The management guidance provided under Class M is more protective than for unclassified lands. Additionally, this land use designation would allow the Bureau to transfer these lands to another entity that may be able to manage this small, isolated parcel more efficiently than the Bureau.

The benefits to the desert tortoise described in the previous three paragraphs are not likely to be substantial because, with the exceptions of the Mojave Monkeyflower and Pisgah areas of critical environmental concern, relatively few desert tortoises likely occur in these areas. Nevertheless, conserving desert tortoises in these areas is important because it allows them to persist in a greater variety of habitat types and possibly for maintaining some degree of genetic diversity. The conservation of desert tortoises in the Pisgah Area of Critical Environmental Concern area is particularly important because of their use of extensive areas of lava flows; the conservation of this use of an atypical habitat is an important component of protecting the full suite of ecosystems upon which the desert tortoise depends.

The change in multiple-use class designations from Class M and L to unclassified on 6,828 acres in southern Inyo County will likely have a minor negative effect on the desert tortoise. Once designated as unclassified, the Bureau may dispose of these lands; subsequently, they may be developed. These areas, which lie outside of any desert wildlife management areas and critical habitat for the desert tortoise, are located at the northern edge of the desert tortoise's range in this portion of the desert. Additionally, approximately half of these lands are outside the range of the desert tortoise, as it was defined in 2002 (see Map 3-10 in the final environmental impact report and statement). Consequently, the number of animals in these areas is generally very low, if any occur there at all. An additional ameliorating effect is that the parcels selected for disposal are located immediately adjacent to Highways 395 and 178; the density of desert tortoises near busy roads is generally lower than in surrounding areas farther from the roads.

The Bureau also proposes to adjust the zoning within the West Mojave Land Tenure Adjustment Program and change the multiple-use class designations to reflect the new land tenure. The Bureau would remove lands from the disposal zone and place them into retention or consolidation zones; it would also change the multiple-use class designations from unclassified to Class L in these areas. These changes will result in approximately 21,902 additional acres being managed for the conservation of the desert tortoise. The principle areas where boundaries will be modified in this manner are south of Edwards Air Force Base, along the southern borders of the Fremont-Kramer and Superior-Cronese desert wildlife management areas, and in the area south of Highway 58 east of Helendale Road.

As we noted previously in this biological opinion, the Bureau was required to re-initiate formal consultation on the West Mojave Land Tenure Adjustment Program if the Department of the Army completed its expansion proposal for Fort Irwin; the Bureau had delayed land exchange activities within the eastern 200 square miles of the project area until the status of these lands was determined (Service 1990). In the initial consultation, the Bureau anticipated that the ratio of private lands acquired to public lands disposed would be approximately 2.4 to 1. Because of

the expansion of Fort Irwin into large areas of public land (and a smaller area of private lands), the Army's acquisition of approximately 99,000 acres of private land to compensate for the expansion, and the fact that owners of large areas of private land are limited within the areas covered by the proposed desert wildlife management areas, the Bureau may no longer be able to maintain a ratio of 2.4 to 1. Despite the likelihood that the Bureau may not be able to maintain this ratio and that some desert tortoises may reside on lands that the Bureau may offer for exchange, we consider the overall effect of the West Mojave Land Tenure Adjustment Program and the changes proposed in this amendment on the species to be positive because, although the Bureau will no longer be able to exchange these lands for others of high conservation value, their retention expands the area within which desert tortoises can be managed. We have not conducted a quantitative analysis of the changes; however, the addition of these lands to the retention zone seems to decrease the ratio of the boundary length to the area of the desert wildlife management areas. As the recovery plan notes, smaller boundary length to area ratios provide a better design for reserves because the indirect effects of activities outside of the conservation area cannot reach as far into the reserve. Additionally, the lands that the Bureau will offer for exchange are generally isolated from large blocks of public land or at the edges of urbanized areas; in general, their management for conservation would require relatively greater expenditures of the Bureau's resources in relation to the conservation value. Finally, these areas support few desert tortoises. The Bureau will continue to notify the new owners of the requirements of the Endangered Species Act. In the event that the entities acquiring these parcels intended to engage in activities that may kill or injure desert tortoises, they should contact the Service to determine how best to comply with the Endangered Species Act.

The Bureau, in the final environmental impact report and statement, notes that 4,839 acres of non-wilderness Class C lands would undergo changes in multiple-use class to Class L, M, or I. In general, the lands would be re-assigned to multiple-use classes that are more appropriate for the uses on surrounding lands. Lands that would be reclassified and either support or may support desert tortoises occur near four wilderness areas and constitute a small portion of the desert wildlife management area system in the Western Mojave Recovery Unit. Additionally, most of the parcels would remain within a desert wildlife management area and be protected by the one percent limit on allowable ground disturbance. Consequently, although these changes may reduce the level of protection afforded to the desert tortoise on these lands to some degree, any adverse effect of the reclassifications would be minor.

We discussed the issues surrounding the Western Rand Area of Critical Environmental Concern in the previous section of this biological opinion and will not repeat them here. We note that, the change of the multiple-use class designation from Class M to Class L on 13,120 acres would benefit the conservation of the desert tortoise for the reasons discussed previously in this section of the biological opinion.

The actions discussed in the preceding paragraphs will be authorized under the California Desert Conservation Area Plan and would become effective upon the Bureau's signing of the record of decision. Consequently, the Bureau and Service will not consult on these issues again, unless the agencies determine that re-initiation of consultation is required, as described at 50 *Code of Federal Regulations* 402.16.

Effects on Critical Habitat of the Desert Tortoise

Public lands within the boundaries of the Western Mojave Land Tenure Adjustment program that were formerly identified for disposal lie within the boundaries of critical habitat. The Bureau's proposal to retain these lands and manage them under the guidelines of Class L will promote the conservation role and function of critical habitat because, as we have stated previously in this biological opinion, the Class L guidelines provide a greater emphasis on the conservation of natural resources than other land use classes (with the exception of Class C) and the one percent limit on surface disturbance associated with desert wildlife management areas and habitat conservation areas will apply.

Amendment 4, Designation of the Mohave Ground Squirrel Conservation Area.

The Bureau will establish conservation areas for the Mohave ground squirrel that cover 1,308,877 acres to the west, northwest, and north of the Fremont-Kramer Desert Wildlife Management Area.

Effects on the Desert Tortoise

The establishment of the conservation area for the Mohave ground squirrel is likely to promote the conservation of the desert tortoise to some degree in areas that are outside of desert wildlife management areas because the one percent limit on future ground disturbance will also be in effect within this area. In particular, desert tortoises located to the north and west of the Fremont-Kramer Desert Wildlife Management Area will likely derive conservation benefit from this action because the protective measures of a conservation area will apply.

Effects on Critical Habitat of the Desert Tortoise

The establishment of the conservation area for the Mohave ground squirrel will extend the provisions of the one percent limit on future ground disturbance to areas that are outside of desert wildlife management areas. In particular, this measure will benefit the management of the parcels of critical habitat located to the north of the Fremont-Kramer Desert Wildlife Management Area and at the northwest corner of the Superior-Cronese Desert Wildlife Management Area. Approximately 847 acres of critical habitat will be included in the conservation area for the Mohave ground squirrel in the Fremont-Kramer Critical Habitat Unit; approximately 1,712 acres of critical habitat will be included in the conservation area for the Mohave ground squirrel in the Superior-Cronese Critical Habitat Unit (Service 2005d).

Amendment 5, Implementation of the Rand Mountain – Fremont Valley Management Plan.

The Bureau proposes to expand the Western Rand Area of Critical Environmental Concern by 13,120 acres, designate the lands in the expanded area of critical environmental concern as Class L, close the entire management area to off-highway vehicle use except for 129 miles of designated open routes, and categorize a portion of the Rand Mountains - Fremont Valley Management Area as Category I habitat for the desert tortoise. The Bureau will withdraw

32,590 acres within the Rand Mountains - Fremont Valley Management Area from mineral location and entry. The 6,090-acre Koehn Lake and an additional 8,320 acres would remain as Class I and open to mineral entry. The Bureau will require visitors to obtain a permit if they wish to use vehicles in the Rand Mountains.

The actions discussed in the preceding paragraph will be authorized under the California Desert Conservation Area Plan and would become effective upon the Bureau's signing of the record of decision. Consequently, the Bureau and Service will not consult on these issues again, unless the agencies determine that re-initiation of consultation is required, as described at 50 *Code of Federal Regulations* 402.16. Note that, although the West Mojave Plan constitutes the Bureau's proposed action with regard to the Western Rand Area of Critical Environmental Concern, the decision to remove the closure can be made separately from the record of decision for the planning area as a whole. Consequently, the Bureau will remove the closure when it considers the management of vehicle use in this area to be in compliance with the established guidelines.

Effects on the Desert Tortoise

Implementation of the Rand Mountains – Fremont Valley Management Plan may substantially benefit the desert tortoise. Although recreationists have shown disregard for the 12,300-acre area that is currently closed, the Bureau has expended extensive effort to ensure that the benefits of implementing the management plan are realized.

As part of the settlement agreement with the Center for Biological Diversity, the Bureau has closed this area to vehicles since March 29, 2002. Despite this closure, a monitor hired by the Bureau to observe its effectiveness documented numerous instances of lack of compliance with the closure of the area. For example, from August 2002 to March 2003, the monitor documented 64 occasions of motorcyclists and occasionally truck drivers traveling cross-country, over restored areas, and parallel to existing routes; these observations were made at fixed monitoring points (McEwan undated). She also incidentally observed tracks on 129 occasions. The monitor observed tracks going around closure signs on 14 occasions. Motorcyclists and occasionally truck drivers have driven around the end of wing fences to enter the closure area. Multiple motorcycle tracks going around the end of the wing fences have been observed on 22 occasions. Motorcyclists have cut the fence to enter the closure area, particularly in the southwest corner of the closure where the terrain is rugged. The monitor observed 20 fence cuts during this period. On four occasions, drivers have backed trucks over the fence or knocked down gates. Motorcyclists and occasionally truck drivers have entered the closure from the unfenced area along Munsey Road and from private land on the north side. Motorcycle tracks were observed on 14 occasions and truck tracks were observed twice (McEwan undated).

Desert tortoises persist in this area (McEwan undated); however, their numbers have decreased dramatically. Vehicles driving cross-country pose a substantial risk to desert tortoises; if such events occur on a frequent basis, the number of desert tortoises may decrease to a point where a viable population is no longer present.

To address the issue of use of unauthorized routes, the Bureau has undertaken numerous remedial actions and proposed additional measures, through this plan amendment. Since March 2002, the Bureau has been undertaking an extensive program of monitoring and restoration work (attachments 1 and 2 from Bureau 2005c). Workers from the Student Conservation Association have closed 853 intrusions, installed 204 carsonite signs, restored approximately 23.6 miles of unauthorized trails, placed 445 straw bales, planted 650 live shrubs, and installed 75 drainage structures and 3.8 miles of fence (attachments 4 and 5 from Bureau 2005c). Maps prepared by the Bureau (attachment 6 from Bureau 2005c) depict the extensive network of unauthorized routes that the Bureau has made unavailable for use through this work. The Bureau estimates that at least 349 miles of unauthorized routes have been made unavailable for use through the work conducted by the Student Conservation Association (LaPre 2005q).

The Bureau's efforts to restore habitat and close unauthorized routes comprises an important component of managing vehicular use in the Rand Mountains. For example, the Bureau can more easily enforce its regulations with regard to unauthorized use if it has established a clear system of legal routes. The restoration of unauthorized routes, in large part, makes them more difficult to see; therefore, riders are far less likely to use them. In effect, the restoration work should establish an altered pattern of use in which riders restrict their activities to designated routes.

The Bureau's proposal to allow use of 129 miles of designated routes within the Rand Mountains - Fremont Valley Management Area is likely to result in injuries or mortalities to desert tortoises. As in most cases where dispersed use occurs, predicting the number of desert tortoises that could be killed or injured is not possible. We anticipate, however, that the potential for desert tortoises to be killed or injured will decrease because the extent of the route network will be substantially less than prior to the closure.

Requiring visitors to pay a fee and obtain a permit to use vehicles in the Rand Mountains may reduce the number of individuals who use the site for off-highway vehicle recreation; it may also increase the environmental awareness of riders who continue to use the area. In either case, the number of desert tortoises that may be struck by vehicles in the management area would likely decrease. The potential also exists that riders will transfer their recreational uses to other areas in the California Desert Conservation Area. We understand that a shift in use patterns occurred when the Bureau imposed an interim closure for part of the Imperial Sand Dunes Recreation Area in Imperial County. A shift in use may not be immediately detectable and may result in the establishment of new patterns of use before the Bureau recognizes them. If this situation occurs, the level of unauthorized off-road vehicle use may increase elsewhere in the California Desert Conservation Area, to the detriment of the desert tortoise.

The Bureau will withdraw 32,590 acres within the Rand Mountains - Fremont Valley Management Area from mineral location and entry. This action will benefit the desert tortoise by reducing the likelihood that desert tortoises will be killed or injured by new mining activities.

Retaining areas within the Koehn Lake and Randsburg areas as Class I and open to mineral entry is unlikely to have substantial direct effects on the desert tortoise because neither area supports

high quality habitat; previous disturbance, lake bed and lake-edge habitat conditions around Koehn Lake, and higher elevations around Randsburg are the likely reasons for the lower number of animals. We cannot assess, at this time, the specific effects of human use of these areas on the desert tortoise; we should be able to provide better estimates of the number of desert tortoises that may be affected during site- and project-specific reviews.

In summary, the implementation of the proposed management for the area comprising the Rand Mountains and Fremont Valley should reduce the adverse effects of vehicle use and other activities, such as mining, on desert tortoises. For this reason, this component of the proposed amendment to the California Desert Conservation Area Plan is not likely to reduce the reproduction, numbers, or distribution of the desert tortoise.

Effects on Critical Habitat of the Desert Tortoise

Implementation of the Rand Mountains – Fremont Valley Management Plan may promote the conservation role and function of critical habitat. The previous section documented the level of unauthorized use that occurred in the closed area in late 2002 and early 2003 and the remedial actions that the Bureau has undertaken since that time. The restoration work may not restore the primary constituent elements of critical habitat of the desert tortoise in and of itself. However, because the evidence of previous use has largely been removed, riders may be more likely to restrict themselves to designated routes; if areas outside of these routes are not continually disturbed by vehicle use, the potential exists that the primary constituent elements of critical habitat, such as appropriate substrates, forage plants, and scrubs may begin to attain pre-disturbance characteristics.

The Bureau's proposal to allow use of 129 miles of designated routes within the Rand Mountains - Fremont Valley Management Area is not likely to degrade the conservation role and function of critical habitat. These routes have been in use for years; consequently, the primary constituent elements of critical habitat have already been removed from the area within these designated routes and their continued use in an authorized manner will not degrade adjacent lands. More importantly, the vast majority of the area covered by the management plan remains available to support the primary constituent elements of critical habitat.

Requiring visitors to pay a fee and obtain a permit to use vehicles in the Rand Mountains may reduce the number of individuals who use the site for off-highway vehicle recreation; it may also increase the environmental awareness of riders who continue to use the area. In either case, the amount of unauthorized use in the management area would likely decrease; consequently, the condition of the primary constituent elements, particularly those related to the composition of the annual and perennial plant communities and nature of substrates, would likely improve. The potential also exists that riders will transfer their recreational uses to other areas in the California Desert Conservation Area. We understand that a shift in use patterns occurred when the Bureau imposed an interim closure for part of the Imperial Sand Dunes Recreation Area in Imperial County. A shift in use may not be immediately detectable and may result in the establishment of new patterns of use before the Bureau recognizes them. If this situation occurs, the level of

unauthorized off-road vehicle use may increase elsewhere in the California Desert Conservation Area, to the detriment of critical habitat of the desert tortoise.

The Bureau will withdraw 32,590 acres within the Rand Mountains - Fremont Valley Management Area from mineral location and entry. This action will reduce the likelihood that new mining activities will disturb the primary constituent elements of critical habitat; consequently, this action would support the conservation role and function of critical habitat of the desert tortoise.

In summary, the implementation of the proposed management for the area comprising the Rand Mountains and Fremont Valley should reduce the adverse effects of vehicle use and other activities, such as mining, on critical habitat of the desert tortoise. For this reason, this component of the proposed amendment to the California Desert Conservation Area Plan is not likely to compromise the conservation role and function of critical habitat.

Amendment 8, Adoption of Standards and Guidelines for Management of Grazing. The Bureau has proposed numerous modifications to the management prescriptions for livestock grazing. Our analysis first considers the effects of livestock grazing on the desert tortoise and its critical habitat. We then consider the likely effects on the desert tortoise and the primary constituent elements of its critical habitat of the general management prescriptions proposed by the Bureau in the West Mojave Plan. Finally, we evaluate the effects of the grazing program, as modified by the Bureau's prescriptions in the West Mojave Plan, on the desert tortoise and its critical habitat in the Western Mojave Recovery Unit.

Effects of the Livestock Grazing

Effects on the Desert Tortoise

Livestock grazing affects desert tortoises in several ways. Desert tortoises can be killed or injured during the construction, maintenance, and use of range improvements. Cattle have trampled desert tortoises. They also damage or destroy the burrows of desert tortoises. Predators, such as common ravens, can be attracted to and subsidized by livestock waters, carcasses of livestock, and some range improvements; predators attracted to or subsidized by these features could feed on desert tortoises.

The construction, maintenance, and use of range improvements would affect desert tortoises in a manner generally similar to other smaller projects. Vehicles and workers could trample desert tortoises during any phase of these operations. In comparison with a large-scale development such as a solar power plant, the construction, maintenance, and use of range improvements likely result in the injury and mortality of few desert tortoises.

Desert tortoises have been trampled by livestock both above ground or while they are in their burrows. Although documented instances exist of cattle crushing adult desert tortoises in their burrows, neonate and juvenile desert tortoises are likely at some greater risk of trampling because they use rodent burrows for shelter. Rodent burrows are often shallowly excavated and

run parallel to the surface of the ground; therefore, they are more vulnerable to trampling by livestock than burrows of sub-adult and adult desert tortoises. The propensity for rodents to place their burrows near and under shrubs may offer some degree of protection.

No data exist on the frequency at which cattle trample desert tortoises. Cattle likely pose a low degree of risk to adult desert tortoises and possibly sub-adults above ground, simply because cattle would likely try to avoid stepping on what essentially would appear to them to be a rock (Boarman 2002). Cattle would be more likely to trample desert tortoises when they are being herded; while traveling in groups and at a faster rate, cattle are less likely to be aware of their surroundings. Finally, an important concept to consider is that numerous cattle, distributed over large areas of desert tortoise habitat, present a greater likelihood of killing or injuring more desert tortoises than fewer cattle grazing over a smaller area; simply stated, fewer hooves in proximity to fewer desert tortoises are less likely to cause trampling.

Avery and Neibergs (1997) found that more burrows of desert tortoises were partially or completely destroyed in areas that were grazed by cattle than in a fenced area. Within the enclosure, desert tortoises remained in their burrows all night significantly more than animals located outside the enclosure, which would be expected because more burrows were damaged outside of the enclosure. The increased time spent outside of their burrows likely exposes desert tortoises to greater risk of predation and to temperature extremes.

Common ravens can be attracted to livestock waters, carcasses of livestock, and some range improvements. Common ravens are likely better able to survive and have greater reproductive success because of ranching activities. Increasing the number of potential predators poses a greater level of risk of predation to desert tortoises; additionally, common ravens attracted to carcasses and range improvements may also feed on desert tortoises. In a similar vein to that discussed in the previous paragraph, more range improvements over a greater area likely provide greater level of subsidy than a limited number of cattle facilities; large subsidies likely lead to greater numbers of common ravens, which, in turn, would be able to consume more desert tortoises.

We do not have information that conclusively links livestock grazing to recent declines in the numbers of desert tortoises in California. Until recently, the eastern Mojave Desert supported the highest densities of desert tortoises and was also the region most heavily used for cattle grazing. However, the effects of grazing may function in combination with other factors in the environment to lower the fitness of desert tortoises.

Livestock grazing, as implemented under the direction of the California Desert Conservation Area Plan, likely kills or injures desert tortoises. The magnitude of the mortality of desert tortoises attributable to the trampling of individuals or their burrows and increased predation by common ravens is extremely difficult to quantify, simply because cattle, common ravens, and desert tortoises are so widely distributed.

As noted previously in this section, until recent declines occurred, desert tortoises in the eastern Mojave Desert of California seemed to persist in the presence of cattle. For this reason, we

assume that cattle do not likely kill many desert tortoises, although we are aware that some individuals are killed by grazing livestock. We are unaware of any positive effects of livestock on desert tortoises.

Sheep grazing affects desert tortoises in ways that are similar to grazing by cattle. The primary differences are related to the timing of sheep grazing and their management within tight bands. Because sheep are grazed in the Mojave Desert only during the spring months, the range improvements used for their grazing are temporary; additionally, sheep carcasses would be unavailable for most of the year. Therefore, any subsidies that common ravens receive from sheep would be of limited duration; however, these temporary subsidies may increase reproductive success of some pairs of common ravens because the sheep grazing overlaps temporally with their nesting period. Sheep are more likely to trample desert tortoises than cattle because they are managed in tight bands of over 1,000 animals; as with cattle, smaller desert tortoises are at greater risk of being trampled than larger individuals. In a study using various sizes of Styrofoam models, sheep trampled 20 percent of the juvenile "desert tortoises" and only 2 and 3 percent of the adult- and subadult-sized models (Tracy 1996 in Boarman 2002). Other studies have demonstrated that sheep also destroy desert tortoise burrows (Berry 1978, Nicholson and Humphreys 1981, Tracy 1996, and Webb and Stielstra 1979 in Boarman 2002).

An additional consideration when one is evaluating the effects of the Bureau's livestock grazing program on desert tortoises is that the Bureau does not authorize grazing at the same level every year. The number of animal unit months that are authorized varies with the condition of the forage. This variation in animal unit months is particularly important with regard to cattle; in the case of sheep grazing, the Bureau may not authorize any sheep grazing at all if forage conditions are not appropriate. Additionally, when the Bureau authorizes grazing in any given year, it cannot predict the precise areas within an allotment where grazing will occur. Consequently, given the variation in levels of authorization, grazing patterns, and the distribution of desert tortoises, any analysis of the effects of livestock grazing on this species lacks precision.

The Bureau approves numerous actions and makes decisions throughout the year with regard to the grazing of livestock in the California Desert Conservation Area; these actions and decisions range from day-to-day decisions on the abundance of forage, the results of health assessments, development of range improvements, annual authorizations, and allotment management plans. Since the listing of the desert tortoise (and designation of its critical habitat), the Bureau and Service have consulted numerous times on livestock grazing; the provisions of the West Mojave Plan have modified the Bureau's previous proposed actions that we evaluated in those biological opinions, which have considered the effects of the grazing program on the desert tortoise (and, where appropriate, its critical habitat) in the planning area. Our analyses have taken into consideration the overall effects of livestock grazing and the types of decisions and actions that the Bureau makes with regard to the management of livestock. For this reason, we do not consider it necessary to consult on future actions that are within the scope and intent of management that we considered in this and previous consultations. Therefore, although we welcome any opportunity to coordinate with the Bureau, we do not consider consultation to be necessary on actions such as day-to-day decisions on the abundance of forage, the results of health assessments, annual authorizations, and other minor activities that do not alter the basic

effects of the actions upon which we have consulted previously. The development of range improvements and allotment management plans can alter the basic workings of an allotment and, in turn, the effects on the desert tortoise (and its critical habitat); therefore, the Bureau should continue to consult on these actions. In conclusion, the Bureau and Service will not consult on grazing issues again, except as noted for the development of specific range improvements and allotment management plans, unless the agencies determine that re-initiation of consultation is required, as described at 50 *Code of Federal Regulations* 402.16.

Effects of Livestock Grazing on Critical Habitat

Livestock grazing affects habitat of the desert tortoise in numerous ways. Most of the effects are subtler than those of construction projects where the primary constituent elements of critical habitat can be removed quickly, totally, and permanently. For this reason, we have generally described each primary constituent element of critical habitat of the desert tortoise and then evaluated the effects of livestock grazing on specific aspects of the primary constituent element.

A primary constituent element of critical habitat of the desert tortoise is the maintenance of sufficient space to support viable populations within each of the six recovery units and to provide for movement, dispersal, and gene flow. Livestock grazing does not result in the complete and total removal of the primary constituent elements of critical habitat on every acre of every allotment. The development of range improvements within an allotment, such as the construction of stock tanks and corrals, could remove some areas that support the primary constituent elements of critical habitat; in some cases, these facilities could be located in previously disturbed areas that do not support the primary constituent elements. The primary constituent elements of critical habitat may also be completely removed from areas where livestock congregate in large numbers for extended periods of time. In relation to the size of the allotments, these areas are very restricted in size. Most of the activity associated with grazing of cattle and its effects are more widely scattered over space and time; the effects of sheep grazing are somewhat different because they graze in tight bands.

The second primary constituent element of critical habitat of the desert tortoise comprises sufficient quality and quantity of forage species and the proper substrate conditions to provide for the growth of these species. Livestock grazing decreases the amount of plant cover and biomass and can change the species composition of plant communities over large areas (Lovich and Bainbridge 1999). Humphrey (1958, 1987 in Boarman 2002) noted that livestock was implicated in the conversion of grass-dominated communities to shrub lands; however, other factors such as fire suppression, rodents and other herbivores, and competition probably influenced the conversion. (Note that this review primarily evaluated native grasslands of Arizona, New Mexico, and Texas; the Mojave Desert in California likely did not support extensive grasslands in historic times.) Other authors note that grazing reduces the amount of herbaceous species and increases that of woody species (Roundy and Jordan 1988, Vaughan 1982 and 1984 in Service 1994b) and that non-native species, such as Mediterranean grass and cheatgrass (*Bromus tectorum*), benefit from grazing (Berry and Nicholson 1984 and Kie 1990 in Service 1994b). Desert tortoises feed primarily on herbaceous species; therefore, the

replacement of native herbaceous species with shrubs, which they generally do not consume, results in a net loss of appropriate forage for desert tortoises.

Avery (1998) found that a grazed area had a significantly lower diversity of winter annuals when compared to an ungrazed area. In addition, the ungrazed area contained more individuals of the desert dandelion (*Malacothrix glabrata*), a forage plant preferred by desert tortoises. The ungrazed and grazed areas did not differ in biomass, cover, density and species richness of annual plants. Boarman (2002) notes that, because the ungrazed area had been fenced to exclude cattle for only 12 years, the effects of previous grazing may still be present. Changes in species composition could be unfavorable to desert tortoises if palatable and nutritious plants are replaced by those that do not provide adequate nutrition.

Non-native grasses have spread to the deserts and other arid areas of North America and reduced the relative abundance of native species (Mack 1981, D'Antonio and Vitousek 1992, and Rundel and Gibson 1996 in Avery 1998); livestock grazing has, at least, contributed to their spread. Regardless of whether they are native or introduced, annual desert grasses contain less crude protein, calcium, sodium, and water than desert forbs (Ofstedal et al. 1993 and McArthur et al. 1994 in Avery 1998). Avery (1998) found that desert tortoises eating Mediterranean grass (*Schismus* spp.) *ad libitum* exhibited a negative nitrogen balance. Generally, turtles consuming a diet low in protein (i.e., where the nitrogen concentration in forage is low) experience reduced growth rates (Gibbons 1967, 1970, Parmenter 1980, Vogt and Guzman 1988, and Avery et al. 1993 in Avery 1998) and lower egg production (White 1993 and Henen 1993, 1997 in Avery 1998). Because desert tortoises are more vulnerable to predation when they are smaller, reducing their rate of growth may eventually result in fewer individuals reaching breeding age. Additionally, decreases in the number of eggs would reduce eventual recruitment into the adult population. If growth rates and egg production are lowered over wide areas for long periods of time, a decline in the population would be likely. Avery (1998) also noted that Mediterranean grass had high concentrations of heavy metals; we are uncertain how these elements affect the desert tortoise. Because desert tortoises require a diet of a variety of herbaceous species that provided important nutrients, the replacement of native herbaceous species with non-native herbaceous species, which are less nutritious, results in a net loss of appropriate forage for desert tortoises. Finally, desert habitats that have been invaded by Mediterranean grass, brome grass (*Bromus* spp.), and Sahara mustard are prone to wildfire; the effects of fire on desert tortoises and their habitat are discussed elsewhere in this biological opinion.

As discussed in the Status of the Species section of this biological opinion, neonate desert tortoises consume germinating annual plants. These small plants would be trampled by livestock and, depending on the number and distribution of livestock, could be eliminated from the forage base in a local area. Because neonate desert tortoises are less likely to be able to travel great distances in safety for food, the effects of grazing in a local area may be relatively greater on them than on sub-adults and adults.

Livestock grazing can also damage soil crusts (Lovich and Bainbridge 1999) and thereby affect the ability of the land to maintain the proper substrate conditions to provide for the growth of sufficient quality and quantity of forage species. Disturbance to soil crusts may increase erosion

by wind and water, which could result in further damage to plants in surrounding areas. The loss of cryptogamic or microbiotic crusts, which are composed of nitrogen-fixing lichens and fungi, may reduce the ability of substrates to support native annual plants; the disturbance of crusts also likely reduces the amount of favorable germination sites for seeds of native annual plants and the moisture-holding capacity of the soils. A study by DeFalco (et al. 2001) demonstrated that the higher nitrogen content of substrates with microbiotic crusts may allow non-native herbaceous species to grow faster and thus attain a competitive advantage over native plant species. An implication of this study is that the spread of non-native species may be more detrimental to native ecosystems than was previously thought because undisturbed substrates may not provide a competitive advantage to native plant species.

Sheep graze differently than cattle; that is, they often pull plants from the ground rather than biting off portions. Also, they are grazed in tight bands that often contain well over 1,000 individuals. For these reasons, sheep can have severe local impacts on this primary constituent element of critical habitat. For example, a band of sheep can remove most of annual plants and trample most of the substrate, including any cryptogamic crusts, in a local area in a fairly short period of time. In large areas of the western Mojave Desert where sheep have grazed over time, most of the native annual plants are confined to the coppice mounds of shrubs that afford them some protection from grazing. The vegetation in the intershrub areas is dominated by Mediterranean grass and filaree (*Erodium cicutarium*), both of which are not native. The lack of a diverse assemblage of native annual species in such areas may compromise the ability of desert tortoises to obtain the nutrients they require. We acknowledge that sheep grazing has not altered the flora of other areas of the western Mojave Desert as dramatically as in the area southwest of Barstow; other factors may also be affecting how a given area reacts to grazing pressure.

The third primary constituent element comprises suitable substrates for burrowing, nesting, and overwintering. The desert tortoise spends a considerable portion of its life underground, where it can avoid predators and the temperature extremes of the desert; they also lay their eggs at the mouths of their burrow in shallow holes. Therefore, substrates that are suitable for these functions are crucial for the recovery of the species. Although livestock may occasionally trample a burrow, they generally do not alter the substrates throughout allotments to the degree that burrowing is no longer possible. Livestock can, however, substantially alter the substrate in areas where they congregate on a frequent basis. Through alteration of the basic structure of the substrate, livestock render these areas unsuitable for burrowing or placement of nests. Livestock tend to congregate near salt licks and tanks and are occasionally restrained in corrals; the substrates in these areas are highly unlikely to be able to support burrowing and nesting by desert tortoises.

Burrows, caliche caves, and other shelter sites comprise the fourth primary constituent element of critical habitat. Livestock can crush burrows that are not protected from trampling. They also can damage shrubs to the extent that the plants no longer provide adequate cover for desert tortoises; livestock damage shrubs when they push into them to graze herbaceous plants growing on coppice mounds at the base of the shrubs and to seek shade. Most caliche caves are likely protected from crushing by their location in steeper banks and by the harder composition of the substrate. A reduction of the number of shelter sites within the territory of the desert tortoise is

likely to cause the resident animal to spend more time in the open and seeking or constructing burrows; energy expended in these activities cannot be used for foraging and reproduction.

The fourth primary constituent element of critical habitat of the desert tortoise is sufficient vegetation for shelter from temperature extremes and predators. Avery (1998) found that a grazed area had significantly larger creosote bushes (*Larrea tridentata*), more dormant or dead burrobrushes (*Ambrosia dumosa*), fewer and smaller individuals of galleta grass (*Hilaria rigida*), and more individuals of cheesebush (*Hymenoclea salsola*, an indicator of disturbance) when compared to an ungrazed area. Boarman (2002) notes that, because the ungrazed area had been fenced to exclude cattle for only 12 years, the effects of previous grazing may still be present. Changes in species composition could be unfavorable to desert tortoises if plants that provide less cover are replaced by those that do not provide desert tortoises with adequate protection. Note that the differences in shrub cover (larger creosote bushes, more dormant or dead burrobrushes, more individuals of cheesebush) Avery described, as discussed in this paragraph, do not universally constitute adverse effects on the desert tortoise. Because of their usual structure, burrobrushes generally provide better shelter sites than cheesebush; however, larger creosote bushes are likely more than suitable cover sites.

The final primary constituent element is habitat protected from disturbance and human-caused mortality. As discussed in the Effects on the Desert Tortoise section of this livestock element, implementation of the Bureau's guidance for livestock grazing likely results in few desert tortoises being directly killed or injured. Except for times when cattle are being actively driven, activity levels associated with cattle grazing seems to be relatively minor. The transport of sheep into grazing areas and the movement of sheep in tight bands constitutes a greater level of activity.

As we noted in the discussion of the effects of livestock grazing on desert tortoises, several factors involved in this analysis involve a large degree of variation. First, the Bureau does not authorize grazing at the same level every year. The number of animal unit months that are authorized varies with the condition of the forage. This variation in animal unit months is particularly important with regard to cattle; in the case of sheep grazing, the Bureau may not authorize any sheep grazing at all if forage conditions are not appropriate. Additionally, when the Bureau authorizes grazing in any given year, it cannot predict the precise areas within an allotment where grazing will occur. Consequently, given the variation in levels of authorization, grazing patterns, and the patchiness of the distribution of the primary constituent elements of critical habitat, any analysis of the effects of livestock grazing on critical habitat lacks precision.

Effects of the Bureau's Management Prescriptions for Livestock Grazing

Effects on the Desert Tortoise

The Bureau has proposed to remove cattle carcasses that are located within 300 feet of a road or watering source within 2 days. This action will reduce, to some degree, food subsidies to common ravens. If the reduction in food base reduces the number of common ravens, the amount of predation on desert tortoises by common ravens may decrease. The removal of

carcasses may not affect the number of common ravens in the region because so many other factors are involved, such as the amount of food available to common ravens that is not associated with cattle carcasses. Additionally, because a relatively small area of the desert is located within 300 feet of roads or watering sources, we expect that, unless cattle die at a substantially higher rate adjacent to roads than elsewhere, a small portion of dead cattle will be found in such areas. Ranchers traveling cross-country in their vehicles to remove carcasses may crush desert tortoises; however, because the Bureau will limit the distance ranchers may travel off of roads, we expect that few desert tortoises would be killed or injured while carcasses are being removed. Given the size of some allotments, the potential exists that carcasses may be well-scavenged before anyone finds them. If carcasses are thoroughly scavenged when they are found, they will no longer provide food to common ravens. Leaving them in place is likely to pose less risk to desert tortoises than driving cross-country to collect them; additionally, the bones from these carcasses can also provide desert tortoises with a source of calcium over time. Consequently, the removal of cattle carcasses may benefit desert tortoises; however, we expect that the benefits will be difficult to measure.

The voluntary relinquishment of all grazing use would provide substantial conservation benefits to desert tortoises in areas that are most heavily affected by livestock and the activities of the ranchers. These areas of concentrated livestock and human use are where desert tortoises are most likely to be trampled by cattle or crushed by human activities associated with grazing. The removal of livestock would reduce the level of subsidy (e.g., water, food in the form of carcasses and afterbirth, and nesting sites) for common ravens. The magnitude of this benefit would vary with the status of the desert tortoise in the specific allotment.

The Bureau will modify all cattle guards in habitat of the desert tortoise within 3 years of adoption of the West Mojave Plan to prevent entrapment of desert tortoises. Because desert tortoises can be trapped and die in poorly designed cattle guards, this measure will reduce or possibly eliminate mortality from this source and will therefore promote the conservation of the desert tortoise. Although we are aware that some desert tortoises have been trapped in cattle guards, we do not know how frequently such entrapment may occur.

The Bureau's decision to prohibit issuance of temporary non-renewable grazing permits in desert wildlife management areas for all lands below an elevation of 4,000 feet will ensure that additional cattle are not present during the times when desert tortoises are foraging most actively. Consequently, the threat of trampling will not increase during this period.

Granting ephemeral authorization in cattle allotments that are not located within the boundaries of desert wildlife management areas when ephemeral production exceeds 230 pounds per acre would expose desert tortoises to a greater risk of trampling because more cattle would be using the allotment. As we have stated previously, the overall risk of cattle trampling desert tortoises is likely low; the likelihood is less on these allotments where desert tortoises occur in lower densities.

Many of the management prescriptions for sheep are similar to those for cattle and would, in general, ameliorate the effects to desert tortoises in the same manner. As we noted in the

discussion of the effects of livestock grazing on desert tortoises, sheep likely trample smaller desert tortoises more frequently than cattle because of the manner and numbers in which they graze. To attempt to reduce the threat of trampling, the Bureau will limit the number of sheep that can be combined in a band, after the removal of lambs, to 1,600 adult sheep. We are not aware of any data that indicate how the size of a band affects trampling rates. Intuitively, smaller bands may trample fewer desert tortoises; consequently, this measure may reduce the mortality of desert tortoises. Additionally, any measure that results in sheep being removed from habitat of the desert tortoise because of forage limitations will reduce the likelihood of trampling.

The removal of sheep from the 10,633-acre Mojave Monkeyflower Conservation Area in Brisbane Valley is likely to protect desert tortoises to a substantial degree, primarily because desert tortoises likely persist in this area in moderate densities. We note that the Bureau's proposal to "work with the lessee to clearly identify monkeyflower habitat to be avoided" may be insufficient to prevent sheep from entering this conservation area. We base this statement on the fact that flocks of sheep have regularly entered Edwards Air Force Base for many years, even though the boundary is fenced; we are unclear on the precise mechanism, but the fence often seemed to break in areas of abundant forage.

Effects on Critical Habitat

The removal of cattle carcasses will not, in and of itself, affect the primary constituent elements of critical habitat. Cross-country driving associated with the removal of carcasses could affect the primary constituent elements of critical habitat by crushing annual plants that desert tortoises consume, damaging shrubs that they use for cover, and altering substrates by causing compaction or accelerating erosion. Because cattle would only be removed when they are found within 300 feet of a road, we expect that little cross-country vehicular travel is likely to occur as a result of this activity. We expect that ranchers would remove relatively few cattle from a limited portion of critical habitat; therefore these effects are likely to be extremely limited in scale.

The voluntary relinquishment of all grazing use by a lessee would benefit the conservation role and function of critical habitat units by eliminating all adverse effects to the primary constituent elements associated with grazing. Livestock grazing can alter the shape, size, and structure of shrubs that provide shelter to desert tortoises. In areas that are not heavily disturbed by grazing, this primary constituent element of critical habitat may return within a relatively brief period of time, particularly if a series of normal or high rainfall years follows the retirement of grazing. The return of some primary constituent elements of critical habitat, such as appropriate substrates and composition of native forage plants, to pre-grazing conditions is likely to take much longer, particularly around watering sites and corrals where livestock concentrated their activities. The potential exists that different species of plants would colonize these disturbed areas before these sites once again resemble the local plant community. Non-native species that have been spread by and have thrived under a regime of livestock grazing are likely to persist for decades; the potential exists that these species will never be completely removed from the landscape. The magnitude of this benefit would vary with the amount of critical habitat that is grazed within each critical habitat unit; we would expect to see immediate benefits during times of the year

when desert tortoises are actively foraging because competition for resources with livestock would have been eliminated.

Modifying existing cattle guards and installing new ones in a manner to prevent entrapment of desert tortoises is likely to cause extremely localized effects to the primary constituent elements of critical habitat because of the small work area that would likely be required. These localized and primarily temporary effects would certainly not compromise the conservation role and function of any critical habitat unit.

The Bureau's decision to prohibit issuance of temporary non-renewable grazing permits in desert wildlife management areas for all lands below an elevation of 4,000 feet will ensure that desert tortoises will not face additional competition from cattle for annual plants during the times when they are foraging most actively. The nutritional balance of desert tortoises is one of the keys to their survival; years of above-average rainfall and abundant forage may allow young desert tortoises to grow more rapidly and all individuals to improve their overall health. This proposed action may assist substantially in allowing desert tortoises to make use of the forage component of the primary constituent elements of critical habitat.

Many of the management prescriptions for sheep are similar to those for cattle and would, in general, ameliorate the effects to the primary constituent elements of critical habitat in a similar manner. Because the effects of sheep grazing on the quality and quantity of forage species and the substrate conditions to provide for the growth of these species tend to be more intense than those of cattle, prescriptions that reduce the level of sheep use likely provide a relatively greater degree of benefit. Consequently, reducing the effect of sheep grazing on this primary constituent element of critical habitat would promote the conservation role and function of the critical habitat unit.

Effects of the Proposed Grazing Program on the Desert Tortoise and its Critical Habitat

In this section, we will evaluate the effects of grazing within each allotment on the desert tortoise and its critical habitat, where applicable. Livestock grazing occurs on both public and private lands in a manner that is more or less inter-related, depending upon the specific circumstances surrounding the allotment. Additionally, grazing by sheep and cattle differs in some general, fundamental aspects.

For example, public lands comprise all or a large portion of some allotments; in the latter case, Bureau and private lands are also usually intermixed. For example, the Lava Mountain Allotment is composed exclusively of public lands. The Hansen Common and the southern portion of the Rudnick Common allotments, where they overlap habitat of the desert tortoise, provide an example of areas where public and private land are completely interwoven; in such allotments, grazing generally occurs in a uniform manner across the landscape because the boundaries between public and private land are not easily determinable. Consequently, in cases where the pattern of land ownership dictates that the manner of grazing is highly unlikely to cause different levels of effects between public and private lands, we will consider the effects of grazing on both public and private lands.

In contrast, some livestock allotments contain substantially more private than public land; in several cases, the private land occurs in large contiguous blocks, such as in the vicinity of California City and south of Edwards Air Force Base. In such areas, livestock operators graze sheep in a fundamentally different manner than is required by the Bureau on public lands. For example, operators will move sheep over the same area more than once in a season (in contrast with the one pass allowed by the Bureau); they will also operate in areas with less forage and frequently graze on private lands before and after the Bureau opens public lands to grazing, when forage conditions are appropriate. Finally, the public land health standards and the regional standards and guidelines under which the Bureau operates on public lands are not in force on private lands. Consequently, the effects on the desert tortoise and its critical habitat of grazing on large blocks of private lands are highly likely to be substantially different than those on public lands and in situations where public and private lands occur in a checkerboard pattern.

Because these large blocks of private land provide an adequate resource, livestock operators can and do graze sheep on such lands independently of authorized use of public lands. Finally, the environmental impact report and statement states that the Bureau's proposed grazing programs affect public lands only. The environmental impact report and statement does not address the grazing of livestock on private land (Bureau et al. 2005: section 2.2.5.2 regarding cattle; section 2.2.5.5 regarding sheep). Consequently, this biological opinion does not evaluate the effects of the livestock grazing on large blocks of private lands.

The Bureau will no longer authorize grazing on certain allotments for various reasons. Specifically, the Cronese Lake, Cady Mountain, and Harper Lake allotments have been acquired by the Department of the Army to offset the use of additional training lands at Fort Irwin. The area in which the Goldstone Allotment is located has been transferred to the Department of the Army. The Gravel Hills and Superior Valley allotments are located entirely within critical habitat of the desert tortoise. The Pilot Knob Allotment has been purchased by a conservation buyer. Because of the lack of public lands outside of critical habitat, the Bureau does not expect to authorize grazing on the Buckhorn Canyon Allotment; it has not been grazed since 1987 (Bureau 2005c). Because desert tortoises and their critical habitat will not be affected by grazing in these areas, we will not analyze the effects of grazing on these allotments in this biological opinion. The acreages reflected in the following discussion of specific allotments include only those areas that would be affected by the Bureau's proposed action; that is, they do not include large blocks of private lands where grazing may occur in a manner that is substantially different than that managed by the Bureau.

Bissell Allotment

The Bissell Allotment is grazed by sheep. It is located north of Highways 58; the majority of the allotment is within the corporate boundary of California City. Most of the land is within private ownership; the Bureau manages several scattered parcels. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the Bureau (2005c) and the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	2,360	0	2,360
Other Lands	0	46,529	0	46,529
Totals	0	48,889	0	48,889

The Bissell Allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises likely occur in low densities here as a result of past grazing, off-road vehicle use, and other human activities. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise on public lands is not substantially degraded from its current condition. We are unable to assess the effects of grazing on the desert tortoise in the remainder of the allotment because of the large amount of private land; these areas are outside of the action area of this consultation.

Boron Allotment

The Boron Allotment is grazed by sheep. It is located northwest of the junction of Highways 58 and 395. The eastern portion of the allotment is in primarily a checkerboard pattern of land ownership; the central and western portions are largely in private ownership. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information in the following table is from the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	10,868	0	10,868
Other Lands	0	71,993	0	71,993
Totals	0	82,861	0	82,861

This allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises likely occur in low densities here as a result of past grazing, off-road vehicle use, and other human activities. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise on public lands is not substantially degraded from its current condition. We are unable to assess

the effects of grazing on the desert tortoise in the central and western portions of the allotment because of the large amount of private land; these areas are outside of the action area of this consultation.

Cantil Common Allotment

The Cantil Common Allotment is grazed by sheep. It is located east of Highway 14 from just north of Highway 58 to south of Highway 178. The allotment is partially within the corporate boundary of California City. Most of the land within the portion of the allotment south of the Rand Mountains is privately owned; the Bureau manages most of the land within the allotment in and north of the Rand Mountains. The following table depicts the distribution of desert tortoise habitat in relation to land ownership under the grazing system implemented by the Bureau. The information is from the Bureau (2005c) and the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	6,196	197,371	0	203,567
Other Lands	5,442	121,992	0	127,434
Totals	11,638	319,363	0	331,001

The Cantil Common Allotment is partially located within a desert wildlife management area. Desert tortoises occur in low densities as a result of past grazing, off-road vehicle use, and other human activities. North of the Rand Mountains, off-road vehicle use has not been as prevalent as it is on the private land to the south. Additionally, the number of desert tortoises was likely historically lower north of the Rand Mountains because this area is nearing the northern and western edges of their range. The Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands and on interspersed non-federal lands; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise on public lands is not substantially degraded from its current condition. We are unable to assess the effects of grazing on the desert tortoise in the portions of the allotment that consist of large blocks of private land; these areas are outside of the action area of this consultation. These areas include private lands in the southern portion of the allotment that lie south of the Rand Mountains and in the northern portions of the allotment that lie in the southern Indian Wells Valley and due west of the boundary of the Naval Air Weapons Station, China Lake (see attached map of the northern and southern portions of this allotment).

Approximately 6,196 acres of critical habitat on public lands within the Fremont-Kramer Critical Habitat Unit would be grazed (Chavez 2005b). The Bureau will use roads to define manageable boundaries of grazed areas, rather than relying on the boundaries contained in the final rule for the designation of critical habitat of the desert tortoise; in many cases, the boundaries of critical

habitat were drawn on section lines, which cannot be detected on the ground. This amount of grazing will not compromise the conservation role and function of critical habitat because it will affect only a small portion at the edge of the 518,000-acre Fremont-Kramer Critical Habitat Unit.

Hansen Common Allotment

The Hansen Common Allotment is grazed by both cattle and sheep. It is located west of Highway 14 and south of Red Rock Canyon State Park. Most of the allotment is not located within habitat of the desert tortoise; within the area where desert tortoises are most likely to occur, the Bureau manages most of the land (see maps 3-1 and 3-10 of the final environmental impact report and statement). Cattle grazing generally does not occur within habitat of the desert tortoise; desert tortoise habitat is grazed by sheep (Sjaastad 2005a). The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	2,747	32,101	34,848
Other Lands	0	962	36,292	37,254
Totals	0	3,709	68,393	72,102

The Hansen Common Allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises likely occur in low densities here as a result of past grazing, off-road vehicle use, and other human activities; additionally, this area occurs at the western edge of their range in this portion of the desert. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands; additionally, relatively few animals likely persist in this area. Given the small area of private land that would also be grazed (962 acres) and its proximity to a larger amount of public lands, we anticipate that the effects of grazing throughout this area would be similar; consequently, we expect that few desert tortoises are likely to be killed or injured on private lands within this allotment. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition.

Johnson Valley Allotment

The Johnson Valley Allotment is an ephemeral allotment; it is currently vacant but may be grazed by sheep at some time in the future. It is located northeast of Highway 247. Most of the allotment is located on public land. The following table depicts the distribution of desert tortoise

habitat in relation to land ownership. The information is from the final environmental impact report and statement and Chavez (2005f).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	429	108,734	0	109,163
Other Lands	0	9,134	0	9,134
Totals	429	117,868	0	118,297

The Johnson Valley Allotment is not located within a desert wildlife management area; it overlaps, to a large degree, the Johnson Valley Off-highway Vehicle Management Area. A small portion of the allotment overlaps the Ord-Rodman Critical Habitat Unit; as in the case with the Cantil Common Allotment, our mapping of the critical habitat unit followed section lines and the Bureau's allotment boundaries follow roads.

Desert tortoises occur in low densities within the Johnson Valley Allotment as a result of past grazing, off-road vehicle use, and other human activities. Consequently, the Service has not considered most of the lands within this allotment as important for the recovery of the desert tortoise. The grazing of approximately 433 acres of critical habitat on private lands, which would not occur but for the Bureau's authorization of grazing on public lands in this allotment, will not compromise the conservation role and function of the Ord-Rodman Critical Habitat Unit because it will affect a minor portion of the 253,200-acre critical habitat unit. Additionally, the areas that are potentially open for grazing are located on the edge of the critical habitat unit, on the opposite side of Camp Rock Road from most of the critical habitat unit and the desert wildlife management area that the Bureau proposes to manage for the recovery of the desert tortoise. The road forms much a more manageable boundary than the actual lines of the critical habitat designation.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public or private lands; relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition.

Lava Mountain Allotment

The Lava Mountain Allotment is grazed by sheep. It is located east of Highway 395 and north of the Fremont-Kramer and Superior-Cronese critical habitat units. The Bureau manages the entire allotment. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	2,165	18,737	0	20,902
Other Lands	0	0	0	0
Totals	2,165	18,737	0	20,902

The Lava Mountain Allotment is not located within a desert wildlife management area. Desert tortoises likely occur in low densities, based on the information available from the adjacent Naval Air Weapons Station, China Lake. The Service has not considered most of this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition.

Approximately 2,165 acres of critical habitat on public lands within the Fremont-Kramer and Superior-Cronese critical habitat units would be grazed. The Bureau will use roads to define manageable boundaries of grazed areas, rather than relying on the boundaries contained in the final rule for the designation of critical habitat of the desert tortoise; in many cases, the boundaries of critical habitat were drawn on sections lines, which cannot be detected on the ground. This amount of grazing will not compromise the conservation role and function of critical habitat because it will affect only small portions of habitat at the edges of the 518,000-acre Fremont-Kramer Critical Habitat Unit and the 766,900-acre Superior-Cronese Critical Habitat Unit.

Monolith-Cantil Allotment

The Monolith-Cantil Allotment is grazed by sheep. It is located west of Highway 395 and south of the Rand Mountains. The Bureau manages most of the portion of the allotment within San Bernardino County; approximately 700 acres in this portion of the allotment are privately owned. A large block of private land within the allotment lies within Kern County (see attached map). The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from LaPre (2005m).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	10,825	0	10,825
Other Lands	0	3,544	0	3,544
Totals	0	14,739	0	14,739

The Monolith-Cantil Allotment is not located within a desert wildlife management area or in critical habitat. Desert tortoises occur in low densities here as a result of past grazing, off-road vehicle use, and other human activities. The Service has not considered most of this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition.

We are unable to assess the effects of grazing on the desert tortoise within the large block of private land that is located within Kern County. This area, which covers approximately 2,800 acres, is outside of the action area of this consultation.

Ord Mountain Allotment

The Ord Mountain Allotment is grazed by cattle. It is located east of Highway 247 and south of Interstate 40. The Bureau manages most of the lands within the allotment, although the operator owns several thousand acres within its boundaries. Given the proximity of private lands to public lands, we consider all of the private lands to be within the action area. The following table depicts the distribution of desert tortoise habitat in relation to land ownership; the acreages in this table include lands over 4,000 feet in elevation on which desert tortoises are likely to be less abundant. The information is from LaPre (2005j).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	107,961	28,144	0	136,105
Other Lands	17,193	1,559	0	18,752
Totals	125,154	29,703	0	154,547

The Ord Mountain Allotment is located within the Ord-Rodman Desert Wildlife Management Area. Densities of desert tortoises vary throughout the allotment; they are likely most common on alluvial fans at lower elevations. Portions of the allotment at higher elevations, specifically along Camp Rock Road, have been heavily grazed to the degree that the plant associations typically found in such locations are absent. Desert tortoises are likely scarce or possibly absent from such areas. These areas may be located on private lands.

Within the Ord Mountain Allotment, the Bureau's exclusion of cattle from March 15 to June 15 from 34,185 acres of the desert wildlife management area when forage levels fall below 230 pounds will reduce, to some degree, the effects of cattle grazing on desert tortoises on public lands. The potential exists that the operator may move the cattle entirely to private lands during this time; if this situation occurs, the quality of habitat on private lands will continue to be degraded. If, as we noted in the previous paragraph, desert tortoises are scarce or absent on the

private lands where the quality of habitat is heavily degraded, concentrating cattle in these areas for 3 months of the year may have no further effect on individuals or their habitat.

We note that approximately 5,000 acres of the private lands within the Ord Mountain Allotment are located within areas over 4,000 feet in elevation (Bureau 2004b); these areas are likely not important for the conservation of desert tortoises simply because of their greater elevation. Conversely, approximately 13,700 acres of private land may be situated in habitat that is of higher quality for desert tortoises and may be subject to increased grazing pressure. Although the amount of private land within the allotment that is below 4,000 feet in elevation is not trivial, it is scattered over a large area and constitutes a relatively small portion of the Ord-Rodman Desert Wildlife Management Area. For these reasons, cattle grazing, as the Bureau proposes to manage it in the desert wildlife management areas, will not reduce appreciably the reproduction, numbers, or distribution of the desert tortoise in the Western Mojave Recovery Unit.

The Ord Mountain Allotment is the only allotment of substantial size within critical habitat where grazing continues to occur in the planning area. This allotment contains approximately 107,961 acres of critical habitat on public lands that lie within the 253,200-acre critical habitat unit. As we noted previously in this biological opinion, most desert tortoises reside at elevations between 1,000 and 3,000 feet and large portions of the Ord Mountain Allotment are located at 4,000 feet or higher in elevation; these areas of higher elevation likely do not support the primary constituent elements of critical habitat on a widespread basis. We cannot quantify the area within the boundaries of the critical habitat unit that do not support the primary constituent elements because of elevation; however, we can use the distribution of desert tortoise sign as an indication of suitable habitat. During surveys conducted from 1998 through 2002, the highest counts of desert tortoise sign were detected in the northwestern, southwestern, and eastern portions of the Ord-Rodman Critical Habitat Unit; all of these areas lie below 4,000 feet in elevation (Bureau 2003b); the map seems to indicate that a limited amount of sign was detected above 4,000 feet, seemingly on south-facing bajadas and in canyons. In summary, based on the available data, we cannot assess the precise amount of critical habitat within the Ord-Rodman Critical Habitat Unit that supports the primary constituent elements; we note that this is the case for every critical habitat unit but the situation is more pronounced in this region because of the prominence of high elevation areas.

Other factors confound the assessment of the effects of cattle grazing on the Ord-Rodman Critical Habitat Unit. First, the Bureau notes, in the final environmental impact report and statement, that the Ord Mountain Allotment is "not achieving public health standards in habitat for the desert tortoise." Specifically, approximately 9 percent (10,000 acres) of the allotment did not achieve the species standard during a rangeland health assessment in 1999 (Chavez 2005c). Some of the areas that did not meet standards were at higher elevations, in locations that do not support the primary constituent elements of critical habitat of the desert tortoise. The Bureau assesses only the portion of the allotment that lies on public lands.

Second, the primary constituent elements within the Ord-Rodman Critical Habitat Unit are not uniformly distributed; the higher elevations of the Ord, Rodman, and Newberry Mountains separate areas of more suitable habitat for the desert tortoise. Consequently, the more scattered

distribution of the primary constituent elements (when compared with other areas, such as in the Superior-Cronese Critical Habitat Unit) and the uneven grazing levels complicate an overall assessment of the effects of grazing on critical habitat of the desert tortoise. However, most of the larger bajadas where the primary constituent elements of critical habitat are present lie outside of the Ord Mountain Allotment; for this reason and because areas within the allotment continue to support the primary constituent elements, we conclude that this level of grazing is not likely to compromise the conservation role and function of the critical habitat unit.

Rattlesnake Canyon Allotment

The Rattlesnake Canyon Allotment is grazed by cattle. It is located south of Highway 247. Most of the land is managed by the Bureau. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from Chavez (2005e).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	12,800	14,032	26,832
Other Lands	0	5	1,920	1,925
Totals	0	12,805	15,952	28,757

The Rattlesnake Canyon Allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises occur here in low densities, most likely because this area occurs at the edge of their range in this portion of the desert and most of the allotment is located at higher elevations. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public or private lands; additionally, relatively few animals likely reside in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition. We anticipate that, because of the small amount of private lands, the effects of grazing are likely to be similar throughout habitat of the desert tortoise, regardless of land ownership.

Rudnick Common Allotment

The Rudnick Common Allotment is authorized for grazing by both cattle and sheep. The Bureau will not authorize both uses in the same location. It is located west of Highway 14 and south of Highway 178. Most of the northern portion of the allotment is managed by the Bureau; the southern portion exists in a checkerboard pattern of ownership; the Bureau manages most of the land within the area that desert tortoises are most likely to inhabit. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the final environmental impact report and statement and Sjaastad (2005c).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	60,040	103,838	163,878
Other Lands	0	18,960	58,984	77,944
Totals	0	79,000	162,822	241,822

The Rudnick Common Allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises occur here in low densities, most likely because this area occurs at the edge of their range. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands or private lands; additionally, relatively few animals likely reside in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition. We anticipate that, because of the distribution of public and other lands, the effects of grazing are likely to be similar throughout habitat of the desert tortoise, regardless of land ownership.

Shadow Mountain Allotment

The Shadow Mountain Allotment is grazed by sheep. Most of the allotment is located west of Highway 395 and southeast of Edwards Air Force Base; a portion of the allotment extends east of Highway 395. The land ownership throughout large portions of the allotment is a mix of public and non-federal lands; the southwestern edge, southeastern corner, and easternmost portion of the allotment are largely privately owned. The Bureau manages most of the land within the portion of the allotment that overlaps the El Mirage Off-highway Vehicle Management Area. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from LaPre (2005r).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	596	16,965	0	17,561
Other Lands	1,280	31,305	0	32,585
Totals	1,876	48,270	0	50,146

The Bureau would allow grazing within a small portion of the Fremont-Kramer Desert Wildlife Management Area within this allotment. Desert tortoises occur in low densities as a result of past grazing, off-road vehicle use, and other human activities.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands; additionally, relatively few animals likely persist in

this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition. We are unable to assess the effects of grazing on desert tortoises in the portions of the allotment where private land is present (see attached map of the allotment).

Approximately 596 acres of critical habitat on public lands within the Fremont-Kramer Critical Habitat Unit would be grazed (LaPre 2005j). The Bureau will use Shadow Mountain, Adobe Mountain, and Lake roads to define manageable boundaries of grazed areas, rather than relying on the boundaries contained in the final rule for the designation of critical habitat of the desert tortoise; in many cases, the boundaries of critical habitat were drawn on sections lines, which cannot be detected on the ground. This amount of grazing will not compromise the conservation role and function of critical habitat because it will affect only a small portion at the edge of the 518,000-acre Fremont-Kramer Critical Habitat Unit.

Spangler Hills Allotment

The Spangler Hills Allotment is grazed by sheep. It is generally located between the two land holdings of the Naval Air Weapons Station, China Lake. Most of the allotment is located on public land. Approximately 10,000 acres that are not managed by the Bureau have been withdrawn by the Navy for a corridor between its two land holdings and as part of the Naval Air Weapons Station (Sjaastad 2005b). The Bureau manages grazing within the land that comprises the corridor. Because the withdrawn land is a linear corridor along a road and sheep pose a threat to vehicles and their drivers on the road, the amount of grazing that occurs within this area is probably fairly limited (Sjaastad 2005c). Grazing does not occur on the Naval Air Weapons Station. The State of California and private parties own approximately 800 acres of the allotment. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the final environmental impact report and statement, LaPre (2005n), and Sjaastad (2005c).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau and Navy	0	068,183	0	68,183
Other Lands	0	958	0	958
Totals	0	69,141	0	69,141

The Spangler Hills Allotment is not located within a desert wildlife management area; it overlaps, to a large degree, the Spangler Hills Off-highway Vehicle Management Area. Desert tortoises occur in low densities here, partially, as a result of past grazing, off-road vehicle use, and other human activities; additionally, this area is near the edge of the desert tortoise's range. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands or non-federal lands; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition. We anticipate that, because of the distribution of public and other lands, the effects of grazing are likely to be similar throughout habitat of the desert tortoise, regardless of land ownership.

Stoddard Mountain Allotment

The Stoddard Mountain Allotment is grazed by sheep. It occurs in three sections, to the south and west of Barstow. The eastern portion of the allotment extends from the west side of Highway 247 to Interstate 15; in this section, public lands occur in a braided pattern with non-federal lands. In this area, the allotment overlaps, to a large degree, the Stoddard Off-highway Vehicle Management Area. The middle portion of the allotment lies between Interstate 15 and Highway 66; public lands are generally consolidated in two large blocks in this portion of the allotment. The westernmost portion of the allotment lies west of Highway 66. The Bureau will not authorize grazing in the western portion of the allotment (LaPre pers. comm. 2006). The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from LaPre (2005r).

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	77,536	0	77,536
Other Lands	0	85,307	0	85,307
Totals	0	162,843	0	162,843

The Stoddard Mountain Allotment is not located within a desert wildlife management area or in a critical habitat unit. Desert tortoises occur in low densities here as a result of past grazing, off-road vehicle use, and other human activities. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

In the eastern portion of the allotment, few desert tortoises are likely to be killed or injured on public or non-federal lands under the grazing system proposed by the Bureau for this allotment; additionally, relatively few animals likely persist in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition. We anticipate that, because of the distribution of public and other lands, the effects of grazing are likely to be similar throughout habitat of the desert tortoise, regardless of land ownership (see attached map of the allotment).

In the Middle Stoddard Allotment, few desert tortoises are likely to be killed or injured on public lands under the grazing system proposed by the Bureau for this allotment; we expect that this area supports relatively few desert tortoises. The Bureau will not allow grazing to occur within the Mojave Monkeyflower Area of Critical Environmental Concern, which occupies 10,633

acres in the Middle Stoddard Allotment; consequently, sheep grazing will not affect desert tortoises in this area. Desert tortoises on approximately 5,787 acres of public land in the Middle Stoddard Allotment will be affected by grazing of livestock (Service 2006). We are unable to assess the effects of grazing on the desert tortoise in the middle portion of the Stoddard Allotment that consists of large blocks of private land; these areas are outside of the action area of this consultation.

Tunawee Common Allotment

The Tunawee Common Allotment is authorized for grazing by both cattle and sheep. The Bureau will not authorize both uses in the same location. Cattle have not grazed the allotment since 1993; sheep have grazed the allotment since 1994 (Bureau et al. 2005). It straddles Highway 395 a few miles north of the Inyo-Kern county line. The Bureau manages all of the land within habitat of the desert tortoise. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	1,800	49,929	51,729
Other Lands	0	0	4,202	4,202
Totals	0	1,800	54,131	55,931

The Tunawee Common Allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises occur here in low densities, most likely because this area occurs at the edge of their range. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public lands, primarily because relatively few animals likely reside in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition.

Walker Pass Allotment

The Walker Pass Allotment is grazed by cattle. It is located west of Highway 395 and straddles the Inyo-Kern county line. The Bureau manages most of the land; private lands within habitat of the desert tortoise are interspersed with public lands. The following table depicts the distribution of desert tortoise habitat in relation to land ownership. The information is from the final environmental impact report and statement.

Land Status	Acres within the Allotment			Total
	Critical Habitat	Other Desert Tortoise Habitat	Not Desert Tortoise Habitat	
Bureau	0	26,058	62,100	88,158
Other Lands	0	6,000	2,816	8,816
Totals	0	32,058	64,916	96,974

The Walker Pass Allotment is not located within a desert wildlife management area or critical habitat unit. Desert tortoises occur here in low densities, most likely because this area occurs at the edge of their range. Consequently, the Service has not considered this area as important for the recovery of the desert tortoise.

Under the grazing system proposed by the Bureau for this allotment, few desert tortoises are likely to be killed or injured on public or private lands, primarily because relatively few animals likely reside in this area. The measures proposed by the Bureau should ensure that habitat for the desert tortoise is not substantially degraded from its current condition. We anticipate that, because of the distribution of public and other lands, the effects of grazing are likely to be similar throughout habitat of the desert tortoise, regardless of land ownership.

Summary of the Effects of the Livestock Grazing

Through the proposed amendment of the California Desert Conservation Area Plan within the planning area, the amount of livestock grazing on public lands within the action area that affects the desert tortoise and its critical habitat will decrease a substantial amount. Other allotment-specific measures proposed by the Bureau through the amendment process will also alter the existing situation with regard to grazing.

Effects on the Desert Tortoise

Livestock would no longer graze in the Gravel Hills, Pilot Knob, Harper Lake, Cady Mountain, Buckhorn Canyon, and Cronese Lakes allotments and in portions of the Superior Valley, Lava Mountain, Shadow Mountain, Cantil Common, Monolith-Cantil, Lacey-Cactus-McCloud, and Stoddard Mountain allotments as a result of actions proposed by the Bureau. Consequently, approximately 762,000 acres of desert tortoise habitat within the planning area would not be grazed (Service calculations based on information from the Bureau). (The Goldstone Allotment and the remaining portion of the Superior Allotment will also no longer be grazed. The Army will use these areas for training; consequently, we did not include the acreage of these areas in the amount of ungrazed habitat.)

The decreased number of sheep and cattle on allotments in the planning area would reduce, to some degree, the likelihood that desert tortoises will be trampled. The lack of activity with regard to the construction, operation, and maintenance of range improvements would likely reduce the potential for desert tortoises to be killed by ranchers conducting these activities.

We cannot quantify any change in the level of mortality because of the vast areas involved, the varying densities of desert tortoises, and the randomness with which mortality associated with livestock grazing likely occurs.

The Bureau's proposal to allow voluntary relinquishment of the remaining allotments may further reduce the level of mortality of desert tortoises, if operators opt to pursue this course of action. The establishment of forage thresholds should reduce, to a small degree, the level of mortality of desert tortoises on allotments that will be grazed.

The removal of livestock and their waters will reduce subsidies to common ravens. The carcasses and afterbirth of livestock and artificial waters will no longer be available over large areas to provide common ravens with food and water. We expect that the decrease in the subsidies from livestock grazing will affect the common raven population to some unquantifiable degree. Although a decrease in the number of birds may not be noticeable, the likelihood exists that, to some degree, predation by common ravens on young desert tortoises will decrease.

Grazing would continue on approximately 136,105 acres of habitat that supports or has recently supported moderate to higher densities of desert tortoises, primarily within the Ord Mountain Allotment. (This acreage includes all desert tortoise habitat identified on public lands within the boundaries of the Ord Mountain Allotment (LaPre 2005j).) Grazing would also continue on approximately 646,752 acres of habitat that supports lower densities of desert tortoises. These lower densities result from past and ongoing human activities, lower quality habitat at the edge of the range of the species, or a combination of these factors.

We conclude that the grazing program proposed by the Bureau is not likely to appreciably affect the reproduction, numbers, or distribution of the desert tortoise in the action area. We have reached this conclusion because grazing would occur on approximately 136,105 acres of the higher quality habitat on which the Bureau has proposed to establish desert wildlife management areas; the desert wildlife management areas proposed by the Bureau would cover approximately 1,023,329 acres. (The acres of higher quality habitat identified in the previous sentence comprise the acreage of critical habitat on public lands within the Ord Mountain Allotment (LaPre 2005j).) Additionally, the intensity at which the Bureau proposes to allow grazing, both within and outside of desert wildlife management areas, should enable desert tortoises to obtain sufficient nutrition.

Effects on Critical Habitat

Livestock would no longer graze in the Gravel Hills, Harper Lake, and Cronese Lakes allotments and in portions of the Superior Valley, Lava Mountain, Shadow Mountain, Cantil Common, Monolith-Cantil, and Stoddard Mountain allotments as a result of actions proposed by the Bureau. Consequently, approximately 718,000 acres of critical habitat of the desert tortoise within the planning area would not be grazed. (The Goldstone Allotment and the remaining portion of the Superior Allotment will also no longer be grazed. These areas will be used for training by the Army; consequently, we did not include the acreage of these areas in the amount of ungrazed habitat.) This decrease will eliminate the direct adverse effects of grazing on the

primary constituent elements of critical habitat. Non-native plant species whose spread across the landscape may have been assisted by grazing will not disappear from desert tortoise critical habitat; however, the potential exists that the removal of livestock may decrease the suitability of areas for invasive species that are already present and assist in preventing the introduction of new exotic species.

The Bureau's proposal to allow voluntary relinquishment of the remaining allotments may further eliminate adverse effects of grazing on the primary constituent elements of critical habitat, if operators opt to pursue this course of action. The establishment of forage thresholds should reduce, to some degree, the adverse effects of grazing on allotments that will be grazed.

Grazing would continue on approximately 110,000 acres of critical habitat. Most of this acreage is located within the Ord Mountain Allotment. The remaining areas of critical habitat that would continue to be grazed are relatively small parcels that are located at the edges of critical habitat units. These parcels, in total, cover approximately 8,000 acres.

We conclude that the grazing program proposed by the Bureau is not likely to compromise the conservation role and function of critical habitat of the desert tortoise in the action area. We have reached this conclusion because grazing would occur on approximately 110,000 acres of critical habitat. At least portions of the grazed areas are located at elevations where some of the primary constituent elements of critical habitat are not found naturally. Most of the critical habitat within the planning area, which totals approximately 1,670,479 acres (Service 2005g), would not be grazed. Additionally, the intensity at which the Bureau proposes to allow grazing within critical habitat should reduce, to some degree, the adverse effects of grazing on the primary constituent elements.

Amendment 9, Public Land Vehicle Access Network

Through adoption of the West Mojave Plan, the Bureau proposes to designate various types of routes as open to vehicular travel within desert tortoise habitat. The route designation process involved two inventories of routes in the western Mojave Desert. The Bureau conducted its initial review of certain regions from 1985 through 1987; the remainder of the routes was reviewed in 2001 and 2002. The following table lists the types and mileages of routes that the Bureau has designated that may affect the desert tortoise; note that only the total mileage of the 1985 – 1987 routes is available (LaPre 2005e).

Types of Routes	Miles of Routes Within Critical Habitat	Miles of Routes Outside of Critical Habitat
Single Track	140	63.4
Jeep Trails, Two-Tracks, etc.	1,539.6	357.8
Washes	59.6	2.2
1985 - 1987 Inventory	491.6	2,809.8
Total	2,230.8	3,233.2

Effects on the Desert Tortoise

As we have previously noted in this biological opinion, vehicle access exposes desert tortoises to numerous threats. Although vehicle strikes may be the most obvious impact, it may not be the most deleterious effect on desert tortoise populations. Open routes allow increased human access into areas where desert tortoises reside; although many of the casual uses associated with open routes do not directly threaten desert tortoises, these routes also provide access for numerous unauthorized activities, such as poaching, vandalism, and cross-country riding.

Limited routes pose the same threats to desert tortoises as open routes; however, because use of these routes is restricted to specific users and uses, the degree of threat is greatly reduced. The Bureau has designated only 30.6 miles of limited routes within desert tortoise habitat in the planning area (LaPre 2005h).

We have also noted previously in this biological opinion that neither the Bureau or the Service have definitive information on the size of a route network that would have such minimal effects on the desert tortoise that its overall conservation would not be affected; obviously, we expect that roadless areas would not adversely affect desert tortoises. The extent that the changes in the access network affect the desert tortoise will be difficult to measure because of the slow reproductive rate of the species and other factors, such as disease, drought, and predation, which may be affecting the number of individuals in a region.

Despite the indirect effects of open routes and lack of the definitive information cited in the preceding paragraph, the route network proposed by the Bureau in the West Mojave Plan should reduce the adverse effects of vehicle use of the desert tortoise for several reasons. First, the amendment proposed by the Bureau would reduce the amount of existing open routes in subregions that overlap critical habitat of the desert tortoise in the western Mojave Desert from approximately 4,062 to 2,475 miles (Coyote, El Mirage, Fremont, Kramer, Newberry-Rodman, Ord, and Superior subregions, plus the Black Mountain, Rainbow Basin, and Western Rand Mountains areas of critical environmental concern). The Bureau et al. (2005) note that, for several subregions, a proportionately higher number of route closures are in areas characterized by bajada topography. Conversely, a proportionately higher number of routes were designated as open in more mountainous terrain. Desert tortoises are generally more abundant on bajadas and valleys than in mountains areas; also, instances of authorized and unauthorized off-road travel would likely occur less frequently in mountainous terrain. Overall, such a network of routes of travel would have fewer adverse effects on desert tortoises than the current network.

The Bureau's proposal to designate approximately 15 miles of new open routes and approximately 20 miles of open routes as competition routes adjacent to the Spangler Hills Off-highway Vehicle Management Area could cause the loss of some desert tortoises in this region. We expect that few desert tortoises would be affected because they generally occur in lower numbers in this area, possibly as a result of previous vehicular activity and its more northerly location. The closure of approximately 35 miles of currently open routes within the Fremont-Kramer Desert Wildlife Management Area to offset the opening of the routes near the Spangler Hills Off-highway Vehicle Management Area should reduce the potential that desert tortoises

will be affected by vehicular use; these closures are in an area that is capable of supporting moderate to high densities of desert tortoises. Overall, this proposal should result in a net benefit to the desert tortoise.

Finally, we note that the proposed action establishes a network of roads that is more extensive than those proposed by the 1985-87 inventory and the interim network that resulted from the settlement agreement with the Center for Biological Diversity. Realistically, however, the route network in the western Mojave Desert at the current time consists of any route that shows evidence of prior use. The proposed alternative would allow vehicle use only on routes marked as open. Clearly, establishing a well-defined system of marked routes would reduce the density of routes and thereby reduce mortality of desert tortoises.

The Bureau also discusses measures to attempt to reduce the effects of open routes on desert tortoises. For example, it cites the current law regarding speed limits on unimproved roads. We note that this law, as described by the Bureau in the final environmental impact report and statement, would be enforced for "the safety of other persons and property." Because desert tortoises do not fall into that category, current law is likely not enforceable strictly for their protection, particularly much lower speeds are necessary to protect desert tortoises than are generally needed to protect persons and property. Additionally, we expect that the local law enforcement agencies lack the ability to patrol regularly enough to enforce this standard. Therefore, we expect that the enforcement of speed limits on unpaved roads is unlikely to provide substantial protection to desert tortoises.

The final environmental impact report and statement notes that, if monitoring or studies show that certain unimproved roads are causing an increased level of mortality of desert tortoises, the Bureau will consider ways, including speed regulators, to reduce or avoid these effects. This strategy of adaptive management would generally be appropriate; however, many factors render this issue a difficult one to resolve. In the case of desert tortoises in the Western Mojave Recovery Unit, we do not have sufficient baseline data on the level of mortality on unimproved roads to judge whether an increase has occurred. We doubt that the Bureau has sufficient resources to monitor unimproved roads at a level that would provide the baseline and subsequent information, particularly since carcasses in the desert are usually scavenged so quickly that monitors may need to find them almost immediately to ascertain the cause of death with certainty. Additionally, so few desert tortoises remain in some areas of the Western Mojave Recovery Unit that establishing trends may be statistically impossible. Speed may not be the only factor that results in the killing of desert tortoises; small individuals are difficult to see under the best circumstances and large animals may be missed as a vehicle makes a sharp turn or comes over a rise in the road. Finally, we are unaware of any monitoring technology or management strategy that would be effective over such a large area. We again note that the best strategy to protect desert tortoises from vehicles is to separate them from roaded areas to the greatest degree possible.

This action is authorized under the guidance of the California Desert Conservation Area Plan as a casual use and would become effective upon the Bureau's signing of the record of decision.

Consequently, the Bureau and Service will not consult on this causal use again, unless the agencies determine that re-initiation of consultation is required, as described at 50 *Code of Federal Regulations* 402.16.

Effects on Critical Habitat

The use of vehicles on roads and trails that are designated as open or limited will not, in general, adversely affect most of the primary constituent elements of critical habitat because these biological and physical attributes are not present within roadbeds. Some roads support annual plants, possibly even at greater local densities than on adjacent, undisturbed habitat, because of alterations in the hydrological regime caused by the road. Although such areas may be of value to a few desert tortoises, they are not so extensive that they substantially alter the patterns of the distribution of forage plants.

Routes have the potential to fragment habitat and interfere with movement, dispersal, and gene flow; this ability to move and disperse is a central tenant of the first primary constituent element of critical habitat of the desert tortoise. Major highways, such as Interstate 15, are sufficiently wide and busy with vehicles that they form a virtually impenetrable barrier to movement of desert tortoises, if underpasses are not available. Unpaved roads that are used infrequently likely do not pose a threat of fragmentation; we are unaware of any dirt road or track within critical habitat of the desert tortoise that is so heavily traveled that movement of desert tortoises would be precluded. Ongoing road maintenance, which is an indirect effect of a route network, can lower the bed of the road and raise berms to a degree that desert tortoises that enter the roadway cannot exit. These animals are subsequently threatened with predation, exposure to extreme temperatures, collection, and collision with vehicles.

The primary effects of open routes on the primary constituent elements of critical habitat stem from the access they provide for unauthorized activities and as a corridor for the spread of invasive plant species. We noted the prevalence of off-road vehicle tracks that were observed on transects previously in this biological opinion; the final environmental impact report and statement contains additional discussion on this issue. Even a few passes by off-road vehicles can disturb and compact substrates, destroy annual plants, and damage shrubs; these features constitute the primary constituent elements of critical habitat. Additionally, a consistent pattern of behavior in the California Desert Conservation Area is that, once someone has driven through an area, other users deem it an appropriate activity; consequently, the damage to the primary constituent elements of critical habitat is exacerbated. Areas that are most heavily used for off-road activity no longer support the primary constituent elements of critical habitat.

Any user of open routes has the ability to spread non-native plants into desert wildlife management areas. As we have discussed previously in this biological opinion, non-native species can compromise the primary constituent element of critical habitat related to the availability of suitable forage species. They can also create large areas of standing dead material that are more likely to burn; these fires subsequently destroy the shrubs that desert tortoises rely on for shelter.

Amendment 10, Stopping and Parking of Motorized Vehicles and Vehicular Camping.

Through adoption of the West Mojave Plan, the Bureau will amend the California Desert Conservation Area Plan to allow camping in association with motorized vehicles in previously existing disturbed camping areas adjacent to motorized vehicle routes designated as open and the stopping and parking of motorized vehicles within 50 feet of the centerline of the designated route in desert wildlife management areas. Outside of desert wildlife management areas, on public lands administered by the Bureau, stopping, parking and camping associated with motorized vehicles must occur within 300 feet of routes designated as open in accordance with existing regulations.

Effects on the Desert Tortoise

Desert tortoises may be killed or injured as a result of camping in association with motorized vehicles in previously existing disturbed areas and stopping and parking within 50 feet of the centerline of routes within desert wildlife management areas in the planning area. Desert tortoises that are crossing or residing in these disturbed areas would be at risk if a vehicle uses the area at the same time the animal is present. Additionally, desert tortoises may enter disturbed areas after the vehicle is parked to take cover in its shade; the desert tortoise could then be crushed if the vehicle moves. The likelihood that desert tortoises would be killed is likely far less in disturbed areas than in undisturbed areas because the drivers of vehicles are likely more able to see animals without the full component of vegetation that is normally present; additionally, desert tortoises are likely to spend less time in these areas because of the more compact substrates and less vegetation available for shelter and forage.

Reducing the distance from the centerline of the road in which vehicles are allowed to stop and park within desert wildlife management areas from 300 to 50 feet should substantially decrease the likelihood that desert tortoises will be killed. Within the Fremont-Kramer, Superior-Cronese, and Ord-Rodman desert wildlife management areas, the area that is potentially available to stop and park will be reduced from approximately 124,372 to 23,117 acres (page 4-116 of the final environmental impact report and statement). Additionally, as we have noted previously in this biological opinion, the vegetation and terrain in large portions of the desert wildlife management areas will likely preclude the ability of vehicles to leave the designated routes; this factor will also reduce, to some degree, the risk that desert tortoises will be killed.

Outside of desert wildlife management areas, the distance from the centerline of the road that vehicles may stop, park, and camp will remain at 300 feet. Consequently, the risk to desert tortoises will remain unchanged from the current situation. The generally lower densities of desert tortoises outside of desert wildlife management areas is likely to result in relatively fewer animals being killed in these regions of the desert.

Neither we nor the Bureau can provide any quantitative information on how frequently desert users leave routes of travel for these distances to camp, stop, and park either within or outside of desert wildlife management areas. The final environmental impact report and statement notes that 77 of 100 staging areas, 931 of 1,369 camping areas, and 28 of 37 trailheads detected during field work in 2001 and 2002 were located within 100 feet of designated routes; it did not provide any further information on sites located between 50 to 300 feet from the road; consequently, we cannot determine the extent to which the proposed action will change the use of these areas.

This action is authorized under the guidance of the California Desert Conservation Area Plan as a casual use and would become effective upon the Bureau's signing of the record of decision. Consequently, the Bureau and Service will not consult on this causal use again, unless the agencies determine that re-initiation of consultation is required, as described at 50 *Code of Federal Regulations* 402.16.

Effects on Critical Habitat

The primary constituent elements of critical habitat are not likely to be affected to a substantial degree as a result of camping in association with motorized vehicles in previously existing disturbed areas because the value of the biological and physical attributes in such areas is likely already degraded. Stopping and parking within 50 feet of the centerline of routes within desert wildlife management areas in the planning area will adversely affect the primary constituent elements of critical habitat by compacting and disturbing substrates and crushing annual plants and possibly shrubs. The quantity of plants and substrates that are that affected is likely to be minor, in comparison to the amount of annual plants and substrates available within the desert wildlife management areas. The most deleterious effect to critical habitat may result from an acceleration of the spread of invasive plant species.

Reducing the distance from the centerline of the road in which vehicles are allowed to stop and park within desert wildlife management areas from 300 to 50 feet would substantially decrease the amount of critical habitat that could be affected by this activity. As we mentioned in the previous section of this biological opinion, the area that is potentially available to stop and park will be reduced from approximately 124,372 to 23,117 acres within the Fremont-Kramer, Superior-Cronese, and Ord-Rodman desert wildlife management areas (page 4-116 of the final environmental impact report and statement).

Because the boundaries of the critical habitat units and desert wildlife management areas do not entirely overlap, approximately 20.1 miles of routes are located on public lands within critical habitat units but outside of desert wildlife management areas (Pratini 2005). The following table depicts the approximate acreage of critical habitat that is open to stopping and parking. Note that, because the desert wildlife management areas are generally larger than the critical habitat units, the acreages depicted in the "Acreage of Area Open to Stopping and Parking - Within Desert Wildlife Management Areas" likely overestimate the size of areas that are open for stopping and parking.

Critical Habitat Unit	Total Acreage	Acreage of Public Lands	Acreage of Area Open to Stopping and Parking		
			Within Desert Wildlife Management Areas	Outside of Desert Wildlife Management Areas But Within Critical Habitat ¹	Total Within Critical Habitat
Superior-Cronese	772,000	380,592	9,833	260	10,093
Fremont-Kramer	518,000	283,710	10,138	43	10,181
Ord-Rodman	254,142	202,845	3,146	497	3,643
Pinto Mountain	171,700	103,771	Unavailable	573	Unavailable
Totals	1,715,842	970,918	23,117	1,373	23,917

¹ From Pradini 2005.

As the preceding table indicates, relatively minor portions of the critical habitat units are open to stopping and parking. The primary constituent elements of critical habitat will not be disturbed by these activities within the large portions of the critical habitat units that will not be opened to stopping and camping. Additionally, the Bureau's current guidance allows drivers to stop, park, and camp within 300 feet of the route. Under this policy, most people use existing disturbed areas and do not drive through areas with vegetation (Beck and Ahrens pers. comms. 2005); recreational users tend to use disturbed areas at least partially to avoid damage to their vehicles. Finally, as we have noted previously in this biological opinion, the vegetation and terrain in large portions of the critical habitat units will likely preclude the ability of vehicles to leave the designated routes. These factors will also reduce, to some additional degree, the areas in which the primary constituent elements of critical habitat are likely to be disturbed by these activities. Consequently, the Bureau's proposal to allow stopping and parking within approximately 23,917 acres of critical habitat within the planning area is not likely to compromise the conservation role and function of these critical habitat units.

Miscellaneous Actions, Johnson Valley to Parker Race Corridor

The Bureau proposes to retain the Johnson Valley to Parker race corridor, which passes along the southeastern edge of the Ord-Rodman Desert Wildlife Management Area and the Ord-Rodman Critical Habitat Unit.

Effects to the Desert Tortoise

Desert tortoises are present in at least medium densities in this reach of the corridor; desert tortoises could potentially be killed during any event that is held when they are active. Densities of desert tortoises decline to the east of the Pisgah Crater area; therefore, desert tortoises are less likely to be directly affected by races in that area. In areas that contain sensitive resources, such as the relatively greater numbers of desert tortoises near Pisgah Crater, the Bureau would impose "yellow flag" conditions, which could include speed limits, rules concerning passing, and other measures to avoid or reduce impacts (LaPre 2005g); these measures should reduce, to some degree, the potential mortality of desert tortoises.

The Bureau will consider whether to authorize individual events when they are proposed by applicants. Consequently, it will consult with the Service, under the auspices of section 7(a)(2) of the Act, as appropriate if an event is proposed.

Effects on Critical Habitat

Because of the way the Service drew the boundaries of the Ord-Rodman Critical Habitat Unit, the race corridor will be located slightly within its boundaries. The Bureau proposes to limit use of this race corridor to designated open routes. Consequently, vehicles will not travel off of established roads and, therefore, will not disturb the primary constituent elements of critical habitat to a substantial degree. We expect that any straying of riders off of the road will be minimal. To the degree that riders do stray, some disturbance of the primary constituent elements of critical habitat would likely occur, in the form of compacted and disturbed substrates and damaged annual plants and shrubs. Given that we expect this disturbance to be confined to the immediate vicinity of the open route and to be very minor in extent relative to the size of the critical habitat unit, we do not expect that the occasional straying of riders from the road will compromise the function of the critical habitat unit.

Summary of the Effects of the California Desert Conservation Area Plan, as Amended, on the Desert Tortoise and its Critical Habitat

Effects on the Desert Tortoise

The proposed amendment of the California Desert Conservation Area Plan for the Western Mojave Recovery Unit would increase protection of the desert tortoise above the current management situation that occurs within this region. Additionally, except for casual uses (e.g., casual mining exploration, vehicle use on existing roads, hiking, and vehicle camping along existing roads) and ongoing grazing, activities and projects will receive site-specific environmental review and consultation with the Service, pursuant to section 7(a)(2) of the Act, as appropriate. Therefore, all activities and projects, except casual uses, may be denied, modified, or mitigated to reduce adverse effects to desert tortoise if, as proposed for some future specific activity, they would violate section 7(a)(2) of the Act. As we have noted previously in this biological opinion, section 6840 of the Bureau of Land Management Manual states that the Bureau's policy is to "ensure that (its) actions will not reduce the likelihood of survival and recovery of any listed species or destroy or adversely modify their critical habitat."

This biological opinion also addresses specific actions that were adopted as part of the West Mojave Plan to implement various aspects of the recovery plan for the desert tortoise. The following discussion summarizes important components of the West Mojave Plan and its effects on the desert tortoise.

The Bureau's proposal to designate all lands within desert wildlife management areas as Class L should provide increased protection to the desert tortoise over that currently provided by Class M guidance; however, the Bureau can authorize actions within Class L areas that could kill desert tortoises. The proposal to limit the cumulative amount of ground disturbance to one percent

should ensure that the vast majority of desert tortoises residing on public lands within the desert wildlife management areas are conserved in a manner that provides for their survival and recovery.

The designation of routes in desert wildlife management areas, with an overall reduction in the amount of the road network, should reduce the level of mortality of desert tortoises on roads; it should also reduce the area in which they are threatened by other human activities related to access (e.g., poaching, vandalism). Neither the Bureau nor the Service has definitive information on how differing route networks affect the desert tortoise. Roadless areas would have the least adverse effect on desert tortoises; an access network that provides for large expanses of undisturbed habitat for the desert tortoise would seem to provide the opportunity for recovery. The extent that the changes in the access network affect the desert tortoise will be difficult to measure because of the slow reproductive rate of the species and other factors, such as disease, drought, and predation, which may be affecting the number of individuals in a region.

The desert tortoise will benefit from the Bureau's proposal to allow the voluntary relinquishment of grazing leases and related authorizations; cattle have been removed from several allotments and sheep have not grazed substantial areas of critical habitat since it was designated. As a result of this action, only one cattle allotment remains within a desert wildlife management area in this bioregion; desert tortoises will be threatened with trampling and crushing by cattle and operators on a far smaller area.

Reducing the distance that cars and trucks can drive and park from up to 300 feet from a route of travel to 50 feet in the desert wildlife management areas provides a greater degree of protection to the desert tortoise. The requirement that camping be limited to existing disturbed areas provides an additional level of protection.

Maintaining a corridor for competitive events along the Johnson Valley to Parker route is likely to kill or injure desert tortoises. We do not have sufficient information to assess the likely level of mortality at this time. The Bureau's review of a specific proposed race in the future will provide an opportunity to review the potential level of mortality in adequate detail. We note that the Bureau eliminated the western fragment of the corridor for the Barstow to Las Vegas race course; this action eliminates a potential threat to desert tortoises.

The Bureau has proposed to withdraw several areas from mineral location and entry. This action has the potential to reduce to a substantial degree the number of desert tortoises that may be killed during casual use and under future plans of operation.

The acquisition of private lands within desert wildlife management areas will remove at least some threats that desert tortoises may face on non-federal lands; this acquisition will also facilitate the Bureau's management. The addition of lands to the retention zone in the West Mojave Land Tenure Adjustment Program will increase the area within which desert tortoises may be conserved.

Programs to educate visitors about the desert tortoise and how they can assist in conserving the species will also promote recovery of the species. A permitting and education program for use of vehicles in the Rand Mountains may be particularly beneficial, given the difficulty that the Bureau has had in enforcing compliance with the route network in this area.

The California Desert Conservation Area Plan, as amended by the West Mojave Plan, provides guidance, including the requirement to consider the needs of listed species, sufficient to ensure the survival and recovery of the desert tortoise in the Western Mojave Recovery Unit. The decline in this region prompts concern; desert tortoise numbers are low enough in certain areas to make them almost undetectable. Full and swift implementation of the amended California Desert Conservation Area Plan may reduce the severity and duration of the decline, if it is tied to anthropogenic causes.

In summary, the actions in the West Mojave Plan were proposed with consideration of the Bureau's mandates to manage public lands and after careful evaluation of the current situation in these areas and input from the public and numerous agencies. With a few exceptions, such as the Johnson Valley-to-Parker race corridor and permitting vehicles to stop and camp off of routes, the actions that were adopted by the Bureau are highly protective of desert tortoises. Even the exceptions as noted provide greater protection to the desert tortoise than the California Desert Conservation Area Plan of 1980. In addition, as we discussed previously in this biological opinion, the best data available seem to indicate that none of these actions have severe adverse effects on the desert tortoise. However, the cause of the recent declines in the number of desert tortoises across California has not been identified. Consequently, the mechanisms needed to reverse these declines are also unknown. The potential exists that reversal of the decline of the desert tortoise may require substantial additional management; another scenario is that we may not be able to identify or manage the agent or agents responsible for the decline.

Effects on Critical Habitat

The proposed amendment of the California Desert Conservation Area Plan for the Western Mojave Recovery Unit would improve management of critical habitat of the desert tortoise above the current management situation that occurs within this region. Additionally, except for casual uses (e.g., casual mining exploration, use of open wash zones, vehicle use on existing roads, ongoing grazing, hiking, and vehicle camping along existing roads), activities and projects will receive site-specific environmental review and consultation with the Service, pursuant to section 7(a)(2) of the Act. Therefore, all activities and projects, except casual uses, may be denied, modified, or mitigated to reduce adverse effects to the primary constituent elements of critical habitat if, as proposed for some future specific activity, they would violate section 7(a)(2) of the Act. As we have noted previously in this biological opinion, section 6840 of the Bureau of Land Management Manual states that the Bureau's policy is to "ensure that (its) actions will not reduce the likelihood of survival and recovery of any listed species or destroy or adversely modify their critical habitat."

This biological opinion also addresses specific actions that were adopted as part of the West Mojave Plan to implement various aspects of the recovery plan for the desert tortoise. The

following discussion summarizes important components of the bioregional plans and their effects on critical habitat of the desert tortoise.

The Bureau's proposal to designate all lands within desert wildlife management areas as Class L should provide increased protection to critical habitat over that currently provided by Class M guidance. Not all critical habitat was included within desert wildlife management areas; however, even without the portions of critical habitat that have been omitted from desert wildlife management areas, the Bureau has included sufficient areas of critical habitat to ensure the conservation role and function of the critical habitat units in the planning area for the Western Mojave Recovery Unit.

The Bureau can authorize actions within Class L areas that could degrade or remove primary constituent elements of critical habitat. The proposal to limit the cumulative amount of ground disturbance to one percent should ensure that the vast majority of public lands within the critical habitat units is managed for the conservation of the desert tortoise.

The designation of routes within the boundaries of the critical habitat units, with an overall reduction in the amount of the road network, should reduce adverse effects to the primary constituent elements of critical habitat. The closure of 117 miles of navigable washes within desert wildlife management areas will reduce the adverse effects to a great degree.

Maintaining a corridor for competitive events along the Johnson Valley-to-Parker route is not likely to disturb, to a substantial degree, the primary constituent elements of critical habitat where the route borders the Ord-Rodman Critical Habitat Unit because the Bureau will require riders to remain on the designated route. The elimination of the Barstow to Vegas race corridor may have a slight benefit to critical habitat, in that vehicles will no longer have the potential for to stray off of the established route.

Reducing the distance that cars and trucks can drive and park from up to 300 feet from a route of travel to 50 feet within large portions of the critical habitat units in the planning area provides a greater degree of protection to the primary constituent elements of critical habitat of the desert tortoise. The additional requirement to limit camping to existing disturbed areas provides even a higher degree of protection because it restricts this activity to areas that usually lack one or more of the primary constituent elements of critical habitat of the desert tortoise.

The voluntary relinquishment of grazing leases and related authorizations will substantially reduce the effects of cattle and sheep grazing on the primary constituent elements. Cattle have been removed from several allotments and sheep have not grazed substantial areas of critical habitat since it was designated.

The acquisition of private lands within desert wildlife management areas will remove at least some sources of degradation of the primary constituent elements of critical habitat of the desert tortoise that occur on non-federal lands; this acquisition will also facilitate the Bureau's management. The addition of lands to the retention zone in the West Mojave Land Tenure

Adjustment Program will increase the area of critical habitat on which desert tortoises may be conserved.

Programs to educate visitors about how to behave responsibly while visiting areas of critical habitat will also promote conservation of the desert tortoise. A permitting and education program for use of vehicles in the Rand Mountains may be particularly beneficial, given the difficulty that the Bureau has had in enforcing compliance with the route network in this area; if vehicles remain on designated routes, the impacts to the primary constituent elements of critical habitat would be substantially reduced.

In summary, the California Desert Conservation Area Plan, as amended by the West Mojave Plan, provides guidance, including the requirement to consider the needs of listed species, sufficient to ensure the conservation role and function of critical habitat of the desert tortoise in the Western Mojave Recovery Unit. Additionally, the specific actions that were adopted by the Bureau are highly protective of critical habitat. The best data available seem to indicate that the few exceptions to this statement, such as permitting vehicles to stop and camp off of routes, are not likely to have severe adverse effects on the overall function of affected critical habitat units; in these cases, the scale of the impact is minor in comparison with the area of critical habitat. Although recent declines in the numbers of desert tortoises in several regions of the desert prompt concern, we have not been able to attribute those declines in a definitive manner to changes in the condition of desert tortoise habitat.

Any consideration of the effects of an action on a species must consider the scale of those effects; that is, how much of the species' range would be degraded or enhanced by the proposed action. The range, recovery units, and critical habitat units of the desert tortoise encompass vast areas. The scale of the California Desert Conservation Area Plan is also vast. Its goal is to provide for the use of public lands and resources in a manner that enhances, where possible, and does not diminish, on balance, the environmental, cultural, and aesthetic values of the desert and its productivity (Bureau 1999). The immensity of the range of the desert tortoise and the large amount of critical habitat assist in achieving this balance. Although the Bureau has authorized many projects under the guidance of the California Desert Conservation Area Plan, large expanses of habitat, including most critical habitat of the desert tortoise, remain undisturbed by the Bureau's management actions. In our analysis, we place particular emphasis on the Bureau's commitment to ensure that no more than one percent of land within the desert wildlife management areas under its management will be disturbed by future actions; this measure should ensure that the conservation role and function of critical habitat of the desert tortoise are maintained.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act.

The County of San Bernardino is processing applications for several projects that would be located within habitat of the desert tortoise in the western Mojave Desert (Sansone 2004). These potential projects include: the placement of billboards adjacent to Interstate 15 in the Yermo-Harvard area and Interstate 40 in the Newberry Springs area; commercial uses along Interstates 15 and 40 in the Yermo and Newberry Springs areas; the expansion of St. Anthony's Monastery north of Interstate 15 in the Harvard area; and an industrial center west of Interstate 15 north of Victorville and east of the Mojave River.

The placement of billboards adjacent to the interstates is unlikely to result in the loss of desert tortoises because they are generally not abundant near freeways. We expect the amount of habitat loss to be minimal because of the nature of the projects; additionally, habitat near freeways is often severely degraded by various human activities.

The development of commercial facilities along Interstates 15 and 40 in the Yermo and Newberry Springs areas is more likely to cause loss of individuals and habitat of the desert tortoises. These facilities, however, would likely be developed adjacent to freeways and near existing commercial uses; therefore, we expect that the impacts to the desert tortoise and its habitat would be minimal and would have only minor effects on the viability of the Superior-Cronese and Ord-Rodman desert wildlife management areas.

The development of an industrial center north of Victorville may also kill individuals and destroy habitat of the desert tortoise. This area, however, is not within critical habitat of the species or a desert wildlife management area; consequently, the loss of the few desert tortoises that may reside in this area and the habitat that supports them is unlikely to appreciably reduce the ability of the species to survive and recover.

All of these projects have some potential to provide subsidies to common ravens, which, as we have mentioned previously in this biological opinion, prey on juvenile desert tortoises. This increase in subsidies may result in slightly greater numbers of common ravens.

Planners for the County of Kern reported that they did not have any projects that met our definition of cumulative effects (Oviatt 2004). The County of Inyo is not considering any proposed actions within the range of the desert tortoise (Smith pers. comm. 2004). The Bureau does not manage land in Los Angeles County that supports the desert tortoise; consequently, we consider Los Angeles County to be outside the action area of this consultation.

CONCLUSIONS

Desert Tortoise

After reviewing its current status, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to jeopardize the continued existence of the desert tortoise.

We reached this conclusion for two reasons. First, although the number of desert tortoises has declined within the action area of this consultation, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan will ensure that actions the Bureau takes, funds, and authorizes are not likely to reduce appreciably, either directly or indirectly, its reproduction, numbers, or distribution in the action area; additionally, we did not detect any cumulative effects that would substantially alter the status of the desert tortoise in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the desert tortoise and to further its conservation. These measures include, but are not limited to:

- The establishment of large, well-distributed desert wildlife management areas that will be administered in a manner consistent with most of the recommendations of the recovery plan for the desert tortoise and will promote the survival and recovery of the species within this portion of its range;
- The designation of all lands within desert wildlife management areas as Class L, which will provide increased protection to the desert tortoise over that currently provided by Class M;
- Substantial reductions in the amount of livestock grazing to the degree that most desert tortoises and their habitat in these planning areas will not be exposed to cattle or sheep grazing;
- Acquisition of private lands, which will result in a higher level of protection of desert tortoises under the guidance of the California Desert Conservation Area Plan;
- The addition of lands to the retention zone in the West Mojave Land Tenure Adjustment Program, which will increase the area within which desert tortoises may be conserved;
- A limit of one percent of new disturbance within desert wildlife management areas to reduce the loss of desert tortoises, which will ensure that most individuals and their habitat in areas that are essential to their conservation will not be exposed to the adverse effects of human activities;
- A reduction in the distance, in the desert wildlife management areas, from the centerline of roads that vehicles can stop and park from 300 feet to 50 feet, which will reduce the likelihood that desert tortoises will be killed;
- Reducing the places, in the desert wildlife management areas, where vehicles can camp to disturbed areas within 50 feet of the road, which will reduce the likelihood that desert tortoises will be killed;

- The withdrawal of several areas from mineral location and entry, which has the potential to reduce to a substantial degree the number of desert tortoises that may be killed during casual use and under future plans of operation; and
- Closure of routes, which will reduce the exposure of desert tortoises to human-related threats; and

Critical Habitat

After reviewing the current status of critical habitat, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to destroy or adversely modify the critical habitat of the desert tortoise.

We reached this conclusion for two reasons. First, although we are aware of areas within the action area of this consultation where the condition of critical habitat has been degraded to some degree because one or more of the primary constituent elements have been disturbed by human activities, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan will ensure that the condition of critical habitat of the desert tortoise will generally improve or remain functional and continue to serve its conservation role; additionally, we did not detect any cumulative effects that would substantially alter the status of critical habitat of the desert tortoise in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the critical habitat of the desert tortoise and to further the proper functioning of the primary constituent elements. These measures include, but are not limited to, the following actions and proposals:

- The establishment of large, well-distributed desert wildlife management areas encompassing most of the critical habitat in these planning areas that will be administered in a manner consistent with most of the recommendations of the recovery plan for the desert tortoise within this portion of its range;
- Substantial reductions in the amount of livestock grazing to the degree that most critical habitat in these planning areas will not be exposed to grazing activities;
- The designation of all lands within desert wildlife management areas as Class L, which will facilitate management of critical habitat of the desert tortoise to a greater degree than that currently provided by Class M;
- Acquisition of private lands, which will result in a higher level of protection for critical habitat under the guidance of the California Desert Conservation Area Plan;

- The addition of lands to the retention zone in the West Mojave Land Tenure Adjustment Program, which will increase the area of critical habitat that will be managed by the Bureau;
- A limit of one percent of new disturbance within desert wildlife management areas, which will ensure that most critical habitat in these areas will not be exposed to the adverse effects of human activities;
- Reducing the distance from the centerline of the road, in the desert wildlife management areas, that vehicles can stop and park from 300 feet to 50 feet, which will ensure that most critical habitat will not be exposed to the adverse effects of off-road vehicle use;
- Reducing the places, in the desert wildlife management areas, where vehicles can camp to disturbed areas within 50 feet of the road, which will reduce the area that may be subject to off-road vehicle use; and
- The withdrawal of several areas from mineral location and entry, which will reduce, to a substantial degree, the area of critical habitat that may be disturbed during casual use and under future plans of operation.

BIOLOGICAL OPINION FOR PARISH'S DAISY AND ITS CRITICAL HABITAT

STATUS OF THE PARISH'S DAISY AND ITS CRITICAL HABITAT

Basic Ecology of the Parish's Daisy

Parish's daisy is a small perennial herb of the aster family (Asteraceae) that reaches 4 to 12 inches in height. The simple linear leaves are covered with soft, silvery hairs, giving an overall light green appearance to the plant. Up to 10 solitary flower heads are borne on cauline stalks; ray flowers are deep rose to lavender, disk flowers are yellow, and heads have greyish green and glandular phyllaries. The flowering period is from May through June. Parish's daisy has been confused with fleabane daisy (*Erigeron utahensis*), a plant found on carbonate substrates in the mountains of the Mojave Desert and in Utah, Colorado, and Arizona (59 *Federal Register* 43652).

Pollinator species have not been identified for Parish's daisy (Service 2005b). Based on knowledge of species that pollinate other members of the aster family, bees, butterflies or long-tongued flies are likely candidates. We do not have information on the methods of seed dispersal.

Parish's daisy and the other four species listed in the final rule occur primarily on carbonate substrates. The carbonate belt, which consists primarily of limestone and marble, lies along the north slope of the San Bernardino Mountains from White Mountain east to Terrace Springs and southeast to Tip Top Mountain. Approximately 30,000 acres of carbonate substrate occur in this region. Parish's daisy has the widest geographic distribution of the listed carbonate plant

species; it ranges approximately 35 miles along the carbonate belt from Pioneertown in the east to the northern flanks of White Mountain in the west (67 *Federal Register* 78571).

Status of Parish's Daisy

Parish's daisy was listed as threatened on August 24, 1994 (59 *Federal Register* 43652). The primary threat to this species is loss and degradation of habitat resulting from limestone mining. Secondary threats include roads, off-highway vehicle activity, and grazing.

Eliason (2003b) notes that Parish's daisy is found on approximately 1,073 acres. Approximately 655 acres (61 percent of the known range) occur on Federal lands on which mining claims have been filed; mining claims have not been filed on 99 acres (8 percent) of Federal land where the species occurs. Approximately 270 acres (25 percent) occupied by this species are located on non-federal lands (Forest Service and Bureau 2004). These calculations are based on the amount of occupied habitat within the area covered by the carbonate habitat management strategy; the area occupied by the disjunct occurrence of Parish's daisy near Pioneertown is not included in this acreage figures.

Sanders describes Parish's daisy as "clearly declining" as a result of limestone mining (Olson 2003). However, it is still "among the more common of the carbonate endemics" (Olson 2003).

At the time of listing, the Service reported that Parish's daisy was known from approximately 25 occurrences (Olson 2003); in the draft recovery plan, the Service cited 50 occurrences of the species (Service 1997 in Olson 2003). However, Sanders notes that "many of these probably represent reports of different parts of single populations" (Olson 2003). Most populations are on lands within the San Bernardino National Forest at the east end of the San Bernardino Mountains. A few occurrences are located on Bureau lands in this region; two occurrences are located in the Little San Bernardino Mountains (Olson 2003).

Recovery Plan

The Service (1997) prepared a draft recovery plan for the five listed carbonate endemic plants; we have not prepared a final recovery plan for these species. The Bureau, Forest Service, Service, California Native Plant Society, and several mining interests have prepared a management plan for four of the five listed plant species that occur in carbonate habitat in the San Bernardino Mountains (Olson 2003). This carbonate habitat management strategy will functionally serve as a recovery plan for these species.

The carbonate habitat management strategy was developed by the Forest Service, Bureau, Service, mining companies, claim holders, conservation groups, and landowners to resolve conflicts between mining of carbonate materials and the listed plants that occur on these substrates. It is a voluntary regional strategy to balance mining and recovery of these species. The participants in the planning process intend the carbonate habitat management strategy to be operational for 50 years or more; the reserve system for the carbonate plants will be in place in perpetuity. Land in the reserve system will be acquired with public funds, donations, or

redemption of conservation credits; other lands may be exchanged to facilitate both mining and conservation. The carbonate habitat management strategy should result in the conservation of approximately 75 percent of the occupied habitat of Parish's daisy and approximately 50 to 100 percent of its critical habitat (Service 2005b).

Status of Critical Habitat of the Parish's Daisy

Critical habitat for Parish's daisy was designated on December 24, 2002 (67 *Federal Register* 78570). Unless otherwise noted, all of the information in this section is from the final rule. In this final rule, the Service designated critical habitat for five species of carbonate endemic plants in three separate recovery units. Only one unit, the Northeastern Slope Unit, supports the Parish's daisy and Cushenbury milk-vetch; consequently, we will not discuss the other units in this biological opinion.

The Northeastern Slope Unit includes 115 separate polygons around occurrences of the carbonate plants; it extends from White Mountain at the western edge to Rattlesnake Canyon at the eastern edge, a distance of approximately 25 miles. This unit covers 11,280 acres.

Within the Northeastern Slope Unit, critical habitat for Parish's daisy covers 2,231 acres managed by the Forest Service and 940 acres of Bureau lands; 270 acres are owned by non-federal entities. Approximately 2,771 acres of the lands managed by Federal agencies have been claimed under the provisions of the General Mining Law of 1872 (Forest Service and Bureau 2004).

The final rule for designation of critical habitat of the carbonate plants states that every occurrence is important to maintain the natural population dynamics of local extirpation and colonization events that are necessary for the conservation of the species, as a seed source to colonize unoccupied sites and maintain an equilibrium between colonization and extirpation events, and, potentially, to provide important genetic material through cross pollination and seed dispersal, which may help maintain genetic diversity and reduce the likelihood of extirpation. Habitat components that are essential for each of the five carbonate plants are primarily found in, but not limited to, pinyon woodland, pinyon-juniper woodland and forests, Joshua tree woodland, white fir forests, subalpine forest, canyon live oak woodlands and forests, and blackbush scrub vegetation communities in the San Bernardino Mountains. These habitat components likely provide for: individual and population growth, including sites for germination, pollination, reproduction, pollen and seed dispersal, and seed dormancy; areas that allow for and maintain gene flow between localized occurrences through pollinator activity and seed dispersal mechanisms; areas that provide basic requirements for growth such as water, light, minerals; and lands that support pollinators and seed dispersal vectors.

The Service identified numerous factors, based on research conducted by several workers, as important to the conservation of the five carbonate plants or narrow endemic plants in general: the conservation and management of existing populations; the conservation and management of suitable habitat that is not known to be currently occupied to maintain natural equilibrium between local extirpation and colonization; the protection and maintenance of upslope or

upstream geologic features that provide the necessary materials to replace the soils continually lost to natural processes; conservation and adequate connectivity of undisturbed areas between localized occurrences to allow and maintain gene flow among aggregate occurrences through pollen and seed dispersal vectors; the conservation and maintenance of sites that may allow for pollen and seed dispersal; the conservation of suitable micro-habitat that could be colonized to allow localized occurrences to expand and contract, or maintain normal population dynamics; and the maintenance of normal ecological functions within all localized occurrences. The final rule also notes that the small fragmented range of the five carbonate plants and limiting ecological factors that reduce the chances of their survival make these species particularly vulnerable to natural and human disturbance (e.g., non-native species, wildfire, livestock grazing, forest product harvesting, and mining). (Please see the final rule for citations of the research upon which we based our identification of these factors.)

We identified the specific primary constituent elements for the listed carbonate species to include the physical and biological features that would allow for: space for individual and population growth; food, water, air, light, minerals, or other nutritional or physiological requirements; cover; sites for pollination, reproduction, germination, or seed dispersal and dormancy; and habitats that are protected from disturbance or are representative of the historic geographical and ecological distributions of a species. The final rule notes that all areas designated as critical habitat for the carbonate plants are within their respective historical ranges and contain one or more of the primary constituent elements essential for the conservation of each species; note that each species has specifically defined primary constituent elements. The specific primary constituent elements of critical habitat of Parish's daisy consist of, but are not limited to: soils derived primarily from upstream or upslope limestone, dolomite, or quartz monzonite parent materials that occur on dry, rocky hillsides, shallow drainages, or outwash plains at elevations between 3,842 and 6,400 feet; soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment); and associated plant communities that have areas with an open canopy cover.

Most of the land bearing carbonate substrates has either been claimed under the authorities of the General Mining Law of 1872 or patented. Three major limestone mines are currently operating on the north slope of the San Bernardino Mountains. A fourth, known as the Partin Mine, is no longer operating. The following paragraphs provide a general description of mining history within habitat of the carbonate plants; we do not have specific information regarding the locations of these affected areas in relation to the polygons designated as critical habitat.

Omya, Inc., operates the White Knob Quarry, which is located on patented lands within the administrative boundary of the San Bernardino National Forest. The average annual production for this operation is 500,000 tons. Mining would be conducted in phases for up to 30 years. As of 2003, disturbance from mining covered approximately 145 acres. Omya plans to apply to the County of San Bernardino for an amendment to its existing plan of operations to allow mining on 10 acres of unoccupied habitat. As part of this amendment, approximately 10 acres of habitat occupied by the carbonate species that are currently permitted for mining will not be mined (Brown pers. comm. 2003). Omya also leases claims covering approximately 360 acres on the

White Knob-White Ridge deposits. Several Silver Creek Placer claims are also leased by Omya. Some access roads to this mine cross lands managed by the Bureau (Foreman pers. comm. 2003). Specialty Minerals operates the Furnace Canyon (16 acres), Marble Canyon (120 acres), and the C-21 (Arctic Canyon and Cushenbury - 80 acres) quarries. The Nett Hill, Gordon, and Bonnicamp quarries are now inactive (Seal pers. comm. 2003). The Furnace Canyon Quarry and the Marble Canyon Quarry occur on both Forest Service and patented land. The average annual production for Specialty Minerals' operation is 800,000 tons. Some access roads cross lands managed by the Bureau (Foreman pers. comm. 2003).

The Mitsubishi Quarry occupies approximately 173 acres; an additional 18 acres are used to stock pile materials. This mine has an annual production of about 2 million tons of limestone (Shumway pers. comm. 2003). The mine is located on Forest Service and private lands.

An unknown number of occurrences of the listed carbonate plant species have been directly affected by these mining activities. Mining at many of the sites on the north slope of the San Bernardino Mountains was initiated prior to the listing of the carbonate species; the oldest mines were developed without any botanical surveys.

ENVIRONMENTAL BASELINE FOR PARISH'S DAISY AND ITS CRITICAL HABITAT

Previous Consultations

To date, we have formally consulted with the Bureau on two occasions regarding Parish's daisy. On September 30, 1999, we issued a biological opinion on the effects on the Parish's daisy of a proposed limestone quarry on Bureau land near Rattlesnake Canyon (1-8-99-F-77, Service 1999a). The plan of operations called for approximately 5 acres of surface disturbance, with an anticipated production of 86,000 tons per year. To date, this quarry has not been developed (Chavez 2003).

In 1993, the Service issued a biological opinion regarding the effects of cattle grazing on the desert tortoise (1-6-92-F-19; Service 1993b); the Rattlesnake Canyon Allotment, which supports Parish's daisy, was one of the allotments considered in that document. Because the carbonate plants were not federally listed at the time of the grazing consultation, the effects of grazing on those species were not addressed.

The Bureau, Forest Service, and Service recently completed formal consultation, pursuant to section 7(a)(2) of the Act, regarding the effects of the carbonate habitat management strategy on the five listed species, including Parish's daisy (Olsen 2003). The Service issued a biological opinion regarding the carbonate habitat management strategy to the agencies on May 2, 2005 (Service 2005b). The Status of the Parish's Daisy and Its Critical Habitat - Recovery Plan section of this biological opinion contains more information on the carbonate habitat management strategy.

Status of Parish's Daisy in the Action Area

Approximately 237 acres within the Carbonate Endemic Plants Research Natural Area support Parish's daisy and are managed by the Bureau (Forest Service and Bureau 2004). This area comprises approximately 23 percent of the 1,024 acres of habitat occupied by this species (Forest Service and Bureau 2004). Most of the occurrences within the action area are at lower elevations than those on Forest Service lands. Consequently, the action area supports a substantial portion of the distribution of Parish's daisy; additionally, the action area supports plants at the lower elevation range of the species that may not be well represented in occurrences on lands managed by the Forest Service. Maintaining plants in a diversity of habitats, such as may occur over a range of elevations, likely captures a greater degree of genetic variation, which is important in conserving a species on the long term.

Only 2 percent of the disturbed area within carbonate habitat (32 of the 1,590 acres) is on lands managed by the Bureau (San Bernardino National Forest GIS database, Eliason pers. comm. 2003a). Currently, few land uses occur in areas occupied by Parish's daisy.

Status of Critical Habitat of Parish's Daisy in the Action Area

Approximately 940 acres (21 percent) of critical habitat of Parish's daisy occur on public lands managed by the Bureau (Forest Service and Bureau 2004). This acreage indicates the size of the polygons of critical habitat, but not the amount of area that contains the primary constituent elements (67 *Federal Register* 78570). Approximately 746 acres of the critical habitat on public lands have been claimed under the provisions of the mining laws (Forest Service and Bureau 2004). We do not have any further information on the condition of critical habitat in the action area; to the best of our knowledge, most of the area of critical habitat has not been disturbed since its designation.

EFFECTS OF THE ACTION ON PARISH'S DAISY AND ITS CRITICAL HABITAT

Methodology

We used the same methodology to analyze the effects of the proposed action on the Parish's daisy, Cushenbury milk-vetch, and Lane Mountain milk-vetch that we used for the desert tortoise. We will not repeat it here. Additionally, we will not repeat the following sections on the general effects of human activities on listed plant species and their critical habitats for each plant species we discuss.

General Effects of Human Activities on the Listed Plant Species

In this section, we attempted to briefly summarize how various anthropogenic activities could affect the Lane Mountain milk-vetch, Parish's daisy, and Cushenbury milk-vetch. Note that this analysis is general in nature and, unless otherwise noted, is not intended to apply to any specific action that is or may be authorized by the Bureau.

The use and maintenance of roads can affect listed plant species in several ways. Plants that are on or immediately adjacent to roads can be lost or disturbed when vehicles stray from the road during use or maintenance activities. Dust and mud generated by motorized vehicles, whether they are maintaining or using the road, can cover plants and interfere with physiological functions ultimately affecting plant vigor, reproduction, and survival; this impact would be greatest near the road and in areas traversed by numerous roads. Invasive, nonnative plants can be transported into areas along roads. Modifying washes, such as through the use of culverts where roads cross drainages, may alter the manner in which water flows across habitat and thereby change the distribution of individuals of the listed plant species.

Vehicles traveling off of established roads can crush small shrubs or sub-shrubs, such as Parish's daisy, Cushenbury milk-vetch, and Lane Mountain milk-vetch. Vehicles traveling in this manner can also spread seeds of non-native species over great distances.

Hiking and equestrian use can affect Lane Mountain milk-vetch, Parish's daisy, or Cushenbury milk-vetch. The terrain in which these species live is generally accessible on foot, although some portions of the habitat of Parish's daisy and Cushenbury milk-vetch may be too steep for hiking. The primary effect of walking through habitat of these species would be trampling of plants. Equestrian use may also result in trampling. Because these plants occur in habitat that is generally open, people on foot are likely to walk around most individuals. In all cases, seedlings and smaller plants will be more susceptible to trampling. Individuals of Lane Mountain milk-vetch are less likely to be trampled because of their occurrence within shrubs. Hikers and equestrians can spread seeds of non-native species.

Projects that result in ground disturbance can affect Lane Mountain milk-vetch, Parish's daisy, and Cushenbury milk-vetch. These impacts include direct removal of plants and seeds, trampling of plants, changes in hydrology, burial of plants and seeds under overburden and spoils, and interference with pollination and seed dispersal.

Various human activities can spread non-native species; these species can compete with the listed species for nutrients, germination sites, and scarce moisture, and alter the ability of the area to carry wild fires. The species being considered in this biological opinion are not adapted to fire; consequently, fires could result in a substantial loss of individual plants and severely alter the plant community structure within their habitats.

Fragmentation of habitat could result in a decline in the health of the occurrences of the species under consideration in this biological opinion. If the occurrences or portions of the occurrences are separated from one another by habitat that pollinators cannot cross, pollinators may not have adequate access to ensure propagation. At this time, we do not have extensive information on the pollination ecology of these species. Fragmented habitat is also more susceptible to indirect effects, such as dust from roads and other disturbed areas and invasion by non-native species.

The use of herbicides could result in direct mortality of individuals of Lane Mountain milk-vetch, Parish's daisy and Cushenbury milk-vetch. Other pesticides may reduce or eliminate the

populations of pollinators. Both the active ingredient and surfactants may be toxic to individuals of the listed species and pollinators.

General Effects of Human Activities on Critical Habitat of the Listed Plant Species

The final rule for designation of critical habitat for the carbonate plant species describes the specific primary constituent elements of their critical habitat (67 *Federal Register* 78571). We have described the primary constituent elements for both species in their respective "Status of Critical Habitat" sections of this biological opinion. Except for differences in source of the substrates for these two species, the primary constituent elements are similar. Parish's daisy and Cushenbury milk-vetch occur on steeper slopes than those occupied by Lane Mountain milk-vetch; they also occur at higher elevations. The substrate on which Lane Mountain milk-vetch occurs is derived from granitic base materials; the species grows only where a thin layer of this specific substrate is present. In this regard, the substrate requirements of the carbonate species and Lane Mountain milk-vetch are similar. Although Lane Mountain milk-vetch requires a host shrub in which to grow, the host shrubs generally occur in a situation with an open canopy, similar the third primary constituent element of the carbonate species. Consequently, the effects of any given activity would likely be fairly similar to all three species.

The implementation of the guidelines and elements of the West Mojave Plan can remove, disturb, or fragment habitat of the listed plant species, including the primary constituent elements of critical habitat. We conducted the following analysis by generally using the primary constituent elements as the basis for our discussion.

Note that, regardless of whether a specific area is within the boundaries of critical habitat or critical habitat has not been designated for a species (e.g., Lane Mountain milk-vetch), various activities generally affect the physical and biological attributes of habitat that supports the listed plant species in the same manner. In the analysis that follows and throughout the biological opinion, we discuss how the primary constituent elements of critical habitat of Parish's daisy and Cushenbury milk-vetch may be affected by various activities. The same principles apply to habitat of Lane Mountain milk-vetch although we did not designate it as critical. Therefore, for example, ground disturbance has the same general effects on habitat of the plant species, regardless of whether that habitat has been designated as critical. For the purposes of this biological opinion, we do not consider the effects on habitat outside of critical habitat in our conclusions regarding any effects to designated critical habitat.

Soils derived primarily from upstream or upslope limestone, dolomite, or quartz monzonite parent materials that occur on dry, rocky hillsides, shallow drainages, or outwash plains at elevations between 3,842 and 6,400 feet (Parish's daisy); soils derived primarily from the upper and middle members of the Bird Spring Formation and Undivided Cambrian parent materials that occur on dry flats and slopes or along rocky washes with limestone outwash/deposits at elevations between 3,864 and 6,604 feet (Cushenbury milk-vetch). Mining can disturb the primary constituent elements of critical habitat of Parish's daisy and Cushenbury milk-vetch by removing the soils that constitute this primary constituent element or by covering them with overburden materials; in either case, these soils would no longer be available to the plants.

Removing or covering the thin layer of granitic substrates upon which Lane Mountain milk-vetch grows would have the same effect on this species.

Soils with intact, natural surfaces that have not been substantially altered by land use activities (Parish's daisy and Cushenbury milk-vetch). The use and maintenance of roads can affect the primary constituent elements of listed plant species. Dust and mud generated by motorized vehicles, whether they are maintaining or using the road, can cover the substrates upon which these plant species, including Lane Mountain milk-vetch, depend; this impact would be greatest near the road and in areas traversed by numerous roads. The potential effect of dust and mud from adjacent roads is likely minor when it is considered in light of the relatively small areas of the habitats of these species that are adjacent to roads.

We are unaware of any hiking trails that traverse habitat of Parish's daisy, Cushenbury milk-vetch, or Lane Mountain milk-vetch. The terrain in which these species live is generally accessible on foot, although some portions of the habitat of Parish's daisy and Cushenbury milk-vetch may be too steep for hiking. Walking through habitat of these species could, to some degree, alter the intact, natural surface of the substrate; walking could affect substrate where Lane Mountain milk-vetch occurs in the same manner.

Associated plant communities that have areas with an open canopy cover (Parish's daisy); associated plant communities that have areas with an open canopy cover and little accumulation of organic material on the surface of the soil (Cushenbury milk-vetch). Human activity can cause or exacerbate the spread of invasive, nonnative plants into habitat of listed species. If non-native these plants become abundant in an area, they could interfere with this primary constituent element by filling intershrub spaces and increasing the amount of leaf litter that contributes to the accumulation of organic material on the surface of the soil. Their presence in these intershrub spaces may lead to competition for light, nutrients, and water. Perhaps more importantly, non-native species can alter the ability of the area to carry wild fires. Parish's daisy, Cushenbury milk-vetch, and Lane Mountain milk-vetch are not adapted to fire; consequently, fires could result in a substantial alteration of the plant community structure in areas occupied by these species.

Effects of the West Mojave Plan on Parish's Daisy and its Critical Habitat

The area where Parish's daisy may be affected by the Bureau's proposals includes public lands supporting the species or its critical habitat within the Carbonate Endemic Plants Research Natural Area on the northern slope of the San Bernardino Mountains in the area to the east of Highway 18 and north of the boundary of the San Bernardino National Forest. Figure 2-11 on the final environmental impact report and statement depicts the Carbonate Endemic Plants Research Natural Area. This area is appropriate to consider in this biological opinion because it includes all areas where Parish's daisy occurs within the California Desert Conservation Area; additionally, the Bureau designated the Carbonate Endemic Plants Research Natural Area to include the areas where this species may be found and affected by its activities.

Amendment 1, New Areas of Critical Environmental Concern

The Bureau will designate a 5,169-acre conservation area for the carbonate plant species.

Effects on Parish's Daisy

The management direction provided by the designation of the conservation area will generally benefit Parish's daisy for numerous reasons. The Bureau's application of a mitigation fee to new ground-disturbing activities, acquisition of land within the conservation area, designation of routes, and monitoring of biological resources will benefit Parish's daisy. These actions will likely reduce the amount of disturbance, provide at least a minor source of income for conservation projects, reduce the likelihood that off-road vehicle use will damage plants, and enhance the Bureau's management capabilities by consolidating land ownership.

The Bureau's proposal to adopt a standard of no surface occupancy to prevent undue and unnecessary degradation of lands, under the surface mining regulations, to protect Parish's daisy is another important element of the conservation strategy. As a result of the adoption of this standard, surface disturbance would be prohibited on the 171 acres that support Parish's daisy and that have already been claimed under the provisions of the General Mining Law of 1872. Additionally, the same protections would apply to approximately 66 acres of public lands that support individuals of this species and have not been claimed under the General Mining Law of 1872. (The areas of claimed and unclaimed land are from Forest Service and Bureau 2004.) Private lands that may be acquired will not be opened to mineral entry. Therefore, these actions will prevent loss of individuals of Parish's daisy as a result of mining activities.

The prohibition against harvesting native plants within conservation areas will benefit Parish's daisy because the inadvertent removal of individuals of this species is far less likely to occur if collection of all species is prohibited. Additionally, prohibiting the collection of other plants may have minor beneficial effects on the community of pollinators by removing this impact to their habitat.

Activities such as hiking, bird watching, and photography would likely have minimal impact on Parish's daisy because the level of use would probably be low; additionally, because these plants occur in habitat that is generally open, people on foot are likely to step around most individuals. Equestrian uses may result in some trampling.

Commercial activities, such as commercial filming, could result in the trampling of Parish's daisy, if it occurs in occupied habitat. To the best of our knowledge, little, if any filming occurs within this conservation area. Consequently, such activity is unlikely to cause substantial impacts to Parish's daisy.

The Bureau will attempt to place more law enforcement rangers and maintenance workers in the field and to focus their efforts on the conservation of biological resources. As we noted in our discussion on the desert tortoise, the Bureau's presence in the field is essential. Without

adequate staffing, numerous impacts can occur and cause serious detrimental effects before they are even detected.

The one percent threshold for new ground disturbance will apply in this conservation area. Approximately 238 acres of occupied habitat for Parish's daisy occur on public lands within the habitat conservation area. Because of the one percent threshold, up to approximately 52 acres of this occupied habitat (i.e., one percent of 5,169 acres) may be disturbed. In such a situation, Parish's daisy occurring on the remaining 186 acres of occupied habitat within this area will not be disturbed by project-level activities. We expect that the likelihood is extremely low that all of the 52 acres of disturbance would occur within occupied habitat of Parish's daisy. Consequently, more than 186 acres of habitat occupied by Parish's daisy is likely to be conserved. Additionally, this area currently receives little use and few proposals for development; we expect this situation will continue. For these reasons, we conclude that the general management direction provided by the West Mojave Plan will not appreciably reduce the reproduction, numbers, or distribution of Parish's daisy.

With the exception of casual use, such as hiking, bird watching, equestrian use, and photography, all of the activities described in this section would be subject to future consultations, pursuant to section 7(a)(2) of the Act, as appropriate. We will be better able to determine the effects of specific actions at the time they are proposed.

Effects on Critical Habitat of Parish's Daisy

The management direction provided by the designation of the conservation area will generally reduce the level of threats to the primary constituent elements of critical habitat of Parish's daisy for numerous reasons. For example, the application of a mitigation fee to new ground-disturbing activities will provide at least a minor source of income for projects designed to manage critical habitat. Also, implementation of a one percent limit on new surface disturbance will likely reduce the threat of new disturbance to some degree. Land acquisition in the conservation area will enhance the Bureau's capabilities of managing critical habitat by consolidating land ownership.

The Bureau's proposal to adopt a standard of no surface occupancy to prevent undue and unnecessary degradation of lands, under the surface mining regulations, to protect Parish's daisy is another important element of the conservation strategy. As a result of the adoption of this standard, surface disturbance would be prohibited on 746 acres of critical habitat on public lands that have already been claimed under the provisions of the General Mining Law of 1872. Additionally, the same protections would apply to approximately 194 acres of critical habitat on public lands that have not been claimed under the General Mining Law of 1872. (The areas of claimed and unclaimed land are from Forest Service and Bureau 2004.) Private lands that may be acquired will not be opened to mineral entry. Therefore, these actions will prevent degradation of the primary constituent elements of critical habitat of Parish's daisy as a result of mining activities.

Activities such as hiking, bird watching, equestrian use, and photography would likely have minimal impact on the primary constituent elements of the critical habitat of Parish's daisy for several reasons. First, these activities will not result in the removal of the substrates that are necessary for growth of Parish's daisy. With regard to the second primary constituent element, because the level of use would probably be low, little surface area will likely be disturbed by these activities. Finally, these recreational activities are unlikely to alter, in any substantial manner, the open character of the habitat in which Parish's daisy occurs; consequently, effects to the third primary constituent element of critical habitat are likely to be minor, if any occur at all.

Commercial activities, such as commercial filming, could disrupt the surface of substrates and thereby adversely affect this primary constituent element; the intensity of the impact would depend on the type of the activity. To the best of our knowledge, little, if any filming occurs within this conservation area. Consequently, such activity is unlikely to cause substantial impacts to Parish's daisy.

The one percent threshold for new ground disturbance will apply in this conservation area. Approximately 729 acres of critical habitat of Parish's daisy occur on public lands within the conservation area (Bureau 2005b). Because of the one percent threshold, up to approximately 52 acres of this occupied habitat may be disturbed. Consequently, the remaining 677 acres of critical habitat of Parish's daisy within this area will not be disturbed by project-level activities. We expect that the likelihood is extremely low that all of the 52 acres of disturbance would occur within critical habitat of Parish's daisy. Consequently, more than 677 acres of critical habitat is likely to be conserved. Additionally, this area currently receives little use and few proposals for development; we expect this situation will continue. Note that not all the areas within the boundaries of the critical habitat subunits support the primary constituent elements of critical habitat; consequently, the potential also exists that some disturbances within the boundaries of critical habitat may not affect its conservation role and function.

Approximately 211 acres of critical habitat of Parish's daisy occur outside of the boundaries of the conservation area. Critical habitat outside of the conservation area may be at greater risk of disturbance because it will not be subject to the one percent limit on new disturbance or managed at the same level of protection. The maximum amount of critical habitat of Parish's daisy on Bureau lands that may be lost under the provisions of the West Mojave Plan would be 263 acres (i.e., 52 acres within the conservation area, plus 211 acres of critical habitat outside of the boundaries of the conservation area).

Under the worst case scenario described in the Carbonate Habitat Management Strategy for Parish's daisy, approximately 2,357 acres of the total of 4,420 acres of critical habitat would be set aside; this figure includes the area of critical habitat on both Forest Service and Bureau lands. Consequently, the upper limit of disturbance of critical habitat of Parish's daisy that could occur under the direction of the West Mojave Plan would constitute approximately 8.9 percent of the total area of critical habitat that is the minimum to be set aside under the provisions of the Carbonate Habitat Management Strategy. We note that this analysis is doubly conservative because we used the upper limits of disturbance on public lands and the lowest estimate of critical habitat set aside on a range wide basis to arrive at this percentage. Consequently, under

the worst case scenario, approximately 91 percent of designated critical habitat would not be subject to disturbance. For this reason, we conclude that the general management direction provided by the West Mojave Plan will not compromise the conservation role and function of critical habitat of Parish's daisy.

With the exception of casual use, such as hiking, bird watching, equestrian use, and photography, all of the activities described in this section would be subject to future consultations, pursuant to section 7(a)(2) of the Act, as appropriate. We will be better able to determine the effects of specific actions on the primary constituent elements of critical habitat at the time they are proposed.

Amendment 3, Changes in Multiple-use Class Designations

The Bureau proposes to change the multiple-use class designations from Class M to Class L on 4,393 acres on the north slope of the San Bernardino Mountains within the Carbonate Endemic Plants Area of Critical Environmental Concern.

Effects on Parish's Daisy

This action will benefit Parish's daisy because designation of the areas as Class L limits, to a certain degree, the amount of development activity that may occur. We recognize that all development is not prohibited on Class L lands. Our previous biological opinion on the California Desert Conservation Area Plan evaluated the program direction provided by the Bureau's land use classification; we will not repeat that analysis herein. As we noted previously in this biological opinion, specific future actions that the Bureau proposes under the Class L designation will be subject to the consultation requirements of section 7(a)(2) of the Act, as appropriate.

Effects on Critical Habitat of Parish's Daisy

The change proposed by the Bureau will promote the conservation role and function of critical habitat by including these portions of critical habitat in areas that will be managed under the guidelines of Class L, because, as we have stated previously in this biological opinion, these guidelines provide a greater emphasis on the conservation of natural resources than other land use classes (with the exception of Class C) and the one percent limit on surface disturbance associated with desert wildlife management areas and habitat conservation areas will apply. Specific future actions the Bureau proposes under the Class L designation that may affect critical habitat of Parish's daisy will be subject to the consultation requirements of section 7(a)(2) of the Act, as appropriate.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section

because they require separate consultation pursuant to section 7 of the Act. The County of San Bernardino did not identify any actions that are reasonably certain to occur within the action area (Sansone 2005).

CONCLUSIONS

Parish's Daisy

After reviewing its current status, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to jeopardize the continued existence of Parish's daisy.

We reached this conclusion for two reasons. First, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan will ensure that actions the Bureau takes, funds, and authorizes are not likely to reduce appreciably, either directly or indirectly, the reproduction, numbers, or distribution of Parish's daisy; additionally, we did not detect any cumulative effects that would substantially alter the status of Parish's daisy in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the Parish's daisy and to further its conservation. These measures include, but are not limited to:

- The establishment of an area of critical environmental concern that will be managed in a manner that will promote the survival and recovery of the species within this portion of its range;
- The designation of all lands within the area of critical environmental concern as Class L, which will provide increased protection to Parish's daisy over that currently provided by Class M;
- Removal of livestock grazing from habitat occupied by Parish's daisy;
- Acquisition of private lands, which will result in a higher level of protection of Parish's daisy under the guidance of the California Desert Conservation Area Plan;
- A limit of one percent of new disturbance within the area of critical environmental concern to reduce the loss of Parish's daisy, which will ensure that most individuals will not be exposed to the adverse effects of human activities; and
- The adoption of a no surface occupancy standard within the area of critical environmental concern, which will eliminate the loss of Parish's daisy as a result of mining activities.
- Designation of all routes of travel within the area of critical environmental concern as limited use.

Critical Habitat

After reviewing the current status of critical habitat, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to destroy or adversely modify the critical habitat of Parish's daisy.

We reached this conclusion for two reasons. First, although the condition of critical habitat within some portions of the action area of this consultation has been degraded to a degree because one or more of the primary constituent elements have been disturbed by past human activities, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan are compatible with the function of critical habitat of Parish's daisy; additionally, we did not detect any cumulative effects that would alter the status of critical habitat of Parish's daisy in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the critical habitat of Parish's daisy and to further the proper functioning of the primary constituent elements. These measures include, but are not limited to, the following actions and proposals:

- The establishment of an area of critical environmental concern encompassing most of the critical habitat of Parish's daisy and its management in a manner that will promote the survival and recovery of the species within this portion of its range;
- Removal of livestock grazing from critical habitat;
- The designation of all lands within the area of critical environmental concern as Class L, which will facilitate management of critical habitat of Parish's daisy to a greater degree than that currently provided by Class M;
- Acquisition of private lands, which will result in a higher level of protection for critical habitat under the guidance of the California Desert Conservation Area Plan;
- A limit of one percent of new disturbance within the area of critical environmental concern, which will ensure that most critical habitat in these areas will not be exposed to the adverse effects of human activities; and
- The adoption of a no surface occupancy standard within the area of critical environmental concern, which will eliminate disturbance to or loss of the primary constituent elements of critical habitat of Cushenbury milk-vetch as a result of mining activities.
- Designation of all routes of travel within the area of critical environmental concern as limited use.

BIOLOGICAL OPINION FOR CUSHENBURY MILK-VETCH
AND ITS CRITICAL HABITAT

STATUS OF THE CUSHENBURY MILK-VETCH AND ITS CRITICAL HABITAT

Basic Ecology of Cushenbury Milk-vetch

Cushenbury milk-vetch is a small, silvery-white, annual to sometimes perennial herb in the pea family (Fabaceae). The slender stems are decumbent, grow to 12 inches in length, and support leaves consisting of 5 to 9 small leaflets. The pink-purple flowers, which bloom from March to May, occur in 5- to 14-flowered terminal racemes, have banner petals reaching up to 0.5 inch long, and develop 8- to 11-seeded fruits (pods). The pods are up to 0.14 inch wide, crescent shaped with three sides and two chambers, which become papery in maturity. Unless otherwise noted, the information in this section is from the final rule for designation of critical habitat for the carbonate plants (67 *Federal Register* 78570). (Please see the final rule for additional citations regarding information on Cushenbury milk-vetch.)

Given the flower shape and color, small bees are the most likely pollinators; we do not know if this species is self-compatible (Olson 2003). We also do not have information on seed bank dynamics (Olson 2003).

Cushenbury milk-vetch is not as widely distributed as Parish's daisy. Cushenbury milk-vetch occurs along the 11-mile long region from Dry Canyon east to Terrace Springs; its range then stretches southeast 6 miles to approximately 1 mile east of Granite Spring. It is currently found on approximately 1,201 acres (Forest Service and Bureau 2004).

Status of Cushenbury Milk-vetch

Cushenbury milk-vetch was listed as endangered on August 24, 1994 (59 *Federal Register* 43652). The primary threat to this species is loss and degradation of habitat resulting from limestone mining. Approximately 1,023 acres (85 percent of the known range) occurs on Federal lands on which mining claims have been filed; mining claims have not been filed on 92 acres (8 percent) of Federal land where the species occurs. Approximately 84 acres (7 percent) of land occupied by this species are privately owned (Forest Service and Bureau 2004). Secondary threats include roads, off-highway vehicle activity, and grazing.

At the time of listing, the Service estimated that fewer than 20 occurrences of Cushenbury milk-vetch were known (59 *Federal Register* 43652). As we noted for Parish's daisy, determining the number of occurrences is a somewhat subjective exercise. Because the species is an annual, distribution and abundance will vary annually depending on rainfall (Olsen 2003).

Recovery Plan

Please refer to the Status of the Parish's Daisy and Its Critical Habitat - Recovery Plan section of this biological opinion for information on the recovery planning and the carbonate habitat management strategy.

Status of Critical Habitat of Cushenbury Milk-vetch

Critical habitat for Cushenbury milk-vetch was designated on December 24, 2002 (*67 Federal Register* 78570). Unless otherwise noted, all of the information in this section is from the final rule.

Cushenbury milk-vetch occurs in the same critical habitat unit as Parish's daisy. Consequently, all of the information for the Northeastern Slope Unit discussed for Parish's daisy is relevant to Cushenbury milk-vetch.

We also used the same processes and criteria to determine critical habitat for Cushenbury milk-vetch as we did for Parish's daisy. Only the primary constituent elements are different. The primary constituent elements for Cushenbury milk-vetch consist of, but are not limited to: soils derived primarily from the upper and middle members of the Bird Spring Formation and Undivided Cambrian parent materials that occur on dry flats and slopes or along rocky washes with limestone outwash/ deposits at elevations between 3,864 and 6,604 feet; soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment); and associated plant communities that have areas with an open canopy cover and little accumulation of organic material (e.g., leaf litter) on the surface of the soil.

As we noted in the Status of Critical Habitat of Parish's Daisy section of this biological opinion, we do not know the amount of habitat of the carbonate plant species that existing mining removed. The information discussed at the end of the Status of Critical Habitat of Parish's Daisy section is also relevant for Cushenbury milk-vetch.

ENVIRONMENTAL BASELINE CUSHENBURY MILK-VETCH AND ITS CRITICAL HABITAT

Previous Consultations

To date, we have formally consulted with the Bureau on one occasion regarding Cushenbury milk-vetch. The Bureau, Forest Service, and Service recently completed formal consultation, pursuant to section 7(a)(2) of the Act, regarding the effects of the carbonate habitat management strategy on the five listed species, including Cushenbury milk-vetch (Olsen 2003). The Service issued a biological opinion regarding the carbonate habitat management strategy to the agencies on May 2, 2005 (Service 2005b). We provide more information on the carbonate habitat management strategy in the Status of the Parish's Daisy and Its Critical Habitat - Recovery Plan

section of this biological opinion contains more information on the carbonate habitat management strategy.

Status of Cushenbury Milk-vetch in the Action Area

The Bureau manages approximately 148 acres of Cushenbury milk-vetch habitat. That amount is approximately 13 percent of the total of 1,201 acres of occupied habitat (Forest Service and Bureau 2004). Most of the occurrences within the action area are at lower elevations than those on Forest Service lands. Maintaining plants in a diversity of habitats, such as may occur over a range of elevations, likely captures a greater degree of genetic variation, which is important in conserving a species on the long term.

The primary land use that has affected critical habitat of Cushenbury milk-vetch is commercial limestone mining, which has occurred on approximately 1,590 acres on the north slope of the San Bernardino Mountains. Only 2 percent of the disturbed area within carbonate habitat (32 of the 1,590 acres) is on lands managed by the Bureau (San Bernardino National Forest GIS database, Eliason pers. comm. 2003a). Most of these impacts occurred prior to Federal listing of the carbonate plants and, to our knowledge, commercial limestone mining does not currently occur within carbonate plant habitat on Bureau lands. Within the last few years, the Bureau issued a patent for 320 acres of land within this region (Threloff pers. comm. 2003). Currently, few land uses occur in areas occupied by Cushenbury milk-vetch.

Status of Critical Habitat of Cushenbury Milk-vetch in the Action Area

Approximately 841 acres (19 percent) of critical habitat of Cushenbury milk-vetch occur on public land managed by the Bureau (Forest Service and Bureau 2004). This acreage indicates the size of the polygons of critical habitat, but not the amount of area that contains the primary constituent elements (67 *Federal Register* 78570). Approximately 543 acres of the critical habitat on public lands have been claimed under the provisions of the mining laws (Forest Service and Bureau 2004). We do not have any further information on the condition of critical habitat in the action area; to the best of our knowledge, most of the area of critical habitat has not been disturbed since its designation.

EFFECTS OF THE ACTION ON CUSHENBURY MILK-VETCH AND ITS CRITICAL HABITAT

Effects of the West Mojave Plan on Cushenbury Milk-vetch and its Critical Habitat

The area where Cushenbury milk-vetch may be affected by the Bureau's proposals includes public lands supporting the species or its critical habitat within the Carbonate Endemic Plants Research Natural Area on the northern slope of the San Bernardino Mountains in the area to the east of Highway 18 and north of the boundary of the San Bernardino National Forest. Figure 2-11 on the final environmental impact report and statement depicts the Carbonate Endemic Plants Research Natural Area. This area is appropriate to consider in this biological opinion because it includes all areas where Cushenbury milk-vetch occurs within the California Desert

Conservation Area; additionally, the Bureau designated the Carbonate Endemic Plants Research Natural Area to include the areas where this species may be found and affected by its activities.

Amendment 1, New Areas of Critical Environmental Concern

The Bureau will designate a 5,169-acre area of critical environmental concern for the carbonate plant species.

Effects on Cushenbury Milk-vetch

The actions proposed by the Bureau and activities that would occur under the provisions of the West Mojave Plan would affect Cushenbury milk-vetch in the same manner as we discussed for Parish's daisy. Consequently, with the exception of the following paragraphs, we will not discuss these effects herein.

The Bureau's proposal to adopt a standard of no surface occupancy to prevent undue and unnecessary degradation of lands, under the surface mining regulations, to protect Cushenbury milk-vetch is another important element of the conservation strategy. As a result of the adoption of this standard, surface disturbance would be prohibited on 80 acres occupied by Cushenbury milk-vetch on public lands that have been claimed under the provisions of the General Mining Law of 1872. Additionally, the same protections would apply to approximately 68 acres of occupied habitat on public lands that have not been claimed under the General Mining Law of 1872. (The areas of claimed and unclaimed land are from Forest Service and Bureau 2004.) Private lands that may be acquired will not be opened to mineral entry. Therefore, these actions will prevent loss of individuals of Cushenbury milk-vetch as a result of mining activities.

The one percent threshold for new ground disturbance will apply in this area of critical environmental concern. Approximately 148 acres of occupied habitat for Cushenbury milk-vetch occur within the area of critical environmental concern. Because of the one percent threshold, up to approximately 52 acres of this occupied habitat may be disturbed. Conversely, Cushenbury milk-vetch occurring on the remaining 96 acres of occupied habitat within this area will not be disturbed by project-level activities. We expect that the likelihood is extremely low that all of the 52 acres of disturbance would occur within occupied habitat of Cushenbury milk-vetch. Consequently, more than 96 acres of habitat occupied by Cushenbury milk-vetch is likely to be conserved. Additionally, this area currently receives little use and few proposals for development; we expect this situation will continue. For these reasons, we conclude that the general management direction provided by the West Mojave Plan will not appreciably reduce the reproduction, numbers, or distribution of Cushenbury milk-vetch.

With the exception of casual use, such as hiking, bird watching, equestrian use, and photography, all of the activities described in this section would be subject to future consultations, pursuant to section 7(a)(2) of the Act, as appropriate. We will be better able to determine the effects of specific actions at the time they are proposed.

Effects on Critical Habitat of Cushenbury Milk-vetch

The actions proposed by the Bureau and activities that would occur under the provisions of the West Mojave Plan would affect critical habitat of Cushenbury milk-vetch in the same manner as we discussed for critical habitat of Parish's daisy. Consequently, with the exception of the following paragraphs, we will not discuss these effects herein.

The Bureau's proposal to adopt a standard of no surface occupancy to prevent undue and unnecessary degradation of lands, under the surface mining regulations, to protect Cushenbury milk-vetch is another important element of the conservation strategy. As a result of the adoption of this standard, surface disturbance would be prohibited on 543 acres of the species' critical habitat on public lands that have been claimed under the provisions of the General Mining Law of 1872. Additionally, the same protections would apply to approximately 298 acres of critical habitat of Cushenbury milk-vetch on public lands that have not been claimed under the General Mining Law of 1872. (The areas of claimed and unclaimed land are from Forest Service and Bureau 2004.) Private lands that may be acquired will not be opened to mineral entry. Therefore, these actions will prevent degradation of the primary constituent elements of critical habitat of Cushenbury milk-vetch as a result of mining activities.

The one percent threshold for new ground disturbance will apply in this area of critical environmental concern. Approximately 799 acres of critical habitat of Cushenbury milk-vetch occur within the area of critical environmental concern (Bureau 2005b). Because of the one percent threshold, up to approximately 52 acres of the critical habitat may be disturbed. Conversely, the remaining 747 acres of critical habitat of Cushenbury milk-vetch within this area will not be disturbed by project-level activities.

Critical habitat outside of the area of critical environmental concern will not be subject to the one percent limit on new disturbance or managed at the same level of protection; consequently, it may be at slightly greater risk of disturbance. The maximum amount of critical habitat of Cushenbury milk-vetch on Bureau lands that may be lost under the provisions of the West Mojave Plan would be 96 acres (i.e., 52 acres within the area of critical environmental concern, plus 44 acres of critical habitat outside of the boundaries of the area of critical environmental concern (Bureau 2005b)). Approximately 841 acres of critical habitat of Cushenbury milk-vetch occur on public lands managed by the Bureau. Under the worst case scenario described in the Carbonate Habitat Management Strategy for Cushenbury milk-vetch, approximately 3,302 acres of the total of 4,356 acres of critical habitat would be set aside; this figure includes the area of critical habitat on both Forest Service and Bureau lands. Consequently, the upper limit of disturbance of critical habitat of Cushenbury milk-vetch that could occur under the direction of the West Mojave Plan would constitute approximately 25 percent of the total area of critical habitat that is likely to be set aside under the auspices of the Carbonate Habitat Management Strategy. We note that this analysis is doubly conservative because we used the upper limits of disturbance on public lands and the lowest estimate of critical habitat set aside on a range wide basis to arrive at this percentage. Consequently, under the worst case scenario, approximately 75 percent of designated critical habitat would not be subject to disturbance. For this reason, we

conclude that the general management direction provided by the West Mojave Plan will not compromise the conservation role and function of critical habitat of Cushenbury milk-vetch.

With the exception of casual use, such as hiking, bird watching, equestrian use, and photography, all of the activities the Bureau would undertake, fund, or authorize in these habitat conservation areas will be subject to future consultations, pursuant to section 7(a)(2) of the Act, as appropriate. We will be better able to determine the effects of specific actions on the primary constituent elements of critical habitat at the time they are proposed.

Amendment 3, Changes in Multiple-use Class Designations

The Bureau proposes to change the multiple-use class designations from Class M to Class L on 4,393 acres on the north slope of the San Bernardino Mountains within the Carbonate Endemic Plants Area of Critical Environmental Concern.

Effects on Cushenbury Milk-vetch

This action will benefit Cushenbury milk-vetch because designation of the area as Class L limits, to a certain degree, the amount of development activity that may occur. We recognize that all development is not prohibited on Class L lands. Our previous biological opinion on the California Desert Conservation Area Plan evaluated the program direction provided by the Bureau's land use classification; we will not repeat that analysis herein. As we noted previously in this biological opinion, specific future actions that the Bureau proposes under the Class L designation will be subject to the consultation requirements of section 7(a)(2) of the Act, as appropriate.

Effects on Critical Habitat of Cushenbury Milk-vetch

The change proposed by the Bureau will promote the conservation role and function of critical habitat by including these portions of critical habitat in areas that will be managed under the guidelines of Class L, because, as we have stated previously in this biological opinion, these guidelines provide a greater emphasis on the conservation of natural resources than other land use classes (with the exception of Class C) and the one percent limit on surface disturbance associated with desert wildlife management areas and area of critical environmental concerns will apply. Specific future actions the Bureau proposes under the Class L designation that may affect critical habitat of Cushenbury milk-vetch will be subject to the consultation requirements of section 7(a)(2) of the Act, as appropriate.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section

because they require separate consultation pursuant to section 7 of the Act. The County of San Bernardino did not identify any projects that are reasonably certain to occur within the action area (Sansone 2005).

CONCLUSIONS

Cushenbury Milk-vetch

After reviewing its current status, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to jeopardize the continued existence of Cushenbury milk-vetch.

We reached this conclusion for two reasons. First, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan will ensure that actions the Bureau takes, funds, and authorizes are not likely to reduce appreciably, either directly or indirectly, the reproduction, numbers, or distribution of Cushenbury milk-vetch; additionally, we did not detect any cumulative effects that would substantially alter the status of Cushenbury milk-vetch in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the Parish's daisy and to further its conservation. These measures include, but are not limited to:

- The establishment of an area of critical environmental concern that will be managed in a manner that will promote the survival and recovery of the species within this portion of its range;
- The designation of all lands within the area of critical environmental concern as Class L, which will provide increased protection to Cushenbury milk-vetch over that currently provided by Class M;
- Removal of livestock grazing from habitat occupied by Cushenbury milk-vetch;
- Acquisition of private lands, which will result in a higher level of protection of Cushenbury milk-vetch under the guidance of the California Desert Conservation Area Plan;
- A limit of one percent of new disturbance within the area of critical environmental concern to reduce the loss of Cushenbury milk-vetch, which will ensure that most individuals and their habitat in areas that are essential to their conservation will not be exposed to the adverse effects of human activities; and

- The adoption of a no surface occupancy standard within the area of critical environmental concern, which will eliminate the loss of Cushenbury milk-vetch as a result of mining activities.
- Designation of all routes of travel within the area of critical environmental concern as limited use.

Critical Habitat

After reviewing the current status of critical habitat, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to destroy or adversely modify the critical habitat of Cushenbury milk-vetch.

We reached this conclusion for two reasons. First, although the condition of critical habitat within some portions of the action area of this consultation has been degraded to a degree because one or more of the primary constituent elements have been disturbed by past human activities, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan are compatible with the function of critical habitat of Cushenbury milk-vetch; additionally, we did not detect any cumulative effects that would alter the status of critical habitat of Cushenbury milk-vetch in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the critical habitat of Cushenbury milk-vetch and to further the proper functioning of the primary constituent elements. These measures include, but are not limited to, the following actions and proposals:

- The establishment of an area of critical environmental concern encompassing most of the critical habitat of Cushenbury milk-vetch and its management in a manner that will promote the survival and recovery of the species within this portion of its range;
- Removal of livestock grazing from critical habitat;
- The designation of all lands within the area of critical environmental concern as Class L, which will facilitate management of critical habitat of Cushenbury milk-vetch to a greater degree than that currently provided by Class M;
- Acquisition of private lands, which will result in a higher level of protection for critical habitat under the guidance of the California Desert Conservation Area Plan;
- A limit of one percent of new disturbance within the area of critical environmental concern, which will ensure that most critical habitat in these areas will not be exposed to the adverse effects of human activities; and

- The adoption of a no surface occupancy standard within the area of critical environmental concern, which will eliminate disturbance to or loss of the primary constituent elements of critical habitat of Cushenbury milk-vetch as a result of mining activities.
- Designation of all routes of travel within the area of critical environmental concern as limited use.

BIOLOGICAL OPINION FOR LANE MOUNTAIN MILK-VETCH

STATUS OF LANE MOUNTAIN MILK-VETCH

Basic Ecology of the Lane Mountain Milk-vetch

The Lane Mountain milk-vetch is a perennial plant species in the pea family. It is a slender, diffuse plant, 12 to 27.5 inches tall, with straggling, freely branched stems that arise from a buried root-crown (Barneby 1964). Herbage is light-gray or greenish, strigulose with short, fine, straight hairs. The flowers, 5 to 15 per stalk, are cream to purple, or lighter with veins of a deeper color. Fruits are pencil-shaped, linear, smooth, and pendant, 0.6 to 1 inch long; each fruit bears 4 to 18 seeds.

Plants of this species typically grow under and entangled within the canopy of low shrubs. Few plants have been observed in the open. Most of the host species are intricately branched low shrubs, but a few of the observed hosts are bunch grasses (*Stipa* sp.) and subshrubs such as Mojave aster (*Machaeranthera tortifolia*) and wishbone bush (*Mirabilis bigelovii*); the most common host plants are turpentine bush (*Thamnosma montana*), white bursage (*Ambrosia dumosa*), California buckwheat (*Eriogonum fasciculatum* var. *polifoium*), Cooper goldenbush (*Ericameria cooperi*), and Mormon tea (*Ephedra nevadensis*) (Charis Professional Services Corporation 2002, Prigge et al. 2000). Host plants are usually living, but Lane Mountain milk-vetch also occurs in dead shrubs. Many of the host species are used more frequently by Lane Mountain milk-vetch than what would be expected by chance based on their abundance in the area (Prigge et al. 2000).

The scrub community at Lane Mountain milk-vetch sites is typically a diverse mix of shrub species. Brandt et al. (1997) characterized milk-vetch sites as areas where Nevada Mormon tea (*Ephedra nevadensis*) and Cooper goldenbush (*Ericameria cooperi*) are dominant shrubs and where the shrub density is greater than in surrounding areas. The Lane Mountain milk-vetch occurs at elevations of approximately 3,100 to 4,100 feet (Charis Professional Services Corporation 2002).

Lane Mountain milk-vetch occurs on rocky, low ridges, only a foot or two higher than the main bajada slope, and rocky low hills, 10 to 20 feet high, where bedrock is exposed or probably near the surface (Lee and Ro Consulting Engineers 1986). It appears to be largely confined to granitic substrates and to a lesser extent on dioritic and gabbroic-derived soils (Charis Professional Services Corporation 2002).

Lane Mountain milk-vetch seems to have a short growing period in very dry years (Bagley 1989). The perennial rootstock may allow the Lane Mountain milk-vetch to survive occasional dry years; it may endure longer periods of drought by remaining dormant. It typically blooms in April and May, but will bloom as early as February if conditions are favorable.

Limited observations on its pollinators were carried out in 2003 (Kearns 2003 in Service 2004b). Although 30 species of insects were observed visiting flowers in the area, only 4 visited Lane Mountain milk-vetch flowers. The most frequent pollinator was *Anthidium dammersi*, a solitary bee in the megachilid family (Megachilidae) that occurs in the Mojave and Colorado deserts of California, Nevada, and Arizona (Kearns 2003 in Service 2004b). Additional pollinator observations were made in 2004 and are continuing in 2005 (Hopkins 2004).

With careful observation, seedlings can be distinguished from resprouts of established plants by the presence of small cotyledons and a reduced number of leaflets on the youngest branches. Sharifi et al. (2004) observed that, at least in one year, most seedlings died before becoming large enough to bear flowers. In a greenhouse, Sharifi et al. (2003) and Sharifi in litt. (2003 in Service 2004b) determined that 11 percent of seeds germinated readily without additional treatment (e.g., scarification or cold stratification) and 100 percent of seeds germinated with scarification. After germination, seedlings reached 1 to 2 inches in length in 4 to 6 weeks, indicating that the seedlings may be allocating most of their initial growth into root production.

Rundel et al. (2004) tracked over 200 Lane Mountain milk-vetch individuals at 5 locations between 1999 and 2004 and found that less than 15 percent had survived over the 5-year time period. This research indicates that successful recruitment (addition of individuals to a population by reproduction) is correlated with, among other factors, annual precipitation of at least 5.9 inches. Annual precipitation between 4.7 and 5.9 inches may allow established individuals to persist, annual precipitation between 2.8 in and 4.7 inches may cause some individuals die due to water stress, and annual precipitation of less than 2.8 inches may cause many individuals die due to water stress or remain dormant. The level of annual precipitation needed for recruitment (more than 5.9 inches) had not occurred between 1998 and 2004 and it appears that the numbers of individuals of Lane Mountain milk-vetch have been in decline since that time. If the length of time between years favorable for recruitment is longer than the average lifespan of individuals, then the species will be dependent on the seedbank to re-establish above-ground populations. Therefore, the numbers of individuals of Lane Mountain milk-vetch fluctuate over time, not only from year to year, but from one decade to the next, depending on long-term climatic trends. This aspect of the ecology of the species is important to understand in the context of management decisions regarding the maintenance of habitat of suitable quality to maximize the reproductive potential of the species during climatically favorable years.

Status of Lane Mountain Milk-vetch

Lane Mountain milk-vetch was listed as endangered on October 6, 1998 (63 *Federal Register* 53596). The Lane Mountain milk-vetch was listed because of threats related to habitat destruction from dry wash gold mining, other mining activities (materials lease mining), rock

and mineral collecting, off-highway vehicle activity, and potentially from increasing fire frequency and any associated fire suppression activities.

The Lane Mountain milk-vetch is known only from four occurrences within an area of land that is approximately 18 miles in diameter. The southwestern end of the range lies on the northeastern slopes of the Mud Hills; from the Mud Hills, occurrences extend generally to the northeast, across the lower slopes of Lane Mountain and the northern portion of the Paradise Range, ending in unnamed hills in the southern portion of the Goldstone Deep Space Communications Complex. The NASA Goldstone occurrence is located on lands managed by the National Aeronautics and Space Administration and the Department of the Army within the boundaries of Fort Irwin; it is located to the east of the Superior Valley parcel. The Brinkman Wash-Montana Mine occurrence is located within the boundaries of Fort Irwin to the southwest of the NASA Goldstone occurrence. Most of the Paradise Valley occurrence is located within the boundaries of Fort Irwin to the west and southwest of the Brinkman Wash-Montana Mine occurrence; the remaining portions of the occurrence are located on lands managed by the Bureau. We will discuss the Coolgardie Mesa occurrence, which is located to the southwest of the Paradise Valley occurrence, in the Environmental Baseline section of this biological opinion. Based on the available historical and recent information, the Lane Mountain milk-vetch does not appear to have been more widespread than is currently known; no extirpations of populations have been documented.

From mid-April through early August, 2001, the Army conducted extensive surveys for the Lane Mountain milk-vetch. A full description of the methodologies is provided in Charis Professional Services Corporation (2002). The surveys were focused on areas that had not been surveyed in 1999 because data from the 1999 survey was to be included in the final results. The primary objectives of the survey were to identify new occurrences of the Lane Mountain milk-vetch, determine the boundaries of the occurrences, and collect enough information to estimate population numbers. The surveyors used three types of transects; each transect type involved 4 to 7 surveyors walking approximately 30 feet apart and making one or more passes over an area. The surveyors collected GPS and other data on each plant that was detected; after the first 2 weeks, the surveyors reduced the amount of data that were being collected on each plant because of the large number of individuals being detected.

The boundaries of occurrences were mapped to include every plant that was found. The extent of each occurrence was then mapped using a minimum convex polygon (i.e., the smallest polygon in which no internal angle exceeds 180 degrees). The average density of plants was calculated by dividing the total number of plants observed in the occurrence for the area within the transects. The number of plants in the occurrence was then calculated by multiplying the size of the occurrence by the average density of plants. Because individuals of the Lane Mountain milk-vetch are difficult to observe for a variety of reasons and different surveyors vary in their ability to detect plants, the Army developed an "observability" formula to assist in estimating the total number of plants in each occurrence. The following table provides an estimate of the number of Lane Mountain milk-vetch plants adjusted by the observability factor and the actual number of plants observed during surveys within the occurrences found on land managed by the Department of the Army.

Percentage of Observability	NASA Goldstone	Brinkman Wash-Montana Mine	Paradise Valley ³	All Locations Combined ²
10 percent	1,399	3,109	4,324	14,121
50 percent	2,799	6,219	8,648	28,241
100 percent	13,993	31,094	43,239	141,207
Total Recorded Plants ^{1,2}	555	1,487	1,667	5,723

¹ The total number of plants includes only those detected in the 1999 and 2001 surveys. The total number of plants includes mature plants only; seedlings are excluded from the total.

² The total number of plants is for the entire range; that is, it includes plants found on Bureau and private lands on Coolgardie Mesa even though this occurrence is not included in this table. Information on the number of plants within the Coolgardie Mesa occurrence is contained in the Environmental Baseline section for Lane Mountain milk-vetch.

³ The total number of plants for the Paradise Valley occurrence includes plants found on Bureau and private lands outside the boundaries of Fort Irwin. Because the area of this occurrence on Bureau and private lands is a small fraction of the area of entire occurrence, the number of plants is also likely to be a small portion of the total.

The Army conducted additional surveys in 2003. Nine new plants were found clustered in a relatively small area outside the boundary of the Paradise Valley occurrence (Science Applications International Corporation 2003). Mike Dungan of Science Applications International Corporation, who conducted the 2003 surveys, did not believe that these plants warranted increasing the minimum convex polygon for the occurrence. Three new plants were also found outside the boundary of the Coolgardie Mesa occurrence in 2003; Dr. Dungan believed that these individuals did not justify expanding the map of the distribution of Lane Mountain milk-vetch at Coolgardie Mesa.

The Army speculates that the sizes of the occurrences and numbers of individuals likely represent minimum levels “because the survey year represented a normal rainfall year preceded by (2) years of drought and population boundaries were conservatively drawn” and that the boundaries of the occurrences and numbers of individuals may fluctuate after several successive years of normal or above normal rainfall (Charis Professional Services Corporation 2003). We cannot address the degree of conservatism used to draw the boundaries of the occurrences; however, we expect that the information presented in the biological assessment likely represents a reasonable distribution of the plants. Given the normal patterns of rainfall in the Mojave Desert, we would not expect that short-term differences in rainfall would substantially alter the distribution of the Lane Mountain milk-vetch.

The following table describes the current acreage of the occurrences, based on the Army’s use of minimum convex polygons to define the boundaries, and ownership information.

	NASA Goldstone	Brinkman Wash- Montana Mine	Paradise Valley	All Locations Combined ⁴
Acreage ¹	1,283	5,497	4,794	21,349
Land Management Agencies or Owners	Army, NASA	Army ²	Army, Bureau ³	

¹Total acreage in polygons.

²This occurrence includes a small amount of private and State Lands Commission lands; however, the Army proposes to acquire these areas.

³This occurrence includes a small amount of private lands; these areas are proposed for acquisition by the Army or, if they occur outside the boundaries of Fort Irwin, by either the Army or Bureau.

⁴The total acreage is for the entire range; that is, it includes areas on Bureau and private lands on Coolgardie Mesa even though this occurrence is not included in this table. Information on the acreage for the Coolgardie Mesa occurrence is contained in the Environmental Baseline section for the Lane Mountain milk-vetch.

Note that the Service issued a biological opinion to the Army on March 15, 2004, regarding the proposed use of additional training lands at Fort Irwin. In the biological opinion, we concluded that the proposed action was not likely to jeopardize the continued existence of the Lane Mountain milk-vetch. The Army estimated that approximately 11,387 acres of Lane Mountain milk-vetch habitat occur within Fort Irwin. As a result of the proposed action, approximately 6,789 acres would be placed in conservation areas and a 'no-dig' zone; this amount comprises approximately 58.6 percent of the area within the occurrences. The use of the new training lands would result in the loss of approximately 4,598 acres; this amount comprises approximately 21.5 percent of the known habitat for this species.

Recovery Plan

The Service is currently preparing a recovery plan.

Status of Critical Habitat of Lane Mountain Milk-vetch

We published a proposal to designate critical habitat for the Lane Mountain milk-vetch on April 6, 2004 (69 *Federal Register* 18018). In our final rule, which was published on April 8, 2005, we did not designate any critical habitat, based on the "evaluation of the relationship of essential habitat to sections 3(5)(a), 4(a)(3), and 4(b)(2) of the Act" (70 *Federal Register* 18220).

Consequently, we will not discuss critical habitat in relation to the Lane Mountain milk-vetch again in this biological opinion.

ENVIRONMENTAL BASELINE FOR LANE MOUNTAIN MILK-VETCH

Previous Consultations

Sheep grazing has not occurred within the habitat of this species since 1989 as a result, first, of drought and, secondly, of a consultation between the Service and Bureau on the desert tortoise. That consultation resulted in a grazing program for the western Mojave Desert in which sheep were excluded from most of the area designated as critical habitat for the desert tortoise (Service 1994d). The Lane Mountain milk-vetch occurrences in the action area of this consultation are entirely within critical habitat of the desert tortoise.

On February 27, 2002, the Service issued a biological opinion in which we found that the continued implementation of the California Desert Conservation Area Plan, as amended and modified by interim measures, was not likely to jeopardize the continued existence of the Lane Mountain milk-vetch (Service 2002c). This program level biological opinion evaluated the management direction contained in the California Desert Conservation Area Plan. It did not address any specific future actions, although it acknowledged that casual uses authorized by the California Desert Conservation Area Plan could possibly affect the Lane Mountain milk-vetch and its habitat to a limited degree.

On June 30, 2003, the Service issued a biological opinion for route designation in the western Mojave Desert; we determined that the proposed action was not likely to jeopardize the continued existence of the Lane Mountain milk-vetch (Service 2003a). This biological opinion evaluated the specific route network in existence in the western Mojave Desert. It did not address any specific future actions, although it acknowledged that casual use of designated routes could possibly affect the Lane Mountain milk-vetch and its habitat to a limited degree.

Status of the Lane Mountain Milk-vetch in the Action Area

The Coolgardie Mesa occurrence and a small portion of the Paradise Valley occurrence are located at least partially on public lands. The portion of the Paradise Valley occurrence outside of Fort Irwin is approximately 200 acres. The Coolgardie Mesa occurrence covers approximately 9,775 acres; approximately 718 acres (7.3 percent) of this occurrence are privately owned (Service 2005e). The Department of the Army has acquired several parcels of land in this area as mitigation for the impacts of using additional training lands within Fort Irwin.

The action area supports approximately 9,975 acres of occupied habitat of Lane Mountain milk-vetch and therefore includes almost half of the total area occupied by the species. Given the area of occupied Lane Mountain milk-vetch habitat that will likely be disturbed by future training activities within Fort Irwin, conservation of the occurrences on public lands is essential.

The survey conducted by the Army in 2001 constitutes the best available data on the abundance of the Lane Mountain milk-vetch in the action area. Using the same analysis that was described in the Status of the Lane Mountain Milk-vetch section of this biological opinion, the Army concluded that, at 100, 50, and 10 percent of observability, the occurrence of the Lane Mountain milk-vetch on Coolgardie Mesa supports 5,288, 10,576, and 52,881 plants respectively; 2,014 plants were recorded during the survey.

The final environmental impact report and statement notes that the Coolgardie mining district overlaps the western portion of the proposed Coolgardie Conservation Area. This part of the California Desert Conservation Area is managed for mining activity under multiple-use Class L. Gasoline or hand-powered dry washing or sluicing has been done intermittently in this area since 1900. The heaviest concentration of mining claims lies to the west. Schulte (2005a, b) reports that the 22 mining claims located within the Coolgardie Conservation Area cover approximately 785 acres. Approximately 10,107 acres of public lands lie within this 13,354-acre conservation area (Bureau et al. 2005).

The West Paradise Conservation Area includes 1,243 acres; the Bureau manages approximately 257 acres within this area (Bureau et al. 2005). This area supports a moderate potential for mineral resources (Schulte 2005b); it does not contain any claimed areas (Bureau 2003f).

Members of at least four recreational prospecting and mining clubs frequent the area. The larger clubs may have a membership of 400 families. Most of these individuals are operating under casual use and may continue to do so as long as they reclaim their hand-dug pits and the cumulative disturbance does not cause more than "negligible" disturbance (Bureau et al. 2005).

The Coolgardie Mesa occurrence is crossed by numerous roads. In many areas, vehicles seem to remain primarily on the established routes. In the southernmost portion of the occurrence, off-road vehicles use a few large denuded areas as staging areas and spread out from this area. Mark Hessing (pers. comm. 2004) notes that he has observed off-road vehicles traveling through habitat of the Lane Mountain milk-vetch approximately 0.25 mile to the west of Copper City Road, the main dirt road through this occurrence.

As part of the proposed action for the use of additional training lands at Fort Irwin, the Army committed to providing funds or labor to close and rehabilitate roads in the Coolgardie Mesa and West Paradise Conservation Areas. Closure and rehabilitation of unauthorized routes would be an important element in the conservation of the Lane Mountain milk-vetch. Designation and clear marking of open routes in this area, combined with acquisition of private parcels, would allow law enforcement personnel from the Bureau to protect Lane Mountain milk-vetch habitat more effectively. The physical closure of roads, which the Army has proposed to fund, would also increase the level of protection for the Lane Mountain milk-vetch by reducing access points to its habitat and better enabling the Bureau's rangers to police the route network. In total, the measures proposed by the Army should improve the baseline conditions of the Lane Mountain milk-vetch within the action area.

EFFECTS OF THE WEST MOJAVE PLAN ON LANE MOUNTAIN MILK-VETCH

The area where Lane Mountain milk-vetch may be affected by the Bureau's proposals includes all public lands within the West Paradise and Coolgardie Mesa conservation areas in the region generally located to the north of the city of Barstow and south of Fort Irwin. These conservation areas cover 257 and 10,107 acres, respectively. Figure 2-10 on the final environmental impact report and statement depicts these areas. This area is appropriate to consider in this biological opinion because it includes all areas where Lane Mountain milk-vetch occurs within the California Desert Conservation Area; additionally, the Bureau designated the West Paradise and Coolgardie Mesa conservation areas to include the areas where this species may be found and affected by its activities.

Amendment 1, New Areas of Critical Environmental Concern

The Bureau will designate two areas of critical environmental concern for Lane Mountain milk-vetch. The Coolgardie Mesa Conservation Area will cover 10,107 acres of public land. The West Paradise Conservation Area will cover 257 acres of public land.

The actions proposed by the Bureau and activities that would occur under the provisions of the West Mojave Plan would affect Lane Mountain milk-vetch in the same manner as we discussed for Parish's daisy. Consequently, with the exception of the following paragraphs, we will not discuss these effects herein.

The Bureau's proposal to withdraw the habitat conservation area from mineral entry, subject to valid existing rights, to protect Lane Mountain milk-vetch is an important element of the conservation strategy. As a result of the withdrawal, approximately 9,322 acres of public lands within the Coolgardie Conservation Area that have not been claimed under the General Mining Law of 1872 would be unavailable for any type of exploration or development of minerals. (The acreage of claimed land cited in this discussion is from Schulte 2005b. We arrived at the estimate of 9,322 acres of unclaimed public lands by subtracting the acreage of claimed public lands provided by Schulte [2005b] for the acreage of public lands in the conservation area cited in the environmental impact report and statement. See Table 2-31.) An additional 785 acres of the habitat conservation area (Schulte 2005b) that have already been claimed could be subjected to validity examinations to determine if a claimed area contains economically viable mineral deposits; if the claim does not contain economically viable mineral deposits, the Bureau could deny an application to mine the area and extinguish the claim. The 257 acres of public land within the West Paradise Conservation Area will also be withdrawn from mineral entry. Private lands that may be acquired will not be opened to mineral entry. These actions will likely prevent degradation of the conservation areas by mining clubs and others interested in mineral resources.

The one percent threshold for new ground disturbance will apply in these areas of critical environmental concern. Because of the one percent threshold, up to approximately 2.6 acres of the West Paradise Conservation Area and 101 acres of the Coolgardie Mesa Conservation Area may be disturbed. Conversely, Lane Mountain milk-vetch occurring on the remaining 254 and 10,006 acres of the two conservation areas, respectively, will not be disturbed by project-level

activities. Note also that measure P-26 on page 2-108 of the final environmental impact report and statement states that the Bureau will not issue any permits that involve loss of Lane Mountain milk-vetch plants; this measure should ensure that activities authorized by the Bureau do not result in a direct reduction in the number of individuals of this species. For these reasons, we conclude that the general management direction provided by the West Mojave Plan will not appreciably reduce the reproduction, numbers, or distribution of Lane Mountain milk-vetch.

With the exception of casual use, such as hiking, bird watching, equestrian use, and photography, all of the activities that the Bureau would undertake, fund, or authorize in these conservation areas will be subject to future consultations, pursuant to section 7(a)(2) of the Act, as appropriate. We will be better able to determine the effects of specific actions at the time they are proposed. Given the commitments made by the Bureau through measure P-26 in the final environmental impact report and statement, we anticipate that future actions are unlikely to cause appreciable deterioration of the status of Lane Mountain milk-vetch.

Amendment 3, Changes in Multiple-use Class Designations

The Bureau would change the multiple-use class designations from Class M to L on 10,364 acres within the Coolgardie Mesa and West Paradise conservation areas to benefit Lane Mountain milk-vetch.

This action will benefit Lane Mountain milk-vetch because designation of these areas as Class L limits, to a certain degree, the amount of development activity that may occur. We recognize that all development is not prohibited on Class L lands. Our previous biological opinion on the California Desert Conservation Area Plan evaluated the program direction provided by the Bureau's land use classification; we will not repeat that analysis herein. As we noted previously in this biological opinion, specific future actions that the Bureau proposes under the Class L designation will be subject to the consultation requirements of section 7(a)(2) of the Act, as appropriate.

Amendment 9, Public Land Vehicle Access Network

The Bureau proposes to eliminate an additional 5 miles of routes within the area occupied by Lane Mountain milk-vetch than were proposed in the initial route designation process; approximately 21 miles of routes would remain in habitat of the Lane Mountain milk-vetch in the Coolgardie Mesa area after adoption of the amended California Desert Conservation Area Plan (Pratini pers. comm. 2004). The legal use of designated routes could negatively affect the Lane Mountain milk-vetch if dust generated by the passage of vehicles impairs the rate of photosynthesis or the effectiveness of pollinators. The U.S. Geological Survey evaluated the effects of dust on Lane Mountain milk-vetch and concluded that, at the current level of use, dust generated by vehicle use of unpaved roads on Coolgardie Mesa does not greatly affect Lane Mountain milk-vetch (Wijayratne et al. 2005). To date, the effects of dust on pollinators of Lane Mountain milk-vetch have not been studied; we anticipate that, at the current level of use, these effects will be minor because Lane Mountain milk-vetch plants reproduce in close proximity to the routes of travel.

The presence of designated routes of travel through or near the habitat of Lane Mountain milk-vetch facilitates illegal vehicle use off of designated routes. Although the section 7(a)(2) process is not intended to review illegal activities, unauthorized off-road use occurs at least partially as a result of authorized activities and access. The terrain where the Lane Mountain milk-vetch occurs is accessible and can be traversed by both motorcycles and four-wheeled vehicles. In the past, we have observed tracks made by motorcycles within and adjacent to habitat of the Lane Mountain milk-vetch, both on Coolgardie Mesa and on former public lands west of the Paradise Range. More recently, we have observed high levels of vehicular use off of designated routes in the southwestern portion of Lane Mountain milk-vetch habitat on Coolgardie Mesa. The Environmental Baseline section of this section of the biological opinion provides more information on this unauthorized activity.

The reduction in the amount of routes proposed by the Bureau may, in and of itself, diminish the effects of unauthorized use of vehicles in Lane Mountain milk-vetch habitat, primarily because the unauthorized users seem to establish base camps near designated routes; most damage to habitat occurs relatively near these staging areas. The reduction in designated routes would likely render at least some portions of Lane Mountain milk-vetch habitat more distant from staging areas and therefore less likely to be damaged by off-road use. Note that the administrative designation of a route as closed may be ineffective until the Bureau can eliminate the road on the ground; funding that the Army has committed to provide to mitigate for the effects of the expansion of Fort Irwin should enable the Bureau to implement numerous route closure projects.

Amendment 10, Stopping and Parking of Motorized Vehicles and Vehicular Camping

Under the proposed amendment to the California Desert Conservation Area Plan, the distance from the centerline of a route that motorized vehicles will be allowed to stop, park, and camp will be reduced from 300 to 50 feet. Such off-road travel can crush individuals of the Lane Mountain milk-vetch and its host plants, degrade habitat (particularly by removing the thin granitic substrates where Lane Mountain milk-vetch plants grow), and cause the spread of non-native plant species. Neither we nor the Bureau can provide any quantitative information on how frequently desert users leave routes of travel for these distances to camp, stop, and park outside of existing disturbed areas. In at least some areas that are occupied by the Lane Mountain milk-vetch, the density of vegetation would likely prevent most desert users from leaving designated routes of travel. We acknowledge that the proposed action would decrease the distance that vehicles are allowed to travel away from roads; as such, the proposed action will reduce the potential that off-road vehicle use will damage Lane Mountain milk-vetch and its habitat when compared with the current situation. We also acknowledge that, in our experience with areas that are occupied by this species, we have not seen any evidence that people are using areas away from designated routes for stopping, parking, and camping. The staging areas for unauthorized off-road vehicle use at the southern end of the Coolgardie Mesa occurrence may be considered an exception to this statement. These staging areas are heavily disturbed and devoid of most vegetation; the Bureau does not anticipate that the stopping, parking, and camping proposed by this amendment would cause this amount of degradation.

CUMULATIVE EFFECTS

Cumulative effects include the effects of future State, tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act. The County of San Bernardino did not identify any actions that are reasonably certain to occur within the action area for Lane Mountain milk-vetch (Sansonetti 2004).

CONCLUSION

After reviewing its current status, the environmental baseline for the action area, the effects of the proposed action, and the cumulative effects, it is the Service's biological opinion that the amendment of the California Desert Conservation Area Plan, as proposed by the Bureau through the West Mojave Plan, is not likely to jeopardize the continued existence of Lane Mountain milk-vetch.

We reached this conclusion for two reasons. First, the general guidance provided by the California Desert Conservation Area Plan and the specific actions contained in the West Mojave Plan will ensure that actions the Bureau takes, funds, and authorizes are not likely to reduce appreciably, either directly or indirectly, the reproduction, numbers, or distribution of Lane Mountain milk-vetch; additionally, we did not detect any cumulative effects that would substantially alter the status of Lane Mountain milk-vetch in the action area. Second, the Bureau has proposed and, in some cases, already implemented, measures to avoid or reduce adverse effects to the Lane Mountain milk-vetch and to further its conservation. These measures include, but are not limited to:

- The establishment of areas of critical environmental concern that will be managed in a manner that will promote the survival and recovery of the species within this portion of its range;
- The designation of all lands within the area of critical environmental concern as Class L, which will provide increased protection to Lane Mountain milk-vetch over that currently provided by Class M;
- Removal of livestock grazing from habitat occupied by Lane Mountain milk-vetch;
- Acquisition of private lands, which will result in a higher level of protection of Lane Mountain milk-vetch under the guidance of the California Desert Conservation Area Plan;
- A limit of one percent of new disturbance within the area of critical environmental concern to reduce the loss of Lane Mountain milk-vetch, which will ensure that most individuals and their habitat in areas that are essential to their conservation will not be exposed to the adverse effects of human activities; and

- The withdrawal of the area of critical environmental concern from mineral location and entry, which has the potential to reduce, to some degree the number of individuals of Lane Mountain milk-vetch that may be destroyed or disturbed during casual use and under future plans of operation.
- The provision that no activities will be authorized that involve loss of individual Lane Mountain milk-vetch plants.

INCIDENTAL TAKE STATEMENT

Desert Tortoise

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harm is further defined by the Service to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. Harass is defined by the Service as intentional or negligent actions that create the likelihood of injury to listed species by annoying it to such an extent as to significantly disrupt normal behavioral patterns which include, but are not limited to, breeding, feeding or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act provided that such taking is in compliance with the terms and conditions of this incidental take statement and occurs as a result of the action as proposed by the Bureau.

The measures described below are non-discretionary and must be undertaken by the Bureau or made binding conditions of any authorization provided to permittees. The Bureau has a continuing duty to regulate the activities covered by this incidental take statement. If the Bureau fails to assume and implement the terms and conditions of the incidental take statement or to make them enforceable terms of permit or grant documents, the protective coverage of section 7(o)(2) may lapse. To monitor the impact of incidental take, the Bureau must report the progress of its action and their impact on the species to the Service as specified in the incidental take statement (50 *Code of Federal Regulations* 402.14(i)(3)).

The California Desert Conservation Area Plan and West Mojave Plan describe numerous programs under which the Bureau will need to make specific decisions with regard to future actions. Although we have evaluated the general nature of the effects of these actions, both negative and positive, on listed species, we cannot fully assess the potential effects of specific future actions under these programs because information on the location, timing, nature, and other aspects of the actions is not available at this time. Consequently, we cannot provide an exemption from the prohibitions against take, as described in section 9 of the Act, for the incidental take that may result from these future actions that require separate review and authorization by the Bureau. We will review the effects of those actions and, through the section

7(a)(2) consultation process, issue incidental take statements in the future, if appropriate, when the Bureau requests formal consultation on specific discretionary actions.

Given this limitation, this biological opinion provides an exemption from the prohibitions against take only for the incidental take of desert tortoises that is likely to result from actions that are inherently authorized by the approval of the California Desert Conservation Area Plan or its amendments, such as the West Mojave Plan, or from actions for which the record of decision for this bioregional plan constitutes the Bureau's final authorization. These activities include casual use and ongoing grazing within the planning area for the western Mojave Desert.

We cannot quantify the precise numbers of desert tortoises that may be killed or injured as a result of the actions that the Bureau authorizes through approval of the California Desert Conservation Area Plan, as amended by the West Mojave Plan, because of the large size of the action area, the patchy distribution of desert tortoises within the western Mojave Desert, and the unpredictability of when these activities are likely to cause injury or mortality to desert tortoises. Additionally, finding carcasses and assigning a cause of death is problematic over such large areas and in the presence of numerous scavengers that are likely to find dead desert tortoises soon after they die. However, we anticipate that the activities authorized by the Bureau as a direct result of the signing of the record of decision for the West Mojave Plan will result in the incidental take of relatively few desert tortoises.

Casual Use

Incidental take of desert tortoises is likely to occur through casual use (such as walking, equestrian use, or mining conducted at this level, wherever such activities are authorized within the approximately 3,263,874 acres of land managed by the Bureau within the planning area.

Incidental take of desert tortoises is also likely to occur through casual use, in the form of operating vehicles, within the boundaries established for the West Mojave Plan, in the following areas in an authorized manner:

1. along approximately 5,433.4 miles of routes designated as open or limited (see LaPre 2005e for mileage of open routes within habitat of the desert tortoise);
2. along 30.6 miles of routes designated as limited (see LaPre 2005h for mileage of limited routes within habitat of the desert tortoise);
3. within desert wildlife management areas, when camping in previously disturbed areas adjacent to motorized vehicle routes designated as open;
4. within desert wildlife management areas, within 50 feet of the centerline of open routes when stopping and parking; and
5. outside of desert wildlife management areas, within 300 feet of the centerline of open routes when stopping, parking, and camping.

We also consider this exemption to apply to causal use activities that may occur on any lands that the Bureau may acquire, provided that the activities causing the take are in compliance with the Bureau's management direction provided by the California Desert Conservation Area Plan, as amended, and analyzed herein. Note that this exemption may not apply to any desert tortoises that may reside on public lands that are transferred from the management of the Bureau. In such instances, the Service would have to determine whether the exemption would remain in place on a case-by-case basis; the factors we would consider in such cases would include, but not be limited to, any changes in the nature and intensity of use that would result from the transfer.

Livestock Grazing

Incidental take of desert tortoises is likely to occur during activities associated with livestock grazing (but not including new range developments or harm, as defined in the first paragraph of this section) on public lands and intermingled non-federal lands within the boundaries of the following allotments. This incidental take statement exempts incidental take resulting from livestock grazing only on the lands specified in the following table.

Allotment	Acreage of Desert Tortoise Habitat Where Incidental Take Exemption Applies ¹
Bissell	2,360 ⁴
Boron	10,868 ⁴
Cantil Common (North)	203,567 ²
Cantil Common (South)	13,000 ^{2,4}
Hansen Common	3,709
Johnson Valley	118,297
Lava Mountain	20,902
Monolith-Cantil	12,938 ²
Ord Mountain	154,547
Rattlesnake Canyon	12,805
Rudnick Common	79,000
Shadow Mountain	16,936 ^{2,4}
Spangler Hills	69,141
Stoddard Mountain (East)	86,099 ²
Stoddard Mountain (Middle)	5,787 ^{2,4}
Tunawee Common	1,800
Walker Pass Common	32,058
Total	843,814

¹ Unless otherwise stated, acreages are from the sources cited in the Effects of the Proposed Grazing Program on the Desert Tortoise and its Critical Habitat section of this biological opinion. As we noted previously in this biological opinion, some acreage figures for the same area may vary because of differences of data in GIS coverage.

² See attached map. Acreages are from Service (2006).

³ Total does not include lands managed by the California Department of Fish and Game.

⁴ Incidental take exemption applies only to public lands.

Relationship to Incidental Take Statements in Previous Biological Opinions

Through memoranda dated May 17, 1999, and August 3, 2000, the Service (1999b, 2000) extended the incidental take statements that were contained in previous biological opinions for sheep and cattle grazing in the California Desert Conservation Area until such time as the bioregional plans were completed. With the issuance of this biological opinion, this incidental take statement replaces those contained in previous biological opinions regarding livestock grazing for the western Mojave Desert.

This incidental take statement also replaces the incidental take statements contained in the biological opinions for route designation in the western Mojave Desert (Service 2003b) planning area and for management of the planning area described in the Rand Mountains – Fremont Valley Management Plan (Service 1993a). This biological opinion also supercedes the previous biological opinions for the Western Mojave Land Tenure Adjustment Project (Service 1990 and 1998; we re-iterate that, as stated in the later biological opinion, the incidental take statement contained in the 1990 biological opinion is no longer valid.

Effects of the Incidental Take on the Desert Tortoise

All of the activities for which we exempted incidental take have some potential for killing or injuring desert tortoises. Activities such as casual use involving walking, equestrian use, and mining will likely kill or injure very few desert tortoises because these activities are generally low in intensity and scattered over large areas; additionally, because these activities generally involve low speeds, desert tortoises can be seen and avoided.

Stopping and parking within 50 feet of open or limited routes will likely kill few desert tortoises because of the limited area in which this activity will occur, relative to the size of the desert wildlife management areas and considering that terrain and vegetation prohibit this activity in many areas. Camping in disturbed areas will likely kill very few desert tortoises because they are less likely to be in these areas and would be more easily observed in areas that have reduced levels of vegetation.

We anticipate that cattle grazing will directly kill or injure few desert tortoises because livestock attempt to avoid stepping on larger animals; also, this use is dispersed to a large degree, in relation to the distribution of desert tortoises. We acknowledge smaller desert tortoises are at greater risk. Although sheep have the potential to kill more desert tortoises, relatively, than cattle, few desert tortoises are likely to be killed because the vast majority of sheep grazing will occur in areas where they persist in lower numbers. The exemption with regard to livestock grazing does not extend to specific range improvements because the Bureau will need to authorize those on a case-by-case basis or to mortality that may be caused by degradation of habitat; in the latter case, we expect that the Bureau's monitoring and management of livestock use will preclude significant habitat modification or degradation that could result in death or

injury to desert tortoises by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering. The Bureau's grazing prescriptions and standards and guidelines are specifically designed to maintain or improve the condition of habitat; therefore, any degradation of habitat that would likely lead to mortality in desert tortoises would be outside the bounds of the proposed action.

Other forms of activities, such as casual use involving vehicles on routes designated as open or limited, and stopping, parking, and camping within 300 feet of such routes, pose the greatest risk to desert tortoises and are likely to kill or injure more animals because these activities can be conducted at greater speeds and involve large areas of the desert. In spite of these facts, we anticipate that relatively few desert tortoises will be killed or injured for several reasons. Many users of the desert will attempt to avoid killing animals with their vehicles. A large portion of the use will occur when desert tortoises are less active; we acknowledge that the periods of heaviest use – the spring and fall – are also when desert tortoises are most likely to be moving longer distances, which puts them at greater risk.

Many of the actions for which we have exempted incidental take are likely to occur in disturbed areas (e.g., camping off roads) or will not, by their nature, cause removal of habitat (e.g., hiking) to the extent that it would result in harm to desert tortoises. We anticipate that grazing and casual use are likely to result in relatively few mortalities of or injuries to desert tortoises.

In conclusion, despite the numerous actions that will occur and have the potential to kill or injure desert tortoises, we anticipate that relatively few desert tortoises will be killed or injured by these activities.

Parish's Daisy, Cushenbury Milk-vetch, and Lane Mountain Milk-vetch

Section 9 of the Act does not address the incidental take of listed plant species. Because the Act does not address the take of listed plant species, this biological opinion does not contain an incidental take statement, reasonable and prudent measures, or terms and conditions for these species.

The Bureau should be aware that the Act prohibits the removal of endangered plants from Federal lands and their reduction to possession, the malicious damaging, or destruction on such lands; by regulation, the Service extended this prohibition to threatened species. Section 9(a)(2)(B) prohibits any person from removing, cutting, digging up, or damaging or destroying individuals of an endangered listed plant species in knowing violation of any law or regulation of any State or in the course of any violation of a State criminal trespass law.

REASONABLE AND PRUDENT MEASURE

The Service believes the following reasonable and prudent measure is necessary and appropriate to minimize take of the desert tortoise during activities that may result in incidental take that are

directly authorized by adoption of the amendment to the California Desert Conservation Area Plan for the Western Mojave Recovery Unit:

The Bureau must ensure that the level of incidental take anticipated in this biological opinion is commensurate with the analysis contained herein.

The Service's evaluation of the effects of the proposed action includes consideration of the measures developed by the Bureau and repeated in the Description of the Proposed Action portion of this biological opinion to reduce the adverse effects of grazing and casual use on the desert tortoise. Any subsequent changes in the minimization measures proposed by the Bureau or in the conditions under which cattle grazing currently occurs may constitute a modification of the proposed action and may warrant re-initiation of formal consultation, as specified at 50 *Code of Federal Regulations* 402.16. This reasonable and prudent measure is intended to supplement the protective measures that were proposed by the Bureau as part of the proposed action.

TERMS AND CONDITIONS

To be exempt from the prohibitions of section 9 of the Act, the Bureau must comply with the following term and condition, which implements the reasonable and prudent measure described in the previous section; the Bureau must also comply with the reporting requirements described in the following two sections. This term and condition is non-discretionary.

The following term and condition implements the reasonable and prudent measure:

- a. To ensure that the measures proposed by the Bureau are effective and are being properly implemented, the Bureau must contact the Service immediately if it becomes aware that a desert tortoise has been killed or injured by human activities associated with casual use. At that time, the Service and the Bureau must review the circumstances surrounding the incident to determine whether additional protective measures are required. Grazing and casual use may continue pending the outcome of the review, provided that the protective measures contained in the Bureau's proposed action have been and continue to be fully implemented. If, after completion of the review, the Service and Bureau agree that additional protective measures are required, the Bureau must implement the additional measures.
- b. If more than three desert tortoises are found dead or injured in any 12-month period as a result of any specific activity or circumstance, the Bureau must contact the Service to determine whether formal consultation should be re-initiated on that aspect of the West Mojave Plan. This threshold is intended to determine whether certain activities or circumstances (e.g., desert tortoises being trapped in cattle guards or killed along one portion of a road) may be affecting desert tortoises more substantially than we anticipated. The threshold would not be used in situations that we would reasonably expect to occur and that have been considered by the Bureau and Service during this consultation (e.g., desert tortoises being consumed by common ravens.)

REPORTING REQUIREMENTS

By January 31 of each year this biological opinion is in effect, the Bureau must provide a report to the Service that provides details on each desert tortoise that is found dead or injured. The report must include information on the location of each mortality, the circumstances of the incident, and any actions undertaken to prevent similar instances from occurring in the future.

We request that the annual report also describe activities that the Bureau implemented (e.g., the amount of road maintained, habitat restored, etc.) to recover the desert tortoise in the previous year. We also request that your annual report include information on any activities that the Bureau undertakes that may have adversely affected or benefited the listed plant species under consideration in this biological opinion.

DISPOSITION OF DEAD OR INJURED DESERT TORTOISES

Within 3 days of locating a desert tortoise that may have been killed or injured as a result of causal use, you must notify the Service's Division of Law Enforcement (370 Amapola Avenue, Suite 114, Torrance, California 90501) and the Ventura Fish and Wildlife Office by telephone (805 644-1766) and by facsimile (805 644-3958). The report must include the date, time, and location of the carcass, a photograph, cause of death, if known, and any other pertinent information.

Injured desert tortoises must be taken to a qualified veterinarian for treatment. If any injured desert tortoises survive, the Service must be contacted regarding their final disposition.

Care must be taken in handling dead specimens to preserve biological material in the best possible state for later analysis. The remains of desert tortoises must be placed with the U.S. Geological Survey (Contact: Kristin Berry, U.S. Geological Survey, 22835 Calle San Juan De Los Lagos, Moreno Valley, California 92553, (951-697-5361); if the U.S. Geological Survey does not want the carcass because the damage is too extensive, the carcass must be disposed of in an appropriate manner. We recommend that the Bureau maintain a standing arrangement with the U.S. Geological Survey regarding proper disposition of carcasses and ensure that its field offices are well aware this and other procedures regarding the disposition of dead or injured desert tortoises.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the Act directs Federal agencies to use their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information. We offer the following conservation recommendations for your consideration:

Casual Use. The Bureau should provide information on the desert tortoise, its status, the protection it receives under the Endangered Species Act, and the actions that can be taken to avoid killing or injuring desert tortoises when working or recreating in the desert to anyone requesting information on casual use associated with recreation and mining or on other programs that it administers. This information may be in the form of literature prepared specifically for this purpose or other general educational materials related to the desert tortoise's status as a threatened species.

Law Enforcement Rangers and Maintenance Personnel. The Bureau notes, in the final environmental impact report and statement, that two law enforcement rangers and two maintenance personnel would be assigned to the habitat conservation areas to ensure their proper management. An increase in the presence of Bureau employees in desert wildlife management areas may greatly enhance the likelihood that the conservation strategies being proposed in the West Mojave Plan can be successfully implemented. In the absence of Bureau staff in the field, we sense that the public will not view the habitat conservation areas any differently than it does currently. We recognize the difficulties that agencies experience with guaranteeing staffing and funding and the particular issues associated with keeping rangers in the desert year-round; however, the Bureau's on-the-ground presence is probably the most essential element in implementing the conservation strategies in a successful manner. Consequently, we encourage the Bureau to investigate every avenue to ensure that a sufficient number of law enforcement rangers and maintenance personnel are assigned to the desert wildlife management areas to ensure compliance with the provisions of the West Mojave Plan; we also encourage the Bureau to assign these personnel in a manner that ensures an in-the-field presence on a year-round basis, with particular emphasis during periods of heavy public use.

Commercial Activities. We recommend that the Bureau provide higher priority to the conservation of listed and other sensitive species than to commercial activities, such as filming. That is, we recommend that conflicts between listed or sensitive species and commercial activities that can be conducted in areas without such resources be resolved in favor of the biological resources.

Abandoned Adits and Mines. The Bureau should inspect any abandoned mine or adit it discovers to determine whether desert tortoises could be trapped. Any such mines or adits should be filled or fenced to preclude entry by desert tortoises.

Indirect Effects of Mining and Other Human Activities. We encourage the Bureau to support research and work with others to determine if dust from mines, agricultural fields, the edges of roads, and disturbed playas is affecting the health status of desert tortoises.

Research Related to Grazing. The Bureau proposed to conduct a study of the nutritional ecology of the desert tortoise in relation to livestock grazing. We recommend that the design of any such study be developed in coordination with the Service and the U.S. Geological Survey to ensure that it addresses the most relevant issues in the most effective manner. We also strongly recommend that the Bureau assess the current condition of allotments from which grazing has

recently been removed and monitor the changes in habitat conditions in those allotments over time.

Johnson to Parker Race Events. We recommend that the Bureau coordinate with us early in the planning process if an application for this event is proposed. The Bureau should limit the event to times of the year when desert tortoises are less likely to travel widely; it should also ensure the riders remain on designated roads, particularly within the Pisgah Conservation Area to protect desert tortoises and the white-margined beardtongue (*Penstemon albomarginatus*), which is a sensitive plant species found in that area of the California desert.

Extended Fee Program. We recommend that the Bureau adopt a fee program for recreational use of public lands in the California Desert Conservation Area. To the best of our knowledge, users pay some form of fee to use most other recreational lands in southern California. Mandatory fees on adjacent lands likely assist in funding the management of those lands and possibly assist in directing recreational use to lands managed by the Bureau. We suggest that, as an initial strategy, the Bureau establish mandatory fees for organized events and a voluntary system for casual users.

Shooting. We recommend that the Bureau prohibit target shooting in all conservation areas, including the desert wildlife management areas. Although the number of desert tortoises that are likely to be shot accidentally or intentionally is likely a small proportion of the population, preventing the loss of even a small number of individuals in a declining population may be important for the overall recovery of the species.

Please notify us if you implement any conservation recommendations so we may be kept informed of actions that minimize or avoid adverse effects to listed species or their habitats and promote their recovery.

REINITIATION NOTICE

This concludes formal consultation on the proposed amendment of the western Mojave Desert portion of the California Desert Conservation Area Plan. Reinitiation of formal consultation is required where discretionary federal involvement or control over the action has been retained or is authorized by law and: (a) if the amount or extent of taking specified in the incidental take statement is exceeded; (b) if new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered; (c) if the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or (d) if a new species is listed or critical habitat designated that may be affected by the identified action.

If you have any questions regarding this biological opinion, please contact Ray Bransfield of my staff at (805) 644-1766, extension 317.

- U.S. Bureau of Land Management. 2005a. Revisions to term and condition number 1 of biological opinion on the effects of the California Desert Conservation Area Plan on the desert tortoise. (1-8-01-F-16) (CA610 1510 (P)). Memorandum to Office Supervisor, Ventura Fish and Wildlife Office, U.S. Fish and Wildlife Service, Ventura, California. Dated March 17. From District Manager, California Desert District. Moreno Valley, California.
- U.S. Bureau of Land Management. 2005b. GIS calculation of areas of critical habitat of Parish's daisy and Cushenbury milk-vetch managed by the Bureau within the Carbonate area of critical environmental concern. Desert District, Bureau of Land Management. Moreno Valley, California.
- U.S. Bureau of Land Management. 2005c. Review of draft biological opinion on the West Mojave Plan. Memorandum to Field Supervisor, Ventura Fish and Wildlife Office, U.S. Fish and Wildlife Service, Ventura, California. Dated November 4. From District Manager, California Desert District. Moreno Valley, California.
- U.S. Bureau of Land Management, County of San Bernardino, and City of Barstow. 2003. Draft environmental impact report and statement for the West Mojave Plan; a habitat conservation plan and California Desert Conservation Area Plan amendment. Moreno Valley, San Bernardino, and Barstow, California.

- U.S. Bureau of Land Management, County of San Bernardino, and City of Barstow. 2005. Final environmental impact report and statement for the West Mojave Plan; a habitat conservation plan and California Desert Conservation Area Plan amendment. Moreno Valley, San Bernardino, and Barstow, California.
- U.S. Department of the Army. 2004. Letter to U.S. Fish and Wildlife Service, Ventura Fish and Wildlife Office providing an addendum to the biological assessment. Dated February 25. From Colonel Edward L. Flinn, Deputy Commander and Chief of Staff, National Training Center. Fort Irwin, California.
- U.S. Fish and Wildlife Service. 1990. Biological opinion for Western Land Tenure Adjustment Project (2000 (DoD) (CA-931.1)) (1-6-90-F-10). Dated September 4. Memorandum from Office Supervisor, Southern California Field Station to State Director, Bureau of Land Management, Sacramento, California. Ventura, California.
- U.S. Fish and Wildlife Service. 1992a. Biological opinion for the proposed desert tortoise habitat management plan for the Naval Air Weapons Station, China Lake, California (5090 Ser 008/C0808/1309) (1-6-92-F-60). Dated December 3. From Acting Field Supervisor, Ventura Field Office to Thomas Mc Gill, U.S. Navy, China Lake, California. Ventura, California.
- U.S. Fish and Wildlife Service. 1992b. Biological opinion for cattle grazing along the eastern slopes of the Sierra Nevada Range of California (CA-063.50, 1-6-92-F-55). From Acting Field Supervisor, Southern California Field Station to State Director, Bureau of Land Management. Carlsbad, California.
- U.S. Fish and Wildlife Service. 1992c. Biological opinion for the Rand Mountains - Fremont Valley Management Plan (1-6-90-F-54). Dated February 18. From Field Supervisor, Southern California Field Station to State Director, Bureau of Land Management. Carlsbad, California.
- U.S. Fish and Wildlife Service. 1993a. Biological opinion for the Rand Mountains - Fremont Valley Management Plan (1-6-90-F-54R). Dated March 10. From Field Supervisor, Ventura Field Office to State Director, Bureau of Land Management. Ventura, California.
- U.S. Fish and Wildlife Service. 1993b. Biological opinion for cattle grazing on 24 allotments in the Mojave Desert, Riverside and San Bernardino Counties, California (1-6-92-F-19). Dated July 13. From Field Supervisor, Ventura Field Office to State Director, Bureau of Land Management. Ventura, California.

- U.S. Fish and Wildlife Service. 1994a. Biological opinion for the Bureau of Land Management's interim livestock grazing program in Mojave Desert tortoise critical habitat (1-5-94-F-107). Dated April 20. Memorandum from Regional Director, Region 1 to State Director, Bureau of Land Management, Sacramento, California. Portland, Oregon
- U.S. Fish and Wildlife Service. 1994b. Biological opinion for cattle grazing on 25 allotments in the Mojave Desert, Riverside and San Bernardino Counties, California (1-8-94-F-17). Memorandum from Field Supervisor, Ventura Field Office to State Director, Bureau of Land Management, Sacramento, California. Dated March 14. Ventura, California.
- U.S. Fish and Wildlife Service. 1994c. Desert tortoise (Mojave population) recovery plan. Portland, Oregon.
- U.S. Fish and Wildlife Service. 1994d. Biological opinion for ephemeral sheep grazing in the California Desert District (6840 CA-932.5) (1-8-94-F-16). Memorandum from Field Supervisor, Ventura Field Office to State Director, Bureau of Land Management, Sacramento, California. Dated March 15. Ventura, California.
- U.S. Fish and Wildlife Service. 1995. Reinitiation of formal consultation for the desert tortoise habitat management plan for the Naval Air Weapons Station, China Lake, California (5090 Ser 823EOOD C8305) (1-8-95-F-30R). Dated June 27. From Field Supervisor, Ventura Field Office to Carolyn Shepherd, U.S. Navy, China Lake, California. Ventura, California.
- U.S. Fish and Wildlife Service. 1998. Biological Opinion for Western Mojave Land Tenure Adjustment Project (6844440 (CA-063.50)) (1-8-98-F-60R). Dated September 10. From Field Supervisor, Ventura Fish and Wildlife Office to District Manager, California Desert District, Bureau of Land Management, Riverside, California, Ventura, California.
- U.S. Fish and Wildlife Service. 1999a. Biological opinion for a proposed limestone quarry mine on R. Hutcheson's Limeade and Lost Springs Claim, San Bernardino County, California [3809(P) CACA 20339-40 & 20337-38 (CA-680.33)] (1-8-99-F-77). Memorandum to District Manager, Bureau of Land Management, Riverside, California. Dated September 30. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 1999b. Livestock grazing activities in the California desert involving the desert tortoise (6840(P) (CA-610)). Memorandum to District Manager, Bureau of Land Management, Riverside, California. Dated May 17. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.

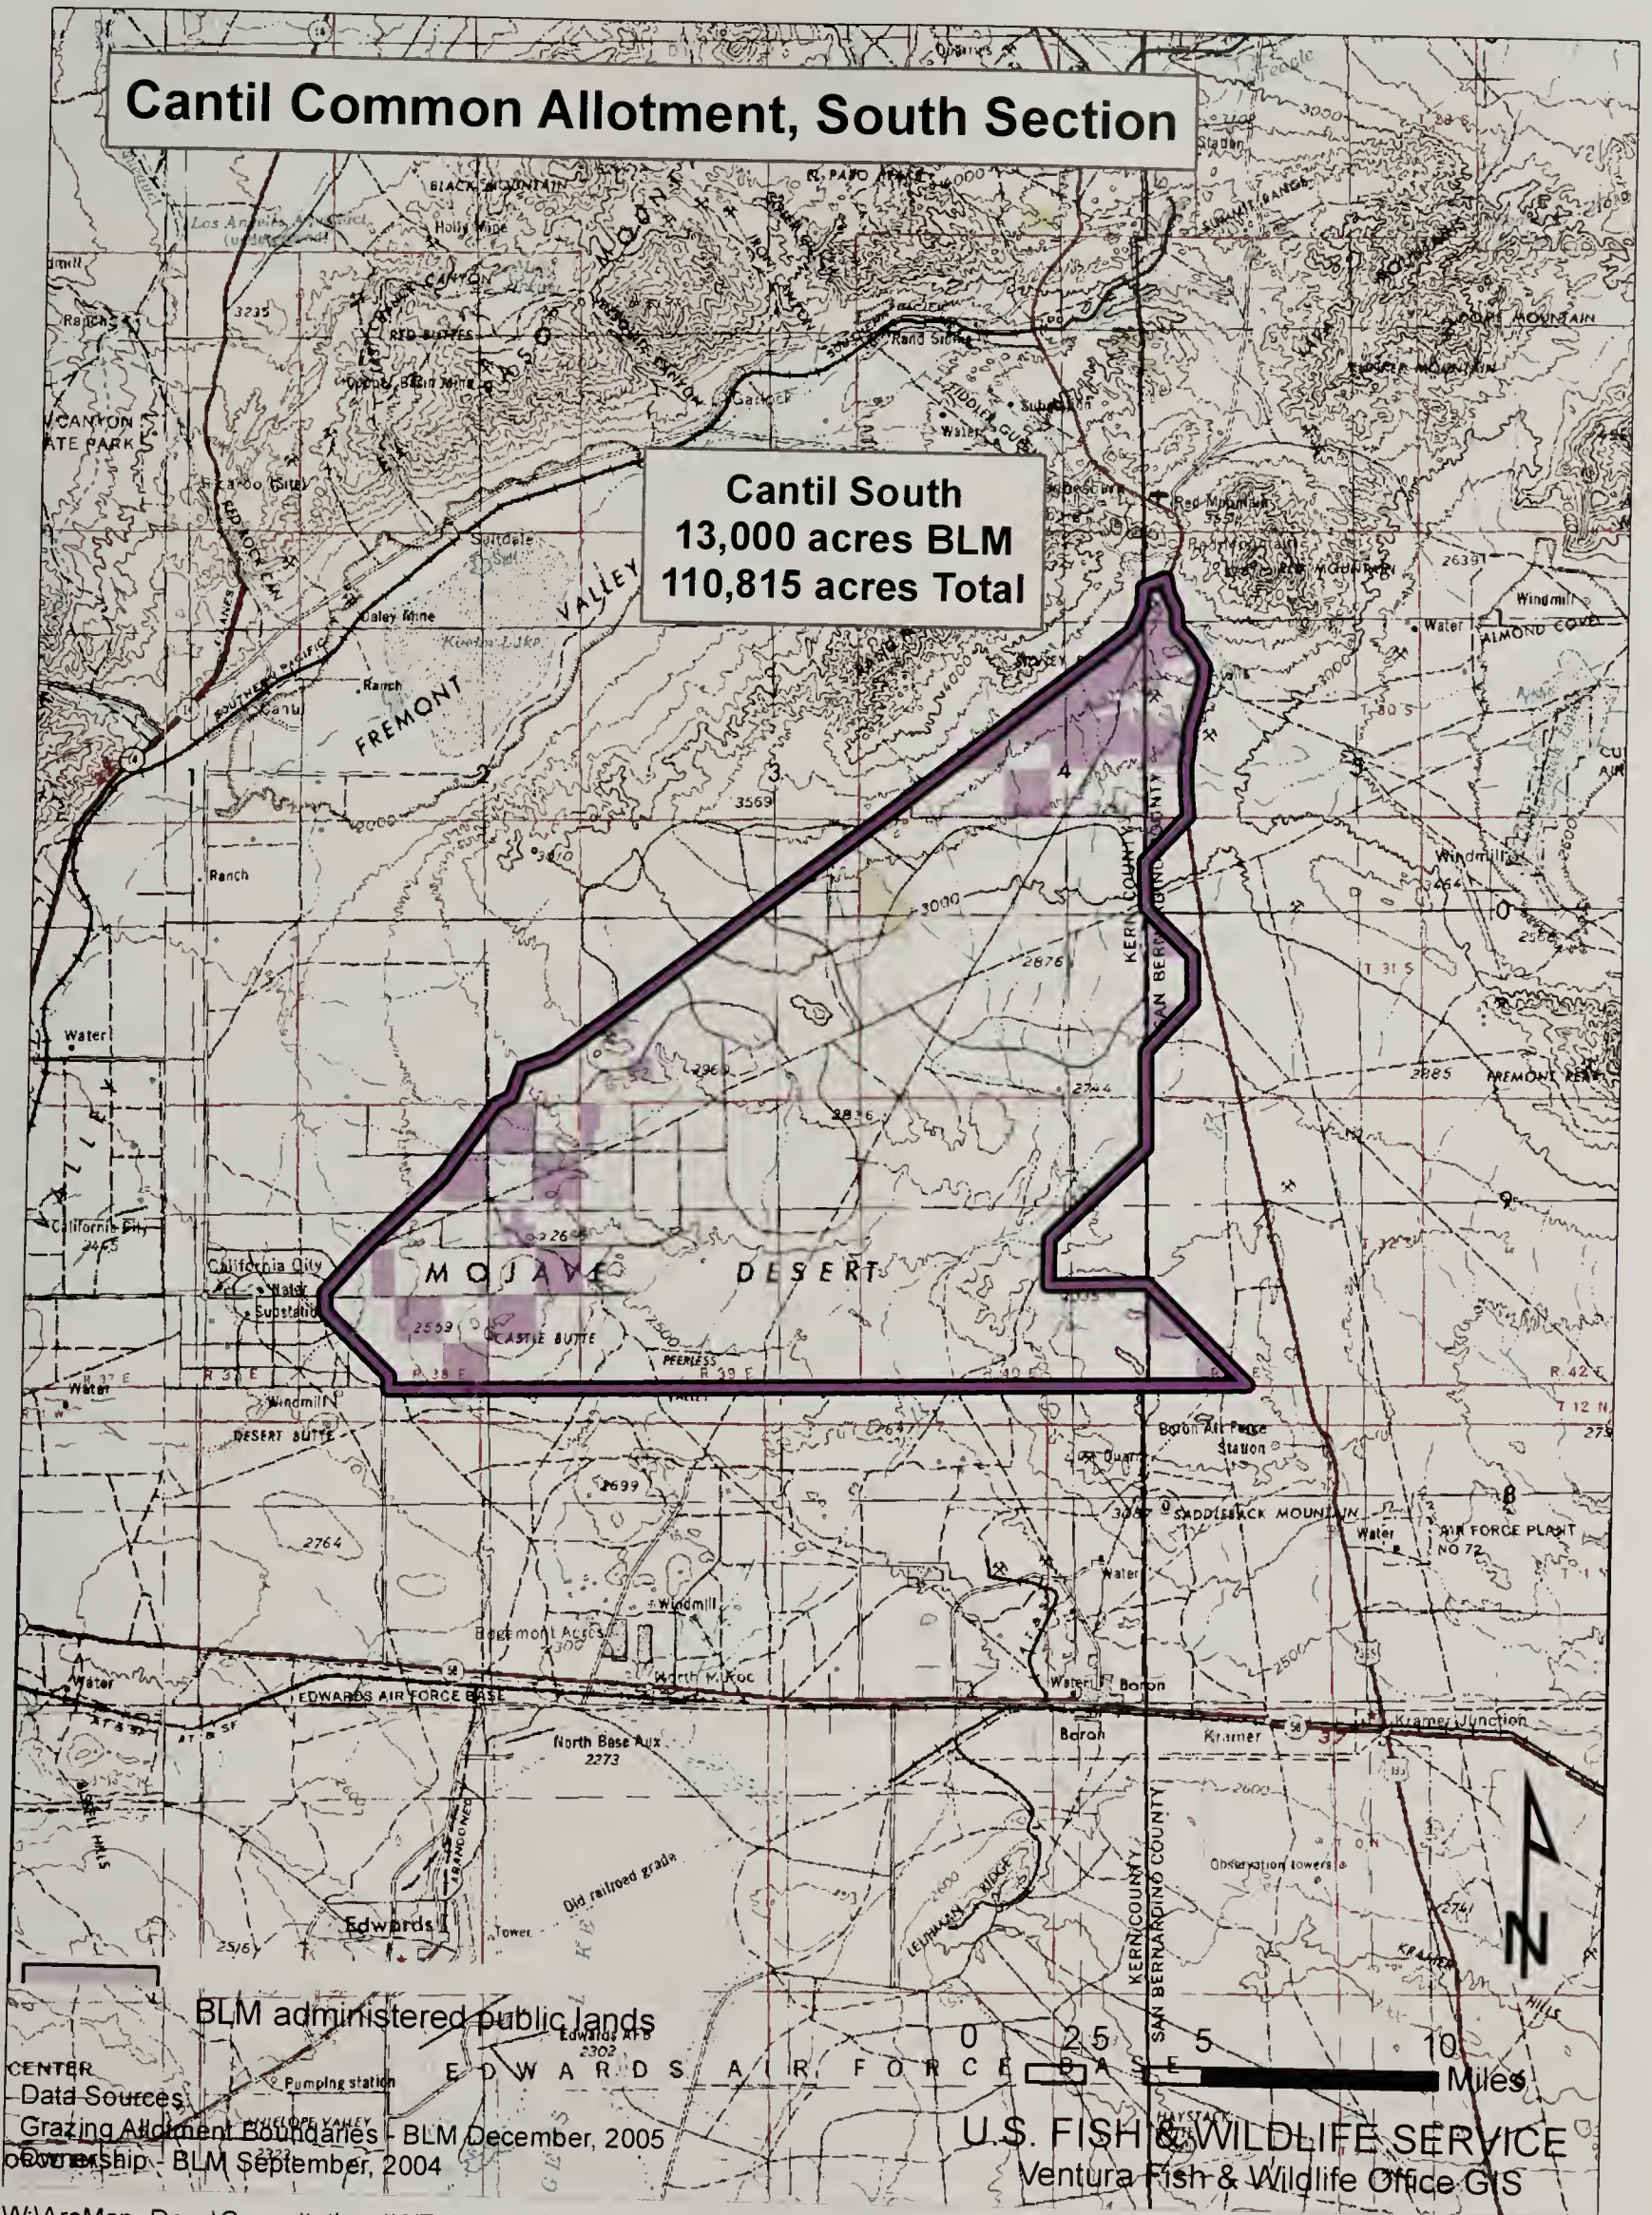

- U.S. Fish and Wildlife Service. 2000. Extension of biological opinions 1-6-92-F-55, 1-8-94-F-17, and 1-5-96-F-29R for livestock grazing in the California desert, Riverside and San Bernardino Counties. Memorandum to District Manager, Bureau of Land Management, Riverside, California. Dated August 3. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2002a. Biological opinion for the California Desert Conservation Area Plan [desert tortoise] (6840(P) CA-063.50) (1-8-01-F-16). Memorandum to State Director, Bureau of Land Management, Sacramento, California. Dated June 17. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2002b. Endangered species consultation on the effects of the California Desert Conservation Area Plan on the southwestern willow flycatcher, least Bell's vireo, and arroyo toad. FWS-ERIV-2600.02. Memorandum to State Director, Bureau of Land Management, Sacramento, California. Dated December 17. From Assistant Field Supervisor, Carlsbad Fish and Wildlife Office. Carlsbad, California.
- U.S. Fish and Wildlife Service. 2002c. Biological opinion for the California Desert Conservation Area Plan [Lane-Mountain milk-vetch, Ash Meadows gumplant, and Amargosa niterwort] (6840(P) CA-063.50) (1-8-01-F-18). Memorandum to State Director, Bureau of Land Management, Sacramento, California. Dated February 27. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2003a. Biological opinion for the designation of routes of travel in the western Mojave Desert, California (6842 CA-063.50) (1-8-03-F-21). Memorandum to District Manager, Bureau of Land Management, Moreno Valley, California. Dated June 30. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2003b. Biological opinion for the California Desert Conservation Area Plan [Parish's daisy, Cushenbury buckwheat, Cushenbury milk-vetch, Cushenbury oxytheca] (6840(P) CA-063.50) (1-8-01-F-68). Memorandum to State Director, Bureau of Land Management, Sacramento, California. Dated September 25. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2003c. California Desert Conservation Area Plan [Inyo California towhee, bald eagle, mountain plover, Yuma clapper rail, Mohave tui chub] (6840(P) CA-063.50). Memorandum to State Director, Bureau of Land Management, Sacramento, California. Dated October 17. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.

- U.S. Fish and Wildlife Service. 2004a. Biological opinion for the proposed addition of maneuver training lands at Fort Irwin, California (1-8-03-F-48). Letter to Colonel Edward Flynn, Fort Irwin, California. Dated March 15. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2004b. Internal draft of a proposed rule. Endangered and threatened wildlife and plants; proposed designation of critical habitat for *Astragalus jaegerianus* (Lane Mountain milk-vetch). Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2004c. Biological opinion for the DARPA Grand Challenge Event, San Bernardino County, California, and Clark County, Nevada (1-8-04-F-7). Letter to Colonel Jose A. Negron, Defense Advanced Research Projects Agency, Arlington, Virginia. Dated February 28. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2005a. GIS calculation of acreages of critical habitat units within the action area of the biological opinion for the California Desert Conservation Area Plan (desert tortoise). Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2005b. Formal section 7 consultation on the Carbonate Habitat Management Strategy, San Bernardino County, California (1-6-05-F-4319). Letter to Gene Zimmerman, Forest Supervisor, San Bernardino National Forest, San Bernardino, California, and Linda Hansen, District Manager, Bureau of Land Management, Moreno Valley, California. Dated April 6. From Karen A. Goebel, Assistant Field Supervisor, U.S. Fish and Wildlife Service. Carlsbad, California.
- U.S. Fish and Wildlife Service. 2005c. Biological opinion for the California Desert Conservation Area Plan [desert tortoise] (6840 CA930(P)) (1-8-04-F-43R). Memorandum to District Manager, Bureau of Land Management, Moreno Valley, California. Dated March 31. From Field Supervisor, Ventura Fish and Wildlife Office. Ventura, California.
- U.S. Fish and Wildlife Service. 2005d. GIS calculation of area of desert tortoise critical habitat managed by the Bureau that was not included within desert wildlife management areas. Ventura Fish and Wildlife Office. Ventura, California.
