(/1690-1912/ Report of 3rd of
July 1912 on the subject of the
newly-discovered fossils from the
area around the village of Lopukhivka.

1. Description of the locality
The locality is situated on the right bank of the river Dniester, about 10 km upstream from the village of Lopukhivka. The area is characterized by low hills and ridges, with numerous small streams and gullies. The terrain is generally flat, with some slight elevation along the river banks. The soil is dark brown, loamy, and relatively fertile. There are several small settlements in the vicinity, including the village of Lopukhivka itself, which is located about 2 km upstream. The climate is temperate, with four distinct seasons. The summer months are warm and humid, while the winter months are cold and dry. The average annual temperature is approximately 10°C, and the average annual precipitation is about 600 mm.

2. Fossils found (Section 10)

2a. 100 - 140 mm. This is a large fossiliferous limestone bed, showing clear signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2b. 140 - 180 mm. This is a smaller, more compact bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2c. 180 - 220 mm. This is a larger, more massive bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2d. 220 - 260 mm. This is a smaller, more compact bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2e. 260 - 300 mm. This is a larger, more massive bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2f. 300 - 340 mm. This is a smaller, more compact bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2g. 340 - 380 mm. This is a larger, more massive bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2h. 380 - 420 mm. This is a smaller, more compact bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

2i. 420 - 460 mm. This is a larger, more massive bed of limestone, showing signs of wave action. The rock is light gray, with some darker, more weathered areas. It contains numerous fossil remains, including fragments of corals, brachiopods, and other marine organisms. The fossils are well preserved, and some appear to be quite large. The overall thickness of the bed is approximately 10 cm.

октябрь 29 г. 1921 г.

А/191

Любезные члены Рабочего комитета, Бюллетеня № 12
и всех граждан, интересующихся политической жизнью.
Мы просим вас обратить внимание на то, что в последнее время
всё более усиливается политическая борьба между различными
группами и партиями. В частности, в последние дни
важнейшими событиями являются: 1) разрыв между большевиками
и меньшевиками; 2) разрыв между большевиками и кадетами;
3) разрыв между большевиками и социал-демократами.
Все эти события имеют большое значение для дальнейшего
развития политической жизни в России. (Все эти события
имеют большое значение для дальнейшего развития политической
жизни в России.)

Сообщение № 1

Сообщение о событиях в Саратове. Речь идет о том, что в Саратове
были убиты несколько человек, включая политических деятелей.
